About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee, ...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: sales@iec.ch.

IEC Products & Services Portal - products.iec.ch

Discover our powerful search engine and read freely all the publications previews, graphical symbols and the glossary. With a subscription you will always have access to up to date content tailored to your needs.

Electropedia - www.electropedia.org

The world's leading online dictionary on electrotechnology, containing more than 22 500 terminological entries in English and French, with equivalent terms in 25 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

QI SPECIFICATION VERSION 2.0 –

Part 5: Communications Physical Layer

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) IEC draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). IEC takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, IEC had not received notice of (a) patent(s), which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at <https://patents.iec.ch>. IEC shall not be held responsible for identifying any or all such patent rights.

IEC 63563-5 has been prepared by technical area 15: Wireless Power Transfer, of IEC technical committee 100: Audio, video and multimedia systems and equipment. It is an International Standard.

It is based on *Qi Specification version 2.0, Communications Physical Layer* and was submitted as a Fast-Track document.

The text of this International Standard is based on the following documents:

| Draft | Report on voting |
|---------------|------------------|
| 100/4250/FDIS | 100/4280/RVD |

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this International Standard is English.

The structure and editorial rules used in this publication reflect the practice of the organization which submitted it.

This document was developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement available at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are described in greater detail at www.iec.ch/publications.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under webstore.iec.ch in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn, or
- revised.

1 General

The Wireless Power Consortium (WPC) is a worldwide organization that aims to develop and promote global standards for wireless power transfer in various application areas. A first application area comprises flat-surface devices such as mobile phones and chargers in the Baseline Power Profile (up to 5 W) and Extended Power Profile (above 5 W).

1.1 Structure of the Qi Specification

General documents

- Introduction
- Glossary, Acronyms, and Symbols

System description documents

- Mechanical, Thermal, and User Interface
- Power Delivery
- Communications Physical Layer
- Communications Protocol
- Foreign Object Detection
- NFC Tag Protection
- Authentication Protocol

IECNORM.COM : Click to view the full PDF of IEC 63563-5:2025

1.2 Scope

The *Communications Physical Layer* (this document) defines the low-level (physical layer and the data link layer) formats of data bits, data bytes, and data packets. In addition, it provides requirements and guidelines for load modulation and frequency-shift keying.

1.3 Compliance

All provisions in the *Qi Specification* are mandatory, unless specifically indicated as recommended, optional, note, example, or informative. Verbal expression of provisions in this Specification follow the rules provided in ISO/IEC Directives, Part 2.

Table 1: Verbal forms for expressions of provisions

| Provision | Verbal form |
|----------------|--------------------------|
| requirement | “shall” or “shall not” |
| recommendation | “should” or “should not” |
| permission | “may” or “may not” |
| capability | “can” or “cannot” |

1.4 References

For undated references, the most recently published document applies. The most recent WPC publications can be downloaded from <http://www.wirelesspowerconsortium.com>.

IECNORM.COM : Click to view the full PDF of IEC 63563-5:2025

1.5 Conventions

1.5.1 Notation of numbers

- Real numbers use the digits 0 to 9, a decimal point, and optionally an exponential part.
- Integer numbers in decimal notation use the digits 0 to 9.
- Integer numbers in hexadecimal notation use the hexadecimal digits 0 to 9 and A to F, and are prefixed by "0x" unless explicitly indicated otherwise.
- Single bit values use the words ZERO and ONE.

1.5.2 Tolerances

Unless indicated otherwise, all numeric values in the *Qi Specification* are exactly as specified and do not have any implied tolerance.

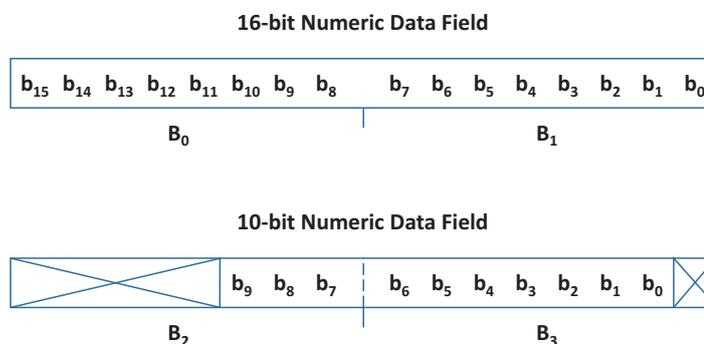

1.5.3 Fields in a data packet

A numeric value stored in a field of a data packet uses a big-endian format. Bits that are more significant are stored at a lower byte offset than bits that are less significant. [Table 2](#) and [Figure 1](#) provide examples of the interpretation of such fields.

