xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[*Note*: The W3C XML Schema definition of this element's content model (ST_Xstring) is located in §A.6.9. *end note*]

21.2.2.67 firstHeader (First Header)

This element specifies the header to use on the first page.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[*Note*: The W3C XML Schema definition of this element's content model (ST_Xstring) is located in §A.6.9. *end note*]

21.2.2.68 firstSliceAng (First Slice Angle)

This element specifies the angle of the first pie or doughnut chart slice, in degrees (clockwise from up).

Attributes	Description
val (First Slice Angle Value)	Specifies the angle of the first slice. The possible values for this attribute are defined by the ST_FirstSliceAng simple type (§21.2.3.15).

[*Note*: The W3C XML Schema definition of this element's content model (CT_FirstSliceAng) is located in §A.5.1. *end note*]

21.2.2.69 floor (Floor)

This element specifies the floor of a 3D chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Surface) is located in §A.5.1. *end note*]

21.2.2.70 fmtId (Format ID)

This element represents a pivot format ID. It serves as a link back to the correct pivotTable which in turn specifies a link that then defines which set of chart format rules apply to this chart.

This ID shall match the chartFormat element, `chart` attribute, described in §18.10.1.12 of the SpreadsheetML reference material. The chartFormat element also contains a `format` attribute which is used to index into the pivotFmts collection (§21.2.2.143).

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute contain an integer number.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_UnsignedInt) is located in §A.5.1. *end note*]

21.2.2.71 formatCode (Format Code)

This element specifies a string representing the format code to apply. For more information see the SpreadsheetML numFmt element's (§18.8.30) formatCode attribute.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model (ST_Xstring) is located in §A.6.9. *end note*]

21.2.2.72 formatting (Formatting)

This element specifies that a user cannot change formatting on chart elements.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0` or `false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.73 forward (Forward)

This element specifies the number of categories (or units on a scatter chart) that the trendline extends after the data for the series that is being trended. On scatter and non-scatter charts, the value shall be any non-negative value.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Double) is located in §A.5.1. *end note*]

21.2.2.74 gapDepth (Gap Depth)

This element specifies the space between bar or column clusters, as a percentage of the bar or column width.

Attributes	Description
val (Gap Size Value)	Specifies that the contents of this attribute contain a gap amount between 0% and 500%. The possible values for this attribute are defined by the ST_GapAmount simple type (§21.2.3.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_GapAmount) is located in §A.5.1. *end note*]

21.2.2.75 gapWidth (Gap Width)

This element specifies the space between bar or column clusters, as a percentage of the bar or column width.

Attributes	Description
val (Gap Size Value)	Specifies that the contents of this attribute contain a gap amount between 0% and 500%. The possible values for this attribute are defined by the ST_GapAmount simple type (§21.2.3.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_GapAmount) is located in §A.5.1. *end note*]

21.2.2.76 grouping (Grouping)

This element specifies the kind of grouping for a column, line, or area chart.

Attributes	Description
val (Grouping	Specifies the grouping value.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
Value)	The possible values for this attribute are defined by the ST_Grouping simple type (§21.2.3.17).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Grouping) is located in §A.5.1. *end note*]

21.2.2.77 grouping (Bar Grouping)

This element specifies the kind of grouping for a bar chart.

Attributes	Description
val (Bar Grouping Value)	Specifies the bar grouping value. The possible values for this attribute are defined by the ST_BarGrouping simple type (§21.2.3.4).

[*Note*: The W3C XML Schema definition of this element's content model (CT_BarGrouping) is located in §A.5.1. *end note*]

21.2.2.78 h (Height)

This element specifies the height (if Height Mode is factor) or bottom (if Height Mode is edge) of the chart element as a fraction of the height of the chart.

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Double) is located in §A.5.1. *end note*]

21.2.2.79 headerFooter (Header and Footer)

This element specifies the headers and footers that shall be used when the chart is printed.

Attributes	Description
alignWithMargins	Specifies the header and footer should align with the left and right margins of the chart.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
(Align With Margins)	A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
differentFirst (Different First)	Specifies the header and footer are different for the first page. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
differentOddEven (Different Odd Even)	Specifies the header and footer are different on odd-numbered pages and even-numbered pages. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_HeaderFooter) is located in §A.5.1. *end note*]

21.2.2.80 hiLowLines (High Low Lines)

This element specifies the high-low lines for the series.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ChartLines) is located in §A.5.1. *end note*]

21.2.2.81 hMode (Height Mode)

This element specifies how to interpret the Height element for this manual layout.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
val (Layout Mode Value)	Specifies the layout mode for the width. The possible values for this attribute are defined by the ST_LayoutMode simple type (§21.2.3.20).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LayoutMode) is located in §A.5.1. *end note*]

21.2.2.82 holeSize (Hole Size)

This element specifies the size of the hole in a doughnut chart group.

Attributes	Description
val (Hole Size Value)	Specifies that the contents of this attribute contain a hole size between 10% and 90% of the size of the plot area. The possible values for this attribute are defined by the ST_HoleSize simple type (§21.2.3.18).

[*Note*: The W3C XML Schema definition of this element's content model (CT_HoleSize) is located in §A.5.1. *end note*]

21.2.2.83 hPercent (Height Percent)

This element specifies the height of a 3-D chart as a percentage of the chart width.

Attributes	Description
val (Height Percent Value)	Specifies that the contents of this attribute contain a height percent between 5% and 500%. The possible values for this attribute are defined by the ST_HPercent simple type (§21.2.3.19).

[*Note*: The W3C XML Schema definition of this element's content model (CT_HPercent) is located in §A.5.1. *end note*]

21.2.2.84 idx (Index)

This element specifies the index of the containing element. This index shall determine which of the parent's children collection this element applies to.

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute contain an integer number.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_UnsignedInt) is located in §A.5.1. *end note*]

21.2.2.85 intercept (Intercept)

This element specifies the value where the trendline shall cross the y axis. This property shall be supported only when the trendline type is exp, linear, or poly.

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Double) is located in §A.5.1. *end note*]

21.2.2.86 invertIfNegative (Invert if Negative)

This element specifies the parent element shall invert its colors if the value is negative.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0` or `false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.87 lang (Editing Language)

This element specifies the primary editing language which was use when this chart was last modified.

Attributes	Description
val (Language Code)	Specifies a language tag as defined by RFC 3066. See simple type for additional information. The possible values for this attribute are defined by the ST_Lang simple type (§22.9.2.6).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextLanguageID) is located in §A.5.1. *end note*]

21.2.2.88 layout (Layout)

This element specifies how the chart element is placed on the chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Layout) is located in §A.5.1. *end note*]

21.2.2.89 layoutTarget (Layout Target)

This element specifies whether to layout the plot area by its inside (not including axis and axis labels) or outside (including axis and axis labels).

Attributes	Description
val (Layout Target Value)	Specifies the layout target value. The possible values for this attribute are defined by the ST_LayoutTarget simple type (§21.2.3.21).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LayoutTarget) is located in §A.5.1. *end note*]

21.2.2.90 lblAlgn (Label Alignment)

This element specifies the text alignment for the tick labels on the axis.

Attributes	Description
val (Label Alignment Value)	Specifies the label alignment. The possible values for this attribute are defined by the ST_LblAlgn simple type (§21.2.3.22).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this element's content model (CT_LblAlgn) is located in §A.5.1. *end note*]

21.2.2.91 lblOffset (Label Offset)

This element specifies the distance of labels from the axis.

Attributes	Description
val (Label Offset Value)	Specifies the distance of labels from the axis. Shall contain a percentage between 0% and 1000%. The possible values for this attribute are defined by the ST_LblOffset simple type (§21.2.3.23).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LblOffset) is located in §A.5.1. *end note*]

21.2.2.92 leaderLines (Leader Lines)

This element specifies the leader lines for data labels.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ChartLines) is located in §A.5.1. *end note*]

21.2.2.93 legend (Legend)

This element specifies the legend.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Legend) is located in §A.5.1. *end note*]

21.2.2.94 legendEntry (Legend Entry)

This element specifies a legend entry.

[*Note*: The W3C XML Schema definition of this element's content model (CT_LegendEntry) is located in §A.5.1. *end note*]

21.2.2.95 legendPos (Legend Position)

This element specifies the position of the legend.

Attributes	Description
val (Legend Position Value)	Specifies the position of the legend. The possible values for this attribute are defined by the ST_LegendPos simple type

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	(§21.2.3.24).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LegendPos) is located in §A.5.1. *end note*]

21.2.2.96 line3DChart (3D Line Charts)

This element contains the 3-D line chart series.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Line3DChart) is located in §A.5.1. *end note*]

21.2.2.97 lineChart (Line Charts)

This element contains the 2-D line chart series.

[*Note*: The W3C XML Schema definition of this element's content model (CT_LineChart) is located in §A.5.1. *end note*]

21.2.2.98 logBase (Logarithmic Base)

This element specifies the logarithmic base for a logarithmic axis.

Attributes	Description
val (Logarithmic Base Value)	Specifies the logarithmic base for a logarithmic axis. Shall contain a floating point value greater than or equal to 2. The possible values for this attribute are defined by the ST_LogBase simple type (§21.2.3.25).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LogBase) is located in §A.5.1. *end note*]

21.2.2.99 lvl (Level)

This element specifies data for a single level of labels for a category axis.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Lvl) is located in §A.5.1. *end note*]

21.2.2.100 majorGridlines (Major Gridlines)

This element specifies major gridlines.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ChartLines) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.2.2.101 majorTickMark (Major Tick Mark)

This element specifies the major tick marks.

Attributes	Description
val (Tick Mark Value)	Specifies the minor tick mark position. The possible values for this attribute are defined by the ST_TickMark simple type (§21.2.3.48).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TickMark) is located in §A.5.1. *end note*]

21.2.2.102 majorTimeUnit (Major Time Unit)

This element specifies the time unit for major tick marks.

Attributes	Description
val (Time Unit Value)	Specifies the time unit for the tick marks. The possible values for this attribute are defined by the ST_TimeUnit simple type (§21.2.3.49).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TimeUnit) is located in §A.5.1. *end note*]

21.2.2.103 majorUnit (Major Unit)

This element specifies the distance between major ticks.

Attributes	Description
val (Major Unit Value)	Specifies the distance between major ticks. Shall contain a positive floating-point number. The possible values for this attribute are defined by the ST_AxisUnit simple type (§21.2.3.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_AxisUnit) is located in §A.5.1. *end note*]

21.2.2.104 manualLayout (Manual Layout)

This element specifies the exact position of a chart element.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_ManualLayout) is located in §A.5.1. *end note*]

21.2.2.105 marker (Show Marker)

This element is a Boolean that, when `true`, specifies that the marker shall be shown.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.106 marker (Marker)

This element specifies a data marker.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Marker) is located in §A.5.1. *end note*]

21.2.2.107 max (Maximum)

This element specifies the maximum value of the axis.

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Double) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

21.2.2.108 min (Minimum)

This element specifies the minimum value of the axis.

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Double) is located in §A.5.1. *end note*]

21.2.2.109 minorGridlines (Minor Gridlines)

This element specifies the minor gridlines.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ChartLines) is located in §A.5.1. *end note*]

21.2.2.110 minorTickMark (Minor Tick Mark)

This element specifies the minor tick marks for the axis.

Attributes	Description
val (Tick Mark Value)	Specifies the minor tick mark position. The possible values for this attribute are defined by the ST_TickMark simple type (§21.2.3.48).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TickMark) is located in §A.5.1. *end note*]

21.2.2.111 minorTimeUnit (Minor Time Unit)

This element specifies the time unit for the minor tick marks.

Attributes	Description
val (Time Unit Value)	Specifies the time unit for the tick marks. The possible values for this attribute are defined by the ST_TimeUnit simple type (§21.2.3.49).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_TimeUnit) is located in §A.5.1. *end note*]

21.2.2.112 minorUnit (Minor Unit)

This element specifies the distance between minor tick marks.

Attributes	Description
val (Minor Unit Value)	Specifies the distance between minor tick marks. Shall contain a positive floating-point number. The possible values for this attribute are defined by the ST_AxisUnit simple type (§21.2.3.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_AxisUnit) is located in §A.5.1. *end note*]

21.2.2.113 minus (Minus)

This element specifies the error bar value in the negative direction. It shall be used only when the errValType is cust.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NumDataSource) is located in §A.5.1. *end note*]

21.2.2.114 multiLvlStrCache (Multi Level String Cache)

This element specifies the last data shown on the chart for a category axis.

[*Note*: The W3C XML Schema definition of this element's content model (CT_MultiLvlStrData) is located in §A.5.1. *end note*]

21.2.2.115 multiLvlStrRef (Multi Level String Reference)

This element specifies a reference to data for the category axis with a cache of the last values used.

[*Note*: The W3C XML Schema definition of this element's content model (CT_MultiLvlStrRef) is located in §A.5.1. *end note*]

21.2.2.116 name (Trendline Name)

This element specifies the name of the trendline.

The possible values for this element are defined by the W3C XML Schema string datatype.

21.2.2.117 name (Pivot Name)

This element specifies the name of the pivot table to get the data for the chart from.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model (ST_Xstring) is located in §A.6.9. *end note*]

21.2.2.118 noEndCap (No End Cap)

This element specifies an end cap is not drawn on the error bars.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.119 noMultiLvlLbl (No Multi-level Labels)

This element specifies the labels shall be shown as flat text. If this element is not included or is set to false, then the labels shall be drawn as a hierarchy.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

21.2.2.120 numCache (Number Cache)

This element specifies the last data shown on the chart for a series.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NumData) is located in §A.5.1. *end note*]

21.2.2.121 numFmt (Number Format)

This element specifies number formatting for the parent element.

Attributes	Description
formatCode (Number Format Code)	This element specifies a string representing the format code to apply. For more information see the SpreadsheetML numFmt element's (§18.8.30) formatCode attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
sourceLinked (Linked to Source)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NumFmt) is located in §A.5.1. *end note*]

21.2.2.122 numLit (Number Literal)

This element specifies a set of numbers used for the parent element.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NumData) is located in §A.5.1. *end note*]

21.2.2.123 numRef (Number Reference)

This element specifies a reference to numeric data with a cache of the last values used.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NumRef) is located in §A.5.1. *end note*]

21.2.2.124 oddFooter (Odd Footer)

This element specifies the footer to use on odd numbered pages.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[*Note*: The W3C XML Schema definition of this element's content model (ST_Xstring) is located in §A.6.9. *end note*]

21.2.2.125 oddHeader (Odd Header)

This element specifies the header to use on odd numbered pages.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[*Note*: The W3C XML Schema definition of this element's content model (ST_Xstring) is located in §A.6.9. *end note*]

21.2.2.126 ofPieChart (Pie of Pie or Bar of Pie Charts)

This element contains the pie of pie or bar of pie series on this chart. Only the first series shall be displayed. The splitType element shall determine whether the splitPos and custSplit elements apply.

[*Note*: The W3C XML Schema definition of this element's content model (CT_OfPieChart) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

21.2.2.127 ofPieType (Pie of Pie or Bar of Pie Type)

This element specifies whether this chart is pie of pie or bar of pie.

Attributes	Description
val (Pie of Pie or Bar of Pie Type Value)	Specifies the type of pie of pie or bar of pie chart. The possible values for this attribute are defined by the ST_OfPieType simple type (§21.2.3.28).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OfPieType) is located in §A.5.1. *end note*]

21.2.2.128 order (Order)

This element specifies the order of the series in the collection. It is 0 based.

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_UnsignedInt) is located in §A.5.1. *end note*]

21.2.2.129 order (Polynomial Trendline Order)

This element specifies the order of the polynomial trend line. It is ignored for other trend line types.

Attributes	Description
val (Order Value)	Specifies that the contents of this attribute contain an integer between 2 and 6. The possible values for this attribute are defined by the ST_Order simple type (§21.2.3.29).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Order) is located in §A.5.1. *end note*]

21.2.2.130 orientation (Axis Orientation)

This element specifies the stretching and stacking of the picture on the data point, series, wall, or floor.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
val (Orientation Value)	Specifies the orientation of the axis. The possible values for this attribute are defined by the ST_Orientation simple type (§21.2.3.30).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Orientation) is located in §A.5.1. *end note*]

21.2.2.131 overlap (Overlap)

This element specifies how much bars and columns shall overlap on 2-D charts.

Attributes	Description
val (Overlap Value)	Specifies how much bars and columns shall overlap on 2-D charts. Shall contain a percentage between -100% and 100%. The possible values for this attribute are defined by the ST_Overlap simple type (§21.2.3.31).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Overlap) is located in §A.5.1. *end note*]

21.2.2.132 overlay (Overlay)

This element specifies that other chart elements shall be allowed to overlap this chart element.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.2.2.133 pageMargins (Page Margins)

This element specifies the page margins for a chart.

Attributes	Description
b (Bottom)	Specifies the bottom page margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
footer (Footer)	Specifies the footer margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
header (Header)	Specifies the header margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
l (Left)	Specifies the left page margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
r (Right)	Specifies the right page margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
t (Top)	Specifies the top page margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PageMargins) is located in §A.5.1. *end note*]

21.2.2.134 pageSetup (Page Setup)

This element defines the page setup for the chart.

