## Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of the joint technical committee is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any of all such patent rights.

ISO/IEC 17345 was prepared by Ecma TC 31 (as ECMA-350) and was adopted, under a special “fast-track procedure”, by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, in parallel with its approval by national bodies of ISO and IEC.

This second edition cancels and replaces the first edition (ISO/IEC 17345:2005), which has been technically revised.

## Introduction

Ecma Technical Committee TC 31 was established in 1984 for the standardization of Optical Disks and Optical Disk Cartridges (ODC). Since its establishment, the Committee has made major contributions to ISO/IEC JTC 1/SC 23 toward the development of International Standards for optical disks with a diameter of 80 mm, 90 mm, 120 mm, 130 mm, 300 mm and 356 mm. Numerous standards have been developed by TC 31 and published by Ecma, almost all of which have also been adopted by ISO/IEC under the fast-track procedure as International Standards. The following International Standards for 130 mm disks have been published by Ecma and adopted by ISO/IEC JTC 1: ISO/IEC 11560:1992, ISO/IEC 13481:1993, ISO/IEC 13549:1993, ISO/IEC 13842:1995, ISO/IEC 15486:1998, ISO/IEC 18093:1999, ISO/IEC 22092:2002.

This International Standard specifies two types of double-sided ODCs — Rewritable (Type RW) and Write Once Read Many (Type WORM), both using thermo-optical Phase Change effects.

# Information technology — Data Interchange on 130 mm Rewritable and Write Once Read Many Ultra Density Optical (UDO) Disk Cartridges — Capacity: 30 Gbytes per Cartridge — First Generation

## Section 1 — General

### 1 Scope

This International Standard specifies the mechanical, physical, and optical characteristics of a 130 mm optical disk cartridge (ODC) that employs thermo-optical Phase Change effects to enable data interchange between such disks.

This International Standard specifies two types:

- Type RW (Rewritable) provides for data to be written read and erased many times over the recording surfaces of the disk.
- Type WORM (Write Once Read Many) provides for data once written to be read a multiplicity of times. This type uses a Write Once Read Many times recording material (written marks cannot be erased and attempted modifications of the written marks are detectable). Multisession (incremental write operations) recording may be performed on Type WORM disks.

The disk is two-sided with a nominal capacity of 15,0 Gbytes per side and the cartridge (two sides) provides a nominal capacity of 30,0 Gbytes.

This International Standard specifies:

- the conditions for conformance testing and the Reference Drive;
- the environments in which the cartridges are to be operated and stored;
- the mechanical, physical and dimensional characteristics of the cartridge so as to provide mechanical interchangeability between data processing systems;
- the format of the information on the disk, both embossed and user-written, including the physical disposition of the tracks and sectors, the error correction codes, the modulation methods used;
- the characteristics of the embossed information on the disk;
- the thermo-optical characteristics of the disk, enabling processing systems to write data onto the disk; and
- the minimum quality of user-written data on the disk, enabling data processing systems to read data from the disk.

This International Standard provides for interchange between optical disk drives. Together with a standard for volume and file structure, it provides for full data interchange between data processing systems.

## 2 Conformance

### 2.1 Optical disk

An ODC shall be in conformance with this International Standard if it meets all mandatory requirements specified therein.

A claim of conformance with this International Standard shall specify the Type, RW, WORM, implemented.

### 2.2 Generating system

A claim of conformance with this International Standard shall specify which Type(s) is (are) supported. A system generating an ODC for interchange shall be in conformance with this International Standard if it meets the mandatory requirements of this International Standard for the Type(s) supported.

### 2.3 Receiving system

A claim of conformance with this International Standard shall specify which Type(s) is (are) supported.

A system receiving an ODC for interchange shall be in conformance with this International Standard if it is able to process any recording made on the cartridge according to 2.1 on the Type(s) specified.

### 2.4 Compatibility statement

A claim of conformance with this International Standard shall include a statement listing any other Optical Disk Cartridge Standard supported by the system for which conformance is claimed. This statement shall specify the number of the Standard(s), including, where appropriate, the ODC Type(s), and whether support includes reading only or both reading and writing.

## 3 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ECMA-287 (2002), *Safety of electronic equipment*

## 4 Terms and definitions

For the purposes of this document the following terms and definitions apply.

**4.1 asymmetry**  
deviation between the centre levels of signals generated by two distinct repeating mark and space length patterns

**4.2 band**  
annular area on the disk having a constant clock frequency

**4.3 case**  
housing for an optical disk that protects the disk and facilitates disk interchange

**4.4****Case Reference Plane**

plane defined for each side of the case, to which the dimensions of the case are referred

**4.5****channel bit**

elements by which, after modulation, the binary values ZERO and ONE are represented by marks and spaces on the disk

**4.6****clamping zone**

annular part of the disk within which the clamping force is applied by the clamping device

**4.7****cover layer**

transparent layer of the disk through which the optical beam accesses the recording layer

**4.8****Cyclic Redundancy Code****CRC**

method for detecting errors in data

**4.9****data field**

subdivision of a sector intended for the recording of user data

**4.10****Defect Management**

method for handling the defective areas on the disk

**4.11****Disk Reference Plane**

plane defined by the perfectly flat annular surface of an ideal spindle onto which the clamping zone of the disk is clamped, and which is normal to the axis of rotation

**4.12****entrance surface**

surface of the disk onto which the optical beam first impinges

**4.13****Error Correction Code****ECC**

error-detecting code designed to correct certain kinds of errors in data

**4.14****field**

subdivision of a sector

**4.15****format**

arrangement or layout of information on the disk

NOTE The annular area on the disk bearing the format is the formatted zone.

**4.16****hub**

central feature on the disk, which interacts with the spindle of the disk drive to provide radial centring and the clamping force

**4.17  
interleaving**

process of allocating the physical sequence of units of data so as to render the data more immune to burst errors

**4.18  
land and groove**

trench-like feature of the disk, applied before the recording of any information, and used to define the track location

NOTE The land is located nearer to the entrance surface than the groove with which it is paired to form a Physical Track. Recording is performed on both the land and groove.

**4.19  
mark**

feature of the recording layer which takes the form of a pit, change in the reflectivity, or any other type or form that can be sensed by the optical system

NOTE The pattern of marks represents the data on the disk.

**4.20  
Mirror Area**

area in which there is no embossed information, neither preformatted headers or grooves

**4.21  
optical disk**

disk that will accept and retain information in the form of marks in a recording layer, that can be read with an optical beam

**4.22  
optical disk cartridge**

device consisting of a case containing an optical disk

**4.23  
Phase Change**

physical effect by which the area of a recording layer irradiated by a laser beam is heated so as to change from an amorphous state to a crystalline state and vice versa

**4.24  
Physical Block Address  
PBA**

numbering system of the data sectors defined to constitute a uniquely addressable sector location to the recording system

**4.25  
Physical Track**

one revolution (360°) of adjacent groove-land pair

**4.26  
read power**

optical power, incident at the entrance surface of the disk, used when reading

**4.27  
recording layer**

layer of the disk on, or in, which data is written during manufacture and/or use

NOTE The recording layer may actually consist of a multiple layer stack of different materials or composite materials.

**4.28****Recording Track**

one revolution (360°) of either a land feature or groove feature of the disk (Land Recording Track or Groove Recording Track) where recording may be performed

**4.29****Reed-Solomon code**

error detection and/or correction code which is particularly suited to the correction of errors which occur in bursts or are strongly correlated

**4.30****sector**

smallest addressable part of a track in the formatted area of the disk

**4.31****space**

area between marks along the track

**4.32****spindle**

part of the disk drive which contacts the disk and/or hub

**4.33****substrate**

layer of the disk provided for mechanical support of the recording layer

**4.34****track**

path which is followed by the focus of the optical beam during exactly one revolution of the disk

**4.35****track pitch**

distance between Land Recording Track centrelines and adjacent Groove Recording Track centrelines, measured in the radial direction

**4.36****User Area**

area of the disk intended for the recording of user data

**4.37****wobble**

periodic radial deviation of the track (groove or land) from the average centreline that is used as a supplemental timing signal

**4.38****write-inhibit hole**

hole in the case which, when detected by the drive to be open, inhibits write operations

**4.39****zone**

annular area of the disk

## 5 Conventions and notations

### 5.1 Representation of numbers

A measured value is rounded off to the least significant digit of the corresponding specified value. For instance, it implies that a specified value of 1,26 with a positive tolerance of + 0,01 and a negative tolerance of - 0,02 allows a range of measured values from 1,235 to 1,275.

Numbers in decimal notations are represented by the digits 0 to 9.

Numbers in hexadecimal notation are represented by the hexadecimal digits 0 to 9 and A to F in parentheses.

The setting of bits is denoted by ZERO and ONE.

Numbers in binary notations and bit patterns are represented by strings of digits 0 and 1, with the most significant bit shown to the left.

Negative values of numbers in binary notation are given as Two's complement.

In each field the data is recorded so that the most significant byte (MSB), identified as Byte 0, is recorded first and the least significant byte (LSB) last. In a field of  $8n$  bits, bit  $b_{(8n-1)}$  shall be the most significant bit (msb) and bit  $b_0$  the least significant bit (lsb). Bit  $b_{(8n-1)}$  is recorded first.

A binary digit which can be set indifferently to ZERO or to ONE is represented by "x".

### 5.2 Names

The names of entities, e.g. specific tracks, fields, areas, zones, etc. are given a capital initial.

## 6 Acronyms

AM	Address Mark
CRC	Cyclic Redundancy Code
DDS	Disk Definition Structure
DIR	Drive Information Record
DMA	Defect Management Area
ECC	Error Correction Code
ESISIC	Enhanced Selective Inter-Symbol Interference Cancellation
ID	Identifier
LBA	Logical Block Address
LSB	Least Significant Byte
lsb	least significant bit
MSB	Most Significant Byte
msb	most significant bit
NA	Numerical Aperture
NBSNR	Narrow-Band Signal-to-Noise Ratio
NRZ	Non Return to Zero
ODC	Optical Disk Cartridge

PA	Postamble
PBA	Physical Block Address
PDL	Primary Defect List
PLL	Phase Locked Loop
PSA	Primary Spares Area
QWM	Quadrature Wobble Marks
QWMG	Quadrature Wobble Marks on Groove
QWML	Quadrature Wobble Marks on Land
RESYNC	Re-synchronization
RFO	Read Focus Offset
RLL	Run-Length Limited (code)
RW	Rewritable
SCSI	Small Computer System Interface
SDI	Specific Disk Information
SDL	Secondary Defect List
SPS	Start Position Shift
SSA	Secondary Spares Area
STOB	Six Time Oversampled Bi-Phase
SYNC	Synchronization
TA	Transition Area
TIA	Time Interval Analyzer
UDO	Ultra Density Optical (disk)
VAP	Verify and Protect
VFO	Variable Frequency Oscillator
WORM	Write Once Read Many
ZCAV	Zoned Constant Angular Velocity

## 7 General description

The optical disk cartridge, which is the subject of this International Standard, consists of a case containing an optical disk.

The case is a protective enclosure for the disk. It has access windows covered by two shutters. One of the windows is automatically uncovered by the drive when the cartridge is inserted into it.

The optical disk is made from two sides that are assembled together. Each side consists of a Phase Change recording layer placed between the substrate and the cover layer. The substrates of each side are bonded together.

The optical disk is recordable on both sides. Data can be written onto the disk as marks with Phase Change characteristics variations in the recording layer, using a focused optical beam. Data can be read by the optical beam using the change in reflectivity and diffraction between mark and space in the recording layer. The beam accesses the recording layer through the transparent cover layer of the disk.

Part of the disk contains read-only data in the form of pre-embossed pits. This data can be read using the diffraction of the optical beam by the embossed pits.

## 8 General requirement

### 8.1 Environments

#### 8.1.1 Test environment

The test environment is the environment where the air immediately surrounding the optical disk cartridge has the following properties:

Temperature :	23 °C ± 2 °C
Relative humidity :	45 % to 55 %
Atmospheric pressure :	60 kPa to 106 kPa
Air cleanliness :	Class 100 000 (see Annex A)

No condensation on or in the optical disk cartridge shall occur. Before testing, the optical disk cartridge shall be conditioned to this environment for 48 hours minimum. It is recommended that, before testing, the entrance surface of the disk be cleaned according to the instructions of the manufacturer of the disk.

Unless otherwise stated, all tests and measurements shall be made in this test environment.

#### 8.1.2 Operating environment

This International Standard requires that an optical disk cartridge, which meets all requirements of this International Standard in the specified test environment, provides interchange over the specified ranges of environmental parameters in the operating environment.

The operating environment is the environment where air immediately surrounding the optical disk cartridge has the following properties:

Temperature :	5 °C to 55 °C
Relative humidity :	3 % to 85 %
Absolute humidity :	1 g/m <sup>3</sup> to 30 g/m <sup>3</sup>
Atmospheric pressure :	60 kPa to 106 kPa
Temperature gradient :	10 °C/h max.
Relative humidity gradient :	10 %/h max.
Air cleanliness :	Office environment (see Annex S)

No condensation on or in the optical disk cartridge shall occur. If an optical disk cartridge has been exposed to conditions outside those specified in this Clause, it shall be acclimatized in an allowed operating environment for at least 2 hours before use (see also Annex T).

#### 8.1.3 Storage environment

The optical disk cartridge without any protective enclosure shall not be stored in an environment outside the range allowed for storage. The storage environment is defined as an environment where the air immediately surrounding the optical disk cartridge has the following properties:

Temperature :	-10 °C to 55 °C
Relative humidity :	3 % to 90 %
Absolute humidity :	1 g/m <sup>3</sup> to 30 g/m <sup>3</sup>
Atmospheric pressure :	60 kPa to 106 kPa
Temperature gradient :	15 °C/h max.

Relative humidity gradient : 10 %/h max.

Air cleanliness : Office environment (see Annex S)

No condensation on or in the optical disk cartridge shall occur.

#### 8.1.4 Transportation

This International Standard does not specify requirements for transportation. Guidance for transportation is given in Annex U.

### 8.2 Temperature shock

The optical disk cartridge shall withstand a temperature shock of up to 20 °C when inserted into, or removed from, the drive.

### 8.3 Safety requirements

The cartridge shall satisfy the safety requirements of Standard ECMA-287, when used in the intended manner or in any foreseeable use in an information processing system.

### 8.4 Flammability

The cartridge and its components shall be made from materials that comply with the flammability class for HB materials, or better, as specified in Standard ECMA-287.

## 9 Reference Drive

The Reference Drive is a drive several critical components of which have well defined properties and which is used to test the read, write, and erase parameters of the disk for conformance to this International Standard. This section gives an outline of all components; components critical for tests in specific sections are specified in those sections.

### 9.1 Optical system

The basic set-up of the optical system of the Reference Drive used for measuring the write, read and erase parameters is shown in figure 1. Different components and locations of components are permitted, provided that the performance remains the same as that of the set-up in figure 1. The optical system shall be such that the detected light reflected from the entrance surface of the disk is minimized so as not to influence the accuracy of the measurements.

Figure 1 — Optical system of the Reference Drive

The combination of the polarizing beamsplitter D and quarter-wave plate E separates the incident optical beam and the beam reflected from the optical disk G. The polarizing beamsplitter D shall have a p-s intensity reflectance ratio of at least 90.

## 9.2 Optical beam

The focused optical beam used for writing, reading and erasing data shall have the following properties:

Wavelength ( $\lambda$ )	405 nm to 410 nm
Polarization	Circular
Numerical aperture	$0,70 \pm 0,01$
Light intensity at the rim of the pupil of the objective lens level	50 % to 60 % of the maximum intensity
Wave front aberration after passing through an ideal cover layer of the disk (Thickness: 0,1 mm and index of refraction: 1,55)	$0,033 \lambda$ rms max.
Relative intensity noise (RIN) $10 \log [(a.c. \text{ light power density/Hz})/d.c. \text{ light power}]$	- 130 dB/Hz max.

### 9.3 Read Channel

The Read Channel shall be used for reading embossed and written marks, using the changes in diffraction and reflectivity produced by the marks.

The Read Channel shall detect the total amount of light in the exit pupil of the objective lens.

The amplifier  $K_1$  after the photodetector shall be d.c.-coupled and have a flat response within 1 dB from d.c. to 60 MHz.

### 9.4 Tracking

The method of generating the axial tracking error is not specified for the Reference Drive.

The radial tracking error is generated in the Radial Tracking Channel from the output currents of a split photodiode detector, the division of which runs parallel to the image of the tracks on the diode (see figure 1).

The radial tracking error signal relates to the difference in the amount of light in the two halves of the exit pupil of the objective lens.

The amplifier  $K_2$  after the photodetector shall be d.c.-coupled with the bandwidth characteristics specified in clause 21.

The requirements for the accuracy with which the focus of the optical beam must follow the tracks is specified in 20.2.4.

### 9.5 Rotation of the disk

The spindle shall position the disk as specified in 12.4. It shall rotate the disk at  $32,5 \text{ Hz} \pm 0,25 \%$  for Type RW and  $35,0 \text{ Hz} \pm 0,25 \%$  for Type WORM. The direction of rotation of the disk side being tested shall be counter-clockwise when viewed from the objective lens.

## Section 2 — Mechanical and physical characteristics

### 10 Dimensional and physical characteristics of the case

#### 10.1 General description of the case

The case (see figure 2) is a rigid protective container of rectangular shape. It has windows on both side A and side B to allow the spindle of the drive to clamp the disk by its hub and to allow the head to access the disk. The A- or B-shutter uncovers the window upon insertion into the drive, and automatically covers it upon removal from the drive. The case has media identification, write-inhibit, mis-insertion features, detent for autoloading, gripper slots for an autochanger, label areas, and side identification inscriptions.

#### 10.2 Relationship of Sides A and B

The features essential for physical interchangeability are represented in figure 2. When Side A of the cartridge faces upwards, Side A of the disk faces downwards. Sides A and B of the case are identical as far as the features given here are concerned. The description is given for one side only. References to Sides A and B can be changed to B or A respectively.

### 10.3 Reference axes and case reference planes

There is a Case Reference Plane P for each side of the case. Each Case Reference Plane P contains two orthogonal axes X and Y to which the dimensions of the case are referred. The intersection of the X and Y axes defines the centre of the location hole. The X axis extends through the centre of the alignment hole.

### 10.4 Case drawings

The case is represented schematically by the following drawings.

Figure 2 shows a composite drawing of Side A of the case in isometric form, with the major features identified from Side A.

Figure 3 shows the envelope of the case with respect to a location hole at the intersection of the X and Y axes of Case Reference Plane P.

Figure 4 shows the surfaces S1, S2, S3 and S4 which establish the Case Reference Plane P.

Figure 4a shows the details of surface S3.

Figure 5 shows the details of the insertion slot and detent.

Figure 6 shows the gripper slots, used for automatic handling.

Figure 7 shows the write-inhibit holes.

Figure 8 shows the media identification sensor holes.

Figure 9 shows the head and motor window.

Figure 10 shows the shutter opening features.

Figures 11a and 11b show the user label areas.

### 10.5 Dimensions of the case

#### 10.5.1 Overall dimensions

The total length of the case (see figure 3) shall be

$$L_1 = 153,0 \text{ mm} \pm 0,4 \text{ mm}$$

The distance from the top of the case to the reference axis X shall be

$$L_2 = 127,0 \text{ mm} \pm 0,3 \text{ mm}$$

The distance from the bottom of the case to the reference axis X shall be

$$L_3 = 26,0 \text{ mm} \pm 0,3 \text{ mm}$$

The total width of the case shall be

$$L_4 = 135,0 \text{ mm} \begin{matrix} + 0,0 \text{ mm} \\ - 0,6 \text{ mm} \end{matrix}$$

The distance from the left-hand side of the cartridge to the reference axis Y shall be

$$L_5 = 128,5 \text{ mm} \begin{array}{l} + 0,0 \text{ mm} \\ - 0,5 \text{ mm} \end{array}$$

The distance from the right-hand side of the cartridge to the reference axis Y shall be

$$L_6 = 6,5 \text{ mm} \pm 0,2 \text{ mm}$$

The width shall be reduced on the top by the radius

$$R_1 = L_4$$

originating from a point defined by  $L_5$  and

$$L_7 = 101,0 \text{ mm} \pm 0,3 \text{ mm}$$

The two corners of the top shall be rounded with a radius

$$R_2 = 1,5 \text{ mm} \pm 0,5 \text{ mm}$$

and the two corners at the bottom with a radius

$$R_3 = 3,0 \text{ mm} \pm 1,0 \text{ mm}$$

The thickness of the case shall be

$$L_8 = 11,00 \text{ mm} \pm 0,30 \text{ mm}$$

The eight long edges of the case shall be rounded with a radius

$$R_4 = 1,0 \text{ mm max.}$$

### 10.5.2 Location hole

The centre of the location hole (see figure 3) shall coincide with the intersection of the reference axes X and Y. It shall have a square form with a side length of

$$L_9 = 4,10 \text{ mm} \begin{array}{l} + 0,00 \text{ mm} \\ - 0,06 \text{ mm} \end{array}$$

held to a depth of

$$L_{10} = 2,35 \text{ mm (i.e. typical wall thickness)}$$

after which a cavity extends through to the alignment hole on the opposite side of the case.

The lead-in edges shall be rounded with a radius

$$R_5 = 0,5 \text{ mm max.}$$

### 10.5.3 Alignment hole

The centre of the alignment hole (see figure 3) shall lie on reference axis X at a distance of

$$L_{11} = 122,0 \text{ mm} \pm 0,2 \text{ mm}$$

from the reference axis Y.

The dimensions of the hole shall be

$$L_{12} = 4,10 \text{ mm} \begin{array}{l} + 0,00 \text{ mm} \\ - 0,06 \text{ mm} \end{array}$$

and

$$L_{13} = 5,0 \text{ mm} \begin{array}{l} + 0,2 \text{ mm} \\ - 0,0 \text{ mm} \end{array}$$

held to a depth of  $L_{10}$ , after which a cavity extends through to the location hole on the opposite side of the case.

The lead-in edges shall be rounded with radius  $R_5$ .

#### 10.5.4 Surfaces on Case Reference Planes P

The Case Reference Plane P (see figures 4 and 4a) for a side of the case shall contain four surfaces (S1, S2, S3 and S4) on that side of the case, specified as follows:

Two circular surfaces S1 and S2.

Surface S1 shall be a circular area centred around the square location hole and have a diameter of

$$D_1 = 9,0 \text{ mm min.}$$

Surface S2 shall be a circular area centred around the rectangular alignment hole and have a diameter of

$$D_2 = 9,0 \text{ mm min.}$$

Two elongated surfaces S3 and S4, that follow the contour of the cartridge and shutter edges.

Surfaces S3 and S4 are shaped symmetrically.

Surface S3 shall be defined by two circular sections with radii

$$R_6 = 1,5 \text{ mm} \pm 0,1 \text{ mm}$$

with an origin given by

$$L_{14} = 4,0 \text{ mm} \pm 0,1 \text{ mm}$$

$$L_{15} = 86,0 \text{ mm} \pm 0,3 \text{ mm}$$

and

$$R_7 = 1,5 \text{ mm} \pm 0,1 \text{ mm}$$

with an origin given by

$$L_{16} = 1,9 \text{ mm} \pm 0,1 \text{ mm}$$

$$L_{17} = 124,5 \text{ mm} \pm 0,3 \text{ mm}$$

The arc with radius  $R_7$  shall continue on the right hand side with radius

$$R_8 = 134,0 \text{ mm} \begin{array}{l} + 0,2 \text{ mm} \\ - 0,7 \text{ mm} \end{array}$$

which is a dimension resulting from  $L_5 + L_{14} + R_6$  with an origin given by  $L_5$  and  $L_7$ . A straight, vertical line shall smoothly join the arc of  $R_6$  to the arc of  $R_8$ .

