Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 14961 was prepared by Technical Committee ISO/TC 20, *Aircraft and space vehicles*, Subcommittee SC 13, *Space data and information transfer systems*.

Space data and information transfer systems — Parameter value language specification

1 Scope

This International Standard specifies the requirements for a parameter value language specification for space data and information transfer systems.

2 Requirements

The requirements are the same as the technical recommendations made in the following publication (reproduced on the following pages), which is adopted as an International Standard :

CCSDS 641.0-B-1, May 1992, *Recommendation for space data system standards — Parameter value language specification.*

For the purposes of international standardization, the modifications outlined below shall apply to the following pages of publication CCSDS 641.0-B-1.

Pages i to iv

This part contains information which is relevant to the CCSDS publication only.

Page vii

Add the following information to reference [8]:

Document CCSDS 301.0-B-2, April 1990 is equivalent to ISO 11104:1991.

3 Revision of publication CCSDS 641.0-B-1

It has been agreed with the Consultative Committee for Space Data Systems that Sub-Committee ISO/TC 20/SC 13 will be consulted in the event of any revision or amendment of publication CCSDS 641.0-B-1. To this end, NASA will act as a liaison body between CCSDS and ISO.

CCSDS Recommendation: Parameter Value Language Specification

AUTHORITY

Issue:	Blue Book, Issue 1
Date:	May 1992
Location:	CCSDS Panel 2 Workshop Oberpfaffenhofen, Germany May 1992

This Recommendation reflects the consensus technical agreement of the following member Agencies of the Consultative Committee for Space Data Systems (CCSDS):

- British National Space Centre (BNSC) / United Kingdom
- Canadian Space Agency (CSA) / Canada
- Centre National D'Etudes Spatiales (CNES) / France
- Deutsche Forschungsanstalt für Luft und Raumfahrt (DLR) / FRG
- European Space Agency (ESA) / Europe
- Instituto de Pesquisas Espaciais (INPE) / Brazil
- National Aeronautics and Space Administration (NASA) / USA
- National Space Development Agency of Japan (NASDA) / Japan

The following observer Agencies also concur with this Recommendation:

- Department of Communication/Communications Research Centre (DOC/CRC)
/ Canada
- Institute for Space Astronautics and Science (ISAS) / Japan

This Recommendation is published and maintained by:

CCSDS Secretariat
Communications and Data Systems Division, (Code-OS)
National Aeronautics and Space Administration
Washington, DC 20546, USA

STATEMENT OF INTENT

The Consultative Committee for Space Data Systems (CCSDS) is an organization officially established by the management of member space Agencies. The Committee meets periodically to address data systems problems that are common to all participants, and to formulate sound technical solutions to these problems. Inasmuch as participation in the CCSDS is completely voluntary, the results of Committee actions are termed Recommendations and are not considered binding on any Agency.

This Recommendation is issued by, and represents the consensus of, the CCSDS Plenary body. Agency endorsement of this Recommendation is entirely voluntary. Endorsement, however, indicates the following understandings:

- Whenever an Agency establishes a CCSDS-related Standard, this Standard will be in accord with the relevant Recommendation. Establishing such a Standard does not preclude other provisions which an Agency may develop.
- Whenever an Agency establishes a CCSDS-related Standard, the Agency will provide other CCSDS member Agencies with the following information:
 - The Standard itself.
 - The anticipated date of initial operational capability.
 - The anticipated duration of operational service.
- Specific service arrangements shall be made via memoranda of agreement. Neither this Recommendation nor any ensuing Standard is a substitute for a memorandum of agreement.

No later than five years from the date of its issuance, this Recommendation will be reviewed by the CCSDS to determine whether it should: (1) remain in effect without change; (2) be changed to reflect the impact of new technologies, new requirements, or new directions; or, (3) be retired or canceled.

CCSDS Recommendation: Parameter Value Language Specification

FOREWORD

This document is a technical Recommendation for the specification of the Parameter Value Language (PVL) and has been prepared by the Consultative Committee for Space Data Systems (CCSDS).

This Recommendation defines the Parameter Value Language which provides a human readable, machine processable language for naming and expressing data values. It allows implementing organizations within each Agency to proceed coherently with the development of compatibly derived Standards for space data systems and widely dispersed data users that are within their cognizance. Derived Agency Standards may implement only a subset of the optional features allowed by the Recommendation and may incorporate features not addressed by the Recommendation.

Through the process of normal evolution, it is expected that expansion, deletion, or modification to this document may occur. This Recommendation is therefore subject to CCSDS document management and change control procedures which are defined in Reference [1].

Questions relative to the contents or status of this document should be addressed to the CCSDS Secretariat.

1 INTRODUCTION

1.1 Purpose and Scope

The purpose of this document is to establish a common Recommendation for the specification of a standard keyword/value type language for naming and expressing data values in order to interchange data in a more uniform fashion within and among Agencies participating in the Consultative Committee for Space Data Systems (CCSDS). This Recommendation provides an overview and formal syntax specification of the Parameter Value Language (PVL).

1.2 Applicability

The specifications in this document are to be invoked through the normal standards program of each member Agency and are applicable to all space-related science and engineering data exchanges where a keyword/value language is desired.

