Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

Amendment 3 to ISO/IEC 13818-1:2007 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 29, *Coding of audio, picture, multimedia and hypermedia information*, in collaboration with ITU-T. The identical text is published as ITU-T Rec. H.222.0 (2006)/Amd.3 (03/2009).

This corrected version modifies the title of the amendment to align with that of ITU-T Rec. H.222.0 (2006)/Amd.3 (03/2009).

INTERNATIONAL STANDARD
RECOMMENDATION ITU-TInformation technology – Generic coding of moving pictures and associated
audio information: Systems

Amendment 3

Transport of scalable video over Rec. ITU-T H.222.0 | ISO/IEC 13818-1

1) Subclause 1.2.2

Replace in subclause 1.2.2:

ITU-T Recommendation H.264 (2005), *Advanced video coding for generic audiovisual services*.

ISO/IEC 14496-10:2005, *Information technology – Coding of audio-visual objects – Part 10: Advanced Video Coding*.

by:

ITU-T Recommendation H.264 (2007), *Advanced video coding for generic audiovisual services*.

ISO/IEC 14496-10:2008, *Information technology – Coding of audio-visual objects – Part 10: Advanced video coding*.

2) Subclause 2.1 (Definitions)

a) Replace subclause 2.1.7:

2.1.7 AVC video stream (system): An ITU-T Rec. H.264 | ISO/IEC 14496-10 stream. An AVC video stream consists of one or more AVC video sequences.

by:

2.1.7 AVC video stream (system): An ITU-T Rec. H.264 | ISO/IEC 14496-10 stream. An AVC video stream consists of one or more AVC video sequences. An AVC video stream may also result from re-assembling video sub-bitstreams.

b) Add after subclause 2.1.76 (New subclauses 2.1.77 – 2.1.81):

2.1.77 video sub-bitstream: A video sub-bitstream is defined to be all VCL NAL units associated with the same value of `dependency_id` of an AVC video stream which conforms to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10 and all associated non-VCL NAL units in decoding order as defined in ITU-T Rec. H.264 | ISO/IEC 14496-10. Re-assembling video sub-bitstreams in a consecutive order of `dependency_id`, starting from the `dependency_id` equal to 0 up to any value of `dependency_id`, results in an AVC video stream. A video sub-bitstream shall have the AVC byte stream format as defined in Annex B of ITU-T Rec. H.264 | ISO/IEC 14496-10.

2.1.78 AVC video sub-bitstream: The video sub-bitstream that contains the base layer as defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10 and that shall additionally contain NAL units with `nal_unit_type` equal to 14 (prefix NAL units). The AVC video sub-bitstream contains all VCL NAL units associated with `dependency_id` equal to 0.

2.1.79 SVC video sub-bitstream: The video sub-bitstream that contains VCL NAL units with `nal_unit_type` equal to 20 with the same NAL unit header syntax element `dependency_id` not equal to 0.

2.1.80 SVC dependency representation: The VCL NAL units of an AVC access unit associated with the same value of `dependency_id` which is provided as part of the NAL unit header or the associated prefix NAL unit header, and the associated non-VCL NAL units. Re-assembling SVC dependency representations in a consecutive order of `dependency_id` starting from the lowest value of `dependency_id` present in the access unit up to any value of `dependency_id` present in the access unit, while reordering the non-VCL NAL units conforming to the order of NAL units within an access unit as defined in ITU-T Rec. H.264 | ISO/IEC 14496-10, results in an AVC access unit.

2.1.81 SVC slice (system): A `byte_stream_nal_unit` as defined in ITU-T Rec. H.264 | ISO/IEC 14496-10 with `nal_unit_type` equal to 20.

3) Subclause 2.4.2.8 (T-STD extensions for carriage of ITU-T Rec. H.264 | ISO/IEC 14496-10 Video)

Replace in subclause 2.4.2.8:

To define the decoding in the T-STD of ITU-T Rec. H.264 | ISO/IEC 14496-10 video streams carried in a Transport Stream, the T-STD model needs to be extended. The T-STD extension and T-STD parameters for decoding of ITU-T Rec. H.264 | ISO/IEC 14496-10 video streams are defined in 2.14.3.1.

by:

To define the decoding in the T-STD of ITU-T Rec. H.264 | ISO/IEC 14496-10 video streams carried in a Transport Stream, the T-STD model needs to be extended. The T-STD extension and T-STD parameters for decoding of AVC video streams conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10 are defined in 2.14.3.1 and T-STD extension and T-STD parameters for decoding of AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10 are defined in 2.14.3.5.

4) Subclause 2.4.3.5 (Semantic definition of fields in adaptation field)

Replace in *Discontinuity_indicator*:

For the purpose of this clause, an elementary stream access point is defined as follows:

- ISO/IEC 11172-2 video and ITU-T Rec. H.262 | ISO/IEC 13818-2 video – The first byte of a video sequence header.
- ISO/IEC 14496-2 visual – The first byte of the visual object sequence header.
- ITU-T Rec. H.264 | ISO/IEC 14496-10 video – The first byte of an AVC access unit. The SPS and PPS parameter sets referenced in this and all subsequent AVC access units in the coded video stream shall be provided after this access point in the byte stream and prior to their activation.
- Audio – The first byte of an audio frame.
- ISO/IEC 14496-17 text stream – The first byte of a text access unit. In case in-band sample descriptions are used, each in-band sample description shall be provided in the ISO/IEC 14496-17 stream after this access point and prior to its use by an access unit.

by:

For the purpose of this clause, an elementary stream access point is defined as follows:

- ISO/IEC 11172-2 video and ITU-T Rec. H.262 | ISO/IEC 13818-2 video – The first byte of a video sequence header.
- ISO/IEC 14496-2 visual – The first byte of the visual object sequence header.
- AVC video streams conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10 – The first byte of an AVC access unit. The SPS and PPS parameter sets referenced in this and all subsequent AVC access units in the coded video stream shall be provided after this access point in the byte stream and prior to their activation.
- Video sub-bitstreams of AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10 – The first byte of an SVC dependency representation is an elementary stream access point if the following conditions are met:
 - The subset sequence parameter sets and picture parameter sets referenced in this and all subsequent SVC dependency representation in the video sub-bitstream shall be provided after this access point in the byte stream and prior to their activation.
 - If this SVC video sub-bitstream access point requires the elementary stream access point of the same AVC access unit, if any, contained in the corresponding elementary stream that needs to be present in decoding order before decoding the elementary stream associated with this elementary stream access point, then the corresponding elementary stream shall also include an elementary stream access point.