The left-hand side of S3 shall be bounded by radius

$$R_9 = 4,5 \text{ mm} \pm 0,3 \text{ mm}$$

which is a dimension resulting from  $L_{18} + L_{14} - R_6$  with an origin given by

$$L_{18} = 2,0 \text{ mm} \pm 0,1 \text{ mm}$$

$$L_{19} = 115,5 \text{ mm} \pm 0,3 \text{ mm}$$

The left-hand side of the boundary shall be closed by two straight lines. The first one shall smoothly join the arc of  $R_6$  to the arc of  $R_9$ . The second one shall run from the left-hand tangent of  $R_7$  to its intersection with  $R_9$ .

#### 10.5.5 Insertion slots and detent features

The case shall have two symmetrical insertion slots with embedded detent features (see figure 5). The slots shall have a length of

$$L_{20} = 35,0 \text{ mm} \pm 0,3 \text{ mm}$$

a width of

$$L_{21} = 6,0 \text{ mm} \begin{array}{l} + 0,3 \text{ mm} \\ - 0,0 \text{ mm} \end{array}$$

and a depth of

$$L_{22} = 3,0 \text{ mm} \pm 0,1 \text{ mm}$$

located

$$L_{23} = 2,5 \text{ mm} \pm 0,2 \text{ mm}$$

from Case Reference Plane P.

The slots shall have a lead-in chamfer given by

$$L_{24} = 0,5 \text{ mm max.}$$

$$L_{25} = 5,0 \text{ mm max.}$$

The detent notch shall be a semi-circle of radius

$$R_{10} = 3,0 \text{ mm} \pm 0,2 \text{ mm}$$

with the origin given by

$$L_{26} = 13,0 \text{ mm} \pm 0,3 \text{ mm}$$

$$L_{27} = 2,0 \text{ mm} \pm 0,1 \text{ mm}$$

$$L_{28} = 114,0 \text{ mm} \pm 0,3 \text{ mm}$$

The dimensions  $L_2$ ,  $L_{26}$ , and  $L_{28}$  are interrelated, their values shall be such so that they are all three within specification.

#### 10.5.6 Gripper slots

The case shall have two symmetrical gripper slots (see figure 6) with a depth of

$$L_{29} = 5,0 \text{ mm} \pm 0,3 \text{ mm}$$

from the edge of the case and a width of

$$L_{30} = 6,0 \text{ mm} \pm 0,3 \text{ mm}$$

The upper edge of a slot shall be

$$L_{31} = 12,0 \text{ mm} \pm 0,3 \text{ mm}$$

above the bottom of the case.

#### 10.5.7 Write-inhibit holes

Sides A and B shall each have a write-inhibit hole (see figure 7). The case shall include a device for opening and closing each hole. The hole at the left-hand side of Side A of the case, is the write-inhibit hole for Side A of the disk. The protected side of the disk shall be made clear by inscriptions on the case or by the fact that the device for Side A of the disk can only be operated from Side A of the case.

When writing and erasing on Side A of the disk is not allowed, the write-inhibit hole shall be open all through the case. It shall have a diameter

$$D_3 = 4,0 \text{ mm min.}$$

Its centre shall be specified by

$$L_{32} = 8,0 \text{ mm} \pm 0,2 \text{ mm}$$

$$L_{33} = 111,0 \text{ mm} \pm 0,3 \text{ mm}$$

on Side A of the case.

When writing is allowed on Side A of the disk, the write-inhibit hole shall be closed on Side A of the case, at a depth of typically  $L_{10}$ , i.e. the wall thickness of the case. In this state, the opposite side of the same hole, at Side B of the case, shall be closed and not recessed from the Case Reference Plane P of Side B of the case by more than

$$L_{34} = 0,3 \text{ mm max.}$$

The opposite side of the write-inhibit hole for protecting Side B of the disk shall have a diameter  $D_3$ . Its centre shall be specified by  $L_{32}$  and

$$L_{35} = 11,0 \text{ mm} \pm 0,2 \text{ mm}$$

on Side A of the case.

### 10.5.8 Media identification sensor holes

There shall be two sets of two media sensor holes (see figure 8). The holes shall extend through the case, and have a diameter of

$$D_4 = 4,0 \text{ mm} \begin{array}{l} + 0,3 \text{ mm} \\ - 0,0 \text{ mm} \end{array}$$

the positions of their centres shall be specified by  $L_{33}$ ,  $L_{35}$  and

$$L_{36} = 19,5 \text{ mm} \pm 0,2 \text{ mm}$$

$$L_{37} = 17,0 \text{ mm} \pm 0,2 \text{ mm}$$

$$L_{38} = 105,0 \text{ mm} \pm 0,3 \text{ mm}$$

A hole is deemed to be open when there is no obstruction in this hole over a diameter  $D_4$  all through the case.

A hole is deemed to be closed, when the hole is closed on both Side A and Side B of the case. The closure shall be recessed from Case Reference plane P by

$$L_{39} = 0,3 \text{ mm max.}$$

The holes closest to the long edges of the case are numbered 1. The other holes are numbered 2. The meaning of the status (closed, open) of each hole shall be as in table 1.

**Table 1 — Media identification sensor holes**

Sensor Hole No.	Indication	Closed	Open
1	Media Type	WORM	RW
2	Future use*	Yes	No

\* This hole shall be closed in cartridges conforming to this International Standard.

### 10.5.9 Head and motor window

The case shall have a window on each side to enable the optical head and the motor spindle to access the disk (see figure 9). The dimensions are referenced to a centreline, located at a distance of

$$L_{40} = 61,0 \text{ mm} \pm 0,2 \text{ mm}$$

to the left of reference axis Y.

The width of the head access shall be defined by

$$L_{41} = 17,50 \text{ mm min.}$$

$$L_{42} = 17,50 \text{ mm min.}$$

and its height shall extend to

$$L_{43} = 118,2 \text{ mm min.}$$

The two inside corners shall be rounded with a radius of

$$R_{11} = 3,0 \text{ mm max.}$$

The motor spindle access shall have a diameter of

$$D_5 = 35,0 \text{ mm min.}$$

and its centre shall be defined by  $L_{40}$  and

$$L_{44} = 43,0 \text{ mm} \pm 0,2 \text{ mm}$$

#### 10.5.10 Shutters

The case shall have two spring-loaded, unidirectional shutters (see figure 10), designed to completely cover the head and motor windows when closed. A shutter movement of 36,5 mm shall be sufficient to ensure that the head and motor window is opened to the minimum size specified in 10.5.9. The shutter shall be free to slide in a recessed area of the case in such a way as to ensure that the overall thickness of the case and shutter shall not exceed  $L_8$ .

The top surface of the shutters shall be at

$$L_{45} = 126,7 \text{ mm} \pm 0,3 \text{ mm}$$

#### 10.5.11 Slots for shutter opener

Both Side A and Side B shutter shall have only one slot (see figure 10) in which the shutter opener of the drive can engage to open the shutter. The slot shall be dimensioned as follows:

When the shutter is closed, the centre of the slot used to push the shutter open shall be located at a distance of

$$L_{46} = 55,0 \text{ mm} \pm 0,5 \text{ mm}$$

from reference axis Y on either side the case.

The length of the slot shall be

$$L_{47} = 7,0 \text{ mm} \pm 0,1 \text{ mm}$$

The depth of the slot shall be

$$L_{48} = 3,5 \text{ mm} \pm 0,5 \text{ mm}$$

The width of each slot from the Case Reference Plane P of Side A and B of the case shall be

$$L_{49} = 4,5 \text{ mm} \begin{matrix} + 0,5 \text{ mm} \\ - 0,0 \text{ mm} \end{matrix}$$

#### 10.5.12 Slots to prevent insertion into a MO-drive

The case shall have two non-moveable slots (see Figure 10) designed to prevent from insertion into MO-drives using cartridges conforming to ISO/IEC 22092 (or into drives using similar cartridge designs as specified in ISO/IEC 18093, ISO/IEC 15486, ISO/IEC 13842, ISO/IEC 13549, ISO/IEC 13481, and ISO/IEC 11560). These two non-moveable slots have no function when the case is inserted into a drive designed to receive cartridges conforming to this International Standard.

The edge designed to engage with the shutter opening arm of such MO-drives and so prevent further insertion, shall be located at a distance of

$$L_{50} = 36,5 \text{ mm} \pm 0,2 \text{ mm}$$

from reference axis Y on either side the case.

The length of the slot shall be

$$L_{51} = 4,5 \text{ mm} \pm 0,5 \text{ mm}$$

and the angle of the lead-out ramp shall be

$$A_1 = 60,0^\circ \pm 1,0^\circ$$

The depth of the slot shall be

$$L_{52} = 4,0 \text{ mm} \pm 0,5 \text{ mm}$$

With both side A and side B shutter closed the width of each slot shall be the full width of the case  $L_8$ .

### 10.5.13 User label areas

The case shall have the following minimum areas for user labels (see figure 11a):

on Side A and Side B: 33,5 mm x 70,5 mm

on the bottom side: 7,0 mm x 115,0 mm

These areas shall be recessed by 0,2 mm min. Their positions are specified by the following dimensions and relations between dimensions.

$$L_{53} = 29,0 \text{ mm min.}$$

$$L_{54} - L_{53} = 70,5 \text{ mm min.}$$

$$L_{56} - L_{55} = 33,5 \text{ mm min.}$$

$$L_8 - L_{59} - L_{60} = 7,0 \text{ mm min.}$$

$$L_4 - L_{57} - L_{58} = 115,0 \text{ mm min.}$$

## 10.6 Mechanical characteristics

All requirements of this clause shall be met in the operating environment.

### 10.6.1 Materials

The case shall be constructed from any suitable materials such that it meets the requirements of this International Standard.

### 10.6.2 Mass

The mass of the case without the optical disk shall not exceed 150 g.

### 10.6.3 Edge distortion

The cartridge shall meet the requirement of the edge distortion test defined in Annex B.

### 10.6.4 Compliance

The cartridge shall meet the requirement of the compliance (flexibility) test defined in Annex C. The requirement guarantees that a cartridge can be constrained in the proper plane of operation within the drive.

### 10.6.5 Shutter opening force

The spring force on the shutter shall be such that the force required to open the shutter does not exceed 2 N. It shall be sufficiently strong to close a free-sliding shutter, irrespective of the orientation of the case.

### 10.7 Drop test

The optical disk cartridge shall withstand dropping on each surface and on each corner from a height of 1,2 m onto a concrete floor covered with a vinyl layer 2 mm thick. The cartridge shall withstand all such impacts without any functional failure.

The write-inhibit switches shall not move to change the state (open or closed) of the write-inhibit holes during the drop test.

### 10.8 Electro-static discharge test

The optical disk cartridge shall meet the electro-static discharge requirements specified in Annex D.

## 11 Dimensional, mechanical, and physical characteristics of the disk

### 11.1 General description of the disk

The disk shall consist of two sides.

Each disk side shall consist of a circular substrate with a hub on one face. The substrate is coated with a recording layer on the same disk face as the hub. The recording layer is protected from environmental influences by a protective 100 µm thick cover layer. The cover layer shall be transparent to allow an optical beam to focus on the recording layer (see 11.5).

The two disk sides shall be assembled with the cover layer facing outwards.

The circular hubs are in the centre of the disk. They interact with the spindle of the drive, and provide the radial centring and the clamping force.

## 11.2 Reference axis and plane of the disk

Some dimensions of the hub are referred to a Disk Reference Plane D (see figure 12). The Disk Reference Plane D is different from Case Reference Plane P that is described in 10.3. Plane D is defined by the perfectly flat annular surface of an ideal spindle onto which the Clamping Zone of the disk is clamped, and which is normal to the axis of rotation of this spindle. The reference axis A of the disk passes through the centre of the centre hole of the hub, and is normal to Disk Reference Plane D.

The recording layer is nominally located on Disk Reference Plane D.

## 11.3 Dimensions of the disk

The dimensions of the disk shall be measured in the test environment. The dimensions of the disk in an operating environment can be estimated from the dimensions specified in this clause.

The outer diameter of the disk shall be 130,0 mm nominal. The tolerance is determined by the movement of the disk inside the case allowed by 12.3 and 12.4.

The total thickness of the disk outside the hub area shall be 2,40 mm min. and 2,80 mm max.

The Clamping Zone is the area on the disk where the clamping mechanism of the optical drive grips the disk and is defined by  $D_6$  and  $D_7$ .

The clearance zone extending from the outer diameter of the Clamping Zone ( $D_6$ ) to the inner diameter of the reflective zone (see clause 17) shall be excluded from the total thickness requirement; however there shall be no projection from the Disk Reference Plane D in the direction of the optical system of more than 0,2 mm in this zone.

### 11.3.1 Hub dimensions

The outer diameter of the hub (see figure 12) shall be

$$D_8 = 25,0 \text{ mm} \begin{matrix} + 0,0 \text{ mm} \\ - 0,2 \text{ mm} \end{matrix}$$

The height of the hub shall be

$$h_1 = 2,2 \text{ mm} \begin{matrix} + 0,0 \text{ mm} \\ - 0,2 \text{ mm} \end{matrix}$$

The diameter of the centre hole of the hub shall be

$$D_9 = 4,004 \text{ mm} \begin{matrix} + 0,012 \text{ mm} \\ - 0,000 \text{ mm} \end{matrix}$$

The height of the top of the centring hole at diameter  $D_9$ , measured above the Disk Reference Plane D, shall be

$$h_2 = 1,9 \text{ mm min.}$$

The centring length at diameter  $D_9$  shall be

$$h_3 = 0,5 \text{ mm min.}$$

The hole shall have a diameter larger than, or equal to,  $D_9$  between the centring length and the Disk Reference Plane D.

There shall be a radius at the rim of the hub at diameter  $D_9$  with height

$$h_4 = 0,2 \text{ mm} \pm 0,1 \text{ mm}$$

At the two surfaces which it intersects, the radius shall be blended to prevent offsets or sharp ridges.

The height of the chamfer at the rim of the hub at diameter  $D_8$  shall be

$$h_5 = 0,4 \text{ mm} \begin{array}{l} + 0,2 \text{ mm} \\ - 0,2 \text{ mm} \end{array}$$

The angle of the chamfer shall be  $45^\circ$ , or a corresponding full radius shall be used.

The outer diameter of the magnetizable ring shall be

$$D_{10} = 19,0 \text{ mm min.}$$

The inner diameter of the magnetizable ring shall be

$$D_{11} = 8,0 \text{ mm max.}$$

The thickness of the magnetizable material shall be

$$h_6 = 0,5 \text{ mm min.}$$

The position of the top of the magnetizable ring relative to the Disk Reference Plane D shall be

$$h_7 = 2,2 \text{ mm} \begin{array}{l} + 0,0 \text{ mm} \\ - 0,1 \text{ mm} \end{array}$$

The outer diameter of the Clamping Zone shall be

$$D_6 = 35,0 \text{ mm min.}$$

The inner diameter of the zone shall be

$$D_7 = 27,0 \text{ mm max.}$$

### 11.3.2 Cover layer dimensions

The inner diameter of the cover layer (see figure 12) shall be

$$D_{12} = 36,0 \pm 1,0 \text{ mm}$$

The outer diameter of the cover layer shall extend beyond the start of the Formatted Zone as described in clause 17.

Figure 12 — Hub Dimensions

#### 11.4 Mechanical characteristics

All requirements in this clause must be met in the operating environment.

##### 11.4.1 Material

The disk shall be made from any suitable materials such that it meets the requirements of this International Standard. The only material properties specified by this International Standard are the magnetic properties of the magnetizable ring in the hub (see 11.3.1) and the optical properties of the cover layer in the Formatted Zone (see 11.5).

##### 11.4.2 Mass

The mass of the disk shall not exceed 60 g.

##### 11.4.3 Moment of inertia

The moment of inertia of the disk relative to axis A shall not exceed 0,13 g·m<sup>2</sup>.

##### 11.4.4 Imbalance

The imbalance of the disk relative to axis A shall not exceed 0,01g·m.

#### 11.4.5 Axial deflection

The axial deflection of the disk is measured as the axial deviation of the recording layer. Thus it comprises the tolerances on the thickness of the cover layer, on its index of refraction, and the deviation of the entrance surface from the Disk Reference Plane D.

The deviation of any point of the recording layer from its nominal position, in a direction normal to the Disk Reference Plane D, shall not exceed 0,13 mm in the Formatted Zone for rotational frequencies of the disk as specified in 9.5. The deviation shall be measured by the optical system defined in 9.1.

#### 11.4.6 Axial acceleration

The maximum allowed axial error  $e_{\max}$  (see Annex V) shall not exceed 0,3  $\mu\text{m}$ , measured using the Reference Servo for axial tracking of the recording layer. The rotational frequency of the disk shall be as specified in 9.5. The stationary part of the motor is assumed to be motionless (no external disturbances). The measurement shall be made using a servo with the transfer function

$$H_s(i\omega) = \frac{1}{3} \times \left( \frac{\omega_0}{i\omega} \right)^2 \times \frac{1 + \frac{3i\omega}{\omega_0}}{1 + \frac{i\omega}{3\omega_0}}$$

where  $\omega = 2\pi f$ ,  $\omega_0/2\pi = 1\,700$  Hz,  $i = \sqrt{-1}$

or any other servo with  $|1 + H|$  within the 20 % of  $|1 + H_s|$  in the bandwidth of 20 Hz to 150 kHz. Thus, the disk shall not require an acceleration of more than 11,4  $\text{m/s}^2$  at low frequencies from the servo motor of the Reference Servo.

#### 11.4.7 Radial runout

The radial runout of the tracks in the recording layer in the Formatted Zone is measured as seen by the optical head of the Reference Drive. Thus it includes the distance between the axis of rotation of the spindle and reference axis A, the tolerances on the dimensions between axis A and the location of the track, and effects of non-uniformities in the index of refraction of the cover layer.

The radial runout is the difference between the maximum and the minimum distance of any track from the axis of rotation, measured along a fixed radial line over one physical track of the disk. The radial runout shall not exceed 50  $\mu\text{m}$  as measured by the optical system under conditions of a hub mounted on a perfect sized test fixture shaft, for rotational frequencies of the disk as specified in 9.5.

#### 11.4.8 Radial acceleration

The maximum allowed radial error  $e_{\max}$  (see Annex V) shall not exceed 0,04  $\mu\text{m}$ , measured using the Reference Servo for radial tracking of the tracks. The rotational frequency of the disk shall be as specified in 9.5. The stationary part of the motor is assumed to be motionless (no external disturbances).

The measurement shall be made using a servo with the transfer function

$$H_s(i\omega) = \frac{1}{3} \times \left( \frac{\omega_0}{i\omega} \right)^2 \times \frac{1 + \frac{3i\omega}{\omega_0}}{1 + \frac{i\omega}{3\omega_0}}$$

where  $\omega = 2\pi f$ ,  $\omega_0/2\pi = 2\,540$  Hz,  $i = \sqrt{-1}$

or any other servo with  $|1 + H|$  within the 20 % of  $|1 + H_s|$  in the bandwidth of 20 Hz to 150 kHz. Thus, the disk shall not require an acceleration of more than  $3,4 \text{ m/s}^2$  at low frequencies from the servo motor of the Reference Servo.

**11.4.9 Tilt**

The tilt angle, defined as the angle which the normal to the entrance surface, averaged over a circular area of 1 mm diameter, makes with the normal to the Disk Reference Plane D, shall not exceed 2,8 mrad in the Formatted Zone.

**11.4.10 Axial damping**

The vibration of the disk clamped to a spindle with a clamping force of  $8 \text{ N} \pm 1 \text{ N}$  shall have a first rotationally symmetric resonance frequency mode (umbrella mode) between 200 Hz and 250 Hz with a resonance peaking, measured at disk radius  $61 \text{ mm} \pm 1 \text{ mm}$ , smaller than 21 dB.

**11.5 Optical characteristics**

**11.5.1 Index of refraction**

The index of refraction of the cover layer within the Formatted Zone shall be  $1,55 \pm 0,10$ .

**11.5.2 Thickness**

The thickness of the cover layer shall be determined by its index of refraction as specified in figure 13.

**Figure 13 — Cover layer thickness as a function of the index of refraction**

**11.5.3 Birefringence**

The birefringence value of the cover layer shall be contained as follows:

$$N_p - N_z \leq |500 \times 10^{-6}|$$

where  $N_p$  is the index of refraction along any direction in the plane of the disk and  $N_z$  is the index of refraction normal to the plane of the disk (see Annex W).

## 11.5.4 Reflectance

### 11.5.4.1 General

The reflectance  $R$  is the value of the reflectance in a Recording Track of the User Zone, measured through the cover layer and does not include the reflectance of the entrance surface.

The nominal value  $R$ , of the reflectance, shall be specified by the manufacturer in byte 39 of the SDI sectors (see 17.4.4).

### 11.5.4.2 Measured value

The measured value  $R_m$  of the reflectance shall be measured under the conditions of 9.2.

Measurements shall be made in the User Zone in any Recording Track.

### 11.5.4.3 Requirement

The value of reflectance prior to writing at the standard wavelength specified in 9.2 shall lie within the range 16,5% to 25,0 % for Type RW disks and within the range 15,5% to 20,5% for Type WORM disks.

The value of reflectance following writing at the standard wavelength specified in 9.2 shall lie within the range 11,5 % to 19,5% for Type RW disks and within the range 7,5 % to 13,0 % for Type WORM disks.

At any point in the User Zone, prior to writing or following writing on Type RW or Type WORM disks, the measured reflectance  $R_m$  shall meet the following requirement:

$$R(1 - 0,22) \leq (R_{m \max} + R_{m \min}) / 2 \leq R(1 + 0,22)$$

where  $R_{m \max}$  and  $R_{m \min}$  are the maximum and minimum values of the measured reflectance in the User Zone.

This requirement specifies the acceptable range for  $R_m$ , for all disks within the same value  $R$ . Additionally, the variation of  $R_m$  within one revolution shall meet the requirement:

$$(R_{m \max} - R_{m \min}) / (R_{m \max} + R_{m \min}) \leq 0,10$$

## 12 Interface between cartridge and drive

### 12.1 Clamping method

When the cartridge is inserted into the drive, the shutter of the case is opened and the drive spindle engages the disk. The disk is held against the spindle by an axial clamping force, provided by the magnetizable material in the hub and the magnets in the spindle. The radial positioning of the disk is provided by the centring of the axis of the spindle in the centre hole of the hub. A turntable of the spindle shall support the disk in its Clamping Zone, determining the axial position of the disk in the case.

### 12.2 Clamping force

The clamping force exerted by the spindle shall be less than 14 N.

The adsorbent force measured by the test device specified in Annex E shall be in the range of 8,0 N to 12,0 N.

### 12.3 Capture cylinder

The capture cylinder (see figure 14) is defined as the volume in which the spindle can expect the centre of the hole of the hub to be at the maximum height of the hub, just prior to capture. The size of the cylinder limits the allowable play of the disk inside its cavity in the case. This cylinder is referred to perfectly located and perfectly sized alignment and location pins in the drive, and includes tolerances of dimensions of the case and the disk between the pins mentioned and the centre of the hub. The bottom of the cylinder is parallel to the Case Reference Plane P, and shall be located at a distance of

$$L_{61} = 0,5 \text{ mm min.}$$

above the Case Reference Plane P of Side B of the case when Side A of the disk is to be used. The top of the cylinder shall be located at a distance of

$$L_{62} = 4,3 \text{ mm max.}$$

above the same Case Reference Plane P, i.e. that of Side B. The diameter of the cylinder shall be

$$D_{13} = 3,0 \text{ mm max.}$$

Its centre shall be defined by the nominal values of  $L_{40}$  and  $L_{44}$  (see 10.5.9).

### 12.4 Disk position in operating condition

When the disk is in the operating condition (see figure 14) within the drive, the position of the active recording layer shall be

$$L_{63} = 4,15 \text{ mm} \pm 0,15 \text{ mm}$$

above the Case Reference Plane P of that side of the case that faces the optical system.

Moreover, the torque to be exerted on the disk in order to maintain a rotational frequency of 35 Hz shall not exceed 0,01 N·m, when the axis of rotation is within a circle of diameter

$$D_{14} = 0,2 \text{ mm max.}$$

and a centre given by the nominal values of  $L_{40}$  and  $L_{44}$  (see 10.5.9).

