Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents) or the IEC list of patent declarations received (see http://patents.iec.ch).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 27, *IT Security techniques*.

This fourth edition cancels and replaces the third edition (ISO/IEC 10118-3:2004), which has been technically revised. It also incorporates the Amendment ISO/IEC 10118-3:2004/Amd1:2006 and Technical Corrigendum ISO/IEC 10118-3:2004/Cor1:2011.

The main changes compared to the previous edition are as follows:

— SHA-3, STREEBOG and SM3 hash-functions have been included;

— SHA-3 extendable-output functions have been included;

— cautionary notes for hash-functions with short hash-codes have been added.

A list of all parts in the ISO/IEC 10118 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

IT Security techniques — Hash-functions —

Part 3:
Dedicated hash-functions

1 Scope

This document specifies dedicated hash-functions, i.e. specially designed hash-functions. The hash-functions in this document are based on the iterative use of a round-function. Distinct round-functions are specified, giving rise to distinct dedicated hash-functions.

The use of Dedicated Hash-Functions 1, 2 and 3 in new digital signature implementations is deprecated.

NOTE As a result of their short hash-code length and/or cryptanalytic results, Dedicated Hash-Functions 1, 2 and 3 do not provide a sufficient level of collision resistance for future digital signature applications and they are therefore, only usable for legacy applications. However, for applications where collision resistance is not required, such as in hash-functions as specified in ISO/IEC 9797-2, or in key derivation functions specified in ISO/IEC 11770-6, their use is not deprecated.

Numerical examples for dedicated hash-functions specified in this document are given in Annex B as additional information. For information purposes, SHA-3 extendable-output functions are specified in Annex C.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO/IEC 10118-1, *Information technology — Security techniques — Hash-functions — Part 1: General*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO/IEC 10118-1 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at https://www.iso.org/obp

— IEC Electropedia: available at http://www.electropedia.org/

3.1
block
bit string of length L_1, i.e., the length of the first input to the round-function

3.2
word
string of bits

3.3
circulant matrix
matrix with the property that each row, apart from the first, consists of the right cyclic shift by one position of the row immediately above it

3.4
abelian group
group $(G, *)$ such that $a*b = b*a$ for every a and b in G

3.5
field
set of elements S and a pair of operations $(+,*)$ defined on S such that: (i) $a*(b + c) = a*b + a*c$ for every a, b and c in S, (ii) S together with + forms an abelian group (with identity element 0) and (iii) S excluding 0 together with * forms an abelian group

4 Symbols

4.1 Symbols specified in ISO/IEC 10118-1

B_i	byte
D	data
H	hash-code
IV	initializing value
L_1	length (in bits) of the first of the two input strings to the round-function Φ
L_2	length (in bits) of the second of the two input strings to the round-function Φ, of the output string from the round-function Φ and of the IV
L_X	length (in bits) of a bit string X
$X \oplus Y$	bitwise exclusive-or of bit strings X and Y (where $L_X = L_Y$)
$X \| \| Y$	concatenation of strings of bits X and Y in the indicated order
Φ	a round-function, i.e. if X, Y are bit strings of lengths L_1 and L_2 respectively, then $\Phi(X, Y)$ is the string obtained by applying Φ to X and Y

4.2 Symbols specific to this document

A^i	sequence of constant matrices used in the specification of the round-function defined in Clause 16
A^n	concatenation of n instances of the word A
a_i, a'_i	sequences of indices used in specifications of a round-function
C_i, C'_i	constant words used in the round-functions
C''	8 × 8 circulant matrix with entries chosen from GF(2^8) used in the specification of the round-function in Clause 16
c_0	function taking a string of 64 elements of GF(2^8) as input and giving an 8 × 8 matrix with entries from GF(2^8) as output, used in specifying the round-function defined in Clause 16
c_1, c_2, c_3	functions taking an 8 × 8 matrix of elements of GF(2^8) as input and giving an 8 × 8 matrix with entries from GF(2^8) as output, used in the specification of the round-function defined in Clause 16

c_4	function taking two 8 × 8 matrices of elements of GF(2^8) as input and giving an 8 × 8 matrix with entries from GF(2^8) as output, used in the specification of the round-function defined in Clause 16
D_i	a block derived from the data string after the padding process
d_i, e_i, f_i, g_i	functions taking either one or three words as input and producing a single word as output, used in specifying round-functions
H_i	a string of L_2 bits which is used in the hashing operation to store an intermediate result
Int_n	an inverse mapping to the mapping Vec_n, i.e. $\mathrm{Int}_n = \mathrm{Vec}_n^{-1}$
GF(2^8)	a field defined as GF(2)[x] / $p_8(x)$ where $p_8(x) = x^8 + x^4 + x^3 + x^2 + 1$. The elements of the field are 8-bit strings
M	an 8 × 8 matrix whose entries are chosen from GF(2^8)
q	number of blocks in the data string after the padding and splitting processes
$R^n()$	operation of right shift by n bits, i.e. if A is a word and n is a non-negative integer then $R^n(A)$ denotes the word obtained by right-shifting the contents of A by n positions
$S^n()$	operation of "circular left shift" by n bit positions, i.e. if A is a word and n is a non-negative integer then $S^n(A)$ denotes the word obtained by left-shifting the contents of A by n places in a cyclic fashion
$S'^n()$	operation of "circular right shift" by n bit positions, i.e. if A is a word and n is a non-negative integer then $S'^n(A)$ denotes the word obtained by right-shifting the contents of A by n places in a cyclic fashion
s	a function, which replaces an element $x \in$ GF(2^8) with another element $s[x] \in$ GF(2^8)
t_i, t'_i	shift-values used in specifying a round-function
Vec_n	a bijective mapping from $\mathbb{Z}_{2^n}$ to the set of n-bit words, which maps an integer from $\mathbb{Z}_{2^n}$ to its binary representation (i.e. for any integer $z = z_0 + 2z_1 + \ldots + 2^{n-1}z_{n-1}$ of the set $\mathbb{Z}_{2^n}$, where $z_j \in \{0,1\}$, $j = 0,\ldots, n-1$, by definition $\mathrm{Vec}_n(z) = (z_{n-1}\|\ldots\|z_1\|z_0)$
W, X_i, X'_i, Y_i, Z_i	words used to store the results of intermediate computations
W', X'', K_i, Y', Z'	matrices with entries chosen from GF(2^8) used to store the results of intermediate computations
$\mathbb{Z}_{2^n}$	set of non-negative integers less than 2^n, together with the operations of addition and multiplication modulo 2^n
$\wedge$	bitwise logical AND operation on bit strings, i.e. if A, B are words then $A \wedge B$ is the word equal to bitwise logical AND of A and B
$\vee$	bitwise logical OR operation on bit strings, i.e. if A, B are words then $A \vee B$ is the word equal to bitwise logical OR of A and B
$\neg$	bitwise logical NOT operation on a bit string, i.e. if A is a word then $\neg A$ is the word equal to the bitwise logical NOT of A

$\uplus$ addition modulo 2^w operation, where w is the number of bits in a word; i.e. if A and B are w–bit words, then $A \uplus B$ is the word obtained by treating A and B as the binary representations of integers and computing their sum modulo 2^w, where the result is constrained to lie between 0 and $2^w - 1$ inclusive. The value of w is 32 for Dedicated Hash-Functions 1 to 4, defined in Clauses 7 to 10, 64 for Dedicated Hash-Functions 5 and 6, defined in Clauses 11 and 12 and 512 for Dedicated Hash-Functions 11 and 12, defined in Clauses 17 and 18

· multiplication operation of 8 × 8 matrices with entries chosen from GF(2^8); i.e. if A and B are such matrices, then A·B is the matrix obtained by multiplying A and B in the following way. Treat each entry of either A or B as the binary polynomial representation of an integer (for example, the binary polynomial representation of integer 89 (hexadecimal) is $x^7 + x^3 + 1$); treat the multiplication of two of the entries as the remainder when multiplication of the two polynomials is divided by a polynomial $p_8(x)$, where $p_8(x) = x^8 + x^4 + x^3 + x^2 + 1$; and treat the sum operation as the operation $\oplus$

:= a symbol denoting the "set equal to" operation used in procedural specifications of round-functions, where it indicates that the value of the variable (e.g. word or matrix) on the left side of the symbol should be set equal to the value of the expression on the right side of the symbol

5 Requirements

Users who wish to employ a hash-function from this document shall select

— one of the dedicated hash-functions specified below, and

— the length, L_H, of the hash-code H.

NOTE 1 All the hash-functions defined in this document take a bit string as input and give a bit string as output; this is independent of the internal byte ordering convention used within each hash-function.

NOTE 2 The choice of L_H affects the security of the hash-function. All of the hash-functions specified in this document are believed to be collision-resistant hash-functions in environments where performing $2^{L_H/2}$ hash-code computation is deemed to be computationally infeasible.

Annex A defines object identifiers that shall be used to identify the hash-functions specified in this document.

6 Models for dedicated hash-functions

6.1 Use of models

The 17 dedicated hash-functions specified in this document are defined using two different models. Dedicated Hash-Functions 1 to 12 and 17 are defined using the general round-function-based model defined in ISO/IEC 10118-1, which is further described in 6.2. Dedicated Hash-Functions 13 to 16 use the sponge construction model as defined in 6.3.

6.2 Round-function model

Dedicated Hash-Functions 1 to 12 and 17 specified in this document are based on the general model for hash-functions given in ISO/IEC 10118-1.

In the specifications of the hash-functions in this document, it is assumed that the padded data string input to the hash-function is in the form of a sequence of bytes. If the padded data string is in the form of a sequence of $8n$ bits, $x_0, x_1, \ldots, x_{8n-1}$, then it shall be interpreted as a sequence of n bytes, $B_0, B_1, \ldots, B_{n-1}$, in the following way. Each group of eight consecutive bits is considered as a byte, the first bit of a group being the most significant bit of that byte. Hence,

$$B_i = 2^7 x_{8i} + 2^6 x_{8i+1} + \ldots + x_{8i+7}$$

for every i ($0 \leq i < n$).

The output transformation for the hash-functions specified in this document is defined so that the hash-code, H, is derived by taking the left-most L_H bits of the final L_2-bit output string H_q.

Identifiers are defined for each of the 17 dedicated hash-functions specified in this document. The hash-function identifiers for the dedicated hash-functions specified in Clauses 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22 and 23 are equal to 31, 32, 33, 34, 35, 36, 37, 38, 39, 3A, 3B, 3C, 3D, 3E, 3F, 40 and 11 (hexadecimal), respectively. Some hash-function identifiers are also used in the OSI object identifiers assigned in Annex A.

6.3 Sponge model

In 6.3, a permutation-based hash-function with sponge construction is specified.

A permutation-based hash-function with sponge construction is defined by a padding method, a permutation and a set of parameters.

The sponge construction[4] is a framework for specifying functions on a binary data with arbitrary output length. The construction employs the following three components:

— an underlying function on fixed-length strings, denoted by f;

— a parameter called the rate, denoted by r;

— a padding rule, denoted by pad.

The function that the construction produces from these components is called a sponge function, denoted by SPONGE[f, pad, r]. A sponge function takes two inputs, a bit string, N, and the bit length, d, of the output string, SPONGE[f, pad, r](N, d).

NOTE For further details on the rationale of the sponge construction framework, see Reference [5].

The function, f, maps strings of a single, fixed length, b, to strings of the same length. b is called the width of f. When the underlying function, f, is invertible, i.e. a permutation, it is a permutation-based hash-function with sponge construction.

The rate, r, is a positive integer that is strictly less than the width b. The capacity, c, is the positive integer $b - r$. Thus, $r + c = b$.

In the padding rule, pad is a function that produces padding, i.e. a string with an appropriate length to append to another string. In general, given a positive integer x and a non-negative integer m, the output pad(x, m) is a string with the property that m + len[pad(x, m)] is a positive multiple of x. Within the sponge construction, $x = r$ and $m = \text{len}(N)$, so that the padded input string can be partitioned into a sequence of r-bit strings.

Given these three components, f, *pad* and r, as described above, the SPONGE[f, pad, r] function on (N, d) is specified by SPONGE[f, pad, r](N, d). The width b is determined by the choice of f.

SPONGE[f, pad, r](N, d)

Input: string N, non-negative integer d

Output: string Z, such that len(Z) = d

Steps:

a) Let $P = N \,||\, \text{pad}[r, \text{len}(N)]$.

b) Let $q = \text{len}(P)/r$.

c) Let $c = b - r$.

d) Let $P_0, \ldots, P_{q-1}$ be the unique sequence of strings of length r, such that $P = P_0 \,||\, \ldots \,||\, P_{q-1}$.

e) Let $S = 0^b$.

f) For i from 0 to $q-1$, let $S = f\,[S \oplus (P_i \,||\, 0^c)]$.

g) Let Z be the empty string.

h) Let $Z = Z \,||\, Trunc_r(S)$.

i) If $d \leq |Z|$, then return $Trunc_d(Z)$; else, continue.

j) Let $S = f(S)$ and continue with step h).

Note that the input d determines the number of bits that SPONGE[f, pad, r](N, d) returns, but it does not affect their values. In principle, the output can be regarded as an infinite string, whose computation, in practice, is halted after the desired number of output bits is produced.

The parameters of a sponge construction include:

— b, the width;

— r, the rate;

— c, the capacity, such that $b = r + c$; and

— d, the output length.

Here, if notations specified in ISO/IEC 10118-1:2016, Clause 3 are used, r can be considered as L_1, which is the length of a block of input data (message), while b can be considered as L_2, which is the output length of the function f. Furthermore, the relation between function f and the round-function Φ as defined in ISO/IEC 10118-1:2016, Clause 3 can be represented as $\Phi\,(P_i, S_{i-1}) = f\,[S_{i-1} \oplus (P_i \,||\, 0^c)]$, where $P_i = D_i$ is the ith data block, while $S_{i-1} = H_{i-1}$ is the output of the previous execution. The squeezing stage is considered the output transformation.

7 Dedicated Hash-Function 1 (RIPEMD-160)

7.1 General

In Clause 7, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value and round-function specified here, when used in the above general model, together define Dedicated Hash-Function 1. This dedicated hash-function can be applied to all data strings, D, containing at most $2^{64}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 1 is equal to `31` (hexadecimal).

NOTE 1 Dedicated Hash-Function 1 defined in Clause 7 is commonly called RIPEMD-160[6].

NOTE 2 As a result of a short hash-code length and/or cryptanalytic results, Dedicated Hash-Function 1 does not provide a sufficient level of collision resistance for future digital signature applications and it is, therefore, only used for legacy applications. However, for applications where collision resistance is not required, such as in hash-functions as specified in the ISO/IEC 9797 series or in key derivation functions specified in ISO/IEC 11770-6, its use is not deprecated.

7.2 Parameters, functions and constants

7.2.1 Parameters

For this hash-function, $L_1 = 512$, $L_2 = 160$ and L_H is up to 160.

7.2.2 Byte ordering convention

In the specification of the round-function of Clause 7, it is assumed that the block input to the round-function is in the form of a sequence of 32-bit words, each 512-bit block being made up of 16 such words. A sequence of 64 bytes, $B_0, B_1, \ldots, B_{63}$, shall be interpreted as a sequence of 16 words, $Z_0, Z_1, \ldots, Z_{15}$, in the following way. Each group of four consecutive bytes is considered as a word, the first byte of a word being the least significant byte of that word. Hence,

$$Z_i = 2^{24}B_{4i+3} + 2^{16}B_{4i+2} + 2^{8}B_{4i+1} + B_{4i}, \quad (0 \le i \le 15).$$

To convert the hash-code from a sequence of words to a byte-sequence, the inverse process shall be followed.

NOTE The byte-ordering specified here is different from that of 9.2.2.

7.2.3 Functions

To facilitate software implementation, the round-function Φ is described in terms of operations on 32-bit words. A sequence of functions $g_0, g_1, \ldots, g_{79}$ is used in this round-function, where each function g_i, $0 \le i \le 79$, takes three words, X_0, X_1 and X_2, as input and produces a single word as output.

The functions g_i are defined as follows:

$$\begin{aligned}
g_i(X_0,X_1,X_2) &= X_0 \oplus X_1 \oplus X_2, && (0 \le i \le 15);\\
g_i(X_0,X_1,X_2) &= (X_0 \wedge X_1) \vee (\neg X_0 \wedge X_2), && (16 \le i \le 31);\\
g_i(X_0,X_1,X_2) &= (X_0 \vee \neg X_2) \oplus X_2, && (32 \le i \le 47);\\
g_i(X_0,X_1,X_2) &= (X_0 \wedge X_2) \vee (X_1 \wedge \neg X_2), && (48 \le i \le 63);\\
g_i(X_0,X_1,X_2) &= X_0 \oplus (X_1 \vee \neg X_2), && (64 \le i \le 79).
\end{aligned}$$

7.2.4 Constants

Two sequences of constant words, $C_0, C_1, \ldots, C_{79}$ and $C'_0, C'_1, \ldots, C'_{79}$, are used in this round-function. In a hexadecimal representation (where the most significant bit corresponds to the left-most bit), these are defined as follows:

$$\begin{aligned}
C_i &= \texttt{00000000}, && (0 \le i \le 15);\\
C_i &= \texttt{5A827999}, && (16 \le i \le 31);\\
C_i &= \texttt{6ED9EBA1}, && (32 \le i \le 47);\\
C_i &= \texttt{8F1BBCDC}, && (48 \le i \le 63);\\
C_i &= \texttt{A953FD4E}, && (64 \le i \le 79)\\
C'_i &= \texttt{50A28BE6}, && (0 \le i \le 15);\\
C'_i &= \texttt{5C4DD124}, && (16 \le i \le 31);\\
C'_i &= \texttt{6D703EF3}, && (32 \le i \le 47);\\
C'_i &= \texttt{7A6D76E9}, && (48 \le i \le 63);\\
C'_i &= \texttt{00000000}, && (64 \le i \le 79).
\end{aligned}$$

Two sequences of 80 shift-values are used in this round-function, where each shift-value is between 5 and 15. These sequences are denoted by $(t_0, t_1, \ldots, t_{79})$ and $(t'_0, t'_1, \ldots, t'_{79})$. Two additional sequences of 80 indices are used in this round-function, where each value in the sequence is between 0 and 15. These sequences are denoted as $(a_0, a_1, \ldots, a_{79})$ and $(a'_0, a'_1, \ldots, a'_{79})$. All four sequences are defined in Table 1.

Table 1 — Sequences for Hash-Function 1

i	0	1	2	3	4	5	6	7

a'_i	6	2	13	14	0	3	9	11

7.2.5 Initializing value

For this round-function, the initializing value, *IV*, shall always be the following 160-bit string, represented here as a sequence of five words, Y_0, Y_1, Y_2, Y_3 and Y_4, in a hexadecimal representation, where Y_0 represents the left-most 32 of the 160 bits:

Y_0 = 67452301;
Y_1 = EFCDAB89;
Y_2 = 98BADCFE;
Y_3 = 10325476;
Y_4 = C3D2E1F0.

7.3 Padding method

The data string, *D*, needs to be padded to make it contain a number of bits which is an integer multiple of 512. The padding procedure operates as follows.

a) *D* is concatenated with a single "1" bit.

b) The result of the previous step is concatenated with between zero and 511 "0" bits such that the length (in bits) of the resultant string is congruent to 448 modulo 512. More explicitly, if the original length of *D* is L_D and letting *r* be the remainder when L_D is divided by 512, then the number

of concatenated zeros is equal to either $447 - r$ (if $r \leq 447$) or $959 - r$ (if $r > 447$). The result will be a bit string whose length will be 64 bits short of an integer multiple of 512 bits.

c) Divide the 64-bit binary representation of L_D into two 32-bit strings, one representing the "most significant half" of L_D and the other the "least significant half". Now concatenate the string resulting from the previous step with these two 32-bit strings, with the "least significant half" preceding the "most significant half".

In the description of the round-function which follows, each 512-bit data block D_i, $1 \leq i \leq q$, is treated as a sequence of 16 words, $Z_0, Z_1, \ldots, Z_{15}$, where Z_0 corresponds to the left-most 32 bits of D_i.

NOTE The concatenation of the two 32-bit strings of L_D in step c) is such that these two 32-bit strings are used directly as the words Z_{14} and Z_{15} of the last data block; based on the byte ordering convention in 7.2.2, the least significant byte of L_D is the left-most byte and the most significant byte of L_D is the right-most byte.

7.4 Description of the round-function

The round-function, Φ, operates as follows.

NOTE In this description, the symbols W, X_0, X_1, X_2, X_3, X_4, X'_0, X'_1, X'_2, X'_3 and X'_4 are used to denote 11 distinct words which contain values required in the computations.

a) Suppose the 512-bit (first) input to Φ is contained in $Z_0, Z_1, \ldots, Z_{15}$, where Z_0 contains the left-most 32 of the 512 bits. Suppose also that the 160-bit (second) input to Φ is contained in five words, Y_0, Y_1, Y_2, Y_3 and Y_4.

b) Let $X_0 := Y_0$, $X_1 := Y_1$, $X_2 := Y_2$, $X_3 := Y_3$ and $X_4 := Y_4$.

c) Let $X'_0 := Y_0$, $X'_1 := Y_1$, $X'_2 := Y_2$, $X'_3 := Y_3$ and $X'_4 := Y_4$.

d) For $i := 0$ to 79, do the following four steps in the order specified:

1) $W := S^{t_i}[X_0 \uplus g_i(X_1, X_2, X_3) \uplus Z_{a_i} \uplus C_i] \uplus X_4$;

2) $X_0 := X_4$; $X_4 := X_3$; $X_3 := S^{10}(X_2)$; $X_2 := X_1$; $X_1 := W$;

3) $W := S^{t'_i}[X'_0 \uplus g_{79\text{-}i}(X'_1, X'_2, X'_3) \uplus Z_{a'_i} \uplus C'_i] \uplus X'_4$;

4) $X'_0 := X'_4$; $X'_4 := X'_3$; $X'_3 := S^{10}(X'_2)$; $X'_2 := X'_1$; $X'_1 := W$.

e) Let $W := Y_0$, $Y_0 := Y_1 \uplus X_2 \uplus X'_3$, $Y_1 := Y_2 \uplus X_3 \uplus X'_4$, $Y_2 := Y_3 \uplus X_4 \uplus X'_0$, $Y_3 := Y_4 \uplus X_0 \uplus X'_1$ and $Y_4 := W \uplus X_1 \uplus X'_2$.

f) The five words, Y_0, Y_1, Y_2, Y_3 and Y_4, represent the output of the round-function Φ. After the final iteration of the round-function, the five words, Y_0, Y_1, Y_2, Y_3 and Y_4, shall be converted to a sequence of 20 bytes using the inverse of the procedure specified in 7.2.2 and where Y_0 shall yield the first four bytes, Y_1 the next four bytes and so on. Thus, the first (left-most) byte will correspond to the least significant byte of Y_0 and the 20th (right-most) byte will correspond to the most significant byte of Y_4. The 20 bytes shall be converted to a string of 160 bits using the inverse of the procedure specified in Clause 6, i.e. the first (left-most) bit will correspond to the most significant bit of the first (left-most) byte and the 160th (right-most) bit will correspond to the least significant bit of the 20th (right-most) byte.

Figure 1 shows steps 1) and 2) of item d) of the round-function Φ in Dedicated Hash-Function 1 (RIPEMD-160) [the other half, i.e. steps 3) and 4) is similar]. In the round-function Φ, steps 1) to 4) of item d) are used 80 times ($i = 0, \ldots, 79$).

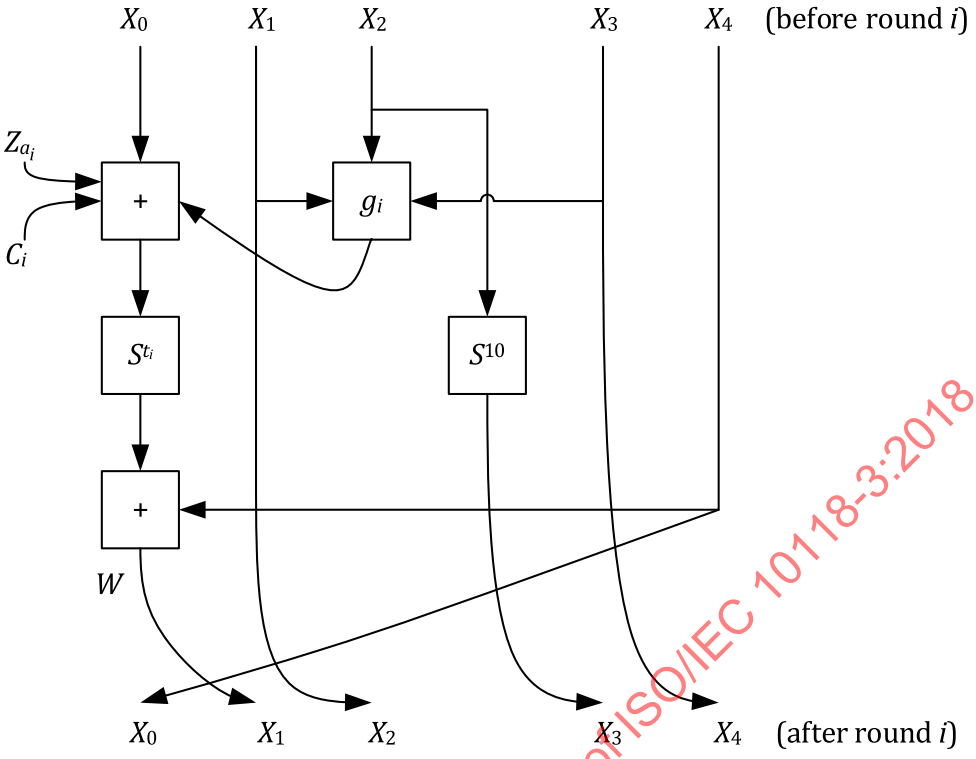

Figure 1 — Part of the round-function in Dedicated Hash-Function 1

8 Dedicated Hash-Function 2 (RIPEMD-128)

8.1 General

In Clause 8, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value and round-function specified here, when used in the above general model, together define Dedicated Hash-Function 2. This dedicated hash-function can be applied to all data strings, D, containing at most $2^{64}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 2 is equal to 32 (hexadecimal).