1.3 Recommended Approach to Reading the Document

A proper understanding of this Recommendation requires familiarity with the terminology used in this document. Terms are defined as they are introduced in the text. Individuals who are accessing the document out of sequence may wish to refer to Annex A, which presents a complete summary of the acronyms and the terminology used in this document. Reference [7] is a tutorial which describes the requirements, the techniques used to fulfill the requirements, usage guidelines and parser implementation guidelines for PVL. Some readers may find it useful to read Reference [7] prior to reading this document.

The document is structured as follows:

- Chapter 2 describes the PVL language, using English text and syntax diagrams.
- Chapter 3 provides the formal syntax specification written in Abstract Syntax Notation One (ASN.1, see Reference [5]). The comments in the ASN.1 are part of the specification. This is the ruling form of the specification.
- Annex A contains acronyms and a glossary of terms used in this document.
- Annex B lists the ASCII codes for the characters used in PVL.

CCSDS Recommendation: Parameter Value Language Specification

This document uses syntax diagrams to illustrate the syntax of the various language constructs. Components of the construct are called elements, are presented in boxes or circles and are connected by directional lines. The following conventions are used:

- Elements that are presented in uppercase and lowercase letters in rectangles are defined elsewhere in the document.
- Elements that are presented in a circle as a single bold character are delimiters or reserved characters.
- Elements that are presented in lowercase letters in a rectangle with rounded corners are basic items not further defined in the syntax diagrams of this document.
- Elements that are presented in bold characters in a rectangle with rounded corners are keywords.
- The item named on the left of the ::= symbol is the item being defined.
- The diagram on the right of the ::= symbol is the definition.
- A vertical branch represents a choice.
- A repetition is indicated by a loop back covering the object to be repeated.
- The termination of each structure is represented by the **o** symbol.

For example:

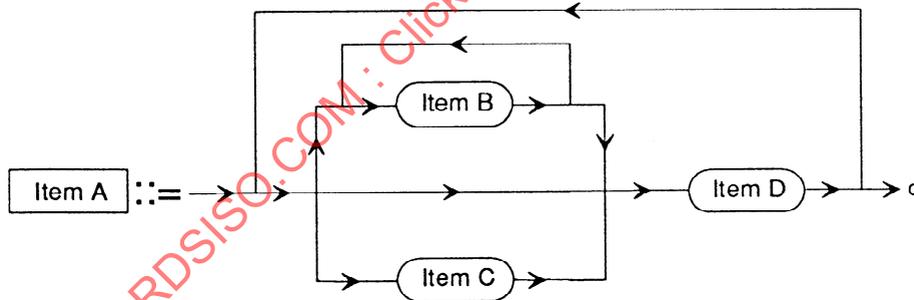

Figure 1-1 Example Structure Diagram

In this example Item A is defined as first a choice between Items B or C or nothing, where Item B itself may be repeated any number of times. Then this structure is followed by one Item D. Once this structure is built up, it may then all be repeated any number of times, until the choice to pass onto the **o** symbol is taken. Of course if any items on the right (B, C or D) contain an Item A, the definition is recursive. Recursive structure definitions are permitted in this Recommendation.

CCSDS Recommendation: Parameter Value Language Specification

1.4 Character Set Definitions

The following sections contain character set definitions used in this specification. A clear understanding of these terms is necessary to understand this Recommendation.

1.4.1 PVL Character Set

The PVL Character Set is a subset of the ASCII character set. The specific subset is defined in Annex B. The PVL Character Set is split into three subsets: white space characters, reserved characters, and unrestricted characters.

1.4.1.1 White Space Character Set

The White Space Character Set is defined as the following characters: space, carriage return, line feed, horizontal tab, vertical tab, and form feed. A sequence of one or more of these characters is known as White Space. The semantic effect of White Space between syntactic elements is not affected by its length.

1.4.1.2 Reserved Character Set

The Reserved Character Set is a collection of characters reserved for specific purposes or future use. The Reserved Character Set is defined in Table 1-1.

Symbol	Name	Symbol	Name	Symbol	Name
&	Ampersand	[Left Square Bracket	%	Percent Sign
<	Less-Than Sign (Open Angle Bracket)]	Right Square Bracket	+	Plus Sign
>	Greater-Than Sign (Close Angle Bracket)	=	Equal Sign	"	Quotation Mark
'	Apostrophe	!	Exclamation Point	;	Semicolon
{	Left Curly Bracket (Left Brace)	#	Number Sign, (Hash)	~	Tilde
}	Right Curly Bracket, (Right Brace)	(Left Parenthesis		Vertical Line
,	Comma)	Right Parenthesis		

Table 1-1 Reserved Character Set

CCSDS Recommendation: Parameter Value Language Specification

1.4.1.3 Unrestricted Character Set

The Unrestricted Character Set is a collection of PVL characters which are not reserved or used as white space. The Unrestricted Character Set is defined as the alphanumeric character set (a-z, A-Z, and 0-9) and the non-alphanumeric characters in Table 1-2.

Symbol	Name	Symbol	Name	Symbol	Name
*	Asterisk	\$	Dollar Sign	?	Question Mark
^	Circumflex Accent, (Caret)	`	Grave Accent	/	Solidus, (Forward Slash)
:	Colon	.	Full Stop, (Period)	\	Reverse Solidus, (Backward Slash)
@	Commercial At	-	Hyphen-Minus Sign	_	Low Line, (Underscore)

Table 1-2 Unrestricted Character Set

1.4.2 Comment

A comment consists of zero or more PVL characters enclosed between a pair of comment delimiters. The begin comment delimiter is the forward slash-asterisk sequence (/ *). The end comment delimiter is the asterisk-forward slash sequence (* /). Comments are treated the same as white space when occurring between syntactic elements. Comments shall not be embedded within other comments.

