Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

International Standard ISO/IEC 10737 was prepared by joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 6, *Telecommunications and information exchange between systems*.

Annex A forms an integral part of this International Standard. Annexes B and C are for information only.

Introduction

This document is one of a set of International Standards produced to facilitate the interconnection of open systems. The set of International Standards covers the services, protocols and management information required to achieve such interconnection.

This International Standard is positioned with respect to other related International Standards by the layers defined in the *Reference Model for Open Systems Interconnection* (ISO 7498). In particular, it is concerned with the definition of Transport Layer management information.

Information technology — Telecommunications and information exchange between systems — Elements of Management Information Related to OSI Transport Layer Standards

1 Scope

This International Standard provides the specification of management information within an Open System related to those operations of the OSI Transport Layer specified by CCITT Recommendations and International Standards. Specifics on how Transport layer management is accomplished is beyond the scope of this document. Transport Layer management information is defined by specifying:

- the managed object class definition of Transport Layer Managed Objects following guidelines put forth by the *Structure of Management Information* (ISO/IEC 10165 and CCITT Recommendations X.720 - X.723),
- the relationship of the Managed Objects and attributes to both the operation of the layer and to other objects and attributes of the layer, and
- the action type operations on the attributes of Transport Layer Managed Objects that are available to OSI Systems Management.

2 Normative references

The following CCITT Recommendations and International Standards contain provisions which, through reference in this text, constitute provisions of this International Standard. At the time of publication, the editions indicated were valid. All Recommendations and Standards are subject to revision, and parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the Recommendations and Standards listed below. Members of IEC and ISO maintain registers of currently valid international standards. The CCITT Secretariat maintains a list of the currently valid CCITT Recommendations.

3 Definitions

3.1 Basic reference model

This International Standard makes use of the following terms defined in ISO 7498.

- a) Open System
- b) (N)-service-access-point
- c) Transport Layer
- d) Transport Protocol
- e) Layer Management
- f) Systems management

3.2 Information model

This International Standard makes use of the following terms defined in ISO/IEC 10165-1.

- a) Attributes
- b) Attribute type
- c) Containment
- d) Distinguished Name
- e) Inheritance
- f) Managed Object
- g) Management Operations
- h) Notifications
- i) Object Class
- j) Relative Distinguished Name
- k) Subclass
- l) Superclass

3.3 GDMO

This International Standard makes use of the following terms defined in ISO/IEC 10165-4.

- a) Managed Object Class Definition
- b) Template
- c) Parameter

3.4 Management Framework

This International Standard makes use of the following term defined in ISO 7498-4.

Management Information

4 Symbols and Abbreviations

Within the Managed Object definitions and GDMO templates the following abbreviations are used in the standard-name element of a document-identifier when making references to other documents.

DMI	CCITT Rec X.721 (1992) ISO/IEC 10165-2: 1992
GMI	CCITT Rec X.723 ISO/IEC 10165-5

This International Standard makes use of the following symbols and abbreviations.

AK TPDU	Data Acknowledge TPDU
CMIP	Common Management Information Protocol
CMIS	Common Management Information Service
DR TPDU	Disconnect Request TPDU
EA TPDU	Expedited Acknowledge TPDU
ED TPDU	Expedited Data TPDU
ER TPDU	Error TPDU
GDMO	Guidelines for Definition of MOs
IVMO	Initial Values Managed Object
MO	Managed Object
OSI	Open Systems Interconnection
PM	Protocol machine
RDN	Relative Distinguished Name
TC	Transport Connection
TPDU	Transport Protocol Data Unit
TSAP	Transport Service Access Point

5 Elements of Transport Layer Management Information

5.1 Managed Object Hierarchy

5.1.1 Summary of managed objects

The following set of managed objects are defined for the Transport Layer:

- a) Transport Subsystem managed object (transportSubsystem, see 5.3)
- b) Transport Entity managed object (transportEntity, see 5.4)
- c) Connectionless Transport Protocol Machine managed object (clmodeTPM, see 5.5)
- d) Connection-Oriented Transport Protocol Machine managed object (comodeTPM, see 5.6)
- e) Transport SAP managed object (tSAP, see 5.7)
- f) Transport Connection managed object (transportConnection, see 5.8.1)
- g) Transport Connection Initial Values managed object (transportConnectionIVMO, see 5.8.2)

These Managed Objects represent OSI Management's view of those elements of an Open System which support the OSI Transport Service subject to OSI management operations. The containment hierarchy is illustrated in figure 1. Managed objects which can have multiple instances are illustrated by multiple boxes. These objects are defined in detail in the following subclauses.

Figure 1 - Transport Layer Containment Hierarchy

5.1.2 Relationships

5.1.2.1 General description

The use of Relationship attributes is illustrated by examples in Annex C of this International Standard. The following describes the individual relationships for Transport layer in more detail.

5.1.2.2 Layer n-1 Services

The Transport Layer Entity has a relation (actualNSAP) to the NSAP MO.

5.1.2.3 Connections

There is a relationship (underlyingConnectionNames) between a Transport Connection MO and its underlying Network LayerConnection MO (if one exists).

5.1.3 Minimum Event Filtering Capabilities

The transport layer management definitions embodied in this specification imply the frequent and possibly excessive generation of notifications of notifications during regular layer operation. These notifications are especially useful for effective fault management where they facilitate the tracing and pinpointing of error situations. To avoid the excessive dissemination of these event reports under normal operating conditions, it is advisable for a managed system to have as a minimum the capability to perform discrimination based on

- a) the source managed object class;
- b) the object Identifier values in the probable cause and specific problems field of Communication alarms, and the communication type field of Communication informations.

5.1.4 Use of Optional Fields

Where reference is made in this International Standard to ASN.1 syntax defined in Rec. X.723 | ISO/IEC 10165-5 or Rec.X.721 | ISO/IEC 10165-2, only the following fields shall be employed:

- a) those which are not OPTIONAL in the ASN.1 syntax;
- b) those which are OPTIONAL, but whose use is explicitly required by this International Standard;
- c) those which are OPTIONAL, but whose ASN.1 type is SET OF MngmntExtension.

The use of any other field is prohibited.

5.2 Common Transport Layer GDMO Definitions

commonCreationDeletion-B BEHAVIOUR
DEFINED AS

!Managed object class imports the 10165-2 objectCreation and objectDeletion notifications. Used as follows:

ObjectCreation - Generated whenever an instance of the managed object class is created. Implementations may optionally include the sourceIndicator parameter in the notification. If creation occurred as a result of internal operation of the resource, the value 'resourceOperation' is used. If creation occurred in response to a management operation, the value 'managementOperation' is used. A value of 'unknown' may be returned if it is not possible to determine the source of the operation. None of the other optional parameters are used.

ObjectDeletion - Generated whenever an instance of the managed object class is deleted. Implementations may optionally include the sourceIndicator parameter in the notification. If deletion occurred as a result of internal operation of the resource, the value 'resourceOperation' is used. If deletion occurred in response to a management operation, the value 'managementOperation' is used. A value of 'unknown' may be returned if it is not possible to determine the source of the operation. None of the other optional parameters are used.!!;

commonStateChange-B BEHAVIOUR
DEFINED AS

!Managed object class imports the 10165-2 stateChange notification. Used to report the changes to the operationalState attribute, and where present, the administrativeState attribute. A single parameter set is included in the State change definition field. Only the (mandatory) attributeId and (optional) newAttributeValue parameters are used.!!;

octetsSentReceivedCounter-B BEHAVIOUR
DEFINED AS

!The octetsSentCounter and octetsReceivedCounter shall count only user data octets in valid data TPDUs. They shall not count user data octets in data TPDUs which are rejected for any reason, nor user data octets in non-data TPDUs.!!;

successfulConnectionEstablishment-B BEHAVIOUR

DEFINED AS

!This Package imports the communicationsInformation notification from "GMI". It is used to report the following events :

successfulConnectionEstablishment: Generated when a connection is successfully established. However the precise synchronization between the notification and the corresponding protocol and service interface interactions is not defined by this Specification