NOTE 1 Dedicated Hash-Function 2 defined in Clause 8 is commonly called RIPEMD-128[6]. This hash-function is only used in applications where a hash-code containing 128 bits or less is considered adequately secure.

NOTE 2 As a result of a short hash-code length and/or cryptanalytic results, Dedicated Hash-Function 2 does not provide a sufficient level of collision resistance for future digital signature applications and it is, therefore, only used for legacy applications. However, for applications where collision resistance is not required, such as in hash-functions as specified in the ISO/IEC 9797 series or in key derivation functions specified in ISO/IEC 11770-6, its use is not deprecated.

8.2 Parameters, functions and constants

8.2.1 Parameters

For this hash-function, $L_1 = 512$, $L_2 = 128$ and L_H is up to 128.

8.2.2 Byte ordering convention

The byte ordering convention for this hash-function is the same as that for the hash-function of Clause 7.

8.2.3 Functions

To facilitate software implementation, the round-function, Φ, is described in terms of operations on 32-bit words. A sequence of functions, $g_0, g_1, \ldots, g_{63}$, is used in this round-function, where each function g_i, $0 \le i \le 63$, takes three words, X_0, X_1 and X_2, as input and produces a single word as output.

The functions g_i are defined to be the same as the first 64 of the functions defined in 7.2.3.

8.2.4 Constants

Two sequences of constant words, $C_0, C_1, \ldots, C_{63}$ and $C'_0, C'_1, \ldots, C'_{63}$, are used in this round-function. In a hexadecimal representation (where the most significant bit corresponds to the left-most bit), these are defined as follows:

C_i = 00000000, $(0 \le i \le 15)$;
C_i = 5A827999, $(16 \le i \le 31)$;
C_i = 6ED9EBA1, $(32 \le i \le 47)$;
C_i = 8F1BBCDC, $(48 \le i \le 63)$.

C'_i = 50A28BE6, $(0 \le i \le 15)$;
C'_i = 5C4DD124, $(16 \le i \le 31)$;
C'_i = 6D703EF3, $(32 \le i \le 47)$;
C'_i = 00000000, $(48 \le i \le 63)$.

Two sequences of 64 shift-values are also used in this round-function, where each shift-value is between 5 and 15. These sequences are denoted by $(t_0, t_1, \ldots, t_{63})$ and $(t'_0, t'_1, \ldots, t'_{63})$ and they are defined to be equal to the first 64 values of the corresponding sequences defined in 7.2.4.

Finally, two further sequences of 64 indices are used in this round-function, where each value in the sequence is between 0 and 15. These sequences are denoted by $(a_0, a_1, \ldots, a_{63})$ and $(a'_0, a'_1, \ldots, a'_{63})$ and they are defined to be equal to the first 64 values of the corresponding sequences defined in 7.2.4.

8.2.5 Initializing value

For this hash-function, the initializing value, IV, shall always be the following 128-bit string, represented here as a sequence of four words, Y_0, Y_1, Y_2 and Y_3, in a hexadecimal representation, where Y_0 represents the left-most 32 of the 128 bits:

Y_0 = 67452301;
Y_1 = EFCDAB89;
Y_2 = 98BADCFE;
Y_3 = 10325476.

8.3 Padding method

The padding method to be used with this hash-function shall be the same as the padding method defined in 7.3.

8.4 Description of the round-function

The round-function, Φ, operates as follows.

NOTE In this description, the symbols W, X_0, X_1, X_2, X_3, X'_0, X'_1, X'_2 and X'_3 are used to denote nine distinct words which contain values required in the computations.

a) Suppose the 512-bit (first) input to Φ is contained in $Z_0, Z_1, \ldots, Z_{15}$, where Z_0 contains the left-most 32 of the 512 bits. Suppose also that the 128-bit (second) input to Φ is contained in four words, Y_0, Y_1, Y_2 and Y_3.

b) Let $X_0 := Y_0$, $X_1 := Y_1$, $X_2 := Y_2$ and $X_3 := Y_3$.

c) Let $X'_0 := Y_0$, $X'_1 := Y_1$, $X'_2 := Y_2$ and $X'_3 := Y_3$.

d) For $i := 0$ to 63, do the following four steps in the order specified:

1) $W := S^{t_i}[X_0 \uplus g_i(X_1, X_2, X_3) \uplus Z_{a_i} \uplus C_i]$;

2) $X_0 := X_3$; $X_3 := X_2$; $X_2 := X_1$; $X_1 := W$;

3) $W := S^{t'_i}[X'_0 \uplus g_{63-i}(X'_1, X'_2, X'_3) \uplus Z_{a'_i} \uplus C'_i]$;

4) $X'_0 := X'_3$; $X'_3 := X'_2$; $X'_2 := X'_1$; $X'_1 := W$.

e) Let $W := Y_0$, $Y_0 := Y_1 \uplus X_2 \uplus X'_3$, $Y_1 := Y_2 \uplus X_3 \uplus X'_0$, $Y_2 := Y_3 \uplus X_0 \uplus X'_1$ and $Y_3 := W \uplus X_1 \uplus X'_2$.

f) The four words, Y_0, Y_1, Y_2 and Y_3, represent the output of the round-function Φ. After the final iteration of the round-function, the four words, Y_0, Y_1, Y_2 and Y_3, shall be converted to a sequence of 16 bytes using the inverse of the procedure specified in 7.2.2 and where Y_0 shall yield the first four bytes, Y_1 the next four bytes and so on. Thus, the first (left-most) byte will correspond to the least significant byte of Y_0 and the 16th (right-most) byte will correspond to the most significant byte of Y_3. The 16 bytes shall be converted to a string of 128 bits using the inverse of the procedure specified in Clause 6, i.e. the first (left-most) bit will correspond to the most significant bit of the first (left-most) byte and the 128th (right-most) bit will correspond to the least significant bit of the 16th (right-most) byte.

Figure 2 shows steps 1) and 2) of item d) of the round-function Φ in Dedicated Hash-Function 2 (RIPEMD-128) [the other half, i.e. steps 3) and 4) is similar]. In the round-function Φ, steps 1) to 4) of item d) are used 64 times ($i = 0, \ldots, 63$).

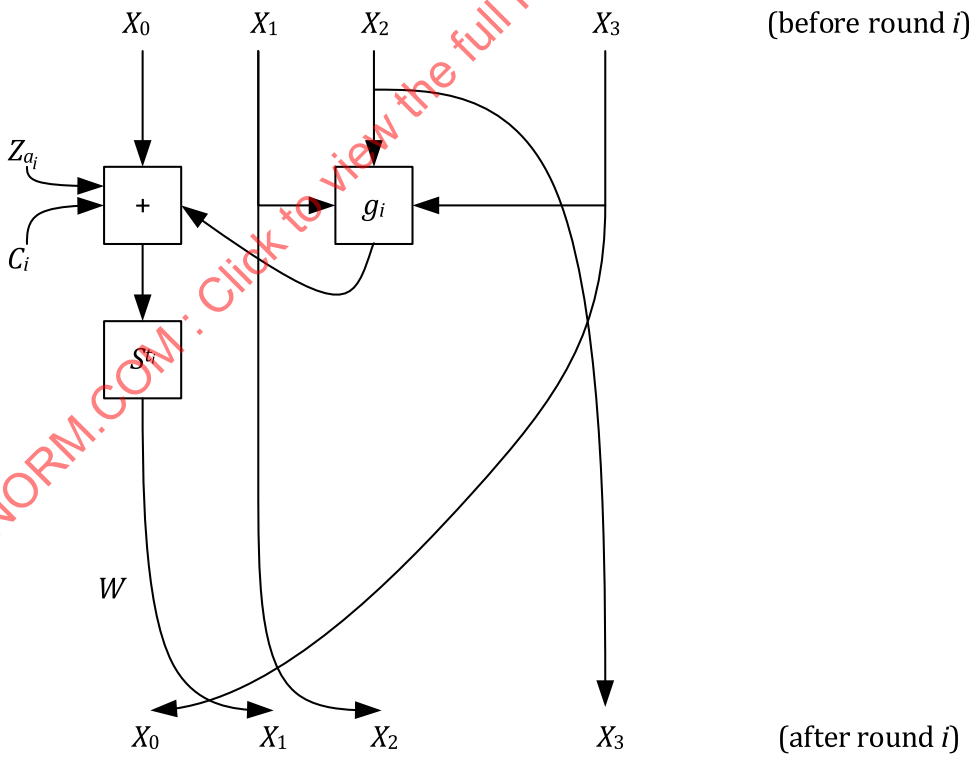

Figure 2 — Part of the round-function in Dedicated Hash-Function 2

9 Dedicated Hash-Function 3 (SHA-1)

9.1 General

In Clause 9, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value and round-function specified here, when used in the above general model, together define the Dedicated Hash-Function 3. This dedicated hash-function can be applied to all data strings, D, containing at most $2^{64}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 3 is equal to 33 (hexadecimal).

NOTE 1 Dedicated Hash-Function 3 defined in Clause 9 is commonly called SHA-1[1].

NOTE 2 As a result of a short hash-code length and/or cryptanalytic results, Dedicated Hash-Function 3 does not provide a sufficient level of collision resistance for future digital signature applications and it is, therefore, only used for legacy applications. However, for applications where collision resistance is not required, such as in hash-functions as specified in the ISO/IEC 9797 series or in key derivation functions specified in ISO/IEC 11770-6, its use is not deprecated.

9.2 Parameters, functions and constants

9.2.1 Parameters

For this hash-function, $L_1 = 512$, $L_2 = 160$ and L_H is up to 160.

9.2.2 Byte ordering convention

In the specification of the round-function of Clause 9, it is assumed that the block input to the round-function is in the form of a sequence of 32-bit words, each 512-bit block made up of 16 such words. A sequence of 64 bytes, $B_0, B_1, \ldots, B_{63}$, shall be interpreted as a sequence of 16 words, $Z_0, Z_1, \ldots, Z_{15}$, in the following way, where each group of four consecutive bytes is considered as a word, the first byte of a word being the most significant byte of that word. Hence,

$$Z_i = 2^{24}B_{4i} + 2^{16}B_{4i+1} + 2^{8}B_{4i+2} + B_{4i+3}, \quad (0 \le i \le 15).$$

To convert the hash-code from a sequence of words to a sequence of bytes, the inverse process shall be followed.

NOTE The byte-ordering specified here is different from that of 7.2.2.

9.2.3 Functions

To facilitate software implementation, the round-function Φ is described in terms of operations on 32-bit words. A sequence of functions, $f_0, f_1, \ldots, f_{79}$, is used in this round-function, where each function, f_i, $0 \le i \le 79$, takes three words, X_0, X_1 and X_2, as input and produces a single word as output.

The functions f_i are defined as follows:

$$\begin{aligned}
f_i(X_0, X_1, X_2) &= (X_0 \wedge X_1) \vee (\neg X_0 \wedge X_2), && (0 \le i \le 19);\\
f_i(X_0, X_1, X_2) &= X_0 \oplus X_1 \oplus X_2, && (20 \le i \le 39);\\
f_i(X_0, X_1, X_2) &= (X_0 \wedge X_1) \vee (X_0 \wedge X_2) \vee (X_1 \wedge X_2), && (40 \le i \le 59);\\
f_i(X_0, X_1, X_2) &= X_0 \oplus X_1 \oplus X_2, && (60 \le i \le 79).
\end{aligned}$$

9.2.4 Constants

A sequence of constant words, $C_0, C_1, \ldots, C_{79}$, is used in this round-function. In a hexadecimal representation (where the most significant bit corresponds to the left-most bit), these are defined as follows:

C_i = 5A827999, $(0 \le i \le 19)$;
C_i = 6ED9EBA1, $(20 \le i \le 39)$;
C_i = 8F1BBCDC, $(40 \le i \le 59)$;
C_i = CA62C1D6, $(60 \le i \le 79)$.

9.2.5 Initializing value

For this round-function the initializing value, *IV*, shall always be the following 160-bit string, represented here as a sequence of five words, Y_0, Y_1, Y_2, Y_3 and Y_4, in a hexadecimal representation, where Y_0 represents the left-most 32 of the 160 bits:

Y_0 = 67452301;
Y_1 = EFCDAB89;
Y_2 = 98BADCFE;
Y_3 = 10325476;
Y_4 = C3D2E1F0.

9.3 Padding method

The data string, *D*, needs to be padded to make it contain a number of bits which is an integer multiple of 512. The padding procedure operates as follows.

a) *D* is concatenated with a single "1" bit.

b) The result of the previous step is concatenated with between zero and 511 "0" bits, such that the length (in bits) of the resultant string is congruent to 448 modulo 512. More explicitly, if the original length of *D* is L_D and letting *r* be the remainder when L_D is divided by 512, then the number of concatenated zeros is equal to either $447 - r$ (if $r \le 447$) or $959 - r$ (if $r > 447$). The result will be a bit string whose length will be 64 bits short of an integer multiple of 512 bits.

c) Concatenate the string resulting from the previous step with the 64-bit binary representation of L_D, most significant bit first.

In the description of the round-function which follows, each 512-bit data block D_i, $1 \le i \le q$, is treated as a sequence of 16 words, $Z_0, Z_1, \ldots Z_{15}$, where Z_0 corresponds to the left-most 32 bits of D_i.

NOTE The concatenation of the 64-bit string of L_D in step c) is such that the most significant 32-bit string and the least significant 32-bit string of L_D are used respectively as the words Z_{14} and Z_{15} of the last data block. Based on the byte ordering convention in 9.2.2, the most significant byte of L_D is the left-most byte and the least significant byte of L_D is the right-most byte.

9.4 Description of the round-function

The round-function, Φ, operates as follows.

NOTE In this description, the symbols $W, X_0, X_1, X_2, X_3, X_4, Z_0, Z_1, \ldots, Z_{79}$ are used to denote 86 distinct words which contain values required in the computations.

a) Suppose the 512-bit (first) input to Φ is contained in $Z_0, Z_1, \ldots, Z_{15}$, where Z_0 contains the left-most 32 of the 512 bits. Suppose also that the 160-bit (second) input to Φ is contained in five words, Y_0, Y_1, Y_2, Y_3 and Y_4.

b) For $i = 16$ to 79, let $Z_i := S^1(Z_{i-3} \oplus Z_{i-8} \oplus Z_{i-14} \oplus Z_{i-16})$.

c) Let $X_0 := Y_0$, $X_1 := Y_1$, $X_2 := Y_2$, $X_3 := Y_3$ and $X_4 := Y_4$.

d) For $i = 0$ to 79, do the following two steps:

1) $W := S^5(X_0) \uplus f_i(X_1, X_2, X_3) \uplus X_4 \uplus Z_i \uplus C_i$;

2) $X_4 := X_3$; $X_3 := X_2$; $X_2 := S^{30}(X_1)$; $X_1 := X_0$; $X_0 := W$.

e) Let $Y_0 := Y_0 \uplus X_0$, $Y_1 := Y_1 \uplus X_1$, $Y_2 := Y_2 \uplus X_2$, $Y_3 := Y_3 \uplus X_3$ and $Y_4 := Y_4 \uplus X_4$.

f) The five words, Y_0, Y_1, Y_2, Y_3 and Y_4, represent the output of the round-function Φ. After the final iteration of the round-function, the five words, Y_0, Y_1, Y_2, Y_3 and Y_4, shall be converted to a sequence of 20 bytes using the inverse of the procedure specified in 9.2.2 and where Y_0 shall yield the first four bytes, Y_1 the next four bytes and so on. Thus, the first (left-most) byte will correspond to the most significant byte of Y_0 and the 20th (right-most) byte will correspond to the least significant byte of Y_4. The 20 bytes shall be converted to a string of 160 bits using the inverse of the procedure specified in Clause 6, i.e. the first (left-most) bit will correspond to the most significant bit of the first (left-most) byte and the 160th (right-most) bit will correspond to the least significant bit of the 20th (right-most) byte.

Figure 3 shows steps 1) and 2) of item d) of the round-function Φ in Dedicated Hash-Function 3 (SHA-1). In the round-function Φ, steps 1) and 2) of item d) are used 80 times (i = 0, ..., 79).

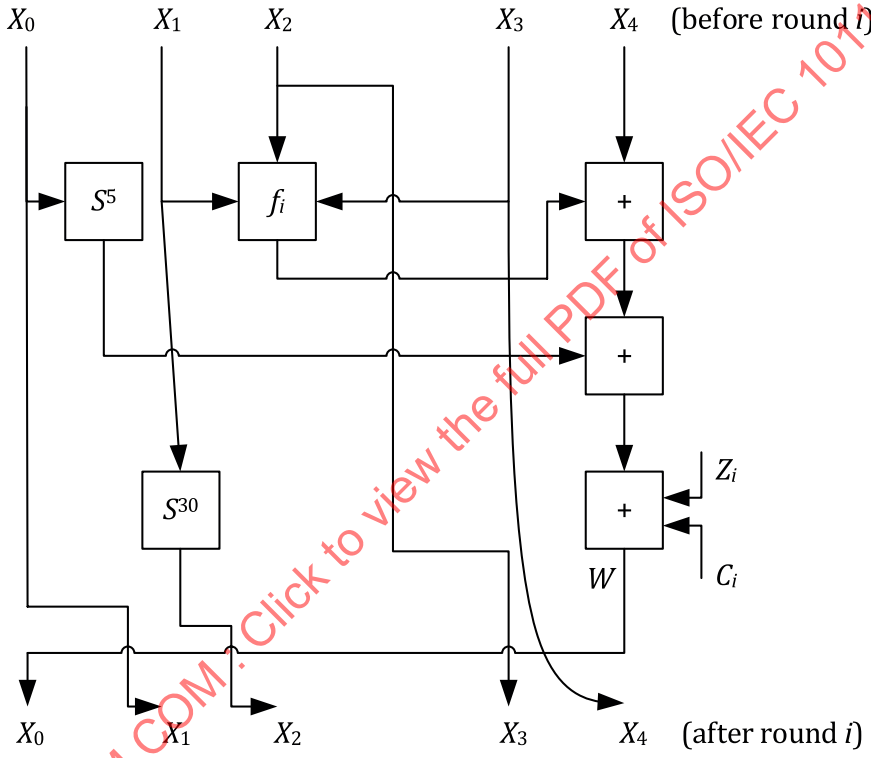

Figure 3 — Part of the round-function in Dedicated Hash-Function 3

10 Dedicated Hash-Function 4 (SHA-256)

10.1 General

In Clause 10, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value and round-function specified here, when used in the above general model, together define Dedicated Hash-Function 4. This dedicated hash-function can be applied to all data strings, D, containing at most $2^{64}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 4 is equal to `34` (hexadecimal).

NOTE Dedicated Hash-Function 4 defined in Clause 10 is commonly called SHA-256[1].

10.2 Parameters, functions and constants

10.2.1 Parameters

For this hash-function, $L_1 = 512$, $L_2 = 256$ and L_H is up to 256.

10.2.2 Byte ordering convention

The byte ordering convention to be used with this hash-function shall be the same as the byte ordering convention defined in 9.2.2.

10.2.3 Functions

To facilitate software implementation, the round-function Φ is described in terms of operations on 32-bit words. A sequence of functions, e_0, e_1, e_2, e_3, e_4 and e_5, is used in this round-function, where e_0 and e_1 each takes three words, X_0, X_1 and X_2, as input; e_2, e_3, e_4 and e_5 each takes one word X_0 as input and each of these six functions produces a single 32-bit word as output.

The functions e_0, e_1, e_2, e_3, e_4 and e_5 are defined as follows:

$$e_0(X_0, X_1, X_2) = (X_0 \wedge X_1) \oplus (\neg X_0 \wedge X_2);$$
$$e_1(X_0, X_1, X_2) = (X_0 \wedge X_1) \oplus (X_0 \wedge X_2) \oplus (X_1 \wedge X_2);$$

$$e_2(X_0) = S'^{2}(X_0) \oplus S'^{13}(X_0) \oplus S'^{22}(X_0);$$
$$e_3(X_0) = S'^{6}(X_0) \oplus S'^{11}(X_0) \oplus S'^{25}(X_0);$$
$$e_4(X_0) = S'^{7}(X_0) \oplus S'^{18}(X_0) \oplus R^{3}(X_0);$$
$$e_5(X_0) = S'^{17}(X_0) \oplus S'^{19}(X_0) \oplus R^{10}(X_0).$$

10.2.4 Constants

A sequence of constant words, C_0, C_1, ..., C_{63}, is used in this round-function. In a hexadecimal representation (where the most significant bit corresponds to the left-most bit), these are defined as follows, where the words are listed in the order C_0, C_1, ..., C_{63}.

```

NOTE These values are the first 32 bits of the fractional parts of the cube roots of the first 64 primes.

10.2.5 Initializing value

For this round-function, the initializing value, *IV*, shall always be the following 256-bit string, represented here as a sequence of eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, in a hexadecimal representation, where Y_0 represents the left-most 32 of the 256 bits:

$$Y_0 = 6A09E667;$$
$$Y_1 = BB67AE85;$$
$$Y_2 = 3C6EF372;$$

Y_3 = A54FF53A;
Y_4 = 510E527F;
Y_5 = 9B05688C;
Y_6 = 1F83D9AB;
Y_7 = 5BE0CD19.

NOTE These values are obtained by taking the fractional parts of the square roots of the first eight primes.

10.3 Padding method

The padding method to be used with this hash-function shall be the same as the padding method defined in 9.3.

10.4 Description of the round-function

The round-function, Φ, operates as follows.

NOTE In this description, the symbols W_1, W_2, X_0, X_1, X_2, X_3, X_4, X_5, X_6, X_7, Z_0, Z_1, ..., Z_{63} are used to denote 74 distinct words which contain values required in the computations.

a) Suppose the 512-bit (first) input to Φ is contained in Z_0, Z_1, ..., Z_{15}, where Z_0 contains the left-most 32 of the 512 bits. Suppose also that the 256-bit (second) input to Φ is contained in eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7.

b) For i = 16 to 63, let Z_i: = $e_5(Z_{i-2}) \uplus Z_{i-7} \uplus e_4(Z_{i-15}) \uplus Z_{i-16}$.

c) Let X_0: = Y_0, X_1: = Y_1, X_2: = Y_2, X_3: = Y_3, X_4: = Y_4, X_5: = Y_5, X_6: = Y_6 and X_7: = Y_7.

d) For i = 0 to 63, do the following three steps:

   1) W_1: = $X_7 \uplus e_3(X_4) \uplus e_0(X_4, X_5, X_6) \uplus C_i \uplus Z_i$;

   2) W_2: = $e_2(X_0) \uplus e_1(X_0, X_1, X_2)$;

   3) X_7: = X_6; X_6: = X_5; X_5: = X_4; X_4: = $X_3 \uplus W_1$; X_3: = X_2; X_2: = X_1; X_1: = X_0; X_0: = $W_1 \uplus W_2$.

e) Let Y_0: = $Y_0 \uplus X_0$, Y_1: = $Y_1 \uplus X_1$, Y_2: = $Y_2 \uplus X_2$, Y_3: = $Y_3 \uplus X_3$, Y_4: = $Y_4 \uplus X_4$, Y_5: = $Y_5 \uplus X_5$, Y_6: = $Y_6 \uplus X_6$ and Y_7: = $Y_7 \uplus X_7$.

f) The eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the round-function Φ. After the final iteration of the round-function, the eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, shall be converted to a sequence of 32 bytes using the inverse of the procedure specified in 10.2.2 and where Y_0 shall yield the first four bytes, Y_1 the next four bytes and so on. Thus, the first (left-most) byte will correspond to the most significant byte of Y_0 and the 32nd (right-most) byte will correspond to the least significant byte of Y_7. The 32 bytes shall be converted to a string of 256 bits using the inverse of the procedure specified in Clause 6, i.e. the first (left-most) bit will correspond to the most significant bit of the first (left-most) byte and the 256th (right-most) bit will correspond to the least significant bit of the 32nd (right-most) byte.

Figure 4 shows steps 1), 2) and 3) of item d) of the round-function Φ in Dedicated Hash-Function 4 (SHA-256). In the round-function Φ, steps 1), 2) and 3) of item d) are used 64 times (i = 0, ..., 63).

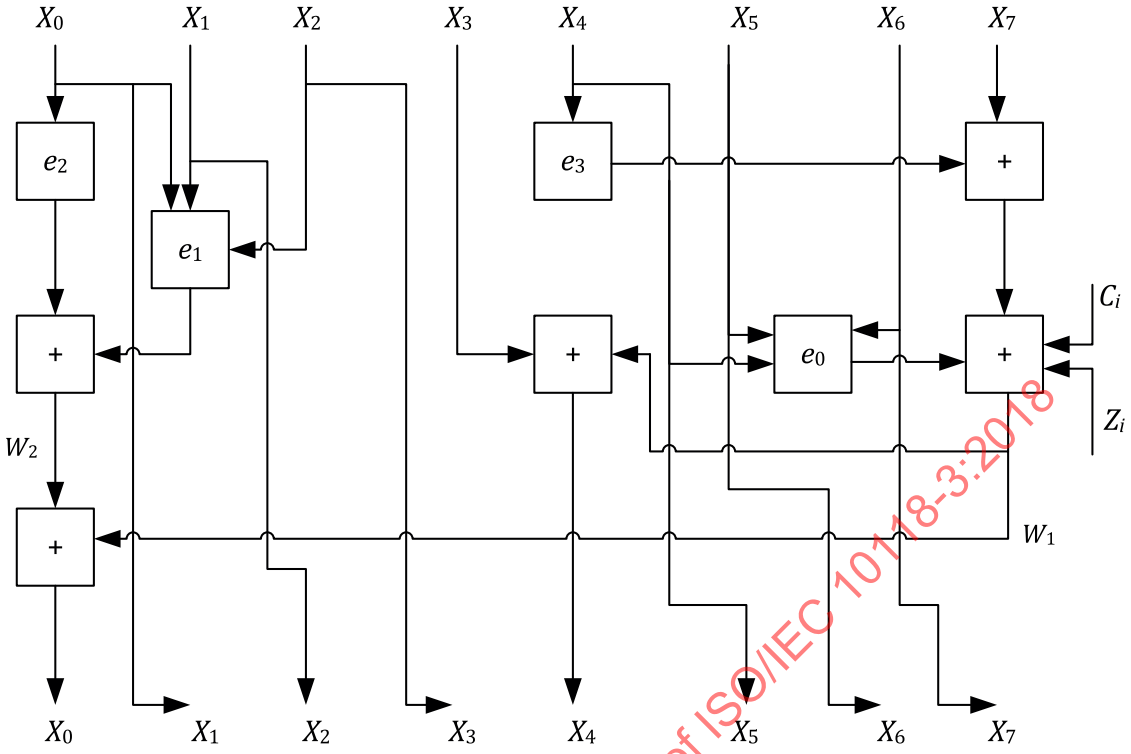

Figure 4 — Part of the round-function in Dedicated Hash-Function 4

11 Dedicated Hash-Function 5 (SHA-512)

11.1 General

In Clause 11, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value and round-function specified here, when used in the above general model, together define Dedicated Hash-Function 5. This dedicated hash-function can be applied to all data strings, D, containing at most $2^{128}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 5 is equal to `35` (hexadecimal).

NOTE Dedicated Hash-Function 5 defined in Clause 11 is commonly called SHA-512[1].

11.2 Parameters, functions and constants

11.2.1 Parameters

For this hash-function, $L_1 = 1\,024$, $L_2 = 512$ and L_H is up to 512.

11.2.2 Byte ordering convention

In the specification of the round-function of Clause 11, it is assumed that the block input to the round-function is in the form of a sequence of 64-bit words, each 1 024-bit block is made up of 16 such words. A sequence of 128 bytes, $B_0, B_1, \ldots, B_{127}$, shall be interpreted as a sequence of 16 words, $Z_0, Z_1, \ldots, Z_{15}$, in the following way. Each group of eight consecutive bytes is considered a word, where the first byte of a word is the most significant byte of that word. Hence,

$$Z_i = 2^{56}B_{8i} + 2^{48}B_{8i+1} + 2^{40}B_{8i+2} + 2^{32}B_{8i+3} + 2^{24}B_{8i+4} + 2^{16}B_{8i+5} + 2^{8}B_{8i+6} + B_{8i+7}, \qquad (0 \le i \le 15).$$

To convert the hash-code from a sequence of words to a sequence of bytes, the inverse process shall be followed.

11.2.3 Functions

To facilitate software implementation, the round-function Φ is described in terms of operations on 64-bit words. A sequence of functions, d_0, d_1, d_2, d_3, d_4 and d_5, is used in this round-function, where d_0 and d_1 each takes three 64-bit words, X_0, X_1 and X_2, as input; d_2, d_3, d_4 and d_5 each takes one 64-bit word X_0 as input and each of these six functions produces a single 64-bit word as output.

The functions d_0, d_1, d_2, d_3, d_4 and d_5 are defined as follows:

$$d_0(X_0, X_1, X_2) = (X_0 \wedge X_1) \oplus (\neg X_0 \wedge X_2);$$
$$d_1(X_0, X_1, X_2) = (X_0 \wedge X_1) \oplus (X_0 \wedge X_2) \oplus (X_1 \wedge X_2);$$

$$d_2(X_0) = S'^{28}(X_0) \oplus S'^{34}(X_0) \oplus S'^{39}(X_0);$$
$$d_3(X_0) = S'^{14}(X_0) \oplus S'^{18}(X_0) \oplus S'^{41}(X_0);$$
$$d_4(X_0) = S'^{1}(X_0) \oplus S'^{8}(X_0) \oplus R^{7}(X_0);$$
$$d_5(X_0) = S'^{19}(X_0) \oplus S'^{61}(X_0) \oplus R^{6}(X_0).$$

11.2.4 Constants

A sequence of constant words, C_0, C_1, ..., C_{79}, is used in this round-function. In a hexadecimal representation (where the most significant bit corresponds to the left-most bit), these are defined as follows, where the words are listed in the order C_0, C_1, ..., C_{79}.