Table 2: Example of fields in a data packet

| | b₇ | b₆ | b₅ | b₄ | b₃ | b₂ | b₁ | b₀ |
|----------------------|---|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|
| B₀ | (msb) 16-bit Numeric Data Field (lsb) | | | | | | | |
| B₁ | | | | | | | | |
| B₂ | Other Field (msb) | | | | | | | |
| B₃ | 10-bit Numeric Data Field (lsb) | | | | | | Field | |

Figure 1. Examples of fields in a data packet

1.5.4 Notation of text strings

Text strings consist of a sequence of printable ASCII characters (i.e. in the range of 0x20 to 0x7E) enclosed in double quotes ("). Text strings are stored in fields of data structures with the first character of the string at the lowest byte offset, and are padded with ASCII NUL (0x00) characters to the end of the field where necessary.

EXAMPLE: The text string "WPC" is stored in a six-byte field as the sequence of characters 'W', 'P', 'C', NUL, NUL, and NUL. The text string "M:4D3A" is stored in a six-byte field as the sequence 'M', ':', '4', 'D', '3', and 'A'.

1.5.5 Short-hand notation for data packets

In many instances, the *Qi Specification* refers to a data packet using the following shorthand notation:

<MNEMONIC>/<modifier>

In this notation, <MNEMONIC> refers to the data packet's mnemonic defined in the *Qi Specification, Communications Protocol*, and <modifier> refers to a particular value in a field of the data packet. The definitions of the data packets in the *Qi Specification, Communications Protocol*, list the meanings of the modifiers.

For example, EPT/cc refers to an End Power Transfer data packet having its End Power Transfer code field set to 0x01.

IECNORM.COM : Click to view the full PDF of IEC 63563-5:2025

1.6 Power Profiles

A Power Profile determines the level of compatibility between a Power Transmitter and a Power Receiver. [Table 3](#) defines the available Power Profiles.

- *BPP PTx*: A Baseline Power Profile Power Transmitter.
- *EPP5 PTx*: An Extended Power Profile Power Transmitter having a restricted power transfer capability, i.e. $P_L^{(pot)} = 5 \text{ W}$.
- *EPP PTx*: An Extended Power Profile Power Transmitter.
- *BPP PRx*: A Baseline Power Profile Power Receiver.
- *EPP PRx*: An Extended Power Profile Power Receiver.

Table 3: Capabilities included in a Power Profile

| Feature | BPP PTx | EPP5 PTx | EPP PTx | BPP PRx | EPP PRx |
|-----------------------|---------|----------|---------|---------|----------|
| Ax or Bx design | Yes | Yes | No | N/A | N/A |
| MP-Ax or MP-Bx design | No | No | Yes | N/A | N/A |
| Baseline Protocol | Yes | Yes | Yes | Yes | Yes |
| Extended Protocol | No | Yes | Yes | No | Yes |
| Authentication | N/A | Optional | Yes | N/A | Optional |

IECNORM.COM : Click to view the full PDF of IEC 63563-5:2025

2 Load Modulation

This section defines both the physical layer and the data link layer of the Power Receiver to Power Transmitter communications interface.

The Power Receiver communicates to the Power Transmitter using backscatter modulation. For this purpose, the Power Receiver modulates the amount of power that it draws from the Power Signal. The Power Transmitter detects this as a modulation of the current through and/or voltage across the Primary Cell. In other words, the Power Receiver and Power Transmitter use an amplitude modulated Power Signal to provide a Power Receiver to Power Transmitter communications channel.

2.1 Modulation scheme

The Power Receiver shall modulate the amount of power that it draws from the Power Signal, such that the Primary Cell current and/or Primary Cell voltage assume two states, namely a HI state and a LO state.¹ A state is characterized in that the amplitude is constant within a certain variation Δ for at least t_s ms. If the Power Receiver is properly aligned to the Primary Cell of a type A10 or MP-A1 Power Transmitter, and for all appropriate loads, at least one of the following three conditions shall apply:²

- The difference of the amplitude of the Primary Cell current in the HI and LO state is at least 15 mA.
- The difference of the Primary Cell current in the HI and LO state is at least 15 mA. The Primary Cell current is measured at instants in time that correspond to one quarter of the cycle of the control signal driving the half-bridge inverter.³
- The difference of the amplitude of the Primary Cell voltage in the HI and LO state is at least 200 mV.