NOTE 1 – If the hierarchy descriptor is present for this SVC video sub-bitstream then the video sub-bitstream of which the *hierarchy_layer_index* equals the *hierarchy_embedded_layer_index* of this SVC sub-bitstream should have an elementary stream access point in the same access unit.
- Audio – The first byte of an audio frame.

- ISO/IEC 14496-17 text stream – The first byte of a text access unit. In case in-band sample descriptions are used, each in-band sample description shall be provided in the ISO/IEC 14496-17 stream after this access point and prior to its use by an access unit.

5) Subclauses 2.4.3.6 (PES packet) and 2.4.3.7 (Semantic definition of fields in PES packet)

a) TREF

Change Table 2-21 as indicated below:

--- Unchanged initial part of Table 2-21 ---		

if (PES_extension_flag_2 == '1') {		
marker_bit	1	bslbf
PES_extension_field_length	7	uimsbf
stream_id_extension_flag	1	bslbf
if (stream_id_extension_flag == '0') {		
stream_id_extension	7	uimsbf
}		
else {		
reserved	6	bslbf
tref_extension_flag	1	bslbf
if (tref_extension_flag == '0') {		
reserved	4	bslbf
TREF[32..30]	3	bslbf
marker_bit	1	bslbf
TREF[29..15]	15	bslbf
marker_bit	1	bslbf
TREF[14..0]	15	bslbf
marker_bit	1	bslbf
}		
}		
for (i=0; i < N3; i++) {		
reserved	8	bslbf
}		

--- Unchanged trailing part of Table 2-21 ---		

b) stream_id

Replace in subclause 2.4.3.7:

stream_id – In Program Streams, the stream_id specifies the type and number of the elementary stream as defined by the stream_id Table 2-22. In Transport Streams, the stream_id may be set to any valid value which correctly describes the elementary stream type as defined in Table 2-22. In Transport Streams, the elementary stream type is specified in the Program Specific Information as specified in 2.4.4.

by:

stream_id – In Program Streams, the stream_id specifies the type and number of the elementary stream as defined by the stream_id Table 2-22. In Transport Streams, the stream_id may be set to any valid value which correctly describes the elementary stream type as defined in Table 2-22. In Transport Streams, the elementary stream type is specified in the Program Specific Information as specified in 2.4.4.

For AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10, all video sub-bitstreams of the same AVC video stream shall have the same stream_id value.

c) PTS (presentation time stamp)

Replace in subclause 2.4.3.7:

For ITU-T Rec. H.264 | ISO/IEC 14496-10 video, if a PTS is present in the PES packet header, it shall refer to the first AVC access unit that commences in this PES packet. An AVC access unit commences in a PES packet if the first byte of the AVC access unit is present in the PES packet. To achieve consistency between the STD model and the HRD model defined in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10, for each decoded AVC access unit, the PTS value in the STD shall, within the accuracy of their respective clocks, indicate the same instant in time as the nominal DPB output time in the HRD, defined herein as $t_{o,n,dpb}(n) = t_{r,n}(n) + t_c * dpb_output_delay(n)$, where $t_{r,n}(n)$, t_c , and $dpb_output_delay(n)$ are defined as in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10.

by:

For AVC video streams conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10, if a PTS is present in the PES packet header, it shall refer to the first AVC access unit that commences in this PES packet. An AVC access unit commences in a PES packet if the first byte of the AVC access unit is present in the PES packet. To achieve consistency between the STD model and the HRD model defined in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10, for each decoded AVC access unit, the PTS value in the STD shall, within the accuracy of their respective clocks, indicate the same instant in time as the nominal DPB output time in the HRD, defined herein as $t_{o,n,dpb}(n) = t_{r,n}(n) + t_c * dpb_output_delay(n)$, where $t_{r,n}(n)$, t_c , and $dpb_output_delay(n)$ are defined as in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10.

For video sub-bitstreams of AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10, if a PTS is present in the PES packet header, it shall refer to the first SVC dependency representation that commences in this PES packet. An SVC dependency representation commences in a PES packet if the first byte of the SVC dependency representation is present in the PES packet. To achieve consistency between the STD model and the HRD model defined in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10, for each re-assembled and decoded AVC access unit, the PTS value in the STD shall, within the accuracy of their respective clocks, indicate the same instant in time as the nominal DPB output time in the HRD, defined herein as $t_{o,n,dpb}(n) = t_{r,n}(n) + t_c * dpb_output_delay(n)$, where $t_{r,n}(n)$, t_c , and $dpb_output_delay(n)$ are defined as in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10.

d) DTS (decoding time stamp)

Replace in subclause 2.4.3.7:

For ITU-T Rec. H.264 | ISO/IEC 14496-10 video, if a DTS is present in the PES packet header, it shall refer to the first AVC access unit that commences in this PES packet. An AVC access unit commences in a PES packet if the first byte of the AVC access unit is present in the PES packet. To achieve consistency between the STD model and the HRD model defined in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10, for each AVC access unit the DTS value in the STD shall, within the accuracy of their respective clocks, indicate the same instant in time as the nominal CPB removal time $t_{r,n}(n)$ in the HRD, as defined in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10.

by:

For AVC video streams conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10, if a DTS is present in the PES packet header, it shall refer to the first AVC access unit that commences in this PES packet. An AVC access unit commences in a PES packet if the first byte of the AVC access unit is present in the PES packet. To achieve consistency between the STD model and the HRD model defined in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10, for each AVC access unit the DTS value in the STD shall, within the accuracy of their respective clocks, indicate the same instant in time as the nominal CPB removal time $t_{r,n}(n)$ in the HRD, as defined in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10.