```

NOTE These values are the first 64 bits of the fractional parts of the cube roots of the first 80 primes.

11.2.5 Initializing value

For this round-function, the initializing value, *IV*, shall always be the following 512-bit string, represented here as a sequence of eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, in a hexadecimal representation, where Y_0 represents the left-most 64 of the 512 bits:

Y_0 = 6A09E667F3BCC908;
Y_1 = BB67AE8584CAA73B;
Y_2 = 3C6EF372FE94F82B;
Y_3 = A54FF53A5F1D36F1;
Y_4 = 510E527FADE682D1;
Y_5 = 9B05688C2B3E6C1F;
Y_6 = 1F83D9ABFB41BD6B;
Y_7 = 5BE0CD19137E2179.

NOTE These values are obtained by taking the fractional parts of the square roots of the first eight primes.

11.3 Padding method

The data string, *D*, needs to be padded to make it contain a number of bits which is an integer multiple of 1 024. The padding procedure is as follows.

a) *D* is concatenated with a single "1" bit.

b) The result of the previous step is concatenated with between zero and 1 023 "0" bits, such that the length (in bits) of the resultant string is congruent to 896 modulo 1 024. More explicitly, if the original length of *D* is L_D, and letting r be the remainder when L_D is divided by 1 024, then the number of concatenated zeros is equal to either $895 - r$ (if $r \leq 895$) or $1\,919 - r$ (if $r > 895$). The result will be a bit string whose length will be 128 bits short of an integer multiple of 1 024 bits.

c) Concatenate the string resulting from the previous step with the 128-bit binary representation of L_D, most significant bit first.

In the description of the round-function which follows, each 1 024-bit data block D_i, $1 \leq i \leq q$, is treated as a sequence of 16 words, $Z_0, Z_1, \ldots, Z_{15}$, where Z_0 corresponds to the left-most 64 bits of D_i.

NOTE The concatenation of the 128-bit string of L_D in step c) is such that the most significant 64-bit string and the least significant 64-bit string of L_D are used respectively as the words Z_{14} and Z_{15} of the last data block. Based on the byte ordering convention in 11.2.2, the most significant byte of L_D is the left-most byte and the least significant byte of L_D is the right-most byte.

11.4 Description of the round-function

The round-function, Φ, operates as follows.

NOTE In this description, the symbols W_1, W_2, X_0, X_1, X_2, X_3, X_4, X_5, X_6, X_7, Z_0, Z_1, ..., Z_{79} are used to denote 90 distinct words which contain values required in the computations.

a) Suppose the 1 024-bit (first) input to Φ is contained in $Z_0, Z_1, \ldots, Z_{15}$, where Z_0 contains the left-most 64 of the 1 024 bits. Suppose also that the 512-bit (second) input to Φ is contained in eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7.

b) For $i = 16$ to 79, let $Z_i := d_5(Z_{i-2}) \uplus Z_{i-7} \uplus d_4(Z_{i-15}) \uplus Z_{i-16}$.

c) Let $X_0 := Y_0$, $X_1 := Y_1$, $X_2 := Y_2$, $X_3 := Y_3$, $X_4 := Y_4$, $X_5 := Y_5$, $X_6 := Y_6$ and $X_7 := Y_7$.

d) For $i = 0$ to 79, do the following three steps:

1) $W_1 := X_7 \uplus d_3(X_4) \uplus d_0(X_4, X_5, X_6) \uplus C_i \uplus Z_i$;

2) $W_2 := d_2(X_0) \uplus d_1(X_0, X_1, X_2)$;

3) $X_7 := X_6$; $X_6 := X_5$; $X_5 := X_4$; $X_4 := X_3 \uplus W_1$; $X_3 := X_2$; $X_2 := X_1$; $X_1 := X_0$; $X_0 := W_1 \uplus W_2$.

e) Let $Y_0 := Y_0 \uplus X_0$, $Y_1 := Y_1 \uplus X_1$, $Y_2 := Y_2 \uplus X_2$, $Y_3 := Y_3 \uplus X_3$, $Y_4 := Y_4 \uplus X_4$, $Y_5 := Y_5 \uplus X_5$, $Y_6 := Y_6 \uplus X_6$ and $Y_7 := Y_7 \uplus X_7$.

f) The eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the round-function Φ. After the final iteration of the round-function, the eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, shall be converted to a sequence of 64 bytes using the inverse of the procedure specified in 11.2.2 and where Y_0 shall yield the first eight bytes, Y_1 the next eight bytes and so on. Thus, the first (left-most) byte will correspond to the most significant byte of Y_0 and the 64th (right-most) byte will correspond to the least significant byte of Y_7. The 64 bytes shall be converted to a string of 512 bits using the inverse of the procedure specified in Clause 6, i.e. the first (left-most) bit will correspond to the most significant bit of the first (left-most) byte and the 512th (right-most) bit will correspond to the least significant bit of the 64th (right-most) byte.

Figure 5 shows steps 1), 2) and 3) of item d) of the round-function Φ in Dedicated Hash-Function 5 (SHA-512). In the round-function Φ, steps 1), 2) and 3) of item d) are used 80 times ($i = 0, \ldots, 79$).

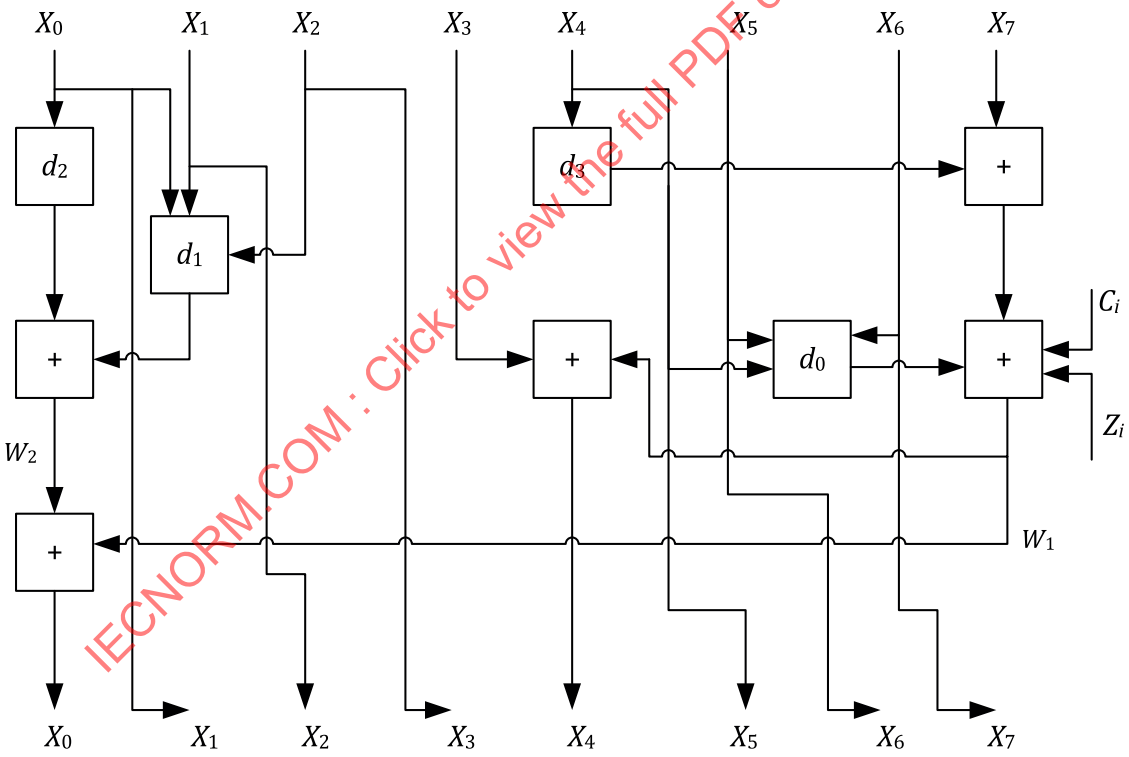

Figure 5 — Part of the round-function in Dedicated Hash-Function 5

12 Dedicated Hash-Function 6 (SHA-384)

12.1 General

In Clause 12, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value

and round-function specified here, when used in the above general model, together define Dedicated Hash-Function 6. This dedicated hash-function can be applied to all data strings, D, containing at most $2^{128}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 6 is equal to `36` (hexadecimal).

NOTE Dedicated Hash-Function 6 defined in Clause 12 is commonly called SHA-384[1].

12.2 Parameters, functions and constants

12.2.1 Parameters

For this hash-function, $L_1 = 1\ 024$, $L_2 = 512$ and $L_H = 384$.

12.2.2 Byte ordering convention

The byte ordering convention for this hash-function is the same as that for the hash-function of Clause 11.

12.2.3 Functions

The functions for this hash-function are the same as that for the hash-function of Clause 11.

12.2.4 Constants

The constants for this hash-function are the same as that for the hash-function of Clause 11.

12.2.5 Initializing value

For this round-function, the initializing value, IV, shall always be the following 512-bit string, represented here as a sequence of eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, in a hexadecimal representation, where Y_0 represents the left-most 64 of the 512 bits:

Y_0 = `CBBB9D5DC1059ED8`;
Y_1 = `629A292A367CD507`;
Y_2 = `9159015A3070DD17`;
Y_3 = `152FECD8F70E5939`;
Y_4 = `67332667FFC00B31`;
Y_5 = `8EB44A8768581511`;
Y_6 = `DB0C2E0D64F98FA7`;
Y_7 = `47B5481DBEFA4FA4`.

NOTE These values are obtained by taking the fractional parts of the square roots of the 9th to the 16th primes.

12.3 Padding method

The padding method to be used with this hash-function shall be the same as the padding method defined in Clause 11.

12.4 Description of the round-function

The round-function to be used with this hash-function shall be the same as the round-function defined in Clause 11.

The final 384-bit hash is obtained by truncating the SHA-512-based hash output to its left-most 384 bits.

13 Dedicated Hash-Function 7 (WHIRLPOOL)

13.1 General

In Clause 13, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value and round-function specified here, when used in the above general model, together define Dedicated Hash-Function 7. This dedicated hash-function can be applied to all data strings, D, containing at most $2^{256}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 7 is equal to 37 (hexadecimal).

NOTE Dedicated Hash-Function 7 defined in Clause 13 is commonly called WHIRLPOOL[3].

13.2 Parameters, functions and constants

13.2.1 Parameters

For this hash-function, $L_1 = 512$, $L_2 = 512$ and L_H is up to 512.

13.2.2 Byte ordering convention

In the specification of the round-function of Clause 13, it is assumed that the block input to the round-function is in the form of a matrix M [where all matrices here are 8×8 matrices with entries chosen from GF(2^8)], each 512-bit block being made up of such a matrix. A sequence of 64 bytes, $B = (B_0, B_1, \ldots, B_{63})$, shall be interpreted as a matrix M in the following way. The entry in the first row and the first column of the matrix shall be the left-most byte (where the left-most byte corresponds to the most significant byte) of the sequence B (i.e. B_0), the entry in the first row and the second column of the matrix shall be the second left-most byte of B (i.e. B_1), ..., and the entry in the eighth row and the eighth column of the matrix shall be the right-most byte of B (i.e. B_{63}). This is performed using function c_0 specified in 13.2.3.

To convert the hash-code from such a matrix to a sequence of bytes, the inverse process of the function c_0 shall be followed.

13.2.3 Functions

To facilitate software implementation, the round-function Φ is described in terms of operations on a matrix M. A sequence of functions, c_0, c_1, c_2, c_3 and c_4, is used in this round-function. They are defined as follows.

a) Function c_0 takes a 64-byte sequence, $B = (B_0, B_1, \ldots, B_{63})$ as input and produces a matrix $Z' = (z'_{ij})$ as output where:

$$z'_{ij} = B_{8i+j} \qquad (0 \le i, j \le 7).$$

This means that $Z' = c_0(B)$, if and only if, $z'_{ij} = B_{8i+j}$ $(0 \le i, j \le 7)$.

b) Function c_1 takes a matrix $X'' = (x''_{ij})$ as input and produces another matrix $W' = (w'_{ij})$ as output where:

$$w'_{ij} = s[x''_{ij}], \qquad (0 \le i, j \le 7),$$

and where s is a function defined below. This means $W' = c_1(X'')$, if and only if, $w'_{ij} = s[x''_{ij}]$ $(0 \le i, j \le 7)$.

The function s replaces an element $x \in$ GF(2^8) with another element $s[x] \in$ GF(2^8). As specified in Table 2, the elements in the first column are the "most significant half" of x and the elements in the first row are the "least significant half" of x. For instance, if x = 01010110 = 56 (hexadecimal), $s[x]$ = 49 (hexadecimal) = 01001001.

Table 2 — Values of the s-box

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F

F	16	3A	69	09	70	B6	D0	ED	CC	42	98	A4	28	5C	F8	86

c) Function c_2 takes a matrix $X'' = (x''_{ij})$ as input and produces another matrix $W' = (w'_{ij})$ as output where:

$$w'_{ij} = x''_{(i\,j) \bmod 8,j}, \qquad (0 \le i, j \le 7).$$

This means that $W' = c_2(X'')$, if and only if, $w'_{ij} = x''_{(i\,-\,j) \bmod 8,j}$ $(0 \le i, j \le 7)$.

d) Function c_3 takes a matrix X'' as input and produces another matrix W' as output where:

$$W' = X'' \cdot C'',$$

and where C'' is an 8×8 circulant matrix with entries chosen from GF(2^8), as specified below:

$$C'' = \begin{bmatrix} 01 & 01 & 04 & 01 & 08 & 05 & 02 & 09 \\ 09 & 01 & 01 & 04 & 01 & 08 & 05 & 02 \\ 02 & 09 & 01 & 01 & 04 & 01 & 08 & 05 \\ 05 & 02 & 09 & 01 & 01 & 04 & 01 & 08 \\ 08 & 05 & 02 & 09 & 01 & 01 & 04 & 01 \\ 01 & 08 & 05 & 02 & 09 & 01 & 01 & 04 \\ 04 & 01 & 08 & 05 & 02 & 09 & 01 & 01 \\ 01 & 04 & 01 & 08 & 05 & 02 & 09 & 01 \end{bmatrix}$$

This means that $W' = c_3(X'')$ if and only if $W' = X'' \cdot C''$.

e) Function c_4 takes two matrices $X'' = (x''_{ij})$ and $Y' = (y'_{ij})$ as input and produces a single matrix $W' = (w'_{ij})$ as output where:

$$w'_{ij} = x''_{ij} \oplus y'_{ij}, \qquad (0 \le i, j \le 7).$$

This means that $W' = c_4(X'', Y')$, if and only if, $w'_{ij} = x''_{ij} \oplus y'_{ij}$ $(0 \le i, j \le 7)$.

13.2.4 Constants

A sequence of constant matrices, $A^r = (A^r_{ij})$ $(0 < r \leq 10)$, is used in this round-function. The round constant for the rth round is a matrix, defined as:

$$A^r_{0j} = s[8(r-1)+j], \qquad (0 \leq j \leq 7),$$

$$A^r_{ij} = 0, \qquad (1 \leq i \leq 7, 0 \leq j \leq 7).$$

13.2.5 Initializing value

The initializing value, *IV*, is a string of 512 "0" bits.

NOTE 512 "0" bits for the initial value is represented by a matrix Y' with entries in GF(2^8).

13.3 Padding method

The data string, D, needs to be padded to make it contain a number of bits which is an integer multiple of 512. The padding procedure is as follows.

a) D is concatenated with a single "1" bit.

b) The result of the previous step is concatenated with between zero and 511 "0" bits, such that the length (in bits) of the resultant string is an odd multiple of 256.

c) If the original length of D is L_D, concatenate the string resulting from the previous step with the 256-bit binary representation of L_D, most significant bit first.

In the description of the round-function which follows, each 512-bit data block D_i, $1 \leq i \leq q$, is treated as a matrix $Z' = (z'_{ij})$ $(0 \leq i, j \leq 7)$, as specified in 13.2.3, where z'_{00} corresponds to the left-most 8 bits of D_i and z'_{77} corresponds to the right-most 8 bits of D_i.

NOTE The concatenation of the 256-bit string of L_D in step c) is such that the 256-bit string is used directly as the second half of the last data matrix. Based on the byte ordering convention in 13.2.2, the most significant byte of L_D is the entry in the fifth row and the first column and the least significant byte of L_D is the entry in the eighth row and the eighth column.

13.4 Description of the round-function

The round-function Φ operates as follows.

NOTE In this description, the symbols W', X'', K_0, K_1, ..., K_{10} are used to denote 13 distinct matrices, each with entries chosen from GF(2^8), which contain values required in the computations.

a) Suppose the 512-bit (first) input to Φ is contained in a matrix Z' with entries chosen from GF(2^8) which is formed by using the byte ordering convention specified in 13.2.2. Suppose also that the 512-bit (second) input to Φ is contained in a matrix Y' with entries chosen from GF(2^8).

b) Let $K_0 := Y'$ and for $i = 1$ to 10, let $K_i := c_4(c_3(c_2(c_1(K_{i-1}))), A^i)$.

NOTE This step expands the matrix Y' onto a sequence of round keys K_0, ..., K_{10}.

c) Let $X'' := c_4(Z', K_0)$ and for $j = 1$ to 10, do the following two steps:

1) $W' := c_4(c_3(c_2(c_1(X''))), K_j)$;

2) $X'' := W'$.

d) Let $Y' := W' \oplus K_0 \oplus Z'$.

The matrix Y' represents the output of the round-function Φ. After the final iteration of the round-function, the matrix Y' shall be converted to a sequence of 64 bytes using the inverse of the procedure

specified in 16.2.2 and where the entry in the first row and the first column of the matrix shall yield the first byte, the entry in the first row and the second column of the matrix the next byte, ..., the entry in the eighth row and the eighth column of the matrix the last byte. The 64 bytes shall be converted to a string of 512 bits using the inverse of the procedure specified in Clause 6, i.e. the first (left-most) bit will correspond to the most significant bit of the first (left-most) byte and the 512th (right-most) bit will correspond to the least significant bit of the 64th (right-most) byte.

Figure 6 shows steps 1) and 2) of item c) of the round-function Φ in Dedicated Hash-Function 7 (WHIRLPOOL). In the round-function Φ, the steps shown in Figure 6 are used 10 times (j = 1, ..., 10).

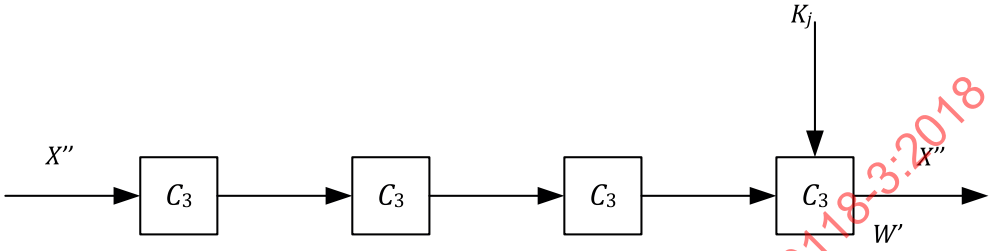

Figure 6 — Part of the round-function in Dedicated Hash-Function 7

14 Dedicated Hash-Function 8 (SHA-224)

14.1 General

In Clause 14, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value and round-function specified here, when used in the above general model, together define Dedicated Hash-Function 8. This dedicated hash-function can be applied to all data strings, D, containing at most $2^{64}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 8 is equal to `38` (hexadecimal).

NOTE Dedicated Hash-Function 8 defined in Clause 14 is commonly called SHA-224[1].

14.2 Parameters, functions and constants

14.2.1 Parameters

For this hash-function, $L_1 = 512$, $L_2 = 256$ and $L_H = 224$.

14.2.2 Byte ordering convention

The byte ordering convention for this hash-function is the same as that for the hash-function of Clause 10.

14.2.3 Functions

The functions for this hash-function are the same as those for the hash-function of Clause 10.

14.2.4 Constants

The constants for this hash-function are the same as those for the hash-function of Clause 10.

14.2.5 Initializing value

For this round-function, the initializing value, *IV*, shall always be the following 256-bit string, represented here as a sequence of eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, in a hexadecimal representation, where Y_0 represents the left-most 32 of the 256 bits:

Y_0 = C1059ED8;
Y_1 = 367CD507;
Y_2 = 3070DD17;
Y_3 = F70E5939;
Y_4 = FFC00B31;
Y_5 = 68581511;
Y_6 = 64F98FA7;
Y_7 = BEFA4FA4.

NOTE These values are the low order 32 bits of the values specified in 12.2.5.

14.3 Padding method

The padding method to be used with this hash-function shall be the same as the padding method defined in 10.3.

14.4 Description of the round-function

The round-function to be used with this hash-function shall be the same as the round-function defined in 10.4.

The final 224-bit hash is obtained by truncating the SHA-256-based hash output to its left-most 224 bits.

15 Dedicated Hash-Function 9 (SHA-512/224)

15.1 General

In Clause 15, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value and round-function specified here, when used in the above general model, together define Dedicated Hash-Function 9. This dedicated hash-function can be applied to all data strings, *D*, containing at most $2^{128}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 9 is equal to 39 (hexadecimal).

