FOREWORD

ISO (the International Organization for Standardization) is a worldwide federation of national standards institutes (ISO member bodies). The work of developing International Standards is carried out through ISO technical committees. Every member body interested in a subject for which a technical committee has been set up has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work.

Draft International Standards adopted by the technical committees are circulated to the member bodies for approval before their acceptance as International Standards by the ISO Council.

International Standard ISO 228/I was developed by Technical Committee ISO/TC 5, *Metal pipes and fittings*, and was circulated to the member bodies in June 1977.

It has been approved by the member bodies of the following countries :

Australia	Hungary	Romania
Belgium	India	South Africa, Rep. of
Brazil	Israel	Spain
Bulgaria	Italy	Sweden
Canada	Japan	Switzerland
Chile	Korea, Dem. P. Rep. of	Turkey
Czechoslovakia	Korea, Rep. of	United Kingdom
Denmark	Mexico	U.S.A.
Egypt, Arab Rep. of	Netherlands	U.S.S.R.
Finland	New Zealand	Yugoslavia
France	Norway	
Germany	Poland	

No member body expressed disapproval of the document.

This International Standard cancels and replaces ISO Recommendation R 228-1961, of which it constitutes a technical revision.

Pipe threads where pressure-tight joints are not made on the threads — Part I : Designation, dimensions and tolerances

1 SCOPE AND FIELD OF APPLICATION

This International Standard specifies the designation, the dimensions and the tolerances of pipe threads where pressure-tight joints are not made on the threads.

These threads are intended for the mechanical assembly of the component parts of fittings, cocks and valves, etc.

If such assemblies must be made pressure-tight, this will be effected by compressing two tightening surfaces outside the threads, and by interposing an appropriate jointing medium, if necessary.

ISO 228/II will deal with the inspection of these threads.

For pipe threads where pressure-tight joints are made on the threads, see ISO 7.

2 REFERENCE

ISO 7/I, *Pipe threads where pressure-tight joints are made on the threads — Part I : Designation, dimensions and tolerances*

3 SYMBOLS AND EXPLANATIONS

G Pipe thread where pressure-tight joints are not made on the threads

A Tighter class of tolerance of external pipe threads where pressure-tight joints are not made on the threads

B Wider class of tolerance of external pipe threads where pressure-tight joints are not made on the threads

H Height of the triangle of the thread profile

h Height of the thread profile with rounded crests and roots

r Radius of rounded crests and roots

P Pitch

d Basic major diameter of the thread

$d_1 = d - 1{,}280\,654\,P$; basic minor diameter of the thread

$d_2 = d - 0{,}640\,327\,P$; basic pitch diameter of the thread

T_{D2} Tolerance on the pitch diameter of the internal thread

T_{d2} Tolerance on the pitch diameter of the external thread

T_{D1} Tolerance on the minor diameter of the internal thread

T_d Tolerance on the major diameter of the external thread

4 DIMENSIONS

The profile of these threads is identical with that of the parallel thread specified in ISO 7. The internal and external threads covered by this International Standard are both parallel.

The crests of the threads may be truncated to the limits of tolerance as given in columns 12 and 13 of the tables, except on internal threads when they are likely to be assembled with external threads to ISO 7.

The tolerances on the pitch diameter of the internal threads correspond to the positive deviation of the diameter tolerances in ISO 7, with the exception of those for diameter 1/16, 1/8, 1/4 and 3/8, for which slightly higher values have been specified.

For external threads, two classes of tolerances on the pitch diameter have been specified :

Class A (column 8) : entirely negative, equivalent in size to the tolerance for the internal thread.

Class B (column 9) : entirely negative, value twice that of class A.

The choice between class A and class B depends on the conditions of application.

Dimensions in millimetres are given in table 1.

Dimensions in inches are given in table 2, in an annex which will be deleted in the next revision.