[*Example*: The following example shows the pageSetup element for ISO A0 paper, printed in black and white, with graphics:

```
<pageSetup blackAndWhite="true" draft="false" paperHeight="1189mm"
paperWidth="841mm"/>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>blackAndWhite (Black and White)</td><td>Specifies the page shall print in black and white.

The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</td></tr>
<tr><td>copies (Copies)</td><td>Specifies the number of copies that shall be printed.

The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</td></tr>
<tr><td>draft (Draft)</td><td>Specifies the page shall be printed in draft mode.

The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</td></tr>
<tr><td>firstPageNumber (First Page Number)</td><td>Specifies the page number.

The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</td></tr>
<tr><td>horizontalDpi (Horizontal DPI)</td><td>Specifies the horizontal resolution to print in dots per inch.

The possible values for this attribute are defined by the W3C XML Schema int datatype.</td></tr>
<tr><td>orientation (Orientation)</td><td>Specifies the orientation of the paper.

The possible values for this attribute are defined by the ST_PageSetupOrientation simple type (§21.2.3.32).</td></tr>
<tr><td>paperHeight (Paper Height)</td><td>Height of custom paper as a number followed by a unit identifier. [Example: <code>297mm</code>, <code>11in</code> end example]

When paperHeight and paperWidth are specified, paperSize shall be ignored.

The possible values for this attribute are defined by the ST_PositiveUniversalMeasure simple type (§22.9.2.12).</td></tr>
<tr><td>paperSize (Paper Size)</td><td>Specifies the paper size according to the following table.
<table>
<tr><th>Paper Size</th><th>Width</th><th>Height</th><th>Value</th></tr>
<tr><td>Letter paper</td><td>8.5 in.</td><td>11 in.</td><td>1</td></tr>
<tr><td>Legal paper</td><td>8.5 in.</td><td>14 in.</td><td>5</td></tr>

When paperHeight and paperWidth are specified, paperSize should be ignored.

The possible values for this attribute are defined by the W3C XML Schema unsignedInt

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	datatype.
paperWidth (Paper Width)	Width of custom paper as a number followed by a unit identifier. [*Example*: `21cm`, `8.5in` *end example*] When paperHeight and paperWidth are specified, paperSize shall be ignored. The possible values for this attribute are defined by the ST_PositiveUniversalMeasure simple type (§22.9.2.12).
useFirstPageNumber (Use First Page Number)	Specifies to use the first page number instead of automatically generating a page number. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
verticalDpi (Vertical DPI)	Specifies the vertical resolution to print in dots per inch. The possible values for this attribute are defined by the W3C XML Schema int datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PageSetup) is located in §A.5.1. *end note*]

21.2.2.135 period (Period)

This element specifies the period of the trend line for a moving average trend line. It is ignored for other trend line variants.

Attributes	Description
val (Period Value)	Specifies the period of the trend line for a moving average trend line. Shall contain an integer between 2 and 255. The possible values for this attribute are defined by the ST_Period simple type (§21.2.3.33).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Period) is located in §A.5.1. *end note*]

21.2.2.136 perspective (Perspective)

This element specifies the field of view angle for the 3-D chart. This element is ignored if Right Angle Axes is true.

Attributes	Description
val (Perspective	Specifies the field of view angle for the 3-D chart. Shall contain an integer between 0

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
Value)	and 240, whose unit is one-half degrees. The possible values for this attribute are defined by the ST_Perspective simple type (§21.2.3.34).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Perspective) is located in §A.5.1. *end note*]

21.2.2.137 pictureFormat (Picture Format)

This element specifies the stretching and stacking of the picture on the data point, series, wall, or floor.

Attributes	Description
val (Picture Format Value)	Specifies the stretching and stacking of the picture. The possible values for this attribute are defined by the ST_PictureFormat simple type (§21.2.3.35).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PictureFormat) is located in §A.5.1. *end note*]

21.2.2.138 pictureOptions (Picture Options)

This element specifies the picture to be used on the data point, series, wall, or floor.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PictureOptions) is located in §A.5.1. *end note*]

21.2.2.139 pictureStackUnit (Picture Stack Unit)

This element specifies the unit for each picture on the chart. This element applies only if the Picture Format is Stack and Scale.

Attributes	Description
val (Picture Stack Unit)	Specifies the unit for each picture on the chart. Shall contain a floating point number. The possible values for this attribute are defined by the ST_PictureStackUnit simple type (§21.2.3.36).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PictureStackUnit) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

21.2.2.140 pie3DChart (3D Pie Charts)

This element contains the 3-D pie series for this chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Pie3DChart) is located in §A.5.1. *end note*]

21.2.2.141 pieChart (Pie Charts)

This element contains the 2-D pie series for this chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PieChart) is located in §A.5.1. *end note*]

21.2.2.142 pivotFmt (Pivot Format)

This element contains a set of formatting to be applied to the chart that is based on a pivotTable.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PivotFmt) is located in §A.5.1. *end note*]

21.2.2.143 pivotFmts (Pivot Formats)

This element contains a collection of formatting bands for a surface chart indexed from low to high.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PivotFmts) is located in §A.5.1. *end note*]

21.2.2.144 pivotSource (Pivot Source)

This element specifies the source pivot table for a pivot chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PivotSource) is located in §A.5.1. *end note*]

21.2.2.145 plotArea (Plot Area)

This element specifies the plot area of the chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PlotArea) is located in §A.5.1. *end note*]

21.2.2.146 plotVisOnly (Plot Visible Only)

This element specifies that only visible cells should be plotted on the chart.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	omitted. A value of `0` or `false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.147 plus (Plus)

This element specifies the error bar value in the positive direction. It shall be used only when the errValType is cust.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NumDataSource) is located in §A.5.1. *end note*]

21.2.2.148 printSettings (Print Settings)

This element specifies the print settings for the chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PrintSettings) is located in §A.5.1. *end note*]

21.2.2.149 protection (Protection)

This element specifies protection for the chart. If the chart is on a protected worksheet or chart sheet, then these settings shall control how a user is able to interact with the chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Protection) is located in §A.5.1. *end note*]

21.2.2.150 pt (Numeric Point)

This element specifies data for a particular data point.

Attributes	Description
formatCode (Number Format)	A string representing the format code to apply. For more information see see the SpreadsheetML numFmt element's (§18.8.30) formatCode attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
idx (Index)	The index of the series in the collection The possible values for this attribute are defined by the W3C XML Schema unsignedInt

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
	datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NumVal) is located in §A.5.1. *end note*]

21.2.2.151 pt (String Point)

This element specifies string data for a specific data point.

Attributes	Description
idx (Index)	A 0 based index into a set of points. Represents the data point number this data is for. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_StrVal) is located in §A.5.1. *end note*]

21.2.2.152 ptCount (Point Count)

This element contains the number of values in the cache.

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_UnsignedInt) is located in §A.5.1. *end note*]

21.2.2.153 radarChart (Radar Charts)

This element contains the radar chart series on this chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_RadarChart) is located in §A.5.1. *end note*]

21.2.2.154 radarStyle (Radar Style)

This element specifies what type of radar chart shall be drawn.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
val (Radar Style Value)	Specifies the style of the radar chart. The possible values for this attribute are defined by the ST_RadarStyle simple type (§21.2.3.37).

[*Note*: The W3C XML Schema definition of this element's content model (CT_RadarStyle) is located in §A.5.1. *end note*]

21.2.2.155 rAngAx (Right Angle Axes)

This element specifies that the chart axes are at right angles, rather than drawn in perspective. Applies only to 3-D charts.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.156 rich (Rich Text)

This element contains a string with rich text formatting.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextBody) is located in §A.4.1. *end note*]

21.2.2.157 rotX (X Rotation)

This element specifies the amount a 3-D chart shall be rotated in the X direction.

Attributes	Description
val (X Rotation Value)	Specifies the amount a 3-D chart shall be rotated in the X direction. Shall contain an integer between -90 and 90. The possible values for this attribute are defined by the ST_RotX simple type

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
	(§21.2.3.38).

[*Note*: The W3C XML Schema definition of this element's content model (CT_RotX) is located in §A.5.1. *end note*]

21.2.2.158 rotY (Y Rotation)

This element specifies the amount a 3-D chart shall be rotated in the Y direction.

Attributes	Description
val (Y Rotation Value)	Specifies the amount a 3-D chart shall be rotated in the Y direction. Shall contain an integer between 0 and 360. The possible values for this attribute are defined by the ST_RotY simple type (§21.2.3.39).

[*Note*: The W3C XML Schema definition of this element's content model (CT_RotY) is located in §A.5.1. *end note*]

21.2.2.159 roundedCorners (Rounded Corners)

This element specifies the chart area shall have rounded corners.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0` or `false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.160 scaling (Scaling)

This element contains additional axis settings.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Scaling) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.2.2.161 scatterChart (Scatter Charts)

This element contains the scatter chart series for this chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ScatterChart) is located in §A.5.1. *end note*]

21.2.2.162 scatterStyle (Scatter Style)

This element specifies the kind of lines for the scatter chart.

Attributes	Description
val (Scatter Style Value)	Specifies the style of the scatter chart. The possible values for this attribute are defined by the ST_ScatterStyle simple type (§21.2.3.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ScatterStyle) is located in §A.5.1. *end note*]

21.2.2.163 secondPiePt (Second Pie Point)

This element specifies a data point that shall be drawn in the second pie or bar in a pie of pie or bar of pie chart.

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_UnsignedInt) is located in §A.5.1. *end note*]

21.2.2.164 secondPieSize (Second Pie Size)

This element specifies the size of the second pie or bar of a pie of pie chart or a bar of pie chart.

Attributes	Description
val (Second Pie Size Value)	Specifies the second pie or bar of a pie of pie chart or a bar of pie chart, as a percentage of the size of the first pie. Shall contain a percentage between 5% and 200%. The possible values for this attribute are defined by the ST_SecondPieSize simple type (§21.2.3.41).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_SecondPieSize) is located in §A.5.1. *end note*]

21.2.2.165 selection (Selection)

This element specifies the chart elements are protected from selection.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.166 separator (Separator)

This element specifies text that shall be used to separate the parts of a data label. The default is a comma, except for pie charts showing only category name and percentage, when a line break shall be used instead.

The possible values for this element are defined by the W3C XML Schema string datatype.

21.2.2.167 ser (Scatter Chart Series)

This element specifies a series on a scatter chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ScatterSer) is located in §A.5.1. *end note*]

21.2.2.168 ser (Area Chart Series)

This element specifies a series on an area chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_AreaSer) is located in §A.5.1. *end note*]

21.2.2.169 ser (Radar Chart Series)

This element specifies a series on a radar chart.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_RadarSer) is located in §A.5.1. *end note*]

21.2.2.170 ser (Bar Chart Series)

This element specifies a series on a bar chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_BarSer) is located in §A.5.1. *end note*]

21.2.2.171 ser (Line Chart Series)

This element specifies a series on a line chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_LineSer) is located in §A.5.1. *end note*]

21.2.2.172 ser (Pie Chart Series)

This element specifies a series on a doughnut or pie chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PieSer) is located in §A.5.1. *end note*]

21.2.2.173 ser (Surface Chart Series)

This element specifies a series on a surface chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SurfaceSer) is located in §A.5.1. *end note*]

21.2.2.174 ser (Bubble Chart Series)

This element specifies a series on a bubble chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_BubbleSer) is located in §A.5.1. *end note*]

21.2.2.175 serAx (Series Axis)

This element specifies a series axis for the chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SerAx) is located in §A.5.1. *end note*]

21.2.2.176 serLines (Series Lines)

This element specifies series lines for the chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ChartLines) is located in §A.5.1. *end note*]

21.2.2.177 shape (Shape)

This element specifies the shape of a series or a 3-D bar chart.

Attributes	Description
val (Shape Value)	Specifies the shape of the series. The possible values for this attribute are defined by the ST_Shape simple type (§21.2.3.42).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Shape) is located in §A.5.1. *end note*]

21.2.2.178 showBubbleSize (Show Bubble Size)

This element specifies the bubble size shall be shown in a data label.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.179 showCatName (Show Category Name)

This element specifies that the category name shall be shown in the data label.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.180 showDLblsOverMax (Show Data Labels over Maximum)

This element specifies data labels over the maximum of the chart shall be shown.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.181 showHorzBorder (Show Horizontal Border)

This element specifies the horizontal borders shall be shown in a data table.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.182 showKeys (Show Legend Keys)

This element specifies the legend keys shall be shown in a data table.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.183 showLeaderLines (Show Leader Lines)

This element specifies leader lines shall be shown for data labels.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.184 showLegendKey (Show Legend Key)

This element specifies legend keys shall be shown in data labels.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element.

Attributes	Description
	A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.185 showNegBubbles (Show Negative Bubbles)

This element specifies negative sized bubbles shall be shown on a bubble chart.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.186 showOutline (Show Outline Border)

This element specifies the outline shall be shown on a data table.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.187 showPercent (Show Percent)

This element specifies that the percentage shall be shown in a data label.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.188 showSerName (Show Series Name)

This element specifies that the series name shall be shown in a data label.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.2.2.189 showVal (Show Value)

This element specifies that the value shall be shown in a data label.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.190 showVertBorder (Show Vertical Border)

This element specifies the vertical border shall be shown in a data table.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.191 sideWall (Side Wall)

This element specifies the side wall.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Surface) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.2.2.192 size (Size)

This element specifies the size of the marker in points.

Attributes	Description
val (Marker Size Value)	Specifies the size of the marker in points. Shall contain an integer between 2 and 72. The possible values for this attribute are defined by the ST_MarkerSize simple type (§21.2.3.26).

[*Note*: The W3C XML Schema definition of this element's content model (CT_MarkerSize) is located in §A.5.1. *end note*]

21.2.2.193 sizeRepresents (Size Represents)

This element specifies how the bubble size values are represented on the chart.

Attributes	Description
val (Size Represents Value)	Specifies how the bubble sizes represent the values. The possible values for this attribute are defined by the ST_SizeRepresents simple type (§21.2.3.43).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SizeRepresents) is located in §A.5.1. *end note*]

21.2.2.194 smooth (Smoothing)

This element specifies the line connecting the points on the chart shall be smoothed using Catmull-Rom splines.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.2.2.195 splitPos (Split Position)

This element specifies a value that shall be used to determine which data points are in the second pie or bar on a pie of pie or bar of pie chart.

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Double) is located in §A.5.1. *end note*]

21.2.2.196 splitType (Split Type)

This element specifies how to determine which data points are in the second pie or bar on a pie of pie or bar of pie chart.

Attributes	Description
val (Split Type Value)	Specifies how to split the data points between the first pie and second pie or bar. The possible values for this attribute are defined by the ST_SplitType simple type (§21.2.3.45).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SplitType) is located in §A.5.1. *end note*]

21.2.2.197 spPr (Shape Properties)

This element specifies the formatting for the parent chart element. The custGeom, prstGeom, scene3d, and xfrm elements are not supported. The bwMode attribute is not supported.

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	the picture has applied to when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShapeProperties) is located in §A.4.1. *end note*]

21.2.2.198 stockChart (Stock Charts)

This element contains the collection of stock chart series.

[*Note*: The W3C XML Schema definition of this element's content model (CT_StockChart) is located in §A.5.1. *end note*]

21.2.2.199 strCache (String Cache)

This element specifies the last string data used for a chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_StrData) is located in §A.5.1. *end note*]

21.2.2.200 strLit (String Literal)

This element specifies a set of strings used for a chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_StrData) is located in §A.5.1. *end note*]

21.2.2.201 strRef (String Reference)

This element specifies a reference to data for a single data label or title with a cache of the last values used.

[*Note*: The W3C XML Schema definition of this element's content model (CT_StrRef) is located in §A.5.1. *end note*]

21.2.2.202 style (Style)

This element specifies the style that shall be applied to the chart.

Attributes	Description
val (Style Type)	Specifies the chart style. The possible values for this attribute are defined by the ST_Style simple type (§21.2.3.46).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_Style) is located in §A.5.1. *end note*]

21.2.2.203 surface3DChart (3D Surface Charts)

This element contains the set of 3-D surface series.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Surface3DChart) is located in §A.5.1. *end note*]

21.2.2.204 surfaceChart (Surface Charts)

This element contains the set of 2-D contour charts.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SurfaceChart) is located in §A.5.1. *end note*]

21.2.2.205 symbol (Symbol)

This element specifies the marker that is used for the data points.

Attributes	Description
val (Marker Style Value)	Specifies the marker style. The possible values for this attribute are defined by the ST_MarkerStyle simple type (§21.2.3.27).

[*Note*: The W3C XML Schema definition of this element's content model (CT_MarkerStyle) is located in §A.5.1. *end note*]

21.2.2.206 thickness (Thickness)

This element specifies the thickness of the walls or floor as a percentage of the largest dimension of the plot volume.

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute contain a percentage. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the ST_Thickness simple type (§21.2.3.59).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Thickness) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.2.2.207 tickLblPos (Tick Label Position)

This element specifies the position of the tick labels on the axis.

Attributes	Description
val (Tick Label Position Value)	Specifies the tick label position. The possible values for this attribute are defined by the ST_TickLblPos simple type (§21.2.3.47).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TickLblPos) is located in §A.5.1. *end note*]

21.2.2.208 tickLblSkip (Tick Label Skip)

This element specifies how many tick labels to skip between label that is drawn.

Attributes	Description
val (Tick Skip Value)	Specifies the how many tick labels to skip between label that is drawn. Shall contain an integer greater than or equal to one. The possible values for this attribute are defined by the ST_Skip simple type (§21.2.3.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Skip) is located in §A.5.1. *end note*]

21.2.2.209 tickMarkSkip (Tick Mark Skip)

This element specifies how many tick marks shall be skipped before the next one shall be drawn.

Attributes	Description
val (Tick Skip Value)	Specifies the how many tick marks shall be skipped before the next one shall be drawn. Shall contain an integer greater than or equal to one. The possible values for this attribute are defined by the ST_Skip simple type (§21.2.3.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Skip) is located in §A.5.1. *end note*]

21.2.2.210 title (Title)

This element specifies a title.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Title) is located in §A.5.1. *end note*]

21.2.2.211 trendline (Trendlines)

This element specifies a trendline.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this element's content model (CT_Trendline) is located in §A.5.1. *end note*]

21.2.2.212 trendlineLbl (Trendline Label)

This element specifies the label for the trendline.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TrendlineLbl) is located in §A.5.1. *end note*]

21.2.2.213 trendlineType (Trendline Type)

This element specifies the style of the trendline.

Attributes	Description