NOTE Dedicated Hash-Function 9 defined in Clause 15 is commonly called SHA-512/224[1].

15.2 Parameters, functions and constants

15.2.1 Parameters

For this hash-function, L_1 = 1 024, L_2 = 512 and L_H is up to 224.

15.2.2 Byte ordering convention

The byte ordering convention for this hash-function is the same as that for the hash-function of Clause 11.

15.2.3 Functions

The functions for this hash-function are the same as that for the hash-function of Clause 11.

15.2.4 Constants

The constants for this hash-function are the same as that for the hash-function of Clause 11.

15.2.5 Initializing value

For this round-function, the initializing value, *IV*, shall always be the following 512-bit string, represented here as a sequence of eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, in a hexadecimal representation, where Y_0 represents the left-most 64 of the 512 bits:

Y_0 = 8C3D37C819544DA2;
Y_1 = 73E1996689DCD4D6;
Y_2 = 1DFAB7AE32FF9C82;
Y_3 = 679DD514582F9FCF;
Y_4 = 0F6D2B697BD44DA8;
Y_5 = 77E36F7304C48942;
Y_6 = 3F9D85A86A1D36C8;
Y_7 = 1112E6AD91D692A1.

15.3 Padding method

The padding method to be used with this hash-function shall be the same as the padding method defined in Clause 11.

15.4 Description of the round-function

The round-function to be used with this hash-function shall be the same as the round-function defined in Clause 11. The final 224-bit hash is obtained by truncating the SHA-512-based hash output to its left-most 224 bits.

16 Dedicated Hash-Function 10 (SHA-512/256)

16.1 General

In Clause 16, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value and round-function specified here, when used in the above general model, together define Dedicated Hash-Function 10. This dedicated hash-function can be applied to all data strings, *D*, containing at most $2^{128}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 10 is equal to 3A (hexadecimal).

NOTE Dedicated Hash-Function 10 defined in Clause 16 is commonly called SHA-512/256[1].

16.2 Parameters, functions and constants

16.2.1 Parameters

For this hash-function, L_1 = 1 024, L_2 = 512 and L_H is up to 256.

16.2.2 Byte ordering convention

The byte ordering convention for this hash-function is the same as that for the hash-function of Clause 11.

16.2.3 Functions

The functions for this hash-function are the same as that for the hash-function of Clause 11.

16.2.4 Constants

The constants for this hash-function are the same as that for the hash-function of Clause 11.

16.2.5 Initializing value

For this round-function the initializing value, *IV*, shall always be the following 512-bit string, represented here as a sequence of eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, in a hexadecimal representation, where Y_0 represents the left-most 64 of the 512 bits:

Y_0 = 22312194FC2BF72C;
Y_1 = 9F555FA3C84C64C2;
Y_2 = 2393B86B6F53B151;
Y_3 = 963877195940EABD;
Y_4 = 96283EE2A88EFFE3;
Y_5 = BE5E1E2553863992;
Y_6 = 2B0199FC2C85B8AA;
Y_7 = 0EB72DDC81C52CA2.

16.3 Padding method

The padding method to be used with this hash-function shall be the same as the padding method defined in Clause 11.

16.4 Description of the round-function

The round-function to be used with this hash-function shall be the same as the round-function defined in Clause 11. The final 256-bit hash is obtained by truncating the SHA-512-based hash output to its left-most 256 bits.

17 Dedicated Hash-Function 11 (STREEBOG-512)

17.1 General

In Clause 17, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value and round-function specified here, when used in the above general model, together define Dedicated Hash-Function 11. This dedicated hash-function can be applied to all data strings, *D*, containing at most $2^{512}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 11 is equal to 3B (hexadecimal).

NOTE Dedicated Hash-Function 11 defined in Clause 17 is one of the functions specified in GOST R 34.11–2012, the national standard of the Russian Federation, commonly called STREEBOG[2].

17.2 Parameters, functions and constants

17.2.1 Parameters

For this hash-function, L_1 = 512, L_2 = 512 and L_H = 512.

17.2.2 Byte ordering convention

In the specification of the round-function of Clause 17, it is assumed that the block input to the round-function is in the form of a sequence of 512 bits. A sequence of 64 bytes, B_0, ..., B_{63}, shall be interpreted as a sequence of consecutive bits in the following way. Each byte is considered as an 8-bit sequence, the most significant bit of the byte shall be the first bit of the sequence. Each 512-bit block is treated as a number in the following format:

$$Z = B_0 + B_1 2^8 + \ldots + B_{63} 2^{504}.$$

To convert the hash-code from a sequence of bits to a sequence of bytes, the inverse process shall be followed.

17.2.3 Functions

17.2.3.1 General

To calculate the hash-code H of the data string D, functions X, S, P, L and MSB_h are used. They are defined in 17.2.3.2 to 17.2.3.6.

17.2.3.2 Function *X*

Function $X[k]$ takes a 512-bit word as input and for the given 512-bit word, produces a 512-bit word as output, where $X[k](a) = k \oplus a$.

17.2.3.3 Function *S*

Function S takes a 512-bit word as input, produces a 512-bit word as output and is defined as:

$$S(a) = S(a_{63} \| \ldots \| a_0) = \pi(a_{63}) \| \ldots \| \pi(a_0),$$

where $a = a_{63} \| \ldots \| a_0$, a_i, $i = 0, \ldots, 63$, are 8-bit words and π denotes a function from the set of octet strings to itself. π is defined as:

$$\pi = \text{Vec}_8 \pi' \text{Int}_8,$$

where $\pi' : \mathbb{Z}_{2^8} \rightarrow \mathbb{Z}_{2^8}$.

The function π' is defined by the array $\pi' = [\pi'(0), \pi'(1), \ldots, \pi'(255)]$:

π' = (252, 238, 221, 17, 207, 110, 49, 22, 251, 196, 250, 218, 35, 197, 4, 77, 233, 119, 240, 219, 147, 46, 153, 186, 23, 54, 241, 187, 20, 205, 95, 193, 249, 24, 101, 90, 226, 92, 239, 33, 129, 28, 60, 66, 139, 1, 142, 79, 5, 132, 2, 174, 227, 106, 143, 160, 6, 11, 237, 152, 127, 212, 211, 31, 235, 52, 44, 81, 234, 200, 72, 171, 242, 42, 104, 162, 253, 58, 206, 204, 181, 112, 14, 86, 8, 12, 118, 18, 191, 114, 19, 71, 156, 183, 93, 135, 21, 161, 150, 41, 16, 123, 154, 199, 243, 145, 120, 111, 157, 158, 178, 177, 50, 117, 25, 61, 255, 53, 138, 126, 109, 84, 198, 128, 195, 189, 13, 87, 223, 245, 36, 169, 62, 168, 67, 201, 215, 121, 214, 246, 124, 34, 185, 3, 224, 15, 236, 222, 122, 148, 176, 188, 220, 232, 40, 80, 78, 51, 10, 74, 167, 151, 96, 115, 30, 0, 98, 68, 26, 184, 56, 130, 100, 159, 38, 65, 173, 69, 70, 146, 39, 94, 85, 47, 140, 163, 165, 125, 105, 213, 149, 59, 7, 88, 179, 64, 134, 172, 29, 247, 48, 55, 107, 228, 136, 217, 231, 137, 225, 27, 131, 73, 76, 63, 248, 254, 141, 83, 170, 144, 202, 216, 133, 97, 32, 113, 103, 164, 45, 43, 9, 91, 203, 155, 37, 208, 190, 229, 108, 82, 89, 166, 116, 210, 230, 244, 180, 192, 209, 102, 175, 194, 57, 75, 99, 182).

17.2.3.4 Function *P*

Function P takes a 512-bit word as input, produces a 512-bit word as output and is defined as:

$$P(a) = P(a_{63} \| \ldots \| a_0) = a_{\tau(63)} \| \ldots \| a_{\tau(0)},$$

where $a = a_{63} \| \ldots \| a_0$, a_i, $i = 0,\ldots, 63$, are 8-bit words and τ is a permutation of the set {0, 1, ..., 63} given by the array $\tau = (\tau(0), \tau(1), \ldots, \tau(63))$:

τ = (0, 8, 16, 24, 32, 40, 48, 56, 1, 9, 17, 25, 33, 41, 49, 57, 2, 10, 18, 26, 34, 42, 50, 58, 3, 11, 19, 27, 35, 43, 51, 59, 4, 12, 20, 28, 36, 44, 52, 60, 5, 13, 21, 29, 37, 45, 53, 61, 6, 14, 22, 30, 38, 46, 54, 62, 7, 15, 23, 31, 39, 47, 55, 63).

17.2.3.5 Function *L*

Function L takes a 512-bit word as input, produces a 512-bit word as output and is defined as:

$$L(a) = L(a_7 \| \ldots \| a_0) = l(a_7) \| \ldots \| l(a_0),$$

where $a = a_7 \| \ldots \| a_0$, a_i, $i = 0, \ldots, 7$, are 64-bit words and l is a function equal to right multiplication by the matrix A, given below, over the field GF(2). The matrix rows are expressed sequentially in hexadecimal notation. The row with number j, $j = 0, \ldots, 63$, (specified in the form $a_{j,15}, \ldots, a_{j,0}$, where $a_{j,i} \in ¢_{16}$, $i = 0, \ldots, 15$), is $\mathrm{Vec}_4(a_{j,15}) \| \ldots \| \mathrm{Vec}_4(a_{j,0})$.

Each row of the given table contains four rows of the matrix A. So, the line with number i, $i = 0, \ldots, 15$, specifies the rows of the matrix A with numbers $4i + j$, $j = 0, \ldots, 3$, in the following left-to-right order: $4i + 0$, $4i + 1$, $4i + 2$, $4i + 3$.

The product of the 64-bit word $b = b_{63}, \ldots, b_0$ and the matrix A is a 64-bit word c:

$$c = b_{63}(\mathrm{Vec}_4(a_{0,15}) \| \ldots \| \mathrm{Vec}_4(a_{0,0})) \oplus \ldots \oplus b_0(\mathrm{Vec}_4(a_{63,15}) \| \ldots \| \mathrm{Vec}_4(a_{63,0})),$$

where

$$b_i\left(\mathrm{Vec}_4\left(a_{63-i,15}\right)\|\ldots\|\mathrm{Vec}_4\left(a_{63-i,0}\right)\right) = \begin{cases} 0^{64}, \text{if } b_i = 0, \\ \left(\mathrm{Vec}_4\left(a_{63-i,15}\right)\|\ldots\|\mathrm{Vec}_4\left(a_{63-i,0}\right)\right), \text{if } b_i = 1, \end{cases}$$

for all $i = 0, \ldots, 63$.

17.2.3.6 Truncation function

Function MSB_n maps the word $z_{k-1} \| \ldots \| z_1 \| z_0$, $k \geq n$ to the word $z_{k-1} \| \ldots \| z_{k-n+1} \| z_{k-n}$.

17.2.4 Constants

Round constants are expressed in hexadecimal notation. The constant value specified in the form $a_{127}, \ldots, a_0$ (where $a_i \in ¢_{16}$, $i = 0, \ldots, 127$) is $\mathrm{Vec}_4(a_{127}) \| \ldots \| \mathrm{Vec}_4(a_0)$:

17.2.5 Initializing value

The initializing value, *IV*, is equal to 0^{512}.

17.3 Padding method

The data string, *D*, needs to be padded to make it contain a number of bits which is an integer multiple of 512. The padding procedure is as follows:

a) *D* is concatenated with a single "1" bit (bit placed to the left).

b) The result of the previous step is concatenated with between zero and 511 "0" bits (placed to the left) such that the length (in bits) of the resultant string is a multiple of 512.

c) If the original length of *D* is L_D, concatenate the string resulting from the previous step with the 512-bit binary representation of L_D.

d) If the data after step b) of padding could be expressed in the form $D_0, D_1, \ldots, D_k$, where D_i are 512-bit words and *k* is a positive integer, calculate the value $\Sigma = D_0 \text{Ш} D_1 \text{Ш} \ldots \text{Ш} D_k$ and concatenate the string resulting from the previous step with value Σ.

17.4 Description of the round-function

The round-function Φ operates as follows. Note that in Clause 17, the symbols h, m and N are used to denote three distinct 512-bit words which contain values required in the computations. The hash-code value of the data string D is calculated using an iterative procedure. Each iteration is performed using a round-function that transforms two 512-bit words to a 512-bit word and is calculated as:

$$\Phi(m, h) = g_N(h, m) = E(LPS(h \oplus N), m) \oplus h \oplus m,$$

where $E(K, m) = X[K_{13}]LPSX[K_{12}]...LPSX[K_2]LPSX[K_1](m)$ and where N denotes a 512-bit word calculated during the iterative procedure.

The values $K_i \in V_{512}$, $i = 1, ..., 13$ are calculated as follows:

$K_1 = K$;

$K_i = LPS(K_{i-1} \oplus C_{i-1})$, $i = 2, ..., 13$.

For brevity, instead of $g_{0^{512}}$, the notation g_0 is used.

The hash-function operates as follows. The input for calculating the hash-code is the data string, D (to be hashed), and the initializing value, IV.

The padding method described in 17.3 is accomplished within the algorithm that follows, i.e. that the padding does not actually have to be done prior to running the algorithm.

The algorithm for calculating the hash-code consists of the following stages.

a) Stage 1

Assign initial values to the following variables:

1) $h := IV$;
2) $N := 0^{512}$;
3) $\Sigma := 0^{512}$;
4) Go to Stage 2.

b) Stage 2

1) Check the condition: $L_D < 512$.

If it is true, then go to Stage 3.

Else, perform the following calculations:

i) Let m be the right-most 512 bits of the message D (so that $D = D' \| m$). Then perform the following calculations:

— $h := g_N(h, m)$;

— $N := \text{Vec}_{512}(\text{Int}_{512}(N) \boxplus 512)$;

— $\Sigma := \text{Vec}_{512}(\text{Int}_{512}(\Sigma) \boxplus \text{Int}_{512}(m))$;

— $D := D'$.

ii) Go to b)1).

c) Stage 3

1) $m := 0^{511-L_D} \| 1 \| D$.

2) $h := g_N(h, m)$.

3) $N := \mathrm{Vec}_{512}(\mathrm{Int}_{512}(N) \boxplus L_D)$.

4) $\Sigma := \mathrm{Vec}_{512}(\mathrm{Int}_{512}(\Sigma) \boxplus \mathrm{Int}_{512}(m))$.

5) $h := g_0(h, N)$.

6) $h := g_0(h, \Sigma)$.

7) End of the algorithm.

The value of the variable h [obtained in step 6)] is the hash-code H.

18 Dedicated Hash-Function 12 (STREEBOG-256)

18.1 General

In Clause 18, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value and round-function specified here, when used in the above general model, together define the Dedicated Hash-Function 12. This dedicated hash-function can be applied to all data strings, D, containing at most $2^{512}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 12 is equal to 3C (hexadecimal).

NOTE Dedicated Hash-Function 12 defined in Clause 18 is one of the functions specified in GOST R 34.11–2012, the national standard of the Russian Federation, commonly called STREEBOG[2].

18.2 Parameters, functions and constants

18.2.1 Parameters

For this hash-function, $L_1 = 512$, $L_2 = 512$ and $L_H = 256$.

18.2.2 Byte ordering convention

The byte ordering convention for this hash-function is the same as that for the hash-function of Clause 17.

18.2.3 Functions

The functions for this hash-function are the same as those for the hash-function of Clause 17.

18.2.4 Constants

The constants for this hash-function are the same as those for the hash-function of Clause 17.

18.2.5 Initializing value

The initializing value, IV, equals $(000\ 000\ 01)^{64}$.

18.3 Padding method

The padding method to be used with this hash-function shall be the same as the padding method defined in Clause 17.

18.4 Description of the round-function

The round-function to be used with this hash-function shall be the same as the round-function defined in Clause 17. The final 256-bit hash is obtained by truncating the STREEBOG-512-based hash output to its most significant 256 bits.

19 Dedicated Hash-Function 13 (SHA3-224)

19.1 General

In Clause 19, a permutation-based hash-function with sponge construction SHA-224 is specified. The ISO/IEC hash-function identifier for Dedicated Hash-Function 13 is equal to 3D (hexadecimal).

19.2 Parameters, functions and constants

19.2.1 Parameters

For this hash-function, $L_1 = r = 1\,152$, $L_2 = b = 1\,600$, $c = b - r = 448$, $d = 224$, L_H is up to 224.

19.2.2 Byte ordering convention

Each data input D to the round-function Φ is a block of 1 152 bits that is XORed into the part of the state. The permutation f is then applied to the state. Because the step mappings that comprise the permutation are defined on the array form of the state, it is convenient to regard D as a sequence of 64-bit words that are XORed directly into the state array. For this purpose, when D is represented as a sequence of 144 bytes, B_0, B_1, ..., B_{143}, then D shall be interpreted as a sequence of 18 lane words, Z_0, Z_1, ..., Z_{17}, as follows:

$$Z_i = 2^{56}B_{8i+7} + 2^{48}B_{8i+6} + 2^{40}B_{8i+5} + 2^{32}B_{8i+4} + 2^{24}B_{8i+3} + 2^{16}B_{8i+2} + 2^{8}B_{8i+1} + B_{8i},$$

for $0 \le i \le 17$.

Hence, each group of eight consecutive bytes is a word and the bytes of the word are arranged in increasing order of significance, so that the first byte in the group becomes the least significant byte of the word.

For dedicated hash-function 13, the function is defined on a $5 \times 5 \times w$ state array. For each array six sub-arrays are defined for step-mappings. Lane is one of the subarrays and defined in 19.2.3.3. Under this interpretation, D is XORed with the state array as follows:

If j and k are the elements of {0, 1, 2, 3, 4} such that (j, k) is the unique pair for which $i = 5k + j$, then for $0 \le i \le 17$, $Lane'(j, k) = Z_i \oplus Lane(j, k)$, where $Lane'(j, k)$ is the updated value of the lane.

19.2.3 Functions

19.2.3.1 General

In 19.2.3.8, the KECCAK-p permutations are specified. A KECCAK-p permutation is determined by two parameters. First, the fixed length of the strings that are permuted, called the *width* of the permutation, is denoted as b. Second, the number of iterations of an internal transformation, called a *round*, is denoted as n_r. For the Dedicated Hash-Functions 13, 14, 15 and 16, $b = 1\,600$ and $n_r = 24$. However, in some of the examples, in particular when a figure is used to illustrate the operations, smaller values of b are used.

A round of a KECCAK-*p* permutation, denoted by *Rnd*, consists of a sequence of five transformations called *step mappings*. The permutation is specified in terms of an array of values for b (= 1 600) bits that is repeatedly updated, called the *state*. The state is initially set to the input values of the permutation.

NOTE The term round is used differently from the term specified in ISO/IEC 10118-1, where a round is a function used to process one single input data block to the hash-function. For the Dedicated Hash-Functions 13, 14, 15 and 16, to process one single data block, the round-function is iterated n_r (= 24) times. That is, each execution of round-function Φ, as it is named in ISO/IEC 10118-1, iterates *Rnd* 24 times.

The notation and terminology for the state are described in 19.2.3.2 to 19.2.3.6. The step mappings are specified in 19.2.3.7. The KECCAK-*p* permutations, including the round-function *Rnd*, are specified in 19.2.3.8.

19.2.3.2 State

The input and output states of the permutation are comprised of b bit strings. To represent the step mappings, a state is represented as a $5 \times 5 \times w$ array of bits, where $w = b/25$. For b = 1 600, w = 64. If S denotes a string that represents the state, then its bits are indexed from 0 to b–1, so that

$$S = S[0] \,||\, S[1] \,||\, \ldots \,||\, S[b-2] \,||\, S[b-1].$$

If **A** denotes a $5 \times 5 \times w$ array of bits that represents the state, then its indices are the integer triples (x, y, z) for which $0 \le x < 5$, $0 \le y < 5$ and $0 \le z < w$. The bit that corresponds to (x, y, z) is denoted by $\mathbf{A}[x, y, z]$. A *state array* is a representation of the state by a three-dimensional array that is indexed in this manner.

19.2.3.3 Parts of the state array

The two-dimensional sub-arrays are called sheets, planes and slices; and the single-dimensional sub-arrays are called rows, columns and lanes.

The algebraic definitions of these sub-arrays are as follows.

Column For a state array, a sub-array of 5 bits with constant x and z coordinates.

Lane For a state array of a KECCAK-*p* permutation with width b, a sub-array of $b/25$ bits with constant x and y coordinates.

Plane For a state array of a KECCAK-*p* permutation with width b, a sub-array of $b/5$ bits with constant y coordinate.

Row For a state array, a sub-array of 5 bits with constant y and z coordinates.

Sheet For a state array of a KECCAK-*p* permutation with width b, a sub-array of $b/5$ bits with a constant x coordinate.

Slice For a state array, a sub-array of 25 bits with a constant z coordinate.

19.2.3.4 Converting strings to state arrays

Let S denote a string of b bits that represents the state for the KECCAK-*p* permutation. The corresponding state array, denoted by **A**, is defined as follows.

For all triples (x, y, z), such that $0 \le x < 5$, $0 \le y < 5$ and $0 \le z < w$,

$$\mathbf{A}[x, y, z] = S\,[w(5y + x) + z].$$

For b = 1 600 and w = 64,

A[0, 0, 0] = *S* [0]	**A**[1, 0, 0] = *S* [64]		**A**[4, 0, 0] = *S* [256]
A[0, 0, 1] = *S*[1]	**A**[1, 0, 1] = *S* [65]		**A**[4, 0, 1] = *S* [257]
A[0, 0, 2] = *S*[2]	**A**[1, 0, 2] = *S* [66]		**A**[4, 0, 2] = *S* [258]
⋮	⋮	...	⋮
A[0, 0, 61] = *S* [61]	**A**[1, 0, 61] = *S* [125]		**A**[4, 0, 61] = *S* [317]
A[0, 0, 62] = *S* [62]	**A**[1, 0, 62] = *S* [126]		**A**[4, 0, 62] = *S* [318]
A[0, 0, 63] = *S* [63]	**A**[1, 0, 63] = *S* [127]		**A**[4, 0, 63] = *S* [319]

and

A[0, 1, 0] = *S* [320]	**A**[1, 1, 0] = *S* [384]		**A**[4, 1, 0] = *S* [576]
A[0, 1, 1] = *S* [321]	**A**[1,1,1] = *S* [385]		**A**[4,1,1] = *S* [577]
A[0, 1, 2] = *S* [322]	**A**[1,1,2] = *S* [386]		**A**[4,1,2] = *S* [578]
⋮	⋮	...	⋮
A[0, 1, 61] = *S* [381]	**A**[1, 1, 61] = *S* [445]		**A**[4, 1, 61] = *S* [637]
A[0, 1, 62] = *S* [382]	**A**[1, 1, 62] = *S* [446]		**A**[4, 1, 62] = *S* [638]
A[0, 1, 63] = *S* [383]	**A**[1, 1, 63] = *S* [447]		**A**[4, 1, 63] = *S* [639]

and

A[0, 2, 0] = *S* [640]	**A**[1, 2, 0] = *S* [704]		**A**[4, 2, 0] = *S* [896]
A[0, 2, 1] = *S* [641]	**A**[1,2,1] = *S* [705]		**A**[4,2,1] = *S* [897]
A[0, 2, 2] = *S* [642]	**A**[1,2,2] = *S* [706]		**A**[4,2,2] = *S* [898]
⋮	⋮	...	⋮
A[0, 2, 61] = *S* [701]	**A**[1, 2, 61] = *S* [765]		**A**[4, 2, 61] = *S* [957]
A[0, 2, 62] = *S* [702]	**A**[1, 2, 62] = *S* [766]		**A**[4, 2, 62] = *S* [958]
A[0, 2, 63] = *S* [703]	**A**[1, 2, 63] = *S* [767]		**A**[4, 2, 63] = *S* [959]

etc.

19.2.3.5 Converting state arrays to strings

Let **A** denote a state array. The corresponding string representation, denoted by *S*, can be constructed from the lanes and planes of **A**, as follows:

For each pair of integers (i, j), such that $0 \le i < 5$ and $0 \le j < 5$, define the string *Lane* (i, j) by using

Lane (i, j) = **A**$[i, j, 0]$ || **A**$[i, j, 1]$ || **A**$[i, j, 2]$ || ... || **A**$[i, j, w\text{-}2]$ || **A**$[i, j, w\text{–}1]$.

For $b = 1\,600$ and $w = 64$,

Lane (0, 0) = **A**[0, 0, 0] || **A**[0, 0, 1] || **A**[0, 0, 2] || ... || **A**[0, 0, 62] || **A**[0, 0, 63]

Lane (1, 0) = **A**[1, 0, 0] || **A**[1, 0, 1] || **A**[1, 0, 2] || ... || **A**[1, 0, 62] || **A**[1, 0, 63]

Lane (2, 0) = **A**[2, 0, 0] || **A**[2, 0, 1] || **A**[2, 0, 2] || ... || **A**[2, 0, 62] || **A**[2, 0, 63]

etc.

