# Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 3.

In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

International Standard ISO/IEC 14443-2 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 17, *Identification cards and related devices*.

ISO/IEC 14443 consists of the following parts, under the general title *Identification cards — Contactless integrated circuit(s) cards — Proximity cards*:

— *Part 1: Physical characteristics*

— *Part 2: Radio frequency power and signal interface*

— *Part 3: Initialization and anticollision*

— *Part 4: Transmission protocol*

Annex A of this part of ISO/IEC 14443 is for information only.

# Introduction

ISO/IEC 14443 is one of a series of International Standards describing the parameters for identification cards as defined in ISO/IEC 7810 and the use of such cards for international interchange.

This part of ISO/IEC 14443 describes the electrical characteristics of two types of contactless interface between a proximity card and a proximity coupling device. The interface includes both power and bi-directional communication.

This part of ISO/IEC 14443 does not preclude the incorporation of other standard technologies on the card, such as those referenced in Annex A.

Contactless card standards cover a variety of types as embodied in ISO/IEC 10536 (close-coupled cards), ISO/IEC 14443 (proximity cards), ISO/IEC 15693 (vicinity cards). These are intended for operation when very near, nearby and at a longer distance from associated coupling devices respectively.

The International Organization for Standardization (ISO) and International Electrotechnical Commission (IEC) draw attention to the fact that it is claimed that compliance with this part of ISO/IEC 14443 may involve the use of patents.

ISO and IEC take no position concerning the evidence, validity and scope of this patent right.

The holders of these patent rights have assured ISO and IEC that they are willing to negotiate licences under reasonable and non discriminatory terms and conditions with applicants throughout the world. In this respect, the statements of the holders of patent rights are registered with ISO and IEC. Information may be obtained from:

Attention is drawn to the possibility that some of the elements of this part of ISO/IEC 14443 may be the subject of patent rights other than those identified above. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

# Identification cards — Contactless integrated circuit(s) cards — Proximity cards —

## Part 2:
## Radio frequency power and signal interface

## 1  Scope

This part of ISO/IEC 14443 specifies the characteristics of the fields to be provided for power and bi-directional communication between proximity coupling devices (PCDs) and proximity cards (PICCs).

This part of ISO/IEC 14443 is intended to be used in conjunction with other parts of ISO/IEC 14443.

This part of ISO/IEC 14443 does not specify the means of generating coupling fields, nor the means of compliance with electromagnetic radiation and human exposure regulations which can vary according to country.

## 2  Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this part of ISO/IEC 14443. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this part of ISO/IEC 14443 are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to apply. Members of ISO and IEC maintain registers of currently valid International Standards.

ISO/IEC 7816-2, *Information technology – Identification cards – Integrated circuit(s) cards with contacts – Part 2: Dimensions and location of the contacts*

ISO/IEC 10373-6, *Identification cards – Test methods – Proximity cards*

ISO/IEC 14443-1, *Identification cards – Contactless integrated circuit(s) cards – Proximity cards – Part 1: Physical characteristics*

ISO/IEC 14443-3, *Identification cards – Contactless integrated circuit(s) cards – Proximity cards – Part 3: Initialization and anticollision*

## 3  Terms and definitions

For the purposes of this part of ISO/IEC 14443, the following terms and definitions apply.

**3.1**
**bit duration**
time during which a logic level is defined, at the end of which a new bit starts

**3.2**
**binary phase shift keying**
phase shift keying where the phase shift is 180°, resulting in two phase state possibilities

**3.3**
**modulation index**
defined as [*a-b*]/[*a+b*] where *a* and *b* are the peak and minimum signal amplitude respectively. The value of the index may be expressed as a percentage

**3.4**
**NRZ-L**
method of bit coding whereby a logic level during a bit duration is represented by one of two defined physical states of a communication medium

**3.5**
**subcarrier**
signal of frequency *fs* used to modulate a carrier of frequency *fc*

**3.6**
**Manchester**
method of bit coding whereby a logic level during a bit duration is represented by a sequence of two defined physical states of a communication medium. The order of the physical states within the sequence defines the logical state

**3.7**
**TR0**
guard time between the end of a PCD transmission and the start of the PICC subcarrier generation

**3.8**
**TR1**
synchronization time between the start of the PICC subcarrier generation and the start of the PICC subcarrier modulation

# 4   Symbols and abbreviated terms

ASK       Amplitude Shift Keying

BPSK     Binary Phase Shift Keying

*fc*         Frequency of operating field (carrier frequency)

*fs*         Frequency of subcarrier modulation

NRZ-L    Non-Return to Zero (L for level)

OOK      On/Off Keying

PCD       Proximity Coupling Device

PICC      Proximity Card

RF         Radio Frequency

## 5  Initial dialogue for proximity cards

The initial dialogue between the PCD and the PICC shall be conducted through the following consecutive operations:

— activation of the PICC by the RF operating field of the PCD;

— the PICC shall wait silently for a command from the PCD;

— transmission of a command by the PCD;

— transmission of a response by the PICC.

