About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigenda or an amendment might have been published.

- Catalogue of IEC publications: www.iec.ch/searchpub

The IEC on-line Catalogue enables you to search by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, withdrawn and replaced publications.

- IEC Just Published: www.iec.ch/online_news/justpub

Stay up to date on all new IEC publications. Just Published details twice a month all new publications released. Available on-line and also by email.

- Electropedia: www.electropedia.org

The world's leading online dictionary of electronic and electrical terms containing more than 20 000 terms and definitions in English and French, with equivalent terms in additional languages. Also known as the International Electrotechnical Vocabulary online.

- Customer Service Centre: www.iec.ch/webstore/custserv

If you wish to give us your feedback on this publication or need further assistance, please visit the Customer Service Centre FAQ or contact us:

INFORMATION TECHNOLOGY – UPNP DEVICE ARCHITECTURE –

Part 3-12: Audio Video Device Control Protocol – Content Directory Service

FOREWORD

- 1) ISO (International Organization for Standardization) and IEC (International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards. Their preparation is entrusted to technical committees; any ISO and IEC member body interested in the subject dealt with may participate in this preparatory work. International governmental and non-governmental organizations liaising with ISO and IEC also participate in this preparation.
- 2) In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.
- 3) The formal decisions or agreements of IEC and ISO on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC and ISO member bodies.
- 4) IEC, ISO and ISO/IEC publications have the form of recommendations for international use and are accepted by IEC and ISO member bodies in that sense. While all reasonable efforts are made to ensure that the technical content of IEC, ISO and ISO/IEC publications is accurate, IEC or ISO cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 5) In order to promote international uniformity, IEC and ISO member bodies undertake to apply IEC, ISO and ISO/IEC publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any ISO/IEC publication and the corresponding national or regional publication should be clearly indicated in the latter.
- 6) ISO and IEC provide no marking procedure to indicate their approval and cannot be rendered responsible for any equipment declared to be in conformity with an ISO/IEC publication.
- 7) All users should ensure that they have the latest edition of this publication.
- 8) No liability shall attach to IEC or ISO or its directors, employees, servants or agents including individual experts and members of their technical committees and IEC or ISO member bodies for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication of, use of, or reliance upon, this ISO/IEC publication or any other IEC, ISO or ISO/IEC publications.
- 9) Attention is drawn to the normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.

IEC and ISO draw attention to the fact that it is claimed that compliance with this document may involve the use of patents as indicated below.

ISO and IEC take no position concerning the evidence, validity and scope of the putative patent rights. The holders of the putative patent rights have assured IEC and ISO that they are willing to negotiate free licences or licences under reasonable and non-discriminatory terms and conditions with applicants throughout the world. In this respect, the statements of the holders of the putative patent rights are registered with IEC and ISO.

Intel Corporation has informed IEC and ISO that it has patent applications or granted patents.

Information may be obtained from:

Intel Corporation
Standards Licensing Department
5200 NE Elam Young Parkway
MS: JFS-98
USA – Hillsboro, Oregon 97124

Microsoft Corporation has informed IEC and ISO that it has patent applications or granted patents as listed below:

6101499 / US; 6687755 / US; 6910068 / US; 7130895 / US; 6725281 / US; 7089307 / US; 7069312 / US; 10/783 524 / US

Information may be obtained from:

One Microsoft Way
USA – Redmond WA 98052

Philips International B.V. has informed IEC and ISO that it has patent applications or granted patents.

Information may be obtained from:

Philips International B.V. – IP&S
High Tech campus, building 44 3A21
NL – 5656 Eindhoven

NXP B.V. (NL) has informed IEC and ISO that it has patent applications or granted patents.

Information may be obtained from:

NXP B.V. (NL)
High Tech campus 60
NL – 5656 AG Eindhoven

Matsushita Electric Industrial Co. Ltd. has informed IEC and ISO that it has patent applications or granted patents.

Information may be obtained from:

Matsushita Electric Industrial Co. Ltd.
1-3-7 Shiromi, Chuoh-ku
JP – Osaka 540-6139

Hewlett Packard Company has informed IEC and ISO that it has patent applications or granted patents as listed below:

5 956 487 / US; 6 170 007 / US; 6 139 177 / US; 6 529 936 / US; 6 470 339 / US; 6 571 388 / US; 6 205 466 / US

Information may be obtained from:

Hewlett Packard Company
1501 Page Mill Road
USA – Palo Alto, CA 94304

Samsung Electronics Co. Ltd. has informed IEC and ISO that it has patent applications or granted patents.

Information may be obtained from:

Digital Media Business, Samsung Electronics Co. Ltd.
416 Maetan 3 Dong, Yeongtang-Gu,
KR – Suwon City 443-742

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights other than those identified above. IEC and ISO shall not be held responsible for identifying any or all such patent rights.

ISO/IEC 29341-3-12 was prepared by UPnP Implementers Corporation and adopted, under the PAS procedure, by joint technical committee ISO/IEC JTC 1, *Information technology*, in parallel with its approval by national bodies of ISO and IEC.

The list of all currently available parts of the ISO/IEC 29341 series, under the general title *Universal plug and play (UPnP) architecture*, can be found on the IEC web site.

This International Standard has been approved by vote of the member bodies, and the voting results may be obtained from the address given on the second title page.

ORIGINAL UPnP DOCUMENTS (informative)

Reference may be made in this document to original UPnP documents. These references are retained in order to maintain consistency between the specifications as published by ISO/IEC and by UPnP Implementers Corporation. The following table indicates the original UPnP document titles and the corresponding part of ISO/IEC 29341:

UPnP Document Title	ISO/IEC 29341 Part

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29341-3-12:2008

1. Overview and Scope

This service template is compliant with the UPnP Device Architecture version 1.0. It defines a service type referred to herein as Content Directory Service (CDS).

1.1. Introduction

Many devices within the home network contain various types of content that other devices would like to access (e.g. music, videos, still images, etc). As an example, a “Media Server” device might contain a significant portion of the homeowner’s audio, video, and still-image library. In order for the homeowner to enjoy this content, the homeowner must be able to browse the objects stored on the Media Server, select a specific one, and cause it to be “played” on an appropriate rendering device (e.g. an audio player for music objects, a TV for video content, an Electronic Picture Frame for still-images, etc).

For maximum convenience, it is highly desirable to allow the homeowner to initiate these operations from a variety of UI devices. In most cases, these UI devices will either be a UI built into the rendering device, or it will be a stand-alone UI device such as a wireless PDA or tablet. In any case, it is unlikely that the homeowner will interact directly with the device containing the content (i.e. the homeowner won’t have to walk over to the server device). In order to enable this capability, the service device needs to provide a uniform mechanism for UI devices to browse the content on the server and to obtain detailed information about individual content objects. This is the purpose of the Content Directory Service

The Content Directory Service additionally provides a lookup/storage service that allows clients (e.g. UI devices) to locate (and possibly store) individual objects (e.g. songs, movies, pictures, etc) that the (server) device is capable of providing. For example, this service can be used to enumerate a list of songs stored on an MP3 player, a list of still-images comprising various slide-shows, a list of movies stored in a DVD-Jukebox, a list of TV shows currently being broadcast (a.k.a an EPG), a list of songs stored in a CD-Jukebox, a list of programs stored on a PVR (Personal Video Recorder) device, etc. Nearly any type of content can be enumerated via this Content Directory service. For those devices that contain multiple types of content (e.g. MP3, MPEG2, JPEG, etc), a single instance of the Content Directory Service can be used to enumerate all objects, regardless of their type.

2. Service Modeling Definitions

2.1. Service Type

The following service type identifies a service that is compliant with this template:

urn:schemas-upnp-org:service:ContentDirectory:1

Content Directory Service (CDS) is used herein to refer to this service type.

2.2. References

This section lists the normative references used in this document and includes the tag inside square brackets that is used for each such reference:

[RFC 2396] Tim Berners-Lee, et. al. *RFC 2396: Uniform Resource Identifiers (URI): Generic Syntax.* 1998. Available at: <http://www.ietf.org/rfc/rfc2396.txt>

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29341-3-12:2008

2.3. Terms

Table 1: Terms

Term	Description
object	Any data entity that can be returned by a Content Directory Service from a browsing or searching action. The Content Directory Service defines a class system to represent the different types of objects that are ‘managed’ by the CDS. The base class, from which all other classes are derived, is named object . The class object cannot be instantiated.
property	A property represents a CDS or client-defined characteristic of an object . The Content Directory Service expresses properties in XML as either elements or attributes. When expressed as an element, the property is addressed via its property/element tag name (including namespace other than DIDL-Lite) e.g. dc:title , upnp:class . When expressed as an attribute, the property is addressed with its parent expression, the @ delimiter and its property name e.g. res@size , res@protocolInfo , upnp:class@name . One exception is if the property is expressed as an attribute of an element which is a top-level object tag (item , container , etc.) in which case it is simply addressed with the @ delimiter and its property name e.g. @id , @parentID , @restricted , @childCount etc. Properties declared in this specification come from one of three metadata namespaces: DIDL-Lite, Dublin Core (dc) or UPnP (upnp). Their data types and meanings are defined in Annex B.
class	A class is used to assign a type to an object , and identifies the minimum required and optional set of properties that must be present on that object. Classes are organized in a hierarchy with certain classes being derived from others as in a typical object oriented system. At the root of the class hierarchy is the object base class. Examples are object.item.audioItem.musicTrack and object.container.album.musicAlbum . See section 2.4 for a definition of the format of the class specification for an object.
item	item is a first-level class derived directly from object . An item most often represents a single piece of AV data, such as a CD track, a movie or an audio file. Items may be playable, meaning they have information that can be played on a rendering device. Any object which derives from the item class is expressed via the DIDL-Lite item structure.
container	container is a first-level class derived directly from object . A container represents a collection of objects. Containers can represent the physical organization of objects (storage containers) or logical collections. Logical collections can have formal definitions of their contents or they can be arbitrary collections. Containers can be either homogeneous, containing objects that are all of the same class, or heterogeneous, containing objects of mixed class. Containers can contain other containers. Any object derived from the container class is expressed via the DIDL-Lite container structure. A CDS is required to maintain a ContainerUpdateID for each of its containers. This value is maintained internally, does not appear in any XML expression of the container, and cannot be used in a search or sort criterion.

Term	Description
container modification	<p>A container is considered modified when any of the following occurs:</p> <ul style="list-style-type: none"> A property of the container is added, removed or changed in value. A direct child element, whether object-derived or ordinary element, is added to or removed from the container. A direct, non-container-derived, child object has one of its properties or child elements added, removed or changed. A direct container-derived child element has one of its properties or non-object-derived child elements added, removed or changed. <p><i>Note to implementors: since ‘ContainerUpdateID’ is not a formal property of a container, a modification to a direct child container that affects that child’s ‘ContainerUpdateID’ does not propagate upward to the parent container.</i></p>
XML fragment	<p>In this document, XML fragment refers to a string that represents one element from a valid XML document. Individual uses of ‘XML fragment’ do not always specify the exact XML context that would be required to validate the fragment. If a “qualifying name” is given, the name defines the root element tag of the fragment. For example, ‘DIDL-Lite XML fragment’ means a string of the form “<DIDL-Lite ...>...</DIDL-Lite>”. In addition, any AV-defined XML fragment is permitted to be fully compliant XML. Any extraneous headers/tags should be gracefully ignored by the code processing the fragment.</p>
CDS	Content Directory Service
ContainerUpdateID	<p>An unsigned integer associated with each container. The integer value is incremented each time the container is modified (see the entry in this ‘Terms’ table for the precise definition of ‘container modification’). Upon reaching the value $2^{32}-1$, the next update rolls the value back to zero. Initial value of ContainerUpdateID for any newly created container is unspecified, but recommended to be zero. Implementers should maintain the same value for each container’s ContainerUpdateID through power cycles and any other disappearance/reappearance on the network.</p>

2.3.1. Notation: Strings Embedded in Other Strings

Some string variables and arguments described in this document contain substrings that must be independently identifiable and extractable for other processing. This requires the definition of appropriate substring delimiters and an escaping mechanism so that these delimiters can also appear as ordinary characters in the string and/or its independent substrings. This document uses embedded strings in two contexts—Comma Separated Value (CSV) lists (see Section 2.5.1.1 below) and property values in search criteria strings. Escaping conventions use the backslash character, \ (UTF-8 character code 0x5C), as follows:

- a. Backslash (\) is represented as ‘\’ in both contexts.
- b. Comma (,) is
 1. represented as ‘\,’ in individual substring entries in CSV lists
 2. not escaped in search strings
- c. Double quote (") is
 1. not escaped in CSV lists
 2. not escaped in search strings when it appears as the start or end delimiter of a property value
 3. represented as ‘\”’ in search strings when it appears as a character that is part of the property value

2.3.2. Notation: Extended Backus-Naur Form

Extended Backus-Naur Form is used in this document for a formal syntax description of certain constructs. The usage here is according to the reference [EBNF].

Typographic conventions for EBNF

Symbol names in monospace font are non-terminal symbols. Character sequences between ‘single quotes’ are terminal strings and must appear literally in valid expressions. Character sequences between (*comment delimiters*) are English language definitions or supplementary explanations of their associated symbols. White space in the EBNF is used to separate elements of the EBNF, not to represent white space in search strings. White space usage in actual search strings is described explicitly in the EBNF. Finally, the EBNF uses the following four operators:

Operator	Semantics
<code>::=</code>	definition — the non-terminal symbol on the left is defined by one or more alternative sequences of terminals and/or non-terminals to its right.
<code> </code>	alternative separator — separates sequences on the right that are independently allowed definitions for the non-terminal on the left.
<code>*</code>	“null” repetition — means the expression to its left may occur zero or more times
<code>+</code>	“non-null” repetition — means the expression to its left must occur at least once and may occur more times

2.4. Class Hierarchy

The ContentDirectory service exposes a class hierarchy which is used to type all objects that can be retrieved from it. The ContentDirectory service exposes a class hierarchy which is used to type all objects that can be retrieved from it. Each class is named using a string of the form described in 2.4.1 below. Each class definition includes a list of properties. Some properties are required while others are optional. Some properties are ‘multi-valued’ for a class, meaning that, in an XML instance of the class, the property may occur more than once. A class that is derived from another class must include all the required properties of the base class. The definition of a subclass may make some optional properties of the base class required. Each property will be expressed in XML as either an XML Element or XML Attribute.