STANDARDSISO.COM : Click to view the full PDF of ISO 14961:1997

2 OVERVIEW OF THE LANGUAGE

PVL provides a specific syntax for the association of values with parameters. A PVL Module consists of a sequence of zero or more statements. These statements are found within an externally provided sequence of octets. Some or all of these statements can be aggregated into named blocks. Layout (i.e., the use of white space to promote human readability) is not significant for the interpretation of these statements.

The PVL Module is delimited by either the end of the provided octet sequence or by the use of an optional end statement (see Section 2.3).

Figure 2-1 contains a syntax diagram for the contents of the PVL Module; it references Figure 2-2 which defines WSC to represent a possibly empty collection of white space characters and/or comments. When this construct appears in syntax diagrams, it represents the capability of using optional white space and/or comments between syntactic elements for readability.

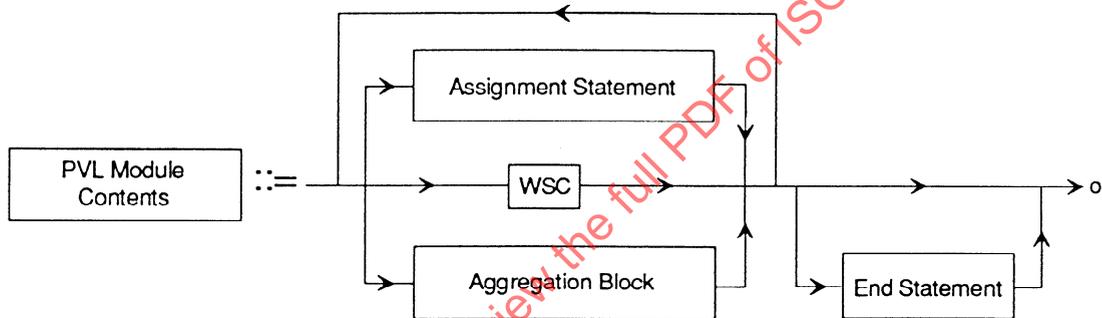

Figure 2-1 PVL Module Contents Syntax Diagram

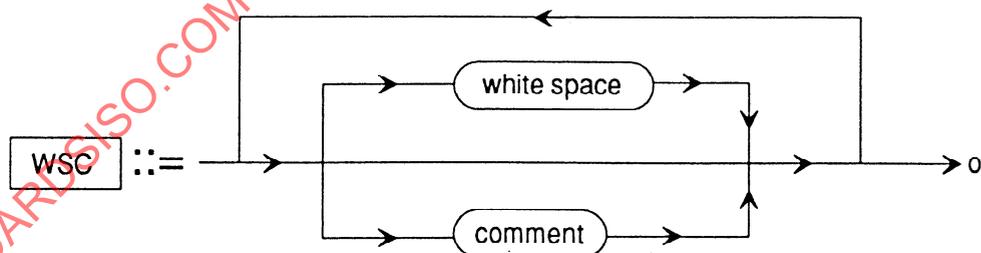

Figure 2-2 White Space/Comment Syntax Diagram

An assignment statement has the following general form:

Parameter = Value

CCSDS Recommendation: Parameter Value Language Specification

An aggregation block has the following general form:

Begin Aggregation Statement

A collection of assignment statements and/or aggregation blocks

End Aggregation Statement

2.1 Assignment Statement

An Assignment Statement is used to assign a value to a parameter name. Within the Assignment Statement, White Spaces and comments are ignored between syntactic elements, except where required for statement delimitation.

The Assignment Statement has the following format (the square brackets indicate that the semicolon is optional):

parameter name = value [;]

Figure 2-3 contains a syntax diagram for the PVL assignment statement.

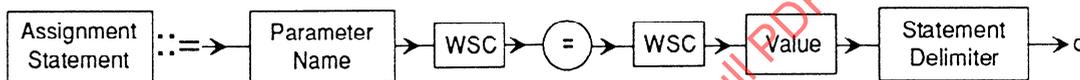

Figure 2-3 Assignment Statement Syntax Diagram

Figure 2-4 contains a syntax diagram illustrating the options for Statement Delimiter.

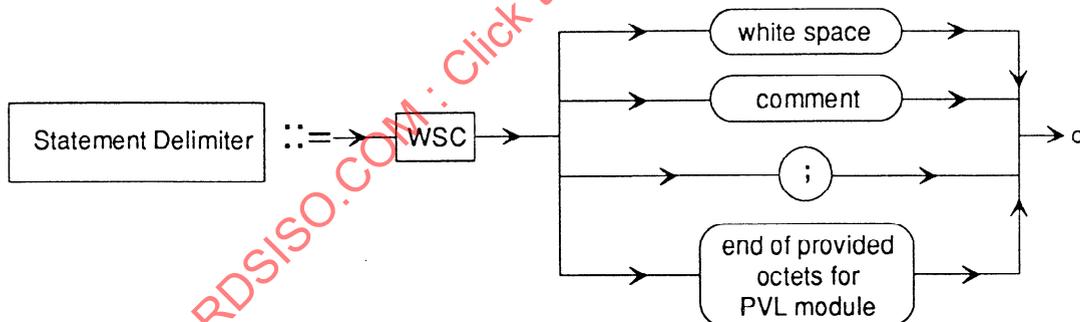

Figure 2-4 Statement Delimiter Syntax Diagram

Statements are separated by the use of a statement delimiter, which follows the value. Within this context, a statement delimiter is defined as one of the following:

- an explicit delimiter character(;), which can be preceded by white space characters and/or comments;
- in the absence of the explicit delimiter character, a set of one or more white space characters or comments;
- the end of the externally provided octet set.