These operations shall use the RF power and signal interface specified in the following clauses.

## 6  Power transfer

The PCD shall produce an energizing RF field which couples to the PICC to transfer power and which shall be modulated for communication.

### 6.1 Frequency

The frequency $fc$ of the RF operating field shall be 13,56 MHz ±7 kHz.

### 6.2 Operating field

The minimum unmodulated operating field shall be $H$min and has a value of 1,5 A/m rms.

The maximum unmodulated operating field shall be $H$max and has a value of 7,5 A/m rms.

A PICC shall operate as intended continuously between $H$min and $H$max.

A PCD shall generate a field of at least $H$min and not exceeding $H$max at manufacturer specified positions (operating volume).

In addition the PCD shall be capable of powering any single reference PICC (defined in ISO/IEC 10373-6) at manufacturer specified positions (operating volume).

The PCD shall not generate a field higher than the value specified in ISO/IEC 14443-1 (alternating magnetic field) in any possible PICC position.

Test methods for the PCD operating field are defined in ISO/IEC 10373-6.

## 7  Signal interface

Two communication signal interfaces, Type A and Type B, are described in the following clauses.

The PCD shall alternate between modulation methods when idling before detecting the presence of a PICC of Type A or Type B.

Only one communication signal interface may be active during a communication session until deactivation by the PCD or removal of the PICC. Subsequent session(s) may then proceed with either modulation method.

Figure 1 is an illustration of the concepts described in the following clauses.

| | **Type A** | **Type B** |
|---|---|---|
| **PCD to PICC** | ASK 100%<br>Modified Miller, 106kbit/s<br><br>0  1  0  0  1 | ASK 10%<br>NRZ, 106kbit/s<br><br>0  1  0  0  1 |
| **PICC to PCD** | Load Modulation<br>Subcarrier $f_c/16$<br>OOK<br>Manchester, 106kbit/s<br><br>0  1  0  0  1 | Load Modulation<br>Subcarrier $f_c/16$<br>BPSK<br>NRZ-L*, 106kbit/s<br><br>0  1  0  0  1 |

\* Inversion of data is also possible

**Figure 1 — Example communication signals for Type A and Type B interfaces**

# 8  Communication signal interface Type A

## 8.1 Communication PCD to PICC

### 8.1.1   Bit rate

The bit rate for the transmission during initialization and anticollision shall be *fc*/128 (~106 kbit/s).

### 8.1.2   Modulation

Communication from PCD to PICC for a bit rate of *fc*/128 shall use the modulation principle of ASK 100% of the RF operating field to create a "Pause" as shown in figure 2.

The envelope of the PCD field shall decrease monotonically to less than 5% of its initial value $H_{INITIAL}$ and remain less than 5% for more than t2. This envelope shall comply to figure 2.
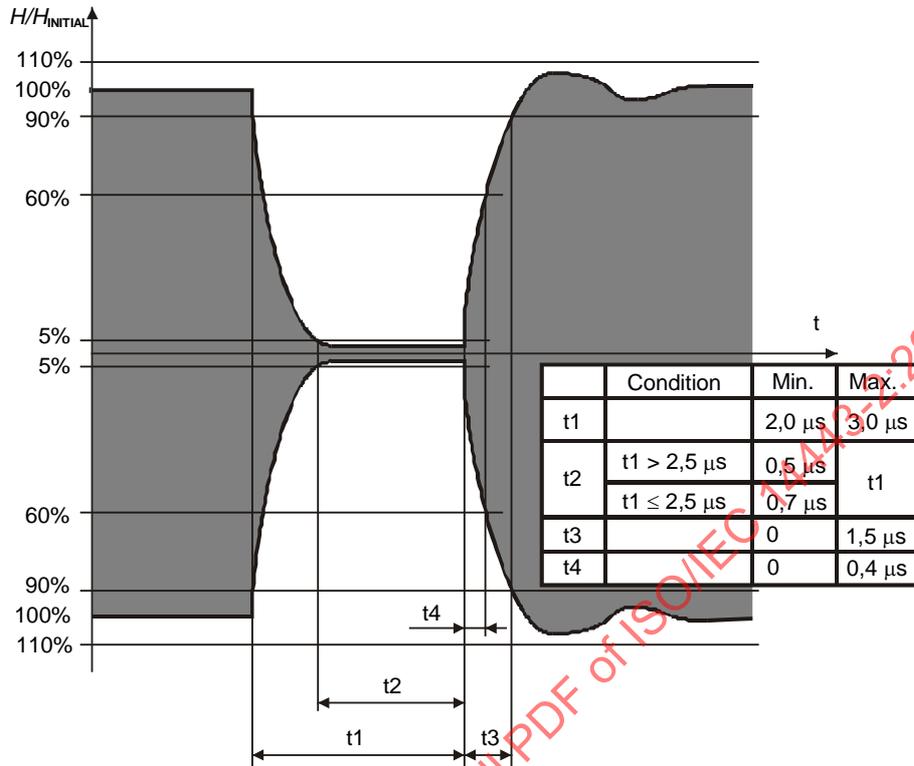

