About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

IEC Catalogue - webstore.iec.ch/catalogue

The stand-alone application for consulting the entire bibliographical information on IEC International Standards, Technical Specifications, Technical Reports and other documents. Available for PC, Mac OS, Android Tablets and iPad.

IEC publications search - www.iec.ch/searchpub

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and also once a month by email.

Electropedia - www.electropedia.org

The world's leading online dictionary of electronic and electrical terms containing more than 30 000 terms and definitions in English and French, with equivalent terms in 14 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

More than 55 000 electrotechnical terminology entries in English and French extracted from the Terms and Definitions clause of IEC publications issued since 2002. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

DC POWER SUPPLY FOR NOTEBOOK COMPUTERS

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

The main task of IEC technical committees is to prepare International Standards. In exceptional circumstances, a technical committee may propose the publication of a technical specification when

- the required support cannot be obtained for the publication of an International Standard, despite repeated efforts, or
- the subject is still under technical development or where, for any other reason, there is the future but no immediate possibility of an agreement on an International Standard.

Technical specifications are subject to review within three years of publication to decide whether they can be transformed into International Standards.

IEC/TS 62700, which is a technical specification, has been prepared by technical area 14: Interfaces and methods of measurement for personal computing equipment of IEC technical committee 100: Audio, video and multimedia systems and equipment.

The text of this technical specification is based on the following documents:

Enquiry draft	Report on voting
100/2170/DTS	100/2231/RVC

Full information on the voting for the approval of this technical specification can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

The committee has decided that the contents of this publication will remain unchanged until the stability date indicated on the IEC web site under "<http://webstore.iec.ch>" in the data related to the specific publication. At this date, the publication will be

- transformed into an International Standard,
- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

In consideration of global discussion on reducing e-waste and improving re-usability of power supplies, this Technical Specification addresses the common electro-mechanical characteristics for AC adapters used with a specified array of notebook computers.

In the current market, hundreds of millions of notebook computers are shipped every year with AC adapters which can typically be shared between generations of OEM notebook computers. A wide range of notebook computers are designed to meet unique market requirements and specific purposes. Each AC adapter is tuned and designed to optimally satisfy the requirements and specifications of the target notebook computers.

Specific combinations of OEM supplied AC adapters and notebook computers are tested and certified as a system in compliance with existing regulations and standards. Failing combinations are not shipped by the OEM to the consumer. This approach promotes consumer satisfaction, safety, and product reliability, while reducing the encroachment of poorly designed or manufactured aftermarket substitutes which may affect the operation of the notebook computer in compliance with regulatory requirements. Additionally, arbitrary combinations of AC adapters and notebook computers have been known to present functional and regulatory safety and EMC compliance issues for the notebook computer. These risks should be considered in any development or adoption of specifications for common AC adapters.

The objective of a common DC power supply is to support global interoperability of adapters for a specific range of notebook computers. This Technical Specification describes design considerations for the common adapters and identifies technical areas that require further development for interoperability with existing notebook computer technologies. The open technical and regulatory compliance issues identified within this Technical Specification which affect both AC adapters and the host notebook computers should be resolved before this specification can be considered as a normative within other standards or regulatory policies and before IEC standardization of the subject matter can be completed.

This Technical Specification also identifies important considerations required to maintain the high standard of safety, compliance and performance expected by users of notebook computers and global regulatory agencies.

The development of this Technical Specification is described in Annex A. Annexes C, D and E describe additional important areas which are required to be resolved in further standardization work.

The objective for future IEC standardization work will be to complete the development of the technical specifications which incorporates considerations for consumer safety, product reliability, system performance, regulatory compliance and technical innovations.

DC POWER SUPPLY FOR NOTEBOOK COMPUTERS

1 Scope

This Technical Specification states the minimum requirements for DC power supply for notebook computers. Specifically, it gives

- an electrical specification (performance characteristics),
- an ID pin method,
- a connector for DC power output.

The no-load power and power efficiency are outside the scope of this Technical Specification.

Note that safety requirements are covered by IEC 60950-1 and EMC requirements are covered by CISPR 22 and CISPR 24. CISPR 32 may be used in place of CISPR 22 for this purpose. These requirements are neither re-stated nor challenged by this Technical Specification but the designer should give due consideration to the performance of the power supply when used with a compatible notebook computer.