CCSDS Recommendation: Parameter Value Language Specification

Statement delimitation in the absence of the explicit delimiter character is the only time when white space or comments have semantic meaning in PVL.

2.1.1 Parameter Name

The Parameter Name provides a way to reference the value assigned in the assignment statement. Parameter names consist of a sequence of Unrestricted Characters.

A Parameter Name must not contain a comment delimiter sequence (`/*` or `*/`) and it shall not conform to numeric encoding rules (see Section 2.1.2.1.1) or date/time encoding rules (see Section 2.1.2.1.3). A Parameter Name terminates with the character immediately prior to a Reserved Character, White Space Character or the beginning of a comment.

There are seven reserved keywords in PVL:

```
BEGIN_GROUP
BEGIN_OBJECT
END
END_GROUP
END_OBJECT
GROUP
OBJECT
```

Reserved keywords are not permitted as Parameter Names within an assignment statement.

2.1.2 Value

The Value in an assignment statement can be a simple value, a set or a sequence. Any simple value, set or sequence can optionally be followed by a units expression.

Figure 2-5 contains a syntax diagram for Value.

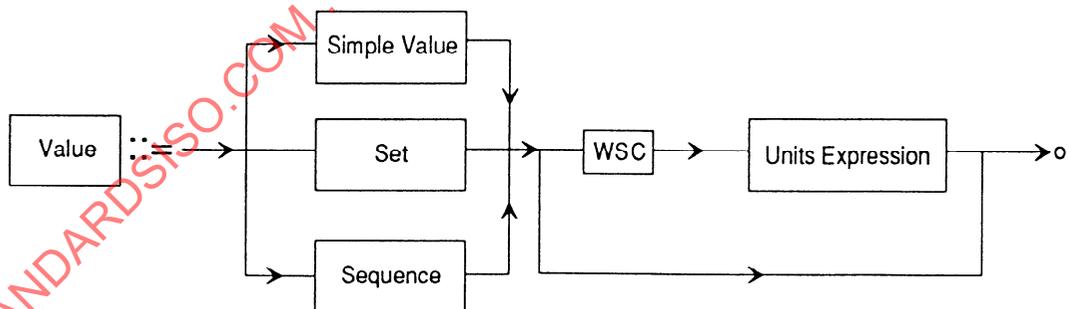

Figure 2-5 Value Syntax Diagram

2.1.2.1 Simple Value

A Simple Value can be a numeric, string, or date/time value.

Figure 2-6 contains a syntax diagram for a Simple Value.

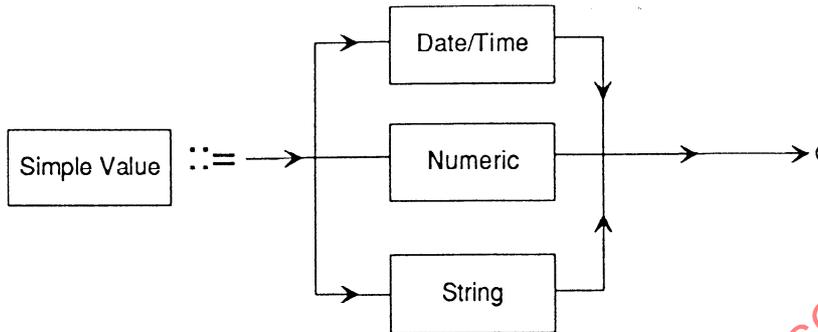

Figure 2-6 Simple Value Syntax Diagram

2.1.2.1.1 Numeric

A Numeric is a sequence of Unrestricted Characters that conform to encoding rules that permit its interpretation as a number. Numerics can be either decimal numbers or one of three non-decimal integer encodings: binary, octal, and hexadecimal.

2.1.2.1.1.1 Decimal Numbers

Decimal Numbers follow the three numerical representations (integer, floating point, exponential) specified in ISO 6093 (see Reference [4]) for decimal representations, with the exception that comma (,) shall not be used as a decimal point.

2.1.2.1.1.1.1 Integer

Integer numbers correspond to the First Numerical Representation (NR1) in ISO 6093. Each number is represented by at least one decimal digit. The number can be optionally prefixed by a sign symbol (+ or -). An unsigned number will be taken as positive.

Examples: 125
 +211109
 -79

2.1.2.1.1.1.2 Floating Point

Floating Point numbers correspond to the Second Numerical Representation (NR2) in ISO 6093. Each number is represented by at least one decimal digit and a decimal point. The decimal point is defined to be the full stop (.). The decimal point can appear anywhere within the sequence. The decimal point is used to separate the integer part of the real number from the fractional part, at the point where the decimal point is placed. The number can be optionally prefixed by a sign symbol (+ or -). An unsigned number will be taken as positive.

CCSDS Recommendation: Parameter Value Language Specification

Examples:

```

69.35
+12456.345
-0.23456
.05
-7.