The value TLM.successfulConnectionEstablishment shall be reported in the informationType field.!

deactivateConnection-B BEHAVIOUR

DEFINED AS

!The deactivate action causes the connection to be terminated. The termination should occur as rapidly as practical, but no particular time constraints are implied. Typically, this action simulates a disconnect request received across the service interface. If a more rapid means for terminating the connection exists, then this should be used. The termination shall occur in conformance to the protocol standard. The Managed Object remains in existence after completion of the Deactivate Action. It is subsequently deleted when the connection is terminated, in the same way as if the connection has been terminated by other means. A Deactivate action may fail (with the ProcessingError response) if it is temporarily not possible to terminate the connection.!

resettingTimer-B BEHAVIOUR

DEFINED AS

!This attribute specifies the interval between certain events in the operation of the protocol state machine. If the value of the attribute is changed to a new value while the protocol state machine is in operation, the implementation shall take the necessary steps to ensure that for any time interval which was in progress when the corresponding attribute was changed, the next expiration of that interval takes place no later than the expiration of the interval in progress or the specified interval whichever is the sooner. The precision with which this time shall be implemented shall be the same as that associated with the basic operation of the timer attribute.!

5.3 The transport subsystem managed object

-- Managed Object for Transport Layer Subsystem

-- There is exactly one of these MOs within
 -- a system. It exists to provide a container for the layer entity MOs.
 --
 -- The transportSubsystem managed object cannot be created or deleted
 -- explicitly by management operation. It exists inherently in a system;
 -- created and deleted as part of system operation.

- Definition of the tEPackageImportedNotifications and of the mapping
- of specific protocol error parameters into the fields of
- communicationsAlarm Notification.
-

```
tEPackageImportedNotifications-B BEHAVIOUR
DEFINED AS
```

!Notification issued when a Transport Entity receives a PDU which is invalid or contains a protocol error. The notification includes the header of the invalid PDU, the source N-Address, and the reason why the PDU is considered to be in error. The Reason code appears only if the protocol error relates to the connection-mode protocol, and if it has been possible to relate the PDU to a particular connection. The reason code is the value placed in the corresponding parameter of the ER TPDU, if sent. The tEPackage imports the communicationsAlarm Notification from DMI, in order to report the ProtocolError event. The probableCause shall be set to TLM.communicationsProtocolError. The tEProtocolErrorPDUHeader, tEProtocolErrorSourceAddress and tEProtocolErrorReasonCode are reported as parameters in the additionalInformation field of the communicationsAlarm. The significance subparameter of each item of the problemData shall be set to the value 'False' (i.e. not significant) so that a managing system receiving the event will be less likely to reject it. The perceivedSeverity shall be set to Minor. A

subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated. No other fields or parameters shall be used, with the exception of further parameters in the additionalInformationfield.!!;

5.6 The Connection-Oriented Transport Protocol Machine MO

```
-- There is no more than one of these MOs per Transport entity.
-- Its definition permits it to be created and deleted explicitly by
-- management operation, but in some systems it will exist inherently
-- and neither creation nor deletion by management operation
-- will be possible. Name bindings are defined for both cases.
--
-- When the protocol machine is operable, the operationalState shall
-- have the value 'enabled'; otherwise it shall have the value
-- 'disabled'.
--
-- Transitions of operationalState shall be reported using the
-- stateChange notification. An comodeTPM MO may be created in the
-- 'enabled' operational state.
```

5.7 The TSAP Managed Object

```

-- There is one tSAP MO for each TSAP currently
-- recognised by the containing Transport Entity.
-- Its definition permits it to be created and deleted by Management
-- operation or to be created and deleted automatically as part
-- of system operation.
-- Some implementations may require TSAP MOs to be created
-- explicitly through management before they can be used.
-- Others may create them automatically when a user entity attaches
-- itself to them (in some implementation-dependent fashion).
-- In this case, it is recommended that the naming convention
-- be used whereby the name of the Managed Object
-- is the representation in hexadecimal of the Transport Selector of
-- the TSAP, so that it is possible to configure Transport Users
-- without system specific knowledge.