5 DESIGNATION

Pipe threads complying with this International Standard shall be designated by :

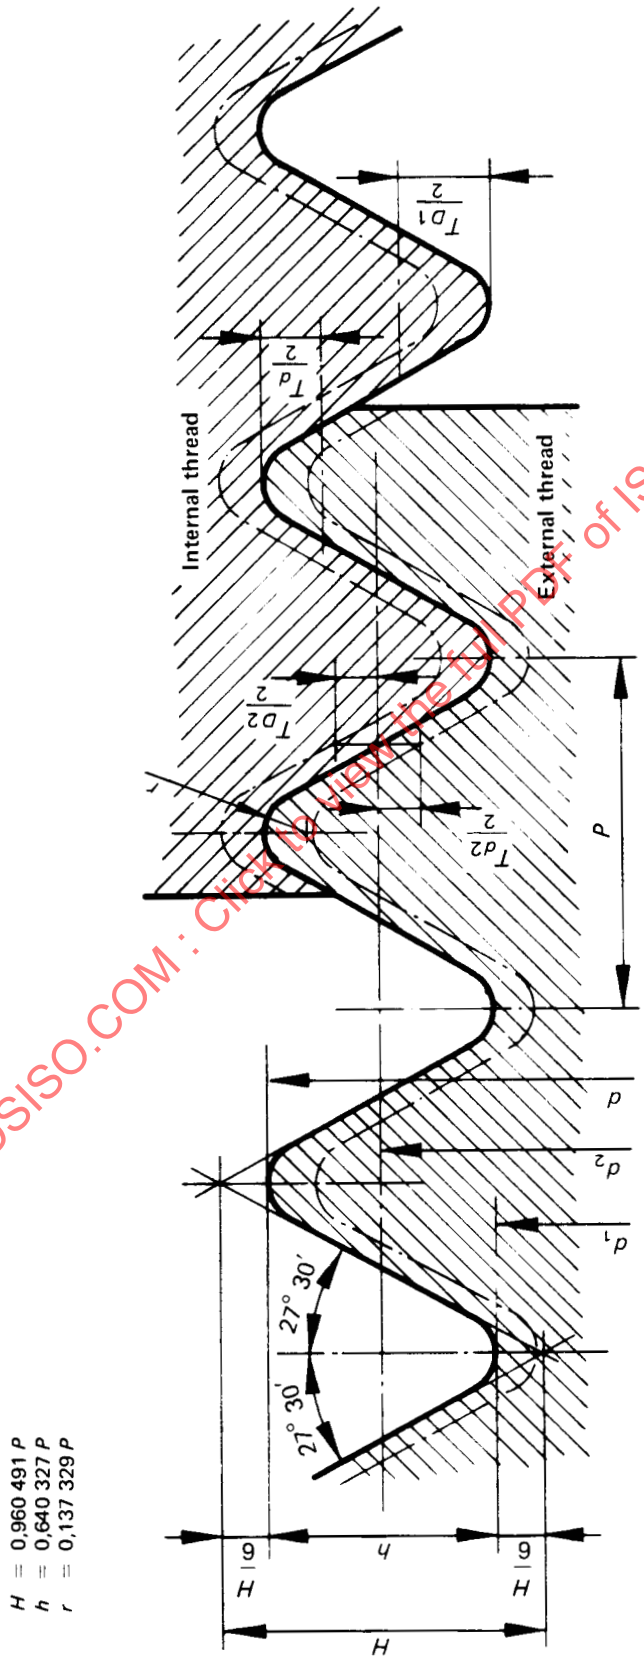
– the letter G followed by the designation of the thread (see table 1, column 1), for internal threads (one class of tolerance only);

– the letter G followed by the designation of the thread and the letter A for class A external threads;

– the letter G followed by the designation of the thread and the letter B for class B external threads.

Examples of the complete designation for thread 1 1/2 are :

Internal thread	**External thread**	
	Class A	Class B
G 1 1/2	**G 1** 1/2 **A**	**G 1** 1/2 **B**



$H = 0{,}960\,491\,P$
$h = 0{,}640\,327\,P$
$r = 0{,}137\,329\,P$