Figure 14 — Capture cylinder

Section 3 — Format of information

13 Track and Header geometry

13.1 Track and Header shape

The Formatted Zone shall contain tracks consisting of grooves or land, intended for the continuous servo method (see figure 15).

Both grooves and lands form continuous spirals except for Preformatted Header areas, where embossed marks are formed in non-grooved areas. A groove is a trench-like feature, the bottom of which is located farther from the entrance surface than the land. Within each 360° adjacent groove-land pair defined as a Physical Track, there are two Recording Tracks, one is located on the centreline of the groove (Groove Recording Track), and the other is located on the centreline of the land (Land Recording Track).

The Headers IDL0, IDL1, and IDL2 are aligned with the centreline of the Land Recording Track, and Headers IDG0, IDG1, and IDG2 are aligned with the centreline of the Groove Recording Track.

The QWM fields, QWML, QWMG, follow IDL0, aligned to the centreline of the Land Recording Track, and IDG0, aligned to the centreline of the Groove Recording Track.

The shape of the groove and land shall be determined by the requirements in clause 21.

Figure 15a - Track and Header geometry

Figure 15b - Track details at zone boundary

Figure 15 - Groove and Land Recording Track geometry

### 13.2 Wobble groove

The groove shall be continuous between Preformatted Header regions, except for the Mirror Area defined in 13.3. The groove shall have a square wave shaped wobble with a period of 240 Channel bits. The frequency of the wobble shall be constant in each band.

The wobble shall complete 502,117 cycles between Preformatted Headers for Type RW media.

The wobble shall complete 499,117 cycles between Preformatted Headers for Type WORM media.

The wobble groove square wave shall begin immediately following the end of the IDG2 field and shall repeat until the start of the next IDL0 field. The displacement of the first half period of the square wave (first 120 Channel bits after IDG2, see figure 16) shall be in the direction of the disc outer.

The wobble characteristics shall comply with the specifications of 21.5. This will correspond to a peak-to-peak displacement of approximately 24 nm.

The Groove Recording Track centreline shall be defined as the point in the radial direction at which the displacement of the wobble toward the inner diameter and outer diameter of the disk are equal.

The Land Recording Track centreline shall be defined as the midpoint in the radial direction between the two adjacent Groove Recording Track centrelines.

The relative radial position of grooves, lands and Preformatted Header elements is illustrated on figure 16.

### 13.3 Mirror Area

The Mirror Area, included for media reflectivity test measurements, shall exist only in specific locations of the disk (see 14.3). The Mirror Area shall be an interruption in the groove immediately following the IDG2 field (see figure 17). The length of the Mirror Area shall be 240 Channel bits.

### 13.4 Direction of spiral

The track shall spiral inward from the outer diameter to the inner diameter, clockwise as viewed from the entrance surface.

### 13.5 Track pitch

The track pitch is the distance between adjacent Land Recording Track centrelines and Groove Recording Track centrelines, measured in a radial direction.

The track pitch for Type RW media shall be  $0,400 \mu\text{m} \pm 0,02 \mu\text{m}$ . The width of a group of bands corresponding to 44 375 Physical Tracks (88 750 Recording Tracks) shall be  $35,50 \text{ mm} \pm 0,10 \text{ mm}$ .

The track pitch for Type WORM media shall be  $0,370 \mu\text{m} \pm 0,02 \mu\text{m}$ . The width of a group of bands corresponding to 47 972 Physical Tracks (95 944 Recording Tracks) shall be  $35,50 \text{ mm} \pm 0,10 \text{ mm}$ .

### 13.6 Physical Track number

Track numbers used in this International Standard refer to Physical Tracks, i.e. to land and groove track recording pairs.

Physical Track 0 shall begin on the land of the first Physical Track containing Preformatted Headers at the outer diameter of the disk. The track numbers of Physical Tracks located at radii smaller than Physical Track 0 shall be increased by 1 for each Physical Track.

Figure 16 — Preformatted Header and wobble groove displacements

Figure 17 — Mirror Area groove interruption

## 14 Track format

### 14.1 Physical Track layout

For Type RW disks, on each track there shall be 14 to 30 sectors per revolution. Each sector shall comprise 122 400 Channel bits. Hence, the length of one Channel bit is determined by the requirement that there are  $(14 \text{ to } 30) \times 122\,400 = 1\,713\,600 \text{ to } 3\,672\,000$  Channel bits on a track. The sectors shall be equally spaced over a track in such a way that the distance between the first Channel bit of a sector and the first Channel bit of the next sector shall be  $122\,400 \text{ Channel bits} \pm 3 \text{ Channel bits}$ . At the rotational rate of 32,5 Hz, the period  $T$  of a Channel bit equals:

$$T = \frac{10^9}{32,5 \times (1\,713\,600 \text{ to } 3\,672\,000)} \text{ ns} = 17,96 \text{ to } 8,38 \text{ ns}$$

For Type WORM disks, on each track there shall be 13 to 28 sectors per revolution. Each sector shall comprise 121 680 Channel bits. Hence, the length of one Channel bit is determined by the requirement that there are  $(13 \text{ to } 28) \times 121\,680 = 1\,581\,840 \text{ to } 3\,407\,040$  Channel bits on a track. The sectors shall be equally spaced over a track in such a way that the distance between the first Channel bit of a sector and the first Channel bit of the next sector shall be  $121\,680 \text{ Channel bits} \pm 3 \text{ Channel bits}$ . At the rotational rate of 35,0 Hz, the period  $T$  of a Channel bit equals:

$$T = \frac{10^9}{35,0 \times (1\,581\,840 \text{ to } 3\,407\,040)} \text{ ns} = 18,06 \text{ to } 8,39 \text{ ns}$$

The period of the wobble groove shall be 240 times the Channel clock period for both Type RW and Type WORM media.

Tables 2 and 3 list Channel clock and wobble groove timing information for Type RW and Type WORM media, respectively.

### 14.2 Physical Block Address (PBA)

Each sector shall be identified using a unique Physical Block Address (PBA).

PBA number 0 shall be located on the land of the first Physical Track that contains Preformatted Headers at a radius  $62,50 \text{ mm} \pm 0,10 \text{ mm}$ .

Each PBA shall be represented by an unsigned 24-bit value.

PBA numbers shall be consecutive within a band when read in the following manner:

Starting with the first sector on the Land Recording Track in the band and continuing to follow the spiral on the Land Recording Track until the end of the band; Returning to the first sector on the Groove Recording Track within the same band and continuing to follow the spiral on the Groove Recording Track until the end of the band.

PBA numbers shall be consecutive at each band boundary.

The PBA numbers sharing the same Physical Track shall be related by the following equation:

$$PBA-G = PBA-L + n / 2$$

where (see 15.2.2)

PBA-L is the PBA value recorded in IDL0, IDL1, and IDL2 fields

PBA-G is the PBA value recorded in IDG0, IDG1, and IDG2 fields

*n* is the total number of PBAs (sectors) within a band.

The PBA mapping for Type RW media shall be according to table 4.

The PBA mapping for Type WORM media shall be according to table 5

**Table 2 — Nominal Channel clock and wobble groove timing for Type RW media at rotational frequency of 32,5 Hz**

Band	Sectors per revolution	Channel clock frequency (MHz)	Channel clock period T (ns)	Wobble frequency (kHz)	Wobble period (µs)

### 14.3 Sectors with Mirror Area

Sectors that include a Mirror Area shall be as specified in table 6 for Type RW media and in table 7 for Type WORM media.

Sectors with a Mirror Area span 3 complete Physical Tracks in each of three different bands located near the outer, middle, and inner diameter of the disk.

Table 6 — Location of sectors with Mirror Area for Type RW media

Band	Physical Track numbers	PBA numbers on Groove Recording Track IDG
0	200 to 202	74 880 to 74 969
8	21 162 to 21 164	1 177 624 to 1 177 689
16	42 975 to 42 977	1 937 360 to 1 937 401

Table 7 — Location of sectors with Mirror Area for Type WORM media

Band	Physical Track numbers	PBA numbers on Groove Recording Track IDG
0	200 to 202	103 264 to 103 347
8	24 497 to 24 499	1 263 528 to 1 263 587
15	46 572 to 46 574	1 961 040 to 1 961 078

## 14.4 Radial alignment

The Headers of the sectors in each band shall be radially aligned in such a way that the distance between the first Channel bits of sectors in adjacent Physical Tracks shall be less than 3 Channel bits.

The wobble groove in each band shall be radially aligned in such a way that the phase difference of the wobble displacement for adjacent grooves shall be less than 3 Channel bits.

The Mirror Area, when present in a sector, shall be radially aligned in such a way that the distance between the first Channel bits of the Mirror Area in the adjacent Physical Tracks that also contain a Mirror Area shall be less than 3 Channel bits.

The Headers of the first sector in all bands shall be radially aligned in such a way that the distance between the first Channel bits of the first sectors of each band shall be less than 120 Channel bits.

## 15 Sector format

### 15.1 Sector layout

The Preformatted Header area of each sector consists of 1 892 Channel bits (see figure 18).

Sectors shall have one of the two layouts shown in figure 19 and figure 20 depending on the media Type, RW or WORM. The media Type is specified by the cartridge media identification sensor holes (see 10.5.8), and also indicated by byte 23 of the SDI sectors (see 17.4.4).

In the Preformatted Header area, each data bit shall be represented by 6 Channel bits. In the Data field area, 8-bit bytes shall be represented by 12 Channel bits. (See clause 16).

Preformatted Header for Land Recording Track						
IDL0	QWML	Blank	IDL1	Blank	IDL2	Blank
294	64	358	294	294	294	294
Total Channel bits = 1892						

Preformatted Header for Groove Recording Track						
Blank	IDG0	QWML	Blank	IDG1	Blank	IDG2
358	294	64	294	294	294	294
Total Channel bits = 1892						

IDL, IDG	
AM	ID
36	258
Total Channel bits = 294	

IDL, IDG = IDL0, IDL1, IDL2, IDG0, IDG1, IDG2

Figure 18 — Preformatted Header format for Type RW and Type WORM media

Preformatted Header	Gap	Guard1	VFO1	Sync	Data field	PA	Guard2	Buffer	TA
Number of Channel bits per field									
1 892	141 + M + N	367 - N	960	48	118 224	12	240 + N	504 - M - N	12
Total Channel bits = 122 400									

M = 0 to 127, N = 0 to 127 (See 15.5, 15.6, and 15.12)

Figure 19 — Sector format for Type RW media

Preformatted Header	Gap	VAP	VFO1	Sync	Data field	PA	Buffer	TA
Number of Channel bits per field								
1 892	141	255	840	48	118 224	12	256	12
Total Channel bits = 121 680								

Figure 20 — Sector format for Type WORM media

## 15.2 IDL, IDG

There shall be six IDL, IDG fields in the Preformatted Header designated as IDL0, IDL1, IDL2, IDG0, IDG1, and IDG2. The position of the six fields shall be as follows:

- |                      |                                                                                        |
|----------------------|----------------------------------------------------------------------------------------|
| IDL0, IDL1, and IDL2 | Located on the centreline of the Land Recording Track with a tolerance of $\pm 5$ nm   |
| IDG0, IDG1, and IDG2 | Located on the centreline of the Groove Recording Track with a tolerance of $\pm 5$ nm |

The format of these six fields shall be identical and shall contain AM and ID sub-fields (see figure 18).

### 15.2.1 Address Mark (AM)

The Address Mark shall consist of an embossed pattern that does not occur elsewhere in the ID field. The field is intended to give the drive STOB bit synchronization (see 16.1) for the following ID field. It shall have length of 36 Channel bits with the following pattern:

Figure 21 — Address Mark field pattern

### 15.2.2 ID

The six ID fields shall each contain the PBA number and CRC bytes. Each field shall consist of six bytes with the following contents:

1st byte:

- |             |                                                                                                                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bits 7 to 3 | Shall all be assumed to be ZEROs for CRC calculation, but not recorded in the ID field.                                                                                                              |
| Bit 2       | Shall specify the groove or land type of ID field, IDG or IDL.<br>When set to 0 it shall mean an IDG field (IDG0, IDG1, or IDG2).<br>When set to 1 it shall mean an IDL field (IDL0, IDL1, or IDL2). |

Bits 1 and 0 Shall specify the ID number.

When set to 0 it shall mean the ID0 field (IDL0 or IDG0).

When set to 1 it shall mean the ID1 field (IDL1 or IDG1).

When set to 2 it shall mean the ID2 field (IDL2 or IDG2).

2<sup>nd</sup> byte: This byte shall be the 8 most significant bits of the PBA (PBA<sub>23-16</sub>).

3<sup>rd</sup> byte: This byte shall be the next 8 most significant bits of the PBA (PBA<sub>15-8</sub>).

4<sup>th</sup> byte: This byte shall be the 8 least significant bits of the PBA (PBA<sub>7-0</sub>).

5<sup>th</sup> and 6<sup>th</sup> bytes: These two bytes shall specify a 16-bit CRC computed over the first four bytes of this field (see Annex F).

The most significant bit of each byte shall be recorded first.

The 43 ID data bits shall be encoded into 258 Channel bits as defined in 16.1.

### 15.3 Blank fields

There shall be Blank fields, with no marks, in the Preformatted Header as shown in figure 18.

### 15.4 Quadrature Wobble Marks (QWM)

This field of the Preformatted Header shall consist of 64 Channel bits following the ID0 field (IDL0 or IDG0).

The QWM field shall consist of long marks with two different patterns as shown on figure 22:

Pattern A: Pattern A shall be located on all even numbered Physical Tracks beginning Physical Track number 0. Pattern A shall start with PBA number 0.

Pattern B: Pattern B shall be located on all odd numbered Physical Tracks beginning with Physical Track number 1.

The QWML field following IDL0 shall be aligned with the centreline of the Land Recording Track with a tolerance of  $\pm 5$  nm. The QWMLG field following IDG0 shall be aligned with the centreline of the Groove Recording Track with a tolerance of  $\pm 5$  nm.

The QWM pattern could be used by the drive for control of radial tracking offset (based on the measurement of relative amplitudes of read signal of these patterns, see Annex X).

Figure 22 — Quadrature Wobble Mark field patterns

### 15.5 Gap

There shall be a Gap field in each sector. The length of the Gap field is variable for Type RW media, and fixed for Type WORM media. The Gap field is the first field after the Preformatted Header and gives the drive some time for processing after it has finished reading the Header.

The length of the Gap field shall be equal to  $141 + M + N$  Channel bits for each sector of Type RW media. The values of  $M$  and  $N$  are:

$$M = 0 \text{ to } 127$$

$$N = 0 \text{ to } 127.$$

$M$  and  $N$  shall be determined by the Start Position Shift (SPS) random signal generator (see Annex Y). The purpose of changing the length of the gap field is to vary the physical location of the start of data written to the disk. Varying the start position extends the number of rewrite cycles for Type RW recording layer materials.

The length of the Gap field shall be equal to 141 Channel bits for each sector of Type WORM media.

The content of the Gap field is not specified, and shall be ignored in interchange.

### 15.6 Guard

There shall be Guard fields in each sector of Type RW media. These fields are not included for sectors of Type WORM media.

The Guard1 and Guard2 fields shall be variable in length from 240 to 367 Channel bits:

- The length of the Guard1 field shall be equal to  $367 - N$  Channel bits.
- The length of the Guard2 field shall be equal to  $240 + N$  Channel bits.

where  $N$  is a value from 0 to 127 determined by the SPS random signal generator (see Annex Y).

The Guard fields shall be written with the following patterns

Figure 23 — Guard field patterns

The contents of the Guard fields shall be ignored in interchange.

**15.7 Verify and Protect (VAP)**

There shall be a VAP field in each sector of Type WORM media. This field is not included for sectors of Type RW media.

The VAP field shall be equal to 255 Channel bits in length. The VAP field is intended to detect a sector has been previously written and verified, and protect such sectors from accidentally being over-written.

The VAP field, if written, shall contain 240 Channel bits of 4T marks and 4T spaces terminated in a 15 Channel bit space (see figure 25). The terminating space allows a buffer between the end of the 4T mark and 4T space pattern and the beginning of the VFO1 field. This buffer is necessary since VFO1 and VAP fields are written at different times. The terminating space also provides some processing time for the drive to check the VAP field prior to writing.

Figure 24 — VAP field pattern

The VAP field shall be read immediately prior to writing any data to a sector. If the VAP field is detected as being written, the write of the sector shall be terminated before the beginning of VFO1.

The VAP field shall only be written during the first optional verify pass of the data. The VAP field shall not be written during any other condition or operation.

**15.8 VFO1, VFO2**

There shall be two fields (see figure 25) designated VFO1 (see 15.1) and VFO2 (see 15.10) to synchronize the VFO.

These fields shall be written by the drive when data is recorded in the sector.

Figure 25 — VFO1, VFO2 field patterns

## 15.9 Sync

The Sync field is intended to allow the drive to obtain byte synchronization for the following Data field. The Sync field content is unique and does not exist elsewhere in data. It shall have length of 48 Channel bits and be recorded with the bit pattern

010 000 001 000 000 010 000 000 010 000 000 010 000 000 100 000

## 15.10 Data field

The Data field is intended for recording user data. It shall consist of 9 852 bytes comprising:

- 8 192 user bytes,
- 1 232 bytes for Control, CRC, ECC,
- 124 bytes for Resync,
- 249 bytes for Reference,
- 50 bytes for VFO2,
- 4 bytes for Extra Sync, and
- 1 byte for Extra Reference.

All bytes in the Data field except Resync, Reference, VFO2, Extra Sync, and Extra Reference fields shall be scrambled in accordance with Annex G.

The disposition of these bytes in the Data field shall be as specified in Annex H.

The Data field shall be encoded into Channel bits as defined in 16.2.

#### 15.10.1 User data bytes

These bytes are at the disposal of the user for recording information. There shall be 8 192 such bytes per sector.

#### 15.10.2 CRC and ECC bytes

The Cyclic Redundancy Code bytes and Error Correction Code bytes are used by the error detection and correction system to rectify erroneous data. The ECC shall be a Reed-Solomon code of degree 32.

The computation of the check bytes of the CRC and ECC shall be as specified in Annex H.

#### 15.10.3 Control bytes

There shall be 12 Control bytes written after the user data bytes. The location of the Control bytes in the Data field shall be as specified in Annex H.

The first 4 bytes (P1) shall be recorded with the 4 bytes Logical Block Address (LBA) of the sector.

The second 4 bytes (P2) shall be recorded with the 4 bytes Physical Block Address (PBA) from the ID field of the sector.

The remaining 4 bytes (P3) shall be recorded with the 4 bytes Drive Information Record (DIR). The Drive Information Record shall be used as specified in Annex I.

#### 15.10.4 Resync bytes

The Resync bytes enable a drive to regain byte synchronization after a large defect in the Data field. Annex J specifies the Resync bytes and the criteria for selection of which of the two patterns is to be used.

The Resync fields shall be inserted among the rest of the bytes of the Data field as specified in Annex H.

#### 15.10.5 Reference byte

The Reference byte provides 3T read signal amplitude information for the drive data decoder. The Reference bytes may also be used to detect data dropout conditions and identify the location for application of erasure ECC correction.

Annex J specifies the Reference byte. The Reference fields shall be inserted among the rest of the Data field as specified in Annex H.

#### 15.11 Postamble (PA)

The PA field shall have a nominal length of 12 Channel bits which shall be used for RLL(1,7) closure. This field shall be encoded with the data byte (FF) and end in a space.

#### 15.12 Buffer

The Buffer field is used to accommodate the various system tolerances. Causes of variation are as follows: Header-to-Header spacing as specified in 14.1 and the actual length of the written data as determined by the runout of the track, speed variation of the disk, and wobble groove PLL timing error.

The length of the Buffer field shall be variable and depends on the length of the SPS random signal generator values  $M$  and  $N$  for Type RW media, and shall equal  $504 - M - N$  Channel bits.

The length of the Buffer field shall be fixed for Type WORM media, and shall equal 256 Channel bits.

The minimum Buffer field length is approximately 0,2 % of the total sector length.

### 15.13 Transition Area (TA)

This area is used for transition from the grooved areas to embossed Headers and shall be equal in length to 12 Channel bits. This area shall not contain user information.

## 16 Recording codes

### 16.1 Preformatted Header

The 43 data bits in each of the six ID fields shall be encoded into Channel bits on the disk using the Six Times Oversampled Bi-Phase (STOB) as defined in figure 26.

All other Preformatted Header fields in a sector have already been defined in terms of Channel bits.

Figure 26 — STOB bit patterns

### 16.2 Data field

The 8-bit bytes in the Data field shall be encoded into Channel bits on the disk according to table 8 and Annex H. Channel bits in the Data field shall be decoded into information bits according to table 9 and Annex H. All other fields in the Data field have already been defined in terms of Channel bits. Write pulses shall produce a mark in a manner such that the edge between a mark and a space or a space and a mark corresponds to a Channel bit that is a ONE.

The recording code used to record all data in the Data fields of the disk shall be the run-length limited code known as RLL(1,7) as defined in tables 8 and 9.

**Table 8 — Encoding of input bits to Channel bits**

Preceding Channel bit	Current input bits	Channel bits RLL(1,7)	Group
0	01	100	A
1	01	000	A
x	10	010	A
0	11	101	A
1	11	001	A
0	00 01	100 001	B
1	00 01	000 001	B
0	00 10	100 000	B
1	00 10	000 000	B
x	00 11	010 001	B
x	00 00	010 000	B

The coding shall start at the first bit of the first byte of the field to be converted. The preceding Channel bit to the first byte is assumed to be ZERO.

Basically two input bits translate into three Channel bits (group A). However, if the two input bits are ZERO ZERO, then the next two input bits are also evaluated, and the four input bits translate into six Channel bits (group B).

Resync and Reference fields shall be ignored for encoding of the input data. Resync and Reference bytes must be inserted into the Channel bit data at the proper locations after encoding.

The insertion of the Resync and Reference fields does not effect closure of the RLL(1,7) encoded data. Closure of the last data byte occurs in the PA field.

**Table 9 — Decoding of Channel bits to information bits**

Preceding Channel bits	Current Channel bits	Following Channel bits	Decoded information bits
xx	010	00	00
xx	010	01 or 10	10
01	000	00	00
01	000	01 or 10	01
10	000	xx	00
00	000	xx	10
xx	100	00	00
xx	100	01 or 10	01
00	001	xx	01
01 or 10	001	xx	11
xx	101	xx	11

Resync and Reference fields shall be ignored for decoding of channel data. Resync and Reference bytes must be removed from the Channel bit data at the proper locations prior to decoding.

## 17 Formatted Zone

### 17.1 General description of the Formatted Zone

The Formatted Zone contains all information on the disk relevant for data interchange. This information comprises embossed tracking provisions, embossed Headers, and possibly user written data. In this clause the term "data" is reserved for the content of the Data field of a sector, which, in general, is transferred to the host.

Clause 17 defines the layout of the information. The characteristics of signals obtained from this information are specified in sections 4 and 6.

### 17.2 Division of the Formatted Zone

The Formatted Zone shall be divided into zones at the radius values specified by table 10.

These zones shall correspond to PBA numbers indicated in table 11 for Type RW media and table 12 for Type WORM media.

The dimensions are given as reference only, and are nominal locations. The tolerance on the location of PBA number 0 is specified in 14.2. The tolerances on the other radii are determined by the tolerance on the track pitch as specified in 13.5.

PBA numbers not listed in table 11 and 12 are used to provide boundary guard tracks between bands and buffer tracks between recording zones. These sectors shall not be recorded by the media manufacturer or the drive system.

The entire Formatted Zone shall be reflective and have the same recording layer.