NOTE Applications for use in aerospace, military, medical, or smart grid are not addressed in this Technical Specification.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 60950-1:2005, *Information technology equipment – Safety – Part 1: General requirements*
Amendment 1:2009
Amendment 2:2013

IEC 61076-2-102, *Connectors for electronic equipment – Part 2-102: Circular connectors with assessed quality – Detail specification for plugs and jacks for external low voltage power supply*

IEC 61204:1993, *Low-voltage power supply devices, d.c. output – Performance characteristics*
Amendment 1:2001

CISPR 22, *Information technology equipment – Radio disturbance characteristics – Limits and methods of measurement*

CISPR 24, *Information technology equipment – Immunity characteristics – Limits and methods of measurement*

CISPR 32, *Electromagnetic compatibility of multimedia equipment – Emission requirements*

3 Terms, definitions and abbreviations

3.1 Terms and definitions

For the purposes of this document, the terms and definitions given in IEC 60950-1 as well as the following apply.

3.1.1

notebook computer

lightweight compactly designed computer with a screen and attached keyboard that is capable of running on battery power for extended periods of time and is relatively easy to transport from one location to another by a single individual

3.1.2

DC power supply

adapter

AC adapter

external power supply which provides DC to the notebook computer

3.1.3

DC output connector

connecting body to connect and disconnect the electrical interface between DC power supply and the notebook computer

3.1.4

DC output plug

male connector of DC output connectors for connecting the DC power supply

3.1.5

identification signal

ID signal

signal which enables communication between a DC power supply to a notebook computer

3.1.6

identification signal connector pin

ID pin

electrical connector pin to transport ID signal

3.2 Abbreviations

AC	Alternating Current
CPU	Central Processing Unit
EIAJ	Electronic Industries Association of Japan
EMC	Electromagnetic Compatibility
EMI	Electro Magnetic Interference
EUT	Equipment Under Test
LPS	Limited Power Supply
OEM	Original Equipment Manufacturer
PSE	Product Safety Electrical appliance and material
SPM	Smart Power Management
VCC	Voltage at the Common Collector

4 Electrical specification (performance characteristics)

4.1 AC input rating

The range of AC input rating acceptable by the power supply shall be stated and specified as (100 to 240) Vrms, 50/60 Hz. Operating tolerance shall be (90 to 264) Vrms at 47 Hz to 63 Hz to accommodate specific country/regional requirements. No further tolerances shall be applied.

4.2 Inrush current

The maximum inrush current, from power-on (with power on at any point on the AC sinewave) and including, but not limited to, three line cycles, shall be less than 220 A. The limit shall be met at the maximum input voltage and across both cold start (all components at minimum temperature) and hot start conditions (and after sustained operation at maximum rated power and ambient temperature).

4.3 DC output load condition and voltage regulation

There are still comments and concerns with respect to the DC output load conditions and voltage regulations. Informative text is given in Clause E.1.

4.4 DC output ripple and noise

The ripple and noise performance for DC output shall be stated and specified as maximum 600 mV peak-to-peak for steady state, except when no load is attached.

IEC 61204:1993, and its Amendment 1:2001, 3.10 “Periodic and random deviation” is applicable.

4.5 Output transient response and capacitor load

The transient response at the output terminal and the capacitor load of the power supply shall be stated. The capacitor load shall be specified as 2 200 μ F maximum.

IEC 61204:1993, 3.16 “Transient response to load current changes” is applicable.

4.6 Power supply timing

4.6.1 Turn on delay time

The time taken, after switch-on of the source, for the output voltage to enter the specification band, shall be stated and specified as less than 3 s maximum under all load conditions.

4.6.2 Hold-up time

The hold-up time shall be stated as more than 10 ms at 110 Vrms/50 Hz.

Note that a reference load should be considered in future work.

4.6.3 Rise time of output voltage

The rise time of output voltage shall be greater than 2 ms and less than 40 ms.

Note that a reference load should be considered in future work.

4.7 Protection

4.7.1 Over-current protection

There are still comments and concerns with respect to over-current protection. Informative text is given in Clause E.2.

4.7.2 Short-circuit protection

Short-circuit protection shall comply with IEC 60950-1.

4.8 Over shoot

During power on or power off, the output voltage shall not exceed 21 V peak nor be outside the regulation requirements for more than 10 ms.

Note that the maximum value shall be verified after further definition of 4.3.

5 DC power supply identification and communication method for notebook computers

This clause needs further investigation and development and is for information only. The use of the ID pin should be clearly defined (including pin configuration and communication mode). This Technical Specification has not addressed any definite method of communication between the AC adapter and computer, nor has the group yet discussed the scope of the data to be communicated.

Historically, AC adapters have commonly used mechanical interference of the DC connector to prevent incompatible combinations of AC adapters and notebook computers. Non-mechanical electrical methods (digital communication, voltage of the adapter, or analog reference) are in proprietary use today with some OEMs and work by identifying the AC adapter to the notebook computer. In general, the identification method is developed by each individual computer manufacturer and the methods used are different. On the other hand, there are many PCs and power supplies that do not use any identification protocol.