For video sub-bitstreams of AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10, if a DTS is present in the PES packet header, it shall refer to the first SVC dependency representation that commences in this PES packet. An SVC dependency representation commences in a PES packet if the first byte of the SVC dependency representation is present in the PES packet. To achieve consistency between the STD model and the HRD model defined in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10, for each re-assembled AVC access unit the DTS value in the STD shall, within the accuracy of their respective clocks, indicate the same instant in time as the nominal CPB removal time $t_{r,n}(n)$ in the HRD, as defined in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10.

e) **P-STD_buffer_size**

Replace in subclause 2.4.3.7:

The size BS_n shall be larger than or equal to the size of the CPB signalled by the $CpbSize[cpb_cnt_minus1]$ specified by the $NAL_hrd_parameters()$ in the AVC video stream. If the $NAL_hrd_parameters()$ are not present in the AVC video stream, then BS_n shall be larger than or equal to the size of the NAL CPB for the byte stream format defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10 as $1200 \times MaxCPB$ for the applied level.

by:

For AVC video streams conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10, the size BS_n shall be larger than or equal to the size of the CPB signalled by the $CpbSize[cpb_cnt_minus1]$ specified by the $NAL_hrd_parameters()$ in the AVC video stream. If the $NAL_hrd_parameters()$ are not present in the AVC video stream, then BS_n shall be larger than or equal to the size of the NAL CPB for the byte stream format defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10 as $1200 \times MaxCPB$ for the applied level.

For video sub-bitstreams of AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10, the size BS_n shall be larger than or equal to the size of the CPB signalled by the $CpbSize[cpb_cnt_minus1]$ specified by the $NAL_hrd_parameters()$ for the video sub-bitstream carried in elementary stream ES_n as defined in 2.14.3.6. If the $NAL_hrd_parameters()$ are not present in the video sub-bitstream, the size BS_n shall be larger than or equal to the size of the NAL CPB for the byte stream format defined in ITU-T Rec. H.264 | ISO/IEC 14496-10 as $1200 \times MaxCPB$ for the applied level for the elementary stream ES_n .

f) **TREF semantics**

Add in subclause 2.4.3.7:

tref_extension_flag – A 1-bit flag, which when set to '0' indicates that a TREF field is present in the PES packet header. The value of '1' for this flag is reserved.

TREF (timestamp reference) – The TREF is a 33-bit number coded in three separate fields. It indicates the decoding time value, $td_n(j)$, in the system target decoder as indicated by the DTS, or in absence of the DTS, by the PTS of the PES header of the same j-th access unit in a corresponding elementary stream n.

6) **Subclause 2.4.4.9 (Semantic definition of fields in Transport Stream program map section)**

Replace Table 2-34 by:

Table 2-34 – Stream type assignments

Value	Description
0x00	ITU-T ISO/IEC Reserved
0x01	ISO/IEC 11172-2 Video
0x02	ITU-T Rec. H.262 ISO/IEC 13818-2 Video or ISO/IEC 11172-2 constrained parameter video stream
0x03	ISO/IEC 11172-3 Audio
0x04	ISO/IEC 13818-3 Audio
0x05	ITU-T Rec. H.222.0 ISO/IEC 13818-1 private_sections
0x06	ITU-T Rec. H.222.0 ISO/IEC 13818-1 PES packets containing private data
0x07	ISO/IEC 13522 MHEG
0x08	ITU-T Rec. H.222.0 ISO/IEC 13818-1 Annex A DSM-CC
0x09	ITU-T Rec. H.222.1
0x0A	ISO/IEC 13818-6 type A
0x0B	ISO/IEC 13818-6 type B
0x0C	ISO/IEC 13818-6 type C
0x0D	ISO/IEC 13818-6 type D
0x0E	ITU-T Rec. H.222.0 ISO/IEC 13818-1 auxiliary
0x0F	ISO/IEC 13818-7 Audio with ADTS transport syntax
0x10	ISO/IEC 14496-2 Visual
0x11	ISO/IEC 14496-3 Audio with the LATM transport syntax as defined in ISO/IEC 14496-3
0x12	ISO/IEC 14496-1 SL-packetized stream or FlexMux stream carried in PES packets

Table 2-34 – Stream type assignments

Value	Description
0x13	ISO/IEC 14496-1 SL-packetized stream or FlexMux stream carried in ISO/IEC 14496_sections
0x14	ISO/IEC 13818-6 Synchronized Download Protocol
0x15	Metadata carried in PES packets
0x16	Metadata carried in metadata_sections
0x17	Metadata carried in ISO/IEC 13818-6 Data Carousel
0x18	Metadata carried in ISO/IEC 13818-6 Object Carousel
0x19	Metadata carried in ISO/IEC 13818-6 Synchronized Download Protocol
0x1A	IPMP stream (defined in ISO/IEC 13818-11, MPEG-2 IPMP)
0x1B	AVC video stream conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 ISO/IEC 14496-10 or AVC video sub-bitstream as defined in 2.1.78
0x1C	ISO/IEC 14496-3 Audio, without using any additional transport syntax, such as DST, ALS and SLS
0x1D	ISO/IEC 14496-17 Text
0x1E	Auxiliary video stream as defined in ISO/IEC 23002-3
0x1F	SVC video sub-bitstream of an AVC video stream conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 ISO/IEC 14496-10
0x20-0x7E	ITU-T Rec. H.222.0 ISO/IEC 13818-1 Reserved
0x7F	IPMP stream
0x80-0xFF	User Private