This section will describe three classes, **object**, **object.item** and **object.container** which make up the base hierarchy from which all other classes (UPnP- or vendor-defined) derive, see Annex C.

2.4.1. Class name syntax

Class name syntax is formally described using EBNF as described in section 2.3.2.

```

className ::= baseName | derivedName
baseName  ::= 'object'
derivedName ::= ( baseName | derivedName ) '.' shortName
shortName ::= (* valid XML name, excluding the characters
               ' ' — UTF-8 code 0x2E and
               '.' — UTF-8 code 0x3A *)

```

2.4.2. Base Properties

These properties are used by the base classes. Where a property is defined as having an "element" XML structure, all properties that are defined as attributes of that XML element are implicitly included (see Annex B for details on those properties). The base properties are defined as follows:

Table 2: Base properties

Property Name	XML Structure	Namespace	Property Type	Property Description
id	Element attribute	DIDL-Lite	String	An identifier for the object. The value of each object id property must be unique with respect to the Content Directory.
title	Element	Dublin Core	String	Name of the object
creator	Element	Dublin Core	String	Primary content creator or owner of the object
res	Element	DIDL-Lite	URI	Resource, typically a media file, associated with the object. Values must be properly escaped URIs as described in [RFC 2396].
class	Element	UPnP	String	Class of the object.
searchable	Element attribute	DIDL-Lite	Boolean	When <i>true</i> , the ability to perform a Search() action under a container is enabled, otherwise a Search() under that container will return no results. The default value of this attribute when it is absent on a container is false
searchClass	Element	UPnP	String	See Annex B for details
createClass	Element	UPnP	String	See Annex B for details
parentID	Element attribute	DIDL-Lite	String	id property of object's parent. The parentID of the Content Directory 'root' container must be set to the reserved value of "-1". No other parentID attribute of any other Content Directory object may take this value.
refID	Element attribute	DIDL-Lite	String	id property of the item being referred to.
restricted	Element attribute	DIDL-Lite	Boolean	When <i>true</i> , ability to modify a given object is confined to the Content Directory Service. Control point metadata write access is disabled.
writeStatus	Element	UPnP	String	When present, controls the modifiability of the resources of a given object. Ability of a Control Point to change writeStatus of a given resource(s) is implementation dependent. Allowed values are: <i>WRITABLE, PROTECTED, NOT_WRITABLE, UNKNOWN, MIXED.</i>
childCount	Element attribute	DIDL-Lite	Integer	Child count for the object. Applies to containers only.

2.4.3. Class ‘object’ (Base Class)

This is the root class of the entire content directory class hierarchy. It can not be instantiated, in the sense that no XML fragment returned by a **Browse()** or **Search()** action can be of class **object**. The **object** class defines properties that are common to both atomic media items, as well as logical collections of these items. The **object** class contains the following properties:

Table 3: Object properties

Property Name	Required	Multiple Values
id	yes	no
parentID	yes	no
title	yes	no
creator	no	no
res	no	yes
class	yes	no
restricted	yes	no
writeStatus	no	no

2.4.4. Class ‘item’ : ‘object’

This is a derived class of **object** used to represent “atomic” content objects, i.e., object that don’t contain other objects, for example, a music track on an audio CD. The XML expression of any instance of a class that is derived from **item** is the **<item>** tag. The **item** class identifies the properties specified on its base class **object**, as well as the following additional properties:

Table 4: Item properties

Property Name	Required	Multiple Values
refID	no	no

2.4.5. Class ‘container’ : ‘object’

This is a derived class of **object** used to represent containers e.g. a music album. The XML expression of any instance of a class that is derived from **container** is the **<container>** tag. The **container** class identifies the properties specified on its base class **object**, as well as the following additional properties:

Table 5: Container properties

Property Name	Required	Multiple Values
childCount	no	no
createClass	no	yes
searchClass	no	yes
searchable	no	no

2.5. State Variables

Unlike most other service templates, the Content Directory Service is primarily ‘action’ based. The service’s state variables exist primarily to support argument passing of the service’s actions. Information is not exposed directly through explicit state variables. Rather, a client retrieves Content Directory Service information via the return parameters of the actions defined below. The majority of state variables defined below exist simply to enable the various actions of this service.

Reader Note: *For first-time reader, it may be more helpful to read the action definitions before reading the state variable definitions.*

2.5.1. Derived data types

This section defines some derived data types that are represented as UPnP string data types with special syntax.

2.5.1.1. Comma Separated Value (CSV) Lists

The UPnP ContentDirectory Service uses variables that represent lists, or one-dimensional arrays, of values. Examples include the lists of active resource transfer ids and tag/value pairs for UpdateObject. The UPnP Device Architecture, Version 1.0 [DEVICE], does not provide for either an array type or a list type, so a list type is defined here. Lists may either be homogeneous (all values are the same type) or heterogeneous (values of different types are allowed). Lists may also consist of repeated occurrences of homogeneous or heterogeneous subsequences, all of which have the same syntax and semantics (same number of values, same value types and in the same order). The data type of a homogeneous list is *string (CSV x)*, where *x* is the UPnP type of the individual values. The data type of a heterogeneous list is of the form *string (CSV x, y, z)*, where *x*, *y* and *z* are the UPnP types of individual values. If the number of values in the heterogeneous list is too large to show each type individually, that variable type is represented as *string (CSV heterogeneous)*, and the variable description includes additional information as to the expected sequence of values appearing in the list and their corresponding types. The data type of a repeated subsequence list is *string (CSV {x, y, z})*, where *x*, *y* and *z* are the types of the individual values in the subsequence and the subsequence may be repeated zero or more times.

- A list is represented as a UPnP string type.
- Commas separate values within a list.
- Integer values are represented in CSVs with the same syntax as the integer data type specified in [DEVICE] (i.e., optional leading sign, optional leading zeroes, numeric ASCII)
- Boolean values are represented in CSVs as either ‘0’ for false or ‘1’ for true. These values are a subset of the defined boolean data type values specified in [DEVICE]: ‘0’, ‘false’, ‘no’, ‘1’, ‘true’, ‘yes’.
- Escaping conventions for the comma and backslash characters are defined in section 2.3.1.
- White space before, after, or interior to any numeric data type is not allowed.
- White space before, after, or interior to any other data type is part of the value.

Table 6: CSV Examples

Type refinement of string	Value	Comments
CSV string	+artist,-date	List of 2 property sort criteria.
CSV int	1,-5,006,0,+7	List of 5 integers.
CSV boolean	0,1,1,0	List of 4 booleans
CSV string	Smith\, Fred,Jones\, Davey	List of 2 names, “Smith, Fred” and “Jones, Davey”
CSV i4,string,ui2	-29837, string with leading blanks,0	Note that the second value is “ string with leading blanks”
CSV i4	3, 4	Illegal CSV. White space is not allowed as part of an integer value.
CSV string	„	List of 3 empty string values
CSV heterogeneous	Alice,Marketing,5,Susan,R&D,21,David,Finance,7	List of unspecified number of people and associated attributes. Each person is described by 3 elements—a name <i>string</i> , a department <i>string</i> and years-of-service <i>ui2</i> .

ContainerUpdateIDs	O	string (CSV {string, ui4})	see section 2.5.21	""	n/a

¹ R = Required, O = Optional, X = Non-standard.

2.5.2. TransferIDs

TransferIDs is a CSV list of type **A_ARG_TYPE_TransferID**. It is evented to notify clients when file transfers initiated by **ImportResource** or **ExportResource** started or finished. When a file transfer starts, its transfer id is added to the **TransferIDs** list. When the transfer ends, its id is removed from **TransferIDs**.

This state variable is used for eventing only.

2.5.3. A_ARG_TYPE_ObjectID

This variable is used in conjunction with those actions that include an **ObjectID** parameter. **ObjectID** parameters uniquely identify individual objects within the Content Directory Service.

2.5.4. A_ARG_TYPE_Result

This variable is used in conjunction with those actions that include a **Result** parameter. The structure of the result is a DIDL-Lite XML fragment:

- Optional XML header e.g. <?xml version="1.0" ?>
- <DIDL-Lite> is the root tag.
- <container> is the tag representing **container** objects.
- <item> is the tag representing **item** objects.
- Tags in the Dublin Core (dc) and UPnP (upnp) namespaces represent object metadata.

See the DIDL-Lite schema in Annex A for more details on the structure. The available metadata tags for properties are described in section 2.3 on Service Base Classes (for the base properties), and in the Annex (for AV working group defined extended properties).

Control points may validate the document fragment returned by prepending the appropriate XML headers on the start of the document fragment.

Note that since the DIDL-Lite format of **Result** is based on XML, it needs to be escaped (using the normal XML rules: [XML] Section 2.4 Character Data and Markup) before embedding in a **SOAP** response message. In addition, when a variable of type **A_ARG_TYPE_Result** is employed as a parameter in a comma-separated list, commas (',') that appear within XML CDATA must be escaped (as '\,'), see section 2.3.1.

2.5.5. A_ARG_TYPE_SearchCriteria

A_ARG_TYPE_SearchCriteria is the related state variable for the **SearchCriteria** parameter used in search actions. The **SearchCriteria** parameter gives one or more search criteria to be used for querying the Content Directory.

2.5.5.1. SearchCriteria String Syntax

SearchCriteria string syntax is described here formally using EBNF as described in section 2.3.2.

```

searchCrit ::= searchExp | asterisk

searchExp ::= relExp |
            searchExp wChar+ logOp wChar+ searchExp |
            '(' wChar* searchExp wChar* ')'

logOp      ::= 'and' | 'or'

relExp     ::= property wChar+ binOp wChar+ quotedVal |
            property wChar+ existsOp wChar+ boolVal

binOp      ::= relOp | stringOp

relOp      ::= '=' | '!=' | '<' | '<=' | '>' | '>='

stringOp   ::= 'contains' | 'doesNotContain' | 'derivedfrom'

existsOp   ::= 'exists'

boolVal    ::= 'true' | 'false'

quotedVal  ::= dQuote escapedQuote dQuote

```

wChar	::=	space hTab lineFeed vTab formFeed return
property	::=	(* property name as defined in section 2.4 *)
escapedQuote	::=	(* double-quote escaped string as defined in section 2.3.1 *)
hTab	::=	(* UTF-8 code 0x09, horizontal tab character *)
lineFeed	::=	(* UTF-8 code 0x0A, line feed character *)
vTab	::=	(* UTF-8 code 0x0B, vertical tab character *)
formFeed	::=	(* UTF-8 code 0x0C, form feed character *)
return	::=	(* UTF-8 code 0x0D, carriage return character *)
space	::=	‘ ’ (* UTF-8 code 0x20, space character *)
dQuote	::=	‘ ” ’ (* UTF-8 code 0x22, double quote character *)
asterisk	::=	‘ * ’ (* UTF-8 code 0x2A, asterisk character *)

2.5.5.2. SearchCriteria String Semantics and Examples

- **Operator precedence**

Precedence, highest to lowest, is:

```
dQuote
( )
binOp, existsOp
and
or
```

Examples:

‘s1 and s2 or s3 or s4 and s5’ is equivalent to:

‘((s1 and s2) or s3) or (s4 and s5)’

‘s1 and s2 or (s3 or s4) and s5’ is equivalent to:

‘(s1 and s2) or ((s3 or s4) and s5)’

- **Return all.** The special value ‘*’ means “find everything”, or “return all objects that exist beneath the selected starting container”.
- **Property existence testing.** Property existence is queried for by using the ‘exists’ operator. Strictly speaking, ‘exists’ could be a unary operator. This searchCriteria syntax makes it a binary operator to simplify search string parsing—there are no unary operators. The string “actor exists true” is true for every object that has at least one occurrence of the actor property. It is false for any object that has no actor property. Similarly, the string “actor exists false” is false for every object that has at least one occurrence of the actor property. It is true for any object that has no actor property.
- **Property omission.** Any property value query (as distinct from an existence query) applied to an object that does not have that property, evaluates to false.
- **Class derivation testing.** Existence of objects whose class is derived from some base class specification is queried for by using the ‘derivedfrom’ operator. For example
 ‘upnp:class derivedfrom “object.item”’ is true for all objects whose class is “object.item”, or whose class name begins with “object.item.”.
- **Numeric comparisons.** When the operator in a relExp is a relOp, and both the escapedQuote value and the actual property value are sequences of decimal digits or sequences of decimal digits preceded by either a ‘+’ or ‘-’ sign (i.e., integers), the comparison is done numerically. For all other combinations of operators and property values, the comparison is done by treating both values as strings, converting a numeric value to its string representation in decimal if necessary.

Note: The CDS is not expected to recognize any kind of numeric data other than decimal integers, composed only of decimal digits with the optional leading sign.

- **String comparisons.** All operators when applied to strings use case-insensitive comparisons.

2.5.6. A_ARG_TYPE_BrowseFlag

This variable is used in conjunction with the browse actions. A **BrowseFlag** parameter specifies a browse option to be used for browsing the Content Directory. Valid values are:

- *BrowseMetadata* - this indicates that the properties of the object specified by the **ObjectID** parameter will be returned in the result.
- *BrowseDirectChildren* - this indicates that first level objects under the object specified by **ObjectID** parameter will be returned in the result, as well as the metadata of all objects specified.

2.5.7. A_ARG_TYPE_Filter

This variable is used in conjunction with those actions that include a **Filter** parameter. The comma-separated list of property specifiers (including namespaces) indicates which metadata properties are to be returned in the results from browsing or searching.

Both properties represented in CDS query results as XML elements, as well as properties represented as element attributes, may be included in the comma-separated list.

If the **Filter** parameter is equal to “*”, all properties are returned.