```

5.8 The Transport Connection Managed Object and IVMO

5.8.1 The Transport Connection Managed Object

```
-- There may be multiple instances of these Managed Objects
-- within a connection-oriented protocol machine. Each corresponds
-- to a Transport connection. A transportConnection is created
-- automatically as part of system operation. A transportConnection may
-- be deleted automatically as part of system operation or
-- may be deleted as a result of the deactivate management operation. A
-- transportConnectionIVMO may be used as the source
-- of initial values of attributes of a transportConnectionMO.
--
-- This section defines the Transport Connection Managed Object. The
-- Transport Connection Managed Object contains the set of attributes
-- characterizing the manageable aspects of a
-- Transport Layer Protocol Connection.

-- An MO of this class exists corresponding to each active Transport
-- Connection, i.e. for which a CR
-- TPDU has been sent or received and which has not yet been
-- terminated. An MO may also exist prior to transmission of a CR TPDU,
-- corresponding to interactions across the service interface.
-- The precise synchronization of the creation and deletion of the MO
-- with the protocol exchanges corresponding to the Transport Connection
-- is not however defined by this standard. For example,
-- there may be a visible delay after transmission or reception of a CR
-- TPDU or interaction at the service interface before the MO is created
-- and becomes visible to management). A Transport
-- Connection MO is not required for terminated connections whose
-- References have been placed in the Frozen state (for Class 4
-- operation), although according to the above the MO may remain
-- visible for some time after the connection has in other respects been
```

```
-- terminated.

-- Behaviours**initialValues-B BEHAVIOUR****DEFINED AS**

! When an instance of the transportConnection Mo is created using the transportConnection-comodeTPM name binding, the initial values for some of the attributes of the transportConnection MO may be supplied by an instance of the transportConnectionIVMO MO. The means by which an instance (if any) of the transportConnectionIVMO are identified are a local matter.!

use-of-initialValues-B BEHAVIOUR**DEFINED AS**

! The creation of an instance of the transportConnection MO using the transportConnection-comodeTPM name binding may reference an instance of the transportConnectionIVMO MO under the conditions specified by the transportConnection MO. When this occurs, some of the initial values of the attributes of the instance of the transportConnection MO may be supplied by the values of the attributes in the specified instance of the transportConnectionIVMO. However any such value may be overridden by a value supplied by local means (for example across an internal interface). Where values are supplied by the IVMO, the initial value of an attribute of transportConnection MO shall be the value of the corresponding attribute in the transportConnectionIVMO (that is, which has the same attribute template label).!

connectionCreationDeletion-B BEHAVIOUR**DEFINED AS**

!Managed object class imports the 10165-2 objectCreation and objectDeletion notifications for transportConnection. The precise synchronisation between these notifications and related protocol and service interactions is not defined by this standard. In addition, where a connection is attempted as a result of an interaction at a single interface (i.e. either the protocol or the service), and fails before any interaction occurs at the other, it is a local matter whether a managed object is created or not, i.e. whether the creation and deletion events occur or not.