Envelope of
Carrier Amplitude

$H/H_{\text{INITIAL}}$

| | Condition | Min. | Max. |
|---|---|---|---|
| t1 | | 2,0 μs | 3,0 μs |
| t2 | t1 > 2,5 μs | 0,5 μs | t1 |
| | t1 ≤ 2,5 μs | 0,7 μs | |
| t3 | | 0 | 1,5 μs |
| t4 | | 0 | 0,4 μs |

**Figure 2 — Pause**

If the envelope of the PCD field does not decrease monotonically, the time between a local maximum and the time of passing the same value before the local maximum shall not exceed 0,5 μs. This shall only apply if the local maximum is greater than 5% of $H_{\text{INITIAL}}$.

Overshoots shall remain within 90% and 110% of $H_{\text{INITIAL}}$.

The PICC shall detect the "End of Pause" after the field exceeds 5% of $H_{\text{INITIAL}}$ and before it exceeds 60% of $H_{\text{INITIAL}}$. Figure 3 shows the definition of the "End of Pause". This definition applies to all modulation envelope timings.
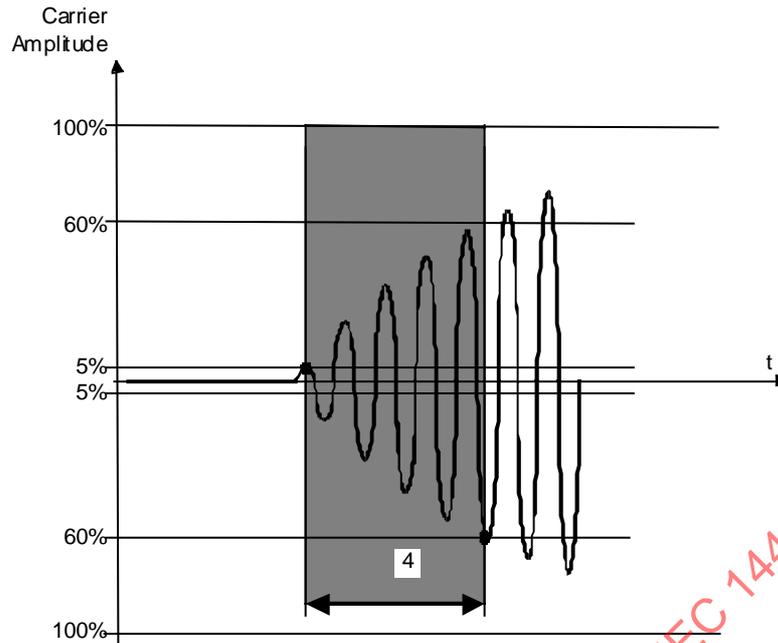

NOTE    In systems designed to handle only one card at a time, t4 need not be respected.

**Figure 3 — Definition of "End of Pause"**

### 8.1.3    Bit representation and coding

The following sequences are defined:

—  sequence X:  after a time of half the bit duration a "Pause" shall occur.

—  sequence Y:  for the full bit duration no modulation shall occur.

—  sequence Z:  at the beginning of the bit duration a "Pause" shall occur.

The above sequences shall be used to code the following information:

—  logic "1":                sequence X.

—  logic "0":                sequence Y with the following two exceptions:

> i) If there are two or more contiguous "0"s, sequence Z shall be used from the second "0" on.

> ii) If the first bit after a "start of frame" is "0", sequence Z shall be used to represent this and any "0"s which follow directly thereafter.

—  start of communication:    sequence Z.

—  end of communication:      logic "0" followed by sequence Y.