7) Subclause 2.5.2.7 (P-STD extensions for carriage of ITU-T Rec. H.264 | ISO/IEC 14496-10 Video)

Replace in subclause 2.5.2.7:

For decoding of ITU-T Rec. H.264 | ISO/IEC 14496-10 video streams carried in a Program Stream in the P-STD model, see 2.14.3.2.

by:

For decoding of AVC video streams conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10 carried in a Program Stream in the P-STD model, see 2.14.3.2 and for decoding of AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10 carried in a Program Stream in the P-STD model, see 2.14.3.6

8) Subclause 2.5.3.6 (Semantic definition of fields in system header)

Replace in subclause 2.5.3.6, in the semantic definition of the field `system_video_lock_flag`:

For ITU-T Rec. H.264 | ISO/IEC 14496-10 video streams, the frequency of the AVC time base is defined by the AVC parameter `time_scale`. If the `system_video_lock_flag` is set to '1' for an AVC video stream, then the frequency of the AVC time base shall be locked to the STC and shall be exactly equal to N times `system_clock_frequency` divided by K, with N and K integers that have a fixed value within each AVC video sequence, with K greater than or equal to N.

by:

For ITU-T Rec. H.264 | ISO/IEC 14496-10 video streams, the frequency of the AVC time base is defined by the AVC parameter `time_scale`. If the `system_video_lock_flag` is set to '1' for an AVC video stream or for a video sub-bitstream, then the frequency of the AVC time base shall be locked to the STC and shall be exactly equal to N times `system_clock_frequency` divided by K, with N and K integers that have a fixed value within each AVC video sequence, with K greater than or equal to N.

9) Subclause 2.5.5 (Program Stream directory)

Replace in subclause 2.5.5:

Directory entries may be required to reference IDR picture or pictures associated with a recovery point SEI message in an AVC video stream. Each such directory entry shall refer to the first byte of an AVC access unit.

by:

For AVC video streams conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10, directory entries may be required to reference IDR picture or pictures associated with a recovery point SEI message in an AVC video stream. Each such directory entry shall refer to the first byte of an AVC access unit.

For video sub-bitstreams of AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10, directory entries may be required to reference IDR picture or pictures to be re-assembled from video sub-bitstreams and associated with a recovery point SEI message present in a video sub-bitstream. Each such directory entry shall refer to the first byte of an SVC dependency representation.

10) Subclause 2.6.1 (Semantic definition of fields in program and program element descriptors)

Replace Table 2-45 by:

Table 2-45 – Program and program element descriptors

descriptor_tag	TS	PS	Identification
0	n/a	n/a	Reserved
1	n/a	X	Forbidden
2	X	X	video_stream_descriptor

11) Subclauses 2.6.6 (*Hierarchy descriptor*) and 2.6.7 (*Semantic definition of fields in hierarchy descriptor*)

a) Replace Table 2-49 by:

Table 2-49 – Hierarchy descriptor

Syntax	No. of bits	Mnemonic
hierarchy_descriptor() {		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
reserved	1	bslbf
temporal_scalability_flag	1	bslbf
spatial_scalability_flag	1	bslbf
quality_scalability_flag	1	bslbf
hierarchy_type	4	uimsbf
reserved	2	bslbf
hierarchy_layer_index	6	uimsbf
tref_present_flag	1	bslbf
reserved	1	bslbf
hierarchy_embedded_layer_index	6	uimsbf
reserved	2	bslbf
hierarchy_channel	6	uimsbf

b) Replace in subclause 2.6.7:

hierarchy_type – The hierarchical relation between the associated hierarchy layer and its hierarchy embedded layer is defined in Table 2-50.

hierarchy_layer_index – The hierarchy_layer_index is a 6-bit field that defines a unique index of the associated program element in a table of coding layer hierarchies. Indices shall be unique within a single program definition.

hierarchy_embedded_layer_index – The hierarchy_embedded_layer_index is a 6-bit field that defines the hierarchy table index of the program element that needs to be accessed before decoding of the elementary stream associated with this hierarchy_descriptor. This field is undefined if the hierarchy_type value is 15 (base layer).

hierarchy_channel – The `hierarchy_channel` is a 6-bit field that indicates the intended channel number for the associated program element in an ordered set of transmission channels. The most robust transmission channel is defined by the lowest value of this field with respect to the overall transmission hierarchy definition.

NOTE – A given `hierarchy_channel` may at the same time be assigned to several program elements.

by:

temporal_scalability_flag – A 1-bit flag, which when set to '0' indicates that the associated program element enhances the frame rate of the bit-stream resulting from the program element referenced by the `hierarchy_embedded_layer_index`. The value of '1' for this flag is reserved.

spatial_scalability_flag – A 1-bit flag, which when set to '0' indicates that the associated program element enhances the spatial resolution of the bit-stream resulting from the program element referenced by the `hierarchy_embedded_layer_index`. The value of '1' for this flag is reserved.

quality_scalability_flag – A 1-bit flag, which when set to '0' indicates that the associated program element enhances the SNR quality or fidelity of the bit-stream resulting from the program element referenced by the `hierarchy_embedded_layer_index`. The value of '1' for this flag is reserved.

hierarchy_type – The hierarchical relation between the associated hierarchy layer and its hierarchy embedded layer is defined in Table 2-50. If scalability applies in more than one dimension, this field shall be set to the value of '8' ("Combined Scalability"), and the flags `temporal_scalability_flag`, `spatial_scalability_flag` and `quality_scalability_flag` shall be set accordingly.

hierarchy_layer_index – The `hierarchy_layer_index` is a 6-bit field that defines a unique index of the associated program element in a table of coding layer hierarchies. Indices shall be unique within a single program definition. For video sub-bitstreams of AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10, this is the program element index, which is assigned in a way that the bitstream order will be correct if associated SVC dependency representations of the video sub-bitstreams of the same access unit are re-assembled in increasing order of `hierarchy_layer_index`.

tref_present_flag – A 1-bit flag, which when set to '0' indicates that the TREF field may be present in the PES packet headers in the associated elementary stream. The value of '1' for this flag is reserved.

hierarchy_embedded_layer_index – The `hierarchy_embedded_layer_index` is a 6-bit field that defines the `hierarchy_layer_index` of the program element that needs to be accessed and be present in decoding order before decoding of the elementary stream associated with this `hierarchy_descriptor`. This field is undefined if the `hierarchy_type` value is 15 (base layer).

hierarchy_channel – The `hierarchy_channel` is a 6-bit field that indicates the intended channel number for the associated program element in an ordered set of transmission channels. The most robust transmission channel is defined by the lowest value of this field with respect to the overall transmission hierarchy definition.