ObjectCreation - Generated whenever an instance of the managed object class is created. The sourceIndicator parameter shall be set to the value 'resourceOperation'. None of the other optional parameters are used, with the exception of the additionalInformation field which contains the following parameters:

transportConnectionName
 protocolClass-PAR
 maxTPDUsize-PAR
 callingTselector-PAR
 calledTSelector-PAR
 callingNSAPAddress-PAR
 calledNSAPAddress-PAR
 respondingNSAPAddress-PAR
 connectionDirection-PAR
 networkConnectionIDs-PAR.

ObjectDeletion - Generated whenever an instance of the managed object class is deleted. The sourceIndicator parameter shall be set to the value 'resourceOperation'. None of the other optional parameters are used, with the exception of the additionalInformation field which contains the following parameters:

transportConnectionName
 protocolClass-PAR
 maxTPDUsize-PAR
 callingTselector-PAR
 calledTSelector-PAR
 callingNSAPAddress-PAR
 calledNSAPAddress-PAR
 respondingNSAPAddress-PAR
 connectionDirection-PAR
 networkConnectionIDs-PAR

objectDeletionCause.!

Entity, the value Outgoing means that it was initiated by the local Transport
Entity.;;
REGISTERED AS {TLM.aoi connectionDirection (60)};

explicitFlowControl ATTRIBUTE
WITH ATTRIBUTE SYNTAX TLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR explicitFlowControl-B BEHAVIOUR
DEFINED AS
enables negotiation / indicates use of explicit Flow Control.
In transportConnectionIVMO, enables negotiation of non-use of explicit flow
control (Class 2 only) during connection Establishment. TRUE enables non-
use, FALSE disables it. In transportConnection, indicates whether non-use of
explicit flow control has been
selected for the connection (TRUE) or not (FALSE). For connections not using
Class 2 of the protocol, this attribute has the value False. During
connection establishment, this attribute represents the desired value and not
necessarily the value which will ultimately be used;;
REGISTERED AS {TLM.aoi explicitFlowControl (45)};

extendedFormat ATTRIBUTE
WITH ATTRIBUTE SYNTAX TLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR extendedFormat-B BEHAVIOUR
DEFINED AS
enables negotiation / indicates use of extended TPDU format.
In transportConnectionIVMO, enables negotiation of extended TPDU format (for
the classes where this is appropriate) during transport connection

establishment. TRUE enables use of extended format, FALSE disables it. In transportConnection, indicates whether extended TPDU format is in use (TRUE) or not (FALSE). For connections not using Class 4 of the protocol, this attribute will be False. During connection establishment, this attribute represents the desired value and not necessarily the value which will ultimately be used;;

REGISTERED AS {TLM.aoi extendedFormat (41)};

inactivityTime ATTRIBUTE

DERIVED FROM "GMI":timer;

BEHAVIOUR inactivityTime-B BEHAVIOUR

DEFINED AS

Value of inactivity time (as defined in ISO 8073)
in use for the connection. Unit is in seconds;;

REGISTERED AS {TLM.aoi inactivityTime (46)};

localReference ATTRIBUTE

WITH ATTRIBUTE SYNTAX TLM.Integer;

MATCHES FOR EQUALITY;

BEHAVIOUR localReference-B BEHAVIOUR

DEFINED AS

The local reference number (as defined in ISO 8073)
in use for the connection;;