val (Trendline Type Value)	Specifies the trendline style. The possible values for this attribute are defined by the ST_TrendlineType simple type (§21.2.3.50).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TrendlineType) is located in §A.5.1. *end note*]

21.2.2.214 tx (Chart Text)

This element specifies text to use on a chart, including rich text formatting.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Tx) is located in §A.5.1. *end note*]

21.2.2.215 tx (Series Text)

This element specifies text for a series name, without rich text formatting.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SerTx) is located in §A.5.1. *end note*]

21.2.2.216 txPr (Text Properties)

This element specifies text formatting. The lstStyle element is not supported.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextBody) is located in §A.4.1. *end note*]

21.2.2.217 upBars (Up Bars)

This element specifies the up bars on the chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_UpDownBar) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

21.2.2.218 upDownBars (Up/Down Bars)

This element specifies the up and down bars.

[*Note*: The W3C XML Schema definition of this element's content model (CT_UpDownBars) is located in §A.5.1. *end note*]

21.2.2.219 userInterface (User Interface)

This element specifies that the protection applies to the user interface only, and not to changes made through the object model.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.220 userShapes (User Shapes)

This element shall specify the shapes drawn on top of the chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Drawing) is located in §A.5.2. *end note*]

21.2.2.221 userShapes (Reference to Chart Drawing Part)

This element specifies a relationship to a separate part which contains a drawing to be drawn on top of the chart.

Attributes	Description
id (Relationship Reference) Namespace: ttp://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship ID for the relationship for this Chart or Chart Drawing part. The type of relationship needed is specified by the parent element. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this element's content model (CT_RelId) is located in §A.5.1. *end note*]

21.2.2.222 v (Numeric Value)

This element specifies a numeric value.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model (ST_Xstring) is located in §A.6.9. *end note*]

21.2.2.223 v (Text Value)

This element specifies a text value for a category axis label or a series name.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model (ST_Xstring) is located in §A.6.9. *end note*]

21.2.2.224 val (Values)

This element specifies the data values which shall be used to define the location of data markers on a chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NumDataSource) is located in §A.5.1. *end note*]

21.2.2.225 val (Error Bar Value)

This element specifies a value which is used with the errBar element to determine the length of the error bars.

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Double) is located in §A.5.1. *end note*]

21.2.2.226 valAx (Value Axis)

This element specifies a value axis.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_ValAx) is located in §A.5.1. *end note*]

21.2.2.227 varyColors (Vary Colors by Point)

This element specifies that each data marker in the series has a different color.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.228 view3D (View In 3D)

This element specifies the 3-D view of the chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_View3D) is located in §A.5.1. *end note*]

21.2.2.229 w (Width)

This element specifies the width (if Width Mode is Factor) or right (if Width Mode is Edge) of the chart element as a fraction of the width of the chart.

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Double) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.2.2.230 wireframe (Wireframe)

This element specifies the surface chart is drawn as a wireframe.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `1 or true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `0 or false` specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Boolean) is located in §A.5.1. *end note*]

21.2.2.231 wMode (Width Mode)

This element specifies how to interpret the Width element for this manual layout.

Attributes	Description
val (Layout Mode Value)	Specifies the layout mode for the width. The possible values for this attribute are defined by the ST_LayoutMode simple type (§21.2.3.20).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LayoutMode) is located in §A.5.1. *end note*]

21.2.2.232 x (Left)

This element specifies the x location (left) of the chart element as a fraction of the width of the chart. If Left Mode is Factor, then the position is relative to the default position for the chart element.

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema double datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_Double) is located in §A.5.1. *end note*]

21.2.2.233 xMode (Left Mode)

This element specifies how to interpret the Left element for this manual layout.

Attributes	Description
val (Layout Mode Value)	Specifies the layout mode for the width. The possible values for this attribute are defined by the ST_LayoutMode simple type (§21.2.3.20).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LayoutMode) is located in §A.5.1. *end note*]

21.2.2.234 xVal (X Values)

This element specifies the x values which shall be used to define the location of data markers on a chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_AxDataSource) is located in §A.5.1. *end note*]

21.2.2.235 y (Top)

This element specifies the top of the chart element as a fraction of the height of the chart. If Top Mode is Factor, then the position is relative to the default position for the chart element.

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Double) is located in §A.5.1. *end note*]

21.2.2.236 yMode (Top Mode)

This element specifies how to interpret the Top element for this manual layout.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
val (Layout Mode Value)	Specifies the layout mode for the width. The possible values for this attribute are defined by the ST_LayoutMode simple type (§21.2.3.20).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LayoutMode) is located in §A.5.1. *end note*]

21.2.2.237 yVal (Y Values)

This element specifies the y values which shall be used to define the location of data markers on a chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NumDataSource) is located in §A.5.1. *end note*]

21.2.3 Simple Types

This is the complete list of simple types dedicated to DrawingML – Charts.

21.2.3.1 ST_AxisUnit (Axis Unit)

This simple type specifies that its contents contain a positive floating point number.

This simple type's contents are a restriction of the W3C XML Schema double datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than 0.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AxisUnit) is located in §A.5.1. *end note*]

21.2.3.2 ST_AxPos (Axis Position)

This simple type specifies the possible positions for an axis.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Bottom)	Specifies that the axis shall be displayed at the bottom of the plot area.
l (Left)	Specifies that the axis shall be displayed at the left of the plot area.
r (Right)	Specifies that the axis shall be displayed at the right of the plot area.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
t (Top)	Specifies that the axis shall be displayed at the top of the plot area.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AxPos) is located in §A.5.1. *end note*]

21.2.3.3 ST_BarDir (Bar Direction)

This simple type specifies the possible directions for a bar chart.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bar (Bar)	Specifies that the chart is a bar chart - the data markers are horizontal rectangles.
col (Column)	Specifies that the chart is a column chart - the data markers are vertical rectangles.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BarDir) is located in §A.5.1. *end note*]

21.2.3.4 ST_BarGrouping (Bar Grouping)

This simple type specifies the possible groupings for a bar chart.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
clustered (Clustered)	Specifies that the chart series are drawn next to each other along the category axis.
percentStacked (100% Stacked)	Specifies that the chart series are drawn next to each other along the value axis and scaled to total 100%.
stacked (Stacked)	Specifies that the chart series are drawn next to each other on the value axis.
standard (Standard)	Specifies that the chart series are drawn next to each other on the depth axis.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BarGrouping) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

21.2.3.5 ST_BubbleScale (Bubble Scale)

This simple type specifies that its contents contain a percentage between 0% and 300%.

This simple type is a union of the following types:

- ST_BubbleScalePercent simple type (§21.2.3.58).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BubbleScale) is located in §A.5.1. *end note*]

21.2.3.6 ST_BuiltInUnit (Built-In Unit)

This simple type specifies the built in display units for an axis.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
billions (Billions)	Specifies the values on the chart shall be divided by 1,000,000,000.
hundredMillions (Hundred Millions)	Specifies the values on the chart shall be divided by 100,000,000.
hundreds (Hundreds)	Specifies the values on the chart shall be divided by 100.
hundredThousands (Hundred Thousands)	Specifies the values on the chart shall be divided by 100,000.
millions (Millions)	Specifies the values on the chart shall be divided by 1,000,000.
tenMillions (Ten Millions)	Specifies the values on the chart shall be divided by 10,000,000.
tenThousands (Ten Thousands)	Specifies the values on the chart shall be divided by 10,000.
thousands (Thousands)	Specifies the values on the chart shall be divided by 1,000.
trillions (Trillions)	Specifies the values on the chart shall be divided by 1,000,000,000,000.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BuiltInUnit) is located in §A.5.1. *end note*]

21.2.3.7 ST_CrossBetween (Cross Between)

This simple type specifies the possible crossing states of an axis.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
between (Between)	Specifies the value axis shall cross the category axis between data markers.
midCat (Midpoint of Category)	Specifies the value axis shall cross the category axis at the midpoint of a category.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CrossBetween) is located in §A.5.1. *end note*]

21.2.3.8 ST_Crosses (Crosses)

This simple type specifies the possible crossing points for an axis.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
autoZero (Axis Crosses at Zero)	The category axis crosses at the zero point of the value axis (if possible), or the minimum value (if the minimum is greater than zero) or the maximum (if the maximum is less than zero).
max (Maximum)	The axis crosses at the maximum value
min (Minimum)	Axis crosses at the minimum value of the chart.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Crosses) is located in §A.5.1. *end note*]

21.2.3.9 ST_DepthPercent (Depth Percent)

This simple type specifies that its contents contain a percentage between 20% and 2000%.

This simple type is a union of the following types:

- ST_DepthPercentWithSymbol simple type (§21.2.3.51).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DepthPercent) is located in §A.5.1. *end note*]

21.2.3.10 ST_DispBlanksAs (Display Blanks As)

This simple type specifies the possible ways to display blanks.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
gap (Gap)	Specifies that blank values shall be left as a gap.
span (Span)	Specifies that blank values shall be spanned with a line.
zero (Zero)	Specifies that blank values shall be treated as zero.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DispBlanksAs) is located in §A.5.1. *end note*]

21.2.3.11 ST_DLblPos (Data Label Position)

This simple type specifies the possible positions for a data label.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Bottom)	Specifies that data labels shall be displayed below the data marker.
bestFit (Best Fit)	Specifies that data labels shall be displayed in the best position.
ctr (Center)	Specifies that data labels shall be displayed centered on the data marker.
inBase (Inside Base)	Specifies that data labels shall be displayed inside the base of the data marker.
inEnd (Inside End)	Specifies that data labels shall be displayed inside the end of the data marker.
l (Left)	Specifies that data labels shall be displayed to the left of the data marker.
outEnd (Outside End)	Specifies that data labels shall be displayed outside the end of the data marker.
r (Right)	Specifies that data labels shall be displayed to the right of the data marker.
t (Top)	Specifies that data labels shall be displayed above the data marker.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DLblPos) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

21.2.3.12 ST_ErrBarType (Error Bar Type)

This simple type specifies the possible ways to draw an error bar.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
both (Both)	Specifies that error bars shall be shown in the positive and negative directions.
minus (Minus)	Specifies that error bars shall be shown in the negative direction only.
plus (Plus)	Specifies that error bars shall be shown in the positive direction only.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ErrBarType) is located in §A.5.1. *end note*]

21.2.3.13 ST_ErrDir (Error Bar Direction)

This simple type specifies the possible directions for error bars.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
x (X)	Specifies that error bars shall be shown in the x direction.
y (Y)	Specifies that error bars shall be shown in the y direction.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ErrDir) is located in §A.5.1. *end note*]

21.2.3.14 ST_ErrValType (Error Value Type)

This simple type specifies the possible ways to determine the length of the error bars

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
cust (Custom Error Bars)	Specifies that the length of the error bars shall be determined by the Plus and Minus elements.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
fixedVal (Fixed Value)	Specifies that the length of the error bars shall be the fixed value determined by Error Bar Value.
percentage (Percentage)	Specifies that the length of the error bars shall be Error Bar Value percent of the data.
stdDev (Standard Deviation)	Specifies that the length of the error bars shall be Error Bar Value standard deviations of the data.
stdErr (Standard Error)	Specifies that the length of the error bars shall be Error Bar Value standard errors of the data.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ErrValType) is located in §A.5.1. *end note*]

21.2.3.15 ST_FirstSliceAng (First Slice Angle)

This simple type specifies that its contents contain an integer between 0 and 360.

This simple type's contents are a restriction of the W3C XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 360.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FirstSliceAng) is located in §A.5.1. *end note*]

21.2.3.16 ST_GapAmount (Gap Amount)

This simple type specifies that its contents contain a percentage between 0% and 500%.

This simple type is a union of the following types:

- ST_GapAmountPercent simple type (§21.2.3.53).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_GapAmount) is located in §A.5.1. *end note*]

21.2.3.17 ST_Grouping (Grouping)

This simple type specifies the possible groupings for a bar chart.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
percentStacked (100% Stacked)	Specifies that the chart series are drawn next to each other along the value axis and scaled to total 100%.
stacked (Stacked)	Specifies that the chart series are drawn next to each other on the value axis.
standard (Standard)	Specifies that the chart series are drawn on the value axis.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Grouping) is located in §A.5.1. *end note*]

21.2.3.18 ST_HoleSize (Hole Size)

This simple type specifies that its contents contain a percentage between 1% and 90%.

This simple type is a union of the following types:

- ST_HoleSizePercent simple type (§21.2.3.55).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_HoleSize) is located in §A.5.1. *end note*]

21.2.3.19 ST_HPercent (Height Percent)

This simple type specifies that its contents contain a percentage between 5% and 500%.

This simple type is a union of the following types:

- ST_HPercentWithSymbol simple type (§21.2.3.52).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_HPercent) is located in §A.5.1. *end note*]

21.2.3.20 ST_LayoutMode (Layout Mode)

This simple type specifies the possible ways to store a chart element's position.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
edge (Edge)	Specifies that the Width or Height shall be interpreted as the Right or Bottom of the chart element.
factor (Factor)	Specifies that the Width or Height shall be interpreted as the Width or Height of the chart element.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_LayoutMode) is located in §A.5.1. *end note*]

21.2.3.21 ST_LayoutTarget (Layout Target)

This simple type specifies the possible ways to layout the plot area.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
inner (Inner)	Specifies that the plot area size shall determine the size of the plot area, not including the tick marks and axis labels.
outer (Outer)	Specifies that the plot area size shall determine the size of the plot area, the tick marks, and the axis labels.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_LayoutTarget) is located in §A.5.1. *end note*]

21.2.3.22 ST_LblAlgn (Label Alignment)

This simple type specifies the possible ways to align the tick labels.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (Center)	Specifies that the text shall be centered.
l (Left)	Specifies that the text shall be left justified.
r (Right)	Specifies that the text shall be right justified.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_LblAlgn) is located in §A.5.1. *end note*]

21.2.3.23 ST_LblOffset (Label Offset)

This simple type specifies that its contents contain a percentage of the default value, between 0% and 1000%.

This simple type is a union of the following types:

- ST_LblOffsetPercent simple type (§21.2.3.56).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_LblOffset) is located in §A.5.1. *end note*]

21.2.3.24 ST_LegendPos (Legend Position)

This simple type specifies the possible positions for a legend.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Bottom)	Specifies that the legend shall be drawn at the bottom of the chart.
l (Left)	Specifies that the legend shall be drawn at the left of the chart.
r (Right)	Specifies that the legend shall be drawn at the right of the chart.
t (Top)	Specifies that the legend shall be drawn at the top of the chart.
tr (Top Right)	Specifies that the legend shall be drawn at the top right of the chart.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_LegendPos) is located in §A.5.1. *end note*]

21.2.3.25 ST_LogBase (Logarithmic Base)

This simple type specifies that its contents contain a floating point number greater than or equal to two.

This simple type's contents are a restriction of the W3C XML Schema double datatype.

This simple type also specifies the following restrictions:

- This simple type has a maximum value of less than or equal to 1000.
- This simple type has a minimum value of greater than or equal to 2.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_LogBase) is located in §A.5.1. *end note*]

21.2.3.26 ST_MarkerSize (Marker Size)

This simple type specifies that its contents contain an integer between 2 and 72, whose contents are a size in points.

This simple type's contents are a restriction of the W3C XML Schema unsignedByte datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2.
- This simple type has a maximum value of less than or equal to 72.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_MarkerSize) is located in §A.5.1. *end note*]

21.2.3.27 ST_MarkerStyle (Marker Style)

This picture shows each of the marker styles. Black is used as the line color, while red is used as the fill color. The height of the dash and the dot are 1/5th of the height of the marker. The width of the dot is 1/2 the width of the marker. The dash and dot have fills as well, but the markers need to be made quite large before these are visible.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
circle (Circle)	Specifies a circle shall be drawn at each data point.
dash (Dash)	Specifies a dash shall be drawn at each data point.
diamond (Diamond)	Specifies a diamond shall be drawn at each data point.
dot (Dot)	Specifies a dot shall be drawn at each data point.
none (None)	Specifies nothing shall be drawn at each data point.
picture (Picture)	Specifies a picture shall be drawn at each data point.
plus (Plus)	Specifies a plus shall be drawn at each data point.
square (Square)	Specifies a square shall be drawn at each data point.
star (Star)	Specifies a star shall be drawn at each data point.
triangle (Triangle)	Specifies a triangle shall be drawn at each data point.
x (X)	Specifies an X shall be drawn at each data point.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_MarkerStyle) is located in §A.5.1. *end note*]

21.2.3.28 ST_OfPieType (Pie of Pie or Bar of Pie Type)

This simple type specifies the possible modes of Pie of Pie or Bar of Pie charts.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bar (Bar)	Specifies that the chart is a bar of pie chart, not a pie of pie chart.
pie (Pie)	Specifies that the chart is pie of pie chart, not a bar of pie chart.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_OfPieType) is located in §A.5.1. *end note*]

21.2.3.29 ST_Order (Order)

This simple type specifies that its contents contain an integer between 2 and 6, whose contents are the order of the trendline polynomial.

This simple type's contents are a restriction of the W3C XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2.
- This simple type has a maximum value of less than or equal to 6.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Order) is located in §A.5.1. *end note*]

21.2.3.30 ST_Orientation (Orientation)

This simple type specifies the possible ways to place a picture on a data point, series, wall, or floor.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
maxMin (Maximum to Minimum)	Specifies that the values on the axis shall be reversed so they go from maximum to minimum.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
minMax (Minimum to Maximum)	Specifies that the axis values shall be in the usual order, minimum to maximum.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Orientation) is located in §A.5.1. *end note*]

21.2.3.31 ST_Overlap (Overlap)

This simple type specifies that its contents contain a percentage between -100% and 100%.

This simple type is a union of the following types:

- ST_OverlapPercent simple type (§21.2.3.57).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Overlap) is located in §A.5.1. *end note*]

21.2.3.32 ST_PageSetupOrientation (Printed Page Orientation)

This simple type specifies the page orientation of the printed page(s) on which this chart shall appear.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
default (Default Page Orientation)	Specifies that the page orientation shall be the default orientation of the system.
landscape (Landscape Page)	Specifies that the printed page shall have landscape orientation.
portrait (Portrait Page)	Specifies that the printed page shall have portrait orientation.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PageSetupOrientation) is located in §A.5.1. *end note*]

21.2.3.33 ST_Period (Period)

This simple type specifies that its contents contain an integer greater than or equal to 2.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
auto (Auto)	Specifies an application-specific marker shall be drawn at each data point.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Period) is located in §A.5.1. *end note*]

21.2.3.34 ST_Perspective (Perspective)

This simple type specifies that its contents contain an integer between 0 and 100, whose contents are a percentage.