Table 10 — Layout of the Formatted Zone by radius

Formatted Zone	Radius (mm)			
	Type RW media		Type WORM media	
	Band		Band	
Lead-in	0	62,50 to 62,18	0	62,50 to 62,20
User Zone 0	0	62,18 to 60,71	0	62,20 to 59,96
Outer Read Focus Offset	0	60,71 to 60,71	0	59,96 to 59,96
Outer Read Reference	0	60,71 to 60,71	0	59,96 to 59,96
Outer Manufacturer	0	60,71 to 60,67	0	59,96 to 59,92
User Zone 1	1	60,66 to 58,47	1	59,92 to 57,68
User Zone 2	2	58,47 to 56,30	2	57,67 to 55,44
User Zone 3	3	56,29 to 54,13	3	55,44 to 53,21

Inner Read Reference	15	1 918 218 to 1 918 256	1 956 958 to 1 956 996
Inner Manufacturer	15	1 918 270 to 1 919 699	1 957 010 to 1 958 439
Lead-out	15	1 919 700 to 1 940 499	1 958 440 to 1 979 239

### 17.2.1 Lead-in Zone

The Lead-in Zone shall be used for positioning purposes only. The Lead-in Zone shall comprise 800 Recording Tracks.

### 17.2.2 Read Focus Offset (RFO) Zones

There shall be an Outer, Middle, and Inner Read Focus Offset Zone on each side of the disk. They are intended to allow drives to adjust the focus offset to the optimal read conditions for the disk.

The Read Focus Offset Zones shall be recorded by the media manufacturer, and shall not be written or modified by the drive system. All three of the Read Focus Offset Zones shall contain identical test data patterns as specified in 17.3.

The recorded data marks shall satisfy the requirements for signals specified in clause 25.

#### 17.2.2.1 Outer Read Focus Offset Zone

The Outer Read Focus Offset Zone shall be located in Band 0.

The Outer Read Focus Offset Zone shall comprise 6 Recording Tracks.

#### 17.2.2.2 Middle Read Focus Offset Zone

The Middle Read Focus Offset Zone shall be located in Band 8.

The Middle Read Focus Offset Zone shall comprise 6 Recording Tracks.

#### 17.2.2.3 Inner Read Focus Offset Zone

The Inner Read Focus Offset Zone shall be located in Band 16 for Type RW media and in Band 15 for Type WORM media.

The Inner Read Focus Offset Zone shall comprise 6 Recording Tracks.

### 17.2.3 Read Reference Zones

There shall be an Outer, Middle, and Inner Read Reference Zone on each side of the disk. They are intended to allow drives to quantify the read performance (byte error rate) and PLL jitter.

The Read Reference Zones shall be recorded by the media manufacturer, and shall not be written or modified by the drive system. All three of the Read Reference Zones shall contain identical test data patterns as specified in 17.3.

The recorded data marks shall satisfy the requirements for signals specified in clause 25.

#### 17.2.3.1 Outer Read Reference Zone

The Outer Read Reference Zone shall be located in Band 0.

The Outer Read Reference Zone shall comprise 6 Recording Tracks.

#### 17.2.3.2 Middle Read Reference Zone

The Middle Read Reference Zone shall be located in Band 8.

The Middle Read Reference Zone shall comprise 6 Recording Tracks.

#### 17.2.3.3 Inner Read Reference Zone

The inner Read Reference Zone shall be located in Band 16 for Type RW media and in Band 15 for Type WORM media.

The Inner Read Reference Zone shall comprise 6 Recording Tracks.

#### **17.2.4 Manufacturer Zones**

There shall be an Outer, Middle, and Inner Manufacturer Zone on each side of the disk. They are provided to allow the media manufacturers to perform tests on the disk, including read and write calibration operations, in areas located away from that intended for user recorded information. The sectors contained in the Manufacturer Zones may be used at the discretion of the media manufacturer.

The Manufacturer Zones are intended for quality tests by the media manufacturer. They should not be used by drives and shall be ignored in interchange.

##### **17.2.4.1 Outer Manufacturer Zone**

The Outer Manufacturer Zone shall be located in Band 0.

The Outer Manufacturer Zone shall comprise 100 Recording Tracks.

##### **17.2.4.2 Middle Manufacturer Zone**

The Middle Manufacturer Zone shall be located in Band 8.

The Middle Manufacturer Zone shall comprise 140 Recording Tracks.

##### **17.2.4.3 Inner Manufacturer Zone**

The Inner Manufacturer Zone shall be located in Band 16 for Type RW media and in Band 15 for Type WORM media.

The Inner Manufacturer Zone shall comprise 220 Recording Tracks.

#### **17.2.5 SDI Zones**

The two, Outer and Inner, SDI Zones on each side of the disk shall be used for recording Specific Disk Information (see 17.4).

The SDI Zones shall consist of sectors recorded by the same modulation method and format as is used in the User Zone (see clauses 15 and 16).

##### **17.2.5.1 Outer SDI Zone**

The Outer SDI Zone shall be located near the outer radius of Band 7.

The Outer SDI Zone shall comprise 2 Recording Tracks.

##### **17.2.5.2 Inner SDI Zone**

The Inner SDI Zone shall be located near the inner radius of Band 7.

The Inner SDI Zone shall comprise 2 Recording Tracks.

#### **17.2.6 DDS Zones**

The two, Outer and Inner, DDS Zones on each side of the disk shall be used for recording the Disk Definition Structure (see 18.5).

The DDS Zones shall consist of sectors recorded by the same modulation method and format as is used in the User Zone (see clauses 15 and 16).

#### **17.2.6.1 Outer DDS Zone**

The Outer DDS Zone shall be located near the outer radius of Band 7.

The Outer DDS Zone shall comprise 2 Recording Tracks.

#### **17.2.6.2 Inner DDS Zone**

The Inner DDS Zone shall be located near the inner radius of Band 7.

The Inner DDS Zone shall comprise 2 Recording Tracks.

#### **17.2.7 PDL3 Zone**

The PDL3 Zone shall be located near the inner radius of Band 7.

The PDL3 Zone shall be used to record a redundant version of the two Primary Defect Lists (PDL1 and PDL2) that are contained in the Defect Management Area (see 18.4).

The PDL3 Zone shall comprise 6 Groove Recording Tracks. The 7 adjacent Land Recording Tracks shall not be recorded.

#### **17.2.8 Write Power Calibration Zone**

The Write Power Calibration Zone is intended for tests to enable a drive to optimize its write power and shall not be used by media manufacturers.

The Write Power Calibration Zone shall be located in Band 8.

The Write Power Calibration Zone shall comprise 100 Recording Tracks for Type RW media and 1 530 Recording Tracks for Type WORM media.

For Type RW media, the tracks and sectors used for testing should be chosen from the Write Calibration Zone in a random way, so as to ensure a gradual degradation of the entire Write Calibration Zone due to use. Then each track in this zone will remain representative for the characteristics of the tracks in the User Zones of the disk.

For Type WORM media, the sectors should be used sequentially by PBA for Land Recording Tracks until depleted, and then followed sequentially by PBA for Groove Recording Tracks within the Write Calibration Zone.

The recommended write power calibration data test pattern is specified in 17.3.

The Write Power Calibration Zone shall be ignored in interchange.

#### **17.2.9 User Zones**

The Data fields in the User Zones shall contain user written data in the format of clause 15. The layout of the User Zones and their sub-divisions is specified in clause 18.

#### **17.2.10 Lead-out Zone**

The Lead-out Zone shall be used for positioning purposes only. The Lead-out Zone shall comprise 3 200 Recording Tracks.

**17.3 Drive test data patterns**

The test patterns used to perform drive calibration for optimal read and write performance are listed in table 13. The purpose of the test patterns is to generate specific encoded channel patterns that can be used to evaluate read signal characteristics.

The test data patterns used in the Read Focus and Read Reference zones shall be as specified in table 13. They shall be written under the following special conditions:

- Test sectors shall be written with data scrambler and ECC disabled/enabled as shown on table 13.
- The Control bytes, CRC bytes, and ECC parity bytes of test sectors shall be written with the test pattern when ECC is disabled.
- The test user data pattern shall be repeated to fill the entire Data field of test sectors.

The suggested write power calibration test pattern consists of a repeated 8T mark and 8T space without inserted synchronization fields (Sync and Resync). This is an illegal data pattern for the RLL(1,7) encoder / decoder. The test pattern is recorded with varying write power within a single sector to determine the optimal recording power.

**Table 13 — Drive Test Zone data patterns**

Drive test zones	Write power	Data scrambler	ECC	User data pattern	Encoded channel pattern
Read Focus Offset zones	Nominal	Disabled	Disabled	(BB BB AA AA AA AA 00 00)	2T-3T-6T
Read Reference zones	Nominal	Enabled	Enabled	(00)	Pseudo-random
Write Power Calibration zone	Varying				8T- 8T (suggested)

**17.4 SDI Zones usage**

The two SDI Zones shall be recorded using the thermo-optical Phase Change recording method in the sector format specified in clause 15. The recorded data marks shall satisfy the requirements for signals specified in clause 25.

Both of the SDI Zones shall be recorded by the media manufacturer, and shall not be written or modified by the drive system. Both of the SDI Zones shall contain identical information.

**17.4.1 SDI amendment**

The SDI Zones shall initially be recorded only in every fourth sector, as shown in tables 14 and 15. The media manufacturer may use the three unrecorded sectors between the recorded sectors to allow for amendment of the SDI data. Up to three amendments to the SDI can be made.

The disk drive system shall use the latest amended SDI data, as determined by the sectors that have been written. Table 14 and 15 list the Physical Block Addresses of the SDI sectors for the initial and amended cases, for Types RW and WORM media.

Table 14 — SDI Sectors by Physical Block Address for Type RW media

#### 17.4.2 LBA Control Bytes in SDI sectors

SDI sectors shall be recorded with the four LBA Control Bytes (P1) (see 15.10.3) set as follows:

$$\text{LBA} = \text{PBA} + (80000000).$$

SDI sectors are located at fixed PBAs, and shall not be remapped to alternate locations.

#### 17.4.3 Parametric conditions

The media read, write, and erase parameters contained in the SDI Zones shall be determined under the following conditions:

- Environment: Test environment (see 8.1.1).
- Optical beam: As defined in 9.2.
- Disk rotation: As defined in 9.5.

**17.4.4 Specific Disk Information**

SDI sectors shall consist of 8 192 bytes that contain Specific Disk Information as defined in Annex K.

**17.5 DDS Zones Usage**

The two DDS Zones shall be recorded using the thermo-optical Phase Change recording method in the sector format specified in clause 15. The recorded data marks shall satisfy the requirements for signals specified in clause 25.

The media manufacturer shall record both of the DDS Zones during the disk certification process. Both of the DDS Zones shall contain identical information.

For Type RW media, the DDS shall be rewritten by the drive system during a format process.

For Type WORM media, the DDS shall not be written or modified by the drive system after disk format.

**17.5.1 DDS Amendment**

The DDS Zones shall initially be recorded only in every fourth sector, as shown in table 16 and 17. The media manufacturer may use the three unrecorded sectors between the recorded sectors to allow for amendment of the DDS data. Up to three amendments to the DDS can be made.

The disk drive system shall use the latest amended DDS data, as determined by the sectors that have been written. Table 16 and 17 list the PBAs of the DDS sectors for the initial and amended cases.

### 17.5.2 LBA Control Bytes in DDS sectors

DDS sectors shall be recorded with the four LBA Control Bytes (P1) (see 15.10.3) set as follows:

$$\text{LBA} = \text{PBA} + (80000000).$$

DDS sectors are located at fixed PBAs, and shall not be remapped to alternate locations.

### 17.5.3 DDS information

The DDS sector shall be recorded with data bytes as specified in 18.5.

## 18 Layout of the User Zones

### 18.1 General description of the User Zones

The total data capacity of the User Zones is 15,0 Gbytes per side for both Type RW and Type WORM disks.

The location and size of the User Zones are specified in clause 17.

### 18.2 Divisions of the User Zones

The User Zones shall be divided into bands as a result of the ZCAV organization of the disk.

There shall be 17 bands numbered 0 to 16 for Type RW media

There shall be 16 bands numbered 0 to 15 for Type WORM media.

Each User Zone is further divided into two groups of contiguous PBA numbers, one group for groove tracks, and one group for land tracks (see tables 18 and 19).

### 18.3 User Area

The Data fields in the User Area are intended for recording of the user data.

The User Area shall be either:

- a Rewritable Zone (Type RW media) intended for writing and rewriting of user data

or

a Write Once Read Many Zone (Type WORM media) intended for write once recording of user data.

A contiguous block of Land Recording Track sectors of User Zone 7 shall be included in a Defect Management Area (DMA).

The User Area and DMA shall include only the PBA numbers specified in tables 18 and 19.

Sectors in the User Zones that are not specified as part of the User Area or DMA shall not be recorded by media manufacturers or the drive system.

**Table 18 — User Area Data Groups and DMA location for Type RW media**

Data Group (Band – Land / Groove)	Sectors per Data Group	Start PBA	End PBA
0 – L	55080	12 000	67 079
0 – G	55080	80 880	135 959
1 – L	79 257	137 847	217103
1 – G	79 257	217 278	296 534

15 – G	16 302	1 940 539	1 956 840

Total Number of Sectors in the User Area Data Groups (Excluding DMA) = 1 834 348

#### 18.4 Defect Management Area (DMA)

The Defect Management Area (DMA) is used to manage media defects found during media initialization as well as defects found dynamically during user writes.

The DMA shall be divided in the following sub-areas: Primary Defect List 1 (PDL1) Area, Secondary Defect List (SDL) Area, Primary Spares Area (PSA), Secondary Spares Area (SSA), SDL Duplicate Pages (SDLDP) Area, and Primary Defect List 2 (PDL2) Area.

The DMA layout shall be as shown in table 20.

Each sub-area shall immediately follow the preceding one except for PSA, SSA and SDLDP Areas which shall be preceded by a 1-sector pad.

#### **18.4.1 Primary Defect List (PDL) Area**

The PDL Area shall store in the PDL Pages two copies, PDL1, PDL2, of the list of defective sectors found during media certification (see 19.5).

A third copy shall be written in PDL3 (see 17.2.7). The PDL3 Area, which is not part of the DMA, is recorded in a dedicated area located near the inner diameter of Band 7.

The redundant copies shall be used for recovery should any PDL sector become damaged.

The size of PDL1 Area shall be established when it is written and shall be the actual number of sectors used (both good and bad) in writing the PDL. At least 1 sector shall be used for PDL1.

The size of PDL2 Area shall be:

$$2 \cdot \text{rounded-up} (\text{number of Primary Defects} / \text{number of entries per PDL Page})$$

The size of the PDL2 Area accommodates twice the number of PDL Pages required for the Primary Defect List, in the event that some sectors in this area may be defective. If certification is not performed or no defective sectors are found during certification, 1 sector shall be used for PDL2.

#### **18.4.2 Secondary Defect List (SDL) Area**

The SDL Area shall store in the SDL Pages the list of defective sectors found during user data writes (see 19.6).

The size of the SDL Area shall be:

$$2 \cdot \text{rounded-up} [(DMA \text{ size} - PDL1 \text{ size} - PDL2 \text{ size} - \text{estimated PSA size} - \text{Pad Sectors}) / \text{maximum entries per SDL Page}]$$

The size of the SDL Area accommodates twice the number of SDL Pages required for the number of sectors remaining in the SSA, in the event that some sectors in this area may be defective.

For Type WORM media, a new SDL Page shall be recorded after a group of sectors (by example 250) has been written into the SSA.

The complete Secondary Defect List shall be determined by reading the SDL Area and also scanning the SSA for any sectors which have not yet been recorded into an SDL Page.

#### **18.4.3 SDL Duplicate Pages (SDLDP) Area**

The SDL Duplicate Pages (SDLDP) Area shall store a copy of the content of the SDL for recovery in the case of damaged SDL sectors

The SDLDP Area size shall be equal to the SDL Area size.

#### **18.4.4 Primary Spares Area (PSA)**

The Primary Spares Area (PSA) shall contain sectors that are slipped due to defects found during media certification.

The PSA size shall be equal to the number of Primary Defects in the User Zones and the PSA. The estimated PSA size shall be defined as the number of sectors required to relocate the Primary Defects in the User Zones.

The actual PSA size shall be increased by 1 sector for each Primary Defect in the PSA. In the event that there are no Primary Defects in the User Zones, 1 sector shall be used for the PSA.

#### 18.4.5 Secondary Spares Area (SSA)

The Secondary Spares Area (SSA) shall contain sectors automatically relocated during writing.

The SSA Area size shall be equal to the size of the DMA Areas minus the size of all other sub-areas and the pad sectors.

**Table 20 — Defect Management Area layout**

Location	Contents	Reserved area size
Start PBA <sup>(1)</sup>	PDL1 <sup>(2)</sup>	Actual number of sectors used in writing PDL. At least 1 sector shall be used.
	SDL <sup>(2)</sup>	$2 \cdot \text{rounded-up} [(DMA \text{ size} - PDL1 \text{ size} - PDL2 \text{ size} - \text{estimated PSA size} - 3 \text{ Pad Sectors}) / \text{maximum entries per SDL Page}]$
	Pad sector	1 PBA
DMA (Defect Management Area)	PSA <sup>(2)</sup>	PSA = Number of defective sectors found in bands and PSA during initialization. At least 1 sector is used for the PSA Area.
	Pad sector	1 PBA
	SSA <sup>(2)</sup>	DMA size – all other sub-areas and pad sectors size within DMA
End PBA	Pad sector	1 PBA
	SDLDP <sup>(2)</sup>	Same size as SDL
	PDL2 <sup>(2)</sup>	$2 \cdot \text{rounded-up} [(number \text{ of Primary Defects} / Number \text{ of entries per PDL Page}]$ At least 1 sector shall be used.

1. This area shall have the indicated dedicated PBA area on the disk. The actual start PBA of valid data for this area however, is indicated in the DDS. The start PBA in this table and the start PBA given in the DDS may be different as an error could occur in writing the first PBA(s) in this area, such that the first PBA(s) are not valid. The DDS structure points to the first valid (“good”) PBA in this area.

2. The actual Start and End PBAs for the sub-areas are recorded in DDS and may differ from the reserved spaces listed above.

#### 18.5 Disk Definition Structure (DDS)

The DDS shall consist of a table with a length of 1 sector. It specifies the location of the Defect Management entities, provides information about the drive that wrote it, and provides information concerning Secondary Defect List (SDL) Page handling. The DDS shall be recorded as specified in 17.5.

Table 21 specifies the format of a DDS sector.

**Table 21 — DDS Sector format**

Byte	Contents
0 - 1	DDS Identifier ((A5A5))
2	DDS Format Revision
3 - 10	Vendor Identification (MSB – LSB) (ASCII)
11 - 26	Product Identification (MSB – LSB) (ASCII)
27 - 30	Product Revision Level (MSB – LSB) (ASCII)
31 - 34	Drive Serial Number (MSB – LSB)
35 - 38	Start of PDL1 (MSB - LSB) (PBA)
39 - 42	End of PDL1 (MSB - LSB) (PBA)
43	PDL1 Valid Flag
44 - 59	PDL1 Good Sector Bitmap
60 - 63	Start of SDL (MSB - LSB) (PBA)
64 - 67	End of SDL (MSB – LSB) (PBA)
68 - 69	Maximum entries per SDL Page (MSB - LSB)
70 - 73	Start of Primary Spares (MSB - LSB) (PBA)
74 - 77	End of Primary Spares (MSB – LSB) (PBA)
78 - 81	Start of Secondary Spares (MSB - LSB) (PBA)
82 - 85	End of Secondary Spares (MSB - LSB) (PBA)
86 - 89	Start of SDL Duplicated Pages (MSB - LSB) (PBA)
90 - 93	End of SDL Duplicated Pages (MSB - LSB) (PBA)
94 - 97	Start of PDL2 (MSB – LSB) (PBA)
98 - 101	End of PDL2 (MSB – LSB) (PBA)
102	PDL2 Valid Flag
103 - 118	PDL2 Good Sector Bitmap
119 - 122	Start of PDL3 (MSB - LSB) (PBA)
123 - 126	End of PDL3 (MSB - LSB) (PBA)
127	PDL3 Valid Flag
128 - 143	PDL3 Good Sector Bitmap
144 - 8189	Unspecified
8190 - 8191	DDS Identifier Complement ((5A5A))

The DDS Format Revision, Vendor Identification, Product Identification, Product Revision, and Drive Serial Number fields shall contain implementation specific information that shall be ignored for the purposes of interchange.

The Start of PDL<sub>n</sub> fields shall contain the PBA of the first good block in the corresponding PDL. In the event that the first page of a PDL set cannot be written, (7FFFFFFF) shall be used, as the starting PBA and the Valid Flag shall be set to ZERO.

The End of PDL<sub>n</sub> fields shall contain the PBA of the last good block in the corresponding PDL.

The PDL<sub>n</sub> Valid Flag fields shall contain a ONE when the corresponding PDL is valid and a ZERO when invalid. All other values for the Valid Flag field are forbidden.

The purpose of the PDL<sub>n</sub> Good Sector Bitmap fields is to provide information useful in determining what sectors in the PDL must be read. The status of each sector in the PDL can be determined by examining the corresponding bit in the bitmap. Good sectors have the bit set, whereas bad sectors do not.

## 19 Defect Management in the Rewritable (RW) and Write Once Read Many (WORM) Zones

Defective sectors on the disk shall be replaced by good sectors according to the Defect Management scheme described below. Each side of the disk shall be initialized before use. This International Standard allows media initialization with or without certification. A sector Slipping Algorithm handles defective sectors found during certification. A Linear Replacement Algorithm handles defective sectors found after initialization. The total number of sectors on a side of the disk replaced by the sector Slipping Algorithm shall not exceed half the number of DMA sectors. The total number of sectors on a side of the disk replaced by both algorithms shall not exceed the number of DMA sectors.

### 19.1 Initialization of the disk

During initialization of the disk, the DMA is partitioned and the DDSs and PDLs are recorded prior to the first use of the disk. The User Area is divided into bands, each containing only data sectors. Media initialization can include a certification of the RW bands and the WORM bands, whereby defective sectors are identified and skipped.

For Type WORM media only a single initialization is allowed. Once the DDSs and PDLs are recorded, it indicates that the disk is initialized and no further initialization is permitted. For Type WORM media, all sectors in the WORM bands, the PSA, the SSA, the SDL, and the SDLDP shall be in the blank state at the end of initialization.

For Type RW media, all sectors in the SDL, the SDLDP, and the SSA shall be in the erased state at the end of initialization.

All DDS parameters shall be recorded in all of the DDS sectors as specified in 17.5. The PDLs shall be recorded in the areas defined in 18.4. The contents of the PDLs and SDLs shall be as shown in tables 23 and 24 (see 19.5 and 19.6).

### 19.2 Certification

If the disk is certified, the certification shall at a minimum be applied to all sectors of the RW and WORM bands in the User Area. This International Standard does not state the method of certification. It may involve, erasing, writing, and reading of sectors. The Slipping Algorithm (see 19.2.1) shall handle defective sectors found during certification. Defective sectors shall not be used for reading or writing in the User Area. Guidelines for replacing defective sectors are given in Annex Z.

#### 19.2.1 Slipping Algorithm

The Slipping Algorithm shall be applied across each band of the disk if certification is performed.

For PBAs less than the start PBA of the DMA, defective data sectors found during certification shall be replaced by the first good sector following the defective sector within the current band, thus causing a slip of one sector towards the DMA. In the case where a sector slips out of a band, with the exception of the last band before the DMA, the replacement sector shall be the first sector of the next band, and so causes a slip of one sector towards the DMA. Sectors slipping out of the band immediately before the DMA are slipped into the PSA. The slip count will increase as the PBA increases.

For PBAs higher than the start PBA of the DMA, defective data sectors found during certification shall be replaced by the first good sector preceding the defective sector within the current band, thus causing a slip of one sector towards the DMA. In the case where a sector slips out of the beginning of a band, with the exception of the first band after the DMA, the replacement sector shall be the last sector of the preceding band, and so causes a slip of one sector towards the DMA. Sectors slipping out of the band immediately after the DMA are slipped into the PSA from the tail end. The slip count will increase as the PBA decreases.

Table 22 shows a simplified example of the Slipping Algorithm for a greatly shortened PBA range over several bands including the DMA and PSA.