Further investigation is necessary in order to determine an identification method. To agree to a data communication protocol, data content and format is a complex task. Measures of robustness and integrity shall be used to help determine a minimum baseline of communication and allow for future evolution of this Technical Specification. Questions to answer are the following.

- Is an ID pin communication mandatory for functionality?
- When should it be acceptable for a computer to reject certain models of AC adapters?
- Which communications standard shall be used?
- What should the system do in the event of a failure of the communication?
- Can a scalable system of both low cost analog and higher function digital approaches be devised?
- Should the communication be bidirectional, or support networking of multiple devices?
- Which is the minimum information that shall be provided by the AC adapter? Which obligations does the notebook computer have to the AC adapter?
- What mechanism will allow for OEM specific innovation? To gain acceptance, the Technical Specification should not exclude innovative or proprietary solutions from manufacturers.
- What roadmap can be provided for future innovation in the communication method, or what process can be used for standardizing new data?

Simple analog methods (such as voltage positioning or presentation of a reference current on a dedicated pin) may be used to identify a few simple characteristics of the AC adapter (such as the announcement of the power output capability) to the notebook computer. Digital communication may be used to communicate more detailed information between the computer and AC adapter. EMI characteristics, power capabilities, or other details may be communicated to the computer to identify and even reject the usage of an unqualified AC adapter.

Health variables (such as reporting an over-temperature of the AC adapter) may require bidirectional signalling initiated by the AC adapter. Configurability of the AC adapter (for example, configuring output voltage) will require a read/write capability of the digital data. Lastly, the communication method may be desired to support proprietary OEM functionality beyond the scope or imagination of this Technical Specification.

Some typical methods used in notebook computers include

Class 1 ID:

The ID is a simple analog voltage. The adapter output voltage is a DC constant, and the notebook smart-power management (SPM) may get limited parameters such as voltage, power level, or even ripple, over-current protection, and over-power protection information by sensing the ID pin. Typical features include:

- the ID pin outputs an analog voltage. Thus, SPM can evaluate the voltage of the ID pin and quality, and make decisions on the acceptability of the adapter with the specific PC;
- SPM may make a dynamic adjustment to the notebooks power consumption by sensing the voltage drop on the ID pin.

Detailed information such as the manufacturer and specification information cannot viably be transmitted with a Class 1 ID, so it remains unknown to the PC.

Class 2 ID:

The ID is digital data stored in memory in the AC adapter. Static configuration reports such as parametric specifications, manufacturer, and safety certification information may be read using the ID. Typical features include the following.

- Data is transferred digitally. Transfers may be bidirectional.
- Any detailed information about the AC adapter can be stored in a known format.
- The AC adapter may store and transfer dynamic information such as total working hours and diagnostic records.
- The memory is read only. The AC adapter may not be reconfigured (for example, to another voltage) by the notebook.

Class 3 ID:

The ID pin is a digital power communication port which may allow configuration of the AC adapter by the notebook. The main features may be summarized as below.

- Digital power output parameters may be reconfigured according to the notebook command, for example, the output voltage can be changed from 16 V to 20 V.
- The protection alarm (for example, temperature, overcurrent, or overvoltage) and protection action signal may be sent mutually between the notebook and AC adapter.
- Include Class 2 ID features (static configuration reports of the AC adapter).

Communication methods may use a separate pin or may be imposed on the power lines (through AC modulation on the DC power line).

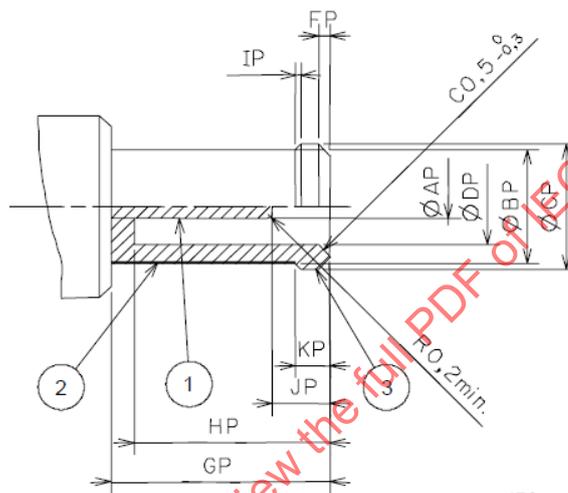

6 Connectors for DC power supply for notebook computer

6.1 General

The AC adapter may be provided with either a captive DC cable or with a replaceable DC cable. A captive cable has no provision for replacement by the end user and shall terminate in a male DC connector plug as described in Figure 1 and Table 1.

An AC adapter with a replaceable DC cable shall terminate with the female connector specified in 6.2.3. A cable assembly is required to connect the AC adapter to the notebook computer.