As a rule, all required properties are returned, but no optional properties will be returned unless explicitly requested in the filter.

A CDS must always respond to **Search()** and **Browse()** requests with valid DIDL-Lite in the **Result** parameter. Individual properties specified in the comma-separated filter list that would result in an invalid DIDL-Lite **Result** are selectively ignored by the CDS.

By the same token, individual properties NOT specified in the comma-separated **Filter** list that are required for a valid DIDL-Lite **Result** are automatically included. For example, since **title** is a required property for both **item** and **container** objects, the <dc:title> element would automatically be included in all <item>s and <container>s in the **Result**.

2.5.8. A_ARG_TYPE_SortCriteria

This variable is used in conjunction with those actions that include a **SortCriteria** parameter.

A_ARG_TYPE_SortCriteria is CSV list of *signed* property names, where *signed* means preceded by ‘+’ or ‘-’ sign. The ‘+’ and ‘-’ indicate the sort is in ascending or descending order, respectively, with regard to the value of its associated property. Properties appear in the list in order of descending sort priority. For example, a value of “+upnp:artist,-dc:date,+dc:title” would sort first on artist in ascending order, then within each artist by date in descending order (most recent first) and finally by title in ascending order. An empty string indicates no sorting requested.

Note that only properties available in **SortCapabilities** can be sorted on.

2.5.9. A_ARG_TYPE_Index

This variable is used in conjunction with those actions that include an Index parameter. Index parameters specify an offset into an arbitrary list of objects. A value of 0 represents the first object in the list.

2.5.10.A_ARG_TYPE_Count

This variable is used in conjunction with those actions that include a **Count** parameter. **Count** parameters specify an ordinal number of arbitrary objects.

2.5.11.A_ARG_TYPE_UpdateID

This variable is used in conjunction with any action that includes an **UpdateID** parameter.

A_ARG_TYPE_UpdateID is the related state variable for the return parameter **UpdateID** used in **Browse()** and **Search()** actions. The return value will either be the **SystemUpdateID** (sec. 2.5.20 below) or a **ContainerUpdateID** (see Terms table, sec. 2.5.21).

2.5.12.A_ARG_TYPE_TransferID

This variable is used in conjunction with those actions that include a **TransferID** parameter. **TransferID** parameters uniquely identify individual file transfers initiated by the **ImportResource()** or the **ExportResource()** action of the Content Directory Service. **TransferID** is a unique value assigned by the device.

2.5.13.A_ARG_TYPE_TransferStatus

This variable is used in conjunction with those actions that include a **TransferStatus** parameter. This variable may assume one of the enumerated values: *IN_PROGRESS*, *STOPPED*, *ERROR*, or *COMPLETED*, indicating the status of a file transfer.

2.5.14.A_ARG_TYPE_TransferLength

This variable is used in conjunction with those actions that include a **TransferLength** parameter. It has the string type of data representing a numerical value that may exceed 32 bits in size.

2.5.15.A_ARG_TYPE_TransferTotal

This variable is used in conjunction with those actions that include a **TransferTotal** parameter. It has the string type of data representing a numerical value that may exceed 32 bits in size.

2.5.16.A_ARG_TYPE_TagValueList

A_ARG_TYPE_TagValueList is a CSV list of pairs of XML fragments. Each fragment is either an empty placeholder or a well-formed XML element. Note that commas (‘,’) that appear within XML CDATA in the fragments must be escaped (as \,), see section 2.3.1.

2.5.17.A_ARG_TYPE_URI

This variable is used in conjunction with any action that includes a URI parameter. A_ARG_TYPE_URI variables utilized as IN or OUT parameters in CDS actions must be properly escaped URIs as described in [RFC 2396].

2.5.18. SearchCapabilities

SearchCapabilities is a CSV list of property names that can be used in search queries. An empty string indicates that the CDS does not support any kind of searching. A wildcard (‘*’) indicates that the device supports search queries using all tags present in the CDS.

2.5.19. SortCapabilities

SortCapabilities is a CSV list of tags that the CDS can use to sort **Search()** or **Browse()** results. An empty string indicates that the device does not support any kind of sorting. A wildcard (‘*’) indicates that the device supports sorting using all tags present in the Content Directory.

2.5.20. SystemUpdateID

This required variable changes whenever anything in the Content Directory changes. A change could be a new or removed object, or a change in the metadata of an object. This variable is evented and the event is moderated at a maximum rate of 0.5 Hz (once every 2 seconds). The actual value of **SystemUpdateID** is unspecified. Clients should only check for equality with previous values of **SystemUpdateID**.

Note that the (optional) **ContainerUpdateIDs** variable provides more information about the scope of the change, since it takes advantage of the **ContainerUpdateID** values maintained for each container.

2.5.21. ContainerUpdateIDs

This optional state variable is an unordered CSV list of ordered pairs. Each pair consists of a **ContainerID** and a **ContainerUpdateID**, in that order. There can be at most one occurrence in **ContainerUpdateIDs** of an ordered pair with any specific **ContainerID**. The initial value of **ContainerUpdateIDs** is the empty string.

Each time a container is modified (see ‘container modification’ in table 2.3), its **ContainerUpdateID** is incremented and the ordered pair of the **ContainerID** and **ContainerUpdateID** are concatenated to the list **ContainerUpdateIDs**. If the **ContainerID** already appears in **ContainerUpdateIDs**, the new ordered pair is *not* added to the list. Instead, the corresponding **ContainerUpdateID** that is already in **ContainerUpdateIDs** is replaced by the new **ContainerUpdateID** value. A subscribing control point only sees the last value of **ContainerUpdateID** prior to the event.

ContainerUpdateIDs is a moderated evented state variable and is *only* used for eventing. There is no action that returns the value of **ContainerUpdateIDs**.

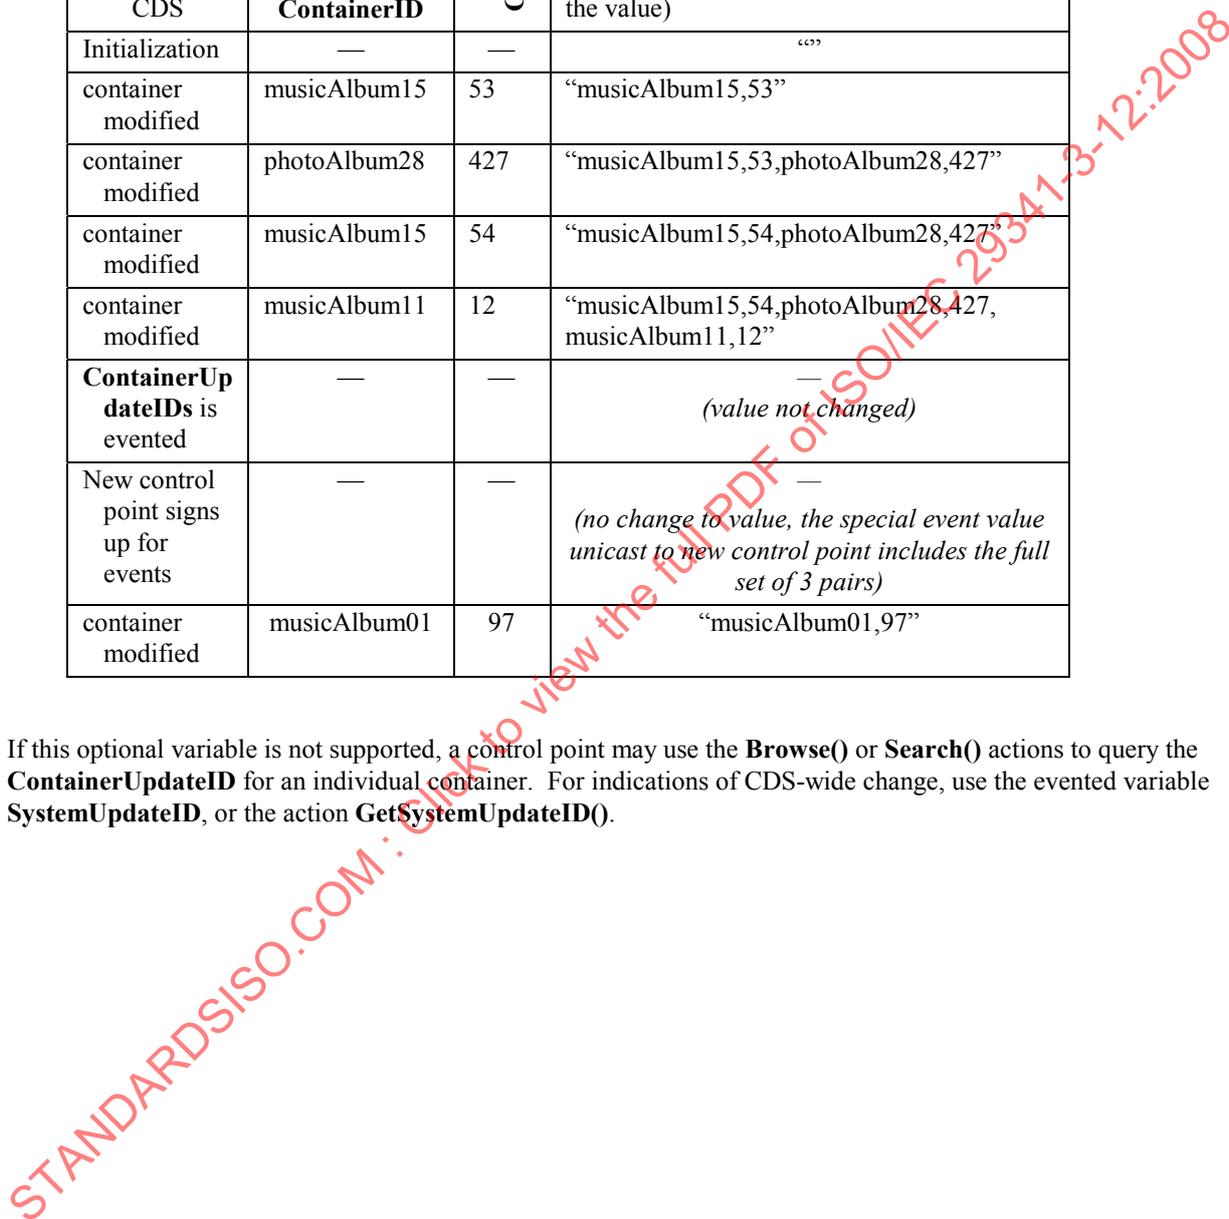

ContainerUpdateIDs is not a history list of container changes. Its evented value will never show the same ‘**ContainerID,ContainerUpdateID**’ pair value twice. The net effect for a ContentDirectory Service implementation is that the first time a new value of a changed value of a **ContainerUpdateID** is added to **ContainerUpdateIDs** after its value has been evented, the value of **ContainerUpdateIDs** is cleared (set to the empty string) before the newly changed ‘**ContainerID,ContainerUpdateID**’ is added to the list.

Example: Table 8 shows a time-ordered sequence of activities on a ContentDirectory Service for container modifications.

Table 8: ContainerUpdateIDs Example

Activity on CDS	ContainerID	New value of ContainerUpdateID	New value of ContainerUpdateIDs (the open close double quote marks are to clearly mark the variable value—they are not part of the value)
Initialization	—	—	“”
container modified	musicAlbum15	53	“musicAlbum15,53”
container modified	photoAlbum28	427	“musicAlbum15,53,photoAlbum28,427”
container modified	musicAlbum15	54	“musicAlbum15,54,photoAlbum28,427”
container modified	musicAlbum11	12	“musicAlbum15,54,photoAlbum28,427,musicAlbum11,12”
ContainerUpdateIDs is evented	—	—	— <i>(value not changed)</i>
New control point signs up for events	—	—	— <i>(no change to value, the special event value unicast to new control point includes the full set of 3 pairs)</i>
container modified	musicAlbum01	97	“musicAlbum01,97”

If this optional variable is not supported, a control point may use the **Browse()** or **Search()** actions to query the **ContainerUpdateID** for an individual container. For indications of CDS-wide change, use the evented variable **SystemUpdateID**, or the action **GetSystemUpdateID()**.

2.6. Eventing and Moderation

Table 9: Event moderation

Variable Name	Evented	Moderated Event	Max Event Rate ¹	Logical Combination	Min Delta per Event ²
TransferIDs	Yes	No	N/A	N/A	N/A
A_ARG_TYPE_ObjectID	No	No	N/A	N/A	N/A
A_ARG_TYPE_Result	No	No	N/A	N/A	N/A
A_ARG_TYPE_SearchCriteria	No	No	N/A	N/A	N/A
A_ARG_TYPE_SortCriteria	No	No	N/A	N/A	N/A
A_ARG_TYPE_UpdateID	No	No	N/A	N/A	N/A
A_ARG_TYPE_BrowseFlag	No	No	N/A	N/A	N/A
A_ARG_TYPE_Filter	No	No	N/A	N/A	N/A
A_ARG_TYPE_Index	No	No	N/A	N/A	N/A
A_ARG_TYPE_Count	No	No	N/A	N/A	N/A
A_ARG_Type_TransferID	No	No	N/A	N/A	N/A
A_ARG_Type_TransferStatus	No	No	N/A	N/A	N/A
A_ARG_Type_TransferLength	No	No	N/A	N/A	N/A
A_ARG_Type_TransferTotal	No	No	N/A	N/A	N/A
A_ARG_TYPE_TagValueList	No	No	N/A	N/A	N/A
A_ARG_TYPE_URI	No	No	N/A	N/A	N/A
SearchCapabilities	No	No	N/A	N/A	N/A
SortCapabilities	No	No	N/A	N/A	N/A
SystemUpdateID	Yes	Yes	2	N/A	N/A
ContainerUpdateIDs	Yes	Yes	2	N/A	N/A

¹ Determined by N, where Rate = (Event)/(N seconds).

² (N) * (allowedValueRange Step).

2.7. Actions

The following tables and subsections define the various CDS actions.

Except where noted, if an invoked action returns an error, the state of the device will be unaffected.