This simple type's contents are a restriction of the W3C XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 240.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Perspective) is located in §A.5.1. *end note*]

21.2.3.35 ST_PictureFormat (Picture Format)

This simple type specifies the possible ways to place a picture on a data point, series, wall, or floor.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
stack (Stack)	Specifies that the picture shall be stacked.
stackScale (Stack and Scale)	Specifies that the picture shall be stacked after being scaled so that it's height is one Picture Stack Unit. Does not apply to walls or floor.
stretch (Stretch)	Specifies that the picture shall be anisotropic stretched to fill the data point, series, wall or floor.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PictureFormat) is located in §A.5.1. *end note*]

21.2.3.36 ST_PictureStackUnit (Picture Stack Unit)

This simple type specifies that its contents contain a floating point number greater than zero.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

This simple type's contents are a restriction of the W3C XML Schema double datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than 0.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PictureStackUnit) is located in §A.5.1. *end note*]

21.2.3.37 ST_RadarStyle (Radar Style)

This simple type specifies the possible styles of radar chart.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
filled (Filled)	Specifies that the radar chart shall be filled and have lines but no markers.
marker (Marker)	Specifies that the radar chart shall have lines and markers but no fill.
standard (Standard)	Specifies that the radar chart shall have lines but no markers and no fill.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_RadarStyle) is located in §A.5.1. *end note*]

21.2.3.38 ST_RotX (X Rotation)

This simple type specifies that its contents contain an integer between -90 and 90, whose contents are an angle in degrees.

This simple type's contents are a restriction of the W3C XML Schema byte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -90.
- This simple type has a maximum value of less than or equal to 90.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_RotX) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.2.3.39 ST_RotY (Y Rotation)

This simple type specifies that its contents contain an integer between 0 and 360, whose contents are an angle in degrees.

This simple type's contents are a restriction of the W3C XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 360.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_RotY) is located in §A.5.1. *end note*]

21.2.3.40 ST_ScatterStyle (Scatter Style)

This simple type specifies the possible styles of scatter chart.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
line (Line)	Specifies the points on the scatter chart shall be connected with straight lines but markers shall not be drawn.
lineMarker (Line with Markers)	Specifies the points on the scatter chart shall be connected with straight lines and markers shall be drawn.
marker (Marker)	Specifies the points on the scatter chart shall not be connected with lines and markers shall be drawn.
none (None)	Specifies the points on the scatter chart shall not be connected with straight lines and markers shall not be drawn.
smooth (Smooth)	Specifies the the points on the scatter chart shall be connected with smoothed lines and markers shall not be drawn.
smoothMarker (Smooth with Markers)	Specifies the the points on the scatter chart shall be connected with smoothed lines and markers shall be drawn.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ScatterStyle) is located in §A.5.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.2.3.41 ST_SecondPieSize (Second Pie Size)

This simple type specifies that its contents contain a percentage between 5% and 200%, whose contents consist of a percentage.

This simple type is a union of the following types:

- ST_SecondPieSizePercent simple type (§21.2.3.55).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SecondPieSize) is located in §A.5.1. *end note*]

21.2.3.42 ST_Shape (Shape)

This simple type specifies the possible shapes for a 3-D data marker.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
box (Box)	Specifies the chart shall be drawn with a box shape.
cone (Cone)	Specifies the chart shall be drawn as a cone, with the base of the cone on the floor and the point of the cone at the top of the data marker.
coneToMax (Cone to Max)	Specifies the chart shall be drawn with truncated cones such that the point of the cone would be the maximum data value.
cylinder (Cylinder)	Specifies the chart shall be drawn as a cylinder.
pyramid (Pyramid)	Specifies the chart shall be drawn as a rectangular pyramid, with the base of the pyramid on the floor and the point of the pyramid at the top of the data marker.
pyramidToMax (Pyramid to Maximum)	Specifies the chart shall be drawn with truncated cones such that the point of the cone would be the maximum data value.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Shape) is located in §A.5.1. *end note*]

21.2.3.43 ST_SizeRepresents (Size Represents)

This simple type specifies the possible ways to represent data as bubble chart sizes.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
area (Bubble Size Represents Area)	Specifies the area of the bubbles shall be proportional to the bubble size value.
w (Bubble Size Represents Width)	Specifies the radius of the bubbles shall be proportional to the bubble size value.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SizeRepresents) is located in §A.5.1. *end note*]

21.2.3.44 ST_Skip (Skip)

This simple type specifies that its contents contain an integer greater than or equal to one.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Skip) is located in §A.5.1. *end note*]

21.2.3.45 ST_SplitType (Split Type)

This simple type specifies the possible ways to split a pie of pie or bar of pie chart.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (Default Split)	Specifies the data points shall be split using the default mechanism for this chart type.
cust (Custom Split)	Specifies the data points shall be split between the pie and the second chart according to the Custom Split values.
percent (Split by Percentage)	Specifies the data points shall be split between the pie and the second chart by putting the points with percentage less than Split Position percent in the second chart.
pos (Split by Position)	Specifies the data points shall be split between the pie and the second chart by putting the last Split Position of the data points in the second chart
val (Split by Value)	Specifies the data points shall be split between the pie and the second chart by putting the data points with

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
	value less than Split Position in the second chart

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SplitType) is located in §A.5.1. *end note*]

21.2.3.46 ST_Style (Style)

This simple type specifies that its contents contain an integer between 1 and 48. The value determines the default formatting for all chart elements through the tables described below.

The default font is the minor font as defined by the document's theme. The default font size for each element is the font size of the chart, except for the title which is always 120% the font size of the chart. If the chart does not have a font size set, then the default font size is 10. Axis titles and chart titles are bold by default, while all other chart elements are normal. The default font color is the same as the Axis & Major Gridlines Line Color.

The default line style, fill style, and effect style are determined by the tables below. Each of the default includes a themed line, fill, or effect (None, Subtle, Moderate, or Intense) and a color to be used when applying that line, fill, or effect. In some cases, both the themed formatting and the color vary per style, in other cases they do not. The default line width is determined by the theme, except for lines for data points it is multipled by the line width value given in the table.

Table 1: Chart element defaults

This table lists whether the default is constant or whether it depends on the ST_Style using one of the later tables.

	Line		Fill		Effect	
Chart Element	Themed Line	Color	Themed Fill	Color	Themed Effect	Color
Axis	Subtle	Table 2	No Fill		No Effect	
Axis Title	No Line		No Fill		No Effect	
Chart Area	Table 2		Subtle	Table 3	No Effect	
Chart Title	No Line		No Fill		No Effect	
Data Labels	No Line		No Fill		No Effect	
DataTable	Subtle	Table 2	No Fill		No Effect	
Down Bars	Table 4		Table 4		Table 4	dk1
Fills for Data Points (2-D)	Subtle	Table 5	Table 5		Table 5	dk1
Fills for Data Points (3-D)	Subtle	Table 5	Table 5		Table 5	dk1
Floor	Table 2		Table 3		No Effect	
Legend	No Line		No Fill		No Effect	
Lines for Data Points	Subtle	Table 5	N/A		No Effect	

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

	Line		Fill		Effect	
Major Gridlines	Subtle	Table 2	N/A		No Effect	
Markers for Data Points	Subtle	Table 5	Table 5		Table 5	dk1
Minor Gridlines	Subtle	Table 2	N/A		No Effect	
Other Lines	Subtle	Table 2	N/A		No Effect	
Plot Area (2-D charts)	No Line		Subtle	Table 3	No Effect	
Plot Area (3-D charts)	No Line		No Fill		No Effect	
Trendline Labels	No Line		No Fill		No Effect	
Up Bars	Table 4		Table 4		Table 4	dk1
Walls	No Line		Table 3		No Effect	

Other Lines includes Drop Lines, Error Bars, High Low Lines, Leader Lines, Series Lines, and Trendlines.

Fills for Data Points (2-D) includes 2-D bar, filled radar, stock, bubble, pie, doughnut and area charts.

Fills for Data Points (3-D) includes all 3-D charts.

Lines for Data Points includes lines on 2-D line, scatter, bubble, and radar charts.

Markers for Data Points includes markers on 2-D line, scatter, and radar charts.

Table 2: Default line formatting per chart style

This table lists line formatting for several chart elements by style.

Style	Axis & Major Gridlines	Minor Gridlines	Chart Area, Data Table, & Floor	Other Lines	Floor & Chart Area
	Color	Color	Color	Color	Themed Line
1-32	tx1	50% tint of tx1	75% tint of tx1	tx1	Subtle
33-34	dk1	50% tint of tx1	75% tint of dk1	dk1	Subtle
35-40	dk1	50% tint of tx1	75% tint of dk1	25% shade of dk1	Subtle
41-48	dk1	90% tint of tx1	lt1	lt1	No Line

Table 3: Default fill formatting per chart style

This table lists fill formatting for several chart elements by style.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Style	Chart Area	Floor, Walls & Plot Area (2-D)	Floor & Walls
	Color	Color	Themed Fill
1-32	bg1	bg1	No Fill
33-34	lt1	20% tint of dk1	Subtle
35-40	lt1	accent1-6	Subtle
41-48	dk1	95% tint of dk1	Subtle

Table 4: Up and down bars default formatting per chart style

This table lists line, fill, and effect formatting for up and down bars by style. The color listed as accent1-6 means that the first style uses accent1, the next uses accent2, up to the sixth uses accent6.

	Up Bars	Down Bars	Up & Down Bars			
			Themed			
Style	Fill Color	Fill Color	Fill	Effect	Line	Line Color
1	25% tint of dk1	85% tint of dk1	Subtle	None	Subtle	tx1
2	5% tint of dk1	95% tint of dk1	Subtle	None	Subtle	tx1
3-8	25% tint of accent1-6	25% shade of accent1-6	Subtle	None	Subtle	tx1
9	25% tint of dk1	85% tint of dk1	Subtle	Subtle	Subtle	tx1
10	5% tint of dk1	95% tint of dk1	Subtle	Subtle	Subtle	tx1
11-16	25% tint of accent1-6	25% shade of accent1-6	Subtle	Subtle	Subtle	tx1
17	25% tint of dk1	85% tint of dk1	Intense	Moderate	No ne	None
18	5% tint of dk1	95% tint of dk1	Intense	Moderate	None	None
19-24	25% tint of accent1-6	25% shade of accent1-6	Intense	Moderate	None	None
25	25% tint of dk1	85% tint of dk1	Intense	Intense	None	None
26	5% tint of dk1	95% tint of dk1	Intense	Intense	None	None

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

	Up Bars	Down Bars	Up & Down Bars			
27-32	25% tint of accent1-6	25% shade of accent1-6	Intense	Intense	None	None
33	lt1	85% tint of dk1	Subtle	None	Subtle	dk1
34	lt1	95% tint of dk1	Subtle	None	Subtle	dk1
35-40	lt1	25% shade of accent1-6	Subtle	None	Subtle	25% shade of accent1-6
41	25% tint of dk1	85% tint of dk1	Intense	Intense	None	None
42	lt1	dk1	Intense	Intense	None	None
43-48	25% tint of accent1-6	25% shade of accent1-6	Intense	Intense	None	None

Table 5: Default data point formatting per chart style

This table lists line, fill, and effect formatting for data points by style. Some of the formatting is a repeating pattern described in the next table (denoted by "Pattern"). Other use a fade pattern in which the first series is a certain% shade of the color listed and the last series is an certain% tint of the color listed. The intermediate colors are linearly interpolated by shade and tint to the listed color. The starting shade% and ending tint% are determined by the spreadsheet application, where shades are always darker than tints.

[*Note*: A suggested way to implement this percentage is by using the formula: shade/tint percent = -70 + 140 * (SeriesFormattingIndex / (HighestFormattingIndexOfAllSeriesOnAllGraphs + 1)). In this case the series formatting index is the `idx` attribute value for the series. Negative outputs are shades, and positive outputs are tints. *end note*]

[*Note*: The arrows across the top of the table indicate which columns apply for that row: i.e., for Fills, Lines, or Markers. So, for example, only the last two columns for Lines for Data Points apply. *end note*]

Fills for Data Points (2-D)	↓	↓		↓	↓		
Fills for Data Points (3-D)		↓	↓	↓	↓		
Lines for Data Points						↓	↓
Markers for Data Points	↓	↓					↓

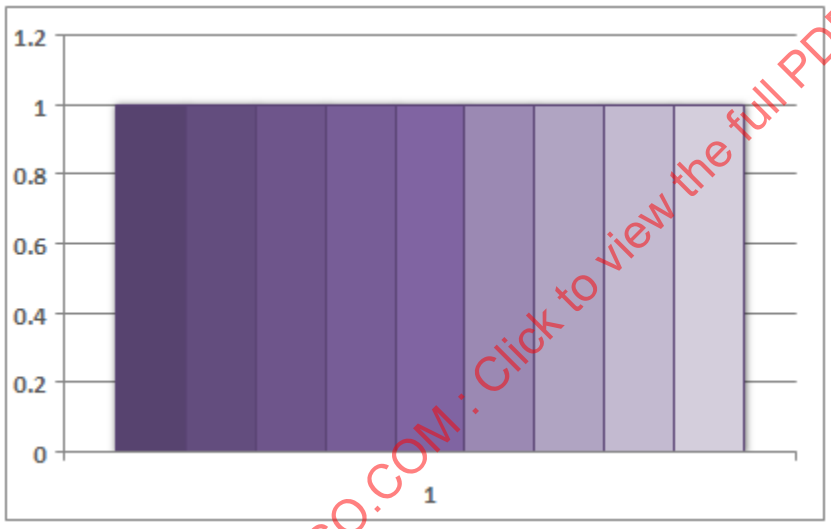
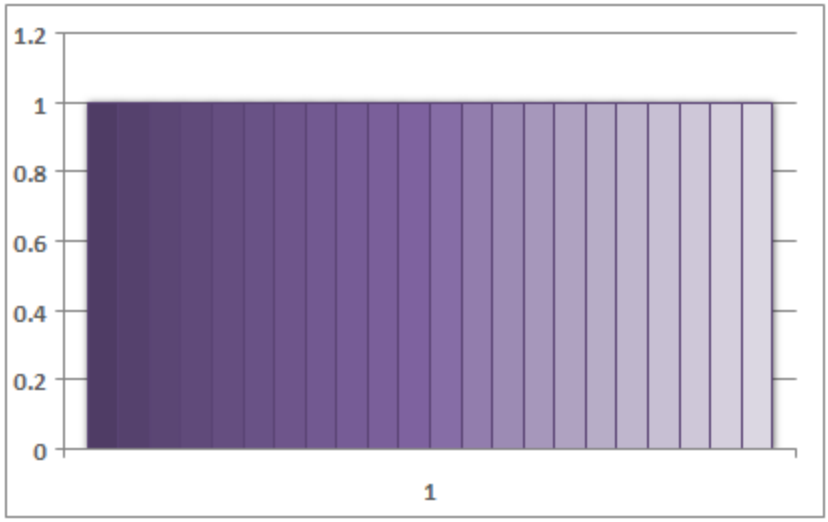
Table 6: Default data point formatting per data point

This table contains the formatting patterns used for each data point when there are is one series, or each series when there is just one series. The patterns in this table can repeat, see the pictures below the table for an illustration.

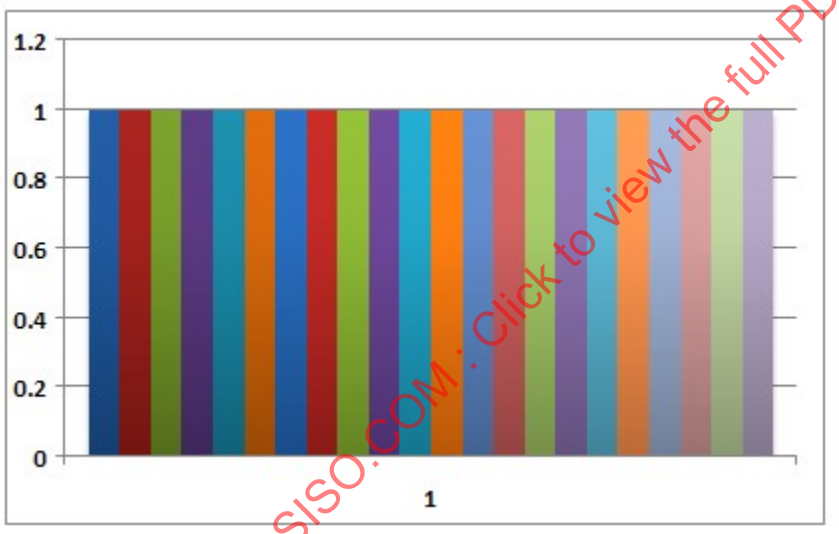
Pattern	Data Point 1	Data Point 2	Data Point 3	Data Point 4	Data Point 5	Data Point 6
1	88.5% tint of dk1	55% tint of dk1	78% tint of dk1	92.5% tint of dk1	70% tint of dk1	30% tint of dk1
2	accent1	accent2	accent3	accent4	Accent5	accent6
3	50% shade of accent1	50% shade of accent2	50% shade of accent3	50% shade of accent4	50% shade of accent5	50% shade of accent6
4	5% tint of dk1	55% tint of dk1	78% tint of dk1	15% tint of dk1	70% tint of dk1	30% tint of dk1



STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012



Above are two charts showing the same monochromatic pattern, just with a different number of series. [*Note*: These charts just have tint and shade adjusted for each series beginning and ending at the same values. *end note*]



Above is a pattern that has 6 distinct accent colors. The colors repeat every 6 data points, but the tint/shade is changed for each set.

This simple type's contents are a restriction of the W3C XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 48.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Style) is located in §A.5.1. *end note*]

21.2.3.47 ST_TickLblPos (Tick Label Position)

This simple type specifies the possible positions for tick labels.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
high (High)	Specifies the axis labels shall be at the high end of the perpendicular axis.
low (Low)	Specifies the axis labels shall be at the low end of the perpendicular axis.
nextTo (Next To)	Specifies the axis labels shall be next to the axis.
none (None)	Specifies the axis labels are not drawn.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TickLblPos) is located in §A.5.1. *end note*]

21.2.3.48 ST_TickMark (Tick Mark)

This simple type specifies the possible positions for tick marks.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
cross (Cross)	Specifies the tick marks shall cross the axis.
in (Inside)	Specifies the tick marks shall be inside the plot area.
none (None)	Specifies there shall be no tick marks.
out (Outside)	Specifies the tick marks shall be outside the plot area.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TickMark) is located in §A.5.1. *end note*]

21.2.3.49 ST_TimeUnit (Time Unit)

This simple type specifies a unit of time.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
days (Days)	Specifies the chart data shall be shown in days.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
months (Months)	Specifies the chart data shall be shown in months.
years (Years)	Specifies the chart data shall be shown in years.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TimeUnit) is located in §A.5.1. *end note*]

21.2.3.50 ST_TrendlineType (Trendline Type)

This simple type specifies all styles of trendline which are available for series in a chart.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
exp (Exponential)	Specifies the trendline shall be an exponential curve in the form $y = ab^x$.
linear (Linear)	Specifies the trendline shall be a line in the form $y = mx + b$.
log (Logarithmic)	Specifies the trendline shall be a logarithmic curve in the form $y = a \log x + b$, where log is the natural logarithm.
movingAvg (Moving Average)	Specifies the trendline shall be a moving average of period Period.
poly (Polynomial)	Specifies the trendline shall be a polynomial curve of order Order in the form $y = ax^6 + bx^5 + cx^4 + dx^3 + ex^2 + fx + g$.
power (Power)	Specifies the trendline shall be a power curve in the form $y = ax^b$.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TrendlineType) is located in §A.5.1. *end note*]

21.2.3.51 ST_DepthPercentWithSymbol (Depth Percent with Symbol)

This simple type specifies that its contents contain a percentage between 20% and 2000%.

The simple type's contents shall match the following regular expression pattern:
0*(([2-9][0-9])|([1-9][0-9][0-9])|(1[0-9][0-9][0-9])|2000)%.

21.2.3.52 ST_HPercentWithSymbol (Height Percent with Symbol)

This simple type specifies that its contents contain a percentage between 5% and 500%.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

The simple type's contents shall match the following regular expression pattern:

0*(([5-9])|([1-9][0-9])|([1-4][0-9][0-9])|500)%.

21.2.3.53 ST_GapAmountPercent (Gap Amount Percentage)

This simple type specifies that its contents contain a percentage between 0% and 500%.

The simple type's contents shall match the following regular expression pattern:

0*(([0-9])|([1-9][0-9])|([1-4][0-9][0-9])|500)%.

21.2.3.54 ST_SecondPieSizePercent (Second Pie Size Percentage)

This simple type specifies that its contents contain a percentage between 5% and 200%.

The simple type's contents shall match the following regular expression pattern:

0* (([5-9])|([1-9][0-9])|(1[0-9][0-9])|200)%.

21.2.3.55 ST_HoleSizePercent (Hole Size Percentage)

This simple type specifies that its contents contain a percentage between 1% and 90%.

The simple type's contents shall match the following regular expression pattern: 0*([1-9]|([1-8][0-9])|90)%.

21.2.3.56 ST_LblOffsetPercent (Label Offset Percentage)

This simple type specifies that its contents contain a percentage between 0% and 1000%.

The simple type's contents shall match the following regular expression pattern:

0*(([0-9])|([1-9][0-9])|([1-9][0-9][0-9])|1000)%.

21.2.3.57 ST_OverlapPercent (Overlap Percentage)

This simple type specifies that its contents contain a percentage between -100% and 100%.

The simple type's contents shall match the following regular expression pattern:

(-?0*(([0-9])|([1-9][0-9])|100))%.

21.2.3.58 ST_BubbleScalePercent (Bubble Scale Percentage)

This simple type specifies that its contents contain a percentage between 0% and 300%.

The simple type's contents shall match the following regular expression pattern:

0*(([0-9])|([1-9][0-9])|([1-2][0-9][0-9])|300)%.

21.2.3.59 ST_Thickness (Thickness Percentage)

This simple type specifies that its contents contain a percentage.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

This simple type is a union of the following types:

- ST_ThicknessPercent simple type (§21.2.3.60).

21.2.3.60 ST_ThicknessPercent (Thickness Percentage)

This simple type specifies that its contents contain a percentage.

The simple type's contents shall match the following regular expression pattern: ([0-9]+)%.

21.3 DrawingML - Chart Drawings

Within a chart, it is sometimes necessary to include DrawingML elements (shapes or pictures) which should be a child object within the parent chart. This relationship allows those elements to optionally be resized with the chart, automatically moved with the chart, etc.

The Chart Drawing namespace acts in this capacity, specifying all information necessary to anchor and display DrawingML objects within a chart.

21.3.1 Table of Contents

This subclause is informative.

21.3.2 Elements 3463
21.3.2.1 absSizeAnchor (Absolute Anchor Shape Size) 3463
21.3.2.2 blipFill (Picture Fill) 3463
21.3.2.3 cNvCxnSpPr (Non-Visual Connection Shape Drawing Properties) 3466
21.3.2.4 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties) 3466
21.3.2.5 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties) 3466
21.3.2.6 cNvPicPr (Non-Visual Picture Drawing Properties) 3466
21.3.2.7 cNvPr (Non-Visual Drawing Properties) 3467
21.3.2.8 cNvSpPr (Non-Visual Shape Drawing Properties) 3469
21.3.2.9 cxnSp (Connection Shape) 3470
21.3.2.10 ext (Shape Extent) 3472
21.3.2.11 from (Starting Anchor Point) 3472
21.3.2.12 graphicFrame (Graphic Frame) 3473
21.3.2.13 grpSp (Group Shape) 3474
21.3.2.14 grpSpPr (Group Shape Properties) 3475
21.3.2.15 nvCxnSpPr (Connector Non Visual Properties) 3475
21.3.2.16 nvGraphicFramePr (Non-Visual Graphic Frame Properties) 3476
21.3.2.17 nvGrpSpPr (Non-Visual Group Shape Properties) 3476
21.3.2.18 nvPicPr (Non-Visual Picture Properties) 3476
21.3.2.19 nvSpPr (Non-Visual Shape Properties) 3476
21.3.2.20 pic (Picture) 3477
21.3.2.21 relSizeAnchor (Relative Anchor Shape Size) 3478
21.3.2.22 sp (Shape) 3478
21.3.2.23 spPr (Shape Properties) 3480

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

21.3.2.24 style (Shape Style) 3480
21.3.2.25 to (Ending Anchor Point) 3481
21.3.2.26 txBody (Shape Text Body) 3481
21.3.2.27 x (Relative X Coordinate) 3481
21.3.2.28 xfrm (Graphic Frame Transform) 3482
21.3.2.29 y (Relative Y Coordinate) 3483

21.3.3 Simple Types 3483

21.3.3.1 ST_MarkerCoordinate (Chart Marker Coordinate Value) 3483

End of informative text.

21.3.2 Elements

The following element define the contents of the ChartDrawing namespace:

21.3.2.1 absSizeAnchor (Absolute Anchor Shape Size)

This element specifies that the shape described here to reside within a chart should be sized based on relative anchor points. This is achieved via two elements. The from element specifies the top left corner of the shape bounding box in a RTL(right-to-left) implementation. The ext element then specifies the bottom right corner of the shape bounding box in a RTL(right-to-left) implementation and thus the size of the shape.

[*Note*: The W3C XML Schema definition of this element's content model (CT_AbsSizeAnchor) is located in §A.5.2. *end note*]

21.3.2.2 blipFill (Picture Fill)

This element specifies the kind of picture fill that the picture object has. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[*Example*: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<pic:pic>
  …
  <pic:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </pic:blipFill>
  …
</pic:pic>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

The above picture object is shown as an example of this fill kind. *end example*]

[*Example*: Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```
<pic:pic>
  …
  <pic:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </pic:blipFill>
  <pic:spPr>
    <a:gradFill>
      <a:gsLst>
        <a:gs pos="0">
          <a:schemeClr val="tx2">
            <a:shade val="50000"/>
          </a:schemeClr>
        </a:gs>
        <a:gs pos="39999">
          <a:schemeClr val="tx2">
            <a:tint val="20000"/>
          </a:schemeClr>
        </a:gs>
        <a:gs pos="70000">
          <a:srgbClr val="C4D6EB"/>
        </a:gs>
        <a:gs pos="100000">
          <a:schemeClr val="bg1"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
        </a:gs>
      </a:gsLst>
    </a:gradFill>
  </pic:spPr>
  …
</pic:pic>
```