NOTE An alternative DC connector can be used if there is an optional means for the user to reconfigure the connector to comply with Figure 1.

Key

- 1 Centre electrode P
- 2 Sleeve
- 3 Insulation collar

Figure 1 – Shape of the plug

Table 1 – Dimensions of the plug

Dimensions in millimetres

AP	BP	CP	DP	FP	GP	HP min.	IP	JP	KP
1,0 ⁰ _{-0,1}	5,0 ^{+0,1} ₀	5,5 ^{+0,1} ₀	3,3 ^{+0,2} ₀	0,5 ⁰ _{-0,3}	9,5 ± 0,3	8,5	0,25 ± 0,1	2,5 ± 0,1	1,5 ± 0,1

NOTE In Japan, this plug is specified in the electrical appliance and material safety law of Japan to apply the voltage range of 10,5 V to 13,5 V only. Thin notebooks and tablet PCs use a smaller size of DC connector. The DC connector specified in Figure 1 does not suit thin notebooks and tablet PCs. Compatibility with backwards PCs will be taken into consideration.

6.2 Specification for DC connectors

6.2.1 General

The plug shown in Figure 1 shall terminate the end of an AC adapter with a captive cable. The DC connector enables 2 or 3 electrical connections (ground, VCC, and possibly a dedicated ID pin).

6.2.2 Shape and dimension of DC connectors

Recently, the notebook PC has become slimmer and thinner in accordance with market demand. The popular type of PC is moving from notebook to tablet. These trends are to be considered and further investigation is necessary.

A candidate for a mechanical DC connector is suggested in Figure 1. However, the 5,5 mm dimension will be too large for the current trend of thinner notebooks. A 4,5 mm connector would be appropriate for many thin computers, but may not have the current carrying capability for a 120 W adapter. A specification should make provisions to allow for a newly customized DC connector/jack combination, if so desired.

6.2.3 Voltage polarity and electrical specification of DC connectors

The outside electrode of the DC output connector shall have a negative (-) polarity and the centre electrode shall have a positive (+) polarity.

NOTE The electrical specification for a DC output connector and a measuring method are not yet determined. Typically, a DC resistance of 30 mΩ is expected from a mated pair. But since the DC connector and jack may be supplied by different vendors, a method of measuring mated DC resistance or current handling capability is not available for this Technical Specification.

6.3 Cable qualities

6.3.1 General

Cable length and construction affect the voltage regulation and the noise emission of the cable. A universal method of EMI mitigation is yet undetermined in this Technical Specification. For example, ferrite common mode chokes are commonly required to limit conducted emissions. A predictable placement and specification of the ferrite is essential for consistent operation.

Neither length, color, texture, diameter nor aesthetic design of the cable are addressed by this Technical Specification.

6.3.2 Special considerations for an AC adapter with replaceable cable

An AC adapter with replaceable cable shall terminate in a female connector on the adapter body compatible to the plug of Figure 1. To connect the AC adapter body to the notebook, a cable shall have at least one end with a DC connector plug described in Figure 1. The other cable end (attaching to the computer) may terminate with a DC connector plug shown in Figure 1, or of a proprietary type suited to the computer OEM. The user may replace the cable, for example for storage or for maintenance.

The resistance of a replaceable cable shall be predictable. This Technical Specification has not addressed the issues related to a replaceable cable, but a replaceable cable shall be understood in terms of its insertion resistance and inductance. Excessive resistance will cause power loss and DC ground shift. Excessive inductance can cause overvoltage to the computer and result in sparking during disconnection (which can cause wear on the connector) or component damage in the computer.

Annex A (informative)

Summary of discussion in project team IEC 62700

The summary below provides background information concerning the development of this Technical Specification.

Following Korea's domestic activities to consider common adapters for notebook computers, the Korean NC (KR) invited the international community to participate towards a standard that would address consumer convenience (through interoperability) and reduce E-waste (by encouraging re-use of a non-obsolete power supply). Recognizing the importance of establishing such an international standard, the Korean NC invited global industry and technology experts to participate in developing a safe and effective IEC standard.

a) History of progress

- New work item proposal 100/1699/NP was circulated on 2010-02-19.
- The NP was approved on 2010-09-17 (100/1753/RVN).
- The project team received comments submitted by National Committees on the NP (New work item Proposal), and agreed to get real data based on the agreed measurement methods.
- Having had face-to-face meetings several times since 2010, and receiving and discussing real measured data, the target date for first CD (Committee Draft) was extended two times in an attempt to clarify remaining comments.

b) The decision to develop a technical specification instead of an international standard

There are still comments and concerns in the NP which have not yet been resolved. These include issues with the proposed NP for international standards which have been identified by the project expert members, including major PC manufacturers. The project team believes more time is needed to understand and address the technical issues.