During a transition, the Primary Cell current and Primary Cell voltage are undefined. See [Figure 2](#) and [Table 4](#).

¹ The HI and LO states do not correspond to fixed Primary Cell current and/or Primary Cell voltage levels.

² The design requirements of the Mobile Device determine both the range of lateral displacements that constitute proper alignment and the range of loading conditions on its Power Receiver.

³ The start of the cycle corresponds the closing of the top switch in the half-bridge inverter.

Figure 2. Amplitude modulation of the Power Signal

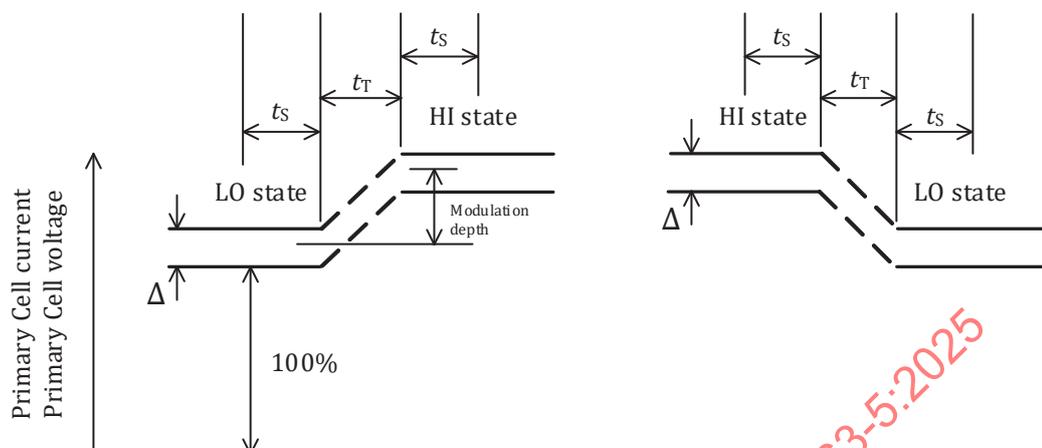

Table 4: Amplitude modulation of the Power Signal

| Parameter | Symbol | Value | Unit |
|-----------------------------|----------|-------|---------------|
| Maximum transition time | t_r | 100 | μs |
| Minimum stable time | t_s | 150 | μs |
| Current amplitude variation | Δ | 8 | mA |
| Voltage amplitude variation | Δ | 110 | mV |

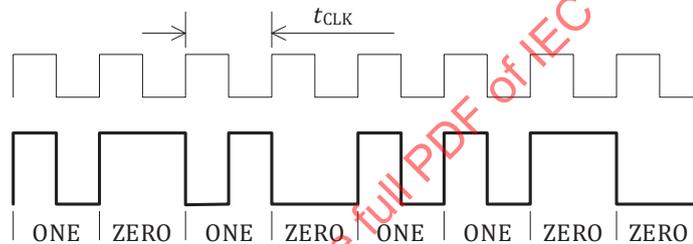

2.2 Bit encoding scheme

The Power Receiver shall use a differential bi-phase encoding scheme to modulate data bits onto the Power Signal. For this purpose, the Power Receiver shall align each data bit to a full period t_{CLK} of an internal clock signal, such that the start of a data bit coincides with the rising edge of the clock signal. This internal clock signal shall have a frequency $f_{CLK} = (2 \pm 4\%) \text{ kHz}$.

NOTE: A ripple on the Power Receiver's load yields a ripple on the Power Transmitter's current. As a result, such a ripple can lead to bit errors in the Power Transmitter. The number of bit errors can be particularly high if this ripple has a frequency that is close to the modulation frequency f_{CLK} .

The Receiver shall encode a ONE bit using two transitions in the Power Signal, such that the first transition coincides with the rising edge of the clock signal and the second transition coincides with the falling edge of the clock signal. The Receiver shall encode a ZERO bit using a single transition in the Power Signal, which coincides with the rising edge of the clock signal.