Table 10: Actions

Name	Req. or Opt. ¹
GetSearchCapabilities	R
GetSortCapabilities	R
GetSystemUpdateID	R
Browse	R
Search	O
CreateObject	O

2.7.1. GetSearchCapabilities

This action returns the searching capabilities that are supported by the device.

2.7.1.1. Arguments

Argument	Direction	Related State Variable
SearchCaps	OUT	SearchCapabilities

2.7.1.2. Effect on State

This action has no effect on the device's current state.

2.7.1.3. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.

2.7.2. GetSortCapabilities

Returns the CSV list of meta-data tags that can be used in sortCriteria

2.7.2.1. Arguments

Argument	Direction	Related State Variable
SortCaps	OUT	SortCapabilities

2.7.2.2. Effect on State

This action has no effect on the device's current state.

2.7.2.3. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.

2.7.3. GetSystemUpdateID

This action returns the current value of state variable **SystemUpdateID**. It can be used by clients that want to 'poll' for any changes in the Content Directory (as opposed to subscribing to events).

2.7.3.1. Arguments

Argument	Direction	Related State Variable
Id	OUT	SystemUpdateID

2.7.3.2. Effect on State

This action has no effect on the device's current state.

2.7.3.3. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.

2.7.4. Browse

This action allows the caller to incrementally browse the *native* hierarchy of the Content Directory objects exposed by the Content Directory Service, including information listing the classes of objects available in any particular object container.

2.7.4.1. Arguments

Argument	Direction	Related State Variable
ObjectID	IN	A_ARG_TYPE_ObjectID
BrowseFlag	IN	A_ARG_TYPE_BrowseFlag
Filter	IN	A_ARG_TYPE_Filter
StartingIndex	IN	A_ARG_TYPE_Index
RequestedCount	IN	A_ARG_TYPE_Count
SortCriteria	IN	A_ARG_TYPE_SortCriteria
Result	OUT	A_ARG_TYPE_Result
NumberReturned	OUT	A_ARG_TYPE_Count
TotalMatches	OUT	A_ARG_TYPE_Count
UpdateID	OUT	A_ARG_TYPE_UpdateID

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29341-3-12:2008

2.7.4.2. Argument Descriptions

Argument	Type	Description
ObjectID	string	Object currently being browsed. An ObjectID value of zero corresponds to the root object of the Content Directory.
BrowseFlag	string	See section 2.5.6.
Filter	string	See section 2.5.7.
StartingIndex	ui4	Starting zero based offset to enumerate children under the container specified by ObjectID . Must be 0 if BrowseFlag is equal to BrowseMetadata .
RequestedCount	ui4	Requested number of entries under the object specified by ObjectID . RequestedCount = 0 indicates request all entries.
SortCriteria	string	See section 2.5.8.
Result	string	See section 2.5.4.
NumberReturned	ui4	Number of objects returned in this result. If BrowseMetadata is specified in the BrowseFlags , then NumberReturned = 1
TotalMatches	ui4	If <i>BrowseMetadata</i> is specified in the BrowseFlags then TotalMatches = 1 , else if <i>BrowseDirectChildren</i> is specified in the BrowseFlags then TotalMatches = total number of objects in the container specified for the Browse() action (independent of the starting index specified by the StartingIndex argument). If the CDS cannot compute TotalMatches and NumberReturned is not equal to zero, then TotalMatches = 0 . If the CDS cannot compute TotalMatches and NumberReturned is equal to zero, then the CDS should return an error code 720.
UpdateID	ui4	ContainerUpdateID (see Terms, sec. 2.5.21) of the container being described if a container is specified in ObjectID . If the control point has an UpdateID for the container that is not equal to the UpdateID last returned, then the control point should refresh all its state relative to that container. If the ObjectID is zero, then the UpdateID returned is SystemUpdateID (see sec. 2.5.20).

2.7.4.3. Effect on State

This action has no effect on the current state of the device.

2.7.4.4. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.
701	No such object	The specified ObjectID is invalid.
709	Unsupported or invalid sort criteria	The sort criteria specified is not supported or is invalid
720	Cannot process the request	Cannot process the request.

2.7.5. Search

This action allows the caller to search the content directory for objects that match some search criteria. The search criteria are specified as a query string operating on properties with comparison and logical operators.

2.7.5.1. Arguments

Argument	Direction	Related State Variable
ContainerID	IN	A_ARG_TYPE_ObjectID
SearchCriteria	IN	A_ARG_TYPE_SearchCriteria
Filter	IN	A_ARG_TYPE_Filter
StartingIndex	IN	A_ARG_TYPE_Index
RequestedCount	IN	A_ARG_TYPE_Count
SortCriteria	IN	A_ARG_TYPE_SortCriteria
Result	OUT	A_ARG_TYPE_Result
NumberReturned	OUT	A_ARG_TYPE_Count
TotalMatches	OUT	A_ARG_TYPE_Count
UpdateID	OUT	A_ARG_TYPE_UpdateID

2.7.5.2. Argument Description

The **Filter**, **StartingIndex**, **RequestedCount**, **SortCriteria** input arguments are the same as the corresponding input parameters for the **Browse()** action. The **Result** and **UpdateID** output arguments are the same as the corresponding output parameters for the **Browse()** action.

Argument	Type	Description
ContainerID	string	Unique identifier of the container in which to begin searching. A ContainerID value of zero corresponds to the root object of the Content Directory.
NumberReturned	ui4	Number of Content Directory objects returned in the Result
TotalMatches	ui4	Total number of Content Directory objects that match the search criteria (specified by the SearchCriteria argument, and independent of the starting index specified by the StartingIndex argument) under the object specified by the ContainerID argument. If the CDS cannot compute TotalMatches and NumberReturned is not equal to zero, then TotalMatches = 0. If the CDS cannot compute TotalMatches and NumberReturned is equal to zero, then the CDS should return an error code 720.
SearchCriteria	string	See section 2.5.5.

2.7.5.3. Effect on State

This action has no effect on the current state of the device.

2.7.5.4. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.
708	Unsupported or invalid search criteria	The search criteria specified is not supported or is invalid
709	Unsupported or invalid sort criteria	The sort criteria specified is not supported or is invalid
710	No such container	The specified ContainerID is invalid or identifies an object that is not a container .
720	Cannot process the request	Cannot process the request

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29341-3-12:2008

2.7.6. CreateObject

This action creates a new object in the container identified by **ContainerID**. The new object is created with the required **id** attribute set to "" and the required **restricted** attribute set to *false*. The actual value of the **id** attribute is supplied by the Content Directory Service.

The other elements of the new object are initialized according to the specified child elements. In addition, the Content Directory Service may create additional elements, for example, to ensure consistency across the whole directory. The unique id assigned to the newly created object is returned in the output parameter **ObjectID**. The complete object description is returned in output parameter **Result** in DIDL-Lite form.

When the new object is required to have one or more child **<res>** elements, the **<res>** elements may be generated in one of two ways:

- **The control point specifies the value of the <res> element.** The **<res>** element must identify a pre-existing resource, for example, an Internet radio station. When **<res>** value is present, then the resource is available for streaming and no additional **ImportResource()** action is needed.
- **The control point does not specify the value of the <res> element.** In this case it is the responsibility of the Content Directory Service to create a new value for the **importUri** attribute of the **<res>** element value for the purpose of importing the resource at a later time. The **res** element returned to the control point (as part of the **Result** output parameter) will have *no* value yet (actually set to ""), and is therefore not yet accessible for control points. After the control point has completely imported the actual resource content, via **ImportResource()** or HTTP POST, the Content Directory Service will add a new **<res>** value, and the content is then accessible. The Content Directory may subsequently decide to remove the **importUri** attribute, or keep it for the purpose of updating resource contents in the future.

In both cases, if the control point knows the MIME-type of the resource being added, the **protocolInfo** attribute of the **<res>** element should be set to **:*:MIME-type:** (e.g., **:*:audio/m3u:**). Otherwise, it should be set to **:*:*.**. It is the responsibility of the Content Directory Service to fill in the appropriate values for the *protocol*, *network* and *additionalInfo* fields of the **protocolInfo** attribute (e.g., *http:*:audio/m3u:**) when it knows them (typically after importing the resource), such that compatibility between server and renderer devices can be checked for this resource.

Three examples of **<res>** elements are shown below:

- object has a resource that can be accessed:

```
<res protocolInfo="rtsp:*:audio/m3u:*" />rtsp://10.0.0.1/contentdir?id=10</res>
```

- object has no resource and can import a resource.

```
<res protocolInfo="*:*:audio:*" importUri="http://10.0.0.1/postdir?id=10" ></res>
```

- object has a resource and the resource can be replaced.

```
<res protocolInfo="rtsp:*:audio/m3u:*" importUri="http://10.0.0.1/postdir?id=10"/>
  rtsp://10.0.0.1/contentdir?id=10
</res>
```

In CDS implementations that don't allow resources to be placed directly under container objects, attempting to create a container object with resource property may generate a 'bad metadata' error. The ability to place resources directly under containers is vendor dependent.

Items that are actually references to other, existing Content Directory items are generated with the **CreateReference()** action. Reference items cannot be generated using **CreateObject()**.

2.7.6.1. Arguments

Argument	Direction	Related State Variable
ContainerID	IN	A_ARG_TYPE_ObjectID
Elements	IN	A_ARG_TYPE_Result
ObjectID	OUT	A_ARG_TYPE_ObjectID
Result	OUT	A_ARG_TYPE_Result

2.7.6.2. Effect on State

Updates the **SystemUpdateID** and the **ContainerUpdateID** for this container. Also, if creation of this object causes other containers to change by the autoupdate process, their **ContainerUpdateID**'s are updated as well.

2.7.6.3. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.
710	No such container	The container identified by ContainerID does not exist.
713	Restricted parent object	Create object failed because restricted attribute of parent container is set to <i>true</i> .
712	Bad metadata	Cannot create object in the specified container with the specified meta-data.

2.7.7. DestroyObject

This action destroys the specified object when permitted. If the object is a container, all of its child objects are also deleted, recursively. Each deleted object becomes invalid and all references to it are also deleted.

The Content Directory Service is allowed (but not required) to delete a resource when it detects, with absolute certainty, that there are no references to it left anywhere in the Content Directory Service after the **DestroyObject()** action.

2.7.7.1. Arguments

Argument	Direction	Related State Variable
ObjectID	IN	A_ARG_TYPE_ObjectID

2.7.7.2. Effect on State

Updates the **SystemUpdateID** and the **ContainerUpdateID** of the parent **container**. Also, if deletion of this object causes other containers to change by the autoupdate process, their **ContainerUpdateID**'s are updated as well.

2.7.7.3. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.
701	No such object	The specified ObjectID is invalid.
711	Restricted object	Destroy object failed because restricted attribute is set to <i>true</i> .
713	Restricted parent object	Operation failed because restricted attribute of parent object is set to <i>true</i> .
715	Resource access denied	Cannot access the local resource

2.7.8. UpdateObject

This action modifies, deletes or inserts object metadata. The object to be updated is specified by **ObjectID**. **CurrentTagValue** is a CSV list of XML fragments. Each fragment is either the complete, exact, current text of an existing metadata element of the object or an empty placeholder. **NewTagValue** is also a CSV list of XML fragments, each of which is the complete new text of a metadata element for the object or an empty placeholder. The two tag/value lists must have the same number of entries. Each entry in **CurrentTagValue** represents metadata to be modified. The corresponding entry in **NewTagValue** represents the new, replacement metadata for the element identified by **CurrentTagValue**.

Identification of existing metadata to be modified must be exact. The **CurrentTagValue** entry text must exactly match the text of the existing element. This is easily done by copying the text from a previously returned **Search()** or **Browse()** result, and it allows **UpdateObject()** to perform a simple string compare between a **CurrentTagValue** entry and the current information. The matched existing element is then replaced by the corresponding entry in **NewTagValue**. The tag in the **NewTagValue** entry must be the same tag as in the **CurrentTagValue** entry. Using **UpdateObject()** to replace one piece of metadata by a completely different kind of metadata is not allowed. This must be accomplished by first deleting the old metadata and then inserting the new metadata.

If an entry in **CurrentTagValue** is an empty string, it matches the “null” element, and the net effect is to insert the corresponding **NewTagValue** entry as a new metadata element. Conversely, if an entry in **CurrentTagValue** is not empty but the corresponding **NewTagValue** entry is, the net effect is to remove the current metadata element. If changing or removing a property would result in an object that no longer satisfies the requirements as specified by the object’s class, the **UpdateObject()** action is illegal. Examples include:

- Removing a required property, unless the property appears multiple times and this single removal leaves the object with a valid set of required occurrences.
- Changing the value of the **date** property to a person’s name.
- Changing the object’s class.

The Content Directory Service is allowed (but not required) to delete a resource when it detects, with absolute certainty, that there are no remaining references to the resource anywhere in the Content Directory Service after the **UpdateObject()** action.

In CDS implementations that don't allow resources to be placed directly under a **container**, attempting to add a resource property may generate a 'bad metadata' error. The ability to place resources directly under containers is vendor dependent.

When the two parameter lists contain two or more entries, the multiple update request is performed as an atomic operation. In other words, all modifications to the object will be made before any change is visible to an external observer. Either the entire request succeeds or the object’s metadata is not changed. A partial update will never occur.

Example:

```
<item>
  <dc:title>My Favorite Song</dc:title>
  <upnp:artist>Singer1</upnp:artist>
  <dc:publisher>Acme Records</dc:publisher>
  <dc:date> 1990-01-01 </dc:date>
</item>
```

Items that are actually references to other, existing Content Directory items are generated with the **CreateReference()** action. Reference items cannot be generated using **UpdateObject()**.