**Table 22 — Sector Slipping Algorithm example**

	Band 0			Band 1			DMA – PSA				Band 2			Band 3		
PBA	0	1	2	10	11	12	20	21	22	23	30	31	32	40	41	42
LBA	0		1	2	3		4	5	6	7	8	9		10	11	
Bad		X				X							X		X	

The address of each defective sector shall be written in the PDLs. If no defective sectors are found during certification, an empty PDL shall be recorded. As the PSA grows, the SSA is diminished accordingly. All replacements performed using the Slipping Algorithm are done without regard for land or groove.

**19.2.2 Linear Replacement Algorithm**

The Linear Replacement Algorithm is used to handle defective sectors found after certification.

The defective sector shall be replaced by the first available sector in the SSA.

As with the Slipping Algorithm, replacement shall be done without regard for land or groove.

If a replacement sector is found to be defective, it shall be replaced by the next available spare sector. The next available spare sector does not have to be the next PBA. The address of the defective sector shall be recorded in the SDL in the appropriate position so that the replacement sector PBA can be calculated from the entry position and the “First Spare in this Page” field in the SDL Page.

The addresses of sectors already recorded in the PDL shall not be recorded in the SDL.

If a replacement sector listed in the SDL is later found to be defective, it shall be dealt with by making a new entry in the SDL indicating a replacement sector for the defective replacement sector.

**19.3 Disk not certified**

The Linear Replacement Algorithm is used to handle sectors found defective on disks, which have not been certified.

The defective sector shall be replaced by the first available sector in the SSA.

If a replacement sector is found to be defective, it shall be replaced by the next available spare sector. The next available spare sector does not have to be the next PBA. The address of the defective sector shall be recorded in the SDL in the appropriate position so that the replacement sector PBA can be calculated from the entry position and the “First Spare in this Page” field in the SDL Page.

If a replacement sector listed in the SDL is later found to be defective, it shall be dealt with by making a new entry in the SDL indicating a replacement sector for the defective replacement sector.

## 19.4 Write procedure

When writing data in the sectors of a band, all defective sectors listed in the PDL shall be skipped and the data shall be recorded in the appropriate sector in accordance with the Slipping Algorithm. If a sector to be written is listed in the SDL, the data shall be written in the spare sector pointed to by the SDL, according to the Linear Replacement Algorithm. When writing in the PSA, all defective sectors listed in the PDL shall be skipped and the data shall be relocated using the Slipping Algorithm. When writing the DDS, PDL, SDL, and in the SSA, all defective sectors listed in the PDL shall be skipped and written in the next available sector in the affected area.

For Type WORM after initialization, all sectors in the User Area shall be in the blank state. Erasing of sectors on Type WORM media is not permitted. If the sector has been written, a write operation is not permitted. During write operations, sectors shall always be recorded with CRC, ECC, and Control Record information as specified by this International Standard. See Annex AA for guidelines for the use of Type WORM media.

## 19.5 Primary Defect List (PDL) format and content

The PDL shall consist of bytes specifying

- the format revision of the PDL,
- information about the drive type that wrote the PDL,
- a PDL Page sequence number,
- the number of entries in the entire PDL,
- the PBAs of the defective sectors, identified at initialization, in ascending order,
- a vendor unique defect code for each defective sector,
- the drive serial number of the drive that found each defective sector.

Table 23 shows the PDL byte layout. All remaining defect entries in the last page of the PDL shall have the PBA set to (7FFFFFFF), the Defect Cause set to (FF), and the Drive Serial Number set to (FFFFFF). If no defective sectors are detected, the Number of Defective Sectors field shall be set to ZERO.

During initialization, a PDL shall be recorded; this PDL may be empty.

**Table 23 — Primary Defect List Page format**

Byte	Contents
0 - 1	PDL Identifier ((0001))
2	PDL Page Format Revision
3 - 10	Vendor Identification (MSB – LSB) (ASCII)
11 - 26	Product Identification (MSB – LSB) (ASCII)
27 - 30	Product Revision Level (MSB – LSB) (ASCII)
31 - 34	Drive Serial Number (MSB – LSB)
35 - 36	PDL Page Number (MSB – LSB)
37 - 40	Number of Defective Sectors (MSB – LSB)
41 - 189	Unspecified
190 - 193	1 <sup>st</sup> Defective Sector (MSB – LSB) (PBA)
194	1 <sup>st</sup> Defective Sector Defect Cause
195 - 197	1 <sup>st</sup> Defective Sector Drive Serial Number (MSB – LSB)
.....	.....

8182 - 8185	1000 <sup>th</sup> Defective Sector (MSB - LSB) (PBA)
8186	1000 <sup>th</sup> Defective Sector Defect Cause
8187 - 8189	1000 <sup>th</sup> Defective Sector Drive Serial Number (MSB - LSB)
8190 - 8191	PDL Identifier Complement ((FFFE))

The PDL Format Revision, Vendor Identification, Product Identification, Product Revision, and Drive Serial Number fields shall contain implementation specific information that shall be ignored for the purposes of interchange. The PDL Format Revision is used to specify the format of the unspecified bytes in the PDL Page.

When writing a PDL Page, the control record LBA shall be set to the PBA + (80000000).

### 19.6 Secondary Defect List (SDL) format and content

The SDL is used to record the addresses of data and spare sectors, which have become defective after initialization and those of their respective replacements. The SDL shall consist of bytes specifying

- the format revision of the SDL Page,
- information about the drive type that wrote the SDL Page,
- a SDL Page sequence number,
- the number of entries in the SDL Page,
- the PBAs of the first sector in the SSA that is covered by the SDL Page,
- the PBA of each defective sector,
- a vendor unique defect code for each defective sector,
- the drive serial number of the drive that found each defective sector,
- the PBA of the first write attempt to the Page,
- the count of the number of times the Page has been updated (set to ZERO for Type WORM media).

Table 24 shows the PDL byte layout. All unused defect entries in an SDL Page shall have the PBA set to (7FFFFFFF), the Defect Cause set to (FF), and the Drive Serial Number set to (FFFFFF). Defective SSA sectors shall be recorded in the SDL Page in the same manner as unused sectors.

**Table 24 — Secondary Defect List Page format**

Byte	Contents
0 - 1	SDL Identifier ((0002))
2	SDL Page Format Revision
3 - 10	Vendor Identification (MSB - LSB) (ASCII)
11 - 26	Product Identification (MSB - LSB) (ASCII)
27 - 30	Product Revision Level (MSB - LSB) (ASCII)
31 - 34	Drive Serial Number (MSB - LSB)
35 - 36	SDL Page Number (MSB - LSB)
37 - 38	Number of PBAs in this Page (MSB - LSB)
39 - 42	First Spare in this Page (MSB - LSB) (PBA)
43 - 46	Page Origin PBA
47 - 48	Page Update Count
49 - 189	Unspecified
190 - 193	1st Defective Sector (MSB - LSB) (PBA)
194	1st Defective Sector Defect Cause
195 - 197	1st Defective Sector Drive Serial Number (MSB - LSB)
.....	.....

8182 - 8185	1000th Defective Sector (MSB - LSB) (PBA)
8186	1000th Defective Sector Defect Cause
8187 - 8189	1000th Defective Sector Drive Serial Number (MSB – LSB)
8190 - 8191	SDL Identifier Complement ((FFFD))

The SDL Format Revision, Vendor Identification, Product Identification, Product Revision, and Drive Serial Number fields shall contain implementation specific information that is ignored for the purposes of interchange. The SDL Format Revision is used to specify the format of the unspecified bytes in the SDL Page.

SDL Pages shall be generated in ascending order by the contents of the First Spare in this Page field. Entries in a given SDL Page shall be in ascending order by replacement PBA. The replacement PBA for a given defective PBA is computed by determining which defect entry contains the defective PBA and taking the index, starting at zero, of that entry and adding it to the contents of the First Spare in this Page field.

Each SDL Page shall contain space for 1 000 defect entries, however the Maximum Entries Per SDL Page field in the DDS dictates the maximum number that may be used. This number may be different for media Type WORM and Type RW. On Type WORM Media, an SDL Page shall only be written when the number of defect entries is equal to the maximum specified in the DDS.

The SDLDP Area shall contain a copy of each completed SDL Page.

When writing an SDL Page, the control record LBA shall be set to the PBA + (80000000).

## Section 4 — Characteristics of embossed information

### 20 Embossed information – Method of testing

The format of the embossed information on the disk is defined in clauses 13 to 17. Clauses 21 and 22 specify the requirements for the signals from the grooves and Preformatted Headers, as obtained when using the Reference Drive specified in clause 9.

#### 20.1 Environment

All signals specified in clauses 21 and 22 shall be within their specified ranges with the cartridge in any environment in the range of allowed operating environments defined in 8.1.2.

#### 20.2 Use of the Reference Drive

All signals specified in clauses 21 and 22 shall be measured in the indicated channels of the Reference Drive. The drive shall have the following characteristics for the purpose of these tests.

##### 20.2.1 Optics and mechanics

The focused optical beam shall have the properties defined in 9.2. The disk shall rotate as specified in 9.5.

##### 20.2.2 Read power

The read power shall be  $500 \mu\text{W} \pm 25 \mu\text{W}$ .

##### 20.2.3 Read Channel

The drive shall have a Read Channel, with the implementation as given in 9.3.

**20.2.4 Tracking**

During the measurement of the signals, the focus of the optical beam shall have an axial deviation of not more than

$$e_{\max}(\text{axial}) = 0,3 \mu\text{m}$$

from the recording layer, and it shall have a radial deviation of not more than

$$e_{\max}(\text{radial}) = 0,04 \mu\text{m}$$

from the centre of a Groove or a Land Recording Track.

**20.2.5 Axial focus offset optimization**

The axial focus offset shall be adjusted to maximize the peak-to-peak amplitude of the 4T mark and 4T space pattern from the AM fields as measured in the Read Channel. This axial focus offset adjustment shall be used during the measurement of all embossed signals.

**20.3 Definition of signals**

Figure 27 shows the signals specified in clauses 21 and 22.

All signals are linearly related to currents through a split photodiode detector, and are therefore linearly related to the optical power falling on the detector.

Two signals  $I_1$  and  $I_2$  are derived from the outputs of the split photodiode detector H of the Reference Drive (see 9.1).

The read signal  $I$  provided by the Read Channel is the high bandwidth sum signal

$$I = (I_1 + I_2)$$

as processed by the low-pass filter described in Annex L.

**Figure 27a — Signals from grooves and lands in the Radial Tracking Channel**

Figure 27b — Signals from Headers in the Read Channel

Figure 27 — Illustration of the various parameters for embossed signal characteristics

## 21 Signals from grooves and lands

The sum signal ( $I_1 + I_2$ ) and difference signal ( $I_1 - I_2$ ) considered in this clause (see figure 27a) shall be filtered using a 5<sup>th</sup> order Bessel filter with a cut-off frequency of 1,0 MHz such that frequencies above the cut-off are attenuated, thereby eliminating the effect of modulation due to embossed Headers.

### 21.1 Ratio of groove to land signal

The on-track signal in groove  $I_{IG}$  or on-land  $I_{OL}$  is the sum signal ( $I_1 + I_2$ ) in the Read Channel when the light beam is following a groove or a land in the Formatted Zone. The on-track signals shall meet the following requirement:

In the case of type WORM Media

$$1,0 \leq \frac{I_{IG}}{I_{OL}} \leq 1,25$$

In the case of type RW media

$$0,85 \leq \frac{I_{IG}}{I_{OL}} \leq 1,15$$

when measured in unrecorded areas.

### 21.2 Ratio of groove/land to Mirror Area signal

The on-track signals shall also meet the following requirements:

In the case of type WORM Media

$$0,60 \leq \frac{I_{IG}}{I_{MA}} \leq 0,90$$

$$0,60 \leq \frac{I_{OL}}{I_{MA}} \leq 0,90$$

In the case of type RW media

$$0,70 \leq \frac{I_{IG}}{I_{MA}} \leq 1,0$$

$$0,70 \leq \frac{I_{OL}}{I_{MA}} \leq 1,0$$

where  $I_{IG}$  and  $I_{OL}$  are measured in an unrecorded area, and  $I_{MA}$  is the sum signal measured in a Mirror Area.

### 21.3 Divided push-pull signal

The divided push-pull signal is the peak-to-peak amplitude derived from the instantaneous level of the differential output ( $I_1 - I_2$ ) divided by the instantaneous level of the sum output ( $I_1 + I_2$ ) when the focused light beam crosses unrecorded fields of grooved tracks.

The radial tracking servo shall be operating in an open-loop mode during this measurement.

The divided push-pull signal shall meet the following requirement:

$$0,70 \leq \left[ \frac{(I_1 - I_2)}{(I_1 + I_2)} \right]_{PP} \leq 1,40$$

### 21.4 Wobble signal

The wobble signal is the signal generated by the square wave shaped displacement of the groove as measured in the Tracking Channel when the focus of the beam is following a groove or a land in the unwritten recording fields of the Formatted Zone as specified in 20.2.4.

The wobble signal shall satisfy the three following requirements:

$$0,05 \leq \frac{\text{Wobble}_{PP}}{(I_1 - I_2)_{PP}} \leq 0,10$$

where  $\text{Wobble}_{PP}$  is the wobble signal peak-to-peak amplitude for both the groove and land tracks, and  $(I_1 - I_2)_{PP}$  is the push pull signal peak-to-peak amplitude when the light beam crosses tracks in unwritten recording fields.

In the case of type WORM media

$$\text{NBSNR} \geq 35 \text{ dB (in a 10 kHz bandwidth)}$$

In the case of type RW media

$$\text{NBSNR} \geq 34 \text{ dB (in a 10 kHz bandwidth)}$$

where NBSNR is the Narrow-Band Signal-to-Noise Ratio of the wobble signal for both groove and land unwritten and written tracks.

$$\frac{A(2F_0)}{A(F_0)} \leq -30 \text{ dB}$$

where  $A(2F_0)$  and  $A(F_0)$  are respectively the amplitudes of the second harmonic  $2F_0$  and the fundamental frequency  $F_0$  of the wobble, measured in a resolution bandwidth of 10 KHz.

### 21.5 Phase depth

The phase depth of the grooves equals

$$\frac{n \times d}{\lambda} \times 360^\circ$$

where  $n$  is the index of refraction of the cover layer,  $d$  is the groove depth, and  $\lambda$  is the wavelength of the laser. The phase depth shall be less than  $90^\circ$ .

### 21.6 Track location

The Recording Track centres shall be located using the Quadrature Wobble Marks for both groove and land tracks (see 15.4 and Annex X).

## 22 Signals from Headers

The signal obtained from the embossed Headers (see figure 27b) shall be measured in the Read Channel of the Reference Drive and processed with the low-pass filter described in Annex L.

### 22.1 Reference reflectance $I_{\text{top}}$

The reference reflectance signal  $I_{\text{top}}$ , corresponding to the peak level of the on-track Quadrature Wobble Mark, shall meet the following requirement:

In the case of type WORM Media

$$0,70 \leq \frac{I_{\text{top}}}{I_{\text{MA}}}$$

In the case of type RW Media

$$0,80 \leq \frac{I_{\text{top}}}{I_{\text{MA}}}$$

### 22.2 Address Mark and ID signals

The signal  $I_p$  from the marks in the Address Mark and ID fields shall meet the requirements:

In the case of type WORM media

$$0,30 \leq \frac{I_{p \max}}{I_{\text{top}}} \leq 0,60$$

$$\frac{I_{p \min}}{I_{p \max}} \geq 0,40$$

In the case of type RW media

$$0,20 \leq \frac{I_{p \max}}{I_{\text{top}}} \leq 0,60$$

$$\frac{I_{p \min}}{I_{p \max}} \geq 0,30$$

where  $I_{p \min}$  and  $I_{p \max}$  are the signals with the minimum and maximum amplitude in the AM and ID fields. The second requirement shall apply over any Header.

### 22.3 QWM signals

The signal  $I_{q \text{ trk}}$  is the read signal from the QWM field positioned in line with the Recording Track.  $I_{q \text{ trk}}$  is associated with the QWML field when tracking in the groove or the QWML field when tracking on the land.

The signal  $I_{q \text{ trk}}$  shall meet the following requirement:

In the case of type WORM media

$$0,30 \leq \frac{I_{q \text{ trk}}}{I_{\text{top}}} \leq 0,70$$

In the case of type RW media

$$0,12 \leq \frac{I_{q \text{ trk}}}{I_{\text{top}}} \leq 0,30$$

The signal  $I_{q \text{ adj}}$  is from the QWM (A and B sub-fields) of the two adjacent Recording Tracks.  $I_{q \text{ adj}}$  is associated with the QWML field when tracking in the groove or the QWML field when tracking on the land.

The signal  $I_{q \text{ adj}}$  shall meet the following requirement:

In the case of type WORM media

$$\frac{I_{q \text{ adj}}}{I_{q \text{ trk}}} \geq 0,15$$

In the case of type RW media

$$\frac{I_{q \text{ adj}}}{I_{q \text{ trk}}} \geq 0,10$$

The signal  $I_{q \text{ dif}}$  is the difference in amplitude from the QWM (A and B sub-fields) of the two adjacent Recording Tracks.  $I_{q \text{ dif}}$  is associated with the QWML field when tracking on the groove or the QWML field when tracking on the land.

The signal  $I_{q \text{ dif}}$  shall meet the following requirement:

$$\frac{|I_{q \text{ dif}}|}{I_{q \text{ adj}}} \leq 0,10$$

This requirement applies to any Header under the condition that the tracking offset has been adjusted so that average value of  $I_{q \text{ dif}}$  is equal to zero for the Recording Track.

## 22.4 Timing mean and jitter

The Header signal shall be read and detected using the Read Channel circuit defined in Annex L under the conditions specified in 20.2. The timing mean  $Mt(H)$  and timing jitter  $Jt(H)$  shall be measured according to the procedure in Annex M and shall meet the following requirement:

$$|Mt(H) - nT| + 5 Jt(H) \leq 1,0 T$$

where  $T$  is the Channel clock period,  $Mt(H)$  is the mean (average), and  $Jt(H)$  is the standard deviation (sigma) of the separately measured time intervals of leading-to-trailing and trailing-to-leading edges of the read signal. The ideal time interval corresponds to  $nT$ .

$Mt(H)$  and  $Jt(H)$  are illustrated in figure M.1 of Annex M.

All the time interval samples detected from the Header signals shall satisfy the condition of  $Mt(H)$  and  $Jt(H)$ .

## Section 5 — Characteristics of the recording layer

### 23 Method of testing

Clauses 24 to 26 describe a series of tests to assess the thermal-optical properties of the recording layer, as used for writing, rewriting, and erasing data. The tests shall be performed only in the Data field of the sectors. The write, rewrite, read, and erase operations necessary for the tests shall be made on the same Reference Drive.

Clauses 24 to 26 specify only the average quality of the recording layer. Local deviations from the specified values, called defects, can cause write or erase problems. These defects are covered in section 6.

#### 23.1 Environment

All signals in clauses 24 to 26 shall be within their specified ranges with the cartridge in any environment in the range of allowed operating environments defined in 8.1.2 except where otherwise noted.

#### 23.2 Reference Drive

The write, rewrite, and erase tests described in clauses 24 to 26 shall be measured in the Read Channel of the Reference Drive. The drive shall have the following characteristics for the purpose of these tests.

### 23.2.1 Optics and mechanics

The focused optical beam shall have the properties defined in 9.2. The disk shall rotate as specified in 9.5.

### 23.2.2 Read power

The read power shall be  $500 \mu\text{W} \pm 25 \mu\text{W}$ .

### 23.2.3 Read Channel

The Reference Drive shall have a Read Channel that can detect the Phase Change marks in the recording layer. This Channel shall have an implementation equivalent to that given in 9.3.

The edge positions in time shall be measured for testing purposes by a threshold detection method. The threshold value is referenced to the centre of the peak-to-peak envelope of the read signal. The positive peak and negative peak signals of the envelope circuit (see Annex N) shall each contain a single pole filter with a – 3 dB rolloff point at 50 kHz.

### 23.2.4 Tracking

During the measurement of the signals, the focus of the optical beam shall have an axial deviation of not more than

$$e_{\max}(\text{axial}) = 0,3 \mu\text{m}$$

from the recording layer, and it shall have a radial deviation of not more than

$$e_{\max}(\text{radial}) = 0,04 \mu\text{m}$$

from the centre of a Groove or a Land Recording Track.

### 23.2.5 Signal detection for testing purposes

The signal from the Read Channel is not equalized before detection. The signal shall be rolled off with a 5<sup>th</sup> order Bessel low-pass filter with a cut-off frequency of half the Channel clock frequency of the band being tested (see Annex L).

Nominally, the threshold value will be constant if the laser power calibration is perfect and there are no parameter variations. However, in some measurements the threshold value may have to be adjusted to minimize the effects of mark size changes due to parameter variations during writing.

## 23.3 Write conditions

### 23.3.1 Write pulse and power waveform

For Type RW and Type WORM media, marks are recorded on the disk by pulses of optical power (see Annex O) at the test rotational frequency. The pulse shape for the purpose of testing shall be nominally rectangular. The rise and fall times (10 % to 90 % or 90 % to 10 %) shall be less than 1,0 ns between any two sequential power levels.

The measurement of laser power shall be done in pulsed operation by averaging. For example, use one pulse every 20 ns with a fixed duty cycle while measuring with a spherical radiometer. The averaging method of measuring the laser power will minimize the accumulation of pulse width and pulse amplitude tolerances. Pulsed operation also enables evaluation of higher laser powers than allowed by the continuous power rating of the laser (see also Annex CC).

The values of  $P_{FW}$ ,  $P_{MP}$ ,  $P_{LW}$ ,  $P_{ER}$ ,  $P_{CL}$ , and  $P_B$  used in any media tests shall be the ones recorded in the SDI sectors for that particular piece of media (see 17.4.4). Values of laser power levels (or ratio of powers) required for groove or land recording in each band shall be recorded in the SDI sectors. The values of pulse timing parameters  $T_{SFP}$ ,  $T_{EFP}$ ,  $T_{X1}$ ,  $T_{X3}$ ,  $T_{SMP}$ ,  $T_{X2}$ ,  $T_{EMP}$ ,  $T_{EMPP}$ ,  $T_{SLP}$ ,  $T_{ELP}$ ,  $T_{ECP}$ , with the required adaptive timing adjustments corresponding to the previous mark or space lengths (see table K.2 of Annex K) shall also be recorded in the SDI sectors.

The write pulse power and pulse widths are determined using the method in 23.3.4.

Mark and space lengths of 2T to 9T shall be used in all media tests to evaluate the recording laser power levels and write pulse timing.

### 23.3.2 Write pulse power

The media manufacturer shall determine the value of the pulse power levels  $P_{FW}$ ,  $P_{MP}$ ,  $P_{LW}$ ,  $P_{ER}$ ,  $P_{CL}$ , and  $P_B$  that are recorded in the SDI sectors.

The nominal write first pulse power level  $P_{FW}$  for groove or land recording in each band at the test rotational speed shall be recorded in the SDI sectors. The remaining power levels are specified as a ratio to the write first pulse level  $P_{FW}$  for groove or land recording for each band.

The average power during writing for any disk at any radius shall not exceed 3,75 mW as measured over a 10  $\mu$ s time interval.

The maximum pulse power level used for recording on any disk at any radius shall not exceed 8,0 mW.

### 23.3.3 Write pulse timing

The media manufacturer shall determine the value of the pulse timing parameters  $T_{SFP}$ ,  $T_{EFP}$ ,  $T_{X1}$ ,  $T_{X3}$ ,  $T_{SMP}$ ,  $T_{X2}$ ,  $T_{EMP}$ ,  $T_{EMPP}$ ,  $T_{SLP}$ ,  $T_{ELP}$ ,  $T_{ECP}$ , and the required adaptive timing adjustments corresponding to the previous mark or space lengths that are recorded in the SDI sectors.

The write pulse timing parameters for each band at the test rotational speed shall be recorded in the SDI sectors.