NOTE – A given `hierarchy_channel` may at the same time be assigned to several program elements.

c) Replace Table 2-50 by:

Table 2-50 – Hierarchy_type field values

Value	Description
0	Reserved
1	Spatial Scalability
2	SNR Scalability
3	Temporal Scalability
4	Data partitioning
5	Extension bit-stream
6	Private Stream
7	Multi-view Profile
8	Combined Scalability
9-14	Reserved
15	Base layer

12) Subclause 2.6.11 (Semantic definition of fields in data stream alignment descriptor)

a) *Replace in subclause 2.6.11:*

Table 2-54 describes the alignment type for ITU-T Rec. H.264 | ISO/IEC 14496-10 video when the data_alignment_indicator in the PES packet header has a value of '1'. In this case the first PES_packet_data_byte following the PES header shall be the first byte of an AVC access unit or the first byte of an AVC slice, as signalled by the alignment_type value.

by:

Table 2-54 describes the alignment type for ITU-T Rec. H.264 | ISO/IEC 14496-10 video when the data_alignment_indicator in the PES packet header has a value of '1'.

In this case:

- For AVC video streams conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10, the first PES_packet_data_byte following the PES header shall be the first byte of an AVC access unit or the first byte of an AVC slice, as signalled by the alignment_type value.
- For video sub-bitstreams of AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10, the first PES_packet_data_byte following the PES header shall be the first byte of an SVC dependency representation or the first byte of an SVC slice, as signalled by the alignment_type value.

b) *Replace Table 2-54 by:*

Table 2-54 – AVC video stream alignment values

Alignment type	Description
00	Reserved
01	AVC slice or AVC access unit
02	AVC access unit
03	SVC slice or SVC dependency representation
04	SVC dependency representation
05-FF	Reserved

13) Subclause 2.6.64 (AVC video descriptor)

a) *Replace in subclause 2.6.64:*

For ITU-T Rec. H.264 | ISO/IEC 14496-10 video streams, the AVC video descriptor provides basic information for identifying coding parameters of the associated AVC video stream, such as on profile and level parameters included in the SPS of an AVC video stream.

The AVC video descriptor also signals the presence of AVC still pictures and the presence of AVC 24-hour pictures in the AVC video stream. If this descriptor is not included in the PMT for an AVC video stream in a transport stream or in the PSM, if present, for an AVC video stream in a program stream, then such AVC video stream shall not contain AVC still pictures and shall not contain AVC 24-hour pictures. (See Table 2-89.)

by:

For AVC video streams, the AVC video descriptor provides basic information for identifying coding parameters of the associated AVC video stream, such as on profile and level parameters included in the SPS of an AVC video stream or in the subset SPS of an SVC video sub-bitstream.

For AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10, there may be one AVC video descriptor associated to each of the video sub-bitstreams identifying coding parameters of the associated re-assembled AVC video streams.

The AVC video descriptor also signals the presence of AVC still pictures and the presence of AVC 24-hour pictures in the AVC video stream. If this descriptor is not included in the PMT for an AVC video stream or a video sub-bitstream in a transport stream or in the PSM, if present, for an AVC video stream or a video sub-bitstream in a program stream, then such AVC video stream shall not contain AVC still pictures and shall not contain AVC 24-hour pictures. (See Table 2-89.)

b) Replace Table 2-89 by:

Table 2-89 – AVC video descriptor

Syntax	No. of bits	Mnemonic
AVC_video_descriptor() {		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
profile_idc	8	uimsbf
constraint_set0_flag	1	bslbf
constraint_set1_flag	1	bslbf
constraint_set2_flag	1	bslbf
constraint_set3_flag	1	bslbf
AVC_compatible_flags	4	bslbf
level_idc	8	uimsbf
AVC_still_present	1	bslbf
AVC_24_hour_picture_flag	1	bslbf
reserved	6	bslbf
}		

14) Subclause 2.6.65 (Semantic definition of fields in AVC video descriptor)

Replace in subclause 2.6.65:

profile_idc, constraint_set0_flag, constraint_set1_flag, constraint_set2_flag, AVC_compatible_flags and level_idc – These fields, with the exception of AVC_compatible_flags shall be coded according to the semantics for these fields defined in ITU-T Rec. H.264 | ISO/IEC 14496-10. The semantics of AVC_compatible_flags are exactly equal to the semantics of the field(s) defined for the 5 bits between the constraint_set2 flag and the level_idc field in the Sequence Parameter Set, as defined in ITU-T Rec. H.264 | ISO/IEC 14496-10. The entire AVC video stream to which the AVC descriptor is associated shall conform to the profile, level and constraints signalled by these fields.

by:

profile_idc, constraint_set0_flag, constraint_set1_flag, constraint_set2_flag, constraint_set3_flag, AVC_compatible_flags and level_idc – These fields, with the exception of AVC_compatible_flags shall be coded according to the semantics for these fields defined in ITU-T Rec. H.264 | ISO/IEC 14496-10. The semantics of AVC_compatible_flags are exactly equal to the semantics of the field(s) defined for the 4 bits between the constraint_set3 flag and the level_idc field in the Sequence Parameter Set, as defined in ITU-T Rec. H.264 | ISO/IEC 14496-10. The entire AVC video stream to which the AVC descriptor is associated shall conform to the profile, level and constraints signaled by these fields.