The above picture object is shown as an example of this double fill kind. *End example*]

Attributes	Description
dpi (DPI Setting) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used. [*Note*: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. *end note*] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_BlipFillProperties) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

21.3.2.3 cNvCxnSpPr (Non-Visual Connection Shape Drawing Properties)

This element specifies the non-visual drawing properties for a connector shape. These non-visual properties are properties that the generating application would utilize when rendering the parent chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualConnectorProperties) is located in §A.4.1. *end note*]

21.3.2.4 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualGraphicFrameProperties) is located in §A.4.1. *end note*]

21.3.2.5 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the chart.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualGroupDrawingShapeProps) is located in §A.4.1. *end note*]

21.3.2.6 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[*Example*: Consider the following DrawingML.

```
<pic:pic>
  …
  <pic:nvPicPr>
    <pic:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
    <pic:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </pic:cNvPicPr>
    <pic:nvPr/>
  </pic:nvPicPr>
  …
</pic:pic>
```

End example]

Attributes	Description
preferRelativeResize (Relative Resize	Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
Preferred) Namespace: http://purl.oclc.org/ooxml/drawingml/main	relative to the original picture size as opposed to the current picture size. [*Example*: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked. If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualPictureProperties) is located in §A.4.1. *end note*]

21.3.2.7 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following ChartDrawingML.

```
<cdr:pic>
  …
  <cdr:nvPicPr>
    <cdr:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
  </cdr:nvPicPr>
  …
</cdr:pic>
```

end example]

Attributes	Description
descr (Alternative Text for Object) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which do not display the current object. If this element is omitted, then no alternative text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… descr="A picture of a bowl of fruit">` The descr attribute contains alternative text which can be used in place of the actual

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	DrawingML object. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
hidden (Hidden) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [*Note*: An application can have settings which allow this object to be viewed. *end note*] If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden). [*Example*: Consider an inline DrawingML object which must be hidden within the document's content. This setting would be specified as follows: `<… hidden="true" />` The hidden attribute has a value of `true`, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
id (Unique Identifier) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document. If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant. [*Example*: Consider a DrawingML object defined as follows: `<… id="10" … >` The id attribute has a value of `10`, which is the unique identifier for this DrawingML object. *end example*] The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).
name (Name) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the name of the object. [*Note*: Typically, this is used to store the original file name of a picture object. *end note*] [*Example*: Consider a DrawingML object defined as follows: `< … name="foo.jpg" >`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	The name attribute has a value of `foo.jpg`, which is the name of this DrawingML object. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
title (Title) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the title (caption) of the current DrawingML object. If this attribute is omitted, then no title text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… title="Process Flow Diagram">` *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualDrawingProps) is located in §A.4.1. *end note*]

21.3.2.8 cNvSpPr (Non-Visual Shape Drawing Properties)

This element specifies the non-visual drawing properties for a shape. These properties are to be used by the generating application to determine how the shape should be dealt with.

[*Example*: Consider the shape that has a shape lock applied to it.

```
<cdr:sp>
  <cdr:nvSpPr>
    <cdr:cNvPr id="2" name="Rectangle 1"/>
    <cdr:cNvSpPr>
      <a:spLocks noGrp="1"/>
    </cdr:cNvSpPr>
  </cdr:nvSpPr>
  …
</cdr:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. *end example*]

Attributes	Description
txBox (Text Box) Namespace:	Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
http://purl.oclc.org/ooxml/drawingml/main	[*Note*: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. *end note*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NonVisualDrawingShapeProps) is located in §A.4.1. *end note*]

21.3.2.9 cxnSp (Connection Shape)

This element specifies a connection shape that is used to connect two sp elements. Once a connection is specified using a cxnSp, it is left to the generating application to determine the exact path the connector takes. That is the connector routing algorithm is left up to the generating application as the desired path might be different depending on the specific needs of the application.

[*Example*:

end example]

[*Example*: Consider the following connector shape that connects two regular shapes.

```
<cdrcdr:grpSp>
  …
  <cdr:sp>
    <cdr:nvSpPr>
      <cdr:cNvPr id="1" name="Rectangle 1"/>
      <cdr:cNvSpPr/>
      <cdr:nvPr/>
    </cdr:nvSpPr>
    …
  </cdr:sp>
  <cdr:sp>
    <cdr:nvSpPr>
      <cdr:cNvPr id="2" name="Rectangle 2"/>
      <cdr:cNvSpPr/>
      <cdr:nvPr/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
      </cdr:nvSpPr>
      …
    </cdr:sp>
    <cdr:cxnSp>
      <cdr:nvCxnSpPr>
        <cdr:cNvPr id="3" name="Elbow Connector 3"/>
        <cdr:cNvCxnSpPr>
          <a:stCxn id="1" idx="3"/>
          <a:endCxn id="2" idx="1"/>
        </cdr:cNvCxnSpPr>
        <cdr:nvPr/>
      </cdr:nvCxnSpPr>
      …
    </cdr:cxnSp>
  </cdr:grpSp>
```

end example]

Attributes	Description

fPublished (Publish to Server)	Specifies whether the shape shall be published with the worksheet when sent to the spreadsheet server. This is for use when interfacing with a document server.
	
	[*Example*: Consider the following shape that is not published with the worksheet when it is published back on the spreadsheet server.
	`<cdr:relSizeAnchor>`
	`…`
	`<cdr:sp fPublished="0">`
	`..`
	`</cdr:sp>`
	`…`
	`</cdr:relSizeAnchor>`
	end example]
	
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

macro (Reference to Custom Function)	This element specifies the custom function associated with the chart. [*Example*: A macro script, add-in function, and so on. *end example*] The format of this string shall be application-defined, and should be ignored if not understood. [*Example*: `<… macro="DoWork()" >` *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Connector) is located in §A.5.2. *end note*]

21.3.2.10 ext (Shape Extent)

This element describes the length and width properties for how far a drawing element should extend for.

Attributes	Description
cx (Extent Length) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `<… cx="1828800" cy="200000"/>` The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
cy (Extent Width) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PositiveSize2D) is located in §A.4.1. *end note*]

21.3.2.11 from (Starting Anchor Point)

This element specifies the first anchor point for the drawing element. This is used to anchor the top and left sides of the shape within the chart. That is when the corresponding chart is adjusted, the shape is also adjusted.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Example*: Consider the following Chart Drawing content:

```
<cdr:relSizeAnchor>
  <cdr:from>
    <cdr:x>0.04583</cdr:x>
    <cdr:y>0.53125</cdr:y>
  </cdr:from>
  <cdr:to>
    <cdr:x>0.24583</cdr:x>
    <cdr:y>0.86458</cdr:y>
  </cdr:to>
  <cdr:sp macro="" textlink="">
  …
  </cdr:sp>
</cdr:relSizeAnchor>
```

The above example shows the first anchor point being specified via the from element. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_Marker) is located in §A.5.2. *end note*]

21.3.2.12 graphicFrame (Graphic Frame)

This element specifies the existence of a graphics frame. This frame contains a graphic that was generated by an external source and needs a container in which to be displayed on the slide surface.

Attributes	Description

fPublished (Publish To Server)	Specifies whether the shape shall be published with the worksheet when sent to the spreadsheet server. This is for use when interfacing with a document server.
	
	[*Example*: Consider the following shape that is not published with the worksheet when it is published back on the spreadsheet server.
	`<cdr:relSizeAnchor>`
	`…`
	`<cdr:sp fPublished="0">`
	`…`
	`</cdr:sp>`
	`…`
	`</cdr:relSizeAnchor>`
	end example]
	
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

macro (Reference to Custom Function)	This element specifies the custom function associated with the chart. [*Example*: A macro script, add-in function, and so on. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	The format of this string shall be application-defined, and should be ignored if not understood. [*Example*: `<… macro="DoWork()" >` *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_GraphicFrame) is located in §A.5.2. *end note*]

21.3.2.13 grpSp (Group Shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[*Example*: Consider the following group shape.

```
<cdr:grpSp>
  <cdr:nvGrpSpPr>
    <cdr:cNvPr id="10" name="Group 9"/>
    <cdr:cNvGrpSpPr/>
    <cdr:nvPr/>
  </cdr:nvGrpSpPr>
  <cdr:grpSpPr>
    <a:xfrm>
      <a:off x="838200" y="990600"/>
      <a:ext cx="2426208" cy="978408"/>
      <a:chOff x="838200" y="990600"/>
      <a:chExt cx="2426208" cy="978408"/>
    </a:xfrm>
  </cdr:grpSpPr>
  <cdr:sp>
  …
  </cdr:sp>
  <cdr:sp>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
    …
    </cdr:sp>
    <cdr:sp>
    …
    </cdr:sp>
  </cdr:grpSp>
```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_GroupShape) is located in §A.5.2. *end note*]

21.3.2.14 grpSpPr (Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes use when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).

[*Note*: The W3C XML Schema definition of this element's content model (CT_GroupShapeProperties) is located in §A.4.1. *end note*]

21.3.2.15 nvCxnSpPr (Connector Non Visual Properties)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ConnectorNonVisual) is located in §A.5.2. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.3.2.16 nvGraphicFramePr (Non-Visual Graphic Frame Properties)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

[*Note*: The W3C XML Schema definition of this element's content model (CT_GraphicFrameNonVisual) is located in §A.5.2. *end note*]

21.3.2.17 nvGrpSpPr (Non-Visual Group Shape Properties)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

[*Note*: The W3C XML Schema definition of this element's content model (CT_GroupShapeNonVisual) is located in §A.5.2. *end note*]

21.3.2.18 nvPicPr (Non-Visual Picture Properties)

This element specifies the non visual properties for a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```
<pic:pic>
  …
  <pic:nvPicPr>
    …
  </pic:nvPicPr>
  …
</pic:pic>
```

End example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_PictureNonVisual) is located in §A.5.2. *end note*]

21.3.2.19 nvSpPr (Non-Visual Shape Properties)

This element specifies all non-visual properties for a shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a shape. This allows for additional information that does not affect the appearance of the shape to be stored.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShapeNonVisual) is located in §A.5.2. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

21.3.2.20 pic (Picture)

This element specifies the existence of a picture object within the document.

[*Example*: Consider the following ChartDrawingML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<cdr:pic>
  <cdr:nvPicPr>
    <cdr:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
    <cdr:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </cdr:cNvPicPr>
    <cdr:nvPr/>
  </cdr:nvPicPr>
  <cdr:blipFill>
  …
  </cdr:blipFill>
  <cdr:spPr>
  …
  </cdr:spPr>
</cdr:pic>
```

end example]

Attributes	Description

fPublished (Publish to Server)	Specifies whether the shape shall be published with the worksheet when sent to the spreadsheet server. This is for use when interfacing with a document server.
	
	[*Example*: Consider the following shape that is not published with the worksheet when it is published back on the spreadsheet server.
	`<cdr:relSizeAnchor>`
	`…`
	`<cdr:sp fPublished="0">`
	`…`
	`</cdr:sp>`
	`…`
	`</cdr:relSizeAnchor>`
	end example]
	
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

macro (Reference to Custom Function)	This element specifies the custom function associated with the chart. [*Example*: A macro script, add-in function, and so on. *end example*] The format of this string shall be application-defined, and should be ignored if not

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	understood. [*Example*: `<… macro="DoWork()" >` *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Picture) is located in §A.5.2. *end note*]

21.3.2.21 relSizeAnchor (Relative Anchor Shape Size)

This element specifies that the shape described here to reside within a chart should be sized based on relative anchor points. This is achieved via two elements. The from element specifies the top left corner of the shape bounding box in a RTL(right-to-left) implementation. The to element then specifies the bottom right corner of the shape bounding box in a RTL(right-to-left) implementation and thus the size of the shape.

[*Note*: The W3C XML Schema definition of this element's content model (CT_RelSizeAnchor) is located in §A.5.2. *end note*]

21.3.2.22 sp (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to geometry, each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

Attributes	Description

fLocksText (Lock Text)	Specifies whether to allow for the editing of text within this shape when the worksheet on which the shape resides has been protected as defined by SpreadsheetML. This allows for the specifying of locked or "protected" text on a per-shape basis within a spreadsheet document. If this attribute is not specified then a value of 0, or false is assumed.
	
	[*Example*: Consider the following shape that does not have locked text on.
	`<cdr:relSizeAnchor>`
	`…`
	`<cdr:sp fLocksText="0">`
	`…`
	`</cdr:sp>`
	`…`
	`</cdr:relSizeAnchor>`

Attributes	Description
	end example] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

fPublished (Publish to Server)	Specifies whether the shape shall be published with the worksheet when sent to the spreadsheet server. This is for use when interfacing with a document server.
	
	[*Example*: Consider the following shape that is not published with the worksheet when it is published back on the spreadsheet server.
	`<cdr:relSizeAnchor>`
	`…`
	`<cdr:sp fPublished="0">`
	`…`
	`</cdr:sp>`
	`…`
	`</cdr:relSizeAnchor>`
	end example]
	
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

macro (Reference to Custom Function)	This element specifies the custom function associated with the chart. [*Example*: A macro script, add-in function, and so on. *end example*] The format of this string shall be application-defined, and should be ignored if not understood. [*Example*: `<… macro="DoWork()" >` *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

textlink (Text Link)	Specifies whether the text contained within this shape is linked to a cell within the spreadsheet. That is the text within the shape has the value defined in the referenced spreadsheet cell.
	
	[*Example*: Consider the following shape with text linked to cell A1.
	`<cdr:relSizeAnchor>`
	`…`
	`<cdr:sp macro="" textlink="A1">`
	`…`
	`</cdr:sp>`
	`…`
	`</cdr:relSizeAnchor>`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	end example] The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Shape) is located in §A.5.2. *end note*]

21.3.2.23 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a special shape such as a connector shape or picture. These are the same properties that are allowed to describe the visual properties of a shape but are used here to describe additional object-specific properties within a document. This allows for these shapes to have both the properties of a shape as well as specific properties that are unique to only them.

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShapeProperties) is located in §A.4.1. *end note*]

21.3.2.24 style (Shape Style)

The element specifies the style that is applied to a shape and the corresponding references for each of the style components such as lines and fills.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShapeStyle) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

21.3.2.25 to (Ending Anchor Point)

This element specifies the second anchor point for the drawing element. This is used to anchor the bottom and right sides of the shape within the spreadsheet. That is when the corresponding chart is adjusted, the shape is also adjusted.

[*Example*: Consider the following ChartDrawingML

```
<cdr:relSizeAnchor>
  <cdr:from>
    <cdr:x>0.04583</cdr:x>
    <cdr:y>0.53125</cdr:y>
  </cdr:from>
  <cdr:to>
    <cdr:x>0.24583</cdr:x>
    <cdr:y>0.86458</cdr:y>
  </cdr:to>
  <cdr:sp macro="" textlink="">
  …
  </cdr:sp>
</cdr:relSizeAnchor>
```

The above example shows the second anchor point being specified via the to element. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_Marker) is located in §A.5.2. *end note*]

21.3.2.26 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextBody) is located in §A.4.1. *end note*]

21.3.2.27 x (Relative X Coordinate)

This element specifies the relative x coordinate that is used to define the percentage-based horizontal position for a shape within a chart drawing object. The coordinate boundaries are specified within the corresponding simple type listed below.

The possible values for this element are defined by the ST_MarkerCoordinate simple type (§21.3.3.1).

[*Note*: The W3C XML Schema definition of this element's content model (ST_MarkerCoordinate) is located in §A.5.2. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

21.3.2.28 xfrm (Graphic Frame Transform)

This element specifies a 2-D transform to be applied to a Graphic Frame.

Attributes	Description
flipH (Horizontal Flip) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a horizontal flip. When true, this attribute defines that the shape is flipped horizontally about the center of its bounding box. [*Example*: The following illustrates the effect of a horizontal flip. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
flipV (Vertical Flip) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box. [*Example*: The following illustrates the effect of a vertical flip. *end example*] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rot (Rotation) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Transform2D) is located in §A.4.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

21.3.2.29 y (Relative Y Coordinate)

This element specifies the relative y coordinate that is used to define the percentage-based vertical position for a shape within a chart drawing object. The coordinate boundaries are specified within the corresponding simple type listed below.

The possible values for this element are defined by the ST_MarkerCoordinate simple type (§21.3.3.1).

[*Note*: The W3C XML Schema definition of this element's content model (ST_MarkerCoordinate) is located in §A.5.2. *end note*]

21.3.3 Simple Types

This is the complete list of simple types dedicated to DrawingML – Chart Drawings.

21.3.3.1 ST_MarkerCoordinate (Chart Marker Coordinate Value)

This simple type specifies the chart marker coordinate value. It is to be represented as a fractional position between 0.0 and 1.0 of the chart width or height with 0.0 being the left or top edge.

This simple type's contents are a restriction of the W3C XML Schema double datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.0.
- This simple type has a maximum value of less than or equal to 1.0.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_MarkerCoordinate) is located in §A.5.2. *end note*]

21.4 DrawingML - Diagrams

A DrawingML diagram allows the definition of diagrams using DrawingML objects and constructs. This namespace defines the contents of a DrawingML diagram.

21.4.1 Table of Contents

This subclause is informative.

21.4.2 Diagram Definition

This section specifies the elements which define the layout and hierarchy of a diagram based on its constituent nodes and connections.

21.4.2.1 adj (Shape Adjust)

Shape adjust value. These can be used to modify the adjust handles supported on various auto shapes. It is only possible to set the initial value, not to modify it using constraints and rules.

[*Example*: Consider the following example of the adj element in a DrawingML diagram:

```
<adjLst>
    <adj idx="2" val=".35" />
</adjLst>
```

In this example we have a single adjust handle being modified by setting its value to 0.35. *end example*]

Attributes	Description
idx (Adjust Handle Index)	Adjust value index. Different shapes support different adjust handles. The possible values for this attribute are defined by the ST_Index1 simple type (§21.4.7.39).
val (Value)	An absolute value. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Adj) is located in §A.5.3. *end note*]

21.4.2.2 adjLst (Shape Adjust List)

This element is simply a list of shape adjusts.

[*Example*: Consider the following example of the adjLst element in a DrawingML diagram:

```
<adjLst>
   <adj idx="1" val="1.35" />
    <adj idx="2" val=".35" />
</adjLst>
```

In this example we have a two adjust handle being modified for the containing shape. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_AdjLst) is located in §A.5.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.4.2.3 alg (Algorithm)

The algorithm used by the containing layout node. The algorithm defines the behavior of the layout node along with the behavior and layout of the nested layout nodes.

[*Example*: Consider the following example of alg being used in a DrawingML diagram:

```
<layoutNode name="arrow">
    <varLst/>
    <alg type="tx" />
    <shape type="upArrow">
          <adjLst>
                <adj idx="2" val=".35" />
          </adjLst>
    </shape>
    <presOf axis="desOrSelf" ptType="node" />
    <ruleLst/>
</layoutNode>
```

In this example, the `tx` algorithm is being used to layout text within the containing layout node. *end example*]

Attributes	Description
rev (Revision Number)	The revision number of an algorithm. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
type (Algorithm Type)	Specifies the algorithm type. The possible values for this attribute are defined by the ST_AlgorithmType simple type (§21.4.7.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Algorithm) is located in §A.5.3. *end note*]

21.4.2.4 cat (Category)

This element specifies a category in the user interface where this layout definition displays to the user.

[*Example*: Consider the following example of a cat in a DrawingML diagram:

```
<catLst>
    <cat type="relationship" pri="19000" />
</catLst>
```

In this example we define a single category called `relationship` which has a priority of `19000`. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
pri (Priority)	The priority within the category for this diagram determines the order in which it displays in the user interface. Lower numbers are displayed at the beginning of the list. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
type (Category Type)	Specifies the category type associated with the element. The possible values for this attribute are defined by the W3C XML Schema anyURI datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Category) is located in §A.5.3. *end note*]

21.4.2.5 catLst (Category List)

This element is simply a list of cat elements.

[*Example*: Consider the following example of a catLst element in a DrawingML diagram:

```
<catLst>
    <cat type="list" pri="18000" />
    <cat type="relationship" pri="19000" />
</catLst>
```

In this example we define two different categories which are to be displayed in the user interface. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_Categories) is located in §A.5.3. *end note*]

21.4.2.6 choose (Choose Element)

The choose element wraps if/else blocks into a choose block.

[*Example*: Consider the following example of a choose element in a DrawingML diagram:

```
<choose name="Name1">
    <if name="Name2" func="var" arg="dir" op="equ" val="norm">
        <alg type="snake">
            <param type="grDir" val="tL"/>
            <param type="flowDir" val="row"/>
            <param type="contDir" val="sameDir"/>
            <param type="off" val="ctr"/>
        </alg>
    </if>
    <else name="Name3">
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
            <alg type="snake">
                  <param type="grDir" val="tR"/>
                  <param type="flowDir" val="row"/>
                  <param type="contDir" val="sameDir"/>
                  <param type="off" val="ctr"/>
            </alg>
      </else>
</choose>
```

In this example, a choose element is used to define two different sets of parameters associated with a snake algorithm depending upon the direction in which the user wants the algorithm to flow (RTL or LTR). *end example*]

Attributes	Description

name (Name)	A unique name associated with the choose statement.
	
	[*Example*: Consider the following example of a choose element in a DrawingML diagram:
	
	`<choose name="Name1">`
	
	…
	
	`</choose>`
	
	In this example, the choose element is named `Name1`. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Choose) is located in §A.5.3. *end note*]

21.4.2.7 clrData (Color Transform Sample Data)

This element defines the sample data that is to be used in the user interface controls regarding displaying color transforms for a given diagram. This sample data predefines a data model to be combined with a layout definition in order to create a diagram which a color transform can be applied and displayed to the user as an example of the color transform.

[*Example*: Consider the following example of a clrData element in a DrawingML diagram:

```
<clrData>
    <dataModel>
          <ptLst>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
                <pt modelId="0" type="doc"/>
                <pt modelId="1"/>
                <pt modelId="2"/>
                <pt modelId="3"/>
                <pt modelId="4"/>
                <pt modelId="5"/>
                <pt modelId="6"/>
            </ptLst>
            <cxnLst>
                <cxn modelId="7" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
                <cxn modelId="8" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
                <cxn modelId="9" srcId="0" destId="3" srcOrd="2" destOrd="0"/>
                <cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>
                <cxn modelId="11" srcId="0" destId="5" srcOrd="4" destOrd="0"/>
                <cxn modelId="12" srcId="0" destId="6" srcOrd="5" destOrd="0"/>
            </cxnLst>
            <bg/>
            <whole/>
        </dataModel>
    </clrData>
```

In this example we define 6 points which all connect back to a seventh document type point. *end example*]

Attributes	Description
useDef (Use Default)	If the value of this attribute is `true`, the data model defined in the clrData element is ignored and a default data model is used instead. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SampleData) is located in §A.5.3. *end note*]

21.4.2.8 constr (Constraint)

This element is used to specify size, position of nodes, text values, and layout dependencies between nodes in a layout definition.

[*Example*: Consider the following example of a constraint list which contains some example constraints being defined and applied to layout nodes in the layout definition:

```
    <constrLst>
        <constr type="w" for="ch" forName="node1" refType="w" refForName=""/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
    <constr type="h" for="ch" forName="node1" refType="w" refFor="ch"
refForName="node1" op="equ" fact="0.6"/>
    <constr type="w" for="ch" forName="transition1" refType="w" refFor="ch"
refForName="node1" op="equ" fact="0.1"/>
    <constr type="primFontSz" for="ch" forName="node1" refForName="" op="equ"
val="100"/>
</constrLst>
```

In this example we can see constraints being defined for the width and height along with the primary font size for a layout node referenced by `node1`. The width for a transition is also specified. *end example*]

Attributes	Description
fact (Factor)	Factor used in a reference constraint or a rule in order to modify a referenced value by the factor defined. [*Example*: Consider the following example of fact in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, the width for `transition1` is being defined as one-tenth the width of `node1`. *end example*] The possible values for this attribute are defined by the W3C XML Schema double datatype.
for (For)	Specifies the axis of layout nodes to apply a constraint or rule to. [*Example*: Consider the following example of for in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, the for attribute is specifying that `node1` is a child node to the current layout node. *end example*] The possible values for this attribute are defined by the ST_ConstraintRelationship simple type (§21.4.7.20).
forName (For Name)	Specifies the name of the layout node to apply a constraint or rule to. [*Example*: Consider the following example of forName in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, forName is specifying the layout node named `transition1` for its reference. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema string datatype.
op (Operator)	The operator constraint used to evaluate the condition. [*Example*: Consider the following example of op in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, op is specifying an equality defined between the two referencing values. *end example*] The possible values for this attribute are defined by the ST_BoolOperator simple type (§21.4.7.10).
ptType (Data Point Type)	Specifies the type of data point to select. The possible values for this attribute are defined by the ST_ElementType simple type (§21.4.7.27).
refFor (Reference For)	The for value of the referenced constraint. [*Example*: Consider the following example of refFor in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, refFor is specifying the reference constraint is a child of the current layout node. *end example*] The possible values for this attribute are defined by the ST_ConstraintRelationship simple type (§21.4.7.20).
refForName (Reference For Name)	The name of the layout node referenced by a reference constraint. [*Example*: Consider the following example of refForName in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, refForName is specifying the layout node named node1 for its reference. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
refPtType (Reference Point Type)	The point type used int he referenced constraint. The possible values for this attribute are defined by the ST_ElementType simple type (§21.4.7.27).
refType (Reference Type)	Specifies the type of a reference constraint. [*Example*: Consider the following example of refType in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, refType is specifying referencing the width attribute of `node1`. *end example*] The possible values for this attribute are defined by the ST_ConstraintType simple type (§21.4.7.21).
type (Constraint Type)	Specifies the constraint to apply to this layout node. [*Example*: Consider the following example of type in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, type is specifying the width attribute of `transition1`. *end example*] The possible values for this attribute are defined by the ST_ConstraintType simple type (§21.4.7.21).
val (Value)	Specifies an absolute value instead of reference another constraint. [*Example*: Consider the following example of forName in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" val="10"/>` In this example, val is specifying the absolute value of the width of `transition1`. *end example*] The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Constraint) is located in §A.5.3. *end note*]

21.4.2.9 constrLst (Constraint List)

This element is simply a list of constraints.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Example*: Consider the following example of a constraint list which contains some example constraints which are being defined and applied to layout nodes in the layout definition:

```
<constrLst>
    <constr type="w" for="ch" forName="node1" refType="w" refForName=""/>
    <constr type="h" for="ch" forName="node1" refType="w" refFor="ch"
refForName="node1" op="equ" fact="0.6"/>
    <constr type="w" for="ch" forName="transition1" refType="w" refFor="ch"
refForName="node1" op="equ" fact="0.1"/>
    <constr type="primFontSz" for="ch" forName="node1" refForName="" op="equ"
val="100"/>
</constrLst>
```

In this example we can see constraints being defined for the width and height along with the primary font size for a layout node referenced by `node1`. The width for a transition is also specified. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_Constraints) is located in §A.5.3. *end note*]

21.4.2.10 dataModel (Data Model)

The data for this instance of the diagram. Either a sample data model, or the data the user has entered.

[*Note*: The W3C XML Schema definition of this element's content model (CT_DataModel) is located in §A.5.3. *end note*]

21.4.2.11 desc (Description)

This element holds a description for a layout definition. The description can be used to describe the qualities associated with a particular layout definition.

Attributes	Description
lang (Language)	The natural language of the title or description of this layout definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.
val (Value)	The string which is used as the description of the layout definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Description) is located in §A.5.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.4.2.12 else (Else)

This element is similar to an else statement in a programming language in that it wraps elements which are to be used when the if conditionals are not true.

[*Example*: Consider the following example of an else element in a DrawingML diagram within the context of a choose statement:

```
<choose name="Name1">
    <if name="Name2" func="var" arg="dir" op="equ" val="norm">
          <alg type="snake">
                <param type="grDir" val="tL"/>
                <param type="flowDir" val="row"/>
                <param type="contDir" val="sameDir"/>
                <param type="off" val="ctr"/>
          </alg>
    </if>
    <else name="Name3">
          <alg type="snake">
                <param type="grDir" val="tR"/>
                <param type="flowDir" val="row"/>
                <param type="contDir" val="sameDir"/>
                <param type="off" val="ctr"/>
          </alg>
    </else>
</choose>
```

In this example, a else element is used to define a set of parameters associated with the snake algorithm when the diagram is reversed. *end example*]

Attributes	Description

name (Name)	A unique name associated with the choose statement.
	
	[*Example*: Consider the following example of a else element in a DrawingML diagram:
	
	`<else name="Name1">`
	
	…
	
	`</else>`
	
	In this example, the else element is named `Name1`. *end example*].
	
	The possible values for this attribute are defined by the W3C XML Schema string

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
	datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Otherwise) is located in §A.5.3. *end note*]

21.4.2.13 extLst (Extension List)

This element specifies an extension list, within which all future extensions are defined within ext elements.

The extension list along with corresponding future extensions is used to extend the storage capabilities of the DrawingML framework. This allows for various new types of data to be stored natively within the existing diagram syntax.

[*Note*: The W3C XML Schema definition of this element's content model (CT_OfficeArtExtensionList) is located in §A.4.1. *end note*]

21.4.2.14 forEach (For Each)

A looping structure, similar to a `for` loop in a programming language, which defines what data model points use this layout node.

[*Example*: Consider the following example of a forEach being used within a DrawingML diagram:

```
<forEach name="Name5" ref="" axis="ch" ptType="node">
    <layoutNode name="node1" styleLbl="" moveWith="">
          <alg type="sp"/>
          <shape
xmlns:r="http://purl.oclc.org/ooxml/officeDocument/relationships" r:blip="">
                <adjLst/>
          </shape>
          <constrLst/>
    </layoutNode>
</forEach>
```

In this example, the forEach element creates a layout node, referenced by the name `node1`, for every associated data model point in the diagram. In this particular instance the forEach creates the layout node for every child of the current point node. *end example*]

Attributes	Description
axis (Axis)	Specifies the axis on which to select data from the data model. [*Example*: `axis="ch"` selects children of the current point node and `axis="des"` selects all descendants. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	The possible values for this attribute are defined by the ST_AxisTypes simple type (§21.4.7.7).

cnt (Count)	Specifies the count of items to use in a data set.
	
	[*Example*: Consider the following example of a forEach in a DrawingML diagram:
	
	`<forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2">`
	
	…
	
	`</forEach>`
	
	In this example, up to two children are obtained through this forEach. *end example*]
	
	The possible values for this attribute are defined by the ST_UnsignedInts simple type (§21.4.7.63).

hideLastTrans (Hide Last Transition)	In algorithms that support transitions, this attribute specifies that the last transition is not rendered. This allows for diagrams that start and end with a node. The possible values for this attribute are defined by the ST_Booleans simple type (§21.4.7.9).
name (Name)	A unique identifier for the layout node. The possible values for this attribute are defined by the W3C XML Schema string datatype.

ptType (Data Point Type)	Specifies the type of data point to select.
	
	[*Example*: Consider the following example of a forEach in a DrawingML diagram:
	
	`<forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2">`
	
	…
	
	`</forEach>`
	
	In this example, the forEach selects all node type points in the set. *end example*]
	
	The possible values for this attribute are defined by the ST_ElementTypes simple type (§21.4.7.28).

ref (Reference)	When used on a for-each element, causes the specified for-each element to be used instead. The possible values for this attribute are defined by the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
st (Start)	Specifies where to start in a data set. [*Example*: Consider the following example of a forEach in a DrawingML diagram: `<presOf axis="desOrSelf" ptType="node" st="2"/>` In this example, the second element in the set is the first point returned. *end example*] The possible values for this attribute are defined by the ST_Ints simple type (§21.4.7.40).
step (Step)	Specifies the step to use in a data set. A step with a value of 2 returns every other item in the set. The possible values for this attribute are defined by the ST_Ints simple type (§21.4.7.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ForEach) is located in §A.5.3. *end note*]

21.4.2.15 if (If)

Like an if statement in a programming language, wraps elements which are to be used under the conditions defined by its attributes.

[*Example*: Consider the following example of an if element in a DrawingML diagram within the context of a choose statement:

```
<choose name="Name1">
    <if name="Name2" func="var" arg="dir" op="equ" val="norm">
          <alg type="snake">
                <param type="grDir" val="tL"/>
                <param type="flowDir" val="row"/>
                <param type="contDir" val="sameDir"/>
                <param type="off" val="ctr"/>
          </alg>
    </if>
    <else name="Name3">
          <alg type="snake">
                <param type="grDir" val="tR"/>
                <param type="flowDir" val="row"/>
                <param type="contDir" val="sameDir"/>
                <param type="off" val="ctr"/>
          </alg>
    </else>
</choose>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

In this example, a if element is used to define a set of parameters associated with the snake algorithm when the diagram is in the normal direction. *end example*]

Attributes	Description
arg (Argument)	Specifies the variable to use as part of the test in an if element. Ignored unless the function attribute is set to "var". The possible values for this attribute are defined by the ST_FunctionArgument simple type (§21.4.7.31).
axis (Axis)	Specifies the axis on which to select data from the data model. [*Example*: `axis="ch"` selects children of the current point node and `axis="des"` selects all descendants. *end example*] The possible values for this attribute are defined by the ST_AxisTypes simple type (§21.4.7.7).

cnt (Count)	Specifies the count of items to use in a data set.
	
	[*Example*: Consider the following example of a forEach in a DrawingML diagram:
	
	`<forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2">`
	
	…
	
	`</forEach>`
	
	In this example, up to two children are obtained through this forEach. *end example*]
	
	The possible values for this attribute are defined by the ST_UnsignedInts simple type (§21.4.7.63).

func (Function)	The function used to evaluate the if condition.
	
	[*Example*: Consider the following example of `func` being used in DrawingML:
	
	`<if name="Name2" func="var" arg="dir" op="equ" val="norm">`
	…
	`</if>`
	
	In this example, `func` is set to `var`. *end example*]
	
	The possible values for this attribute are defined by the ST_FunctionType simple type (§21.4.7.33).

hideLastTrans (Hide Last Transition)	In algorithms that support transitions, this attribute specifies that the last transition is not rendered. This allows for diagrams that start and end with a node. The possible values for this attribute are defined by the ST_Booleans simple type

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	(§21.4.7.9).

name (Name)	A unique identifier for the layout node.
	
	The function used to evaluate the if condition.
	
	[*Example*: Consider the following example of name being used in DrawingML:
	
	`<if name="Name2" func="var" arg="dir" op="equ" val="norm">`
	`…`
	`</if>`
	
	In this example, the name attribute is set to Name2. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema string datatype.

op (Operator)	The operator used to evaluate the condition.
	
	[*Example*: Consider the following example of op being used in DrawingML:
	
	`<if name="Name2" func="var" arg="dir" op="equ" val="norm">`
	`…`
	`</if>`
	
	In this example, op is being used to test the equality of the argument and value. *end example*]
	
	The possible values for this attribute are defined by the ST_FunctionOperator simple type (§21.4.7.32).

ptType (Data Point Type)	Specifies the type of data point to select.
	
	[*Example*: Consider the following example of a forEach in a DrawingML diagram:
	
	`<forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2">`
	
	`…`
	
	`</forEach>`
	
	In this example, the forEach selects all node type points in the set. *end example*]
	
	The possible values for this attribute are defined by the ST_ElementTypes simple type (§21.4.7.28).

st (Start)	Specifies where to start in a data set. [*Example*: Consider the following example of a forEach in a DrawingML diagram:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	<presOf axis="desOrSelf" ptType="node" st="2"/> In this example, the second element in the set is the first point returned. *end example*] The possible values for this attribute are defined by the ST_Ints simple type (§21.4.7.40).
step (Step)	Specifies the step to use in a data set. A step with a value of 2 returns every other item in the set. The possible values for this attribute are defined by the ST_Ints simple type (§21.4.7.40).
val (Value)	An absolute value. The possible values for this attribute are defined by the ST_FunctionValue simple type (§21.4.7.34).