For each integer, j, such that $0 \le j < 5$, define the string $Plane\ (j)$ by using

$$Plane\ (j) = Lane\ (0, j) \,||\, Lane\ (1, j) \,||\, Lane\ (2, j) \,||\, Lane\ (3, j) \,||\, Lane\ (4, j).$$

Then,

$$S = Plane\ (0) \,||\, Plane\ (1) \,||\, Plane\ (2) \,||\, Plane\ (3) \,||\, Plane\ (4).$$

For $b = 1\,600$ and $w = 64$,

$$\begin{aligned} S = {} & \mathbf{A}[0, 0, 0] \,||\, \mathbf{A}[0, 0, 1] \,||\, \mathbf{A}[0, 0, 2] \,||\, \ldots \,||\, \mathbf{A}[0, 0, 62] \,||\, \mathbf{A}[0, 0, 63] \\ & ||\, \mathbf{A}[1, 0, 0] \,||\, \mathbf{A}[1, 0, 1] \,||\, \mathbf{A}[1, 0, 2] \,||\, \ldots \,||\, \mathbf{A}[1, 0, 62] \,||\, \mathbf{A}[1, 0, 63] \\ & ||\, \mathbf{A}[2, 0, 0] \,||\, \mathbf{A}[2, 0, 1] \,||\, \mathbf{A}[2, 0, 2] \,||\, \ldots \,||\, \mathbf{A}[2, 0, 62] \,||\, \mathbf{A}[2, 0, 63] \\ & ||\, \mathbf{A}[3, 0, 0] \,||\, \mathbf{A}[3, 0, 1] \,||\, \mathbf{A}[3, 0, 2] \,||\, \ldots \,||\, \mathbf{A}[3, 0, 62] \,||\, \mathbf{A}[3, 0, 63] \\ & ||\, \mathbf{A}[4, 0, 0] \,||\, \mathbf{A}[4, 0, 1] \,||\, \mathbf{A}[4, 0, 2] \,||\, \ldots \,||\, \mathbf{A}[4, 0, 62] \,||\, \mathbf{A}[4, 0, 63] \\ & ||\, \mathbf{A}[0, 1, 0] \,||\, \mathbf{A}[0, 1, 1] \,||\, \mathbf{A}[0, 1, 2] \,||\, \ldots \,||\, \mathbf{A}[0, 1, 62] \,||\, \mathbf{A}[0, 1, 63] \\ & ||\, \mathbf{A}[1, 1, 0] \,||\, \mathbf{A}[1,1,1] \,||\, \mathbf{A}[1,1,2] \,||\, \ldots \,||\, \mathbf{A}[1, 1, 62] \,||\, \mathbf{A}[1, 1, 63] \\ & ||\, \mathbf{A}[2, 1, 0] \,||\, \mathbf{A}[2,1,1] \,||\, \mathbf{A}[2,1,2] \,||\, \ldots \,||\, \mathbf{A}[2, 1, 62] \,||\, \mathbf{A}[2, 1, 63] \\ & ||\, \mathbf{A}[3, 1, 0] \,||\, \mathbf{A}[3,1,1] \,||\, \mathbf{A}[3,1,2] \,||\, \ldots \,||\, \mathbf{A}[3, 1, 62] \,||\, \mathbf{A}[3, 1, 63] \\ & ||\, \mathbf{A}[4, 1, 0] \,||\, \mathbf{A}[4,1,1] \,||\, \mathbf{A}[4,1,2] \,||\, \ldots \,||\, \mathbf{A}[4, 1, 62] \,||\, \mathbf{A}[4, 1, 63] \\ & \ldots \\ & ||\, \mathbf{A}[0, 4, 0] \,||\, \mathbf{A}[0, 4, 1] \,||\, \mathbf{A}[0, 4, 2] \,||\, \ldots \,||\, \mathbf{A}[0, 4, 62] \,||\, \mathbf{A}[0, 4, 63] \\ & ||\, \mathbf{A}[1, 4, 0] \,||\, \mathbf{A}[1,4,1] \,||\, \mathbf{A}[1,4,2] \,||\, \ldots \,||\, \mathbf{A}[1, 4, 62] \,||\, \mathbf{A}[1, 4, 63] \\ & ||\, \mathbf{A}[2, 4, 0] \,||\, \mathbf{A}[2,4,1] \,||\, \mathbf{A}[2,4,2] \,||\, \ldots \,||\, \mathbf{A}[2, 4, 62] \,||\, \mathbf{A}[2, 4, 63] \\ & ||\, \mathbf{A}[3, 4, 0] \,||\, \mathbf{A}[3,4,1] \,||\, \mathbf{A}[3,4,2] \,||\, \ldots \,||\, \mathbf{A}[3, 4, 62] \,||\, \mathbf{A}[3, 4, 63] \\ & ||\, \mathbf{A}[4, 4, 0] \,||\, \mathbf{A}[4,4,1] \,||\, \mathbf{A}[4,4,2] \,||\, \ldots \,||\, \mathbf{A}[4, 4, 62] \,||\, \mathbf{A}[4, 4, 63]. \end{aligned}$$

19.2.3.6 Labelling convention for the state array

In the diagrams of the state that accompany the specifications of the step mappings, the lane that corresponds to the coordinates $(x, y) = (0, 0)$ is depicted at the centre of the slices.

19.2.3.7 Step mappings

19.2.3.7.1 General

The five step mappings that comprise a round of KECCAK-p are denoted by θ, ρ, π, χ and ι. Specifications for these functions are given in 19.2.3.7.2 to 19.2.3.7.6.

The algorithm for each step mapping takes a state array, denoted by **A**, as an input and returns an updated state array, denoted by **A′**, as the output.

The ι mapping has a second input: an integer called the *round index*, denoted by i_r, which is defined within Algorithm 5 for KECCAK-p, in 19.2.3.7.6. The other step mappings do not depend on the *round index*.

19.2.3.7.2 Specification of θ

Algorithm 1: θ(**A**)

Input: state array **A**

Output: state array **A**′

Steps:

a) For all pairs (x, z), such that $0 \le x < 5$ and $0 \le z < w$, let

$C[x, z] = \mathbf{A}[x, 0, z] \oplus \mathbf{A}[x, 1, z] \oplus \mathbf{A}[x, 2, z] \oplus \mathbf{A}[x, 3, z] \oplus \mathbf{A}[x, 4, z]$.

b) For all pairs (x, z), such that $0 \le x < 5$ and $0 \le z < w$ let

$D[x, z] = C[(x-1) \bmod 5, z] \oplus C[(x+1) \bmod 5, (z - 1) \bmod w]$.

c) For all triples (x, y, z), such that $0 \le x < 5$, $0 \le y < 5$ and $0 \le z < w$, let

$\mathbf{A}'[x, y, z] = \mathbf{A}[x, y, z] \oplus D[x, z]$.

The effect of θ is to XOR each bit in the state with the parities of two columns in the array. In particular, for the bit $\mathbf{A}[x_0, y_0, z_0]$, the x-coordinate of one of the columns is $(x_0 - 1) \bmod 5$, with the same z-coordinate, z_0, while the x-coordinate of the other column is $(x_0 + 1) \bmod 5$, with z-coordinate $(z_0 - 1) \bmod w$.

19.2.3.7.3 Specification of ρ

Algorithm 2: ρ(**A**)

Input: state array **A**

Output: state array **A**′

Steps:

a) For all z such that $0 \le z < w$, let $\mathbf{A}'[0, 0, z] = \mathbf{A}[0, 0, z]$.

b) Let $(x, y) = (1, 0)$.

c) For t from 0 to 23:

1) for all z such that $0 \le z < w$, let $\mathbf{A}'[x, y, z] = \mathbf{A}\{x, y, [z - (t + 1)(t + 2)/2] \bmod w\}$;

2) let $(x, y) = [y, (2x + 3y) \bmod 5]$.

d) Return **A**′.

19.2.3.7.4 Specification of π

Algorithm 3: π(**A**)

Input: state array **A**

Output: state array **A**′

Steps:

a) For all triples (x, y, z) such that $0 \le x < 5$, $0 \le y < 5$ and $0 \le z < w$, let

$\mathbf{A}'[x, y, z] = \mathbf{A}[(x + 3y) \bmod 5, x, z]$.

b) Return **A**′.

19.2.3.7.5 Specification of χ

Algorithm 4: χ(**A**)

Input: state array **A**

Output: state array **A′**

Steps:

a) For all triples (x, y, z) such that $0 \le x < 5$, $0 \le y < 5$ and $0 \le z < w$, let

$\mathbf{A}'[x, y, z] = \mathbf{A}[x, y, z] \oplus <\{\mathbf{A}[(x+1) \bmod 5, y, z] \oplus 1\} \wedge \mathbf{A}[(x+2) \bmod 5, y, z]>$.

b) Return **A′**.

The notation ∧ in the right side of the assignment for step a) is Boolean "AND" operation.

19.2.3.7.6 Specification of ι

The ι mapping is parameterized by the round index, i_r, whose values are specified in step b) of Algorithm 7 for computing KECCAK-*p*, in 19.2.3.8. Within the specification of ι in Algorithm 6, this parameter determines $l + 1$ bits of a lane value called the *round constant*, denoted by *RC*, where $l = \log(w)$. When $w = 64$, $l = 6$. Each of these 7 bits is generated by a function that is based on a linear feedback shift register. This function, denoted by *rc*, is specified in Algorithm 5.

Algorithm 5: $rc(t)$

Input: integer t

Output: bit $rc(t)$

Steps:

a) If $t \bmod 255 = 0$, return 1.

b) Let $R = 10\,000\,000$.

c) For i from 1 to $t \bmod 255$, let:

1) $R = 0 \,||\, R$;

2) $R[0] = R[0] \oplus R[8]$;

3) $R[6] = R[6] \oplus R[8]$;

4) $R[3] = R[3] \oplus R[8]$;

5) $R[2] = R[2] \oplus R[8]$;

6) $R = Trunc_8[R]$.

d) Return $R[0]$.

In Algorithm 6, *RC* is a w-bit binary string and denoted as $RC[0], RC[1], \ldots, RC[w-1]$.

Algorithm 6: $\iota(\mathbf{A}, i_r)$

Input: state array **A**; round index i_r

Output: state array **A′**

Steps:

a) For all triples (x, y, z), such that $0 \le x < 5$, $0 \le y < 5$ and $0 \le z < w$, let $\mathbf{A}'[x, y, z] = \mathbf{A}[x, y, z]$.

b) Let $RC = 0^w$.

c) For j from 0 to 6, let $RC[2_j - 1] = rc(j + 7i_r)$.

d) For all z, such that $0 \le z < w$, let $\mathbf{A}'[0, 0, z] = \mathbf{A}'[0, 0, z] \oplus RC[z]$.

e) Return $\mathbf{A}'$.

The effect of ι is to modify some of the bits of *Lane* (0, 0) in a manner that depends on the round index i_r. The other 24 lanes are not affected by ι.

19.2.3.8 KECCAK-*p*

Given a state array **A** and a round index i_r, the round-function *Rnd* is the transformation that results from applying the step mappings θ, ρ, π, χ and ι, in that order, i.e.:

$$Rnd(\mathbf{A}, i_r) = \iota(\chi<\pi\{\rho[\theta(\mathbf{A})]\}>, i_r).$$

The KECCAK-*p* permutation consists of 24 iterations of *Rnd*, as specified in Algorithm 7.

Algorithm 7: KECCAK-*p* (*S*)

Input: string *S* of length 1 600 bits

Output: string *S* of length 1 600 bits

Steps:

a) Convert *S* into a state array, **A**, as described in 19.2.3.4.

b) For i_r from 0 to 23, let $\mathbf{A} = Rnd(\mathbf{A}, i_r)$.

c) Convert **A** into a string, S' of length *b*, as described in 19.2.3.5.

d) Return S'.

19.3 Padding method

The data, a binary string *M*, will be padded with "01" before applying the padding method pad10*1(*x*, *m*), specified below with x = 1 152.

pad10*1(*x*, *m*)

Input: positive integer *x*; non-negative integer *m*

Output: string *P*, such that $m + 1 + \text{len}(P)$ is a positive multiple of *x*

Steps:

a) Let $j = (-m - 2) \bmod x$.

b) Return $P = 1 \,||\, 0_j \,||\, 1$.

Thus, the asterisk in "pad10*1" indicates that the "0" bit is either omitted or repeated as necessary, in order to produce an output string of the desired length.

That is, the padded data is $P = M \,||\, 01 \,||\, 10^*1$, such that the length of *P* is a multiple of 1 152.

19.4 Description of a round-function

The round-function for Dedicated Hash-Function 13 is the permutation KECCAK-*p* specified in 19.2.3.8. Notice that KECCAK-*p* is considered as *Φ* as defined in ISO/IEC 10118-1. However, for each execution of KECCAK-*p*, it iterates the *Rnd* function 24 times. That is, it executes

$$Rnd(\mathbf{A}, i_r) = \iota(\chi<\pi\{\rho[\theta(\mathbf{A})]\}>, i_r),$$

for i_r = 0, 1, ..., 23.

19.5 Output transformation

In step h) of SPONGE[f, pad, r](N, d), f = KECCAK-p, because r = 1 152, d = 224 and $r > d$, the $Trunc_r(S)$ will be further truncated to d bits.

20 Dedicated Hash-Function 14 (SHA3-256)

20.1 General

In Clause 20, a permutation-based hash-function with sponge construction SHA3-256 is specified. The description of permutation-based hash-function with sponge construction is given in Clause 19.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 14 is equal to 3E (hexadecimal).

20.2 Parameters, functions and constants

20.2.1 Parameters

For this hash-function, $L_1 = r$ = 1 088, $L_2 = b$ = 1 600, $c = b - r$ = 512, d = 256, L_H is up to 256.

20.2.2 Byte ordering convention

Each data input D to the round-function Φ is a block of 1 088 bits that is XORed into the part of the state. The permutation f is then applied to the state. Because the step mappings that comprise the permutation are defined on the array form of the state, it is convenient to regard D as a sequence of 64-bit words that are XORed directly into the state array. For this purpose, when D is represented as a sequence of 136 bytes, B_0, B_1, ..., B_{135}, then D shall be interpreted as a sequence of 17 lane words, Z_0, Z_1, ..., Z_{16}, as follows:

$$Z_i = 2^{56}B_{8i+7} + 2^{48}B_{8i+6} + 2^{40}B_{8i+5} + 2^{32}B_{8i+4} + 2^{24}B_{8i+3} + 2^{16}B_{8i+2} + 2^{8}B_{8i+1} + B_{8i},$$

for $0 \le i \le 16$.

Hence, each group of eight consecutive bytes is a word and the bytes of the word are arranged in increasing order of significance, so that the first byte in the group becomes the least significant byte of the word.

For dedicated hash-function 14, the function is defined on a 5 × 5 × w state array. For each array six sub-arrays are defined for step-mappings. Lane is one of the subarrays and defined in 19.2.3.3. Under this interpretation, D is XORed with the state array as follows.

If j and k are the elements of {0, 1, 2, 3, 4} such that (j, k) is the unique pair for which $i = 5k + j$, then for $0 \le i \le 16$, $Lane'(j, k) = Z_i \oplus Lane(j, k)$, where $Lane'(j, k)$ is the updated value of the lane.

20.2.3 Functions

The functions, including the function *Rnd* and step mappings, for the Dedicated Hash-Function 14 are the same as Dedicated Hash-Function 13 and is specified in Clause 19.

20.2.4 Constants

The constants used for the mapping ρ are the offsets defined in Clause 19.

20.2.5 Initializing value

The initializing value is a 1 600-bit all-zero string.

20.3 Padding method

The data M will be padded with "01" before applying the padding method pad10*1(x, m) specified in Clause 19, with x = 1 088.

That is, the padded data is $P = M \,||\, 01 \,||\, 10^*1$, such that the length of P is a multiple of 1 088.

20.4 Description of round-function

The round-function for Dedicated Hash-Function 14 is the permutation KECCAK-p specified in Clause 19. Notice that KECCAK-p is considered as Φ as defined in ISO/IEC 10118-1. However, for each execution of KECCAK-p, it iterates the *Rnd* function 24 times. That is, it executes

$$Rnd(\mathbf{A}, i_r) = \iota(\chi<\pi\{\rho[\theta(\mathbf{A})]\}>, i_r),$$

for i_r = 0, 1, ..., 23.

20.5 Output transformation

In step h) of SPONGE[f, pad, r](N, d), specified in Clause 19, f = KECCAK-p because r = 1 088, d = 256 and $r > d$, the $Trunc_r(S)$ will be further truncated to d bits.

21 Dedicated Hash-Function 15 (SHA3-384)

21.1 General

In Clause 21, a permutation-based hash-function with sponge construction SHA3-384 is specified. The description of permutation-based hash-function with sponge construction is given in Clause 19.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 15 is equal to `3F` (hexadecimal).

21.2 Parameters, functions and constants

21.2.1 Parameters

For this hash-function, $L_1 = r$ = 832, $L_2 = b$ = 1 600, $c = b - r$ = 768, d = 384, L_H is up to 384.

21.2.2 Byte ordering convention

Each data input D to the round-function Φ is a block of 832 bits that is XORed into the part of the state; the permutation f is then applied to the state. Because the step mappings that comprise the permutation are defined on the array form of the state, it is convenient to regard D as a sequence of 64-bit words that are XORed directly into the state array. For this purpose, when D is represented as a sequence of 104 bytes, $B_0, B_1, \ldots, B_{103}$, then D shall be interpreted as a sequence of 13 lane words, $Z_0, Z_1, \ldots, Z_{12}$, as follows:

$$Z_i = 2^{56}B_{8i+7} + 2^{48}B_{8i+6} + 2^{40}B_{8i+5} + 2^{32}B_{8i+4} + 2^{24}B_{8i+3} + 2^{16}B_{8i+2} + 2^{8}B_{8i+1} + B_{8i},$$

for $0 \le i \le 12$.

Hence, each group of eight consecutive bytes is a word and the bytes of the word are arranged in increasing order of significance, so that the first byte in the group becomes the least significant byte of the word.

For dedicated hash-function 14, the function is defined on a 5 × 5 × w state array. For each array six sub-arrays are defined for step-mappings. Lane is one of the subarrays and defined in 19.2.3.3. Under this interpretation, D is XORed with the state array as follows.

If j and k are the elements of {0, 1, 2, 3, 4} such that (j, k) is the unique pair for which $i = 5k + j$, then for $0 \le i \le 12$, $Lane'(j, k) = Z_i \oplus Lane(j, k)$, where $Lane'(j, k)$ is the updated value of the lane.

21.2.3 Functions

The functions, including the function *Rnd* and step mappings, for the Dedicated Hash-Function 15 are the same as Dedicated Hash-Function 13 and is specified in Clause 19.

21.2.4 Constants

The constants used for the mapping ρ are the offsets defined in Clause 19.

21.2.5 Initializing value

The initializing value is a 1 600-bit all-zero string.

21.3 Padding method

The data M will be padded with "01" before applying the padding method pad10*1(x, m) specified in Clause 19, with x = 832.

That is, the padded data is $P = M \,||\, 01 \,||\, 10^*1$, such that the length of P is a multiple of 832.

21.4 Description of round-function

The round-function for Dedicated Hash-Function 15 is the permutation KECCAK-p specified in Clause 19. Notice that KECCAK-p is considered as Φ as defined in ISO/IEC 10118-1. However, for each execution of KECCAK-p, it iterates the *Rnd* function 24 times. That is, it executes

$$Rnd(\mathbf{A}, i_r) = \iota(\chi<\pi<\rho[\theta(\mathbf{A})]\}>, i_r),$$

for i_r = 0, 1, …, 23.

21.5 Output transformation

In step h) of SPONGE[f, pad, r](N, d) specified in Clause 19, because r = 832, d = 384 and $r > d$, the $Trunc_r(S)$ will be further truncated to d bits.

22 Dedicated Hash-Function 16 (SHA3-512)

22.1 General

In Clause 22, a permutation-based hash-function with sponge construction SHA3-512 is specified. The description of permutation-based hash-function with sponge construction is given in Clause 19.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 16 is equal to `40` (hexadecimal).

22.2 Parameters, functions and constants

22.2.1 Parameters

For this hash-function, $L_1 = r$ = 576, $L_2 = b$ = 1 600, $c = b - r$ = 1 024, d = 512, L_H is up to 512.

22.2.2 Byte ordering convention

Each data input D to the round-function Φ is a block of 576 bits that is XORed into the part of the state. The permutation f is then applied to the state. Because the step mappings that comprise the permutation are defined on the array form of the state, it is convenient to regard D as a sequence of 64-bit words that are XORed directly into the state array. For this purpose, when D is represented as a sequence of 72 bytes, B_0, B_1, …, B_{71}, then D shall be interpreted as a sequence of 9 lane words, Z_0, Z_1, …, Z_8, as follows:

$$Z_i = 2^{56}B_{8i+7} + 2^{48}B_{8i+6} + 2^{40}B_{8i+5} + 2^{32}B_{8i+4} + 2^{24}B_{8i+3} + 2^{16}B_{8i+2} + 2^{8}B_{8i+1} + B_{8i},$$

for $0 \le i \le 8$.

Hence, each group of eight consecutive bytes is a word and the bytes of the word are arranged in increasing order of significance, so that the first byte in the group becomes the least significant byte of the word.

For dedicated hash-function 14, the function is defined on a $5 \times 5 \times w$ state array. For each array six sub-arrays are defined for step-mappings. Lane is one of the subarrays and defined in 19.2.3.3. Under this interpretation, D is XORed with the state array as follows.

If j and k are the elements of {0, 1, 2, 3, 4} such that (j, k) is the unique pair for which $i = 5k + j$, then for $0 \le i \le 8$, $Lane'(j, k) = Z_i \oplus Lane(j, k)$, where $Lane'(j, k)$ is the updated value of the lane.

22.2.3 Functions

The functions, including the function *Rnd* and step mappings, for the Dedicated Hash-Function 16 are the same as Dedicated Hash-Function 13 and is specified in Clause 19.

22.2.4 Constants

The constants used for the mapping ρ are the offsets defined in Clause 19.

22.2.5 Initializing value

The initializing value is a 1 600-bit all-zero string.

22.3 Padding method

The data M will be padded with "01" before applying the padding method pad10*1(x, m) specified in Clause 19, with $x = 576$.

That is, the padded data is $P = M \,||\, 01 \,||\, 10^*1$, such that the length of P is a multiple of 576.

22.4 Description of round-function

The round-function for Dedicated Hash-Function 16 is the permutation KECCAK-p specified in Clause 19. Notice that KECCAK-p is considered as ϕ as defined in ISO/IEC 10118-1. However, for each execution of KECCAK-p, it iterates the *Rnd* function 24 times. That is, it executes

$$Rnd(\mathbf{A}, i_r) = \iota(\chi<\pi\{\rho[\theta(\mathbf{A})]\}>, i_r),$$

for $i_r = 0, 1, \ldots, 23$.

22.5 Output transformation

In step h) of SPONGE[f, pad, r](N, d) specified in Clause 19, f = KECCAK-p, because $r = 576$, $d = 512$ and $r > d$, the $Trunc_r(S)$ will be further truncated to d bits.

23 Dedicated Hash-Function 17 (SM3)

23.1 General

In Clause 23, a padding method, an initializing value and a round-function for use in the general model for hash-functions described in ISO/IEC 10118-1 are specified. The padding method, initializing value and round-function specified here, when used in the above general model, together define Dedicated

Hash-Function 17. This dedicated hash-function can be applied to all data strings, D, containing at most $2^{64}-1$ bits.

The ISO/IEC hash-function identifier for Dedicated Hash-Function 17 is equal to `11` (hexadecimal).

NOTE Dedicated Hash-Function 17 defined in Clause 23 is commonly called SM3[7][8].

23.2 Parameters, functions and constants

23.2.1 Parameters

For this hash-function, $L_1 = 512$, $L_2 = 256$ and L_H is up to 256.

23.2.2 Byte ordering convention

The byte ordering convention to be used with this hash-function shall be the same as the byte ordering convention defined in 9.2.2.

23.2.3 Functions

To facilitate software implementation, the round-function Φ is described in terms of operations on 32-bit words.

Two sequences of functions $b_0, b_1, \ldots, b_{63}$ and $b'_0, b'_1, \ldots, b'_{63}$ are used in this round-function, where each takes three words, X_0, X_1 and X_2, as input and produces a single word as output. Two functions, P_0 and P_1, are also used in this round-function, where each takes one word, X_0, as input and produces a single word as output.

The functions $b_0, b_1, \ldots, b_{63}, b'_0, b'_1, \ldots, b'_{63}, P_0, P_1$ are defined as follows:

$$b_i(X_0,X_1,X_2)=\begin{cases} X_0 \oplus X_1 \oplus X_2, & 0 \le i \le 15, \\ (X_0 \wedge X_1) \vee (X_0 \wedge X_2) \vee (X_1 \wedge X_2), & 16 \le i \le 63, \end{cases}$$

$$b'_i(X_0,X_1,X_2)=\begin{cases} X_0 \oplus X_1 \oplus X_2, & 0 \le i \le 15, \\ (X_0 \wedge X_1) \vee (\neg X_0 \wedge X_2), & 16 \le i \le 63, \end{cases}$$

$$P_0(X_0)=X_0 \oplus S^9(X_0) \oplus S^{17}(X_0),$$

$$P_1(X_0)=X_0 \oplus S^{15}(X_0) \oplus S^{23}(X_0).$$

23.2.4 Constants

A sequence of constant words, C_0, C_1, ..., C_{63}, is used in this round-function. In a hexadecimal representation (the most significant bit corresponds to the left-most bit), these are defined as follows:

$$C_i = \begin{cases} \texttt{79CC4519} & 0 \le i \le 15, \\ \texttt{7A879D8A} & 16 \le i \le 63. \end{cases}$$

23.2.5 Initializing value

For this round-function the initializing value, IV, shall always be the following 256-bit string, represented here as a sequence of eight words, Y_0, Y_1, ..., Y_7, in a hexadecimal representation, where Y_0 represents the left-most 32 of the 256 bits.

Y_0 = `7380166F`;
Y_1 = `4914B2B9`;

Y_2 = 172442D7;
Y_3 = DA8A0600;
Y_4 = A96F30BC;
Y_5 = 163138AA;
Y_6 = E38DEE4D;
Y_7 = B0FB0E4E.

