Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 12612 was prepared by Technical Committee ISO/TC 36, *Cinematography*.

Annexes A and B of this International Standard are for information only.

Cinematography — Interchange of post-production materials

1 Scope

1.1 This International Standard specifies certain parameters and technical characteristics of post-production motion-picture materials used in the international exchange of 35 mm and 70 mm picture and sound elements.

1.2 This International Standard further specifies a method for the evaluation of picture-image quality based on a standardized test image contained in the post-production picture elements.

2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this International Standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

ISO 5-2:1991, *Photography — Density measurements — Part 2: Geometric conditions for transmission density.*

ISO 5-3:1995, *Photography — Density measurements — Part 3: Spectral conditions.*

ISO 162:1985, *Cinematography — Head gaps and sound records for three-, four-, or six-track magnetic sound records on 35 mm and single-track on 17,5 mm motion-picture film containing no picture — Positions and width dimensions.*

ISO 491:1995, *Cinematography — 35 mm motion-picture film and magnetic film — Cutting and perforating dimensions.*

3 Requirements for post-production picture elements

3.1 Cutting and perforating dimensions

Cutting and perforating dimensions for photographic films shall be in accordance with the International Standards given in 3.1.1 to 3.1.3.

3.1.1 For 35 mm original negatives, master positives and duplicate negatives: ISO 491 (preferred Type N perforation and 4,74 mm perforation pitch).

3.1.2 For 35 mm projection prints: ISO 491 (Type P perforation and 4,75 mm perforation pitch).

3.1.3 For 65 mm original negatives, master positives and duplicate negatives and for 70 mm projection prints: ISO 3023.

3.2 Position and dimensions of picture areas

Position and dimensions of picture areas shall be in accordance with the International Standards given in 3.2.1 and 3.2.2.

3.2.1 For 35 mm: ISO 2906 and ISO 2907.

3.2.2 For 65 mm and 70 mm: ISO 2467.

3.3 Splices

Splices shall be in accordance with ISO 6038.

3.4 Requirements for photographic characteristics

The photographic characteristics of post-production picture materials to be interchanged shall be evaluated using densitometric measurements of a test image which is spliced into the original picture rolls and reproduced through the successive stages of duplication.

The control method is based upon the Laboratory Aim Density system (LAD system) (see clause A.1 for a reference concerning the implementation of this system), which assigns specific density values to a control patch in a test image which is spliced into the original camera film, and is then read at each stage throughout the sequence to the projection print. All scenes within the motion picture are graded (timed) relative to the test image which is considered as a "perfect" scene.

Density aim values are chosen so that the print-through equivalent neutral densities on each film in the post-production sequence fall approximately at the mid-point of the straight line portion of that film's characteristic curves.

This achieves the following two objectives.

- a) Most significant picture information is placed on the linear portion of the duplicating film's characteristic curve, carrying a maximum of highlight and shadow information.
- b) A neutral grey scale is maintained throughout the post-production, aiding, in colour grading (timing).

A suitable LAD control image begins as a camera image incorporating a uniform neutral patch of sufficient size for convenient densitometric measurements. This patch may be positioned within a scene suitable for subjective evaluation. An 18 % reflectance grey card under scene illumination is usually appropriate. This LAD control image is spliced into the roll of original negative as specified in 3.5.3.

Ultimately, picture quality will be reviewed subjectively, but within the tolerances of normal film, printer and process variability, and the characteristics of specific duplicating film systems, objective measurements of the LAD system assist in readily obtaining consistent duplicates with good tone and colour reproduction characteristics.

3.4.1 Densitometry

The densities of all picture materials intended for reproduction shall be measured using ISO standard diffuse status M transmission densitometry (ISO 5-2 and ISO 5-3). Densities of picture materials intended for viewing by projection shall be measured using ISO standard diffuse status A transmission densitometry.

3.4.2 Density of the original camera negative LAD test image (LAD control patch)

The densities of the LAD control patch (see clause A.2) shall be chosen to be representative of the centre of scene density range normally obtained on a modern (colour-masked) colour negative film with normal exposure and processing.

3.4.3 Density of the LAD test image in master positive

The LAD control patch should be printed to the centre of the usable straight-line portion of the duplicating film. These aim densities are specified by the film manufacturer for the particular duplicating stock.

3.4.4 Density of the LAD test image in duplicate negative

The LAD control patch should be printed according to the aim densities specified by the film manufacturer for the particular duplicating stock. These densities are normally near the centre of the usable straight-line portion of the characteristic curve, but may be different from those specified for the master positive in order to aid intercutability with original camera negatives and to facilitate high-speed printing.