Table 11: Update examples

Operation	Current Tag Value	New Tag Value	Notes:
Change the title of the Song	<dc:title>My Favorite Song</dc:title>	<dc:title>My Second Favorite Song</dc:title>	
Delete the date property	<dc:date> 1990-01-01</dc:date>	(Empty String)	
Insert a genre tag	(Empty String)	<upnp:genre> Swing</upnp:genre>	
Change the artist's name from Singer1 to Singer2	<upnp:artist>Singer1</upnp:artist>	<upnp:artist >Singer2</upnp:artist >	The entire top-level tag (i.e. <upnp:artist>) is included in both CurrentTagValue and NewTagValue .
Change the title, insert another genre, and delete the publisher property	<dc:title>My Favorite Song</dc:title>,, <dc:publisher>Acme Music</dc:publisher >	<dc:title>My Third Favorite Song</dc:title>, <upnp:genre> Jazz</upnp:genre>, 	In CurrentTagValue , note the double-comma placeholder just after </dc:title>. In NewTagValue , note that the trailing comma at the end is a placeholder for the deleted <dc:publisher> tag.

2.7.8.1. Arguments

Argument	Direction	Related State Variable
ObjectID	IN	A_ARG_TYPE_ObjectID
CurrentTagValue	IN	A_ARG_TYPE_TagValueList
NewTagValue	IN	A_ARG_TYPE_TagValueList

2.7.8.2. Dependency on State

The specified object must already exist. When modifying or deleting a specific tag, that tag must already exist.

2.7.8.3. Effect on State

This action will change the state of the metadata of the specified object. It also updates the **SystemUpdateID** and the **ContainerUpdateID** for the parent **container**. Finally, if changing this object causes other containers to change by the autoupdate process, their **ContainerUpdateID**'s are updated as well.

2.7.8.4. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.
701	No such object	The specified ObjectID is invalid.
702	Invalid currentTagValue	The tag/value pair(s) listed in CurrentTagValue do not match the current state of the CDS. The specified data is likely out of date.
703	Invalid newTagValue	The specified value for the NewTagValue parameter is invalid.
704	Required tag	Unable to delete a required tag. See Annex.
705	Read only tag	Unable to update a read only tag. See Annex.
706	Parameter Mismatch	The number of tag/value pairs (including empty placeholders) in CurrentTagValue and NewTagValue do not match.
711	Restricted object	Operation failed because restricted attribute of object is set to <i>true</i> .
712	Bad metadata	Operation fails because it would result in invalid or disallowed metadata in current object.
713	Restricted parent object	Operation failed because restricted attribute of parent object is set to <i>true</i> .

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29341-3-12:2008

2.7.9. ImportResource

This action transfers a file from a remote source resource, specified by **SourceURI**, to a local destination resource, specified by **DestinationURI**, in the Content Directory Service. When the Content Directory Service identifies the destination resource in CDS, the action will return a unique **TransferID** in the response and start HTTP GET. A client can monitor the progress of file transfer by using **GetTransferProgress()**.

The **DestinationURI** should correspond to an **importURI** attribute of a <res> element present in the CDS. This <res> element might already have accessible content, or not. In the first case, **ImportResource()** actually updates the resource contents. In the second case, **ImportResource()** assigns the first content to a object. Note that it is up to the Content Directory Service to determine if a specified <res> element is actually allowed to be updated.

2.7.9.1. Arguments

Argument	Direction	Related State Variable
SourceURI	IN	A_ARG_TYPE_URI
DestinationURI	IN	A_ARG_TYPE_URI
TransferID	OUT	A_ARG_TYPE_TransferID

2.7.9.2. Effect on State

When the file transfer is started, the **TransferID** returned by **ImportResource()** is added into the status **TransferIDs**. When the file transfer is finished, **TransferID** is removed from the status **TransferIDs**.

2.7.9.3. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.
713	Restricted parent object	Operation failed because the restricted attribute of parent object is set to <i>true</i> .
714	No such source resource	Cannot identify the specified source resource
715	Source resource access denied	Cannot access the specified source resource
716	Transfer busy	Another file transfer is not accepted
718	No such destination resource	Cannot identify the specified destination resource
719	Destination resource access denied	Cannot access the specified destination resource

2.7.10.ExportResource

This action transfers a file from a local source resource, specified by **SourceURI**, to a remote destination resource, specified by **DestinationURI**. When the CDS identifies the source resource, the action will return a unique **TransferID** in the response and start the HTTP POST. A client can monitor the progress of file transfer by using the **GetTransferProgress()** action.

2.7.10.1.Arguments

Argument	Direction	Related State Variable
SourceURI	IN	A_ARG_TYPE_URI
DestinationURI	IN	A_ARG_TYPE_URI
TransferID	OUT	A_ARG_TYPE_TransferID

2.7.10.2.Effect on State

When the file transfer is started, the **TransferID** returned by **ExportResource()** is added into the status **TransferIDs**. When the file transfer is finished, **TransferID** is removed from the status **TransferIDs**.

2.7.10.3.Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.
714	No such source resource	Cannot identify the specified source resource
715	Source resource access denied	Cannot access the specified source resource
716	Transfer busy	Another file transfer is not accepted
718	No such destination resource	Cannot identify the specified destination resource
719	Destination resource access denied	Cannot access the specified destination resource

2.7.11. StopTransferResource

This action stops the file transfer initiated by the **ImportResource()** or **ExportResource()** action. The file transfer, identified by **TransferID**, is halted immediately.

2.7.11.1. Arguments

Argument	Direction	Related State Variable
TransferID	IN	A_ARG_TYPE_TransferID

2.7.11.2. Effect on State

When the file transfer is finished, **TransferID** is removed from the status **TransferIDs**.

2.7.11.3. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.
717	No such file transfer	The file transfer specified by TransferID does not exist

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29341-3-12:2008

2.7.12. GetTransferProgress

This action is used to query the progress of the file transfer initiated by the **ImportResource()** or the **ExportResource()** action. Progress of the file transfer, specified by **TransferID**, will be returned in the response. **TransferStatus** indicates the status of the file transfer, it can be either *IN_PROGRESS*, *STOPPED*, *ERROR*, or *COMPLETED*. **TransferLength** specifies the length in bytes that has been transferred.

TransferTotal specifies the total length of file in bytes that should be transferred in this file transfer. If the CDS cannot determine the total length, **TransferTotal** is set to zero. If the file transfer is started, the status is changed to *IN_PROGRESS*. If the file transfer is finished, the status is changed to either *STOPPED*, *ERROR*, or *COMPLETED* depending on the result of the file transfer. CDS maintains the status of a file transfer for at least 30 seconds after the file transfer has finished, ensuring that a client can query the result of file transfer.

2.7.12.1. Arguments

Argument	Direction	Related State Variable
TransferID	IN	A_ARG_TYPE_TransferID
TransferStatus	OUT	A_ARG_TYPE_TransferStatus
TransferLength	OUT	A_ARG_TYPE_TransferLength
TransferTotal	OUT	A_ARG_TYPE_TransferTotal

2.7.12.2. Effect on State

2.7.12.3. None.

2.7.12.4. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.
717	No such file transfer	The file transfer specified by TransferID does not exist

2.7.13.DeleteResource

This action uses the specified **ResourceURI** to locate and delete all of the corresponding <res> elements in the CDS. Whether or not the resource identified by **ResourceURI** is actually deleted is implementation dependent.

2.7.13.1. Arguments

Argument	Direction	Related State Variable
ResourceURI	IN	A_ARG_TYPE_URI

2.7.13.2. Effect on State

Updates **SystemUpdateID**. Also updates **ContainerUpdateId** for each container in which a <res> element is removed from an object.

2.7.13.3. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.
713	Restricted parent object	Operation failed because the restricted attribute of the parent object is set to <i>true</i> .
714	No such resource	Cannot identify the specified resource
715	Resource access denied	Cannot access the specified resource

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29341-3-12:2008

2.7.14. CreateReference

This action creates a reference to an existing **item**, specified by the **ObjectID** argument, in the parent container, specified by the **ContainerID** argument. Both the **ContainerID** and **ObjectID** must already exist in the CDS. A unique, new object id is assigned to the newly created reference item and returned in the **NewID** output parameter.

A reference **item** may appear with the same meta data as that contained in the original **item** when browsed or searched, or may it may contain additional metadata. Reference items are distinguished from non-reference items by the addition of the **refID** attribute and value in the <**item**> tag.

2.7.14.1. Arguments

Argument	Direction	Related State Variable
ContainerID	IN	A_ARG_TYPE_ObjectID
ObjectID	IN	A_ARG_TYPE_ObjectID
NewID	OUT	A_ARG_TYPE_ObjectID

2.7.14.2. Effect on State

A new reference object is added to the specified parent object.

2.7.14.3. Errors

Error Code	Error Description	Description
402	Invalid args	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.
701	No such object	The specified ObjectID is invalid.
710	No such container	The specified ContainerID is invalid or identifies an object that is not a container .
713	Restricted parent object	Operation failed because the restricted attribute of parent object is set to <i>true</i> .

2.7.15. Non-Standard Actions Implemented by an UPnP Vendor

To facilitate certification, non-standard actions implemented by a UPnP vendor should be included in the device's service template. The UPnP Device Architecture lists naming requirements for non-standard actions (cf. section on Description).

2.7.16. Common Error Codes

The following table lists error codes common to actions for this service type. If a given action results in multiple errors, the most specific error should be returned.

Table 12: Common error codes

Error Code	Error Description	Description
401	Invalid Action	See UPnP Device Architecture section on Control.
402	Invalid args	See UPnP Device Architecture section on Control.
404	Invalid Var	See UPnP Device Architecture section on Control.
501	Action failed	See UPnP Device Architecture section on Control.
600-699	TBD	Common action errors. Defined by UPnP Forum Technical Committee.
701	No such object	The specified ObjectID is invalid.
702	Invalid CurrentTagValue	The tag/value pair(s) listed in CurrentTagValue do not match the current state of the CDS. The specified data is likely out of date.
703	Invalid NewTagValue	The specified value for the NewTagValue parameter is invalid.
704	Required tag	Unable to delete a required tag. See Annex.
705	Read only tag	Unable to update a read only tag. See Annex.
706	Parameter Mismatch	The number of tag/value pairs (including empty placeholders) in CurrentTagValue and NewTagValue do not match.
708	Unsupported or invalid search criteria	The search criteria specified is not supported or is invalid
709	Unsupported or invalid sort criteria	The sort criteria specified is not supported or is invalid
710	No such container	The specified ContainerID is invalid or identifies an object that is not a container .
711	Restricted object	Operation failed because the restricted attribute of object is set to <i>true</i> .
712	Bad metadata	Operation fails because it would result in invalid or disallowed metadata in current object.
713	Restricted parent object	Operation failed because the restricted attribute of parent object is set to <i>true</i> .
714	No such source resource	Cannot identify the specified source resource
715	Source resource access denied	Cannot access the specified source resource
716	Transfer busy	Another file transfer is not accepted
717	No such file transfer	The file transfer specified by TransferID does not exist
718	No such destination resource	Cannot identify the specified destination resource
719	Destination resource access denied	Cannot access the specified destination resource
720	Cannot process the request	Cannot process the request
800-899	TBD	(Specified by UPnP vendor.)

2.8. Theory of Operation (Informative)

2.8.1. Introduction

This section walks through several scenarios to illustrate the various actions supported by the Content Directory. These include browsing, searching, object creation, update, and deletion, property creation, update and deletion, content transfer, playlist manipulation, Internet content representation, and asynchronous behavior.

2.8.2. Content setup for Browsing and Searching

The following illustrates the logical structure of a Content Directory Service which exposes a physical directory structure on a PC like file system. The content includes music and photos organized into a few directory folders. The logical directory hierarchy is as follows:

- Name="Content"
 - Name="My Music"
 - Name="Singles Soundtrack - Various Artists.musicalbum"
 - Name="Would - Alice In Chains.wma", Size="90000"
 - Name="Chloe Dancer - Mother Love Bone.wma", Size="200000"
 - Name="State Of Love And Trust - Pearl Jam.wma", Size="70000"
 - Name="Drown - Smashing Pumpkins.mp3", Size="140000"
 - Name="Brand New Day - Sting.musicalbum"
 - Name="A Thousand Years - Sting.wma", Size="100000"
 - Name="Desert Rose - Sting.wma", Size="50000"
 - Name="Big Lie Small World - Sting.mp3", Size="80000"
 - Name="My Photos"
 - Name="Mexico Trip.photoalbum"
 - Name="Sunset on the beach - 10/20/2001.jpg", Size="20000"
 - Name="Playing in the pool - 10/25/2001.jpg", Size="25000"
 - Name="Christmas.photoalbum"
 - Name="John and Mary by the fire - 12/24/2001.jpg", Size="22000"
 - Name="Christmas Tree loaded with presents - 12/25/2001.jpg", Size="10000"
- Name="Album Art"
 - Name="Brand New Day.albumart", Size="20000"
 - Name="Singles Soundtrack.albumart", Size="20000"

2.8.3. Browsing

The **Browse()** action is designed to allow the control point to navigate the “native” content hierarchy exposed by the CDS. This hierarchy could map onto an explicit physical hierarchy or a logical one. In addition, the **Browse()** action enables the following features while navigating the hierarchy:

- **Metadata only browsing.** The metadata associated with a particular object can be retrieved.
- **Children object browsing.** The direct children of an object derived from a container can be retrieved.
- **Incremental navigation** i.e. the full hierarchy is never returned in one call since this is likely to flood the resources available to the control point (memory, network bandwidth, etc.). Also within a particular hierarchy level, the control point can restrict the number (and the starting offset) of objects returned in the result.
- **Sorting.** The result can be requested in a particular sort order. The available sort orders are expressed in the return value of the **GetSortCapabilities()** action.
- **Filtering.** The result data can be filtered to only include a subset of the properties available on the object (see section 2.5.7). Note that certain properties may not be filtered out in order to maintain the validity of the result data fragment. If a non-filterable property is left out of the filter set, it will still be included in the result.