REGISTERED AS {TLM.aoi localReference (53)};

maximumWindow ATTRIBUTE

WITH ATTRIBUTE SYNTAX TLM.Integer;

MATCHES FOR EQUALITY, ORDERING;

BEHAVIOUR maximumWindow-B BEHAVIOUR

DEFINED AS

The maximum window permitted to be given on the connection
at any time. Buffering or other implementation constraints or policies may
cause a smaller value to be used.;;

REGISTERED AS {TLM.aoi maximumWindow (36)};

maxTPDUSize ATTRIBUTE

WITH ATTRIBUTE SYNTAX TLM.Integer;

MATCHES FOR EQUALITY, ORDERING;

BEHAVIOUR maxTPDUSize-B BEHAVIOUR

DEFINED AS

The maximum TPDU size negotiated for the connection. Implementation
constraints or policies, or relating to the remote NSPA or Transport Entity,
may cause a smaller value to be used as an initial value for negotiation.
During connection establishment, this attribute represents the desired value
and not necessarily the value which will ultimately be used;;

REGISTERED AS {TLM.aoi maxTPDUSize (51)};

maxTransmissions ATTRIBUTE

WITH ATTRIBUTE SYNTAX TLM.Integer;

MATCHES FOR EQUALITY, ORDERING;

BEHAVIOUR maxTransmissions-B BEHAVIOUR

DEFINED AS

The maximum number of transmissions
as defined (for Class 4 only) as the parameter 'N' in ISO 8073;;

REGISTERED AS {TLM.aoi maxTransmissions (52)};

networkConnectionIDs ATTRIBUTE

WITH ATTRIBUTE SYNTAX TLM.LocalDistinguishedNames;

MATCHES FOR SET-COMPARISON, SET-INTERSECTION;

BEHAVIOUR networkConnectionIDs-B BEHAVIOUR

DEFINED AS

The Network Connection(s) which support the Transport Connection. If the TC
is running over the CLNS, this attribute has the value of the empty set.;;

REGISTERED AS {TLM.aoi networkConnectionIDs (61)};

networkExpeditedData ATTRIBUTE
 WITH ATTRIBUTE SYNTAX TLM.Boolean;
 MATCHES FOR EQUALITY;
 BEHAVIOUR networkExpeditedData-B BEHAVIOUR
 DEFINED AS
 enables negotiation / indicates use of Network Expedited
 in transportConnectionIVMO, enables the negotiation of use or non-use of
 Network Expedited Data (for class 1 only) during transport connection
 establishment. TRUE enables use of Network Expedited Data, FALSE disables
 it. In transportConnection, indicates whether Network Expedited Data is in
 use (TRUE) or not (FALSE). For connections not using Class 1, the value will
 always be False. During connection establishment, this attribute represents
 the desired value and not necessarily the value which will ultimately be
 used;;
 REGISTERED AS {TLM.aoi networkExpeditedData (42)};

protocolClass ATTRIBUTE
 WITH ATTRIBUTE SYNTAX TLM.ProtocolClassSyntax;
 MATCHES FOR EQUALITY;
 BEHAVIOUR protocolClass-B BEHAVIOUR
 DEFINED AS
 The protocol class in use on the connection,
 as negotiated during connection establishment.
 During connection establishment (before the connection reaches the OPEN
 state) this indicates what is currently preferred and not necessarily the
 ultimate Class which will be used for the connection;;
 REGISTERED AS {TLM.aoi protocolClass (40)};

protocolClasses ATTRIBUTE
 WITH ATTRIBUTE SYNTAX TLM.ProtocolClassesSyntax;
 MATCHES FOR SET-COMPARISON, SET-INTERSECTION;
 BEHAVIOUR protocolClasses-B BEHAVIOUR
 DEFINED AS
 The preferred/alternate set of protocol classes
 which may be stated at connection establishment. The default value is
 implementation dependent, but must be consistent with the class negotiation
 rules of ISO 8073 and Addendum 2;;
 REGISTERED AS {TLM.aoi protocolClasses (26)};

reassignmentsAfterFailure ATTRIBUTE
 DERIVED FROM "GMI":nonWrapping64BitCounter;
 BEHAVIOUR reassignmentsAfterFailure-B BEHAVIOUR
