B.8 Application management - data structure destruction

This appendix provides the test data and expected results (for the ICC-Resident stack model that implements the ENVELOPE APDU) as described in Annex A.1.8, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.8.

Annex C
(informative)

Non ICC-Resident stack expected component test inputs and outputs

Sequence tests for non ICC-Resident stack models shall test only inputs and outputs at SAL Agent interface. The expected DER/TLV encoding of the ASN.1 of the inputs and outputs is defined below. All other interfaces shall be tested as defined in the relevant clauses i.e. GCI clause 6.2, IFD clause 6.3 and TC clause 6.4.

All ASN.1 TLV encoded data enforces Destinguished Encoding Rules (DER).

The default pathsecurity shall be TLS 1.0

C.1 Application management - alpha card-application data structure construction

This appendix provides the test data and expected results, as described in Annex A.1.1, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.1.

  <invocationType>CALL</invocationType>
  <description>Pre-condition: Connect to the Alpha card application. This
shall automatically invoke Open on the TC
     layer and then EstablishContext on the IFDProxy as connectivity to the
smartcard host has not yet been established.
     Then it shall invoke connect on the IFDProxy. In turn connect shall be
invoked on the IFD Layer on the client side.
     After connect has completed, transmit on the IFDProxy shall be invoked
to transmit the CardApplicationConnect APDU to
     the Alpha card application. If the sessionIdentifier field in the
ChannelHandle is null then the SAL Proxy shall
     create a new TC connection. If the sessionIdentifier field is not null
then the TC connection must exist at this
     point. In this case sessionIdentifier is null. The smartcard path shall
be replaced when comparing the results to
     those from an ISO247272 stack.</description>

      <description>Return of previous SAL Proxy call: Pre-condition: Connect to
    the Alpha card application. This shall
        automatically invoke Open on the TC layer and then EstablishContext on
    the IFDProxy as connectivity to the smartcard
        host has not yet been established. Then it shall invoke connect on the
    IFDProxy. In turn connect shall be invoked on
        the IFD layer on the client side. After connect has completed, transmit
    on the IFDProxy shall be invoked to transmit
        the CardApplicationConnect APDU to the Alpha card application. If the
    sessionIdentifier field in the ChannelHandle is
        null then the SAL Proxy shall create a new TC connection. If the
    sessionIdentifier field is not null then the TC
        connection must exist at this point. In this case sessionIdentifier is
    null. The smartcard path shall be replaced
        when comparing the results to those from an ISO247272
    stack.</description>

C.2 Application management - first application data structure construction

This appendix provides the test data and expected results, as described in Annex A.1.2, that shall be consumed and interpreted by the components under test and/or the test components. The encoded data (i.e. Data encoded:) represents the expected communication protocol specific transmitted packages that are to be compared against the actual data that has been intercepted at these interfaces. The encoded data is the protocol specific representation of the parameters as defined in Annex A.1.2.