15) Subclause 2.6.66 (AVC timing and HRD descriptor)

Replace in subclause 2.6.66:

The AVC timing and HRD descriptor provides timing and HRD parameters of the associated AVC video stream. For each AVC video stream carried in an ITU-T Rec. H.222.0 | ISO/IEC 13818-1 stream, the AVC timing and HRD descriptor shall be included in the PMT or in the PSM, if PSM is present in the program stream, unless the AVC video stream carries VUI parameters with the timing_info_present_flag set to '1':

- for each IDR picture; and
- for each picture that is associated with a recovery point SEI message.

Absence of the AVC timing and HRD descriptor in the PMT for an AVC video stream signals usage of the leak method in the T-STD is defined in 2.14.3.1 for the transfer from MB_n to EB_n but such usage can also be signalled by the hrd_management_valid_flag set to '0' in the AVC timing and HRD descriptor. If the transfer rate into buffer EB_n can be determined from HRD parameters contained in an AVC video stream, and if this transfer rate is used in the T-STD for the transfer between MB_n to EB_n, then the AVC timing and HRD descriptor with the hrd_management_valid_flag set to '1' shall be included in the PMT for that AVC video stream. (See Table 2-90.)

by:

The AVC timing and HRD descriptor provides timing and HRD parameters of the associated AVC video stream. For each AVC video stream and for each video sub-bitstream carried in an ITU-T Rec. H.222.0 | ISO/IEC 13818-1 stream, the AVC timing and HRD descriptor shall be included in the PMT or in the PSM, if PSM is present in the program stream, unless the AVC video stream or the video sub-bitstream carries VUI parameters with the `timing_info_present_flag` set to '1':

- for each IDR picture or re-assembled IDR picture; and
- for each picture or re-assembled picture that is associated with a recovery point SEI message.

Absence of the AVC timing and HRD descriptor in the PMT for an AVC video stream or a re-assembled AVC video stream signals usage of the leak method in the T-STD for the transfer from MB_n to EB_n as defined:

- in 2.14.3.1 for an AVC video stream conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10;
- in 2.14.3.5 for video sub-bitstreams of an AVC video stream conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10.

But such usage can also be signalled by the `hrd_management_valid_flag` set to '0' in the AVC timing and HRD descriptor. If the transfer rate into buffer EB_n can be determined from HRD parameters contained in an AVC video stream or an AVC video stream re-assembled from video sub-bitstreams, and if this transfer rate is used in the T-STD for the transfer between MB_n to EB_n , then the AVC timing and HRD descriptor with the `hrd_management_valid_flag` set to '1' shall be included in the PMT for that AVC video stream or for the re-assembled AVC video stream. (See Table 2-90.)

16) Subclause 2.6.67 (*Semantic definition of fields in AVC timing and HRD descriptor*)

Replace in subclause 2.6.67:

hrd_management_valid_flag – This 1-bit field is only defined for use in transport streams.

When the AVC timing and HRD descriptor is associated to an AVC video stream carried in a transport stream, then the following applies. If the `hrd_management_valid_flag` is set to '1', then Buffering Period SEI and Picture Timing SEI messages, as defined in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10, shall be present in the associated AVC video stream. These Buffering Period SEI messages shall carry coded `initial_cpb_removal_delay` and `initial_cpb_removal_delay_offset` values for the NAL HRD. If the `hrd_management_valid_flag` is set to '1', then the transfer of each byte from MB_n to EB_n in the T-STD shall be according to the delivery schedule for that byte into the CPB in the NAL HRD, as determined from the coded `initial_cpb_removal_delay` and `initial_cpb_removal_delay_offset` values for `SchedSelIdx = cpb_cnt_minus1`. When the `hrd_management_valid_flag` is set to '0', the leak method as defined in 2.14.3.1 shall be used for the transfer from MB_n to EB_n in the T-STD.

When the AVC timing and HRD descriptor is associated to an AVC video stream carried in a program stream, then the meaning of the `hrd_management_valid_flag` is not defined.

by:

hrd_management_valid_flag – This 1-bit field is only defined for use in transport streams.

When the AVC timing and HRD descriptor is associated to an AVC video stream or a re-assembled AVC video stream carried in a transport stream, then the following applies. If the `hrd_management_valid_flag` is set to '1', then Buffering Period SEI and Picture Timing SEI messages, as defined in Annex C of ITU-T Rec. H.264 | ISO/IEC 14496-10, shall be present in the associated AVC video stream or re-assembled AVC video stream. These Buffering Period SEI messages shall carry coded `initial_cpb_removal_delay` and `initial_cpb_removal_delay_offset` values for the NAL HRD. If the `hrd_management_valid_flag` is set to '1', then the transfer of each byte from MB_n to EB_n in the T-STD shall be according to the delivery schedule for that byte into the CPB in the NAL HRD, as determined from the coded `initial_cpb_removal_delay` and `initial_cpb_removal_delay_offset` values for `SchedSelIdx = cpb_cnt_minus1`. When the `hrd_management_valid_flag` is set to '0', the leak method for the transfer from MB_n to EB_n in the T-STD shall be used:

- as defined in 2.14.3.1 for AVC video streams conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10;
- as defined in 2.14.3.5 for video sub-bitstreams of AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10.

When the AVC timing and HRD descriptor is associated to an AVC video stream or a re-assembled AVC video stream carried in a program stream, then the meaning of the `hrd_management_valid_flag` is not defined.