3.4.5 Density of the LAD test image in projection print

The LAD control patch should be printed to a neutral grey of 1,00 density (1,00 equivalent neutral density) on the print. The status A densities corresponding to a 1,00 neutral grey are specified by the film manufacturer, and will depend upon the dyes in the print film and the viewing illumination in accordance with ISO 2910.

3.5 Leaders for picture materials

3.5.1 Head and tail leaders for picture materials shall be in accordance with ISO 4241.

3.5.2 A synchronizing mark, clearly identified as "Head Sync", shall be placed on the "Picture Gate" frame (frame 192) of the head leader.

3.5.3 The test image referred to in 3.4 shall be located in or before the head leader in a position which ensures that the printing machine has reached full and steady speed when the test image is exposed. It is recommended that the test image replaces from one to six of the head leader frames 97 to 102.

3.5.4 Additional requirements for head and tail leaders are subject to agreement between the parties involved.

4 Requirements for post-production sound elements

4.1 Cutting and perforating dimensions

Cutting and perforating dimensions for 35 mm magnetic recording films shall be in accordance with ISO 491 (Type P perforation and 4,75 mm perforation pitch).

NOTE — The use of 17,5 mm magnetic film is permissible only by prior agreement between all parties involved.

4.2 Position, dimensions and track assignments

Position, dimensions and track assignments of sound tracks shall be in accordance with ISO 162 for 35 mm magnetic film and ISO 9525 for 17,5 mm magnetic film.

4.3 Nominal velocity

The nominal velocity of 35 mm magnetic sound records shall be in agreement with the intended projection frame rate of the accompanying picture, normally 24 frames per second which is equivalent to 96 perforation holes per second or approximately 45,6 cm/s.

4.4 Recordings

Recordings shall be made on magnetic film containing no splices. No more than two editorial splices shall be allowed in any roll of magnetic film.

4.5 Sound records to be interchanged for making monophonic release prints (see clause A.3)

By agreement between the parties involved, sound records shall be recorded using

- a one-track standard on separate magnetic film;
- a three- or four-track standard on a single magnetic film.

4.5.1 Three sound records shall be recorded on a single three-track magnetic film with the following track assignments:

- Track 1 — Dialog record;
- Track 2 — Music record;
- Track 3 — Sound effects record;

4.5.2 Four sound records shall be recorded on a single four-track magnetic film with the following track assignments:

- Track 1 — Dialog record;
- Track 2 — Music record;
- Track 3 — Sound effects record;
- Track 4 — Special components record (see the following note).

NOTE — Special components may include original language or alternate dialog for reference, sound tracks of synchronized noises corresponding to the noises of the synchronized dialog sound records, crowd noise, musical accompaniment for soloists to be added at later stages, a laugh track, special sound effects, etc.

4.6 Components of sound records to be interchanged for making 35 mm stereophonic release prints (see also clause A.3)

By agreement between the parties involved, sound records shall be interchanged as either three or four components in either matrix encoded or discrete channel formats with the track assignments given in 4.6.1 and 4.6.2.

4.6.1 Stereophonic matrix encoded components

- Track 1 — Special components record (see note 1).
- Track 2 — Music and sound effects Left total record.
- Track 3 — Music and sound effects Right total record.

The original language dialog track is customarily supplied for translation and timing, either as a monophonic magnetic record or as a photographic record on a standard release print.

NOTES

1 Special components may include original language or alternate dialog for reference, sound tracks of synchronized noises corresponding to the noises of the synchronized dialog sound records, crowd noise, musical accompaniment for soloists to be added at later stages, a laugh track, special sound effects, etc.

2 In the United States, it is customary to use the following track assignments:

- Track 1 — Music and sound effects Left total record.
- Track 2 — Music and sound effects Right total record.
- Track 3 — Special components record (see note 1).

4.6.2 Stereophonic discrete components

- Track 1 — Left music and sound effects record.
- Track 2 — Centre music and sound effects record.
- Track 3 — Right music and sound effects record.
- Track 4 — Surround music and sound effects record.

By agreement between the parties involved, sound records may be interchanged as six components as given below:

- Track 1 — Left music and sound effects record.
- Track 2 — Centre music and sound effects record.
- Track 3 — Right music and sound effects record.
- Track 4 — Surround music and sound effects record.
- Track 5 — Special components record.
- Track 6 — Special components record.