```

2.1.2.1.1.1.3 Exponential

Exponential numbers correspond to the Third Numerical Representation (NR3) in ISO 6093. Each number is represented by two sequences of decimal digits called the significand (i.e., mantissa) and exponent, separated by the ASCII character **E** or **e**. The value of the number equals the value of the significand multiplied by the result of 10 raised to the power represented by the exponent. The significand can be optionally prefixed by the sign symbol (+ or -). The exponent is an optionally signed integer. If either the significand or exponent is unsigned, it will be taken as positive.

Examples:

```

-2.345678E12
1.567E-10
+4.99E+3

```

2.1.2.1.1.2 Non-decimal Representations

Integer values can also be represented in bases other than base 10. Non-decimal integers can have a radix of 2 (binary), 8 (octal), or 16 (hexadecimal). The non-decimal format begins with an optional sign (+ or -) and the radix (in decimal notation), followed by the non-decimal form enclosed within a pair of number signs (#). If the optional leading sign has been omitted, then the number will be taken as positive. The non-decimal form itself is interpreted as a positive, uncomplemented integer.

A non-decimal integer has the following form

[sign]radix#non_decimal_integer#

where the radix denotes whether the number is binary, octal, or hexadecimal.

NOTE: Any of the above forms of numerics are stored internally by PVL support software in a format that may be unknown to the user. Therefore, if a particular string of bits is required or must be conserved, for instance, as a mask or flag, then this should be expressed as a quoted string, e.g. MASK = "01110101"; and translated to a bit pattern by the application.

2.1.2.1.1.2.1 Binary Numbers

Binary Numbers are represented with a radix value of 2. The non-decimal portion is a sequence of the characters 0 or 1.

Example: 2#0101# is equal to the decimal value 5.

2.1.2.1.1.2.2 Octal Numbers

Octal Numbers are represented with a radix value of 8. The non-decimal portion is a sequence of characters from the following set:

0, 1, 2, 3, 4, 5, 6, 7.

CCSDS Recommendation: Parameter Value Language Specification

Example: 8#0107# is equal to decimal value 71.

2.1.2.1.1.2.3 Hexadecimal Numbers

Hexadecimal Numbers are represented with a radix value of 16. The non-decimal portion is a sequence of characters from the following set:

0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F, a, b, c, d, e, f

Lower case letters are equivalent to their upper case counterparts.

Example: 16#100A# is equal to the decimal value 4106.

2.1.2.1.2 String

A String is a sequence of PVL characters that conforms to the requirements for either a quoted string or an unquoted string. Figure 2-7 contains a syntax diagram illustrating the two types of String.

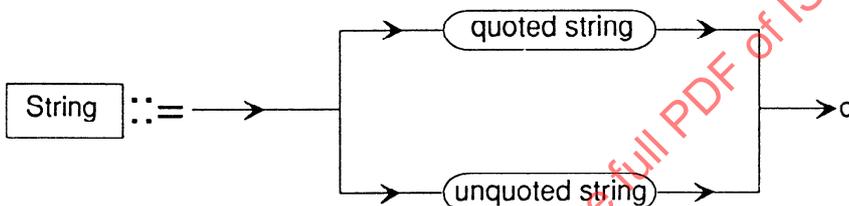

Figure 2-7 String Type Syntax Diagram

2.1.2.1.2.1 Quoted String

A Quoted String consists of zero or more PVL characters enclosed between matching quote delimiters. The quote string delimiters are the quotation mark (") or the apostrophe (').

NOTE 1: A quote string delimiter character can be embedded within a string by the use of the quote string delimiter not used to enclose the string itself. (e.g. "John said 'GOODBYE' and then left" or 'John said "GOODBYE" and then left').

NOTE 2: If a string is to contain any of the Reserved Characters, White Space Characters, or the comment delimiter sequences, it must be a quoted string rather than an unquoted string. A string must also be quoted if it conforms to the encoding rules for either numeric or datetime.

NOTE 3: The above definition allows for null length (i.e., empty) strings. A null length string may have meaning and therefore is permitted.

2.1.2.1.2.2 Unquoted String

An Unquoted String is a sequence of one or more Unrestricted Characters.

An Unquoted String shall not contain the begin comment delimiter (/*) or end comment delimiter (* /), nor shall it conform to numeric or date/time encoding rules. An Unquoted String terminates with the character immediately prior to a White Space Character, a Reserved Character, the beginning of a comment, or the end of the PVL Module.

2.1.2.1.3 Date/Time Value

The date/time value is a strict subset of the CCSDS ASCII Time Code recommendation (Reference [8]), in which all time is represented in Universal Coordinated Time, (i.e. Greenwich Mean Time). The time construct consists of a combination of date and time constructs.

The date construct has two forms:

YYYY-DDD

where

YYYY is year (0001 to 9999)

DDD is day of year (001 to 365, 366 for leap year)

and

YYYY-MM-DD

where

YYYY is four digit year (0001 to 9999)

MM is month (01 to 12)

DD is day of month(01 to 28, 29, 30 or 31)

Note that each field has a specified width, leading zeros must be included if needed to assure field width. Figure 2-8 contains a syntax diagram of the date format.