17) **New subclauses 2.6.76 to 2.6.77 (SVC extension descriptor)**

Add after subclause 2.6.75:

2.6.76 SVC extension descriptor

For video sub-bitstreams of AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10, the SVC extension descriptor provides information about the AVC video stream resulting from re-assembling (up to) the associated video sub-bitstream and provides information about scalability and re-assembly of the associated video sub-bitstream. There may be one SVC extension descriptor associated to any of the video sub-bitstreams of an AVC video stream conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10.

Table AMD3-1 – SVC extension descriptor

Syntax	No. of bits	Mnemonic
SVC_extension_descriptor() {		
descriptor_tag	8	uimsbf
descriptor_length	8	uimsbf
width	16	uimsbf
height	16	uimsbf
frame_rate	16	uimsbf
average_bitrate	16	uimsbf
maximum_bitrate	16	uimsbf
dependency_id	3	bslbf
reserved	5	bslbf
quality_id_start	4	bslbf
quality_id_end	4	bslbf
temporal_id_start	3	bslbf
temporal_id_end	3	bslbf
no_sei_nal_unit_present	1	bslbf
reserved	1	bslbf
}		

2.6.77 Semantic definition of fields in SVC extension descriptor

width – This 16-bit field indicates the maximum image width resolution, in pixels of the re-assembled AVC video stream.

height – This 16-bit field indicates the maximum image height resolution, in pixels of the re-assembled AVC video stream.

frame_rate – This 16-bit field indicates the maximum frame rate, in frames/256 seconds of the re-assembled AVC video stream.

average_bitrate – This 16-bit field indicates the average bit rate, in kbit per second, of the re-assembled AVC video stream.

maximum_bitrate – This 16-bit field indicates the maximum bit rate, in kbit per second, of the re-assembled AVC video stream.

dependency_id – This 3-bit field indicates the value of `dependency_id` associated to the video sub-bitstream.

quality_id_start – This 4-bit field indicates the minimum value of the `quality_id` of the NAL unit header syntax element of all the NAL units contained in the associated video sub-bitstream.

quality_id_end – This 4-bit field indicates the maximum value of the `quality_id` of the NAL unit header syntax element of all the NAL units contained in the associated video sub-bitstream.

temporal_id_start – This 3-bit field indicates the minimum value of the `temporal_id` of the NAL unit header syntax element of all the NAL units contained in the associated video sub-bitstream.

temporal_id_end – This 3-bit field indicates the maximum value of the `temporal_id` of the NAL unit header syntax element of all the NAL units contained in the associated video sub-bitstream.

no_sei_nal_unit_present – This 1-bit flag when set to '1' indicates that no SEI NAL units are present in the associated video sub-bitstream.

NOTE – In case the `no_sei_nal_unit_present` flag is set to '1' for all SVC video sub-bitstreams and is not set to '1' or not present for the AVC video sub-bitstream, any SEI NAL units, if present, are included in the AVC video sub-bitstream. If the SVC extension descriptor is absent for all video sub-bitstreams, SEI NAL units may be present in any SVC dependency representation of an SVC video sub-bitstream, and may require re-ordering to the order of NAL units within an access unit as defined in ITU-T Rec. H.264 | ISO/IEC 14496-10 before access unit re-assembling.

18) Subclause 2.7.6 (Timing constraints for scalable coding)

Add in subclause 2.7.6:

For AVC video streams conforming to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10, there are no timing constraints on SVC dependency representations or re-assembled AVC access units of video sub-bitstreams of an AVC video stream.

19) Subclause 2.14.1 (Carriage of ITU-T Rec. H.264 | ISO/IEC 14496-10 Video)

Add after the last sentence of subclause 2.14.1:

When an AVC video stream conforms to one or more profiles defined in Annex G of ITU-T Rec. H.264 | ISO/IEC 14496-10, the following constraints additionally apply:

- The AVC video sub-bitstream as defined in 2.1.78 shall be an element of an ITU-T Rec. H.222.0 | ISO/IEC 13818-1 program and the `stream_type` for this elementary stream shall be equal to 0x1B.
- For each SVC video sub-bitstream as defined in 2.1.79 that is an element of the same ITU-T Rec. H.222.0 | ISO/IEC 13818-1 program, the `stream_type` for this elementary stream shall be equal to 0x1F.
- All subset Sequence Parameter Sets and Picture Parameter Sets necessary for decoding an SVC video sub-bitstream shall be present within the elementary stream carrying the SVC video sub-bitstream.
- In each elementary stream with `stream_type` equal to 0x1F, exactly one `SVC_drd_nal_unit` as defined in 2.14.3.3 may precede all the NAL units of the same SVC dependency representation.

NOTE 1 – If any `SVC_drd_nal_unit` is included in any SVC dependency representation then the HRD model should include this `SVC_drd_nal_unit` in the buffer model as additional non-VCL NAL units. The NAL unit type 24 may be used in a different way by other specifications out of scope of this Specification.
- The TREF field as defined in 2.4.3.7 may be present in the PES headers of elementary streams with `stream_type` equal to 0x1F. The TREF field shall be set and shall be present in the PES headers as specified in 2.14.3.5 and 2.14.3.6 respectively.

NOTE 2 – Currently the presence of TREF is only specified for elementary streams with `stream_type` equal to 0x1F.
- When an ITU-T Rec. H.222.0 | ISO/IEC 13818-1 program includes more than one SVC video sub-bitstream, or more than one AVC video sub-bitstream and at least one SVC video sub-bitstream, a hierarchy descriptor as defined in 2.6.7 shall be used to indicate the dependencies of the related video sub-bitstreams.
- All NAL units of a re-assembled AVC access unit shall be passed to the decoder in the order of NAL units within an access unit as defined in ITU-T Rec. H.264 | ISO/IEC 14496-10.