The following examples illustrate the typical **Browse()** request-response interaction between a control point and a CDS. It assumes the content setup specified in section 2.8.2

2.8.3.1. Retrieving sort capabilities

When it connects to the content directory, the control point determines which properties can be used as sort criteria in a **Browse()** or **Search()** request. It does this via the **GetSortCapabilities** action:

request: GetSortCapabilities()

response: GetSortCapabilities("dc:title,dc:creator,dc:date,res@size")

2.8.3.2. Browsing the root level metadata

The control point needs to retrieve the root level metadata for the content directory. It does this via the following Browse action:

request: Browse("0", "BrowseMetadata", "*", 0, 0, "")

response: Browse (

```
<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
  <container id="0" parentID="-1" childCount="2" restricted="true"
  searchable="true">
    <dc:title>My multimedia stuff</dc:title>
    <upnp:class>object.container.storageFolder</upnp:class>
    <upnp:storageUsed>907000</upnp:storageUsed>
    <upnp:writeStatus>WRITABLE</upnp:writeStatus>
    <upnp:searchClass includeDerived="false" >
      object.container.album.musicAlbum
    </upnp:searchClass>
    <upnp:searchClass includeDerived="false" >
      object.container.album.photoAlbum
    </upnp:searchClass>
    <upnp:searchClass includeDerived="false" >
      object.item.audioItem.musicTrack
    </upnp:searchClass>
```

```

    <upnp:searchClass includeDerived="false" >
      object.item.imageItem.photo
    </upnp:searchClass>
    <upnp:searchClass name="Vendor Album Art" includeDerived="true">
      object.item.imageItem.photo.vendorAlbumArt
    </upnp:searchClass>
  </container>
</DIDL-Lite>", 1, 1, 10 )

```

Note that the response contains the DIDL-Lite fragment with the metadata corresponding to the root container of the CDS (**container id=0**), and the other out parameters **NumberReturned**, **TotalMatches**, and **ContainerUpdateID**, respectively.

2.8.3.3. Browsing the children of the root level

The control point needs to retrieve the children of the root-level container. The control point can display 3 items at a time, so it restricts the number of children returned in the result. It does this via the following **Browse()** action:

request: Browse("0", "BrowseDirectChildren", "*", 0, 3, "")

```

response: Browse (
  "<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
    xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
    xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
  <container id="1" parentID="0" childCount="2" restricted="false">
    <dc:title>My Music</dc:title>
    <upnp:class>object.container.storageFolder</upnp:class>
    <upnp:storageUsed>730000</upnp:storageUsed>
    <upnp:writeStatus>WRITABLE</upnp:writeStatus>
    <upnp:searchClass includeDerived="false">
      object.container.album.musicAlbum
    </upnp:searchClass>
    <upnp:searchClass includeDerived="false">
      object.item.audioItem.musicTrack
    </upnp:searchClass>
    <upnp:createClass includeDerived="false">
      object.container.album.musicAlbum
    </upnp:createClass>
  </container>
  <container id="2" parentID="0" childCount="2" restricted="false">
    <dc:title>My Photos</dc:title>
    <upnp:class>object.container.storageFolder</upnp:class>
    <upnp:storageUsed>177000</upnp:storageUsed>
    <upnp:writeStatus>WRITABLE</upnp:writeStatus>
    <upnp:searchClass includeDerived="false">
      object.container.album.photoAlbum
    </upnp:searchClass>
    <upnp:searchClass includeDerived="false">
      object.item.imageItem.photo
    </upnp:searchClass>
    <upnp:createClass includeDerived="false">
      object.container.album.photoAlbum
    </upnp:createClass>
  </container>
  <container id="30" parentID="0" childCount="2" restricted="false">
    <dc:title>Album Art</dc:title>
    <upnp:class>object.container.storageFolder</upnp:class>
    <upnp:storageUsed>40000</upnp:storageUsed>
    <upnp:writeStatus>WRITABLE</upnp:writeStatus>
    <upnp:searchClass name="Vendor Album Art"
      includeDerived="true">
      object.item.imageItem.photo.vendorAlbumArt
    </upnp:searchClass>

```

```

    <upnp:createClass includeDerived="true">
      object.item.audioItem.photo.vendorAlbumArt
    </upnp:createClass>
  </container>
</DIDL-Lite> ", 2, 2, 10 )

```

2.8.3.4. Browsing the children of the My Music folder

The control point needs to retrieve the children of the *My Music* folder. The control point can display 3 items at a time, so it specifies the number of children returned in the result. In addition, it specifies the result to be sorted in ascending order by the creator property. It does this via the following **Browse()** action:

request: Browse("1", "BrowseDirectChildren", "*", 0, 3, "+dc:creator")

```

response: Browse (
  "<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
    xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
    xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
    <container id="4" parentID="1" childCount="3" restricted="false">
      <dc:title>Brand New Day</dc:title>
      <dc:creator>Sting</dc:creator>
      <upnp:class>object.container.album.musicAlbum</upnp:class>
      <upnp:searchClass includeDerived="false">
        object.item.audioItem.musicTrack
      </upnp:searchClass>
      <upnp:createClass includeDerived="false">
        object.item.audioItem.musicTrack
      </upnp:createClass>
    </container>
    <container id="3" parentID="1" childCount="4" restricted="false">
      <dc:title>Singles Soundtrack</dc:title>
      <dc:creator>Various Artists</dc:creator>
      <upnp:class>object.container.album.musicAlbum</upnp:class>
      <upnp:searchClass includeDerived="false">
        object.item.audioItem.musicTrack
      </upnp:searchClass>
      <upnp:createClass includeDerived="false">
        object.item.audioItem.musicTrack
      </upnp:createClass>
    </container>
  </DIDL-Lite> ", 2, 2, 21 )

```

2.8.3.5. Browsing the children of the Singles Soundtrack music album

The control point needs to retrieve the children of the Singles Soundtrack music album. The control point can display 3 items at a time, so it restricts the number of children returned in each result. In addition, it specifies the result to be sorted in ascending order by the title property. It does this via the following **Browse()** action:

request: Browse("3", "BrowseDirectChildren", "*", 0, 3, "+dc:title")

```

response: Browse (
  "<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
    xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
    xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
    <item id="6" parentID="3" restricted="false">
      <dc:title>Chloe Dancer</dc:title>
      <dc:creator>Mother Love Bone</dc:creator>
      <upnp:class>object.item.audioItem.musicTrack</upnp:class>
      <res protocolInfo="http-get:*:audio/x-ms-wma:*" size="200000">
        http://10.0.0.1/getcontent.asp?id=6
      </res>
    </item>
  </DIDL-Lite> "

```

```

</item>
<item id="8" parentID="3" restricted="false">
  <dc:title>Drown</dc:title>
  <dc:creator>Smashing Pumpkins</dc:creator>
  <upnp:class>object.item.audioItem.musicTrack</upnp:class>
  <res protocolInfo="http-get:*:audio/mpeg:*" size="140000">
    http://10.0.0.1/getcontent.asp?id=8
  </res>
</item>
<item id="7" parentID="3" restricted="false">
  <dc:title>State Of Love And Trust</dc:title>
  <dc:creator>Pearl Jam</dc:creator>
  <upnp:class>object.item.audioItem.musicTrack</upnp:class>
  <res protocolInfo="http-get:*:audio/x-ms-wma:*" size="70000">
    http://10.0.0.1/getcontent.asp?id=7
  </res>
</item>
</DIDL-Lite> ", 3, 4, 18 )

```

request: Browse("3", "BrowseDirectChildren", "*", 3, 3, "+dc:title")

```

response: Browse(
"<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
  <item id="5" parentID="3" restricted="false">
    <dc:title>Would</dc:title>
    <dc:creator>Alice In Chains</dc:creator>
    <upnp:class>object.item.audioItem.musicTrack</upnp:class>
    <res protocolInfo="http-get:*:audio/x-ms-wma:*" size="90000">
      http://10.0.0.1/getcontent.asp?id=5
    </res>
  </item>
</DIDL-Lite> ", 1, 4, 18 )

```

2.8.3.6. Browsing the children of the Album Art folder

The control point needs to retrieve the children of the Album Art folder. The control point can display 3 items at a time so it restricts the number of children returned in the result. It does this via the following **Browse()** action:

request: Browse("30", "BrowseDirectChildren", "*", 0, 3, "")

```

response: Browse(
"<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
  <item id="31" parentID="30" restricted="false">
    <dc:title>Brand New Day</dc:title>
    <upnp:class name="Vendor Album Art">
      object.item.imageItem.photo.vendorAlbumArt
    </upnp:class>
    <res protocolInfo="http-get:*:image/jpeg:*" size="20000">
      http://10.0.0.1/getcontent.asp?id=31
    </res>
  </item>
  <item id="32" parentID="30" restricted="false">
    <dc:title>Singles Soundtrack</dc:title>
    <upnp:class name="Vendor Album Art">
      object.item.imageItem.photo.vendorAlbumArt
    </upnp:class>
    <res protocolInfo="http-get:*:image/jpeg:*" size="20000">
      http://10.0.0.1/getcontent.asp?id=32

```

```

        </res>
    </item>
</DIDL-Lite> ", 2, 2, 50 )

```

2.8.4. Searching

The **Search()** action is designed to allow a control point to search for objects in the content directory that match a given search criteria (see section 2.5.5). In addition, the **Search()** action supports the following features:

- **Incremental result retrieval** i.e. in the context of a particular request the control point can restrict the number (and the starting offset) of objects returned in the result.
- **Sorting.** The result can be requested in a particular sort order. The available sort orders are expressed in the return value of the **GetSortCapabilities** action.
- **Filtering.** The result data can be filtered to only include a subset of the properties available on the object (see section 2.5.7). Note that certain properties may not be filtered out in order to maintain the validity of the result data fragment. If a non-filterable property is left out of the filter set, it will still be included in the result.

The following examples illustrate the typical **Search()** request-response interaction between a control point and a CDS. It assumes the content setup specified in section 2.8.2

2.8.4.1. Retrieving search capabilities

When it connects to the CDS, the control point determines which properties can be used in the search criteria in a **Search()** request. It does this via the **GetSearchCapabilities()** action:

request: `GetSearchCapabilities()`

response:

```
GetSearchCapabilities("dc:title,dc:creator,dc:date,upnp:class,res@size")
```

2.8.4.2. Search for all content by Sting

Search for all objects where **dc:creator** is *Sting* and sort the result in ascending order by **dc:title**. The control point can only display 3 items at a time so it restricts the number requested. The following **Search()** action is used:

request: `Search("0", "dc:creator = \"Sting\"", "*", 0, 3, "+dc:title")`

response: `Search(`

```

"<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
  <item id="9" parentID="4" restricted="false">
    <dc:title>A Thousand Years</dc:title>
    <dc:creator>Sting</dc:creator>
    <upnp:class>object.item.audioItem.musicTrack</upnp:class>
    <res protocolInfo="http-get:*:audio/x-ms-wma:*" size="100000">
      http://10.0.0.1/getcontent.asp?id=9
    </res>
  </item>
  <item id="11" parentID="4" restricted="false">
    <dc:title>Big Lie, Small World</dc:title>
    <dc:creator>Sting</dc:creator>
    <upnp:class>object.item.audioItem.musicTrack</upnp:class>
    <res protocolInfo="http-get:*:audio/mpeg:*" size="70000">
      http://10.0.0.1/getcontent.asp?id=11
    </res>
  </item>

```

```

    <container id="4" parentID="1" childCount="3" restricted="false"
searchable="true">
      <dc:title>Brand New Day</dc:title>
      <dc:creator>Sting</dc:creator>
      <upnp:class>object.container.album.musicAlbum</upnp:class>
      <upnp:searchClass includeDerived="false">
        object.item.audioItem.musicTrack
      </upnp:searchClass>
      <upnp:createClass includeDerived="false">
        object.item.audioItem.musicTrack
      </upnp:createClass>
    </container>
</DIDL-Lite> ", 3, 4, 10 )

```

request: Search("0", "dc:creator = "Sting"", "*", 3, 3, "+dc:title")

```

response: Search(
"<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
  <item id="10" parentID="4" restricted="false">
    <dc:title>Desert Rose</dc:title>
    <dc:creator>Sting</dc:creator>
    <upnp:class>object.item.audioItem.musicTrack</upnp:class>
    <res protocolInfo="http-get:*:audio/x-ms-wma:*" size="50000">
      http://10.0.0.1/getcontent.asp?id=10
    </res>
  </item>
</DIDL-Lite> ", 1, 4, 10 )

```

2.8.4.3. Search for all photos taken during October

Search for all photo objects whose **dc:date** is in October and sort the result in ascending order by **dc:date**. The control point can only display 3 items at a time so it restricts the number requested. The following **Search()** action is used:

request: Search("0", "upnp:class = "object.item.imageItem.photo" and "(dc:date >= "2001-10-01" and dc:date <= "2001-10-31")", "*", 0, 3, "+dc:date")

```

response: Search(
"<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
  <item id="14" parentID="12" restricted="false">
    <dc:title>Sunset on the beach</dc:title>
    <dc:date>2001-10-20</dc:date>
    <upnp:class>object.item.imageItem.photo</upnp:class>
    <res protocolInfo="http-get:*:image/jpeg:*" size="20000">
      http://10.0.0.1/getcontent.asp?id=14
    </res>
  </item>
  <item id="15" parentID="12" restricted="false">
    <dc:title>Playing in the pool</dc:title>
    <dc:date>2001-10-25</dc:date>
    <upnp:class>object.item.imageItem.photo</upnp:class>
    <res protocolInfo="http-get:*:image/jpeg:*" size="25000">
      http://10.0.0.1/getcontent.asp?id=15
    </res>
  </item>
</DIDL-Lite> ", 2, 2, 10 )