 DEFINED AS
 The total number of times the TC has been reassigned to NC;;
 REGISTERED AS {TLM.aoi reassignmentsAfterFailure (62)};

reassignmentTime ATTRIBUTE
 DERIVED FROM "GMI":timer;
 BEHAVIOUR reassignmentTime-B BEHAVIOUR
 DEFINED AS
 The value of the Reassignment Time (as defined in ISO 8073)
 to be conveyed or established during connection establishment. Unit is in
 seconds;;
 REGISTERED AS {TLM.aoi reassignmentTime (48)};

receiptConfirmation ATTRIBUTE
 WITH ATTRIBUTE SYNTAX TLM.Boolean;
 MATCHES FOR EQUALITY;
 BEHAVIOUR receiptConfirmation-B BEHAVIOUR
 DEFINED AS
 enables negotiation / indicates use of receipt confirmation. In
 transportConnectionIVMO, enables negotiation of use of network receipt
 confirmation (Class 1 only) during transport connection establishment. TRUE

enables use, FALSE enables non-use. In transportConnection, indicates whether use of network receipt confirmation has been selected for the connection (TRUE) or not (FALSE).

For connections not using Class 1 of the protocol, this attribute has the value False. During connection establishment, this attribute represents the desired value and not necessarily the value which will ultimately be used;;

REGISTERED AS {TLM.aoi receiptConfirmation (44)};

relatingNCCMONames ATTRIBUTE

WITH ATTRIBUTE SYNTAX TLM.LocalDistinguishedNames;

MATCHES FOR SET-COMPARISON, SET-INTERSECTION;

BEHAVIOUR relatingNCCMONames-B BEHAVIOUR

DEFINED AS

This attribute indicates the NCC MO(s);;

REGISTERED AS {TLM.aoi relatingNCCMONames (66)};

remoteReference ATTRIBUTE

WITH ATTRIBUTE SYNTAX TLM.Integer;

MATCHES FOR EQUALITY;

BEHAVIOUR remoteReference-B BEHAVIOUR

DEFINED AS

The remote reference number (as defined in ISO 8073) in use for the connection;;

REGISTERED AS {TLM.aoi remoteReference (54)};

respondingNSAPAddress ATTRIBUTE

WITH ATTRIBUTE SYNTAX TLM.OctetString;

MATCHES FOR EQUALITY;

BEHAVIOUR respondingNSAPAddress-B BEHAVIOUR

DEFINED AS

The Responding NSAP Address received at network service interface at N-connection establishment.

The value of this attribute is only meaningful when operating over the CONS, and when the N-connection was initiated by Transport Entity. Otherwise, the value is not meaningful and no constraints are applied to the value;;

REGISTERED AS {TLM.aoi respondingNSAPAddress (59)};

retransmissionTime ATTRIBUTE

DERIVED FROM "GMI":timer;

BEHAVIOUR resettingTimer-B, retransmissionTime-B BEHAVIOUR

DEFINED AS

Initial or Current value for the Local Retransmission Time as defined in ISO 8073. Another value may be adopted initially based on knowledge concerning the remote system. The current value may change during the lifetime of the connection, based on observations of traffic on the connection or other information concerning the remote transport entity. The value of this attribute is used in the absence of other information. Unit is in seconds;;

REGISTERED AS {TLM.aoi retransmissionTime (49)};

transportConnectionIVMOId ATTRIBUTE

WITH ATTRIBUTE SYNTAX TLM.NamingString;

MATCHES FOR EQUALITY, SUBSTRINGS;

BEHAVIOUR transportConnectionIVMOId-B BEHAVIOUR

DEFINED AS The name of this instance of transportConnectionIVMO;;

REGISTERED AS {TLM.aoi transportConnectionIVMOId (25)};

transportExpeditedService ATTRIBUTE

WITH ATTRIBUTE SYNTAX TLM.Boolean;

BEHAVIOUR transportExpeditedService-B BEHAVIOUR

DEFINED AS

Indicated whether the Transport Expedited Service is provided (true) or not (False).;;

REGISTERED AS {TLM.aoi transportExpeditedService(65)};