NOTE 3 – If SEI NAL units are present in any SVC dependency representation of an SVC video sub-bitstream, these NAL units may require re-ordering to the order of NAL units within an access unit as defined in ITU-T Rec. H.264 | ISO/IEC 14496-10 before access unit re-assembling.
- The profile and level limitations indicated by `profile_idc` and `level_idc` syntax elements in the `AVC_video_descriptor`, if present, and the Type II HRD parameters in the `AVC_timing_and_HRD_descriptor`, if present, for an AVC video stream resulting from re-assembling (up to) the video sub-bitstream associated to the descriptors shall include NAL units with `nal_unit_type` syntax element equal to 14 in the AVC video sub-bitstream and, if present in the SVC video sub-bitstream, NAL units with `nal_unit_type` syntax element equal to 24.

20) Subclause 2.14.3.1 (T-STD extensions)

Replace in subclause 2.14.3.1:

The T-STD model includes a transport buffer TB_n and a multiplex buffer MB_n prior to buffer EB_n for decoding of each ITU-T Rec. H.264 | ISO/IEC 14496-10 video elementary stream n . See Figure 2-11.

by:

The T-STD model includes a transport buffer TB_n and a multiplex buffer MB_n prior to buffer EB_n for decoding of each AVC video elementary stream n conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10. See Figure 2-11.

21) Subclause 2.14.3.2 (P-STD extensions)

Replace in subclause 2.14.3.2:

The P-STD model for the decoding of an ITU-T Rec. H.264 | ISO/IEC 14496-10 elementary stream includes a multiplex buffer B_n and a decoder D_n followed by a buffer DPB_n (see Figure 2-12). For each AVC video stream n , the size BS_n of buffer B_n in the P-STD is defined by the P-STD_buffer_size field in the PES packet header.

by:

The P-STD model for the decoding of an AVC video stream conforming to one or more profiles defined in Annex A of ITU-T Rec. H.264 | ISO/IEC 14496-10, includes a multiplex buffer B_n and a decoder D_n followed by a buffer DPB_n (see Figure 2-12). For each AVC video stream n , the size BS_n of buffer B_n in the P-STD is defined by the P-STD_buffer_size field in the PES packet header.

22) New subclauses 2.14.3.3 to 2.14.3.6

Add after subclause 2.14.3.2:

2.14.3.3 SVC dependency representation delimiter nal unit

See Table AMD3-2.

Table AMD3-2 – SVC dependency representation delimiter nal unit

Syntax	No. of bits	Mnemonic
SVC_drd_nal_unit() {		
forbidden_zero_bit	1	bslbf
nal_ref_idc	2	bslbf
nal_unit_type	5	bslbf
}		

2.14.3.4 Semantic definition of SVC dependency representation delimiter nal unit

forbidden_zero_bit – shall be equal to 0x0

nal_ref_idc – shall be equal to 0x0

nal_unit_type – shall be equal to 0x18

2.14.3.5 T-STD extensions for SVC

The T-STD model described in 2.14.3.1 is applied if the received elementary stream is a video sub-bitstream of stream_type 0x1B, i.e. only the AVC video sub-bitstream is received and decoded.

When there is a set of received video sub-bitstreams in an ITU-T Rec. H.222.0 | ISO/IEC 13818-1 program, for which dependencies may be signaled in the hierarchy_descriptor as defined in 2.6.6, and when there is at least one of the video sub-bitstreams in the set of received elementary streams having the value of stream_type equal to 0x1F, the T-STD model as described in 2.14.3.1 is extended as illustrated in Figure AMD3-1 and as specified below.

Figure AMD3-1 – T-STD model extensions for ITU-T Rec. H.264 | ISO/IEC 14496-10 Video with scalable video sub-bitstreams

The following additional notations are used to describe the T-STD extensions and are illustrated in Figure AMD3-1 above.

- ES_n is the received elementary stream associated to dependency_id value equal to n
- ES_H is the received elementary stream associated to the highest value H of dependency_id present in the set of received elementary streams
- j is an index to the re-assembled access units
- j_n is an index to the SVC dependency representations of the elementary stream associated to dependency_id value equal to n
- $DR_n(j_n)$ is the j_n -th SVC dependency representation of video sub-bitstream associated to dependency_id value equal to n
- $A_H(j)$ is the j-th access unit resulting from re-assembling (up to) the j_H -th SVC dependency representations with dependency_id value equal to H
- $td_n(j_n)$ is the decoding time, measured in seconds, in the system target decoder of the j_n -th SVC dependency representation of the video sub-bitstream associated to dependency_id value equal to n
- $td_H(j)$ is the decoding time, measured in seconds, in the system target decoder of the j-th access unit $A_H(j)$ resulting from re-assembling (up to) the j_H -th SVC dependency representations $DR_H(j_H)$
- $tref_n(j_n)$ is equal to the decoding time value $td_{n-1}(j_{n-1})$ associated to the j_{n-1} -th SVC dependency representation $DR_{n-1}(j_{n-1})$, indicated by the TREF field of the PES header of the j_n -th SVC dependency representation $DR_n(j_n)$ of the same access unit
- TB_n is the transport buffer for elementary stream associated to dependency_id value equal to n
- TBS_n is the size of the transport buffer TB_n , measured in bytes
- MB_n is the multiplexing buffer for elementary stream associated to dependency_id value equal to n
- MBS_n is the size of the multiplexing buffer MB_n , measured in bytes
- DRB_n is the dependency representation buffer for elementary stream ES_n
- $DRBS_n$ is the size of dependency representation buffer DRB_n , measured in bytes
- EB_H is the elementary stream buffer for all video sub-bitstreams
- EBS_H is the size of elementary stream buffer EB_H , measured in bytes
- Rx_n is specified in 2.14.3.1

Carriage in PES packets

For correct re-assembling of the SVC dependency representations to an AVC access unit, if there is both an SVC dependency representation with any dependency_id equal to n and an SVC dependency representation with dependency_id equal to (n+1) in the same AVC access unit, the following applies:

- a PES packet per SVC dependency representation start shall be present, i.e. at most one SVC dependency representation may commence in the same PES packet;