Based on the remaining issues, the project team was concerned that it would be difficult to reach consensus to develop an International Standard within the program work time period.

The project team decided to continue the discussion on e-waste and the resolution of technical challenges in order to move forward.

c) Considered aspects

The following is a summary of aspects considered by the project team IEC 62700. The details are shown in Annex C and Annex D.

1) Technical innovation / Advancement of technologies for PC systems

Innovative technologies are actively under development to improve power efficiency of PC systems. IEC work intends to support continuing innovation.

2) Product development cost and maintenance costs

The project team is mindful of the potential implementation and support costs to industry. The publication of an international standard should be carefully considered as responsible to the market requirements.

3) Feasibility for the reduction of the resource and e-waste

Shipment of the PC along with the AC adapter will be continued to meet regulatory and other market requirements. The project team does not suggest a certain reduction in e-waste by virtue of a common AC adapter.

4) Risk in system reliability, risk for consumers

The use of untested combinations of PC and third party AC adapters may cause unexpected problems and unknown business liability issues. Performance, reliability and safety for consumers are important.

5) Exploration and resolution of technical challenges

Issues in safety and EMC are being addressed. Additionally, relevant electro-mechanical characteristic issues have been identified and require further exploration.

Annex B (informative)

Ad-hoc activities

Measured data for the limited combinations between AC adapters and notebook computers are listed below.

Korea (KR), Japan, US and Ireland expert members participated in these ad-hoc activities.

a) Korean expert members submitted EMI measurement results tested in accordance with CISPR 22 as specified below.

1) EUT

AC adapter: 4 units, notebook PC: 3 units

Battery charging condition in notebook PC: 10 % and 100 %

NOTE AC adapters and notebook PCs are commonly available market products.

2) Measured combinations

Radiated emission: 48 combinations

Conducted emission on AC lines: 48 combinations

Conducted emission on LAN Port: 48 combinations

3) Result: Reduced margins were measured with the following 4 combinations.

A0: AC adapter, L2, L5: Notebook PC

The diagrams of these measurements are shown in Figure B.1 and Figure B.2.