```

2.8.4.4. Search for all objects in the My Photos folder containing the word Christmas

Search for all objects where the title contains Christmas under the *My Photos* folder. The control point can only display 3 items at a time so it restricts the number requested. The result is sorted in ascending order by **dc:title**. The following **Search()** action is used:

```
request: Search( "2", "dc:title contains \"Christmas\"", "*", 0, 3,
"+dc:title" )
```

```
response: Search(
"<DIDL-Lite xmlns:dc=\"http://purl.org/dc/elements/1.1/\"
  xmlns:upnp=\"urn:schemas-upnp-org:metadata-1-0/upnp/\"
  xmlns=\"urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/\">
  <container id=\"13\" parentID=\"2\" restricted=\"false\" searchable=\"true\">
    <dc:title>Christmas</dc:title>
    <upnp:class>object.container.album.photoAlbum</upnp:class>
    <upnp:searchClass includeDerived=\"false\">
      object.item.imageItem.photo
    </upnp:searchClass>
    <upnp:createClass includeDerived=\"false\">
      object.item.imageItem.photo
    </upnp:createClass>
  </container>
  <item id=\"17\" parentID=\"13\" restricted=\"false\">
    <dc:title>Christmas tree loaded with presents</dc:title>
    <dc:date>2001-12-25</dc:date>
    <upnp:class>object.item.imageItem.photo</upnp:class>
    <res protocolInfo=\"http-get:*:image/jpeg:*\" size=\"25000\">
      http://10.0.0.1/getcontent.asp?id=17
    </res>
  </item>
</DIDL-Lite>", 2, 2, 47 )
```

2.8.4.5. Search for all album objects in the Content Directory

Search for all objects that are derived from **object.container.album**. The following **Search()** action is used:

```
request: Search( "0", "upnp:class derivedfrom \"object.container.album\"",
"*", 0, 4, "" )
```

```
response: Search(
"<DIDL-Lite xmlns:dc=\"http://purl.org/dc/elements/1.1/\"
  xmlns:upnp=\"urn:schemas-upnp-org:metadata-1-0/upnp/\"
  xmlns=\"urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/\">
  <container id=\"3\" parentID=\"1\" childCount=\"4\" restricted=\"false\"
searchable=\"true\">
    <dc:title>Singles Soundtrack</dc:title>
    <dc:creator>Various Artists</dc:creator>
    <upnp:class>object.container.album.musicAlbum</upnp:class>
    < upnp:searchClass includeDerived=\"false\">
      object.item.audioItem.musicTrack
    </upnp:searchClass>
    <upnp:createClass includeDerived=\"false\">
      object.item.audioItem.musicTrack
    </upnp:createClass>
  </container>
  <container id=\"4\" parentID=\"1\" childCount=\"3\" restricted=\"false\"
searchable=\"true\">
    <dc:title>Brand New Day</dc:title>
    <dc:creator>Sting</dc:creator>
    <upnp:class>object.container.album.musicAlbum</upnp:class>
    <upnp:searchClass includeDerived=\"false\">
      object.item.audioItem.musicTrack
    </upnp:searchClass>
```

```

    <upnp:createClass includeDerived="false">
      object.item.audioItem.musicTrack
    </upnp:createClass>
  </container>
  <container id="12" parentID="2" restricted="false" searchable="true">
    <dc:title>Mexico Trip</dc:title>
    <upnp:class>object.container.album.photoAlbum</upnp:class>
    <upnp:searchClass includeDerived="false" >
      object.item.imageItem.photo
    </upnp:searchClass>
    <upnp:createClass includeDerived="false">
      object.item.imageItem.photo
    </upnp:createClass>
  </container>
  <container id="13" parentID="2" restricted="false" searchable="true">
    <dc:title>Christmas</dc:title>
    <upnp:class>object.container.album.photoAlbum</upnp:class>
    <upnp:searchClass includeDerived="false" >
      object.item.imageItem.photo
    </upnp:searchClass>
    <upnp:createClass includeDerived="false">
      object.item.imageItem.photo
    </upnp:createClass>
  </container>
</DIDL-Lite>", 4, 4, 10 )

```

2.8.5. Browsing, Searching, and References

Using the content setup above, the following examples illustrate creation of a reference, the result of a search where the result contains a reference, and deletion of a reference.

2.8.5.1. Creating a reference to a photo in the Mexico Trip album inside the Christmas album

A reference to an existing **item** is created via the following action:

request: CreateReference("13", "15")

response: CreateReference("20")

2.8.5.2. Search for all photos taken during October

Search for all photo objects whose **dc:date** is in October and sort the result in ascending order by **dc:date**. The control point can only display 3 items at a time so it restricts the number requested. The following **Search()** action is used:

request: Search("0", "upnp:class = \"object.item.imageItem.photo\" and (dc:date >= \"2001-10-01\" and dc:date <= \"2001-10-31\")", "*", 0, 3, "+dc:date")

response: Search(
 <DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
 xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
 xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
 <item id="14" parentID="12" restricted="false">
 <dc:title>Sunset on the beach</dc:title>
 <dc:date>2001-10-20</dc:date>
 <upnp:class>object.item.imageItem.photo</upnp:class>
 <res protocolInfo="http-get:*:image/jpeg:*" size="20000">
 http://10.0.0.1/getcontent.asp?id=14
 </res>
 </item>
 <item id="15" parentID="12" restricted="false">
 <dc:title>Playing in the pool</dc:title>

```

<dc:date>2001-10-25</dc:date>
<upnp:class>object.item.imageItem.photo</upnp:class>
<res protocolInfo="http-get:*:image/jpeg:*" size="25000">
  http://10.0.0.1/getcontent.asp?id=15
</res>
</item>
<item id="20" refID="15" parentID="13" restricted="false">
  <dc:title>Playing in the pool</dc:title>
  <dc:date>2001-10-25</dc:date>
  <upnp:class>object.item.imageItem.photo</upnp:class>
  <res protocolInfo="http-get:*:image/jpeg:*" size="25000">
    http://10.0.0.1/getcontent.asp?id=15
  </res>
</item>
</DIDL-Lite>", 3, 3, 10 )

```

2.8.5.3. Deletion of the reference to the photo in the Mexico trip album

A reference is deleted via the following action:

request: DestroyObject("20")

response: DestroyObject()

2.8.6. Browsing, Searching, and Filtering

Using the content setup above, the following examples illustrate filtering of properties. In each case, a **Search()** is performed for a particular item id, but with filtering of different properties.

2.8.6.1. Result when requesting all properties

The following **Search()** action is used:

request: Search("0", "@id = \"20\"", "*", 0, 3, "")

response: Search(

```

"<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
  <item id="18" parentID="13" restricted="false">
    <dc:title>John and Mary by the fire</dc:title>
    <dc:date>2001-12-24</dc:date>
    <upnp:class>object.item.imageItem.photo</upnp:class>
    <res protocolInfo="http-get:*:image/jpeg:*" size="22000">
      http://10.0.0.1/getcontent.asp?id=18
    </res>
  </item>
</DIDL-Lite>", 1, 1, 10 )

```

2.8.6.2. Result when requesting required properties, and leaving out properties expressed as elements e.g. dc:date, res

The following **Search()** action is used:

request: Search("0", "@id = \"20\"",
"@id,@parentID,@restricted,dc:title,upnp:class", 0, 3, "")

response: Search(

```

"<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
  <item id="18" parentID="13" restricted="false">
    <dc:title>John and Mary by the fire</dc:title>
    <upnp:class>object.item.imageItem.photo</upnp:class>
  </item>
</DIDL-Lite>", 1, 1, 10 )

```

Note that only the properties requested are returned in the search result.

2.8.6.3. Result when requesting required properties, and leaving out properties expressed as attributes e.g. *res@size*

The following **Search()** action is used:

```
request: Search( "0", "@id = "20"",
"@id,@parentID,@restricted,dc:title,dc:date,upnp:class,res,res@protocolInfo",
0, 3, "" )
```

```
response: Search(
"<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
<item id="18" parentID="13" restricted="false">
<dc:title>John and Mary by the fire</dc:title>
<dc:date>2001-12-24</dc:date>
<upnp:class>object.item.imageItem.photo</upnp:class>
<res protocolInfo="http-get:*:image/jpeg:*">
http://10.0.0.1/getcontent.asp?id=18
</res>
</item>
</DIDL-Lite>", 1, 1, 10 )
```

Note that only the properties requested are returned in the search result.

2.8.6.4. Result when leaving out required properties e.g. *@id*, *@parentID*, *@restricted*, *upnp:class*, *dc:title*, and leaving out properties expressed as attributes e.g. *res@size*

The following **Search()** action is used:

```
request: Search( "0", "@id = "20"", "dc:date,res,res@protocolInfo", 0, 3,
"" )
```

```
response: Search(
"<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
<item id="18" parentID="13" restricted="false">
<dc:title>John and Mary by the fire</dc:title>
<dc:date>2001-12-24</dc:date>
<upnp:class>object.item.imageItem.photo</upnp:class>
<res protocolInfo="http-get:*:image/jpeg:*">
http://10.0.0.1/getcontent.asp?id=18
</res>
</item>
</DIDL-Lite>", 1, 1, 10 )
```

Note that the required properties, and the properties requested are returned in the search result.

2.8.7. Object Creation

2.8.7.1. Creating New Objects

The **CreateObject()** action is used to create a new object in the specified container. In general, Control Points invoke the **CreateObject()** with meta-data that includes the **upnp:class** element for the newly created object. The Content Directory Service will create an object according to the specified meta-data and additional meta-data may be added by the CDS. The action returns **ObjectID** and meta-data of the created object. Note that all required elements must exist in the **Result**.

2.8.7.2. Example: Creating a new MusicTrack in the Album1 (id=10)

Invoke **CreateObject()** with the **ContainerID** parameter set to 10 and the **Elements** parameter set to meta-data that contained **upnp:class** of class **id=MusicTrack**.

```
request: CreateObject("10",
  "<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite">
  <item id="" restricted="false">
    <dc:title>New Track</dc:title>
    <upnp:class>
      object.item.audioItem.musicTrack
    </upnp:class>
  </item>
</DIDL-Lite>")
```

```
response: CreateObject("12",
  "<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite">
  <item id="12" parentID="10" restricted="false">
    <dc:title>New Track</dc:title>
    <dc:creator></dc:creator>
    <res importUri="http://pc/item?id=12"
      protocolInfo="*:*:audio:*"/>
    <upnp:class>
      object.item.audioItem.musicTrack
    </upnp:class>
    <upnp:genre></upnp:genre>
    <upnp:album>Album1</upnp:album>
  </item>
</DIDL-Lite>")
```

2.8.8. File Transfer of a resource in Objects

The **ImportResource()** action and **ExportResource()** action are used for a file transfer of resources in an object. A **<res>** element identifies a resource of the object and contains the uri locator of the resource to access. The **protocolInfo** attribute indicates the protocol for exporting the resource and HTTP protocol is recommended for the purpose of a file transfer. The **importUri** attribute indicates the uri of the resource used in the **ImportResource()** action.

Shown below are three cases of **<res>** elements. Generally when an object is created, it has no resource. If the object has resources to be access, the **<res>** element has a uri value and designates a value for the **protocolInfo** attribute. Note that the **<res>** value and the **protocolInfo** attribute value may be updated by the file transfer from a remote resource to a local resource in the object.

2.8.8.1. case A

The **<res>** element contains no resource. A Control Point can import a resource to the object, and the value of the **importUri** attribute is used in the **ImportResource()** action. For example,

```
<res protocolInfo="*:*:audio:*"
  importUri="http://10.0.0.1/cd/import?id=3"/>
```

2.8.8.2. case B

The **<res>** element has a resource to be accessed by Control Points. The Control Point cannot replace the resource of the **<res>** element. For example,

```
<res protocolInfo="http-get:*:audio/m3u:*">
  http://10.0.0.1/cd/content?id=3
</res>
```

2.8.8.3. case C

The <res> element has assigned a resource. The Control Point can replace the assigned resource using the **ImportResource()** action. For example,

```
<res protocolInfo="http-get:*:audio/m3u:*"
  importUri="http://10.0.0.1/cd/import?id=3">
  http://10.0.0.1/cd/content?id=3
</res>
```

2.8.8.4. Transferring using the ImportResource() action

The destination resource, e.g. http://10.0.0.1/cd/import?id=3, is located in the CDS and the source resource, e.g. http://server/song.mp3, is located in another CDS, or is any resource identified by uri. If a control point wants to create a new object that imports a file into a resource, it can invoke the **CreateObject()** action before the file transfer.

For example, the <res> element is as shown below before a file transfer.

```
<res protocolInfo="*:*:audio:*"
  importUri="http://10.0.0.1/cd/import?id=3"/>
```

A control point invokes **ImportResource()** and the CDS identifies the local destination resource.

request: ImportResource("http://server/song.mp3", "http://10.0.0.1/cd/import?id=3")

response: ImportResource(1234)

The CDS initiates the HTTP::GET to the remote source resource and begins receiving data which is directed to the local destination resource. Note that the specified scheme of a remote source resource is used by the CDS.

GET /song.mp3 HTTP/1.1

HTTP/1.1 200 OK

The control point may query the progress

request: GetTransferProgress(1234)

response: GetTransferProgress("IN_PROGRESS", 43852, 125327)

Finally, HTTP::GET has finished successfully.

The control point can query the result of file transfer.

request: GetTransferProgress(1234)

response: GetTransferProgress("COMPLETED", 125327, 125327)

If a control point receives events from the CDS, the control point receives two events of the **TransferIDs** status variable.

A file transfer starts at step 1)

event: TransferIDs="1234".

A file transfer ends at step 4) successfully or when it fails by an error or is stopped by the **StopTransferResource()** action.

event: TransferIDs="".

After the file transfer, <res> element is as shown below.

```
<res protocolInfo="http-get:*:audio/m3u:*">
  http://10.0.0.1/cd/content?id=3
</res>
```

2.8.8.5. Transfer using direct HTTP::POST

If the source resource is located in the control point, it is obviously easy for a control point to access the destination resource directly.

A control point initiates HTTP::POST at the destination resource and begins sending data from the local source resource. Note that the specified scheme of a remote destination resource is used by the control point.

```
POST /cd/content?id=3 HTTP/1.1
HTTP/1.1 200 OK
```

2.8.8.6. Transfer using the ExportResource() action

The source resource, e.g. "http://10.0.0.1/cd/content?id=3", is located locally, and the destination resource, e.g. "http://server/content?id=6", is located remotely, or is generally any resource identified by URI.