```
windowTimer ATTRIBUTE
  DERIVED FROM "GMI":timer;
  BEHAVIOUR windowTimer-B BEHAVIOUR
  DEFINED AS
    Value of Window Timer as defined in ISO 8073.
    The value of this attribute is meaningful only for connections using Class 4
    of the protocol. For other connections no constraint is placed on the value
    to be returned. Unit is in seconds;;
REGISTERED AS {TLM.aoi windowTimer (50)};

7 Conformance

7.1 Conformance requirements to this International Standard

An implementation for which conformance to this International Standard as a managed implementation is claimed shall

- a) support the transportSubsystem MO;
- b) for each MO supported, support at least one name binding defined in this International Standard, for which the MO is the subordinate;
- c) for each MO supported, support all elements of management information as defined in GDMO description for the MO.

7.2 Protocol specific conformance requirements

7.2.1 Conformance to the management operation of ISO 8073

An implementation claiming conformance to the management operation of ISO 8073 as a managed implementation shall:

- a) conform to ISO/IEC 10737 as defined in 7.1;
- b) support the transportEntity MO, the comodeTPM MO, the TSAP MO and the transportEntity MO.

7.2.2 Conformance to the management operation of ISO 8602

An implementation claiming conformance to the management operation of ISO 8602 as a managed implementation shall

- a) conform to ISO/IEC 10737 as defined in 7.1;
- b) support the transportEntity MO, the clmodeTPM MO and the TSAP MO.

NOTE - Behaviour clauses defined in this International Standard may not always be testable. Care should be exercised when defining behaviour tests suites in order not to impose additional constraints to those defined in this standard for implementations.

Annex A (normative)

Allocation of Object Identifiers

The following Object Identifiers have been allocated by the body of this International Standard. Object Identifiers which had been allocated when this International Standard was at the Draft International Standard stage have not been re-allocated. If any modification, other than a change to the behaviour clause, has been made to any template which had been allocated an Object Identifier, the new template has been allocated a new Object Identifier and the old Object Identifier (identified thus: *obsolete* (1)) shall not be re-used.

Annex B (informative)

Shorthand Description of Managed Objects

The information in this annex is intended only to give a broad outline of the Transport Layer Management Specification. While the information contained herein has been derived from the normative GDMO text in the body of this International Standard, it should be treated with caution, as there may be errors.

The following abbreviations are used to describe the property lists of attributes:

G	Get
R	Replace
RWD	Replace With Default
A	Add
RM	Remove

The following abbreviations are used for external label references:

DMI:	"CCITT Rec.X721 (1992) ISO/IEC 10165-2:1992"
GMI:	"CCITT Rec.X723 ISO/IEC 10165-5"

Template types with a '*' suffix (for example ATTRIBUTE*) refer to template types defined in conditional packages. All inherited templates, except those inherited from 'top', are included in each Managed Object Class.

The inheritance hierarchy is illustrated in figure B.1.

Figure B.1

MANAGED OBJECT CLASS transportConnectionIVMO DERIVED FROM (DMI:top) CONTAINED IN (comodeTPM)

- checksumNonuse ATTRIBUTE* (G, R, RWD)
enables negotiation / indicates non-use of checksum.
- explicitFlowControl ATTRIBUTE* (G, R, RWD)

enables negotiation / indicates use of explicit Flow Control
 extendedFormat ATTRIBUTE* (G, R, RWD)
 enables negotiation / indicates use of extended TPDU Format
 inactivityTime ATTRIBUTE* (G, R, RWD)
 Value of inactivity time (as defined in ISO 8073)
 maxTPDUSize ATTRIBUTE (G, R, RWD)
 The maximum TPDU size negotiated for the connection.
 maxTransmissions ATTRIBUTE* (G, R, RWD)
 The maximum number of transmissions
 maximumWindow ATTRIBUTE* (G, R, RWD)
 The maximum window permitted to be given on the connection
 networkExpeditedData ATTRIBUTE* (G, R, RWD)
 enables negotiation / indicates use of Network Expedited
 protocolClasses ATTRIBUTE (G, R, RWD)
 The preferred/alternate set of protocol classes
 reassignmentTime ATTRIBUTE* (G, R, RWD)
 The value of the Reassignment Time
 receiptConfirmation ATTRIBUTE* (G, R, RWD)
 enables negotiation / indicates use of Receipt Confirmation
 retransmissionTime ATTRIBUTE* (G, R, RWD)
 Initial or Current value for the Local Retransmission Time
 transportConnectionIVMOId ATTRIBUTE (G)
 The name of this instance of the Transport Connection IVMO
 transportExpeditedService ATTRIBUTE* (G, R, RWD)
 Indicates whether the Transport Expedited Service is provided
 windowTimer ATTRIBUTE* (G, R, RWD)
 Value of Window Timer as defined in ISO 8073.