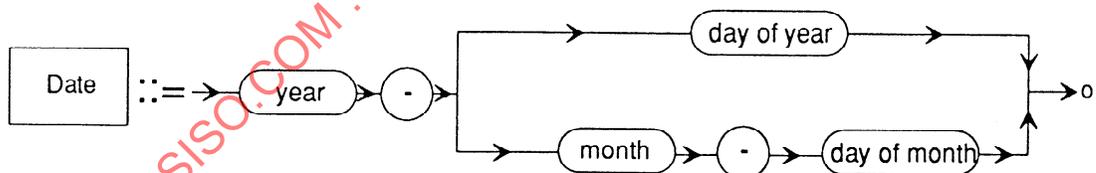

Figure 2-8 Date Syntax Diagram

Examples: 2000-012 is the twelfth day of the year 2000
 1995-06-08 is June 8, 1995
 1978-04-30 is April 30, 1978

CCSDS Recommendation: Parameter Value Language Specification

The time construct has the form

hh:mm[:ss[.d...d]]

where

hh is hours (00 to 23)

mm is minutes (00 to 59)

ss is seconds (00 to 60, 60 is to accommodate leap seconds).

d...d is fractional seconds represented by 1 or more digits.

Figure 2-9 contains a syntax diagram for the time format.

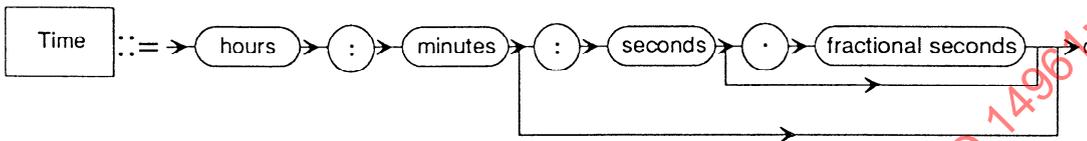

Figure 2-9 Time Syntax Diagram

Examples: 00:00:00.0
12:01:56
23:01

The complete time construct consists of date, followed by the separator T followed by the time construct, all of this can be optionally followed by the character Z as a terminator. Separate time and date values can also be used. Figure 2-10 contains a syntax diagram of the date/time format.

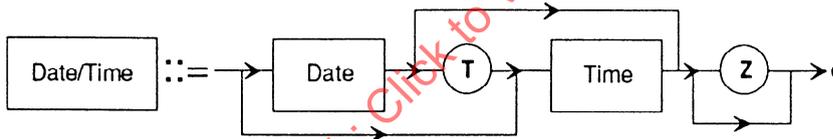

Figure 2-10 Date/Time Syntax Diagram

Examples: 1991-12-22T22:03:12.01Z
2001-001T12:13
1998-02-12T00:00:01.00
1995-360T14:02:13.0123456Z

CCSDS Recommendation: Parameter Value Language Specification

2.1.2.2 Set

A Set is a delimited collection of values in which the order of the values is not significant and need not be maintained. A Set can contain zero or more values. If a Set contains two or more values, they are separated by commas. The beginning of a Set is indicated by an left curly bracket ($\{$), and the end by a right curly bracket ($\}$).

NOTE: The above definition allows for empty sets. An empty set may have meaning and is therefore permitted.

Figure 2-11 contains a syntax diagram for the Set format.

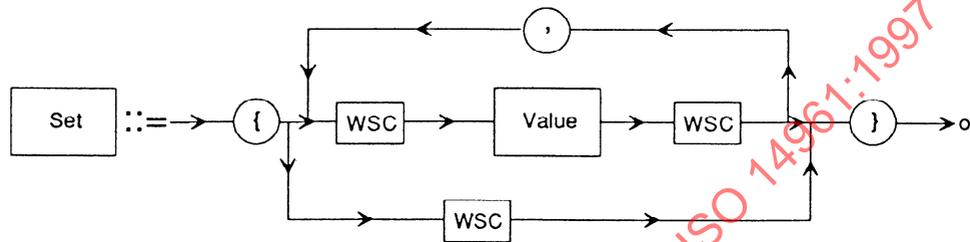

Figure 2-11 Set Syntax Diagram

2.1.2.3 Sequence

A Sequence is a delimited collection of values in which the order of the values is significant. A Sequence can contain zero or more values. If two or more values are contained in a Sequence, they are separated by commas. The beginning of a Sequence is indicated by an left parenthesis ($($) and the end by a right parenthesis ($)$).

NOTE: The above definition allows for empty sequences. An empty sequence may have meaning and is therefore permitted.

Figure 2-12 contains a syntax diagram for the Sequence format.

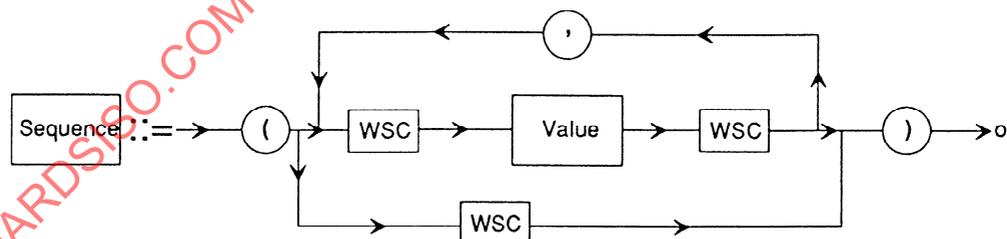

Figure 2-12 Sequence Syntax Diagram

CCSDS Recommendation: Parameter Value Language Specification

2.1.2.4 Units Expression

Any simple value, set or sequence can optionally be followed by a Units Expression. The Units Expression consists of a Units Value contained between an open angle bracket (<) and a close angle bracket(>). The Units Value begins with the first non-white space character after the open angle bracket and ends with the last non-white space character before the close angle bracket. A Units Value can contain any PVL character other than the angle brackets themselves.