23.3 Padding method

The padding method to be used with this hash-function shall be the same as the padding method defined in 9.3.

23.4 Description of the round-function

The round-function, Φ, operates as follows.

NOTE In this description, the symbols W_1, W_2, W_3, W_4, X_0, X_1, X_2, X_3, X_4, X_5, X_6, X_7, Z_0, Z_1, ..., Z_{67}, Z'_0, Z'_1, ..., Z'_{63} are used to denote 144 distinct words which contain values required in the computations.

a) Suppose the 512-bit (first) input to Φ is contained in Z_0, Z_1, ..., Z_{15}, where Z_0 contains the left-most 32 of the 512 bits. Suppose also that the 256-bit (second) input to Φ is contained in eight words, Y_0, Y_1, ..., Y_7.

b) For i = 16 to 67, let $Z_i := P_1[Z_{i-16} \oplus Z_{i-9} \oplus S^{15}(Z_{i-3})] \oplus S^7(Z_{i-13}) \oplus Z_{i-6}$.

c) For i = 0 to 63, let $Z'_i := Z_i \oplus Z_{i+4}$.

d) Let X_0: = Y_0, X_1: = Y_1, X_2: = Y_2, X_3: = Y_3, X_4: = Y_4, X_5: = Y_5, X_6: = Y_6, X_7: = Y_7.

e) For i = 0 to 63, do the following five steps:

   1) W_1: = $S^7[S^{12}(X_0) \uplus X_4 \uplus S^i(C_i)]$;

   2) W_2: = $W_1 \oplus S^{12}(X_0)$;

   3) W_3: = $b_i(X_0, X_1, X_2) \uplus X_3 \uplus W_2 \uplus Z'_i$;

   4) W_4: = $b'_i(X_4, X_5, X_6) \uplus X_7 \uplus W_1 \uplus Z_i$;

   5) X_7: = X_6, X_6: = $S^{19}(X_5)$, X_5: = X_4, X_4: = $P_0(W_4)$, X_3: = X_2, X_2: = $S^9(X_1)$, X_1: = X_0, X_0: = W_3;

f) Let Y_0: = $Y_0 \oplus X_0$, Y_1: = $Y_1 \oplus X_1$, Y_2: = $Y_2 \oplus X_2$, Y_3: = $Y_3 \oplus X_3$, Y_4: = $Y_4 \oplus X_4$, Y_5: = $Y_5 \oplus X_5$, Y_6: = $Y_6 \oplus X_6$ and Y_7: = $Y_7 \oplus X_7$.

g) The eight words, Y_0, Y_1, ..., Y_7, represent the output of the round-function Φ. After the final iteration of the round-function, the eight words, Y_0, Y_1, ..., Y_7, shall be converted to a sequence of 32 bytes using the inverse of the procedure specified in Clause 9, where Y_0 shall yield the first four bytes, Y_1 the next four bytes and so on. Thus, the first (left-most) byte will correspond to the most significant byte of Y_0 and the 32nd (right-most) byte will correspond to the least significant byte of Y_7. The 32 bytes shall be converted to a string of 256 bits using the inverse of the procedure specified in Clause 6, i.e. the first (left-most) bit will correspond to the most significant bit of the first (left-most) byte and the 256th (right-most) bit will correspond to the least significant bit of the 32nd (right-most) byte.

Figure 7 shows steps 1), 2), 3), 4) and 5) of item e) of the round-function Φ in SM3. In the round-function Φ, steps 1), 2), 3), 4) and 5) of item e) are used 64 times (i = 0, 1, ..., 63).

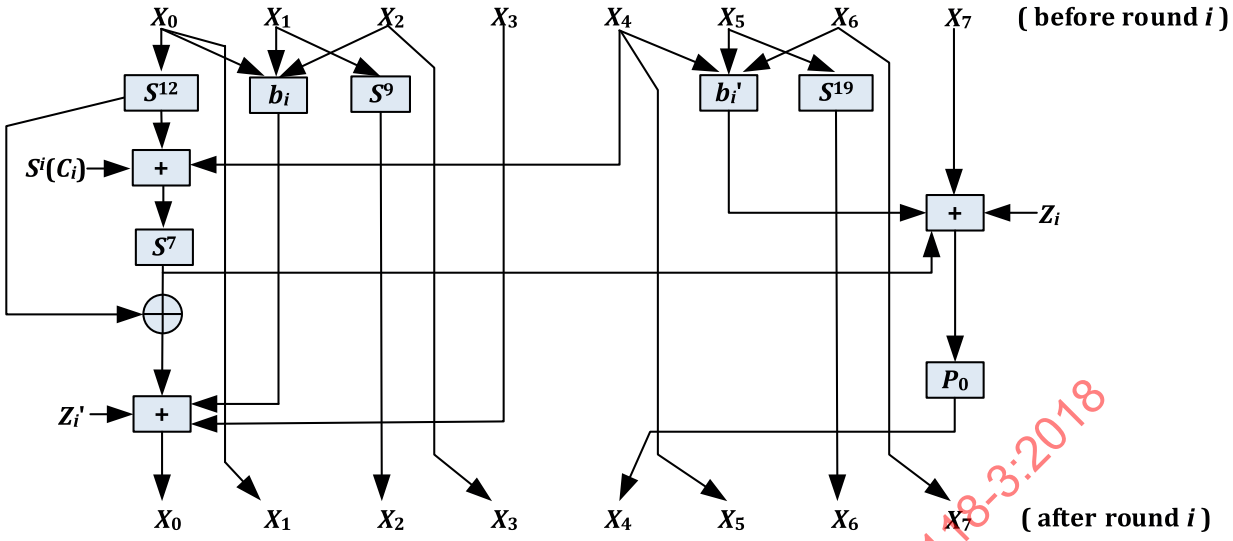

Figure 7 — Part of the round-function in Dedicated Hash-Function 17

Annex B
(informative)

Numerical examples

B.1 General

This annex gives numerical examples for the computation of Dedicated Hash-Functions 1 to 17. For each of the hash-functions, intermediate values derived during the hash-function's operation are given for some examples.

Throughout this annex, it is referred to as ASCII coding of data strings, which is equivalent to coding using ISO/IEC 646.

B.2 Dedicated Hash-Function 1 (RIPEMD-160)

NOTE Reference [4] contains a pseudocode description of Dedicated Hash-Function 1.

B.2.1 Example 1

In this example, the data string is the empty string, i.e., the string of length zero.

The hash-code is the following 160-bit string.

```
9C 11 85 A5 C5 E9 FC 54 61 28 08 97 7E E8 F5 48 B2 25 8D 31
```

B.2.2 Example 2

In this example, the data string consists of a single byte, namely the ASCII-coded version of the letter "a".

The hash-code is the following 160-bit string.

```
0B DC 9D 2D 25 6B 3E E9 DA AE 34 7B E6 F4 DC 83 5A 46 7F FE
```

B.2.3 Example 3

In this example, the data string is the 3-byte string consisting of the ASCII-coded version of "abc". This is equivalent to the bit string "01100001 01100010 01100011".

After the padding process, the single 16-word block derived from the data string is as follows.

```
80636261  00000000  00000000  00000000  00000000  00000000  00000000  00000000
00000000  00000000  00000000  00000000  00000000  00000000  00000018  00000000
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X'_0, X'_1, X'_2, X'_3 and X'_4.

```

The hash-code is the following 160-bit string.

```
8E B2 08 F7 E0 5D 98 7A 9B 04 4A 8E 98 C6 B0 87 F1 5A 0B FC
```

B.2.4 Example 4

In this example, the data string is the 14-byte string consisting of the ASCII-coded version of

"message digest"

The hash-code is the following 160-bit string.

```
5D 06 89 EF 49 D2 FA E5 72 B8 81 B1 23 A8 5F FA 21 59 5F 36
```

B.2.5 Example 5

In this example, the data string is the 26-byte string consisting of the ASCII-coded version of

"abcdefghijklmnopqrstuvwxyz"

The hash-code is the following 160-bit string.

```
F7 1C 27 10 9C 69 2C 1B 56 BB DC EB 5B 9D 28 65 B3 70 8D BC
```

B.2.6 Example 6

In this example, the data string is the 62-byte string consisting of the ASCII-coded version of

"ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789"

The hash-code is the following 160-bit string.

```
B0 E2 0B 6E 31 16 64 02 86 ED 3A 87 A5 71 30 79 B2 1F 51 89
```

B.2.7 Example 7

In this example, the data string is the 80-byte string consisting of the ASCII-coded version of eight repetitions of

"1234567890"

The hash-code is the following 160-bit string.

```
9B 75 2E 45 57 3D 4B 39 F4 DB D3 32 3C AB 82 BF 63 32 6B FB
```

B.2.8 Example 8

In this example, the data string is the 56-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijkijkljklmklmnlmnomnopnopq"

After the padding process, the two 16-word blocks derived from the data string are as follows.

```
64636261  65646362  66656463  67666564  68676665  69686766  6A696867  6B6A6968
6C6B6A69  6D6C6B6A  6E6D6C6B  6F6E6D6C  706F6E6D  71706F6E  00000080  00000000
00000000  00000000  00000000  00000000  00000000  00000000  00000000  00000000
00000000  00000000  00000000  00000000  00000000  00000000  000001C0  00000000
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X'_0, X'_1, X'_2, X'_3 and X'_4, obtained during the processing of the first block.

```

The hash-code is the following 160-bit string.

```
12 A0 53 38 4A 9C 0C 88 E4 05 A0 6C 27 DC F4 9A DA 62 EB 2B
```

B.2.9 Example 9

In this example, the data string is the 1 000 000-byte string consisting of the ASCII-coded version of "a" repeated 10^6 times.

The hash-code is the following 160-bit string.

```
52 78 32 43 C1 69 7B DB E1 6D 37 F9 7F 68 F0 83 25 DC 15 28
```

B.2.10 Example 10

In this example, the data string is the 112-byte string consisting of the ASCII-coded version of

"abcdefghbcdefghicdefghijdefghijkefghijklfghijklmghijklmn
hijklmnoijklmnopjklmnopqklmnopqrlmnopqrsmnopqrstnopqrstu"

(with no line break after the first n).

The hash-code is the following 160-bit string.

```
6F 3F A3 9B 6B 50 3C 38 4F 91 9A 49 A7 AA 5C 2C 08 BD FB 45
```

B.2.11 Example 11

In this example, the data string is the 32-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijk"

The hash-code is the following 160-bit string.

```
94 C2 64 11 54 04 E6 33 79 0D FC C8 7B 58 7D 36 77 06 7D 9F
```

B.3 Dedicated Hash-Function 2 (RIPEMD-128)

B.3.1 Example 1

In this example, the data string is the empty string, i.e., the string of length zero.

The hash-code is the following 128-bit string.

```
CD F2 62 13 A1 50 DC 3E CB 61 0F 18 F6 B3 8B 46
```

B.3.2 Example 2

In this example, the data string consists of a single byte, namely the ASCII-coded version of the letter "a".

The hash-code is the following 128-bit string.

```
86 BE 7A FA 33 9D 0F C7 CF C7 85 E7 2F 57 8D 33
```

B.3.3 Example 3

In this example, the data string is the 3-byte string consisting of the ASCII-coded version of "abc". This is equivalent to the bit string "01100001 01100010 01100011".

After the padding process, the single 16-word block derived from the data string is as follows.

```
80636261  00000000  00000000  00000000  00000000  00000000  00000000  00000000
00000000  00000000  00000000  00000000  00000000  00000000  00000018  00000000
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X'_0, X'_1, X'_2 and X'_3.

```

The hash-code is the following 128-bit string.

C1 4A 12 19 9C 66 E4 BA 84 63 6B 0F 69 14 4C 77

B.3.4 Example 4

In this example, the data string is the 14-byte string consisting of the ASCII-coded version of

"message digest"

The hash-code is the following 128-bit string.

9E 32 7B 3D 6E 52 30 62 AF C1 13 2D 7D F9 D1 B8

B.3.5 Example 5

In this example, the data string is the 26-byte string consisting of the ASCII-coded version of

"abcdefghijklmnopqrstuvwxyz"

The hash-code is the following 128-bit string.

FD 2A A6 07 F7 1D C8 F5 10 71 49 22 B3 71 83 4E

B.3.6 Example 6

In this example, the data string is the 62-byte string consisting of the ASCII-coded version of

"ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789"

The hash-code is the following 128-bit string.

D1 E9 59 EB 17 9C 91 1F AE A4 62 4C 60 C5 C7 02

B.3.7 Example 7

In this example, the data string is the 80-byte string consisting of the ASCII-coded version of eight repetitions of

"1234567890"

The hash-code is the following 128-bit string.

3F 45 EF 19 47 32 C2 DB B2 C4 A2 C7 69 79 5F A3

B.3.8 Example 8

In this example, the data string is the 56-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijkijkljklmklmnlmnomnopnopq"

After the padding process, the two 16-word blocks derived from the data string are as follows.

```
64636261  65646362  66656463  67666564  68676665  69686766  6A696867  6B6A6968
6C6B6A69  6D6C6B6A  6E6D6C6B  6F6E6D6C  706F6E6D  71706F6E  00000080  00000000
00000000  00000000  00000000  00000000  00000000  00000000  00000000  00000000
00000000  00000000  00000000  00000000  00000000  00000000  000001C0  00000000
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X'_0, X'_1, X'_2 and X'_3 obtained during the processing of the first block.

```

The hash-code is the following 128-bit string.

```
A1 AA 06 89 D0 FA FA 2D DC 22 E8 8B 49 13 3A 06
```

B.3.9 Example 9

In this example, the data string is the 1 000 000-byte string consisting of the ASCII-coded version of "a" repeated 10^6 times.

The hash-code is the following 128-bit string.

```
4A 7F 57 23 F9 54 EB A1 21 6C 9D 8F 63 20 43 1F
```

B.3.10 Example 10

In this example, the data string is the 112-byte string consisting of the ASCII-coded version of

"abcdefghbcdefghicdefghijdefghijkefghijklfghijklmghijklmn
hijklmnoijklmnopjklmnopqklmnopqrlmnopqrsmnopqrstnopqrstu"

(with no line break after the first n).

The hash-code is the following 128-bit string.

```
D4 EC C9 13 E1 DF 77 6B F4 8D E9 D5 5B 1F 25 46
```

B.3.11 Example 11

In this example, the data string is the 32-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijk"

The hash-code is the following 128-bit string.

```
13 FC 13 E8 EF FF 34 7D E1 93 FF 46 DB AC CF D4
```

B.4 Dedicated Hash-Function 3 (SHA-1)

B.4.1 Example 1

In this example, the data string is the empty string, i.e., the string of length zero.

The hash-code is the following 160-bit string.

```
DA 39 A3 EE 5E 6B 4B 0D 32 55 BF EF 95 60 18 90 AF D8 07 09
```

B.4.2 Example 2

In this example, the data string consists of a single byte, namely the ASCII-coded version of the letter "a".

The hash-code is the following 160-bit string.

```
86 F7 E4 37 FA A5 A7 FC E1 5D 1D DC B9 EA EA EA 37 76 67 B8
```

B.4.3 Example 3

In this example, the data string is the 3-byte string consisting of the ASCII-coded version of "abc". This is equivalent to the bit string "01100001 01100010 01100011".

After the padding process, the single 16-word block derived from the data string is as follows.

```
61626380  00000000  00000000  00000000  00000000  00000000  00000000  00000000
00000000  00000000  00000000  00000000  00000000  00000000  00000000  00000018
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3 and X_4.

42541B35, 5738D5E1, 21834873, 681E6DF6, D8FDF6AD
```

The hash-code is the following 160-bit string.

```
A9 99 3E 36 47 06 81 6A BA 3E 25 71 78 50 C2 6C 9C D0 D8 9D
```

B.4.4 Example 4

In this example, the data string is the 14-byte string consisting of the ASCII-coded version of

"message digest"

The hash-code is the following 160-bit string.

```
C1 22 52 CE DA 8B E8 99 4D 5F A0 29 0A 47 23 1C 1D 16 AA E3
```

B.4.5 Example 5

In this example, the data string is the 26-byte string consisting of the ASCII-coded version of

"abcdefghijklmnopqrstuvwxyz"

The hash-code is the following 160-bit string.

```
32 D1 0C 7B 8C F9 65 70 CA 04 CE 37 F2 A1 9D 84 24 0D 3A 89
```

B.4.6 Example 6

In this example, the data string is the 62-byte string consisting of the ASCII-coded version of

"ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789"

The hash-code is the following 160-bit string.

```
76 1C 45 7B F7 3B 14 D2 7E 9E 92 65 C4 6F 4B 4D DA 11 F9 40
```

B.4.7 Example 7

In this example, the data string is the 80-byte string consisting of the ASCII-coded version of eight repetitions of

"1234567890"

The hash-code is the following 160-bit string.

```
50 AB F5 70 6A 15 09 90 A0 8B 2C 5E A4 0F A0 E5 85 55 47 32
```

B.4.8 Example 8

In this example, the data string is the 56-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijkijkljklmklmnlmnomnopnopq"

After the padding process, the two 16-word blocks derived from the data string are as follows.

```
61626364  62636465  63646566  64656667  65666768  66676869  6768696A  68696A6B
696A6B6C  6A6B6C6D  6B6C6D6E  6C6D6E6F  6D6E6F70  6E6F7071  80000000  00000000
00000000  00000000  00000000  00000000  00000000  00000000  00000000  00000000
00000000  00000000  00000000  00000000  00000000  00000000  00000000  000001C0
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3 and X_4 obtained during the processing of the first block.

```

The hash-code is the following 160-bit string.

```
84 98 3E 44 1C 3B D2 6E BA AE 4A A1 F9 51 29 E5 E5 46 70 F1
```

B.4.9 Example 9

In this example, the data string is the 1 000 000-byte string consisting of the ASCII-coded version of "a" repeated 10^6 times.

The hash-code is the following 160-bit string.

```
34 AA 97 3C D4 C4 DA A4 F6 1E EB 2B DB AD 27 31 65 34 01 6F
```

B.4.10 Example 10

In this example, the data string is the 112-byte string consisting of the ASCII-coded version of

"abcdefghbcdefghicdefghijdefghijkefghijklfghijklmghijklmn
hijklmnoijklmnopjklmnopqklmnopqrlmnopqrsmnopqrstnopqrstu"

(with no line break after the first n).

The hash-code is the following 160-bit string.

A4 9B 24 46 A0 2C 64 5B F4 19 F9 95 B6 70 91 25 3A 04 A2 59

B.4.11 Example 11

In this example, the data string is the 32-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijk"

The hash-code is the following 160-bit string.

37 BC 52 21 AD E3 BC 09 CA D1 5E 47 84 F3 C7 05 14 54 B1 B3

B.5 Dedicated Hash-Function 4 (SHA-256)

B.5.1 Example 1

In this example, the data string is the empty string, i.e., the string of length zero.

The hash-code is the following 256-bit string.

E3B0C442 98FC1C14 9AFBF4C8 996FB924 27AE41E4 649B934C A495991B 7852B855

B.5.2 Example 2

In this example, the data string consists of a single byte, namely the ASCII-coded version of the letter "a".

The hash-code is the following 256-bit string.

CA978112 CA1BBDCA FAC231B3 9A23DC4D A786EFF8 147C4E72 B9807785 AFEE48BB

B.5.3 Example 3

In this example, the data string is the 3-byte string consisting of the ASCII-coded version of "abc". This is equivalent to the bit string "01100001 01100010 01100011".

After the padding process, the single 16-word block derived from the data string is as follows.

61626380 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000018

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7.

```

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the final iteration of the round-function.

Y_0 = 6A09E667 ⊎ 506E3058 = BA7816BF
Y_1 = BB67AE85 ⊎ D39A2165 = 8F01CFEA
Y_2 = 3C6EF372 ⊎ 04D24D6C = 414140DE
Y_3 = A54FF53A ⊎ B85E2CE9 = 5DAE2223
Y_4 = 510E527F ⊎ 5EF50F24 = B00361A3
Y_5 = 9B05688C ⊎ FB121210 = 96177A9C
Y_6 = 1F83D9AB ⊎ 948D25B6 = B410FF61
Y_7 = 5BE0CD19 ⊎ 961F4894 = F20015AD

The hash value is the following 256-bit string.

```
BA7816BF 8F01CFEA 414140DE 5DAE2223 B00361A3 96177A9C B410FF61 F20015AD
```

B.5.4 Example 4

In this example, the data string is the 14-byte string consisting of the ASCII-coded version of

"message digest"

The hash value is the following 256-bit string.

```
F7846F55 CF23E14E EBEAB5B4 E1550CAD 5B509E33 48FBC4EF A3A1413D 393CB650
```

B.5.5 Example 5

In this example, the data string is the 26-byte string consisting of the ASCII-coded version of

"abcdefghijklmnopqrstuvwxyz"

The hash value is the following 256-bit string.

```
71C480DF 93D6AE2F 1EFAD144 7C66C952 5E316218 CF51FC8D 9ED832F2 DAF18B73
```

B.5.6 Example 6

In this example, the data string is the 62-byte string consisting of the ASCII-coded version of

"ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789"

The hash value is the following 256-bit string.

```
DB4BFCBD 4DA0CD85 A60C3C37 D3FBD880 5C77F15F C6B1FDFE 614EE0A7 C8FDB4C0
```

B.5.7 Example 7

In this example, the data string is the 80-byte string consisting of the ASCII-coded version of eight repetitions of

"1234567890"

The hash-code is the following 256-bit string.

```
F371BC4A 311F2B00 9EEF952D D83CA80E 2B60026C 8E935592 D0F9C308 453C813E
```

B.5.8 Example 8

In this example, the data string is the 56-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijkijkljklmklmnlmnomnopnopq"

After the padding process, the following two 16-word blocks are derived from the data string.

```
61626364 62636465 63646566 64656667 65666768 66676869 6768696A 68696A6B

```

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the round-function in the first block process.

Y_0 = 6A09E667 ⊎ 1BDC6F6F = 85E655D6
Y_1 = BB67AE85 ⊎ 86126910 = 417A1795
Y_2 = 3C6EF372 ⊎ F6F443F8 = 3363376A
Y_3 = A54FF53A ⊎ BCFCE922 = 624CDE5C
Y_4 = 510E527F ⊎ 25D2430A = 76E09589
Y_5 = 9B05688C ⊎ 2FC08F85 = CAC5F811
Y_6 = 1F83D9AB ⊎ ACC75916 = CC4B32C1
Y_7 = 5BE0CD19 ⊎ 962D8621 = F20E533A

The following are (hexadecimal representations of) the successive values of the variables Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7 in the second block process.

```

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the final iteration of the round-function.

$$
\begin{aligned}
Y_0 &= \text{85E655D6} \boxplus \text{9EA7148B} = \text{248D6A61} \\
Y_1 &= \text{417A1795} \boxplus \text{908C2123} = \text{D20638B8} \\
Y_2 &= \text{3363376A} \boxplus \text{B25CEF29} = \text{E5C02693} \\
Y_3 &= \text{624CDE5C} \boxplus \text{A9F181DD} = \text{0C3E6039} \\
Y_4 &= \text{76E09589} \boxplus \text{2C5C4ED0} = \text{A33CE459} \\
Y_5 &= \text{CAC5F811} \boxplus \text{9A392956} = \text{64FF2167} \\
Y_6 &= \text{CC4B32C1} \boxplus \text{2AA1BB13} = \text{F6ECEDD4} \\
Y_7 &= \text{F20E533A} \boxplus \text{27CCB387} = \text{19DB06C1}
\end{aligned}
$$

The hash value for this message is

```
248D6A61 D20638B8 E5C02693 0C3E6039 A33CE459 64FF2167 F6ECEDD4 19DB06C1
```

B.5.9 Example 9

In this example, the data string is the 1 000 000-byte string consisting of the ASCII-coded version of "a" repeated 10^6 times.

The hash-code is the following 256-bit string.

```
CDC76E5C 9914FB92 81A1C7E2 84D73E67 F1809A48 A497200E 046D39CC C7112CD0
```

B.5.10 Example 10

In this example, the data string is the 112-byte string consisting of the ASCII-coded version of

"abcdefghbcdefghicdefghijdefghijkefghijklfghijklmghijklmn
hijklmnoijklmnopjklmnopqklmnopqrlmnopqrsmnopqrstnopqrstu"

(with no line break after the first n).

The hash-code is the following 256-bit string.

```
CF5B16A7 78AF8380 036CE59E 7B049237 0B249B11 E8F07A51 AFAC4503 7AFEE9D1
```

B.5.11 Example 11

In this example, the data string is the 32-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijk"

The hash-code is the following 256-bit string.

```
B09CBD26 3B043F00 0C5BEFCA A40BC2F5 5A4785E0 24E5DEB7 49B56061 EAFB65E9
```

B.6 Dedicated Hash-Function 5 (SHA-512)

B.6.1 Example 1

In this example, the data string is the empty string, i.e. the string of length zero.

The hash-code is the following 512-bit string.

```
CF83E1357EEFB8BD F1542850D66D8007 D620E4050B5715DC 83F4A921D36CE9CE
47D0D13C5D85F2B0 FF8318D2877EEC2F 63B931BD47417A81 A538327AF927DA3E
```

B.6.2 Example 2

In this example, the data string consists of a single byte, namely the ASCII-coded version of the letter "a".

The hash-code is the following 512-bit string.

```
1F40FC92DA241694 750979EE6CF582F2 D5D7D28E18335DE0 5ABC54D0560E0F53
02860C652BF08D56 0252AA5E74210546 F369FBBBCE8C12CF C7957B2652FE9A75
```

B.6.3 Example 3

In this example, the data string is the 3-byte string consisting of the ASCII-coded version of "abc". This is equivalent to the bit string "01100001 01100010 01100011".

After the padding process, the single 16-word block derived from the data string is as follows.

```
61626380 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000018
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7.