IECNORM.COM : Click to view the full PDF of IEC TS 62700:2014

IECNORM.COM : Click to view the full PDF of IEC TS 62700:2014

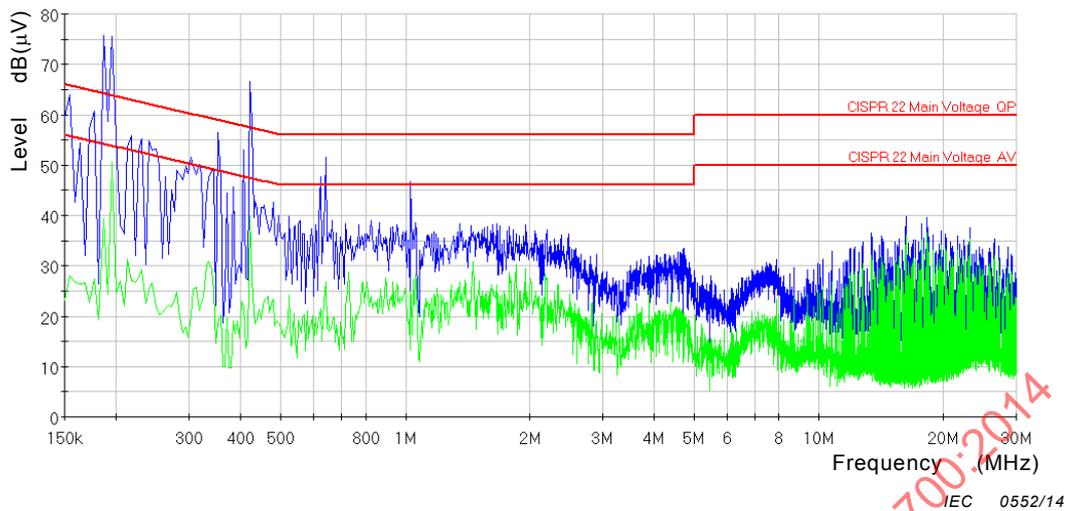

Figure B.2a – A2 with L2 Charging 100 %_Neutral

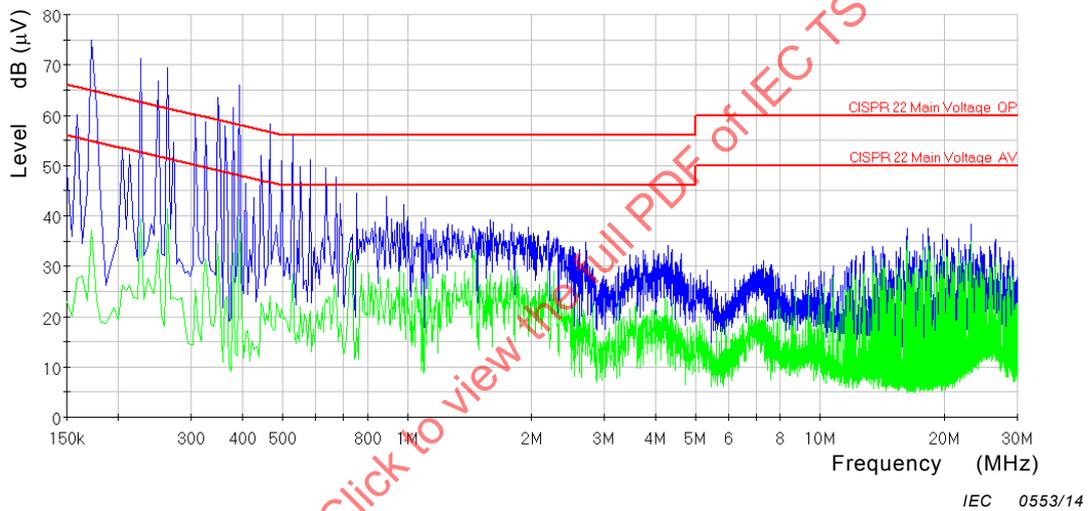

Figure B.2b – A2 with L4 Charging 100 %_Live

Figure B.2 – Conducted emission

b) Japan expert members submitted EMI measurement results tested in accordance with CISPR 22 as specified below.

1) EUT

AC adapter: 8 units, Notebook PC: 7 units

Battery charging condition in notebook PC: 100 %.

NOTE AC adapters and notebook PCs are commonly available market products.

2) Measured combinations

Radiated emission: 19 combinations

Conducted emission on AC lines: 14 combinations

3) Result: Reduced margins were measured with one combination as follows.

The diagrams of these measurements are shown in Figure B.3.

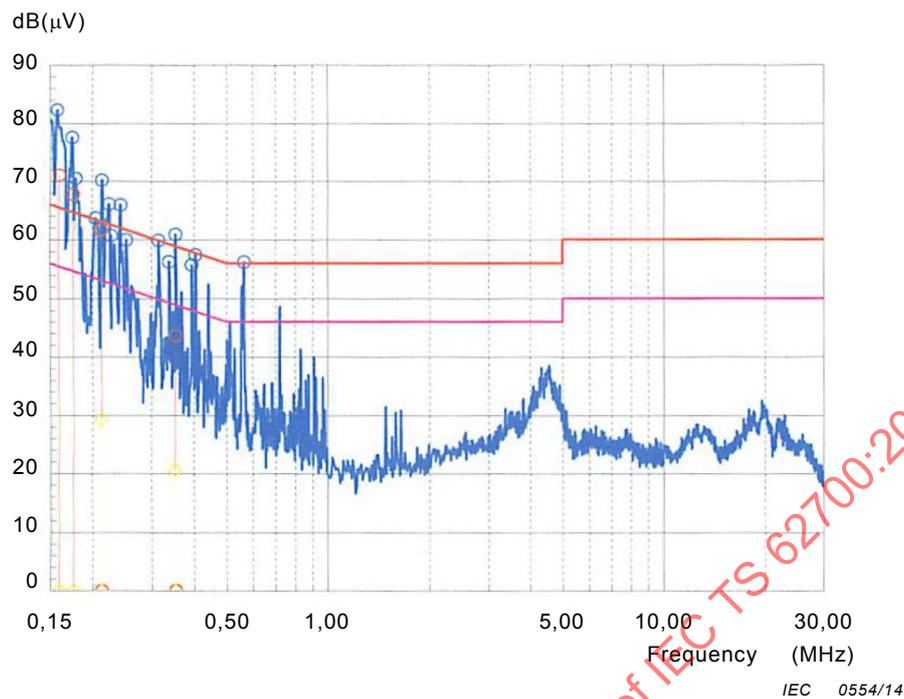

Figure B.3 – Conducted emission

c) Conclusion

- 1) There is not much difference in the conducted emission testing with several combinations according to CISPR 22.
- 2) Regarding the radiated emission test, the data measured from Japan and Korea with respect to the limit specified in CISPR 22 were satisfactory.
- 3) The reduced margin for some combinations of adapters and PCs remains a concern. Further investigation may be necessary to characterise this issue.
- 4) See Clause C.2 for further information regarding EMC considerations.