Figure 3. Example of a differential bi-phase encoding scheme

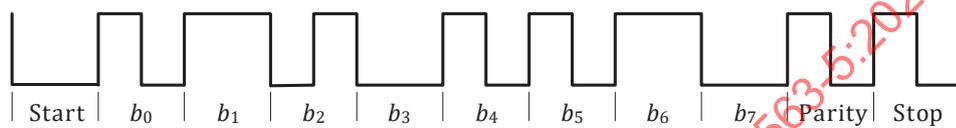

IECNORM.COM : Click to view the full PDF of IEC 63563-5:2025

2.3 Byte encoding scheme

The Power Receiver shall use an 11-bit asynchronous serial format to transmit a data byte. This format consists of a start bit, the 8 data bits of the byte, a parity bit, and a single stop bit. The start bit is a ZERO. The order of the data bits is LSB first. The parity bit is odd. This means that the Power Receiver shall set the parity bit to ONE if the data byte contains an even number of ONE bits. Otherwise, the Power Receiver shall set the parity bit to ZERO. The stop bit is a ONE. Figure 4 shows the data byte format—including the differential bi-phase encoding of each individual bit—using the value 0x35 as an example.

Figure 4. Example of the asynchronous serial format

IECNORM.COM : Click to view the full PDF of IEC 63563-5:2025

2.4 Data packet structure

The Power Receiver shall communicate to the Power Transmitter using data packets. As shown in [Figure 5](#), a data packet consists of 4 parts, namely a preamble, a header, a message, and a checksum. The preamble consists of a minimum of 11 and a maximum of 25 bits, all set to ONE, and encoded as defined in [Section 2.1, Modulation scheme](#). The preamble enables the Power Transmitter to synchronize with the incoming data and accurately detect the start bit of the header.

The header, message, and checksum consist of a sequence of three or more bytes encoded as defined in [Section 2.3, Byte encoding scheme](#).⁴

Figure 5. data packet format

| | | | |
|----------|--------|---------|----------|
| Preamble | Header | Message | Checksum |
|----------|--------|---------|----------|

The Power Transmitter shall consider a data packet as received correctly if:

- The Power Transmitter has detected at least 4 preamble bits that are followed by a start bit.
- The Power Transmitter has not detected a parity error in any of the bytes that comprise the data packet. This includes the header byte, the message bytes, and the checksum byte.
- The Power Transmitter has detected the stop bit of the checksum byte.
- The Power Transmitter has determined that the checksum byte is consistent (see [Section 2.4.3, Checksum](#)).

If the Power Transmitter does not receive a data packet correctly, the Power Transmitter shall discard the data packet and not use any of the information contained therein.

NOTE: In the ping phase as well as in the identification and configuration phase, this typically leads to a time-out, which causes the Power Transmitter to remove the Power Signal.

IECNORM.COM : Click to view the full PDF of IEC 63563-5:2025

⁴ The Power Receiver should turn off its communications modulator after transmitting a data packet. This may cause an additional HI state to LO state or LO state to HI state transition in the Primary Cell current.

2.4.1 Header

The header consists of a single byte that indicates the data packet type. In addition, the header implicitly provides the size of the message contained in the data packet. The number of bytes in a message is calculated from the value contained in the header of the data packet, as shown in the center column of [Table 5](#).

Table 5: Message size

| Header | Message Size* | Comment |
|---|----------------------------------|-------------------------------|
| 0x00...0x1F | $1 + (\text{Header} - 0) / 32$ | 1 × 32 messages (size 1) |
| 0x20...0x7F | $2 + (\text{Header} - 32) / 16$ | 6 × 16 messages (size 2...7) |
| 0x80...0xDF | $8 + (\text{Header} - 128) / 8$ | 12 × 8 messages (size 8...19) |
| 0xE0...0xFF | $20 + (\text{Header} - 224) / 4$ | 8 × 4 messages (size 20...27) |
| *Values in this column are truncated to an integer. | | |

2.4.2 Message

The Power Receiver shall ensure that the message contained in the data packet is consistent with the data packet type indicated in the header. See *Qi Specification, Communications Protocol* for a detailed definition of the possible messages. The first byte of the message, byte B_0 , directly follows the header.

2.4.3 Checksum

The checksum consists of a single byte that enables the Power Transmitter to check for transmission errors. The Power Transmitter shall calculate the checksum as follows:

$$C := H \oplus B_0 \oplus B_1 \oplus \dots \oplus B_{\text{last}}$$

where C represents the calculated checksum, H represents the header byte, and $B_0, B_1, \dots, B_{\text{last}}$ represent the message bytes.

If the calculated checksum C and the checksum byte contained in the data packet are not equal, the Power Transmitter shall determine that the checksum is inconsistent.