```

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the final iteration of the round-function.

Y_0 = 6A09E667F3BCC908 ⊎ 73A54F399FA4B1B2 = DDAF35A193617ABA
Y_1 = BB67AE8584CAA73B ⊎ 10D9C4C4295599F6 = CC417349AE204131
Y_2 = 3C6EF372FE94F82B ⊎ D67806DB8B148677 = 12E6FA4E89A97EA2
Y_3 = A54FF53A5F1D36F1 ⊎ 654EF9ABEC389CA9 = 0A9EEEE64B55D39A
Y_4 = 510E527FADE682D1 ⊎ D08446AA79693ED7 = 2192992A274FC1A8
Y_5 = 9B05688C2B3E6C1F ⊎ 9BB4D39778C07F9E = 36BA3C23A3FEEBBD
Y_6 = 1F83D9ABFB41BD6B ⊎ 25C96A7768FB2AA3 = 454D4423643CE80E
Y_7 = 5BE0CD19137E2179 ⊎ CEB9FC3691CE8326 = 2A9AC94FA54CA49F

The hash value is the following 512-bit string.

```
DDAF35A193617ABA CC417349AE204131 12E6FA4E89A97EA2 0A9EEEE64B55D39A
2192992A274FC1A8 36BA3C23A3FEEBBD 454D4423643CE80E 2A9AC94FA54CA49F
```

B.6.4 Example 4

In this example, the data string is the 14-byte string consisting of the ASCII-coded version of

“message digest”

The hash-code is the following 512-bit string.

```
107DBF389D9E9F71 A3A95F6C055B9251 BC5268C2BE16D6C1 3492EA45B0199F33
09E16455AB1E9611 8E8A905D5597B720 38DDB372A8982604 6DE66687BB420E7C
```

B.6.5 Example 5

In this example, the data string is the 26-byte string consisting of the ASCII-coded version of

“abcdefghijklmnopqrstuvwxyz”

The hash-code is the following 512-bit string.

```
4DBFF86CC2CA1BAE 1E16468A05CB9881 C97F1753BCE36190 34898FAA1AABE429
955A1BF8EC483D74 21FE3C1646613A59 ED5441FB0F321389 F77F48A879C7B1F1
```

B.6.6 Example 6

In this example, the data string is the 62-byte string consisting of the ASCII-coded version of

"ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789"

The hash-code is the following 512-bit string.

```
1E07BE23C26A86EA 37EA810C8EC78093 52515A970E9253C2 6F536CFC7A9996C4
5C8370583E0A78FA 4A90041D71A4CEAB 7423F19C71B9D5A3 E01249F0BEBD5894
```

B.6.7 Example 7

In this example, the data string is the 80-byte string consisting of the ASCII-coded version of eight repetitions of

"1234567890"

The hash-code is the following 512-bit string.

```
72EC1EF1124A45B0 47E8B7C75A932195 135BB61DE24EC0D1 914042246E0AEC3A
2354E093D76F3048 B456764346900CB1 30D2A4FD5DD16ABB 5E30BCB850DEE843
```

B.6.8 Example 8

In this example, the data string is the 56-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijkijkljklmklmnlmnomnopnopq"

The hash-code is the following 512-bit string.

```
204A8FC6DDA82F0A 0CED7BEB8E08A416 57C16EF468B228A8 279BE331A703C335
96FD15C13B1B07F9 AA1D3BEA57789CA0 31AD85C7A71DD703 54EC631238CA3445
```

B.6.9 Example 9

In this example, the data string is the 1 000 000-byte string consisting of the ASCII-coded version of "a" repeated 10^6 times.

The hash-code is the following 512-bit string.

```
E718483D0CE76964 4E2E42C7BC15B463 8E1F98B13B204428 5632A803AFA973EB
DE0FF244877EA60A 4CB0432CE577C31B EB009C5C2C49AA2E 4EADB217AD8CC09B
```

B.6.10 Example 10

In this example, the data string is the 112-byte string consisting of the ASCII-coded version of

"abcdefghbcdefghicdefghijdefghijkefghijklfghijklmghijklmn
hijklmnoijklmnopjklmnopqklmnopqrlmnopqrsmnopqrstnopqrstu"

(with no line break after the first n).

After the padding process, the following two 16-word blocks are derived from the data string.

```
61626364 65666768 62636465 66676869 63646566 6768696A 64656667 68696A6B

```

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the round-function in the first block process.

Y_0 = 6A09E667F3BCC908 ⊎ D90F1B1237B3A561 = 4319017A2B706E69
Y_1 = BB67AE8584CAA73B ⊎ 11E3570E06E3B74E = CD4B05938BAE5E89
Y_2 = 3C6EF372FE94F82B ⊎ C517CBA6A09BB26A = 0186BF199F30AA95
Y_3 = A54FF53A5F1D36F1 ⊎ C9A8C1E2D063CE94 = 6EF8B71D2F810585
Y_4 = 510E527FADE682D1 ⊎ 867983F69D3A3AD1 = D787D6764B20BDA2
Y_5 = 9B05688C2B3E6C1F ⊎ 075AABBADE34FD01 = A260144709736920
Y_6 = 1F83D9ABFB41BD6B ⊎ E1682BD33C8F8E23 = 00EC057F37D14B8E
Y_7 = 5BE0CD19137E2179 ⊎ AACD089BFAE8FAF9 = 06ADD5B50E671C72

The following are (hexadecimal representations of) the successive values of the variables Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7 in the second block process.

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the final iteration of the round-function.

$$
\begin{aligned}
Y_0 &= 4319017A2B706E69 \boxplus 4B7C99FBAF72A571 = 8E959B75DAE313DA \\
Y_1 &= CD4B05938BAE5E89 \boxplus BFA9F194894DB5B6 = 8CF4F72814FC143F \\
Y_2 &= 0186BF199F30AA95 \boxplus 8DF0BAAD4C6ED50C = 8F7779C6EB9F7FA1 \\
Y_3 &= 6EF8B71D2F810585 \boxplus 03A0F79087078A93 = 7299AEADB6889018 \\
Y_4 &= D787D6764B20BDA2 \boxplus 78955227FDE03A42 = 501D289E4900F7E4 \\
Y_5 &= A260144709736920 \boxplus 90BB8597BB41DA1A = 331B99DEC4B5433A \\
Y_6 &= 00EC057F37D14B8E \boxplus C6E7246F7F0BDAC6 = C7D329EEB6DD2654 \\
Y_7 &= 06ADD5B50E671C72 \boxplus 57E90FA678E4CC97 = 5E96E55B874BE909
\end{aligned}
$$

The following is the hash value for this message.

```
8E959B75DAE313DA 8CF4F72814FC143F 8F7779C6EB9F7FA1 7299AEADB6889018
501D289E4900F7E4 331B99DEC4B5433A C7D329EEB6DD2654 5E96E55B874BE909
```

B.6.11 Example 11

In this example, the data string is the 32-byte string consisting of the ASCII-coded version of

“abcdbcdecdefdefgefghfghighijhijk”

The hash-code is the following 512-bit string.

```
C50E7A500D4058BF 530EC603B66B032A 989A3E033A340090 DC51086CFD8CB222
09027932EA830F9B 6BC09DAFE882F908 38C2C91018245904 828C1232FC0942EB
```

B.7 Dedicated Hash-Function 6 (SHA-384)

B.7.1 Example 1

In this example, the data string is the empty string, i.e. the string of length zero.

The hash-code is the following 384-bit string.

```
38B060A751AC9638 4CD9327EB1B1E36A 21FDB71114BE0743 4C0CC7BF63F6E1DA
                 274EDEBFE76F65FB D51AD2F14898B95B
```

B.7.2 Example 2

In this example, the data string consists of a single byte, namely the ASCII-coded version of the letter “a”.

The hash-code is the following 384-bit string.

```
54A59B9F22B0B808 80D8427E548B7C23 ABD873486E1F035D CE9CD697E8517503
                 3CAA88E6D57BC35E FAE0B5AFD3145F31
```

B.7.3 Example 3

In this example, the data string is the 3-byte string consisting of the ASCII-coded version of “abc”. This is equivalent to the bit string “01100001 01100010 01100011”.

After the padding process, the single 16-word block derived from the data string is as follows.

```
61626380 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000018
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7.

```

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the final iteration of the round-function.

Y_0 = CBBB9D5DC1059ED8 ⊎ FF44D7E1849DBFB3 = CB00753F45A35E8B
Y_1 = 629A292A367CD507 ⊎ 5306143F64497B00 = B5A03D699AC65007
Y_2 = 9159015A3070DD17 ⊎ 95D33150DE6DF44C = 272C32AB0EDED163
Y_3 = 152FECD8F70E5939 ⊎ 055B73814CF102B4 = 1A8B605A43FF5BED
Y_4 = 67332667FFC00B31 ⊎ 1952E0C3A227C0F2 = 8086072BA1E7CC23
Y_5 = 8EB44A8768581514 ⊎ CA06A219CC701096 = 58BAECA134C825A7
Y_6 = DB0C2E0D64F98FA7 ⊎ C7F7BFF08EBF0D30 = A303EDFDF3B89CD7
Y_7 = 47B5481DBEFA4FA4 ⊎ C4B149710F5D6A71 = 0C66918ECE57BA15

The hash value is the following 384-bit string.

```
CB00753F45A35E8B B5A03D699AC65007 272C32AB0EDED163 1A8B605A43FF5BED
                 8086072BA1E7CC23 58BAECA134C825A7
```

B.7.4 Example 4

In this example, the data string is the 14-byte string consisting of the ASCII-coded version of

"message digest"

The hash-code is the following 384-bit string.

```
473ED35167EC1F5D 8E550368A3DB39BE 54639F828868E945 4C239FC8B52E3C61
                 DBD0D8B4DE1390C2 56DCBB5D5FD99CD5
```

B.7.5 Example 5

In this example, the data string is the 26-byte string consisting of the ASCII-coded version of

"abcdefghijklmnopqrstuvwxyz"

The hash-code is the following 384-bit string.

```
FEB67349DF3DB6F5 924815D6C3DC133F 091809213731FE5C 7B5F4999E463479F
F2877F5F2936FA63 BB43784B12F3EBB4
```

B.7.6 Example 6

In this example, the data string is the 62-byte string consisting of the ASCII-coded version of

"ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789"

The hash-code is the following 384-bit string.

```
1761336E3F7CBFE5 1DEB137F026F89E0 1A448E3B1FAFA640 39C1464EE8732F11
A5341A6F41E0C202 294736ED64DB1A84
```

B.7.7 Example 7

In this example, the data string is the 80-byte string consisting of the ASCII-coded version of eight repetitions of

"1234567890"

The hash-code is the following 384-bit string.

```
B12932B0627D1C06 0942F54477641556 55BD4DA0C9AFA6DD 9B9EF53129AF1B8F
B0195996D2DE9CA0 DF9D821FFEE67026
```

B.7.8 Example 8

In this example, the data string is the 56-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijkijkljklmklmnlmnomnopnopq"

The hash-code is the following 384-bit string.

```
3391FDDDFC8DC739 3707A65B1B470939 7CF8B1D162AF05AB FE8F450DE5F36BC6
B0455A8520BC4E6F 5FE95B1FE3C8452B
```

B.7.9 Example 9

In this example, the data string is the 1 000 000-byte string consisting of the ASCII-coded version of "a" repeated 10^6 times.

The hash-code is the following 384-bit string.

```
9D0E1809716474CB 086E834E310A4A1C ED149E9C00F24852 7972CEC5704C2A5B
07B8B3DC38ECC4EB AE97DDD87F3D8985
```

B.7.10 Example 10

In this example, the data string is the 112-byte string consisting of the ASCII-coded version of

"abcdefghbcdefghicdefghijdefghijkefghijklfghijklmghijklmn
hijklmnoijklmnopjklmnopqklmnopqrlmnopqrsmnopqrstnopqrstu"

(with no line break after the first n).

After the padding process, the following two 16-word blocks are derived from the data string.

```
61626364 65666768 62636465 66676869 63646566 6768696A 64656667 68696A6B
65666768 696A6B6C 66676869 6A6B6C6D 6768696A 6B6C6D6E 68696A6B 6C6D6E6F
696A6B6C 6D6E6F70 6A6B6C6D 6E6F7071 6B6C6D6E 6F707172 6C6D6E6F 70717273
6D6E6F70 71727374 6E6F7071 72737475 80000000 00000000 00000000 00000000

00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000380
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7 in the first block process.

```

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the round-function in the first block process.

Y_0 = CBBB9D5DC1059ED8 ⊎ 5EC3802B9ECFEF33 = 2A7F1D895FD58E0B
Y_1 = 629A292A367CD507 ⊎ 88146DA76FF6F23A = EAAE96D1A673C741
Y_2 = 9159015A3070DD17 ⊎ 7001201948FB3D71 = 015A2173796C1A88
Y_3 = 152FECD8F70E5939 ⊎ E1053FC85F9E56BE = F6352CA156ACAFF7
Y_4 = 67332667FFC00B31 ⊎ 5F2EEAD69EFB4233 = C662113E9EBB4D64
Y_5 = 8EB44A8768581511 ⊎ 8901CFFE7A74DB98 = 17B61A85E2CCF0A9
Y_6 = DB0C2E0D64F98FA7 ⊎ 5CDF6C58FC052572 = 37EB9A6660FEB519
Y_7 = 47B5481DBEFA4FA4 ⊎ 4779767CC2EC5321 = 8F2EBE9A81E6A2C5

The following are (hexadecimal representations of) the successive values of the variables Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7 in the second block process.

\end{aligned}
$$

The following is the hash value for this message.

```
09330C33F71147E8 3D192FC782CD1B47 53111B173B3B05D2 2FA08086E3B0F712
FCC7C71A557E2DB9 66C3E9FA91746039
```

B.7.11 Example 11

In this example, the data string is the 32-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijk"

The hash-code is the following 384-bit string.

```
D4CC646A83A55044 DF94814DB93B6062 E656623DB0B9E2DA B8819174589BF0C9
D7192B9799E30169 8B97ADAA3D82E20C
```

B.8 Dedicated Hash-Function 7 (WHIRLPOOL)

B.8.1 Example 1

In this example, the data string is the empty string, i.e. the string of length zero.

The hash-code is the following 512-bit string.

```
19FA61D75522A466 9B44E39C1D2E1726 C530232130D407F8 9AFEE0964997F7A7
3E83BE698B288FEB CF88E3E03C4F0757 EA8964E59B63D937 08B138CC42A66EB3
```

B.8.2 Example 2

In this example, the data string consists of a single byte, namely the ASCII-coded version of the letter "a".

The hash-code is the following 512-bit string.

```
8ACA2602792AEC6F 11A67206531FB7D7 F0DFF59413145E69 73C45001D0087B42
D11BC645413AEFF6 3A42391A39145A59 1A92200D560195E5 3B478584FDAE231A
```

B.8.3 Example 3

In this example, the data string is the 3-byte string consisting of the ASCII-coded version of "abc".

After the padding process, the 8 × 8 matrix Z' derived from the data string is as follows.

```
61 62 63 80 00 00 00 00
00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 18
```

The K_0 matrix (from the initialization value, IV) and X'' matrix are as follows.

```
00 00 00 00 00 00 00 00        61 62 63 80 00 00 00 00
00 00 00 00 00 00 00 00        00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00        00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00        00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00        00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00        00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00        00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00        00 00 00 00 00 00 00 18
```

The following are (hexadecimal representations of) the successive values of the variables K_i for i = 1 to 10 and W'.

i = 1:

```

```

B.8.6 Example 6

In this example, the data string is the 62-byte string consisting of the ASCII-coded version of

"ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789"

The hash-code is the following 512-bit string.

```
DC37E008CF9EE69B F11F00ED9ABA2690 1DD7C28CDEC066CC 6AF42E40F82F3A1E
08EBA26629129D8F B7CB57211B9281A6 5517CC879D7B9621 42C65F5A7AF01467
```

B.8.7 Example 7

In this example, the data string is the 80-byte string consisting of the ASCII-coded version of eight repetitions of

"1234567890"

The hash-code is the following 512-bit string.

```
466EF18BABB0154D 25B9D38A6414F5C0 8784372BCCB204D6 549C4AFADB601429

```

B.8.8 Example 8

In this example, the data string is the 32-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijk"

After the padding process, the two 8 × 8 matrices derived from the data string are as follows.

```
61 62 63 64 62 63 64 65        00 00 00 00 00 00 00 00
63 64 65 66 64 65 66 67        00 00 00 00 00 00 00 00
65 66 67 68 66 67 68 69        00 00 00 00 00 00 00 00
67 68 69 6A 68 69 6A 6B        00 00 00 00 00 00 00 00
80 00 00 00 00 00 00 00        00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00        00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00        00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00        00 00 00 00 00 00 01 00
```

The first Z' matrix is as follows.

```
61 62 63 64 62 63 64 65
63 64 65 66 64 65 66 67
65 66 67 68 66 67 68 69
67 68 69 6A 68 69 6A 6B
80 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00
```

For the first Z' matrix, the K_0 matrix (from the initialization value, IV) and the X'' matrix are as follows.

```
00 00 00 00 00 00 00 00        61 62 63 64 62 63 64 65
00 00 00 00 00 00 00 00        63 64 65 66 64 65 66 67

```

The hash-code is the following 512-bit string.

```
2A987EA40F917061 F5D6F0A0E4644F48 8A7A5A52DEEE6562 07C562F988E95C69
16BDC8031BC5BE1B 7B947639FE050B56 939BAAA0ADFF9AE6 745B7B181C3BE3FD
```

B.8.9 Example 9

In this example, the data string is the 1 000 000-byte string consisting of the ASCII-coded version of "a" repeated 10^6 times.

The hash-code is the following 512-bit string.

```
0C99005BEB57EFF5 0A7CF005560DDF5D 29057FD86B20BFD6 2DECA0F1CCEA4AF5
1FC15490EDDC47AF 32BB2B66C34FF9AD 8C6008AD677F7712 6953B226E4ED8B01
```

B.9 Dedicated Hash-Function 8 (SHA-224)

B.9.1 Example 1

In this example, the data string is the empty string, i.e. the string of length zero.

The hash-code is the following 224-bit string.

```
D14A028C 2A3A2BC9 476102BB 288234C4 15A2B01F 828EA62A C5B3E42F
```

B.9.2 Example 2

In this example, the data string consists of a single byte, namely the ASCII-coded version of the letter "a".

The hash-code is the following 224-bit string.

```
ABD37534 C7D9A2EF B9465DE9 31CD7055 FFDB8879 563AE980 78D6D6D5
```

B.9.3 Example 3

In this example, the data string is the 3-byte string consisting of the ASCII-coded version of "abc". This is equivalent to the bit string "01100001 01100010 01100011".

After the padding process, the single 16-word block derived from the data string is as follows.

```
61626380 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000018
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7.

```

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the final iteration of the round-function.

$$Y_0 = \text{C1059ED8} \boxplus \text{6203DE4A} = \text{23097D22}$$
$$Y_1 = \text{367CD507} \boxplus \text{FD89031B} = \text{3405D822}$$
$$Y_2 = \text{3070DD17} \boxplus \text{55D1C760} = \text{8642A477}$$
$$Y_3 = \text{F70E5939} \boxplus \text{C693FC7A} = \text{BDA255B3}$$
$$Y_4 = \text{FFC00B31} \boxplus \text{2AEDB1B3} = \text{2AADBCE4}$$
$$Y_5 = \text{68581511} \boxplus \text{55489EE6} = \text{BDA0B3F7}$$
$$Y_6 = \text{64F98FA7} \boxplus \text{7E730E00} = \text{E36C9DA7}$$
$$Y_7 = \text{BEFA4FA4} \boxplus \text{13DFB889} = \text{AD25F72D}$$

The hash value is the following 224-bit string.

```
23097D22 3405D822 8642A477 BDA255B3 2AADBCE4 BDA0B3F7 E36C9DA7
```

B.9.4 Example 4

In this example, the data string is the 14-byte string consisting of the ASCII-coded version of

"message digest"

The hash-code is the following 224-bit string.

```
2CB21C83 AE2F004D E7E81C3C 7019CBCB 65B71AB6 56B22D6D 0C39B8EB
```

B.9.5 Example 5

In this example, the data string is the 62-byte string consisting of the ASCII-coded version of

"ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789"

The hash-code is the following 224-bit string.

```
BFF72B4F CB7D75E5 632900AC 5F90D219 E05E97A7 BDE72E74 0DB393D9
```

B.9.6 Example 6

In this example, the data string is the 80-byte string consisting of the ASCII-coded version of eight repetitions of

"1234567890"

The hash-code is the following 224-bit string.

```
B50AECBE 4E9BB0B5 7BC5F3AE 760A8E01 DB24F203 FB3CDCD1 3148046E
```

B.9.7 Example 7

In this example, the data string is the 56-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijkijkljklmklmnlmnomnopnopq"

After the padding process, the following two 16-word blocks are derived from the data string.

```
61626364 62636465 63646566 64656667 65666768 66676869 6768696A 68696A6B
696A6B6C 6A6B6C6D 6B6C6D6E 6C6D6E6F 6D6E6F70 6E6F7071 80000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 000001C0
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7 in the first block process.

```

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7 represent the output of the round-function in the first block process.

Y_0 = C1059ED8 ⊎ C14B4785 = 8250E65D
Y_1 = 367CD507 ⊎ 86795A7D = BCF62F84
Y_2 = 3070DD17 ⊎ 35F4BF1C = 66659C33
Y_3 = F70E9939 ⊎ 3CD78FE1 = 33E5E91A
Y_4 = FF000B31 ⊎ 1108AC7F = 10C8B7B0
Y_5 = 66581511 ⊎ 2CE11258 = 95392769
Y_6 = 64F98FA7 ⊎ BA1A8A1B = 1F1419C2
Y_7 = BEFA4FA4 ⊎ 3E1CA2F1 = FD16F295

The following are (hexadecimal representations of) the successive values of the variables Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7 in the second block process.

```

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the final iteration of the round-function.

$$Y_0 = 8250E65D \boxplus F2E7A4B9 = 75388B16$$
$$Y_1 = BCF62F84 \boxplus 94314748 = 512776CC$$
$$Y_2 = 66659C33 \boxplus F754C16E = 5DBA5DA1$$
$$Y_3 = 33E5E91A \boxplus C9A31836 = FD890150$$
$$Y_4 = 10C8B7B0 \boxplus 9FFD8DAC = B0C6455C$$
$$Y_5 = 95392769 \boxplus 1FBC63B0 = B4F58B19$$
$$Y_6 = 1F1419C2 \boxplus 333E0B63 = 52522525$$
$$Y_7 = FD16F295 \boxplus 9E40A370 = 635651E5$$

The hash value is the following 224-bit string.

```
75388B16 512776CC 5DBA5DA1 FD890150 B0C6455C B4F58B19 52522525
```

B.9.8 Example 8

In this example, the data string is the 1 000 000-byte string consisting of the ASCII-coded version of "a" repeated 10^6 times.

The hash-code is the following 224-bit string.

```
20794655 980C91D8 BBB4C1EA 97618A4B F03F4258 1948B2EE 4EE7AD67
```

B.9.9 Example 9

In this example, the data string consists of a single bit, namely 0.

The hash-code is the following 224-bit string.

```
D3FE57CB 76CDD24E 9EB23E7E 15684E03 9C75459B EAAE100F 89712E9D
```

B.9.10 Example 10

In this example, the data string consists of a single bit, namely 1.

The hash-code is the following 224-bit string.

```
0D05096B CA2A4A77 A2B47A05 A59618D0 1174B378 92376135 C1B6E957
```

B.9.11 Example 11

In this example, the data string consists of 101 bits, namely 1010101...01.

The hash-code is the following 224-bit string.

```
2B1D4A34 155C04D7 A51065D6 A4476203 9A38DFFD 73E76B17 B043555C
```

B.9.12 Example 12

In this example, the data string consists of 256 octets, namely 00 01 02 03 ... FE FF.

The hash-code is the following 224-bit string.