Annex C (informative)

AC adapters used with notebook computers – Areas to be investigated

C.1 Safety

An adapter and notebook combination supplied by a single manufacturer is designed to be compatible and to work together as comprehensive system in accordance with safety standards. If an adapter designed to meet this Technical Specification is used with a third party notebook, a specific assessment of the resulting combination may be necessary to ensure that it will function safely within the meaning of the applicable product safety standard. Issues of compatibility and user safety as described in Clause D.1 were discussed but a technical solution has not been found yet.

C.2 EMC

The EMC levels of emissions and the immunity of adapters are dependent on the host system. EMI was measured with combinations of adapters and PCs by an Ad hoc group of the project team IEC 62700 using CISPR 22, but a conclusion of how to guarantee the EMC compliance when an adapter designed to meet this Technical Specification is connected to any host PC could not be found. See Clause D.2.

NOTE This Technical Specification does not yet suggest a reliable method of ensuring compliance for anonymous combinations of AC adapters and notebook computers. DC power supplies for notebook computers are tested and shown to be compliant with IEC 61000-3-2, IEC 61000-3-3, CISPR 22 (or CISPR 32) and CISPR 24. This group has observed some anecdotal results of combinations of AC adapters and computers, but has not reached a satisfactory solution that ensures EMC compliance of the notebook computer when arbitrary combinations of DC power supplies are used.

C.3 Future trends in connectivity and power delivery

Power delivery for portable information devices (computers, tablets, phones) is continuously evolving. One trend is new technology which combines data transport with high power delivery. An example is the USB power delivery specification which now supports up to 100 W of bidirectional power (sink/source) and up to 5 Gbit/s of data transport over USB3. Such new technologies provide single cable solutions that will enable new use cases such as enhanced adapters with docking station functionalities where the adapters not only deliver power to the information device, but also connectivity to the infrastructure (displays, networking, I/O). Trends in connectivity include combinations of I/O connectors and the reduction of different types of connectors needed to be carried by end users to support different use cases (from simple single device charging, to multiple device powering and data communication).

Annex D

(informative)

Expected issues when any adapter is connected to any host PC

D.1 Safety issues

D.1.1 Over-voltage protection

Components used in the power path of a PC where an AC adapter is connected have a rated voltage. If a failure in the AC adapter occurs and causes an over-voltage to the components in the power path of the PC, catastrophic system damage or a fire hazard may occur.

D.1.2 Over-current protection and short circuit protection

If the input circuit of the PC load is short-circuited at an unfused point, an unspecified AC adapter without overcurrent protection or overvoltage protection may result in damage, smoke or fire. However, if protection is provided on the AC adapter, the step load of the sink during normal operation may falsely trigger the protection circuit in the AC adapter and cause a loss of functionality in the system. Matching the requirements of the sink and source are essential for normal operation and also protection against exceptional failure.

D.1.3 Leakage current

Notebook computers with metal chassis have become common. These metal surfaces require due care by the manufacturer to reduce the risk of electric shock. The leakage limits stated by IEC 60950-1 may be above the threshold for pain or discomfort for some users, and mitigation AC adapter leakage is viewed as an essential part of the system quality.

D.1.4 Peak current

Because of the power management in a notebook computer, the difference between the average power and the peak power of the PC (for example, the load step when a high power CPU transitions from idle to busy, or during bursty “Turbo” operation) is very large. The practice of supporting peak currents which exceed the nominal rated current during limited periods is common in tested source and sink combinations. If the AC adapter does not support the peak input current required by the PC, the AC adapter will be overloaded and may result in loss of function, damage to the AC adapter or notebook, smoke or fire.

D.1.5 Surge and ringing

Combinations of the inductance of AC adapter's DC cable and the load capacitance in the PC can cause a voltage fluctuation on the cable during current transitions caused by the sink. Overvoltage protection on the AC adapter is essential to avoid the risk of damage due to those voltage spikes. Also, the cable inductance and current step transitions shall be bounded in the PC sink. Not all PC makers have addressed this issue today.

D.1.6 Surface temperature of enclosure of AC adapters

If an AC adapter is loaded to a power level above the rated current, but less than the “over current protection”, the AC adapter may heat excessively. This heating may increase the surface case temperature of the AC adapter and lead to discomfort or burn to the human body if touched, or result in deformation, discoloration or even failure of the AC adapter.

D.1.7 Risk of electric shock

A PC with an integral negative-ion generator has been commercialized before, and there is a future likelihood of the use of negative-ion (corona wind) cooling systems in notebook

computers. The AC adapters for these systems require circuitry for discharging between the primary and secondary sides. If an AC adapter that doesn't have the discharging resistor is used with the PC, then operators may receive an electric shock after touching metal on the PC chassis.