2.4.4 Correct reception of a data packet

A Power Transmitter shall decide that it has received a data packet correctly if and only if:

- the start bit and stop bits of each data byte are correct;
- the parity bit of each data byte is correct; and
- the checksum value at the end of the data packet is correct.

If the Power Transmitter has not received a data packet correctly, it shall discard the data packet and proceed as if it had not received the latter.

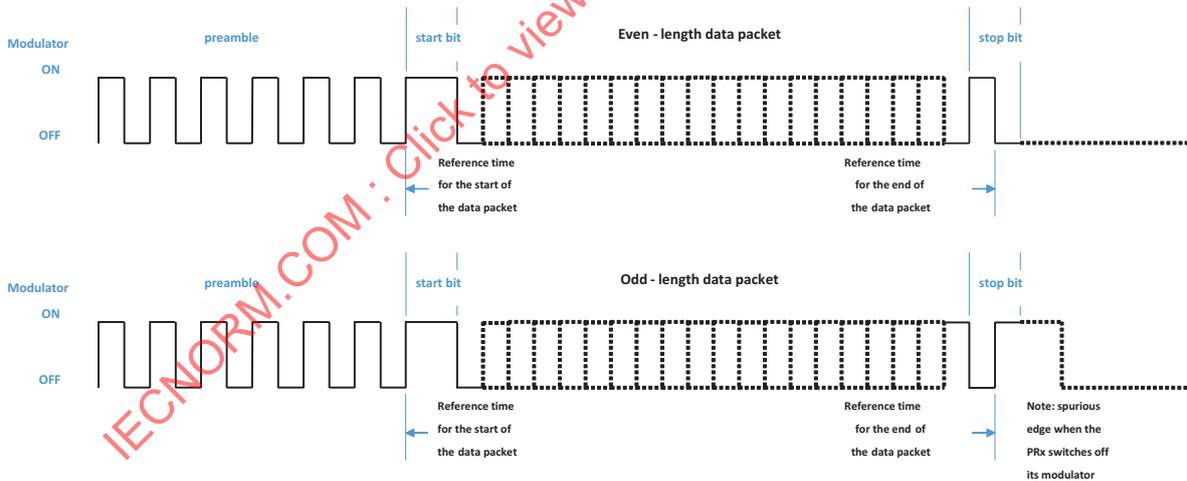

NOTE: The above requirement implies that a Power Transmitter does not respond to simple-query data packets or to data-request data packets that are incorrectly received.

2.4.5 Start and end of a data packet

Figure 6 zooms in on the start and end of a data packet, showing a number of preamble data bits, the first start bit, and the final stop bit. The reference time for the start of a data packet is the edge at the start of the first start bit (a ZERO). The reference time for the end of a data packet is the edge at the center of the final stop bit (a ONE).

After transmitting a data packet containing an odd number of data bytes, the communications signal contains an additional edge. This additional edge is not a part of the data packet; it results from the Power Receiver switching off its modulator.

Figure 6. Start and end of a load-modulated data packet

3 Frequency-shift keying

The Power Transmitter communicates to the Power Receiver using Frequency Shift Keying, in which the Power Transmitter modulates the Operating Frequency of the Power Signal.

This section defines both the physical layer and the data link layer of the Power Transmitter to Power Receiver communications interface. The data link layer supports both data packets and Responses. The format of a data packet is defined in [Section 3.3, Byte encoding scheme](#). The format of a Response is defined in [Section 3.5, Response Pattern](#).

3.1 Modulation scheme

The Power Transmitter shall switch its Operating Frequency between the Operating Frequency f_{op} in the unmodulated state and the Operating Frequency f_{mod} in the modulated state. The difference between these two frequencies is characterized by two parameters:

- *Polarity*. This parameter determines whether the difference between f_{mod} and f_{op} is positive or negative.

NOTE: In both the Configuration data packet and a Specific Request data packet that has its Request field set to 0x03 (FSK Parameters), the Power Receiver encodes the positive polarity as a ZERO and the negative polarity as a ONE. In addition, note that a negative polarity typically increases the voltage induced in the Secondary Coil, and therefore should be used with care.

- *Depth*. This parameter determines the magnitude of the difference between f_{op} and f_{mod} .

NOTE: Both the Configuration data packet and the Specific Request data packet (Request 0x03, FSK Parameters) encode the modulation depth in a two-bit unsigned integer value.