—  no information:            at least two sequences Y.

## 8.2 Communication PICC to PCD

### 8.2.1 Bit rate

The bit rate for the transmission during initialization and anticollision shall be $fc$/128 (~106 kbit/s).

### 8.2.2 Load modulation

The PICC shall be capable of communication to the PCD via an inductive coupling area where the carrier frequency is loaded to generate a subcarrier with frequency $fs$. The subcarrier shall be generated by switching a load in the PICC.

The load modulation amplitude shall be at least 30/$H$[1,2] (mVpeak) when measured as described in ISO/IEC 10373-6, where $H$ is the (rms) value of magnetic field strength in A/m.

### 8.2.3 Subcarrier

The frequency $fs$ of the subcarrier shall be $fc$/16 (~847 kHz). Consequently, during initialization and anticollision, one bit duration is equivalent to 8 periods of the subcarrier.

### 8.2.4 Subcarrier modulation

Every bit period shall start with a defined phase relation to the subcarrier. The bit period shall start with the loaded state of the subcarrier.

The subcarrier is modulated using OOK with the sequences defined in 8.2.5.

### 8.2.5 Bit representation and coding

The following sequences are defined :

— sequence D: the carrier shall be modulated with the subcarrier for the first half (50%) of the bit duration.

— sequence E: the carrier shall be modulated with the subcarrier for the second half (50%) of the bit duration.

— sequence F: the carrier is not modulated with the subcarrier for one bit duration.

Bit coding shall be Manchester with the following definitions:

— logic "1": sequence D

— logic "0": sequence E

— start of communication: sequence D

— end of communication: sequence F

— no information: no subcarrier

# 9    Communication signal interface Type B

## 9.1 Communication PCD to PICC

### 9.1.1    Bit rate

The bit rate for the transmission during initialization and anticollision shall be nominally $fc$/128 (~106 kbit/s). Tolerance and bit boundaries are defined in ISO/IEC 14443-3.

### 9.1.2    Modulation

Communication from PCD to PICC shall use the modulation principle of ASK 10% of the RF operating field.

The modulation index shall be between 8% and 14%.

The modulation waveform shall comply to figure 4. The rising and falling edges of the modulation shall be monotonic.

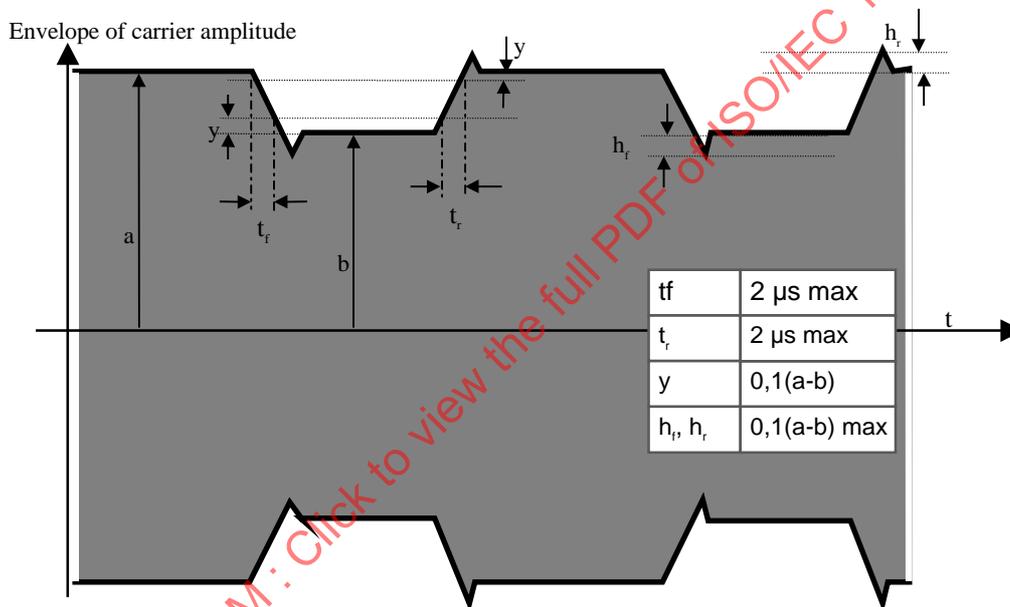

**Figure 4 — Type B modulation waveform**

### 9.1.3    Bit representation and coding

Bit coding format shall be NRZ-L with logic levels defined as follows:

—  logic "1":          carrier high field amplitude (no modulation applied).

—  logic "0":          carrier low field amplitude.