### 23.3.4 Write pulse power and pulse timing determination

The media manufacturer shall determine the value of the write pulse power levels and pulse timing parameters using the following method:

- Write several Groove and Land Recording Tracks with the test patterns described in Annex N. The recordings shall be done at a media temperature of  $25\text{ }^{\circ}\text{C} \pm 2\text{ }^{\circ}\text{C}$  and at the test rotational frequency.
- Read and detect the readback signal with the detection method given in Annex L. Adjust focus for maximum readback signal using the 3T mark and 3T space pattern of VFO1 and set the threshold at 50 % of the peak-to-peak signal amplitude for this test.
- Measure the time intervals between edges using a TIA as described in Annex M. Adjust the write pulse power levels and pulse timing parameters to minimize the timing mean  $M_t$  and timing jitter  $J_t$  for each mark and space length from 2T to 9T.
- Adjusting the pulse power levels and pulse timing parameters is a multi-variable iterative process. The media manufacturer may use any optimization algorithm that minimizes both  $M_t$  and  $J_t$ , within the optical power constraints of 23.3.2 and 23.4.
- The process shall be repeated for Groove and Land Recording Tracks in each band on the disk.

The write parameters recorded in the SDI sectors shall generate written data that complies with the requirements of clause 25 for Groove and Land Recording Tracks in all bands.

### 23.4 Erase power for Type RW media

For Type RW media, marks can be erased from the disk by a constant optical power. The erase optical power  $P_{ER}$  is also used between write pulses for direct overwriting of the recording field. The erase power is the optical power required for any given track at the entrance surface to erase or direct overwrite marks written according to 23.3.

The ratio of erase power level  $P_{ER}$  to the write first pulse level  $P_{FW}$  for groove or land recording is recorded in the SDI sectors for each band at the test rotational speed (see 17.4.4).

The erase power for any disk at any radius shall not exceed 3,75 mW.

### 23.5 Read power damage

Recorded data shall not become damaged due to the repetitive reading of sectors. Media shall be tested against read power damage for Groove and Land Recording Tracks in the innermost band at the test rotational speed. Media shall be tested for read power damage as follows:

- Several sectors shall be written on the Groove and Land Recording Tracks of the innermost band according to 23.3. Sectors shall be selected which are verified as correctable with less than 10 byte errors per sector using the ECC as defined in Annex H.
- The read power shall then be increased to  $600 \mu\text{W} \pm 25 \mu\text{W}$ . The disk shall make 1 000 000 revolutions while remaining on a single Recording Track which contains the selected sectors.
- After all test revolutions have completed, the read power shall be returned to the nominal power level. All selected sectors shall be verified as correctable with less than 100 byte errors per sector.
- This test shall be preformed for both Groove and Land Recording Tracks.

## 24 Phase Change characteristics

### 24.1 Mark polarity

The Phase Change marks shall be either more or less reflective than spaces.

The polarity of Phase Change marks shall be specified by the manufacturer in byte 40 of the SDI sectors (see 17.4.4).

### 24.2 Rewrite cycles for Type RW media

The number of rewrite cycles for Type RW media is not specified by this International Standard.

## 25 Write characteristics

### 25.1 Resolution

$I_L$  is the peak-to-peak value of the signal obtained in the Read Channel from 9T marks and 9T spaces (see figure 29) written under any of the conditions given in 23.3, and read under the conditions specified in 23.2. A 9T is the longest interval allowed in the recording field of a sector.

$I_H$  is the peak-to-peak value of the signal obtained in the Read Channel from 2T marks and 2T spaces (see figure 28) written under any of the conditions given in 23.3, and read under the conditions specified in 23.2. A 2T is the shortest interval allowed by the RLL(1,7) code in the recording field of a sector.

The resolution  $I_H / I_L$  shall not be less than 0,10 within any sector.

Figure 28 — Definition of  $I_L$  and  $I_H$  for resolution measurement

## 25.2 Narrow-Band Signal-to-Noise Ratio (NBSNR)

The Narrow-Band Signal-to-Noise Ratio NBSNR is the ratio of the signal level to the noise level of a specified pattern, measured in a 30 kHz bandwidth. It shall be determined as follows.

- Write a series of 2T marks followed by 2T spaces in the Data field of a series of sectors at a frequency  $f_0$  of the highest frequency allowed by the RLL(1,7) code for each zone. The write conditions shall be as specified in 23.3.
- Read the recording fields with the Read Channel under the conditions specified in 23.2 using a spectrum analyzer with bandwidth of 30 kHz. Measure the amplitudes of the signal and noise at frequency  $f_0$  indicated in figure 29. The measurements shall be corrected for the effect of the Header fields and for any instrumentation error in order to obtain the Data field only.

The Narrow-Band Signal-to-Noise Ratio shall be

$$\text{NBSNR} = 20 \log_{10} \frac{\text{Signal level}}{\text{Noise level}}$$

The NBSNR shall be greater than 43 dB for all sectors in the RW or 40 dB for all sectors in the WORM zones using the optical system as defined in 9.1.

Figure 29 — Amplitude versus frequency for the Phase Change signal

### 25.3 Cross-talk ratio

The cross-talk from  $nT$  marks and spaces shall be measured as follow:

- Write a series of  $nT$  marks followed by  $nT$  spaces in the Data field of the sectors on Recording Track  $n$  at the frequency specified for each band in the Formatted Zone. The write conditions shall be as specified in 23.3.
- Read the recording fields of the sectors in Recording Track  $n-1$ ,  $n$ , and  $n+1$  under the conditions specified in 23.2.

The cross-talk from track  $n$  to  $n-1$  and from track  $n$  to  $n+1$  for 2T marks and 2T spaces and 9T marks and 9T spaces measured as the ratio in dB of the read signal of these tracks shall be lower than  $-26$  dB for type RW media and  $-23$  dB for type WORM media.

### 25.4 Timing mean

The timing mean  $Mt(nT)$  of  $nT$  marks and spaces is defined as the mean (average) of the separately measured time intervals of leading-to-trailing and trailing-to-leading edges of the read signal.

The ideal time interval is  $nT$  where  $T$  is the Channel clock period.

The data shall be written in accordance with 23.3 and the procedures described in Annex N.

The signal shall be read and detected using the Read Channel circuit defined in Annex L under the conditions specified in 23.2. The timing mean  $Mt$  shall be measured according to the procedure in Annex M.

#### 25.4.1 Timing mean for 2T marks and spaces

The timing mean for 2T marks and spaces shall meet the following requirement in the Formatted Zone:

$$-0,20 T \leq Mt(2T) - 2T \leq +0,20 T$$

#### 25.4.2 Timing mean for $n = 3T$ to 9T, marks and spaces

The timing mean for  $n = 3T$  to 9T, marks and spaces shall meet the following requirement in the Formatted Zone:

$$-0,15 T \leq Mt(nT) - nT \leq +0,15 T$$

## 25.5 Timing jitter

The timing jitter  $J_t$  is defined as the standard deviation ( $\sigma$ ) of the separately measured time intervals of leading-to-trailing and trailing-to-leading edges of the read signal.

The data shall be written in accordance with 23.3 and the procedures described in Annex N.

The signal shall be read and detected using the Read Channel circuit defined in Annex L under the conditions specified in 23.2. The timing jitter  $J_t$  shall be measured according to the procedure in Annex M.

### 25.5.1 Timing jitter for 2T marks and spaces

The timing jitter for 2T marks and spaces shall meet the following requirement in the Formatted Zone:

$$J_t (2T) \leq 0,20 T$$

### 25.5.2 Timing jitter for 3T to 9T marks and spaces

The timing jitter for 3T to 9T marks and spaces shall meet the following requirement in the Formatted Zone:

$$J_t (3T \text{ to } 9T) \leq 0,15 T$$

## 25.6 Asymmetry

The asymmetry (see Annex P) of the user written marks relates to the deviation of the centre levels of the signals generated by two distinct repeating mark and space length patterns.

### 25.6.1 Asymmetry (3T-2T)

For type WORM media the asymmetry (3T-2T) in a sector shall be in the range  $-0,25$  to  $+0,10$ .

For type RW media the asymmetry (3T-2T) in a sector shall be in the range  $-0,20$  to  $+0,20$ .

### 25.6.2 Asymmetry (9T-3T)

For type WORM media the asymmetry (9T-3T) in a sector shall be in the range  $-0,0$  to  $+0,25$ .

For type RW media the asymmetry (9T-3T) in a sector shall be in the range  $-0,18$  to  $+0,15$ .

## 26 Erase power determination for Type RW media

Erase power determination is critical for maximizing the rewrite cycle life of Type RW media. Excessive erase power levels can damage the recording layer, and thereby reduce the rewrite cycle life.

The media manufacturer shall determine the erase to write power ratios that are recorded in the SDI sectors. The erase power is the optical power level for the given radius and rotational speed that is sufficient to erase or direct overwrite the current track, without damaging the recording layer or erasing data on the adjacent tracks.

The media manufacturer shall perform direct overwrite cycle testing at varying erase powers to determine the power level that maximizes the number of rewrite cycles. The resulting optimal erase power level must comply with all requirements of clause 25, and also meet the requirement of 26.1 for cross-erase.

This procedure shall be repeated to determine the erase to write power ratio for both Groove and Land Recording Tracks for each band of the disk.

## 26.1 Cross-Erase for Type RW Media

The following procedure shall be used to determine the effect of erasing and direct overwriting Recording Tracks that are adjacent to previously recorded data on Type RW media:

- A. Select any group of three adjacent tracks  $n-1$ ,  $n$ , and  $n+1$  in the Formatted Zone:
  - Erase Recording Tracks  $n-1$  and  $n+1$  using the erase power determined in clause 26.
  - Write a series of 2T marks followed by 2T spaces in the Data field of the sectors on Recording Track  $n$  at the frequency specified for each band in the Formatted Zone. The write conditions shall be as specified in 23.3 (see also Annex CC).
  - Measure the initial NBSNR on track  $n$  as specified in 25.2.
- B. Using a radial tracking offset equal to zero:
  - Write the Data fields of track  $n-1$  and track  $n+1$  with a series of 2T marks followed by 2T spaces.
  - Write the Data fields of track  $n-1$  and track  $n+1$  with a series of 9T marks followed by 9T spaces.
  - Erase the Data fields of track  $n-1$  and track  $n+1$ .
- C. Adjust the radial tracking offset by 40 nm toward the outer diameter of the disk:
  - Write the Data fields of track  $n-1$  and track  $n+1$  with a series of 2T marks followed by 2T spaces.
  - Write the Data fields of track  $n-1$  and track  $n+1$  with a series of 9T marks followed by 9T spaces.
  - Erase the Data fields of track  $n-1$  and track  $n+1$ .
- D. Adjust the radial tracking offset by 40 nm toward the inner diameter of the disk:
  - Write the Data fields of track  $n-1$  and track  $n+1$  with a series of 2T marks followed by 2T spaces.
  - Write the Data fields of track  $n-1$  and track  $n+1$  with a series of 9T marks followed by 9T spaces.
  - Erase the Data fields of track  $n-1$  and track  $n+1$ .
- E. Repeat steps B, C, and D on track  $n-1$  and track  $n+1$  for 10 complete cycles.
- F. Using a radial tracking offset equal to zero, measure the final NBSNR on track  $n$ .

For the specified cross-erase test conditions, the change in NBSNR of track  $n$  shall be

$$\text{NBSNR}_{\text{initial}} - \text{NBSNR}_{\text{final}} < 1,0 \text{ dB}$$

## Section 6 — Characteristics of user data

### 27 User Data – Method of testing

Clauses 28 and 29 describe a series of measurements to test conformance of the user data on the disk with this International Standard. It checks the legibility of both Preformatted Header and user written data. The user written data is assumed to be arbitrary. The user written data may have been written by any drive in any environment. The read tests shall be performed on the Reference Drive.

Whereas defects are disregarded in clauses 20 to 26, they are included in clauses 28 and 29 as unavoidable deterioration of the read signal. The severity of a defect is determined by the correctability of the ensuing errors by the error detection and correction circuits in the Read Channel defined below. The requirements in clauses 28 and 29 define a minimum quality of the data, necessary for data interchange.

#### 27.1 Environment

All signals specified in clauses 28 and 29 shall be within their specified ranges with the cartridge in any environment in the range of allowed operating environments defined in 8.1.2. It is recommended that before testing, the entrance surface of the optical disk shall be cleaned according to the instructions of the manufacturer of the disk.

#### 27.2 Reference Drive

All signals specified in clauses 28 and 29 shall be measured in the Reference Drive. The drive shall have the following characteristics for the purpose of these tests:

##### 27.2.1 Optics and mechanics

The focused optical beam shall have the properties specified in 9.2. The disk shall rotate as specified in 9.5.

##### 27.2.2 Read power

The read power shall be  $500 \mu\text{W} \pm 25 \mu\text{W}$ .

##### 27.2.3 Read Channel

The Read Channel shall be as specified in 9.3 and Annex L.

##### 27.2.4 Mark quality

The signal in the Read Channel shall be processed (see Annex L) with the specified low-pass filter and equalization, and compared with the threshold follower level. The threshold level shall be adjusted to minimize the bias of the mark and space intervals from their desired (or ideal) values of  $2T$ ,  $3T$ , ...  $9T$ . The output signals from the comparator are converted to binary signals with the edge detector (see also Annex N).

The timing jitter in this section is defined as the standard deviation ( $\sigma$ ) of the separately measured time intervals of leading-to-trailing and trailing-to-leading edges excluding outlying observations caused by defects. The measurement is made using a TIA with the output signals from the edge detectors of the marks and spaces in a sector. Therefore, the number of marks and spaces in a sector limits the independent interval samples for this measurement. The timing jitter values shall be expressed as a percentage of the Channel bit time  $T$ .

The converter shall operate correctly for analog signals from embossed marks with signal characteristics as determined by clause 22.

The converter shall operate correctly for analog signals from user written marks with signal characteristics as determined by clause 25.

### 27.2.5 Channel bit clock

The Channel bit clock shall be virtually locked to the signals from the analog-to-binary converters during reading to provide a time base for the leading and/or the trailing edges of the binary signals. During reading, the Channel bit clock shall be adjusted in order to minimize the accumulated value of timing errors of the leading-to-trailing and trailing-to-leading edges from the Channel bit clock.

The Channel bit clock shall be virtually locked to the wobble groove signal during writing, rewriting, and erasing to provide a time base for the write pulse generator. During writing, rewriting, or erasing, the Channel bit clock shall be adjusted in order to minimize the accumulated value of timing error from the groove wobble period and 240 Channel bit clock periods (240 T).

### 27.2.6 Binary-to-digital converters

The binary signals shall be correctly converted to the data bytes with the binary-to-digital converters based on the sector format and recording code defined in clauses 15 and 16. The 2T marks and 2T spaces in the recording area shall be detected using the ESISIC algorithm described in Annex Q.

### 27.2.7 Error correction

Correction of errors in the data bytes shall be carried out by an error detection and correction system based on the definition in H.2 and H.3 of Annex H.

### 27.2.8 Tracking

During the measurement of the signals, the focus of the optical beam shall have an axial deviation of not more than

$$e_{\max}(\text{axial}) = 0,3 \mu\text{m}$$

from the recording layer, and it shall have a radial deviation of not more than

$$e_{\max}(\text{radial}) = 0,04 \mu\text{m}$$

from the centre of a Groove or a Land Recording Track.

## 28 Minimum quality of a sector

This clause specifies the minimum quality of the Header and Data fields of a sector as required for interchange of the data contained in that sector. The quality shall be measured on the Reference Drive specified in 27.2.

A byte error occurs when one or more bits in a byte have a wrong setting, as detected by ECC and/or CRC circuits.

### 28.1 Headers ID

At least one of the three ID fields contained in the Preformatted Headers shall not have any byte errors as checked by the CRC in the field. Sectors shall only be recorded with user data under this condition.

Sectors shall be readable under the condition that all three of the ID fields have byte errors as checked by CRC.

## 28.2 User-written data

### 28.2.1 Recording field

When the VFO1 field is recorded, it shall start at 508 Channel bits – 6/+ 133 Channel bits from the end of the Preformatted Header for Type RW media.

When the VFO1 field is recorded, it shall start at 396 Channel bits  $\pm$  6 Channel bits from the end of the Preformatted Header for Type WORM media.

### 28.2.2 Byte errors

The user written data in a sector shall not contain any byte errors that cannot be corrected by the error correction defined in 27.2.7.

### 28.2.3 Timing mean

The timing mean of the user written marks shall comply with the requirements of 25.4.

### 28.2.4 Timing jitter

The timing jitter of the user written marks shall comply with the requirements of 25.5.

### 28.2.5 Asymmetry

The asymmetry of the user written marks shall comply with the requirements of 25.6.

## 28.3 Wobble signal

The wobble signal shall comply with the requirements of 21.5.

## 29 Data interchange requirements

A disk offered for interchange of data shall comply with the following requirements (see also Annex R).

### 29.1 Tracking

The focus of the optical beam shall not jump tracks unintentionally.

### 29.2 User-written data

Any sector written in the User Zone that does not comply with 28.2 shall have been replaced according to the rules of the Defect Management as defined in clause 19.

### 29.3 Quality of disk

The quality of the disk is reflected in the number of replaced sectors in the User Zone. This International Standard allows a maximum number of replaced sectors per side (see clause 19).

## Annex A (normative)

### Air cleanliness class 100 000

The classification of air cleanliness is based on a particle count with a maximum allowable number of specified minimum sized particles per unit volume, and on a statistical average particle size distribution.

#### A.1 Definition

The particle count shall not exceed a total of 3 500 000 particles per cubic metre of a size 0,5 µm and larger.

The statistical average particle size distribution is given in figure A.1. Class 100 000 means that 3 500 000 particles per cubic metre of a size of 0,5 µm and larger are allowed, but only 25 000 particles per cubic metre of a size of 5,0 µm and larger.

It shall be recognized that single sample distribution may deviate from this curve because of local or temporary conditions. Counts below 350 000 particles per cubic metre are unreliable except when a large number of a samplings is taken.

#### A.2 Test method

For particles of size in the range of 0,5 µm to 5,0 µm, equipment employing light-scattering principles shall be used. The air in the controlled environment is sampled at a known flow rate. Particles contained in the sampled air are passed through an illuminated sensing zone in the optical chamber of the instrument. Light scattered by individual particles is received by a photo detector which converts the light pulses into electrical current pulses. An electronic system relates the pulse height to particle size and counts the pulses such that the number of particles in relation to particle size is registered or displayed.

Figure A.1 — Particle size distribution curve

## Annex B (normative)

### Edge distortion test

#### B.1 Purpose

The distortion test checks if the case is free from unacceptable distortion and protrusions along its edges. The test is made by causing the cartridge to pass through the vertical slot of a gauge while applying a specified force in addition to the gravitational pull.

#### B.2 Distortion gauge construction

The gauge shall be made of a suitable material, e.g. of chrome-plated carbon steel. The inner surfaces shall be polished to a surface finish of 5 µm peak-to-peak.

#### B.3 Distortion gauge dimensions

The dimensions shall be as follows (see figure B.1):

$$A = 155,0 \text{ mm}$$

$$B = 136,0 \text{ mm} \pm 0,1 \text{ mm}$$

$$C = 10,0 \text{ mm} \pm 0,1 \text{ mm}$$

$$D = 11,40 \text{ mm} \pm 0,01 \text{ mm}$$

$$E = 11,60 \text{ mm min.}$$

#### B.4 Requirement

When the cartridge is inserted vertically into the gauge, a vertical downward force  $F$  of 2,7 N maximum, applied to the centre of the top edge of the cartridge, shall cause the cartridge to pass through the gauge.

Figure B.1 — Distortion gauge

## Annex C (normative)

### Compliance test

#### C.1 Purpose

The compliance test checks the flatness and flexibility of the case by forcing the four reference surfaces of the cartridge into a plane.

#### C.2 Reference surfaces

The location of the four reference surfaces S1, S2, S3, and S4 is defined in 10.5.4 and figure 4.

#### C.3 Compliance gauge

The test gauge consists of a base plate on which four posts P1, P2, P3, and P4 are fixed so as to correspond to the surfaces S1, S2, S3, and S4 respectively (see Figure C.1). The dimensions are as follows (see Figures C.2 and C.3):

$$L_a = 122,0 \text{ mm} \pm 0,2 \text{ mm}$$

$$L_b = 4,0 \text{ mm} \pm 0,5 \text{ mm}$$

$$L_c = 130,0 \text{ mm} \pm 0,5 \text{ mm}$$

$$L_d = 101,0 \text{ mm} \pm 0,5 \text{ mm}$$

$$D_a = 6,50 \text{ mm} \pm 0,01 \text{ mm}$$

$$D_b = 4,00 \text{ mm} \begin{array}{l} + 0,00 \text{ mm} \\ - 0,02 \text{ mm} \end{array}$$

$$D_c = 5,50 \text{ mm} \pm 0,01 \text{ mm}$$

$$H_a = 1,0 \text{ mm} \pm 0,1 \text{ mm}$$

$$H_b = 2,0 \text{ mm max.}$$

After assembly, the upper annular surfaces of the four posts shall lie between two horizontal planes spaced 0,01 mm apart.

#### C.4 Test conditions

The cartridge shall be placed with its reference surfaces onto the posts of the horizontal gauge. A vertical down force F of 0,4 N shall be exerted on the cartridge opposite each of the four posts.

### C.5 Requirement

Under the conditions of C.4, any three of the four surfaces S1 to S4 shall be in contact with the annular surface of respective posts. Any gap between the remaining surface S and the annular surface of its post shall not exceed 0,1 mm.

Figure C.1 — Compliance gauge

Figure C.2 — Location of the posts

Figure C.3 — Detail of the posts

## Annex D (normative)

### Cartridge electro-static discharge test

#### D.1 Test procedure

The test procedure shall use the following steps:

- 1 Acclimate test cartridges at 10 % relative humidity for at least 12 hours before testing.
- 2 Remove all charge from the test cartridge using ionized air.
- 3 Mount the cartridge in the fixture shown in figure D.1.
- 4 Apply 1,00 kV to the charge plate.
- 5 10 seconds  $\pm$  1 second after applying 1,00 kV, remove the voltage source (charge plate is floating).
- 6 Measure the decay time defined as the time required for the charged plate voltage to decay 5 % to 950 V.

Prior to testing a cartridge, ensure there is a non-ionizing environment by performing steps 4 – 6 above with no cartridge present. Decay time with no cartridge shall be larger than 100 seconds.

#### D.2 Specification

The decay time shall be smaller than 30 seconds at 10 % relative humidity and 25 °C.

Figure D.1 — Cartridge electro-static discharge test fixture

## Annex E (normative)

### Test method for measuring the adsorbent force of the hub

#### E.1 Purpose

The purpose of this test is to determine the magnetic characteristic of the magnetizable material of the hub.

#### E.2 Dimensions

The test device (see figure E.1) consists of a spacer, a magnet, a back yoke, and a centre shaft. The dimensions of the test device are as follows:

$$D_d = 8,0 \text{ mm} \pm 0,1 \text{ mm}$$

$$D_e = 20,0 \text{ mm} \pm 0,1 \text{ mm}$$

$$D_f = 19,0 \text{ mm max.}$$

$$D_g = 3,9 \text{ mm} \begin{array}{l} + 0,0 \text{ mm} \\ - 0,1 \text{ mm} \end{array}$$

$$H_c = 0,40 \text{ mm} \pm 0,01 \text{ mm}$$

$$H_d = 1,2 \text{ mm (typical, to be adjusted to meet the force requirement of E.4)}$$

#### E.3 Material

The material of the test device shall be:

Magnet	: Any magnetizable material, typically Sm-Co
Back yoke	: Any suitable magnetizable material
Spacer	: Non-magnetizable material or air gap
Centre shaft	: Non-magnetizable material

#### E.4 Characteristics of the magnet with back yoke

Number of poles : 4 (typical)

Maximum energy product ( $BH_{max}$ ) :  $175 \text{ kJ/m}^3 \pm 16 \text{ kJ/m}^3$

The characteristics of the magnet with back yoke shall be adjusted so that with a pure nickel plate of the following dimensions (see figure E.2), and the adsorbent force of this plate at the point  $H_c = 0,4 \text{ mm}$  when spaced from the magnet surface shall be  $9,5 \text{ N} \pm 0,6 \text{ N}$ .

$$D_h = 7,0 \text{ mm} \pm 0,1 \text{ mm}$$

$$D_j = 22,0 \text{ mm} \pm 0,1 \text{ mm}$$

$$H_e = 2,0 \text{ mm} \pm 0,05 \text{ mm}$$

### E.5 Test condition for temperature

This condition shall be as specified in 8.1.1.