Figure 2-13 contains a syntax diagram for the Units Expression format. Note that white space is a collection of one or more white space characters.

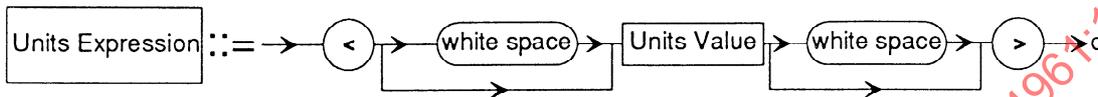

Figure 2-13 Units Expression Syntax Diagram

Figure 2-14 contains a syntax diagram for the Units Value format, in which a units character is any PVL character other than the open angle bracket (<), close angle bracket (>), or white space character.

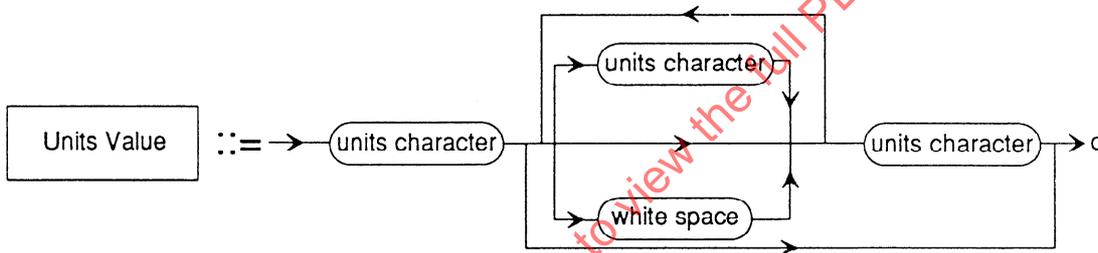

Figure 2-14 Units Value Syntax Diagram

2.2 Aggregation Block

The Aggregation Block is a named collection of assignment statements and/or other aggregation blocks. The Aggregation Block is identified by a block name. The start of the block is indicated by a begin aggregation statement and is terminated by an end aggregation statement. Figure 2-15 contains a syntax diagram for the Aggregation Block format.

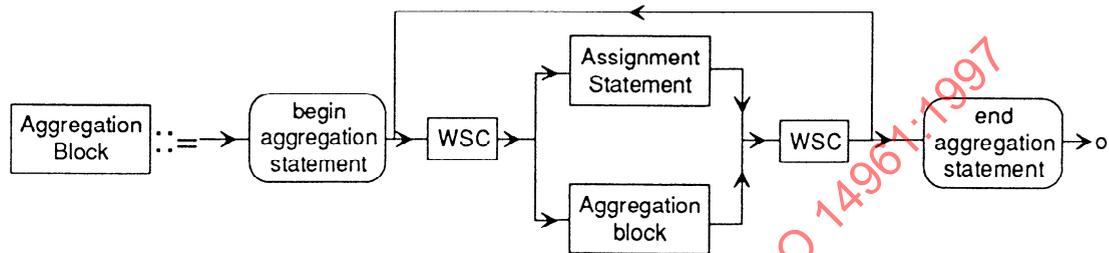

Figure 2-15 Aggregation Block Syntax Diagram

Aggregations are commonly referred to as groups or objects. These two keyword forms for aggregation statements are permitted to allow for the stylistic preferences. No semantic differentiation between the two is made by PVL. Applications are free to assign such differentiation if required.

2.2.1 Begin Aggregation Statement

The Begin Aggregation Statement is parallel in construction to the assignment statement. The Begin Aggregation Statement has the following format (the square brackets indicate that the semicolon is optional):

begin-aggregation keyword = block name [;]

The begin-aggregation keywords are **BEGIN_GROUP** and **BEGIN_OBJECT** and are matched with statements that use **END_GROUP** and **END_OBJECT** respectively. The keyword **OBJECT** is a synonym for **BEGIN_OBJECT** and the keyword **GROUP** is a synonym for **BEGIN_GROUP**. The form of the block name is identical to parameter name.

NOTE: These synonyms are allowed for historical compatibility with several existing keyword languages.

CCSDS Recommendation: Parameter Value Language Specification

Figure 2-16 contains a syntax diagram of the begin aggregation statement formats.

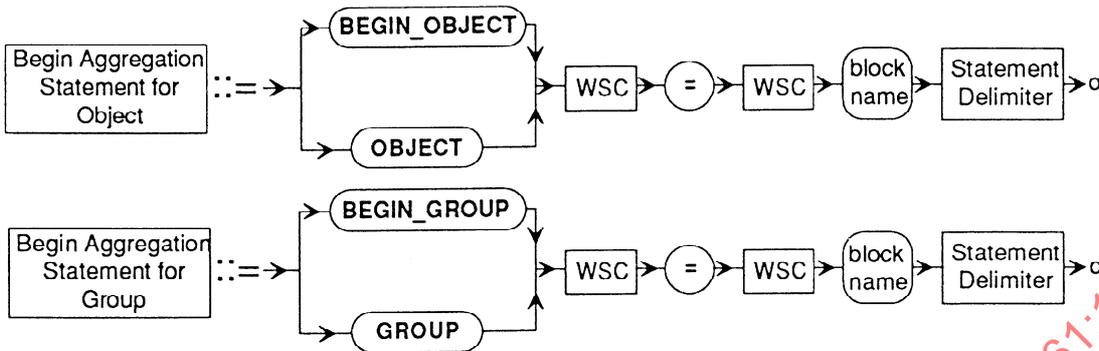

Figure 2-16 Aggregation Begin Statement Syntax Diagram

2.2.2 End Aggregation Statement

The End Aggregation Statement is identified by the end-aggregation keyword. The full form of the end aggregation statement follows the same construction rules as an assignment statement; it has the following format (the square brackets indicate that the semicolon is optional):

end-aggregation keyword = block name [;]