```
88702E63 237824C4 EB0D0FCF E41469A4 62493E8B EB2A75BB E5981734
```

B.9.13 Example 13

In this example, the data string is the H_0 consists of 224 0 bits. For i = 1 to 100 let H_i be the hash-code of H_{i-1}.

The hash-code H_{100} is the following 224-bit string.

A0884CC1 A335042B FE452BF4 6777ED20 217A3472 81DC389E 7B1FBFEE

B.10 Dedicated Hash-Function 9 (SHA-512/224)

B.10.1 Example 1

In this example, the input message is “abc”. The padded one block input (1 024 bits) is

$Z[\,0] = 6162638000000000$
$Z[\,1] = 0000000000000000$
$Z[\,2] = 0000000000000000$
$Z[\,3] = 0000000000000000$
$Z[\,4] = 0000000000000000$
$Z[\,5] = 0000000000000000$
$Z[\,6] = 0000000000000000$
$Z[\,7] = 0000000000000000$
$Z[\,8] = 0000000000000000$
$Z[\,9] = 0000000000000000$
$Z[10] = 0000000000000000$
$Z[11] = 0000000000000000$
$Z[12] = 0000000000000000$
$Z[13] = 0000000000000000$
$Z[14] = 0000000000000000$
$Z[15] = 0000000000000018$

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7 in each round.

B.10.2 Example 2

In this example, the input message is

"abcdefghbcdefghicdefghijdefghijkefghijklfghijklmghijklmnhijkl
mnoijklmnopjklmnopqklmnopqrlmnopqrsmnopqrstnopqrstu"

The padded message consists of two blocks.

The first block input (1 024 bits) is

$Z[0]$ = 6162636465666768
$Z[1]$ = 6263646566676869
$Z[2]$ = 636465666768696A
$Z[3]$ = 6465666768696A6B
$Z[4]$ = 65666768696A6B6C
$Z[5]$ = 666768696A6B6C6D
$Z[6]$ = 6768696A6B6C6D6E
$Z[7]$ = 68696A6B6C6D6E6F
$Z[8]$ = 696A6B6C6D6E6F70
$Z[9]$ = 6A6B6C6D6E6F7071
$Z[10]$ = 6B6C6D6E6F707172
$Z[11]$ = 6C6D6E6F70717273
$Z[12]$ = 6D6E6F7071727374
$Z[13]$ = 6E6F707172737475
$Z[14]$ = 8000000000000000
$Z[15]$ = 0000000000000000

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7 in each round when the first block is processed.

\end{aligned}
$$

The message digest is

```
23FEC5BB 94D60B23 30819264 0B0C4533 35D66473 4FE40E72 68674AF9
```

B.11 Dedicated Hash-Function 10 (SHA-512/256)

B.11.1 Example 1

In this example, the input message is “abc”. The padded one block input (1 024 bits) is

```
Z[ 0] = 6162638000000000
Z[ 1] = 0000000000000000
Z[ 2] = 0000000000000000
Z[ 3] = 0000000000000000
Z[ 4] = 0000000000000000
Z[ 5] = 0000000000000000
Z[ 6] = 0000000000000000
Z[ 7] = 0000000000000000
Z[ 8] = 0000000000000000
Z[ 9] = 0000000000000000
Z[10] = 0000000000000000
Z[11] = 0000000000000000
Z[12] = 0000000000000000
Z[13] = 0000000000000000
Z[14] = 0000000000000000
Z[15] = 0000000000000018
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7 in each round.

$$

The message digest is

53048E26 81941EF9 9B2E29B7 6B4C7DAB E4C2D0C6 34FC6D46 E0E2F131 07E7AF23

B.11.2 Example 2

In this example, the input message is

"abcdefghbcdefghicdefghijdefghijkefghijklfghijklmghijklmnhijkl
mnoijklmnopjklmnopqklmnopqrlmnopqrsmnopqrstnopqrstu".

The padded message consists of two blocks.

The first block input (1 024 bits) is

$Z[0]$ = 6162636465666768
$Z[1]$ = 6263646566676869
$Z[2]$ = 636465666768696A
$Z[3]$ = 6465666768696A6B
$Z[4]$ = 65666768696A6B6C
$Z[5]$ = 666768696A6B6C6D
$Z[6]$ = 6768696A6B6C6D6E
$Z[7]$ = 68696A6B6C6D6E6F
$Z[8]$ = 696A6B6C6D6E6F70
$Z[9]$ = 6A6B6C6D6E6F7071
$Z[10]$ = 6B6C6D6E6F707172
$Z[11]$ = 6C6D6E6F70717273
$Z[12]$ = 6D6E6F7071727374
$Z[13]$ = 6E6F707172737475
$Z[14]$ = 8000000000000000
$Z[15]$ = 0000000000000000

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7 in each round when the first block is processed.

The output after processing the first block is

Y_0 = 22312194FC2BF72C ⊎ 6BA87D1B8505285F = 8DD99EB081311F8B
Y_1 = 9F555FA3C84C64C2 ⊎ 2C666488FF634DC6 = CBBBC42CC7AFB288
Y_2 = 2393B86B6F53B151 ⊎ C555881BC0EDEBCD = E8E9408730419D1E
Y_3 = 963877195940EABD ⊎ FF078089585319D0 = 953FF7A2B194048D
Y_4 = 96283EE2A88EFFE3 ⊎ 17FBD871DB354C99 = AE24175483C44C7C
Y_5 = BE5E1E2553863992 ⊎ C23D16693B02AA5A = 809B348E8E88E3EC
Y_6 = 2B0199FC2C85B8AA ⊎ 942D0C18A267E3B1 = BF2EA614CEED9C5B
Y_7 = 0EB72DDC81C52CA2 ⊎ 42C94B5B6F533B3F = 51807937F11867E1

The second block input (1 024 bits) is

$Z[0]$ = 0000000000000000
$Z[1]$ = 0000000000000000
$Z[2]$ = 0000000000000000
$Z[3]$ = 0000000000000000
$Z[4]$ = 0000000000000000
$Z[5]$ = 0000000000000000
$Z[6]$ = 0000000000000000
$Z[7]$ = 0000000000000000
$Z[8]$ = 0000000000000000
$Z[9]$ = 0000000000000000
$Z[10]$ = 0000000000000000
$Z[11]$ = 0000000000000000
$Z[12]$ = 0000000000000000
$Z[13]$ = 0000000000000000
$Z[14]$ = 0000000000000000
$Z[15]$ = 0000000000000380

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7 in each round when the second block is processed.

\end{aligned}
$$

The message digest is

3928E184 FB8690F8 40DA3988 121D31BE 65CB9D3E F83EE614 6FEAC861 E19B563A.

B.12 Dedicated Hash-Function 11 (STREEBOG-512)

B.12.1 General

The binary words are expressed in hexadecimal notation. The $4n$-bit word is given in the form a_{n-1}, ..., a_0, where $a_i \in ¢_{16}$, $i = 0, ..., n-1$ is $\mathrm{Vec}_4(a_{n-1}) \| ... \| \mathrm{Vec}_4(a_0)$.

It should be noted that in this set of examples, all data strings treated in right-to-left order. Byte ordering convention holds.

B.12.2 Example 1

In this example, the data string is given as a sequence of bytes (in hexadecimal notation):

M_1 = 30 31 32 33 34 35 36 37 38 39 30 31 32 33 34 35 36 37 38 39 30 31 32 33 34 35 36 37
38 39 30 31 32 33 34 35 36 37 38 39 30 31 32 33 34 35 36 37 38 39 30 31 32 33 34 35 36 37
38 39 30 31 32

Assign the following values to the variables:

$h := IV = 0^{512}$;

$N := 0^{512}$;

$\Sigma := 0^{512}$.

The length of the message is $L_{M_1} = 504 < 512$, so the incomplete block is padded:

$m :=$ 01323130393837363534333231303938373635343332313039383736353433323130393837363534333231303938373635343332
31303938373635343332313039383736353433323130393837363534333231303938373635343332313039383736353433323130.

Calculate $K := LPS(h \oplus N) = LPS(0^{512})$.

After the transformation S:

$S(h \oplus N) =$ FCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFC
FCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFC,

after the transformation P:

$PS(h \oplus N) =$ FCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFC
FCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFC,

after the transformation L:

$K = LPS(h \oplus N) =$ B383FC2ECED4A574B383FC2ECED4A574B383FC2ECED4A574B383FC2ECED4
A574B383FC2ECED4A574B383FC2ECED4A574B383FC2ECED4A574B383FC2ECED4A574.

Then the transformation $E(K, m)$ is performed:

Iteration 1

The result of the transformation $g_0(h, N)$ is

h = 5C881FD924695CF196C2E4FEC20D14B642026F2A0B1716EBAABB7067D4D59752
3D2DB69D6D3794622147A14F19A66E7F9037E1D662D34501A8901A5DE7771D7C.

The result of the transformation $g_0(h, \Sigma)$ is

h = 486F64C1917879417FEF082B3381A4E211C324F074654C38823A7B76F830AD00
FA1FBAE42B1285C0352F227524BC9AB16254288DD6863DCCD5B9F54A1AD0541B.

The hash-code of the message M_1 is the value:

H = 486F64C1917879417FEF082B3381A4E211C324F074654C38823A7B76F830AD00
FA1FBAE42B1285C0352F227524BC9AB16254288DD6863DCCD5B9F54A1AD0541B.

B.12.3 Example 2

In this example, the data string is given as a sequence of bytes (in hexadecimal notation):

M_1 = D1 E5 20 E2 E5 F2 F0 E8 2C 20 D1 F2 F0 E8 E1 EE E6 E8 20 E2 ED F3 F6 E8 2C 20 E2 E5
FE F2 FA 20 F1 20 EC EE F0 FF 20 F1 F2 F0 E5 EB E0 EC E8 20 ED E0 20 F5 F0 E0 E1 F0 FB FF
20 EF EB FA EA FB 20 C8 E3 EE F0 E5 E2 FB.

Assign the following values to the variables:

$h := IV = 0^{512}$;

$N := 0^{512}$;

$\Sigma := 0^{512}$.

The length of the message is $L_{M_1} = 576 > 512$, so a part of this message is initially processed:

m := FBEAFAEBEF20FFFBF0E1E0F0F520E0ED20E8ECE0EBE5F0F2F120FFF0EEEC20F1
20FAF2FEE5E2202CE8F6F3EDE220E8E6EEE1E8F0F2D1202CE8F0F2E5E220E5D1.

Calculate $K := LPS(h \oplus N) = LPS(0^{512})$.

After the transformation S:

$S(h \oplus N)$ = FCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFC
FCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFC,

after the transformation P:

$PS(h \oplus N)$ = FCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFC
FCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFCFC,

after the transformation L:

$K = LPS(h \oplus N)$ = B383FC2ECED4A574B383FC2ECED4A574B383FC2ECED4A574B383FC2ECED4A574
B383FC2ECED4A574B383FC2ECED4A574B383FC2ECED4A574B383FC2ECED4A574.

Then the transformation $E(K, m)$ is performed:

The result of the transformation $g_0(h, \Sigma)$ is

h = 28FBC9BADA033B1460642BDCDDB90C3FB3E56C497CCD0F62B8A2AD4935E85F03
7613966DE4EE00531AE60F3B5A47F8DAE06915D5F2F194996FCABF2622E6881E.

The hash-code of the message M_2 is the value:

H = 28FBC9BADA033B1460642BDCDDB90C3FB3E56C497CCD0F62B8A2AD4935E85F03
7613966DE4EE00531AE60F3B5A47F8DAE06915D5F2F194996FCABF2622E6881E.

B.13 Dedicated Hash-Function 12 (STREEBOG-256)

B.13.1 General

The binary words are expressed in hexadecimal notation. The $4n$-bit word is given in the form $a_{n-1}, \ldots, a_0$, where $a_i \in ¢_{16}$, $i = 0, \ldots, n-1$ is $\mathrm{Vec}_4(a_{n-1}) \| \ldots \| \mathrm{Vec}_4(a_0)$.

It should be noted that in this set of examples all data strings treated in right-to-left order. Byte ordering convention holds.

B.13.2 Example 1

In this example, the data string is given as a sequence of bytes (in hexadecimal notation):

M_1 = 30 31 32 33 34 35 36 37 38 39 30 31 32 33 34 35 36 37 38 39 30 31 32 33 34 35 36 37
38 39 30 31 32 33 34 35 36 37 38 39 30 31 32 33 34 35 36 37 38 39 30 31 32 33 34 35 36 37
38 39 30 31 32

Assign the following values to the variables:

$h := IV = (000\ 000\ 01)^{64}$;

$N := 0^{512}$;

$\Sigma := 0^{512}$.

The length of the message is $L_{M_1} = 504 < 512$, so the incomplete block is padded:

m := 0132313039383736353433323130393837363534333231303938373635343332
3130393837363534333231303938373635343332313039383736353433323130.

Calculate $K := LPS(h \oplus N) = LPS[(000\ 000\ 01)^{64}]$.

After the transformation S:

$S(h \oplus N)$ = EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE
EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE,

after the transformation P:

$PS(h \oplus N)$ = EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE
EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE,

after the transformation L:

$K = LPS(h \oplus N)$ = 23C5EE40B07B5F1523C5EE40B07B5F1523C5EE40B07B5F1523C5EE40B07B5F15
23C5EE40B07B5F1523C5EE40B07B5F1523C5EE40B07B5F1523C5EE40B07B5F15.

Then the transformation $E(K, m)$ is performed:

The result of the transformation $g_0(h, \Sigma)$ is

h = 00557BE5E584FD52A449B16B0251D05D27F94AB76CBAA6DA890B59D8EF1E159D
2088E482E2ACF564E0E9795A51E4DD261F3F667985A2FCC40AC8631FACA1709A.

The hash-code of the message M_1 is the value:

H = 00557BE5E584FD52A449B16B0251D05D27F94AB76CBAA6DA890B59D8EF1E159D.

B.13.3 Example 2

In this example, the data string is given as a sequence of bytes (in hexadecimal notation):

M_2 = D1 E5 20 E2 E5 F2 F0 E8 2C 20 D1 F2 F0 E8 E1 EE E6 E8 20 E2 ED F3 F6 E8 2C 20 E2 E5
FE F2 FA 20 F1 20 EC EE F0 FF 20 F1 F2 F0 E5 EB E0 EC E8 20 ED E0 20 F5 F0 E0 E1 F0 FB FF
20 EF EB FA EA FB 20 C8 E3 EE F0 E5 E2 FB.

Assign the following values to the variables:

$h := IV = (000\ 000\ 01)^{64}$;

$N := 0^{512}$;

$\Sigma := 0^{512}$.

The length of the message is $L_{M_2} = 576 > 512$, so a part of this message is initially processed

m := FBEAFAEBEF20FFFBF0E1E0F0F520E0ED20E8ECE0EBE5F0F2F120FFF0EEEC20F1
20FAF2FEE5E2202CE8F6F3EDE220E8E6EEE1E8F0F2D1202CE8F0F2E5E220E5D1.

Calculate $K := LPS(h \oplus N) = LPS((000\ 000\ 01)^{64})$.

After the transformation S:

$S(h \oplus N)$ = EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE
EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE,

after the transformation P:

$PS(h \oplus N)$ = EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE
EEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEEE,

after the transformation L:

$K = LPS(h \oplus N)$ = 23C5EE40B07B5F1523C5EE40B07B5F1523C5EE40B07B5F1523C5EE40B07B5F15
23C5EE40B07B5F1523C5EE40B07B5F1523C5EE40B07B5F1523C5EE40B07B5F15.

Then the transformation $E(K, m)$ is performed:

Iteration 1

B.14 Dedicated Hash-Function 13 (SHA3-224)

NOTE 1 Data is presented in three different ways: bit strings, byte strings and w-length words (for the lanes).

NOTE 2 Bit strings are the sequence of bits from left to right.

NOTE 3 Byte strings are the bytes from left to right and the bits within the byte are right to left.

NOTE 4 Words are the integer representation of the values in the lanes.

The message as bit string

(empty message)

XORed state (in bytes)

```

B.15 Dedicated Hash-Function 14 (SHA3-256)

NOTE 1 Data is presented in three different ways: bit strings, byte strings and *w*-length words (for the lanes).

NOTE 2 Bit strings are the sequence of bits from left to right.

NOTE 3 Byte strings are the bytes from left to right and the bits within the byte are right to left.

NOTE 4 Words are the integer representation of the values in the lanes.

The message as bit string

(empty message)

XORed state (in bytes)

B.16 Dedicated Hash-Function 15 (SHA3-384)

NOTE 1 Data is presented in three different ways: bit strings, byte strings and *w*-length words (for the lanes).

NOTE 2 Bit strings are the sequence of bits from left to right.

NOTE 3 Byte strings are the bytes from left to right and the bits within the byte are right to left.

NOTE 4 Words are the integer representation of the values in the lanes.

The message as bit string

(empty message)

XORed state (in bytes)

B.17 Dedicated Hash-Function 16 (SHA3-512)

NOTE 1 Data is presented in three different ways: bit strings, byte strings and *w*-length words (for the lanes).

NOTE 2 Bit strings are the sequence of bits from left to right.

NOTE 3 Byte strings are the bytes from left to right and the bits within the byte are right to left.

NOTE 4 Words are the integer representation of the values in the lanes.

The message as bit string

(empty message)

B.18 Dedicated Hash-Function 17 (SM3)

B.18.1 Example 1

In this example, the data string is the empty string, i.e. the string of length zero.

The hash-code is the following 256-bit string.

1AB21D83 55CFA17F 8E611948 31E81A8F 22BEC8C7 28FEFB74 7ED035EB 5082AA2B

B.18.2 Example 2

In this example, the data string consists of a single byte, namely the ASCII-coded version of the letter “a”.

The hash-code is the following 256-bit string.

```
623476AC 18F65A29 09E43C7F EC61B49C 7E764A91 A18CCB82 F1917A29 C86C5E88
```

B.18.3 Example 3

In this example, the data string is the 3-byte string consisting of the ASCII-coded version of "abc". This is equivalent to the bitstring "01100001 01100010 01100011".

After the padding process, the single 16-word block derived from the data string is as follows.

```
61626380 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000018
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7.

```

```

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the final iteration of the round-function.

$$
\begin{aligned}
Y_0 &= 1547E69B \oplus 7380166F = 66C7F0F4 \\
Y_1 &= 2BFA5F60 \oplus 4914B2B9 = 62EEEDD9 \\
Y_2 &= C6D696BC \oplus 172442D7 = D1F2D46B \\
Y_3 &= 069AE2E2 \oplus DA8A0600 = DC10E4E2 \\
Y_4 &= E808F43B \oplus A96F30BC = 4167C487 \\
Y_5 &= 4AC3CF08 \oplus 163138AA = 5CF2F7A2 \\
Y_6 &= CAF04E66 \oplus E38DEE4D = 297DA02B \\
Y_7 &= 3FB0A6AE \oplus B0FB0E4E = 8F4BA8E0
\end{aligned}
$$

The hash-code is the following 256-bit string.

```
66C7F0F4 62EEEDD9 D1F2D46B DC10E4E2 4167C487 5CF2F7A2 297DA02B 8F4BA8E0
```

B.18.4 Example 4

In this example, the data string is the 14-byte string consisting of the ASCII-coded version of

"message digest"

The hash-code is the following 256-bit string.

```
C522A942 E89BD80D 97DD666E 7A5531B3 6188C981 7149E9B2 58DFE51E CE98ED77
```

B.18.5 Example 5

In this example, the data string is the 26-byte string consisting of the ASCII-coded version of

"abcdefghijklmnopqrstuvwxyz"

The hash-code is the following 256-bit string.

```
B80FE97A 4DA24AFC 277564F6 6A359EF4 40462AD2 8DCC6D63 ADB24D5C 20A61595
```

B.18.6 Example 6

In this example, the data string is the 62-byte string consisting of the ASCII-coded version of

"ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789"

The hash-code is the following 256-bit string.

```
2971D10C 8842B70C 979E5506 3480C50B ACFFD90E 98E2E60D 2512AB8A BFDFCEC5
```

B.18.7 Example 7

In this example, the data string is the 80-byte string consisting of the ASCII-coded version of eight repetitions of

"1234567890"

The hash-code is the following 256-bit string.

```
AD818053 21F3E69D 251235BF 886A5648 44873B56 DD7DDE40 0F055B7D DE39307A
```

B.18.8 Example 8

In this example, the data string is the 56-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijkijkljklmklmnlmnomnopnopq"

After the padding process, the following two 16-word blocks are derived from the data string.

```
61626364 62636465 63646566 64656667 65666768 66676869 6768696A 68696A6B
696A6B6C 6A6B6C6D 6B6C6D6E 6C6D6E6F 6D6E6F70 6E6F7071 80000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000 00000000 00000000 00000000 000001c0
```

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7 in the first block process.

```

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the round-function in the first block process.

Y_0 = 6ABB79FD ⊕ 7380166F = 193B6F92
Y_1 = C3C11EE8 ⊕ 4914B2B9 = 8AD5AC51
Y_2 = B893D78C ⊕ 172442D7 = AFB7955B
Y_3 = 7715785A ⊕ DA8A0600 = AD9F7E5A
Y_4 = B9DD7BBB ⊕ A96F30BC = 10B24B07
Y_5 = AE18F3A1 ⊕ 163138AA = B829CB0B
Y_6 = 536F2861 ⊕ E38DEE4D = B0E2C62C
Y_7 = EC9F6EF9 ⊕ B0FB0E4E = 5C6460B7

The following are (hexadecimal representations of) the successive values of the variables X_0, X_1, X_2, X_3, X_4, X_5, X_6 and X_7 in the second block process.

The following eight words, Y_0, Y_1, Y_2, Y_3, Y_4, Y_5, Y_6 and Y_7, represent the output of the final iteration of the round-function.

Y_0 = 7AA00357 ⊕ 193B6F92 = 639B6CC5
Y_1 = 6C983266 ⊕ 4914B2B9 = E64D9E37
Y_2 = 0C2724C9 ⊕ 172442D7 = A390B192
Y_3 = 72D0DFB0 ⊕ DA8A0600 = DF4FA1EA
Y_4 = 1792E073 ⊕ A96F30BC = 0720AB74
Y_5 = C7DF59B2 ⊕ 163138AA = 7FF692B9
Y_6 = 436E884A ⊕ E38DEE4D = F38C4E66
Y_7 = F11FECB2 ⊕ B0FB0E4E = AD7B8C05

The hash-code for this message is

639B6CC5 E64D9E37 A390B192 DF4FA1EA 0720AB74 7FF692B9 F38C4E66 AD7B8C05.

B.18.9 Example 9

In this example, the data string is the 1 000 000-byte string consisting of the ASCII- coded version of "a" repeated 10^6 times.

The hash-code is the following 256-bit string.

C8AAF894 29554029 E231941A 2ACC0AD6 1FF2A5AC D8FADD25 847A3A73 2B3B02C3

B.18.10 Example 10

In this example, the data string is the 112-byte string consisting of the ASCII-coded version of

"abcdefghbcdefghicdefghijdefghijkefghijklfghijklmghijklmn
hijklmnoijklmnopjklmnopqklmnopqrlmnopqrsmnopqrstnopqrstu"

(with no line break after the first n).

The hash-code is the following 256-bit string.

78BCFB58 6ACD983D 7FAE8E69 30157F15 62019E26 AF68F1C9 8A855F1A 95BB89BB

B.18.11 Example 11

In this example, the data string is the 32-byte string consisting of the ASCII-coded version of

"abcdbcdecdefdefgefghfghighijhijk"

The hash-code is the following 256-bit string.

F6556D8D B8BED431 81A678DA 7F6AFFE4 51DEBA50 115F3150 F19DEBB8 10B9958A

Annex C
(informative)

SHA-3 Extendable-Output Functions

C.1 SHAKE-128

C.1.1 Parameters, functions and constants

C.1.1.1 Parameters

For SHAKE-128, $L_1 = r = 1\ 344$, $L_2 = b = 1\ 600$ and $c = b - r = 256$. For SHAKE-128, d is a variable to determine the output length.

C.1.1.2 Byte ordering convention

Each data input D to the round-function ϕ is a block of 1 344 bits that is XORed into the part of the state. The permutation f is then applied to the state. Because the step mappings that comprise the permutation are defined on the array form of the state, it is convenient to regard D as a sequence of 64-bit words that are XORed directly into the state array. For this purpose, when D is represented as a sequence of 168 bytes, B_0, B_1, ..., B_{167}, then D should be interpreted as a sequence of 21 lane words, Z_0, Z_1, ..., Z_{20}, as follows:

$$Z_i = 2^{56}B_{8i+7} + 2^{48}B_{8i+6} + 2^{40}B_{8i+5} + 2^{32}B_{8i+4} + 2^{24}B_{8i+3} + 2^{16}B_{8i+2} + 2^{8}B_{8i+1} + B_{8i},$$

for $0 \le i \le 20$.

Hence, each group of eight consecutive bytes is a word and the bytes of the word are arranged in increasing order of significance, so that the first byte in the group becomes the least significant byte of the word.

For dedicated hash-function 14, the function is defined on a $5 \times 5 \times w$ state array. For each array six sub-arrays are defined for step-mappings. Lane is one of the subarrays and defined in 19.2.3.3. Under this interpretation, D is XORed with the state array as follows.

If j and k are the elements of {0, 1, 2, 3, 4}, such that (j, k) is the unique pair for which $i = 5k + j$, then for $0 \le i \le 20$, $Lane'(j, k) = Z_i \oplus Lane(j, k)$, where $Lane'(j, k)$ is the updated value of the lane.

C.1.1.3 Functions

The functions, including the function *Rnd* and step mappings, for the dedicated SHAKE-128 are the same as Dedicated Hash-Function 13 and is specified in Clause 19.

C.1.1.4 Constants

The constants used for the mapping are the offsets defined in Clause 19.

C.1.1.5 Initializing value

The initializing value is a 1 600-bit all-zero string.

C.1.2 Padding method

The data M will be padded with "1111" before applying the padding method pad10*1(x, m) specified in 19.2 with x = 1 344.

That is, the padded data is $P = M \,||\, 1111 \,||\, 10^*1$, such that the length of P is a multiple of 1 344.

C.1.3 Description of round-function

The round-function for SHAKE-128 is the permutation KECCAK-p specified in Clause 19 Notice that KECCAK-p is considered as defined in ISO/IEC 10118-1. However, for each execution of KECCAK-p, it iterates the *Rnd* function 24 times. That is, it executes

$$Rnd(\mathbf{A}, i_r) = \iota\,(\chi\,<\pi\,\{\rho\,[\theta\,(\mathbf{A})]\}>, i_r)$$

for i_r = 0, 1, …, 23.

C.1.4 Output transformation

In step h) of SPONGE[f, pad, r](N, d) specified in Clause 19, f = KECCAK-p, each execution of f in the squeezing stage for SHAKE-128 generates r = 1 344 bits. The output is concatenated until enough bits are generated to obtain d bits. That is, for a given d, after the last data block is inputted, it generates the first r bits of output.

Then, it executes the function f $[d/r] - 1$ times to generate a total of $[d/r] \cdot r$ output bits and then truncates to d bits.

C.1.5 Examples

NOTE 1 Data is presented in three different ways: bit strings, byte strings and w-length words (for the lanes).

NOTE 2 Bit strings are the sequence of bits from left to right.

NOTE 3 Byte strings are the bytes from left to right and the bits within the byte are right to left.

NOTE 4 Words are the integer representation of the values in the lanes.

SHAKE-128 sample to produce 4 096 bits of output