For masters containing two-channel surround records, the track assignments shall be made by agreement between the parties involved.

The original language dialog track is customarily supplied for translation and timing, either as a monophonic magnetic record or as a photographic record on a standard release print.

4.7 Sound records to be interchanged for making 70 mm release prints (see also clause A.3)

Sound records shall be interchanged as six components with the following track assignments:

- Track 1 — Left channel music and sound effects record.
- Track 2 — Left-extra channel music and sound effects record.

- Track 3 — Centre channel music and sound effects record.
- Track 4 — Right-extra channel music and sound effects record.
- Track 5 — Right channel music and sound effects record.
- Track 6 — Surround channel music and sound effects record.

The original language dialog track is customarily supplied as a separate monophonic film for reference.

By agreement between the parties involved, there may be other assignments of the sound tracks, which shall be marked on the label.

4.8 Requirements for sound record characteristics

The peak level of each of the individual records should be controlled so that a simple sum of the records at equal levels does not exceed the capabilities of the format in which the print is to be released to commercial theatres.

4.8.1 Frequency range and response: as specified in ISO 4834.

4.8.2 Recording level: each component of the sound records shall be recorded using the reference level specified in ISO 4834.

4.8.3 The relationship between the recording levels of the individual sound components in a complete mixed sound record should assure that dialog can be easily understood.

4.8.4 Sound records shall be free of defects affecting the sound quality. Noticeable limitations of frequency range or response, non-linear distortion, wow and flutter, and extraneous noise shall not be present in the sound records.

4.8.5 Cross-talk between the tracks of multitrack magnetic films shall be attenuated by at least 40 dB between 100 Hz and 10 kHz inclusive.

4.8.6 A complete set of component magnetic sound tracks shall include a special test roll with the following signals, recorded in-phase on all tracks without the use of noise-reduction systems.

- A recording of pink noise at a level of 10 dB below nominal with a duration of at least 30 s.
- A recording of reference level tone for alignment of noise-reduction systems with a duration of at least 30 s.
- Other additional signals by agreement between the parties involved.

NOTE — It is recommended that a test roll be spliced at the head of one of the magnetic sound components.

4.9 Leaders for sound materials

4.9.1 Each roll of magnetic film material shall use a protective, unrecorded section of head leader not less than 8 m in length. The protective tail leader on each roll of magnetic film shall be not less than 5 m in length.

4.9.2 A recording of a 1 000 Hz sine wave tone at reference level, which is in-phase on all tracks, shall be recorded on all rolls of magnetic film material, following the protective section, for a duration of at least 30 s.

4.9.3 A recording of pink noise at reference level, which is in-phase on all tracks, shall be recorded on all rolls of magnetic film material following the 1 000 Hz tone for a duration of at least 30 s.

4.9.4 Other signals (such as alignment signals for companding noise-reduction systems, etc.) may be included in the head leaders by agreement between the parties involved.

4.9.5 No magnetic recorded test signals shall intrude in the area of film opposite the picture leader specified in ISO 4241, except as specified below.

4.9.6 Each roll of magnetic film material shall have a synchronizing mark clearly identified as "Head Sync" placed on the magnetic film in editorial sync (level sync) with the "Picture Gate" frame (frame 192) of the leader specified in ISO 4241 (see 3.5.2).

4.9.7 Each roll of magnetic film material shall have a 1 000 Hz sine wave tone at reference level recorded for a duration of 1 frame in editorial sync with the "2" frame (frame 48) of the leader specified in ISO 4241.

4.9.8 Each roll of magnetic film material shall have a 1 000 Hz sine wave tone at reference level recorded for a duration of 1 frame in editorial sync with the END frame of the tail leader specified in ISO 4241.

4.9.9 The tail leader shall include a recording of the beginning of the subsequent sound track roll for a duration of at least 30 frames.

5 Packing and marking

5.1 Photographic films and magnetic recording films shall be wound on reels or cores as specified in ISO 1039.

5.2 Cans in which post-production materials are transported and/or stored shall have identification labels containing the information specified in ISO 5758.

5.2.1 For magnetic recording films, the following additional information is required on the label:

- title of the film;
- roll number;
- designation of sound component(s);
- track format (1, 3, 4 or 6 track);
- track assignments (see 4.5, 4.6 and 4.7);
- total roll length, including head and tail leaders and protection leaders;
- type of noise-reduction system;
- test signals contained in the leader between protective and synchronizing sections.