D.2 EMC issues

D.2.1 Load change

An AC adaptor shall support a wide range of load current. To save power and increase efficiency, the AC adapter controls such features as PFC, switching frequency, or will alternate between skip mode and continuous mode, and so on in accordance with the PC's load change. These changes in mode influence the EMC of the system. Traditionally, the acceptability of the solution shall be confirmed by an EMC test with a specific combination of PC and AC adaptor. In shipping products today, EMC test failures are known even when using otherwise functionally and parametrically compatible combinations of AC adapters and PCs.

D.2.2 Input power circuit of PC

EMC characteristics of the AC adapter depend on common mode filtering in the PC. EMC of the AC adapter degrades and noise of PC is radiated through the AC adapter and AC mains if the common mode filter in the PC is not appropriate. In some systems, additional countermeasures are required on the AC adapter. Common mode filtering performance as a system relies on specific knowledge of both the sink and source.

D.3 Environment issues

D.3.1 Inrush current

The failure instance of the AC adaptor will increase if the inrush current of PC is not specified and accommodated in the AC adapter. The inrush current by the sink that exceeds the AC adapters design may cause damage to the AC adapter and result in a waste of the resource.

D.3.2 General specifications

AC input specifications (voltage, frequency, and load change, etc.), DC output specifications (ripple noise, recovery method from short-circuited, etc.), and environmental specifications (allowed ambient temperature, vibration, impact, etc.) have been decided by each company uniquely, often in response to local market requirements. Failure or damage of the AC adaptor or PC happens frequently when these specifications are not met, resulting in a waste of the resource.

D.3.3 High-efficiency technology

Technology for AC adapters continues to evolve, especially benefitting the efficiency and decreasing the power consumed at low and zero loads. The objective to reduce e-waste by perpetually reusing older technology AC adapters should be weighed against the advantage in power savings using replacement adapters made with improved technology.

D.4 Reliability and quality issues

D.4.1 Life time

The life time of AC adapters is largely determined by the life time of its electrolytic capacitors. Each PC maker decides on the life time of electrolytic capacitors considering how many years the PC is used. If one AC adapter is used for several PCs, the life time becomes shorter. Then the AC adapter is broken at an early time. Also, a DC cord is broken by bending or twisting many times.

D.4.2 Extraordinary noise

To decrease power consumption, the AC adapter controls operations such as PFC ON or OFF, switching frequency, skip mode or continuous mode and so on in accordance with PC's load change. Each control or transition may cause an acoustically audible noise. Even if a common standard is agreed upon for audible noise, the customer may complain to the provider of the PC maker about this sensitive issue.

D.5 Standards issues

D.5.1 Environments

Power savings initiatives (such as Energy Star Programme originated by the Environmental Protection Agency for energy efficient office equipment or EuP COC) rely on aggressively reducing the power consumption of the system as a whole (including both AC adapter and notebook). The limits for power consumption will be periodically tightened, sometimes per country. Combinations of old AC adapters and latest PCs may not satisfy these upcoming regulations.

D.5.2 EMC evaluation

Untested combinations of AC adapters and PCs are not recognized by CISPR. According to the requirements of CISPR 22 and CISPR 24, the evaluation shall be done by a specific combination of PC and AC adapter. If any other AC adapters are used, the PC evaluation shall be repeated using each of the other AC adapters.

D.5.3 EMC class

According to the requirements of CISPR 22, a Class B PC may not be used with a Class A AC adapter.

D.5.4 Safety evaluation

According to the requirements of IEC 60950-1, evaluation shall be done by a specific combination of PC and AC adapter. If any other AC adapters are used, the evaluation shall be repeated using each of the other AC adapters.

D.5.5 LPS requirements

According to the requirements of IEC 60950-1, 120 W AC adapter (non-LPS) is prohibited to use with a PC sold with an LPS AC adapters. The reason is that HB40 and HB75 class material may be used for an LPS system.

Material of V-1 or higher is required for the PC enclosure if the AC adapter is non-LPS (IEC 60950-1:2005, 4.7.2.1 and 4.7.3.2). HB40 and HB75 class material is allowed for PC enclosure if the AC adapter is LPS (IEC 60950-1:2005, 4.7.2.2).

D.5.6 Plug

The 5,5 mm EIAJ plug suggested in 6.3 is allowed for use only between 10,5 V to 13,5 V by IEC 61076-2-102 and Japan PSE law. The purpose of the limitation is to protect incumbent devices from high voltage of more than 13,5 V.

D.5.7 Marking of electrical ratings on PC

The customer may have trouble identifying which AC adapter is compatible with their PC. Subclause 1.7.1 of IEC 60950-1:2005, Amendment 1:2009 and Amendment 2:2013 does not require marking of input ratings to DC operated equipment (PC). So the customer will have