For any given Operating Frequency f_{op} , and depending on the polarity and depth parameters, f_{mod} shall be chosen such that the time difference between a single cycle of f_{mod} and a single cycle of f_{op} is in the range that is defined in [Table 6](#).

NOTE: The minimum time difference in this Table corresponds to a single cycle of a 32 MHz clock.

Table 6: FSK States

| Polarity | Depth | $\frac{1}{f_{\text{mod}}} - \frac{1}{f_{\text{op}}}$ | | Unit |
|----------|-------|--|---------|------|
| | | Minimum | Maximum | |
| positive | 3 | -282.00 | -249.00 | ns |
| positive | 2 | -157.00 | -124.00 | ns |
| positive | 1 | -94.50 | -61.50 | ns |
| positive | 0 | -63.25 | -30.25 | ns |
| negative | 0 | 30.25 | 63.25 | ns |
| negative | 1 | 61.50 | 94.50 | ns |
| negative | 2 | 124.00 | 157.00 | ns |
| negative | 3 | 249.00 | 282.00 | ns |

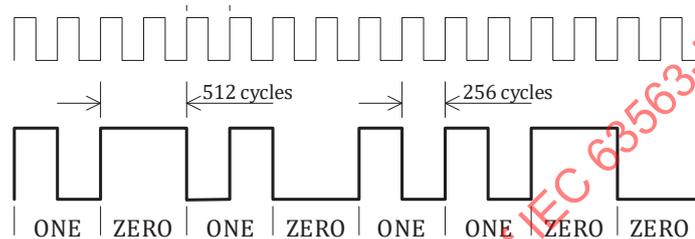

IECNORM.COM : Click to view the full PDF of IEC 63563-5:2025

3.2 Bit encoding scheme

The Power Transmitter shall use a differential bi-phase encoding scheme to modulate data bits in the Power Signal. For this purpose, the Power Transmitter shall align each data bit to the number of cycles contained in the Power Transfer Contract (default 512).

The Power Transmitter shall encode a ONE bit using two transitions in the Power Signal frequency. The first transition shall occur at the start of the bit and the second transition shall occur at half the number of cycles per bit (default 256). The Transmitter shall encode a ZERO bit using a single transition in the Power Signal frequency at the start of the bit.

Figure 7. Example of differential bi-phase encoding

A Power Receiver shall be resilient to variations in the number of cycles per half bit of plus or minus $\text{ceil}(\text{Ncycles}/200)$, where $\text{ceil}(x)$ represents the smallest integer larger than x . For example, a Power Receiver shall be able to decode FSK data bits encoded using any number of Power Signal cycles ranging from 253 to 259, inclusive if the number of cycles per bit is 512 (see [Table 7](#)).

[Table 7](#) lists the NCYCLES containing number of samples and allowed variation.

Table 7: Resilience to variations in the number of cycles per half bit

| NCycles | Minimum | Target | Maximum |
|---------|---------|--------|---------|
| 512 | 253 | 256 | 259 |
| 256 | 126 | 128 | 130 |
| 128 | 63 | 64 | 65 |
| 64 | 31 | 32 | 33 |

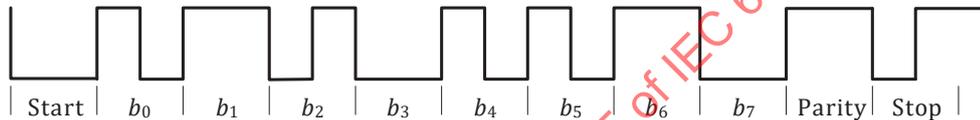

3.3 Byte encoding scheme

The Power Transmitter shall use an 11-bit asynchronous serial format to transmit a data byte. This format consists of a start bit, the 8 data bits of the byte, a parity bit, and a single stop bit. The start bit is a ZERO. The order of the data bits is LSB first. The parity is even, which means that the Power Transmitter shall set the parity bit to ONE if the data byte contains an odd number of ONE bits. Otherwise, the Power Transmitter shall set the parity bit to ZERO.

NOTE: For clarity, Power Receiver to Power Transmitter communications use odd parity, as defined in the *Qi Specification, Power Delivery*.

The stop bit is a ONE. [Figure 8](#) shows the data byte format—including the differential bi-phase encoding of each individual bit—using the value 0x35 as an example. The Power Transmitter shall send all bits in a contiguous sequence without a pause in between two consecutive bits. It shall send the start bit first and the stop bit last.

Figure 8. Example of the asynchronous serial format