For example, the <res> element is as shown below before a file transfer.

```
<res protocolInfo="http-get:*:audio/m3u:*" >
  http://10.0.0.1/cd/content?id=3
</res>
```

- 1) A control point invokes **ExportResource()** and the CDS identifies the local source resource.

```
request: ExportResource("http://10.0.0.1/cd/content?id=3","http://server/content?id=6")
response: ExportResource(1235)
```

- 2) The CDS initiates the HTTP::POST at the remote destination resource and begins sending data from the local source resource. Note that the specified scheme of a remote destination resource is used by the CDS.

```
POST content?id=6 HTTP/1.1
HTTP/1.1 200 OK
```

The subsequent steps are as same as the case of **ImportResource()**.

2.8.8.7. Transfer using direct HTTP::GET

If the destination resource is located in the control point, it is obviously easy for a control point to access the source resource directly.

A control point initiates HTTP::GET at the remote source resource and begins receiving data which is directed to the local destination resource. Note that the specified scheme of a remote source resource is used by the control point.

2.8.9. Playlist Manipulation

2.8.9.1. Playlist file representation in CDS

A playlist file is represented as an object of the playlist class (object.item.playlist). The format of the playlist is indicated by the MIME type section of the **res@protocolInfo** property on the playlist object. If a search were performed for all objects of class object.item.playlist in the content directory, it would return a result of the following form:

```
<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/" >
  <item id="2" parentID="1" restricted="false">
    <dc:title>Playlist of John and Mary's music</dc:title>
    <dc:creator>John Jones</dc:creator>
    <upnp:class>object.item.playlist</upnp:class>
```

```

        <res protocolInfo="http-get:*:audio/m3u:*">
            http://pc/k.m3u
        </res>
    </item>
</DIDL-Lite>

```

2.8.9.2. Playlist file generation from container derived object resources

Objects derived from the container class (object.container) may contain objects derived from the item (object.item) or container classes. An example of such a class is the musicAlbum class (object.container.album.musicAlbum). It is desired to allow a control point to set up a rendering session of all the items in the music album. This may be accomplished by having the album object expose a resource property (**res**), and the URI of the resource generates a playlist file in a format that is understood by the media renderer. The content of the playlist file is a list of all the items in the container.

Note: the order of the items in the playlist file is defined by the generator of the playlist, but should match the order of the items as returned from the **Browse()** action on that container. The following example illustrates:

- A **Browse()** of a musicAlbum object's metadata would return a result of the following form:

```

<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
  <container id="1" parentID="0" restricted="false"
    searchable="true">
    <dc:title>Brand New Day</dc:title>
    <dc:creator>Sting</dc:creator>
    <upnp:class>
      object.container.album.musicAlbum
    </upnp:class>
    <upnp:searchClass includeDerived="false">
      object.item.audioItem.musicTrack
    </upnp:searchClass>
    <upnp:createClass includeDerived="false">
      object.item.audioItem.musicTrack
    </upnp:createClass>
    <res protocolInfo="http-get:*:audio/m3u:*">
      http://pc/genm3u?containerID="1"
    </res>
  </container>
</DIDL-Lite>

```

- A **Browse()** of that musicAlbum object's direct children would return a result of the following form:

```

<DIDL-Lite xmlns:dc="http://purl.org/dc/elements/1.1/"
  xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
  xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/">
  <item id="2" parentID="1" restricted="false">
    <dc:title>A Thousand Years</dc:title>
    <dc:creator>Sting</dc:creator>
    <upnp:class>
      object.item.audioItem.musicTrack
    </upnp:class>
    <res protocolInfo="http-get:*:audio/x-ms-wma:*">
      http://pc/getcontent?contentID="2"
    </res>
  </item>
  <item id="3" parentID="1">
    <dc:title>Desert Rose</dc:title>
    <dc:creator>Sting</dc:creator>
    <upnp:class>
      object.item.audioItem.musicTrack
    </upnp:class>
    <res protocolInfo="http-get:*:audio/x-ms-wma:*">

```

```

        http://pc/getcontent?contentID="3"
      </res>
    </item>
  </DIDL-Lite>

```

- The control point would use the content of the **<res>** element on the musicAlbum **container** object to set the URI on the AVTransport Service of the media renderer. The media renderer would issue an HTTP GET on the URI "http://pc/genm3u?containerID="1" " to retrieve the generated M3U resource which would have the following content:

```

http://pc/getcontent?contentID="2"
http://pc/getcontent?contentID="3"

```

2.8.10. Internet Content Representation

A CDS implementation will always reside on a UPnP device. However, various URIs present as metadata inside the Content Directory are allowed to point to locations, e.g., web servers, that are outside the UPnP network. For example, an Internet Radio station may be represented by an object in a CDS hosted by a UPnP MediaServer device.

In order to be compatible with as many renderer (player) devices in the UPnP home network as possible, a MediaServer device may be able to perform protocol and/or format conversion of content. Protocol and format information is exposed via the DIDL-lite **<res>** element. MediaServer devices that can serve content using multiple protocols will generally have multiple **<res>** elements for a single object. For example, consider an Internet video resource using RTSP/RTP/UDP. To accommodate MediaRenderer devices that can only play via HTTP, a MediaServer could provide protocol translation, and offer the following meta data:

```

<item id="InternetStream1" restricted="false">
  <res protocolInfo="rtsp-rtp-udp:*:MPV:*">
    rtsp://internet-server/stream1.m2v
  </res>
  <res protocolInfo="http-get:*:video/mpeg:*">
    http://upnp-device/stream1.m2v
  </res>
</item>

```

MediaRenderer devices that can deal with RTSP/RTP/UDP streams can play from the Internet server directly, whereas MediaRenderer devices that can only deal with HTTP streams would stream the same content over HTTP via the MediaServer device that acts as a translating proxy.

2.8.11. Vendor Metadata Extensions

Vendors may extend DIDL-Lite metadata by placing blocks of vendor-specific metadata into **<desc>** blocks. In DIDL-Lite, a **<desc>** element identifies a **descriptor**. The required **nameSpace** attribute identifies the namespace of the contained metadata. **<desc>** elements may appear as child elements of **<DIDL-Lite>** root elements, **<container>**, and **<item>** elements. The contents of each **<desc>** must be associated with only one namespace.

A **descriptor** is employed to associate blocks of other XML-based metadata with a given CDS object. Examples of other XML-based metadata include DIG35, MPEG7, RDF, XrML, and etc. **descriptor** blocks could also be employed to contain vendor-specific content ratings information, digitally signed rights descriptions, and etc.

Allowing the **<desc>** to contain only elements from the namespace defined by the **nameSpace** attribute allows control points vendors to selectively deploy support for a given namespace using parser 'plug-in' techniques. **<desc>** blocks designating unfamiliar namespaces are ignored by the control point.

3. XML Service Description

```

<?xml version="1.0"?>
<scpd xmlns="urn:schemas-upnp-org:service-1-0">

Annex A (normative)

DIDL-Lite

This section contains a complete XML schema for the DIDL-Lite element set. The UPnP, Dublin Core and XML namespaces are imported into the DIDL-Lite schema.

DIDL-Lite is derived from a subset of DIDL, a Digital Item Declaration Language recently developed within ISO/MPEG21 [DIDL].

The attached DIDL-Lite schema may be copied at the 'cut' lines and saved into a file for use in a validating parser or instance document editing tool.

It is anticipated that few if any, UPnP A/V Control Points or Content Directories will employ schema-based validation in the implementation of A/V functionality. In any case, the schema serves as the normative reference for the format of DIDL-Lite fragments.

The schema, however, may have a use in testing and certifying the UPnP A/V standard compliance of UPnP A/V Control Points and UPnP A/V Content Directory Services (see section 4.0).

This DIDL-Lite schema has been constructed using the May 2, 2001 W3C XML Schema Recommendation.

</xsd:complexType>

<!--=====

A 'container' element may contain any number of 1. Dublin Core, 2. upnp, 3. res, 4. ref, 5 item, 6. container and 7. desc elements. In all cases, the first element in each container child element sequence is required to be "dc:title". The 'upnp:class' element must also appear under container. Each container is required to specify a value for the 'id' and 'parentID' attributes. Each container is also required to specify a value for the 'restricted' attribute (true, false, 1, 0). When restricted="true", the ability to change or delete the container is restricted. Other optional container element attributes are 'parentID', 'childCount', and 'searchable'. Other optional attributes are 'parentID' and 'childCount'.

Attributes:

| | | | |
|------------|-------|---------|---------------|
| id | type: | string | use: required |
| parentID | type: | string | use: required |
| childCount | type: | int | use: optional |
| restricted | type: | boolean | use: required |

The equivalent MPEG21 DIDL element is 'CONTAINER'

=====

```
<xsd:group name="allowed-under-container">

</xsd:complexType>
<!--=====

```

A 'res' element identifies a resource. A resource is typically some type of a binary asset, such as photo, song, video, etc. A 'res' element contains a uri that identifies the resource.

Attributes:

'importUri' type: anyURI use: optional
The 'importUri' attribute is the optional uri locator for resource update.

'protocolInfo' type: string use: required
The 'protocolInfo' attribute is a string that identifies the streaming or transport protocol for transmitting the resource. If not present then the content has not yet been fully imported by the ContentDirectory and is not yet accessible for playback purposes.

'size' type: unsignedLong use: optional
The size, in bytes, of the resource.

'duration' type: string use: optional
The 'duration' attribute identifies the duration of the playback of the resource, at normal speed.
The form of the duration string is:

H*:MM:SS.F*, or H*:MM:SS.F0/F1
where :

- H* means any number of digits (including no digits) to indicate elapsed hours
- MM means exactly 2 digits to indicate minutes (00 to 59)
- SS means exactly 2 digits to indicate seconds (00 to 59)
- F* means any number of digits (including no digits) to indicate fractions of seconds
- F0/F1 means a fraction, with F0 and F1 at least one digit long, and F0 < F1
- The string may be preceded by an optional + or – sign, and the decimal point itself

may be omitted if there are no fractional second digits.

'bitrate' type: unsignedInt use: optional
The bitrate in bytes/second of the resource.

'sampleFrequency' type: unsignedInt use: optional
The sample frequency of the resource in Hz

'bitsPerSample' type: unsignedInt use: optional
The bits per sample of the resource.

'nrAudioChannels' type: unsignedInt use: optional
Number of audio channels of the resource, e.g. 1 for mono, 2 for stereo, 6 for Dolby surround, etc.

'resolution' type: pattern-string use: optional
X*Y resolution of the resource (image or video). The string pattern is restricted to strings of the form: [0-9]+x[0-9]+ (one or more digits,'x', followed by one or more digits).

'colorDepth' type: unsignedInt use: optional
The color depth in bits of the resource (image or video).

'protection' type: string use: optional
Some statement of the protection type of the resource (not standardized).

The equivalent MPEG21 DIDL element is 'RESOURCE'.

```

Annex B (normative)

AV Working Committee Extended Properties

The table below lists all properties defined by the AV Working Committee. In addition, a number of Dublin Core properties are listed (see Dublin Core Metadata Elements, Version 1.1 (<http://dublincore.org/documents/dces>), where applicable.

| Property Name | Namespace | Property Type | Multiple Values | Property Description |
|------------------------|-------------|---------------|-----------------|--|
| Base properties | | | | |
| <i>(object)</i> @id | DIDL-Lite | string | no | An identifier for the object. The value of each object id property should be unique with respect to the Content Directory. |
| title | Dublin Core | string | no | Name of the object |
| creator | Dublin Core | string | no | Primary content creator or owner of the object |
| res | DIDL-Lite | URI | yes | Resource, typically a media file, associated with the object. Values must be properly escaped URIs as described in [RFC 2396]. |
| class | upnp | string | no | Class of the object. |
| class@name | upnp | string | no | Friendly name for the class of the object. This should not be used for class based searches as it is not guaranteed to be unique or consistent across content items of the same class |
| container@searchable | DIDL-Lite | boolean | no | When <i>true</i> , the ability to perform a Search action under a container is enabled, otherwise a Search under that container will return no results. The default value of this attribute when if it is absent on a container is false. |

| Property Name | Namespace | Property Type | Multiple Values | Property Description |
|----------------------------|-----------|---------------|-----------------|--|
| searchClass | upnp | string | yes | <p>Search class of the associated container object.</p> <p>If (object)@searchable = true, then</p> <ul style="list-style-type: none"> • If no searchClass elements are specified, then Search can return any match • If searchClass elements are specified then, the Search can return only matches from the classes specified in the searchClass tags • searchClass is optional • searchClass is always CDS determined • searchClass semantics are per container, there is no parent-child relationship, they only apply to searches started from that container. |
| searchClass@includeDerived | upnp | boolean | no | This is a required attribute of searchClass and indicates that the class specified also includes derived classes |
| searchClass@name | upnp | string | no | This is an optional attribute of searchClass and indicates a friendly name for the class |

| Property Name | Namespace | Property Type | Multiple Values | Property Description |
|----------------------------|-----------|---------------|-----------------|--|
| createClass | upnp | string | yes | <p>Create class of the associated container object.</p> <p>If restricted = false, then</p> <ul style="list-style-type: none"> • If no createClass elements are specified, then CreateObject can create any class of object under the container • If createClass elements are specified then, CreateObject can only create classes of objects specified in the createClass tags • createClass is optional • createClass semantics are per container, there is no parent-child relationship, they only apply to CreateObject actions in that container |
| createClass@includeDerived | upnp | boolean | no | This is a required attribute of createClass, and indicates that the class specified also includes derived classes |
| createClass@name | upnp | string | no | This is an optional attribute of createClass and indicates a friendly name for the class |
| (object)@parentID | DIDL-Lite | string | no | id property of object's parent. The parentID of the Content Directory 'root' container must be set to the reserved value of "-1". No other parentID attribute of any other Content Directory object may take this value. |
| item@refID | DIDL-Lite | string | no | id property of the item being referred to. |
| object@restricted | DIDL-Lite | boolean | no | When <i>true</i> , ability to modify a given object is confined to the Content Directory. Control point metadata write access is disabled. |