An abbreviated form of the end aggregation statement is allowed as a convenience to the user. The abbreviated end aggregation statement has the following format:

end-aggregation keyword [;]

The defined end-aggregation keywords are `END_GROUP` and `END_OBJECT`. Figure 2-17 contains a syntax diagram for the end aggregation statement.

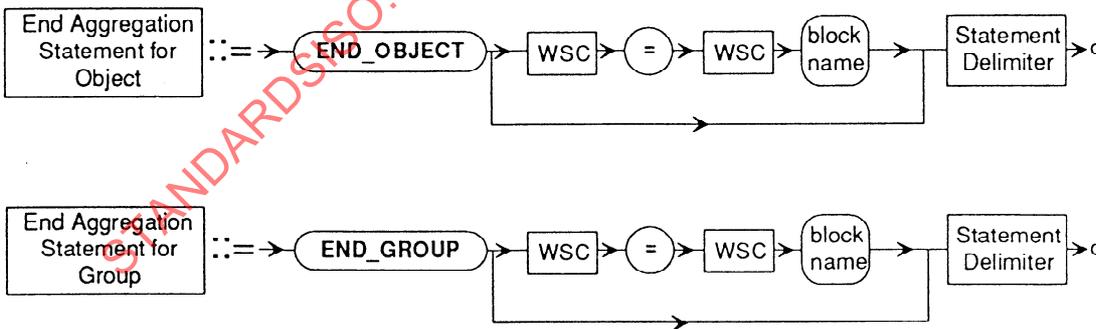

Figure 2-17 End Aggregation Statement Syntax Diagram

NOTE: The preferred form of the aggregation end statement is the full form, which includes the block name.

2.2.3 Aggregation Block Construction Rules

The end aggregation statement must be paired with an begin aggregation statement. In other words, an Aggregation Block which starts with a **BEGIN_GROUP** statement must end with an **END_GROUP** statement. If a block name is used in the end aggregation statement, it must match the name used in the matching begin aggregation statement.

STANDARDSISO.COM : Click to view the full PDF of ISO 14961:1997

2.3 End Statement

The End Statement is a special type of statement used to delimit a PVL Module prior to the end of the externally provided octet sequence. Figure 2-18 illustrates the syntax

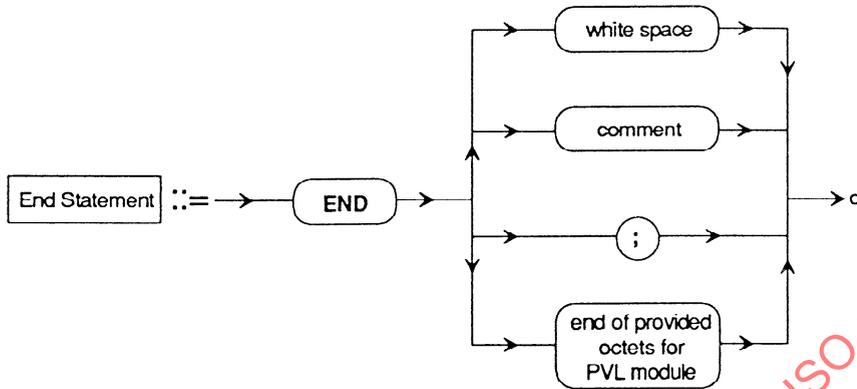

Figure 2-18 End Statement Syntax Diagram

The End Statement is delimited by one of the following: a semicolon; the first white space character; the end of a comment; or the end of the provided octet space.

NOTE: The statement delimitation of the End statement is more restrictive than for other statements since the remaining octets in the sequence which may include white space, comments, or semi-colons, as well as any other character, may have significance to the application.

There shall be at most one End statement in a PVL Module, and if present it shall be the last statement of the PVL Module.

3 PARAMETER VALUE LANGUAGE FORMAL SYNTAX SPECIFICATION

Precedence: In the case of ambiguity of the preceding sections or disagreement with this formal specification, this formal specification shall take precedence. This specification is presented in Abstract Syntax Notation One (ASN.1, see Reference[5]). The comments in the ASN.1 are also part of the specification. Readers unfamiliar with ASN.1 may wish to consult an ASN.1 tutorial such as Reference [6].

The ASN.1 specification is organized into groupings based on major constructs. Each group begins on a new page with comment block immediately followed by the definition of the construct with its components in alphabetical order. Components used by more than one major construct are listed in the common language elements group at the end of the specification. Common language elements contain components such as statement delimiter, separator, the combination of white space and comment (WSC), and character sets.

The construct sections are found on the following pages:

PVL Module Contents	20
Aggregation Block	21
Assignment Statement	24
Comment	25
Date/Time	26
Numeric Values	32
Sequence	35
Set	36
String	37
Units Expression	39
Common Language Elements	40

NOTE: The term IA5String as used in this ASN.1 refers to the International ASCII Character Set #5.