Figure E.1 — Test device for the clamping characteristic of the hub

Figure E.2 — Calibration plate of the test device

## Annex F (normative)

### CRC for ID fields

The sixteen bits of the CRC shall be computed over the first four bytes of the ID field. The generator polynomial shall be

$$G(x) = x^{16} + x^{12} + x^5 + 1$$

The residual polynomial shall be

$$R(x) = \left( \sum_{i=16}^{i=31} \bar{a}_i x^i + \sum_{i=0}^{i=15} a_i x^i \right) x^{16} \bmod G(x)$$

where  $a_i$  denotes a bit of the first four bytes and  $\bar{a}_i$  an inverted bit. The highest order bit of the first byte is  $a_{31}$ .

The sixteen bits  $c_k$  of the CRC are defined by

$$R(x) = \sum_{k=0}^{k=15} c_k x^k$$

where  $c_{15}$  is recorded as the highest order bit of the fifth byte in the ID field and  $c_0$  is the lowest order bit of the sixth byte in the ID field.

## Annex G (normative)

### Data field scrambler implementation

#### G.1 Data field scrambler purpose

The purpose of Data field scrambling is to randomize user data to generate various mark and space lengths in the encoded data. The data scrambler tends to reduce the d.c. content of the encoded data waveform. This is of primary importance for sectors with block of fixed data bytes. In these cases, without scrambling, the encoded data could consist of the same repeated patterns, which can generate a large d.c. content.

#### G.2 Data field scrambler order of processing

The Data field shall be as detailed in Annex H.

The entire Data field except for Resync, Reference, and VFO2 bytes shall be scrambled. The order of processing for encoding shall be

- 1 Interleave user data and Control bytes
- 2 Generate CRC and ECC bytes
- 3 Scramble bytes of the Data field
- 4 Insert Resync, Reference, and VFO2 bytes (not scrambled)

The order of processing for decoding shall be the reverse of the encoding process

- 1 Remove Resync, Reference, and VFO2 bytes
- 2 Unscramble bytes of Data field
- 3 Perform ECC and check CRC
- 4 De-interleave user data and Control bytes

#### G.3 Data field scrambler circuit and preset values

The scrambling byte generation circuit shall be as shown in figure G.1. The circuit consists of a feedback bit shift register in which bits  $r_7$  (msb) to  $r_0$  (lsb) are used as a scrambling byte at each 8-bit shift.

The initial preset number, shown in table G.1 is equivalent to least significant 4 bits of the 31-bit PBA value,  $b_3$  to  $b_0$ , in which  $b_3$  is the msb and  $b_0$  is the lsb. At the beginning of each Data field, the initial value of  $r_{14}$  to  $r_0$  shall be preset corresponding to the PBA of the sector as shown in table G.1 (the msb of the pre-set value shall be discarded).

The initial value shall be changed every sector, and after 16 sectors, the sequence shall be repeated.

The lower 8 bits of the initial values of  $r_7$  to  $r_0$  shall be taken out as scrambling byte  $S_1$ . After that, the 8-bit shift shall be repeated for each scrambled byte of the Data field. As a result, scrambling bytes  $S_2$  to  $S_n$  shall be taken from the shift register at each 8-bit shift.

Table G.1 — Initial value of shift register

Initial preset number	Initial register value
(0)	(0001)
(1)	(5500)
(2)	(0002)
(3)	(2A00)
(4)	(0004)
(5)	(5400)
(6)	(0008)
(7)	(2800)
(8)	(0010)
(9)	(5000)
(A)	(0020)
(B)	(2001)
(C)	(0040)
(D)	(4002)
(E)	(0080)
(F)	(0005)

Figure G.1 — Feedback shift register for generating the scrambling byte

Scrambling for data byte  $D_k$  in figure G.1 is defined as follows:

$$D'_k = D_k \oplus S_k \quad (k = 1 \text{ to } n)$$

where

$D'_k$  is the scrambled data byte

$D_k$  is an unscrambled data byte

$S_k$  is the scrambling byte from the feedback shift register

$n$  is the number of data bytes to be scrambled in the Data field

and  $\oplus$  means Exclusive-OR logical operation.

## Annex H (normative)

### Interleave, CRC, ECC, Resync, and Reference for the Data field

#### H.1 Interleave

The different bytes recorded on the disk for each sector with 8192 data-user bytes shall be designated as follows

- $D_n$  are user data bytes
- $P_{q,r}$  are Control bytes (see 15.10.3)
- $C_k$  are CRC check bytes
- $E_{s,t}$  are ECC check bytes

These bytes shall be ordered in a sequence  $A_n$  in the order in which they shall be recorded on the disk. The order of  $n$  of  $D_n$  is the same as that in which they are input from the interface. Depending on the value of  $n$ , these elements are

- for  $1 \leq n \leq 8\,192$  :  $A_n = D_n$
- for  $8\,193 \leq n \leq 8\,204$  :  $A_n = P_{q,r}$
- for  $8\,205 \leq n \leq 8\,208$  :  $A_n = C_k$
- for  $8\,209 \leq n \leq 9\,424$  :  $A_n = E_{s,t}$

where:

$$q = \text{int} [(n - 8\,193) / 4] + 1$$

$$r = [(n - 8\,193) \bmod 4] + 1$$

$$k = n - 8\,204$$

$$s = [(n - 8\,209) \bmod 38] + 1$$

$$t = \text{int} [(n - 8\,209) / 38] + 1$$

The notation  $\text{int} [x]$  denotes the largest integer not greater than  $x$ .

The first four parts of  $A_n$  are 38-way interleaved by mapping them onto a two-dimensional matrix  $B_{ij}$  with 216 rows and 38 columns. Thus

$$\text{for } 1 \leq n \leq 8\,208 \quad : \quad B_{i,j} = A_n$$

where:

$$i = 215 - \text{int} [(n - 1) / 38]$$

$$j = (n - 1) \bmod 38$$

## H.2 CRC

The CRC and the ECC shall be computed over the Galois field based on the primitive polynomial

$$G_P(x) = x^8 + x^4 + x^3 + x^2 + 1$$

The generator polynomial for the CRC bytes shall be

$$G_C(x) = \prod_{i=32}^{i=35} (x + \alpha^i) = x^4 + (68) x^3 + (69) x^2 + (F1) x + (DA)$$

where the element  $\alpha = 0000\ 0010$ .

The contents of the four check bytes are defined by the residual polynomial

$$R_C(x) = I_C(x) x^4 \text{ mod } G_C(x)$$

$$k=4$$

$$R_C(x) = \sum_{k=1} C_k x^{4-k}$$

The last equation specifies the storage locations for the coefficients of the polynomial.

### H.2.1 Check byte calculation

The four check bytes of CRC shall be computed over the user data and the control bytes as specified in H.2.

The information polynomial shall be

$$I_C(x) = \left[ \sum_{i=1}^{i=215} \left( \sum_{j=0}^{j=37} (B_{i,j}) x^j \right) \right] + \sum_{j=0}^{j=33} (B_{0,j})$$

## H.3 ECC

The primitive polynomial  $G_P(x)$  and the element  $\alpha^i$  shall be as specified in H.2. The generator polynomial for the check bytes of the ECC shall be

$$G_E(x) = \prod_{i=0}^{i=31} (x + \alpha^i)$$

where the element  $\alpha = 0000\ 0010$ .

The 1216 check bytes of the ECC shall be computed over the user bytes, the control bytes, and the CRC bytes. The corresponding 38 information polynomials shall be

$$I_{Ej}(x) = \sum_{i=0}^{i=215} (B_{i,j}) x^i$$

where  $0 \leq j \leq 37$ .

The contents of the 32 check bytes  $E_{s,t}$  for each polynomial  $I_{Ej}(x)$  are defined by the residual polynomial

$$R_{Ej}(x) = I_{Ej}(x) x^{32} \bmod G_E(x)$$

$$R_{Ej}(x) = \sum_{t=1}^{t=32} E_{j+1,t} x^{32-t}$$

The last equation specifies the storage locations for the coefficients of the polynomial.

#### H.4 Resync

The Resync fields (see Annex J) shall be inserted in the Data field to prevent loss of synchronization and limit the propagation of errors in the user data. They are numbered consecutively and shall contain one of the two following patterns of Channel bits.

010 000 000 010 000 000 010 010      for RS1, RS3, RS5, ...

010 000 000 010 000 000 010 000      for RS2, RS4, RS6, ...

A field  $RSn$  shall be inserted between bytes  $A_{152n}$  and  $A_{152n+1}$ , where  $1 \leq n \leq 62$ .

RS62 shall be inserted immediately after byte  $A_{9424}$ .

#### H.5 Reference

The Reference fields (see Annex J) shall be inserted in the Data field to provide read signal reference levels. They are numbered consecutively and shall contain the following pattern of Channel bits.

010 010 010 010

A field  $RFn$  shall be inserted between bytes  $A_{38n}$  and  $A_{38n+1}$ , where  $0 \leq n \leq 248$ .

RF0 shall be inserted between the Sync field and byte  $A_1$ . RF248 shall be inserted between RS62 and the PA field.

The Reference byte shall be inserted after the Resync bytes whenever both are inserted between the same Data field bytes.

#### H.6 VFO2, Extra Sync (SBX), and Extra Reference (RFX) fields

The VFO2, SBX, and RFX fields shall be inserted in the Data field to provide redundant fields in the event that the primary fields (VFO1, Sync, and RF0) are obscured or damaged.

These three fields shall be inserted in the following order between bytes RF8 and  $A_{305}$ :

- 1) VFO2
- 2) SBX
- 3) RFX.

### H.6.1 VFO2

The VFO2 field shall be inserted in the Data field to provide a redundant field for locking the VFO in the event that VFO1 is obscured or damaged. The VFO2 pattern shall be as defined in 15.8.

### H.6.2 Extra Sync (SBX)

The Extra Sync field shall be inserted in the Data field after VFO2 to provide a redundant field for synchronization in the event that the Sync field is obscured or damaged. The Extra Sync pattern shall be the same as the Sync field defined in 15.9.

### H.6.3 Extra Reference (RFX)

The Extra Reference field shall be inserted in the Data field after SBX to provide a redundant field for reference amplitude. The Extra Reference pattern shall be the same as the Reference field defined in H.5.

## H.7 Recording sequence for Data field

The elements of the Data field shall be recorded on the disk according to sequence  $A_n$  immediately following the Sync bytes, with Resync bytes inserted as specified in H.4, Reference bytes inserted as specified in H.5, and VFO2, SBX, RFX bytes inserted as specified in H.6.

Figure H.1 shows in matrix form the arrangement of these elements. The sequence of recording is from top-to-bottom and from left-to-right.

- SB designates a Sync byte
- D designates a user byte
- RS designates a Resync byte
- RF designates a Reference byte
- VF designates a VFO2 byte
- P designates a Control byte
- C designates a check byte for CRC
- E designates a check byte for ECC
- PA designates the PA byte

Figure H.1 shows that the first 216 rows contain in columns 0 to 37, the user bytes, the Control bytes, and the CRC check bytes. The next 32 rows contain only ECC check bytes.

## Annex I (normative)

### Drive Information Record (DIR) usage

The 4-byte Drive Information Record (P3) of the Control bytes shall be used to save drive related information into each sector as it is written or rewritten.

For normally written sectors, the DIR shall contain the following information in the specified location:

**Byte 1**

Bit position	7	6	5	4	3	2	1	0
	Unspecified	Verify enabled	Verify Pass Relocation	Relocation cause				

**Byte 2**

Bit position	7	6	5	4	3	2	1	0
	Unspecified	Relocation Attempt			Drive Serial Number bits (19 – 16)			

**Byte 3**

Bit position	7	6	5	4	3	2	1	0
	Drive Serial Number bits (15 – 8)							

**Byte 4**

Bit position	7	6	5	4	3	2	1	0
	Drive Serial Number bits (7 – 0)							

Unspecified bits shall be set to ZERO and shall be ignored in interchange.

The Verify Enabled bit shall indicate whether the sector was written with Verify after Write enabled, as follows:

Verify after Write disabled = ZERO

Verify after Write enabled = ONE.

The Verify Pass Relocation bit shall be set to ZERO for all sectors that have not been relocated.

The Verify Pass Relocation bit shall indicate whether a relocated sector was spared due to a Verify error, as follows:

Write Error Relocation = ZERO

Verify Error Relocation = ONE.

The Relocation Cause field is vendor unique, and may be used to identify the reason for relocating the sector. The Relocation Cause field shall be ignored in interchange.

The Relocation Attempt field shall be set to ZERO for all sectors that have not been relocated.

The Relocation Attempt field shall contain the number of the relocation attempt for all relocated sectors as follows:

Attempt 1 = 0

Attempt 2 = 1

.....

Attempt 8 = 7

The Drive Serial Number is vendor unique and shall be ignored in interchange.

For SDI, DDS, PDL, and SDL sectors, the Verify Pass Relocation, Relocation Cause, and Relocation Attempt fields shall be set to ZERO.

## Annex J (normative)

### Determination of the Resync and Reference patterns

#### J.1 Conditions of Resync pattern

The Resync pattern shall have the following characteristics to satisfy its required function:

1. The Resync patterns consist of irregular Channel bit patterns that do not occur in RLL(1,7) modulation code.
2. The irregularity of the Resync patterns is easily detectable.
3. There are two unique patterns, one for odd numbered Resync fields, and another for even numbered Resync fields.
4. The length of the Resync pattern shall be 24 Channel bits.

#### J.2 Resync pattern

Selection of one of the two Resync patterns shown below shall be made in order to provide additional Data field synchronization information.

The criteria for selecting either Resync Pattern 1 or Resync Pattern 2 is based on the position of the Resync fields within the data area.

Resync Pattern 1 shall be used for all odd numbered Resync fields (RS1, RS3, RS5, ...).

Resync Pattern 2 shall be used for all even numbered Resync fields (RS2, RS4, RS6, ...).

#### J.3 Conditions of Reference pattern

The Reference pattern shall have the following characteristics to satisfy its required function:

1. The Reference pattern is a Channel bit pattern consisting of either a 3T mark, 3Tspace, 3T mark or a 3T space, 3T mark, 3T space. The triple 3T patterns can be used for determining the read signal amplitude of 3T marks and spaces as a reference level for decoding of RLL(1,7) information.
2. The read signal amplitude and shape of the reference pattern can be checked and used to locate possible data error positions for erasure ECC processing.
3. The length of the Reference pattern shall be 12 Channel bits.

#### J.4 Reference pattern

The Reference pattern shall be as follows.

## Annex K (normative)

### Specific Disk Information

SDI sectors shall consist of 8 192 bytes that contain Specific Disk Information. These bytes shall specify the following.

#### Bytes 0 and 1

These bytes shall be recorded with the SDI Identifier. Both bytes shall be recorded with (D1) to indicate that this is a SDI sector.

#### Bytes 2 to 6

These five bytes shall contain the Disk Serial Number and Disk Side (A or B) (see table K.1). The Disk Serial Number shall be the same for both the A and B sides of the disk. The serial number and side of the disk shall be represented in hexadecimal notation.

**Table K.1 — Disk Serial Number and Disk Side bytes**

Byte	Bits	Description	Allowed values
2	7 – 4	1 <sup>st</sup> digit of Disk Serial Number	(0) – (F)
2	3 – 0	2 <sup>nd</sup> digit of Disk Serial Number	(0) – (F)
3	7 – 4	3 <sup>rd</sup> digit of Disk Serial Number	(0) – (F)
3	3 – 0	4 <sup>th</sup> digit of Disk Serial Number	(0) – (F)
4	7 – 4	5 <sup>th</sup> digit of Disk Serial Number	(0) – (F)
4	3 – 0	6 <sup>th</sup> digit of Disk Serial Number	(0) – (F)
5	7 – 4	7 <sup>th</sup> digit of Disk Serial Number	(0) – (F)
5	3 – 0	8 <sup>th</sup> digit of Disk Serial Number	(0) – (F)
6	7 – 4	9 <sup>th</sup> digit of Disk Serial Number	(0) – (F)
6	3 – 0	Disk Side	(A) or (B)

#### Byte 7

This byte shall specify the SDI Revision number. The SDI Revision number may be used by the disk manufacturer to denote the use of the Unspecified SDI bytes.

#### Bytes 8 to 15

These eight bytes shall contain the disk manufacturer code in ASCII representation.

#### Byte 16

This byte shall specify the year of disk manufacture. It shall be specified as a number  $n$  such that

$$n = \text{year} - 2000.$$

**Byte 17**

This byte shall specify the month of disk manufacture. This byte shall be recorded with a value in the range from 1 (January) to 12 (December).

**Byte 18**

This byte shall specify the day of disk manufacture. This byte shall be recorded with a value in the range from 1 to 31.

**Bytes 19 to 22**

These four bytes shall contain the Drive Serial Number (DSN) of the unit that recorded the SDI sectors. The serial number of the drive shall be represented in binary notation. Byte 19 shall contain the MSB and Byte 22 shall contain the LSB.

**Byte 23**

This byte shall specify the Media Type. This byte shall be recorded with

- 0 for Type RW,
- 1 for Type WORM.

**Bytes 24 and 25**

These bytes shall specify the user data capacity of the ODC in Gbytes. The capacity of the ODC shall be represented in binary notation. Byte 24 shall contain the MSB and Byte 25 shall contain the LSB.

These bytes shall be set to (001E) indicating a user data capacity of 30 Gbytes per cartridge.

**Byte 26**

This byte shall specify the sector size in user data bytes. This byte shall be recorded with a number  $n$  such that

$$n = \text{sector size} / 1024.$$

It shall be set to 8 indicating a sector size of 8 192 user data bytes per sector.

**Byte 27**

This byte shall specify the Recording Track pitch in nm. This byte shall be recorded with a number  $n$  such that

$$n = \text{track pitch} / 5.$$

It shall be set to 80 for Type RW media indicating a Recording Track pitch of 400 nm.

It shall be set to 74 for Type WORM media indicating a Recording Track pitch of 370 nm.

**Byte 28**

This byte shall specify the nominal wavelength  $\lambda$  of the laser in nm. This byte shall be recorded with a number  $n$  such that

$$n = \lambda / 5.$$

It shall be set to 81 indicating a laser wavelength of  $\lambda = 405$  nm.

**Byte 29**

This byte shall specify the nominal Numerical Aperture NA of the objective lens. This byte shall be recorded with a number  $n$  such that

$$n = NA \times 100.$$

It shall be set to 70 indicating an objective lens with NA = 0,70.

**Bytes 30 and 31**

These bytes shall specify the nominal cover layer index of refraction. These bytes shall be recorded with a number  $n$  such that

$$n = \text{index of refraction} \times 10\,000.$$

Byte 30 shall contain the MSB and Byte 31 shall contain the LSB of the number  $n$ .

**Byte 32**

This byte shall indicate the nominal cover layer thickness in nm.

**Byte 33**

This byte shall indicate the average cover layer thickness in nm at disk radius  $r = 62$  mm.

**Byte 34**

This byte shall indicate the average cover layer thickness in nm at disk radius  $r = 45$  mm.

**Byte 35**

This byte shall indicate the average cover layer thickness in nm at disk radius  $r = 28$  mm.

**Byte 36**

This byte shall specify the nominal disk rotational frequency in Hz. This byte shall be recorded with a number  $n$  such that

$$n = \text{rotational frequency} \times 4.$$

It shall be set to 130 for Type RW media indicating a disk rotational frequency of 32,5 Hz.

It shall be set to 140 for Type WORM media indicating a disk rotational frequency of 35,0 Hz.

**Byte 37**

This byte shall specify the nominal laser read power in  $\mu\text{W}$ . This byte shall be recorded with a number  $n$  such that

$$n = \text{read power} / 5.$$

It shall be set to 100 indicating a laser read power of 500  $\mu\text{W}$ .

**Byte 38**

This byte shall specify the maximum laser read power in  $\mu\text{W}$ . This byte shall be recorded with a number  $n$  such that

$$n = \text{maximum read power} / 5.$$

This value shall be the recommendation of the media manufacturer for maximum laser read power at any radius of the disk.

#### Byte 39

This byte shall specify the baseline reflectance  $R$  of the disk in its unrecorded initialized state as measured in a Mirror Area. This byte shall be recorded with a number  $n$  such that

$$n = R \times 100.$$

#### Byte 40

This byte shall specify the change in reflectance  $R$  for user written marks. This byte shall be recorded with

(00) for  $R_{\text{mark}} > R_{\text{space}}$

(FF) for  $R_{\text{mark}} < R_{\text{space}}$

#### Byte 41

This byte shall specify the maximum linear velocity for writing in m/s. This byte shall be recorded with a number  $n$  such that

$$n = \text{maximum linear velocity} \times 10.$$

#### Bytes 42 to 44

These bytes shall specify which bands of the disk can be recorded with a single pass write. This information shall be contained in a bit map where

- 0 Indicates band may be recorded in a single pass write.
- 1 Indicates band requires an erase pass prior to writing.

#### Byte 42

Bit 7	ZERO
Bit 6	ZERO
Bit 5	ZERO
Bit 4	ZERO
Bit 3	ZERO
Bit 2	ZERO
Bit 1	ZERO
Bit 0	Band 16

#### Byte 43

Bit 7	Band 15
Bit 6	Band 14
Bit 5	Band 13
Bit 4	Band 12
Bit 3	Band 11
Bit 2	Band 10
Bit 1	Band 9
Bit 0	Band 8

Byte 44

Bit 7	Band 7
Bit 6	Band 6
Bit 5	Band 5
Bit 4	Band 4
Bit 3	Band 3
Bit 2	Band 2
Bit 1	Band 1
Bit 0	Band 0

For Type WORM media, bytes 42 to 44 shall be recorded with (00).

**Byte 45**

This byte shall specify the QWML position offset in nm. This byte shall be a signed value (-128 to 127) denoting the physical offset of the QWML fields with respect to the midpoint of the groove centrelines in the radial direction. A positive value indicates that the QWML fields are positioned too close to the outer diameter of the disk.

**Bytes 46**

This byte shall specify the Write Power Calibration Optimal Power Factor  $\rho$ , defined as the ratio:

$$\rho = \frac{\text{Optimal Write Power}}{\text{Threshold Write Power}}$$

This byte shall be recorded with a number  $n$  such that

$$n = \rho \times 100.$$

The Write Power Calibration Optimal Power Factor could be measured in the Write Power Calibration Zone using the 8T – 8T test pattern (see 17.3).

**Bytes 47 to 127**

These bytes are Reserved and shall be recorded with (00).

**Bytes 128 to 2 647 - Parameter Pages**

Bytes 128 to 2 647 are specifying Parameter Pages.

A Parameter Page shall be 24 bytes in length and shall specify a single Write Strategy parameter (see 23.3) for 24 bands.

For Type RW media, the first 17 bytes of the Parameter Page shall specify the parameter value for Band 0 through 16. The last 7 bytes shall be reserved and recorded with (00).

For Type WORM media, the first 16 bytes of the Parameter Page shall specify the parameter value for Band 0 through 15. The last 8 bytes shall be reserved and recorded with (00).

Page Offset 0	Parameter byte value for Band 0
Page Offset 1	Parameter byte value for Band 1
Page Offset 2	Parameter byte value for Band 2
Page Offset 3	Parameter byte value for Band 3
Page Offset 4	Parameter byte value for Band 4
Page Offset 5	Parameter byte value for Band 5
Page Offset 6	Parameter byte value for Band 6
Page Offset 7	Parameter byte value for Band 7
Page Offset 8	Parameter byte value for Band 8
Page Offset 9	Parameter byte value for Band 9

Page Offset 10	Parameter byte value for Band 10
Page Offset 11	Parameter byte value for Band 11
Page Offset 12	Parameter byte value for Band 12
Page Offset 13	Parameter byte value for Band 13
Page Offset 14	Parameter byte value for Band 14
Page Offset 15	Parameter byte value for Band 15
Page Offset 16	Parameter byte value for Band 16 for RW / Reserved = (00) for WORM
Page Offset 17 to 23	Reserved = (00)

**Bytes 128 to 151**

This Parameter Page shall specify the nominal first pulse write power on Groove Recording Tracks  $P_{FW-G}$  in mW. Each byte shall be recorded with a number  $n$  such that

$$n = P_{FW-G} \times 10.$$

**Bytes 152 to 175**

This Parameter Page shall specify the nominal first pulse write power on Land Recording Tracks  $P_{FW-L}$  in mW. Each byte shall be recorded with a number  $n$  such that

$$n = P_{FW-L} \times 10.$$

**Bytes 176 to 199**

This Parameter Page shall specify the multi-pulse to first pulse write power ratio on Groove Recording Tracks  $P_{MW-G} / P_{FW-G}$ . Each byte shall be recorded with a number  $n$  such that

$$n = (P_{MW-G} / P_{FW-G}) \times 100.$$

**Bytes 200 to 223**

This Parameter Page shall specify the multi-pulse to first pulse write power ratio on Land Recording Tracks ( $P_{MW-L} / P_{FW-L}$ ). Each byte shall be recorded with a number  $n$  such that

$$n = (P_{MW-L} / P_{FW-L}) \times 100.$$

**Bytes 224 to 247**

This Parameter Page shall specify the last pulse to first pulse write power ratio on Groove Recording Tracks ( $P_{LW-G} / P_{FW-G}$ ). Each byte shall be recorded with a number  $n$  such that

$$n = (P_{LW-G} / P_{FW-G}) \times 100.$$

**Bytes 248 to 271**

This Parameter Page shall specify the last pulse to first pulse write power ratio on Land Recording Tracks ( $P_{LW-L} / P_{FW-L}$ ). Each byte shall be recorded with a number  $n$  such that

$$n = (P_{LW-L} / P_{FW-L}) \times 100.$$

**Bytes 272 to 295**

This Parameter Page shall specify the erase to first pulse write power ratio on Groove Recording Tracks ( $P_{ER-G} / P_{FW-G}$ ). Each byte shall be recorded with a number  $n$  such that

$$n = (P_{ER-G} / P_{FW-G}) \times 100.$$

For Type WORM media, each byte is typically set to  $(P_{B-G} / P_{FW-G}) \times 100$  to apply the bias power during the recording of spaces.

**Bytes 296 to 319**

This Parameter Page shall specify the erase to first pulse write power ratio on Land Recording Tracks ( $P_{ER-L} / P_{FW-L}$ ). Each byte shall be recorded with a number  $n$  such that

$$n = (P_{ER-L} / P_{FW-L}) \times 100.$$

For Type WORM media, each byte is typically set to  $(P_{B-L} / P_{FW-L}) \times 100$  to apply the bias power during the recording of spaces.

**Bytes 320 to 343**

This Parameter Page shall specify the cooling pulse to first pulse write power ratio on Groove Recording Tracks ( $P_{CL-G} / P_{FW-G}$ ). Each byte shall be recorded with a number  $n$  such that

$$n = (P_{CL-G} / P_{FW-G}) \times 100.$$

**Bytes 344 to 367**

This Parameter Page shall specify the cooling pulse to first pulse write power ratio on Land Recording Tracks ( $P_{CL-L} / P_{FW-L}$ ). Each byte shall be recorded with a number  $n$  such that

$$n = (P_{CL-L} / P_{FW-L}) \times 100.$$

**Bytes 368 to 391**

This Parameter Page shall specify the bias pulse to first pulse write power ratio on Groove Recording Tracks ( $P_{B-G} / P_{FW-G}$ ). Each byte shall be recorded with a number  $n$  such that

$$n = (P_{B-G} / P_{FW-G}) \times 100.$$

**Bytes 392 to 415**

This Parameter Page shall specify the bias pulse to first pulse write power ratio on Land Recording Tracks ( $P_{B-L} / P_{FW-L}$ ). Each byte shall be recorded with a number  $n$  such that

$$n = (P_{B-L} / P_{FW-L}) \times 100.$$

**Bytes 416 to 2 647 shall specify the write pulse timing strategy.**

The contents of the different time delay parameters specified by these bytes are given in table K.2 (see also Annex O).

The value contained in each of these bytes shall represent a time delay  $\delta T$  expressed as a sum of an integer numbers  $m$  of Channel Clock period  $T$  and an integer number  $n$  of units of  $1/40$  of the Channel Clock period  $T$ :

$$\delta T = mT + n(T/40).$$

The value of  $m$  and  $n$  shall be assigned to each byte using the following bit fields:

Bit 7-6 shall represent the value  $m$  (0 to 3).

Bit 5-0 shall represent the value  $n$  (0 to 39).

Bit 7 shall be the most significant bit of value  $m$ .

Bit 5 shall be the most significant bit of value  $n$ .

**Table K.2 — Contents of the time delay parameters used in the write pulse strategy**

Parameter	Content
$T_{SFP}$	Time delay of Start First Pulse: This time defines the start location of the first write pulse of a mark. It starts 1T before the space-mark transition of the NRZ signal. It is depending on the space-mark lengths. The power level selected at the end of this time is $P_{FW}$ .
$T_{EFP}$	Time delay of End First Pulse: This time defines the end location of the first write pulse of a mark. It starts 1T before the space-mark transition of the NRZ signal. It is depending on the space-mark lengths. The power level selected at the end of this time is $P_{CL}$ for 2T marks and $P_B$ for marks longer than 2T.
$T_{X1}$	Time delay of Extra One: This time defines the start location of the second pulse of a write sequence (for mark at least 4T long). It starts 1T after the space-mark transition of the NRZ signal. The power level selected at the end of this time is $P_{MP}$ .
$T_{X3}$	Time delay of Extra Three: This time defines the end location of the second pulse of a write sequence (for mark at least 4T long). It starts 1T after the space-mark transition of the NRZ signal. The power level selected at the end of this time is $P_B$ .
$T_{SMP}$	Time delay of Start Multi-Pulse: This time defines the start location of the third or more inner write pulse of a mark (for mark at least 5T long). It starts at every middle T of a long mark (at 2T, 3T, 4T, . . . after the space-mark transition). The power level selected at the end of this time is $P_{MP}$ .
$T_{X2}$	Time delay of Extra Two: This time defines the end location of the third write pulse of a mark (for mark at least 5T long). It starts 2T after the space-mark transition of the NRZ signal. The power level selected at the end of this time is $P_B$ .
$T_{EMP}$	Time delay of End Multi Pulse. This time defines the end location of the third or more inner write pulse started by $T_{SMP}$ (for mark at least 6T long). It starts at every middle T of a long mark (at 3T, 4T, 5T, . . . after the space-mark transition). The power level selected at the end of this time is $P_b$ .
$T_{EMPP}$	Time delay of End Multi Pulse Programmable. This time defines the end location of the last inner write pulse started by $T_{SMP}$ (for mark at least 4T long). It starts 3T before the mark-space transition of the NRZ signal. It is depending on the mark-space lengths. The power level selected at the end of this time is $P_B$ .
$T_{SLP}$	Time delay of Start Last Pulse. This time defines the start location of the last write pulse of a mark (for mark at least 3T long). It starts 2T before the mark-space transition of the NRZ signal. The power level selected at the end of this time is $P_{LW}$ .
$T_{ELP}$	Time delay of End Last Pulse: This time defines the end location of the last write pulse of a mark (for mark at least 3T long). It starts 2T before the mark-space transition of the NRZ signal. It is depending on the mark-space lengths. The power level selected at the end of this time is the final cooling power following a mark, $P_{CL}$ .
$T_{ECP}$	Time delay of End Cooling Pulse. This time defines the end location of the final cooling pulse, and starts the erase power of the space region. It starts 1T before the mark-space transition. It is depending on the mark-space lengths. The power level selected at the end of this time is $P_{ER}$ .

**Bytes 416 to 439**

This Parameter Page shall specify the start multi-pulse delay  $T_{SMP}$ .

**Bytes 440 to 463**

This Parameter Page shall specify the end multi-pulse delay  $T_{EMP}$ .

**Bytes 464 to 487**

This Parameter Page shall specify the start extra 1 pulse delay  $T_{X1}$ .

**Bytes 488 to 511**

This Parameter Page shall specify the end extra 2 pulse delay  $T_{X2}$ .

**Bytes 512 to 535**

This Parameter Page shall specify the end extra 3 pulse delay  $T_{X3}$ .

**Bytes 536 to 559**

This Parameter Page shall specify the end multi-pulse programmable delay of a 4T mark followed by a 2T space  $T_{EMPP}$  (4M-2S).

**Bytes 560 to 583**

This Parameter Page shall specify the end multi-pulse programmable delay of a 4T mark followed by a 3T space  $T_{EMPP}$  (4M-3S).

**Bytes 584 to 607**

This Parameter Page shall specify the end multi-pulse programmable delay of a 4T mark followed by a 4T space  $T_{EMPP}$  (4M-4S).

**Bytes 608 to 631**

This Parameter Page shall specify the end multi-pulse programmable delay of a 4T mark followed by a 5T or longer space  $T_{EMPP}$  (4M-5S).

**Bytes 632 to 655**

This Parameter Page shall specify the end multi-pulse programmable delay of a 5T or longer mark followed by a 2T space  $T_{EMPP}$  (5M-2S).

**Bytes 656 to 679**

This Parameter Page shall specify the end multi-pulse programmable delay of a 5T or longer mark followed by a 3T space  $T_{EMPP}$  (5M-3S).

**Bytes 680 to 703**

This Parameter Page shall specify the end multi-pulse programmable delay of a 5T or longer mark followed by a 4T space  $T_{EMPP}$  (5M-4S).

**Bytes 704 to 727**

This Parameter Page shall specify the end multi-pulse programmable delay of a 5T or longer mark followed by a 5T or longer space  $T_{EMPP}$  (5M-5S).

**Bytes 728 to 751**

This Parameter Page shall specify the end cooling pulse delay of a 2T mark followed by a 2T space  $T_{ECP}$  (2M-2S).

**Bytes 752 to 775**

This Parameter Page shall specify the end cooling pulse delay of a 2T mark followed by a 3T space  $T_{ECP}$  (2M-3S).

**Bytes 776 to 799**

This Parameter Page shall specify the end cooling pulse delay of a 2T mark followed by a 4T space  $T_{ECP}$  (2M-4S).

**Bytes 800 to 823**

This Parameter Page shall specify the end cooling pulse delay of a 2T mark followed by a 5T or longer space  $T_{ECP}$  (2M-5S).

**Bytes 824 to 847**

This Parameter Page shall specify the end cooling pulse delay of a 3T mark followed by a 2T space  $T_{ECP}$  (3M-2S).

**Bytes 848 to 871**

This Parameter Page shall specify the end cooling pulse delay of a 3T mark followed by a 3T space  $T_{ECP}$  (3M-3S).

**Bytes 872 to 895**

This Parameter Page shall specify the end cooling pulse delay of a 3T mark followed by a 4T space  $T_{ECP}$  (3M-4S).

**Bytes 896 to 919**

This Parameter Page shall specify the end cooling pulse delay of a 3T mark followed by a 5T or longer space  $T_{ECP}$  (3M-5S).

**Bytes 920 to 943**

This Parameter Page shall specify the end cooling pulse delay of a 4T mark followed by a 2T space  $T_{ECP}$  (4M-2S).

**Bytes 944 to 967**

This Parameter Page shall specify the end cooling pulse delay of a 4T mark followed by a 3T space  $T_{ECP}$  (4M-3S).

**Bytes 968 to 991**

This Parameter Page shall specify the end cooling pulse delay of a 4T mark followed by a 4T space  $T_{ECP}$  (4M-4S).

**Bytes 992 to 1 015**

This Parameter Page shall specify the end cooling pulse delay of a 4T mark followed by a 5T or longer space  $T_{ECP}$  (4M-5S).

**Bytes 1 016 to 1 039**

This Parameter Page shall specify the end cooling pulse delay of a 5T or longer mark followed by a 2T space  $T_{ECP}$  (5M-2S).

**Bytes 1 040 to 1 063**

This Parameter Page shall specify the end cooling pulse delay of a 5T or longer mark followed by a 3T space  $T_{ECP}$  (5M-3S).

**Bytes 1 064 to 1 087**

This Parameter Page shall specify the end cooling pulse delay of a 5T or longer mark followed by a 4T space  $T_{ECP}$  (5M-4S).

**Bytes 1 088 to 1 111**

This Parameter Page shall specify the end cooling pulse delay of a 5T or longer mark followed by a 5T or longer space  $T_{ECP}$  (5M-5S).

**Bytes 1 112 to 1 135**

This Parameter Page shall specify the end last pulse delay of a 2T mark followed by a 2T space  $T_{ELP}$  (2M-2S).

**Bytes 1 136 to 1 159**

This Parameter Page shall specify the end last pulse delay of a 2T mark followed by a 3T space  $T_{ELP}$  (2M-3S).

**Bytes 1 160 to 1 183**

This Parameter Page shall specify the end last pulse delay of a 2T mark followed by a 4T space  $T_{ELP}$  (2M-4S).

**Bytes 1 184 to 1 207**

This Parameter Page shall specify the end last pulse delay of a 2T mark followed by a 5T or longer space  $T_{ELP}$  (2M-5S).

**Bytes 1 208 to 1 231**

This Parameter Page shall specify the end last pulse delay of a 3T mark followed by a 2T space  $T_{ELP}$  (3M-2S).

**Bytes 1 232 to 1 255**

This Parameter Page shall specify the end last pulse delay of a 3T mark followed by a 3T space  $T_{ELP}$  (3M-3S).

**Bytes 1 256 to 1 279**

This Parameter Page shall specify the end last pulse delay of a 3T mark followed by a 4T space  $T_{ELP}$  (3M-4S).

**Bytes 1 280 to 1 303**

This Parameter Page shall specify the end last pulse delay of a 3T mark followed by a 5T or longer space  $T_{ELP}$  (3M-5S).

**Bytes 1 304 to 1 327**

This Parameter Page shall specify the end last pulse delay of a 4T mark followed by a 2T space  $T_{ELP}$  (4M-2S).

**Bytes 1 328 to 1 351**

This Parameter Page shall specify the end last pulse delay of a 4T mark followed by a 3T space  $T_{ELP}$  (4M-3S).

**Bytes 1 352 to 1 375**

This Parameter Page shall specify the end last pulse delay of a 4T mark followed by a 4T space  $T_{ELP}$  (4M-4S).

**Bytes 1 376 to 1 399**

This Parameter Page shall specify the end last pulse delay of a 4T mark followed by a 5T or longer space  $T_{ELP}$  (4M-5S).

**Bytes 1 400 to 1 423**

This Parameter Page shall specify the end last pulse delay of a 5T or longer mark followed by a 2T space  $T_{ELP}$  (5M-2S).

**Bytes 1 424 to 1 447**

This Parameter Page shall specify the end last pulse delay of a 5T or longer mark followed by a 3T space  $T_{ELP}$  (5M-3S).

**Bytes 1 448 to 1 471**

This Parameter Page shall specify the end last pulse delay of a 5T or longer mark followed by a 4T space  $T_{ELP}$  (5M-4S).

**Bytes 1 472 to 1 495**

This Parameter Page shall specify the end last pulse delay of a 5T or longer mark followed by a 5T or longer space  $T_{ELP}$  (5M-5S).

**Bytes 1 496 to 1 519**

This Parameter Page shall specify the start last pulse delay of a 2T mark followed by a 2T space  $T_{SLP}$  (2M-2S).

**Bytes 1 520 to 1 543**

This Parameter Page shall specify the start last pulse delay of a 2T mark followed by a 3T space  $T_{SLP}$  (2M-3S).

**Bytes 1 544 to 1 567**

This Parameter Page shall specify the start last pulse delay of a 2T mark followed by a 4T space  $T_{SLP}$  (2M-4S).

**Bytes 1 568 to 1 591**

This Parameter Page shall specify the start last pulse delay of a 2T mark followed by a 5T or longer space  $T_{SLP}$  (2M-5S).

**Bytes 1 592 to 1 615**

This Parameter Page shall specify the start last pulse delay of a 3T mark followed by a 2T space  $T_{SLP}$  (3M-2S).

**Bytes 1 616 to 1 639**

This Parameter Page shall specify the start last pulse delay of a 3T mark followed by a 3T space  $T_{SLP}$  (3M-3S).

**Bytes 1 640 to 1 663**

This Parameter Page shall specify the start last pulse delay of a 3T mark followed by a 4T space  $T_{SLP}$  (3M-4S).

**Bytes 1 664 to 1 687**

This Parameter Page shall specify the start last pulse delay of a 3T mark followed by a 5T or longer space  $T_{SLP}$  (3M-5S).

**Bytes 1 688 to 1 711**

This Parameter Page shall specify the start last pulse delay of a 4T mark followed by a 2T space  $T_{SLP}$  (4M-2S).

**Bytes 1 712 to 1 735**

This Parameter Page shall specify the start last pulse delay of a 4T mark followed by a 3T space  $T_{SLP}$  (4M-3S).

**Bytes 1 736 to 1 759**

This Parameter Page shall specify the start last pulse delay of a 4T mark followed by a 4T space  $T_{SLP}$  (4M-4S).

**Bytes 1 760 to 1 783**

This Parameter Page shall specify the start last pulse delay of a 4T mark followed by a 5T or longer space  $T_{SLP}$  (4M-5S).

**Bytes 1 784 to 1 807**

This Parameter Page shall specify the start last pulse delay of a 5T or longer mark followed by a 2T space  $T_{SLP}$  (5M-2S).

**Bytes 1 808 to 1 831**

This Parameter Page shall specify the start last pulse delay of a 5T or longer mark followed by a 3T space  $T_{SLP}$  (5M-3S).

**Bytes 1 832 to 1 855**

This Parameter Page shall specify the start last pulse delay of a 5T or longer mark followed by a 4T space  $T_{SLP}$  (5M-4S).

**Bytes 1 856 to 1 879**

This Parameter Page shall specify the start last pulse delay of a 5T or longer mark followed by a 5T or longer space  $T_{SLP}$  (5M-5S).

**Bytes 1 880 to 1 903**

This Parameter Page shall specify the end first pulse delay of a 2T mark following a 2T space  $T_{EFP}$  (2S-2M).

**Bytes 1 904 to 1 927**

This Parameter Page shall specify the end first pulse delay of a 3T mark following a 2T space  $T_{EFP}$  (2S-3M).

**Bytes 1 928 to 1 951**

This Parameter Page shall specify the end first pulse delay of a 4T mark following a 2T space  $T_{EFP}$  (2S-4M).

**Bytes 1 952 to 1 975**

This Parameter Page shall specify the end first pulse delay of a 5T or longer mark following a 2T space  $T_{EFP}$  (2S-5M).

**Bytes 1 976 to 1999**

This Parameter Page shall specify the end first pulse delay of a 2T mark following a 3T space  $T_{EFP}$  (3S-2M).

**Bytes 2 000 to 2 023**

This Parameter Page shall specify the end first pulse delay of a 3T mark following a 3T space  $T_{EFP}$  (3S-3M).

**Bytes 2 024 to 2 047**

This Parameter Page shall specify the end first pulse delay of a 4T mark following a 3T space  $T_{EFP}$  (3S-4M).

**Bytes 2 048 to 2 071**

This Parameter Page shall specify the end first pulse delay of a 5T or longer mark following a 3T space  $T_{EFP}$  (3S-5M).

**Byte 2 072 to 2 095**

This Parameter Page shall specify the end first pulse delay of a 2T mark following a 4T space  $T_{EFP}$  (4S-2M).

**Bytes 2 096 to 2 119**

This Parameter Page shall specify the end first pulse delay of a 3T mark following a 4T space  $T_{EFP}$  (4S-3M).

**Bytes 2 120 to 2 143**

This Parameter Page shall specify the end first pulse delay of a 4T mark following a 4T space  $T_{EFP}$  (4S-4M).

**Bytes 2 144 to 2 167**

This Parameter Page shall specify the end first pulse delay of a 5T or longer mark following a 4T space  $T_{EFP}$  (4S-5M).

**Bytes 2 168 to 2 191**

This Parameter Page shall specify the end first pulse delay of a 2T mark following a 5T or longer space  $T_{EFP}$  (5S-2M).

**Bytes 2 192 to 2 215**

This Parameter Page shall specify the end first pulse delay of a 3T mark following a 5T or longer space  $T_{EFP}$  (5S-3M).

**Bytes 2 216 to 2 239**

This Parameter Page shall specify the end first pulse delay of a 4T mark following a 5T or longer space  $T_{EFP}$  (5S-4M).

**Bytes 2 240 to 2 263**

This Parameter Page shall specify the end first pulse delay of a 5T or longer mark following a 5T or longer space  $T_{EFP}$  (5S-5M).

**Bytes 2 264 to 2 287**

This Parameter Page shall specify the start first pulse delay of a 2T mark following a 2T space  $T_{SFP}$  (2S-2M).

**Bytes 2 288 to 2 311**

This Parameter Page shall specify the start first pulse delay of a 3T mark following a 2T space  $T_{SFP}$  (2S-3M).

**Bytes 2 312 to 2 335**

This Parameter Page shall specify the start first pulse delay of a 4T mark following a 2T space  $T_{SFP}$  (2S-4M).

**Bytes 2 336 to 2 359**

This Parameter Page shall specify the start first pulse delay of a 5T or longer mark following a 2T space  $T_{SFP}$  (2S-5M).

**Bytes 2 360 to 2 383**

This Parameter Page shall specify the start first pulse delay of a 2T mark following a 3T space  $T_{SFP}$  (3S-2M).

**Bytes 2 384 to 2 407**

This Parameter Page shall specify the start first pulse delay of a 3T mark following a 3T space  $T_{SFP}$  (3S-3M).

**Bytes 2 408 to 2 431**

This Parameter Page shall specify the start first pulse delay of a 4T mark following a 3T space  $T_{SFP}$  (3S-4M).

**Bytes 2 432 to 2 455**

This Parameter Page shall specify the start first pulse delay of a 5T or longer mark following a 3T space  $T_{SFP}$  (3S-5M).

**Bytes 2 456 to 2 479**

This Parameter Page shall specify the start first pulse delay of a 2T mark following a 4T space  $T_{SFP}$  (4S-2M).

**Bytes 2 480 to 2503**

This Parameter Page shall specify the start first pulse delay of a 3T mark following a 4T space  $T_{SFP}$  (4S-3M).

**Bytes 2 504 to 2527**

This Parameter Page shall specify the start first pulse delay of a 4T mark following a 4T space  $T_{SFP}$  (4S-4M).

**Bytes 2 528 to 2551**

This Parameter Page shall specify the start first pulse delay of a 5T or longer mark following a 4T space  $T_{SFP}$  (4S-5M).

**Bytes 2 552 to 2575**

This Parameter Page shall specify the start first pulse delay of a 2T mark following a 5T or longer space  $T_{SFP}$  (5S-2M).

**Bytes 2 576 to 2599**

This Parameter Page shall specify the start first pulse delay of a 3T mark following a 5T or longer space  $T_{SFP}$  (5S-3M).

**Bytes 2 600 to 2623**

This Parameter Page shall specify the start first pulse delay of a 4T mark following a 5T or longer space  $T_{SFP}$  (5S-4M).

**Bytes 2 624 to 2647**

This Parameter Page shall specify the start first pulse delay of a 5T or longer mark following a 5T or longer space  $T_{SFP}$  (5S-5M).

**Bytes 2 648 to 8189**

These bytes are Unspecified and shall be ignored in interchange. Media manufacturers may use these bytes at their discretion to record additional disk information.

**Bytes 8190 and 8191**

These bytes shall be recorded with the SDI Identifier Complement. Both bytes shall be recorded with (2E) to indicate that this is a SDI sector.