[*Note*: The W3C XML Schema definition of this element's content model (CT_When) is located in §A.5.3. *end note*]

21.4.2.16 layoutDef (Layout Definition)

This element is the root element for defining a layout definition. The layout definition is defined through a set of nested layout nodes. The layout definition is responsible for defining the look of a diagram.

Attributes	Description
defStyle (Default Style)	This attribute defines a reference to a default style which is to be applied to the diagram. The possible values for this attribute are defined by the W3C XML Schema string datatype.
minVer (Minimum Version)	Minimum product version that can support this layout definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.
uniqueId (Unique Identifier)	The unique identifier for this layout definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_DiagramDefinition) is located in §A.5.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

21.4.2.17 layoutDefHdr (Layout Definition Header)

This element is the header information representing the minimum knowledge needed by an application to preload information about a layout definition. This preloading allows for the actual load of the layout definition to occur at a later time which helps with any performance concerns an application might have.

[*Example*: Consider the following example of a layoutDefHdr within a DrawingML diagram:

```
<layoutDefHdr uniqueId="urn:layout/default">
    <title val="Basic Block List" />
    <desc val="" />
    <catLst>
        <cat type="list" pri="1000" />
    </catLst>
</layoutDefHdr>
```

In this example we define a title along with a category and prioritization for the diagram referenced by the uniqueId of urn:layout:default. *end example*]

Attributes	Description
defStyle (Default Style)	This attribute defines a reference to a default style which is to be applied to the diagram. The possible values for this attribute are defined by the W3C XML Schema string datatype.
minVer (Minimum Version)	Minimum product version that can support this Diagram Layout. The possible values for this attribute are defined by the W3C XML Schema string datatype.
resId (Resource Identifier)	Resource ID used internally. The possible values for this attribute are defined by the W3C XML Schema int datatype.
uniqueId (Unique Identifier)	The unique identifier for this layout definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_DiagramDefinitionHeader) is located in §A.5.3. *end note*]

21.4.2.18 layoutDefHdrLst (Diagram Layout Header List)

This element is simply a list of layout definition headers. This list of headers is used internally as a way to group all of the layout definition headers together into a single structure.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_DiagramDefinitionHeaderLst) is located in §A.5.3. *end note*]

21.4.2.19 layoutNode (Layout Node)

The layout node is the basic building block of diagrams. The layout node is responsible for defining how shapes are arranged in a diagram and how the data maps to a particular shape in a diagram.

[*Example*: Consider the following example of a basic layout node defined in a DrawingML diagram:

```
<layoutNode name="node">
    <varLst>
          <bulletEnabled val="1"/>
    </varLst>
    <presOf axis="desOrSelf" ptType="node"/>
    <alg type="tx"/>
    <shape type="rect"
xmlns:r="http://purl.oclc.org/ooxml/officeDocument/relationships" r:blip="">
          <adjLst/>
    </shape>
    <constrLst/>
    <ruleLst>
          <rule type="primFontSz" forName="" val="2" fact="NaN" max="NaN"/>
    </ruleLst>
</layoutNode>
```

In this example we define a layout node which holds text and is a rectangle. *end example*]

Attributes	Description
chOrder (Child Order)	Specifes the ordering of the child layout nodes for a given layout node. The possible values for this attribute are defined by the ST_ChildOrderType simple type (§21.4.7.15).
moveWith (Move With)	Reference to another layout node that this layout node moves with. The possible values for this attribute are defined by the W3C XML Schema string datatype.
name (Name)	A unique identifier for the layout node. The possible values for this attribute are defined by the W3C XML Schema string datatype.
styleLbl (Style Label)	Specify which formatting option from a style or color variation should be applied to this layout node. The possible values for this attribute are defined by the W3C XML Schema string

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
	datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_LayoutNode) is located in §A.5.3. *end note*]

21.4.2.20 param (Parameter)

The parameter element modifies the default behavior of an algorithm.

[*Example*: Consider the following example of a param being used in a DrawingML diagram:

```
<alg type="snake">
    <param type="grDir" val="tL"/>
    <param type="flowDir" val="row"/>
    <param type="contDir" val="sameDir"/>
    <param type="off" val="ctr"/>
</alg>
```

In this example we see the snake algorithm being utilized and four parameters being set which are associated with the snake algorithm and modify its behavior. *end example*]

Attributes	Description
type (Parameter Type)	Specifies the parameter which is being modified. The possible values for this attribute are defined by the ST_ParameterId simple type (§21.4.7.49).
val (Value)	Specifies the actual value to be given to the parameter type defined by the type attribute. The possible values for this attribute are defined by the ST_ParameterVal simple type (§21.4.7.50).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Parameter) is located in §A.5.3. *end note*]

21.4.2.21 presOf (Presentation Of)

This element specifies a particular data model point which is to be mapped to the containing layout node. This attribute is responsible for defining the mapping of data to the layout nodes in a diagram.

[*Example*: Consider the following example of presOf in use within a DrawingML diagram:

```
<presOf axis="desOrSelf" ptType="node"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

In this example the presOf element is mapping to a particular data model point. *end example*]

Attributes	Description
axis (Axis)	Specifies the axis on which to select data from the data model. [*Example*: `axis="ch"` selects children of the current point node and `axis="des"` selects all descendants. *end example*] The possible values for this attribute are defined by the ST_AxisTypes simple type (§21.4.7.7).

cnt (Count)	Specifies the count of items to use in a data set.
	
	[*Example*: Consider the following example of a forEach in a DrawingML diagram:
	
	`<forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2">`
	
	…
	
	`</forEach>`
	
	In this example, up to two children are obtained through this forEach. *end example*]
	
	The possible values for this attribute are defined by the ST_UnsignedInts simple type (§21.4.7.63).

hideLastTrans (Hide Last Transition)	In algorithms that support transitions, this attribute specifies that the last transition is not rendered. This allows for diagrams that start and end with a node. The possible values for this attribute are defined by the ST_Booleans simple type (§21.4.7.9).

ptType (Data Point Type)	Specifies the type of data point to select.
	
	[*Example*: Consider the following example of a forEach in a DrawingML diagram:
	
	`<forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2">`
	
	…
	
	`</forEach>`
	
	In this example, the forEach selects all node type points in the set. *end example*]
	
	The possible values for this attribute are defined by the ST_ElementTypes simple type (§21.4.7.28).

st (Start)	Specifies where to start in a data set. [*Example*: Consider the following example of a forEach in a DrawingML diagram:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
	<presOf axis="desOrSelf" ptType="node" st="2"/> In this example, the second element in the set is the first point returned. *end example*] The possible values for this attribute are defined by the ST_Ints simple type (§21.4.7.40).
step (Step)	Specifies the step to use in a data set. A step with a value of 2 returns every other item in the set. The possible values for this attribute are defined by the ST_Ints simple type (§21.4.7.40).

[*Note*: The W3C XML Schema definition of this element's content model (CT_PresentationOf) is located in §A.5.3. *end note*]

21.4.2.22 relIds (Explicit Relationships to Diagram Parts)

This element specifies the relationship IDs used to explicitly reference each of the four constituent parts of a DrawingML diagram:

- Diagram Colors (cs attribute)
- Diagram Data (dm attribute)
- Diagram Layout Definition (lo attribute)
- Diagram Style (qs attribute)

Attributes	Description
cs (Explicit Relationship to Diagram Colors Part) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship ID for the explicit relationship to the Diagram Colors part used by this diagram. This relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramColors or the document shall be considered non-conformant. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
dm (Explicit Relationship to Diagram Data Part) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship ID for the explicit relationship to the Diagram Data part used by this diagram. This relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramData or the document shall be considered non-conformant. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
lo (Explicit Relationship to Diagram Layout Definition Part) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship ID for the explicit relationship to the Diagram Layout Definition part used by this diagram. This relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramLayout or the document shall be considered non-conformant. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
qs (Explicit Relationship to Style Definition Part) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship ID for the explicit relationship to the Diagram Style part used by this diagram. This relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramQuickStyle or the document shall be considered non-conformant. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model (CT_RelIds) is located in §A.5.3. *end note*]

21.4.2.23 resizeHandles (Shape Resize Style)

This element defines the behavior when resizing shapes within a diagram. Because the size of the shape plays a large role in the overall layout of other nodes within the diagram, there are two ways resize can occur on a node.

Attributes	Description
val (Shape Resize Style Type)	Specifies the behavior for a shape when resizing shapes within a diagram. If this attribute is not specified, the default value shall be `rel`. The possible values for this attribute are defined by the ST_ResizeHandlesStr simple type (§21.4.7.54).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ResizeHandles) is located in §A.5.3. *end note*]

21.4.2.24 rule (Rule)

This element allows for a rule to be specified which changes the value of an existing constraint.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Example*: Consider the following example of a rule in a DrawingML diagram:

```
<ruleLst>
    <rule type="primFontSz" val="2" />
</ruleLst>
```

In this example a rule is being defined that shrinks the primary font size down to a lower limit of 2pt font when the text no longer fits correctly in the layout node. *end example*]

Attributes	Description
fact (Factor)	Factor used in a reference constraint or a rule in order to modify a referenced value by the factor defined. [*Example*: Consider the following example of fact in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, the width for `transition1` is being defined as one-tenth the width of `node1`. *end example*] The possible values for this attribute are defined by the W3C XML Schema double datatype.
for (For)	Specifies the axis of layout nodes to apply a constraint or rule to. [*Example*: Consider the following example of for in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, the for attribute is specifying that `node1` is a child node to the current layout node. *end example*] The possible values for this attribute are defined by the ST_ConstraintRelationship simple type (§21.4.7.20).
forName (For Name)	Specifies the name of the layout node to apply a constraint or rule to. [*Example*: Consider the following example of forName in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, forName is specifying the layout node named `transition1` for its reference. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
max (Max Value)	Sets the maximum value for a constraint so rules can no longer increase the constraint beyond that value. The possible values for this attribute are defined by the W3C XML Schema double datatype.
ptType (Data Point Type)	Specifies the type of data point to select. The possible values for this attribute are defined by the ST_ElementType simple type (§21.4.7.27).
type (Constraint Type)	Specifies the constraint to apply to this layout node. [*Example*: Consider the following example of type in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, type is specifying the width attribute of `transition1`. *end example*] The possible values for this attribute are defined by the ST_ConstraintType simple type (§21.4.7.21).
val (Value)	Specifies an absolute value instead of reference another constraint. [*Example*: Consider the following example of forName in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" val="10"/>` In this example, val is specifying the absolute value of the width of `transition1`. *end example*] The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NumericRule) is located in §A.5.3. *end note*]

21.4.2.25 ruleLst (Rule List)

This element is simply a list of rules.

This element allows for a rule to be specified which changes the value of an existing constraint.

[*Example*: Consider the following example of a ruleLst in a DrawingML diagram:

```
<ruleLst>
    <rule type="primFontSz" val="2" />
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
</ruleLst>
```

In this example a single rule is being defined in the ruleLst that shrinks the primary font size down to a lower limit of 2pt font when the text no longer fits correctly in the layout node. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_Rules) is located in §A.5.3. *end note*]

21.4.2.26 sampData (Sample Data)

This element defines the sample data model which is used to pre-populate a diagram with placeholder data in order for the diagram to display itself in the user interface which shows all of the available diagrams to a user.

[*Example*: Consider the following example of a sampData element within a DrawingML diagram:

```
<sampData>
    <dataModel>
          <ptLst>
                <pt modelId="0" type="doc"/>
                <pt modelId="1">
                      <prSet phldr="1"/>
                </pt>
                <pt modelId="2">
                      <prSet phldr="1"/>
                </pt>
                <pt modelId="3">
                      <prSet phldr="1"/>
                </pt>
                <pt modelId="4">
                      <prSet phldr="1"/>
                </pt>
                <pt modelId="5">
                      <prSet phldr="1"/>
                </pt>
          </ptLst>
          <cxnLst>
                <cxn modelId="6" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
                <cxn modelId="7" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
                <cxn modelId="8" srcId="0" destId="3" srcOrd="2" destOrd="0"/>
                <cxn modelId="9" srcId="0" destId="4" srcOrd="3" destOrd="0"/>
                <cxn modelId="10" srcId="0" destId="5" srcOrd="4" destOrd="0"/>
          </cxnLst>
          <bg/>
          <whole/>
    </dataModel>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
</sampData>
```

In this example we define the sample data to consist of five nodes all attached to a document point type node. When displayed, this diagram shows five shapes in the diagram. *end example*]

Attributes	Description
useDef (Use Default)	If the value of this attribute is `true`, the data model defined in the clrData element is ignored and a default data model is used instead. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SampleData) is located in §A.5.3. *end note*]

21.4.2.27 shape (Shape)

The shape displayed by the containing layout node. Not all layout nodes display shapes.

Attributes	Description
blip (Relationship to Image Part) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship ID of the explicit relationship to an image which shall be used as the image for the contents of this shape. This relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/image or the document shall be considered non-conformant. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
blipPhldr (Image Placeholder)	Specifies whether to use an image placeholder or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
hideGeom (Hide Geometry)	When set to "true", hides the geometry of the shape. The text is still visible. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
lkTxEntry (Prevent Text Editing)	Prevents text editing on this shape. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rot (Rotation)	Rotates the shape by the specified number of degrees. The possible values for this attribute are defined by the W3C XML Schema double datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
type (Shape Type)	Specifies the type of shape. The possible values for this attribute are defined by the ST_LayoutShapeType simple type (§21.4.7.41).
zOrderOff (Z-Order Offset)	Offsets the shape from its default z-order stacking, which is based on the order the layout nodes appear in the XML. The possible values for this attribute are defined by the W3C XML Schema int datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Shape) is located in §A.5.3. *end note*]

21.4.2.28 style (Shape Style)

This element specifies the style information for a shape, as defined by its DrawingML child elements.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShapeStyle) is located in §A.4.1. *end note*]

21.4.2.29 styleData (Style Data)

This element defines the style data model which is used to pre-populate a diagram with placeholder data in order for the diagram to display itself in the user interface which shows a quick style applied to the diagram.

[*Example*: Consider the following example of a styleData being used within a DrawingML diagram:

```
<styleData>
    <dataModel>
          <ptLst>
                <pt modelId="0" type="doc"/>
                <pt modelId="1"/>
                <pt modelId="2"/>
          </ptLst>
          <cxnLst>
                <cxn modelId="3" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
                <cxn modelId="4" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
          </cxnLst>
          <bg/>
          <whole/>
    </dataModel>
</styleData>
```

In this example we define a data model which has only two nodes which are shown in the user interface when a layout definition is combined with this data model. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
useDef (Use Default)	If the value of this attribute is `true`, the data model defined in the clrData element is ignored and a default data model is used instead. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SampleData) is located in §A.5.3. *end note*]

21.4.2.30 title (Title)

Title of the Diagram Layout.

Attributes	Description
lang (Language)	Specifies the language of the title or description of this layout definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.
val (Value)	Specifies the title or description of this layout definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Name) is located in §A.5.3. *end note*]

21.4.2.31 varLst (Variable List)

This element consists of a list of variables which interact with user interface components.

[*Example*: Consider the following example of a varLst in a DrawingML diagram:

```
<varLst>
    <chMax val="2" />
    <dir val="norm" />
    <resizeHandles val="exact" />
</varLst>
```

In this example we see different variables being defined which modify the behavior of user interface components directly. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_LayoutVariablePropertySet) is located in §A.5.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

21.4.3 Data

This section specifies the data that is to be contained within a diagram.

21.4.3.1 bg (Background Formatting)

This element defines formatting that can be applied to the background shape of the entire diagram. The background shape can hold formatting options just as a normal shape can hold within DrawingML.

[*Example*: Consider the following example of a bg in DiagramML:

```
<bg>
     <solidFill>
          <schemeClr val="tx1"/>
     </solidFill>
     <effectLst>
          <glow rad="152400">
               <schemeClr val="accent1">
                    <alpha val="75000"/>
               </schemeClr>
          </glow>
     </effectLst>
</bg>
```

In this example we see a solid fill applied to the background of the diagram along with a glow. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_BackgroundFormatting) is located in §A.4.1. *end note*]

21.4.3.2 cxn (Connection)

This element defines a connection between two points. A connection defines a relationship between two points in a diagram.

[*Example*: Consider the following example of a cxn in DiagramML:

```
<cxnLst>
    <cxn modelId="7" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
    <cxn modelId="8" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
    <cxn modelId="9" srcId="0" destId="3" srcOrd="2" destOrd="0"/>
    <cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>
    <cxn modelId="11" srcId="0" destId="5" srcOrd="4" destOrd="0"/>
    <cxn modelId="12" srcId="0" destId="6" srcOrd="5" destOrd="0"/>
</cxnLst>
```

In this example we see 6 cxn elements defined within a cxnLst element (§21.4.3.3). In this example, a relationship is being defined between point 0 and every other point in the diagram. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
destId (Destination Identifier)	The model identifier of the destination point for a connection. [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>` In this example we see the destination identifier referencing a point who's model identifier is 4. *end example*] The possible values for this attribute are defined by the ST_ModelId simple type (§21.4.7.43).
destOrd (Destination Position)	The relative position of the destination point among it's siblings. [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>` In this example we see the destination position is 0. This means that it is ranked first among its siblings if there are sibling points present. *end example*] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
modelId (Model Identifier)	The unique identifier associated with this cxn. [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>` In this example we see the model identifier is 10. *end example*] The possible values for this attribute are defined by the ST_ModelId simple type (§21.4.7.43).
parTransId (Parent Transition Identifier)	The model identifier of the point representing the parent transition. [*Example*: One example of a parent transition can be thought of as the shape connecting two points, such as an arrow in the diagram. *end example*] The unique identifier associated with this cxn. [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0" parTransId="9" sibTransId="5"/>` In this example we see the parent transition identifier is referencing a point who's model identifier is 9. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_ModelId simple type (§21.4.7.43).
presId (Presentation Identifier)	The unique identifier of the layout associated to the cxn (only the active presentation (layout) is saved so all the presId's in the file should be the same). [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" type="presParOf" srcId="0" destId="4" srcOrd="3" destOrd="0" presId="urn:sampleLayouts/layout1"/>` In this example we see the presentation identifier is `urn:sampleLayouts/layout1`. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.
sibTransId (Sibling Transition Identifier)	The model identifier of the point representing the sibling transition. [*Example*: An example of a sibling transition can be thought of as the shape connecting two points, such as an arrow in the diagram. *end example*] [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0" parTransId="9" sibTransId="5"/>` In this example we see the sibling transition identifier is referencing a point who's model identifier is 5. *end example*] The possible values for this attribute are defined by the ST_ModelId simple type (§21.4.7.43).
srcId (Source Identifier)	The model identifier of the source point for a connection. [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>` In this example we see the souce identifier referencing a point who's model identifier is `0`. *end example*] The possible values for this attribute are defined by the ST_ModelId simple type (§21.4.7.43).
srcOrd (Source Position)	The relative position of the source point among it's siblings. [*Example*: Consider the following example cxn within DiagramML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/> In this example we see the source position is 3. This means that it is ranked third among its siblings. *end example*] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
type (Point Type)	The type of point, which corresponds to a connection in this case. [*Example*: Consider the following example cxn within DiagramML: <cxn modelId="10" type="presParOf" srcId="0" destId="4" srcOrd="3" destOrd="0" presId="urn:sampleLayouts/layout1"/> In this example we see the point type is defined as presParOf. *end example*] The possible values for this attribute are defined by the ST_CxnType simple type (§21.4.7.23).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Cxn) is located in §A.5.3. *end note*]

21.4.3.3 cxnLst (Connection List)

This element defines a group of connections. There can be a connection list defined for any data model which holds all of the connections between points defined in the diagram.

[*Example*: Consider the following example of a cxnLst in DiagramML:

```
<cxnLst>
    <cxn modelId="7" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
    <cxn modelId="8" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
    <cxn modelId="9" srcId="0" destId="3" srcOrd="2" destOrd="0"/>
    <cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>
    <cxn modelId="11" srcId="0" destId="5" srcOrd="4" destOrd="0"/>
    <cxn modelId="12" srcId="0" destId="6" srcOrd="5" destOrd="0"/>
</cxnLst>
```

In this example we see 6 cxn elements (§21.4.3.2) defined within a cxnLst element. In this example, a relationship is being defined between point 0 and every other point in the diagram. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_CxnList) is located in §A.5.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

21.4.3.4 prSet (Property Set)

This element holds properties and customizations which are used throughout certain elements in DiagramML. The properties can be grouped into the following general categories:

- Presentation Properties - presLayoutVars, style, presAssocId, presName, presStyleLbl, presStyleIdx, presStyleCnt
- Document Properties - loTypeId, loCatId, qsTypeId, qaCatId, csTypeId, coherent3DOff
- Semantic Element Properties - phldrT, phldr
- Customization Properties - custAng, custFlipVert, custFlipHor, custSzX, custSzY, custScaleX, custScaleY, custT, custLinFactX, custLinFactY, custLinFactNeighborX, custLinFactNeighborY, custRadScaleRad, custRadScaleInc

[*Example*: Consider the basic example of prSet in use in DrawingML on a document point type:

```
<prSet loTypeId="urn:microsoft.com/office/officeart/2005/8/layout/default"
loCatId="list"
qsTypeId="urn:microsoft.com/office/officeart/2005/8/quickstyle/3d1" qsCatId="3D"
csTypeId="urn:microsoft.com/office/officeart/2005/8/colors/colorful2"
csCatId="colorful" phldr="1"/>
```

In this example we define the layout identifier, the category of the layout, the quick style identifier, the quick style category, along with the color style and color style category. *end example*]

Attributes	Description
coherent3DOff (Coherent 3D Behavior)	Enables or disables the Coherent 3D behavior for styles that specify this property. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
csCatId (Color Transform Category)	This attribute specifies the identifier of the current color transform category. The possible values for this attribute are defined by the W3C XML Schema string datatype.
csTypeId (Color Transform Type Identifier)	This attribute specifies the identifier of the currently applied color transform. The possible values for this attribute are defined by the W3C XML Schema string datatype.
custAng (Custom Rotation)	Specifies the amount that rotation is customized by. The possible values for this attribute are defined by the W3C XML Schema int datatype.
custFlipHor (Custom Horizontal Flip)	Specifies if there is a custom horizontal flip applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
custFlipVert	Specifies if there is a custom vertical flip applied.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
(Custom Vertical Flip)	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
custLinFactNeighborX (Neighbor Offset Width)	Specifies the percentage of the neighbor's width used for offsetting shape. The possible values for this attribute are defined by ST_PrSetCustVal simple type (§21.4.7.66).
custLinFactNeighborY (Neighbor Offset Height)	Specifies the percentage of the neighbor's height used for offsetting shape. The possible values for this attribute are defined by ST_PrSetCustVal simple type (§21.4.7.66).
custLinFactX (Custom Factor Width)	Specifies the percentage of the current shape width used for offsetting the shape. The possible values for this attribute are defined by ST_PrSetCustVal simple type (§21.4.7.66).
custLinFactY (Custom Factor Height)	Specifies the percentage of the current shape height used for offsetting the shape. The possible values for this attribute are defined by ST_PrSetCustVal simple type (§21.4.7.66).
custRadScaleInc (Include Angle Scale)	Specifies the amount that the include angle has been scaled by. The possible values for this attribute are defined by ST_PrSetCustVal simple type (§21.4.7.66).
custRadScaleRad (Radius Scale)	Specifies how much the radius has been scaled. The possible values for this attribute are defined by ST_PrSetCustVal simple type (§21.4.7.66).
custScaleX (Width Scale)	Specifies the amount that the width has been scaled by. The possible values for this attribute are defined by ST_PrSetCustVal simple type (§21.4.7.66).
custScaleY (Height Scale)	Specifies the amount that the height has been scaled by. The possible values for this attribute are defined by ST_PrSetCustVal simple type (§21.4.7.66).
custSzX (Fixed Width Override)	Specifies a fixed width override for a shape. The possible values for this attribute are defined by the W3C XML Schema int datatype.
custSzY (Fixed Height Override)	Specifies a fixed height override for a shape. The possible values for this attribute are defined by the W3C XML Schema int datatype.
custT (Text	Specifies if the text has been customized which allows layout to ignore automatic

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
Changed)	formatting options available to the text. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
loCatId (Current Diagram Category)	Specifies the current identifier of the layout category applied to the diagram. The possible values for this attribute are defined by the W3C XML Schema string datatype.
loTypeId (Current Diagram Type)	Specifies the identifier for the layout currently applied to the diagram. The possible values for this attribute are defined by the W3C XML Schema string datatype.
phldr (Placeholder)	Indicates that the point is a placeholder or sample item. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
phldrT (Placeholder Text)	The text used for display in the element if the placeholder flag is set to `true`. If this property is not set then the default placeholder text is used. The possible values for this attribute are defined by the W3C XML Schema string datatype.
presAssocID (Presentation Element Identifier)	The point associated with this presentation element. This identifier is used together with presName to create a unique key for presentation element indexing. The possible values for this attribute are defined by the ST_ModelId simple type (§21.4.7.43).
presName (Presentation Name)	The layout node name of this presentation element. This name is used together with presAssocID to create a unique key for presentation element indexing. The possible values for this attribute are defined by the W3C XML Schema string datatype.
presStyleCnt (Presentation Style Count)	Specifies the layout node style count of this presentation element. The possible values for this attribute are defined by the W3C XML Schema int datatype.
presStyleIdx (Presentation Style Index)	Specifies the layout node style index of this presentation element. The possible values for this attribute are defined by the W3C XML Schema int datatype.
presStyleLbl (Presentation Style Label)	Specifies the layout node style label of this presentation element. The possible values for this attribute are defined by the W3C XML Schema string datatype.
qsCatId (Current	Specifies the identifier of the category of the currently applied quick style.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
Style Category)	The possible values for this attribute are defined by the W3C XML Schema string datatype.
qsTypeId (Current Style Type)	Specifies the identifier of the currently applied quick style. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ElemPropSet) is located in §A.5.3. *end note*]

21.4.3.5 pt (Point)

This element defines a point in DiagramML. A point in DiagramML is defined to hold data associated with a particular point or node in a diagram. Transitions between nodes in a diagram along with the nodes themselves are defined as different types of points. A point is not only responsible for holding the data associated with a node in a diagram, but also for holding customization properties made to the text and shape associated with the particular node.

[*Example*: Consider the following example of a pt in DiagramML:

```
<pt modelId="{C6A8900D-3F1B-4F1D-A514-4E8BDD964568}">
    <prSet phldrT="[Text]"/>
    <spPr/>
    <t>
          <bodyPr/>
          <lstStyle/>
          <p>
                <r>
                      <rPr lang="en-US" smtClean="0"/>
                      <t>Text 2</t>
                </r>
                <endParaRPr lang="en-US" dirty="0"/>
          </p>
    </t>
</pt>
```

In this example we define a point which holds the data associated with a node in a diagram. The actual text in the diagram is defined in the text body, t, tag and consists of the string "Text 2". There are no overrides made to the shape properties and placeholder text defined for this node when there is no text body present. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description

cxnId (Connection Identifier)	The model identifier of the connection that represents the transition node.
	
	[*Example*: Consider the following example of a `cxnId`:
	
	`<dgm:pt modelId="5" type="parTrans" cxnId="9">`
	`  <dgm:prSet/>`
	`  <dgm:spPr/>`
	`</dgm:pt>`
	
	In this example we define the connection related to this point to reference connection 9. *end example*]
	
	The possible values for this attribute are defined by the ST_ModelId simple type (§21.4.7.43).

modelId (Model Identifier)	The unique identifier of the element within the data model. This identifier should be unique only relative to the containing data model.
	
	[*Example*: Consider the following example of a `cxnId`:
	
	`<dgm:pt modelId="5" type="parTrans" cxnId="9">`
	`  <dgm:prSet/>`
	`  <dgm:spPr/>`
	`</dgm:pt>`
	
	In this example we define the point type is to be 5. *end example*]
	
	The possible values for this attribute are defined by the ST_ModelId simple type (§21.4.7.43).

type (Point Type)	The type of point.
	
	[*Example*: Consider the following example of a `cxnId`:
	
	`<dgm:pt modelId="5" type="parTrans" cxnId="9">`
	`  <dgm:prSet/>`
	`  <dgm:spPr/>`
	`</dgm:pt>`
	
	In this example the point type is defined as a `parTrans` point type. *end example*]
	
	The possible values for this attribute are defined by the ST_PtType simple type (§21.4.7.51).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Pt) is located in §A.5.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.4.3.6 ptLst (Point List)

This element simply holds a list of points within the data model.

[*Example*: Consider the following example of a very simple point list in DiagramML:

```
<dgm:ptLst>
    <dgm:pt modelId="0" type="doc"/>
    <dgm:pt modelId="1"/>
    <dgm:pt modelId="2"/>
    <dgm:pt modelId="3"/>
    <dgm:pt modelId="4"/>
    <dgm:pt modelId="5"/>
    <dgm:pt modelId="6"/>
</dgm:ptLst>
```

In this example we define a single document type point and five node type points. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_PtList) is located in §A.5.3. *end note*]

21.4.3.7 spPr (Shape Properties)

This element specifies the properties for a single shape in a diagram's data, as defined using DrawingML child elements.

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ShapeProperties) is located in §A.4.1. *end note*]

21.4.3.8 t (Text Body)

Text body containing the default body, paragraph and character properties. There should be a signle paragraph and no text runs. Any runs in the first paragraph and paragraphs in addition to the first are ignored.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextBody) is located in §A.4.1. *end note*]

21.4.3.9 whole (Whole E2O Formatting)

Formatting that applies to the entire diagram object, and not just the background, includes line and effect properties.

[*Note*: The W3C XML Schema definition of this element's content model (CT_WholeE2oFormatting) is located in §A.4.1. *end note*]

21.4.4 Color Information

This section defines the coloring information that is to be associated with a diagram.

21.4.4.1 cat (Color Transform Category)

This element specifies the category in the user interface that a color transform is to be displayed within.

[*Example*: Consider the following example of a cat in DiagramML:

```
<dgm:cat type="mainScheme" pri="10300"/>
```

In this example we see a cat defined with a category type and priority. *end example*]

Attributes	Description
pri (Priority)	The priority within the category for this color variation determines the order in which it displays in the user interface. The lower numbers are to be displayed at the beginning of the list. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
type (Category Type)	The category type used to organize the color transforms in the user interface. The possible values for this attribute are defined by the W3C XML Schema anyURI datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_CTCategory) is located in §A.5.3. *end note*]

21.4.4.2 catLst (Color Transform Category List)

This element defines a list of color transform categories. This list can be used to populate user interface components which could separate color transforms into categories.

[*Example*: Consider the following example of a catLst in DiagramML:

```
<dgm:catLst>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
        <dgm:cat type="mainScheme" pri="10300"/>
    </dgm:catLst>
```

In this example we see a catLst defined which holds a single *color transform category* (§21.4.4.1). *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_CTCategories) is located in §A.5.3. *end note*]

21.4.4.3 colorsDef (Color Transform Definitions)

This element is the root element for color transforms. Held within this element are all of the available color transforms themselves along with other elements and attributes associated with defining the general color transform properties and attributes.

[*Example*: Consider the following example of a colorsDef in DiagramML:

```
<dgm:colorsDef
xmlns:dgm="http://schemas.openxmlformats.org/drawingml/2006/diagram"
xmlns:a="http://schemas.openxmlformats.org/drawingml/2006/main"
uniqueId="urn:microsoft.com/office/officeart/2005/8/colors/accent0_3"
minVer="12.0">
    <dgm:title lang="" val=""/>
    <dgm:desc lang="" val=""/>
    <dgm:catLst>
        <dgm:cat type="mainScheme" pri="10300"/>
    </dgm:catLst>
    <dgm:styleLbl name="node0">
        …
    </dgm:styleLbl>
    …
</dgm:colorsDef>
```

In this example we see a sampling of a colorsDef being defined with a number of styleLbl elements held within the colorsDef. *end example*]

Attributes	Description

minVer (Minimum Version)	The minimum product version that can support this color transform.
	
	[*Example*: Consider the following example:
	
	`<colorsDef uniqueId="urn:colors/accent0_3" minVer="12.0">`
	`…`
	`</colorsDef>`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	In this example we see the minVer set to `12.0`. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

uniqueId (Unique ID)	A unique id associated with the color transform definition.
	
	[*Example*: Consider the following example:
	
	`<colorsDef uniqueId="urn:colors/accent0_3" minVer="12.0">`
	`…`
	`</colorsDef>`
	
	In this example we see the uniqueId set to `urn:colors/accent0_3`. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ColorTransform) is located in §A.5.3. *end note*]

21.4.4.4 colorsDefHdr (Color Transform Definition Header)

This element specifies header information associated with a color transform definition. The header information is used by an application to preprocess required data in order to help with possible performance concerns associated with an initial full load of a color transform definition.

[*Example*: Consider the following example of a colorsDefHdr within DiagramML:

```
<colorsDefHdr uniqueId="urn:colors/accent0_1">
    <title val="Main 1" />
    <desc val="" />
    <catLst>
        <cat type="mainScheme" pri="10100" />
    </catLst>
</colorsDefHdr>
```

In this example we see a color transform definition header which defines a title and category for a set of color transforms. *end example*]

Attributes	Description
minVer (Minimum Version)	The minimum product version that can support the associated color transform definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
resId (Resource ID)	This attribute is the id which associates this header to the actual color transform definition. The possible values for this attribute are defined by the W3C XML Schema int datatype.
uniqueId (Unique ID)	This attribute defines a unique identifier for the associated color transform definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ColorTransformHeader) is located in §A.5.3. *end note*]

21.4.4.5 colorsDefHdrLst (Color Transform Header List)

This element is simply a list of color transform definition headers and is used to consolidate multiple headers in a group.

[*Note*: The W3C XML Schema definition of this element's content model (CT_ColorTransformHeaderLst) is located in §A.5.3. *end note*]

21.4.4.6 desc (Description)

This element holds a description for a color definition. The description can be used to describe the qualities associated with a particular color transform definition.

Attributes	Description
lang (Language)	The natural language of the color transform definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.
val (Description Value)	The string which is used as the description of the color transform definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_CTDescription) is located in §A.5.3. *end note*]

21.4.4.7 effectClrLst (Effect Color List)

This element defines a list of colors applied to effects within a color transform.

[*Example*: Consider the following example of an effectClrLst in DiagramML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<dgm:effectClrLst meth="repeat">
    <a:schemeClr val="dk2">
          <a:tint val="60000"/>
    </a:schemeClr>
</dgm:effectClrLst>
```

In this example we see a single color defined in the effectClrLst, more specifically we see a scheme color being utilized with a tint applied to the color. *end example*]

Attributes	Description

hueDir (Hue Direction)	The direction around the color wheel the hue shift (if defined) occurs.
	
	[*Example*: Consider the following example of a hueDir in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example an lnClrLst is defined with a hue direction defined as clockwise. *end example*]
	
	The possible values for this attribute are defined by the ST_HueDir simple type (§21.4.7.38).

meth (Color Application Method Type)	The method used to apply the color transform.
	
	[*Example*: Consider the following example of a meth in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example and lnClrLst is defined using the `repeat` color application method. *end example*]
	
	The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§21.4.7.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Colors) is located in §A.5.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

21.4.4.8 fillClrLst (Fill Color List)

This element defines a list of colors which are used as fill colors in the color transform. The fill colors define the color of the nodes in a diagram.

[*Example*: Consider the following example of a fillClrLst in DiagramML:

```
<dgm:fillClrLst meth="repeat">
     <a:schemeClr val="dk2"/>
</dgm:fillClrLst>
```

In this example the fillClrList contains a single scheme color and is utilizing the repeat method for color application. *end example*]

Attributes	Description

hueDir (Hue Direction)	The direction around the color wheel the hue shift (if defined) occurs.
	
	[*Example*: Consider the following example of a hueDir in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example an lnClrLst is defined with a hue direction defined as clockwise. *end example*]
	
	The possible values for this attribute are defined by the ST_HueDir simple type (§21.4.7.38).

meth (Color Application Method Type)	The method used to apply the color transform.
	
	[*Example*: Consider the following example of a meth in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example and lnClrLst is defined using the `repeat` color application method. *end example*]
	
	The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§21.4.7.16).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_Colors) is located in §A.5.3. *end note*]

21.4.4.9 lnClrLst (Line Color List)

This element defines a list of colors which are used as line colors in the color transform. The line colors define the color of the lines used on a given node in a diagram

[*Example*: Consider the following example of a lnClrLst in DiagramML:

```
<dgm:lnClrLst meth="repeat">
     <a:schemeClr val="dk2"/>
</dgm:lnClrLst>
```

In this example the lnClrList contains a single scheme color and is utilizing the repeat method for color application. *end example*]

Attributes	Description

hueDir (Hue Direction)	The direction around the color wheel the hue shift (if defined) occurs.
	
	[*Example*: Consider the following example of a hueDir in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example an lnClrLst is defined with a hue direction defined as clockwise. *end example*]
	
	The possible values for this attribute are defined by the ST_HueDir simple type (§21.4.7.38).

meth (Color Application Method Type)	The method used to apply the color transform.
	
	[*Example*: Consider the following example of a meth in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example and lnClrLst is defined using the `repeat` color application method. *end example*]
	
	The possible values for this attribute are defined by the ST_ClrAppMethod simple type

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	(§21.4.7.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Colors) is located in §A.5.3. *end note*]

21.4.4.10 styleLbl (Style Label)

This element defines a style label. The style label is used to define a color transform that is applied to a given node in a diagram.

[*Example*: Consider the following example of a styleLbl in DiagramML:

```
<dgm:styleLbl name="exampleStyleLabel">
    <dgm:fillClrLst>
          <a:schemeClr val="accent2"/>
          <a:schemeClr val="accent3"/>
    </dgm:fillClrLst>
    <dgm:linClrLst meth="repeat">
          <a:schemeClr val="lt1"/>
    </dgm:linClrLst>
    <dgm:effectClrLst/>
    <dgm:txLinClrLst/>
    <dgm:txFillClrLst/>
    <dgm:txEffectClrLst/>
</dgm:styleLbl>
```

In this example we see a style label defined in its entirety. This style label can be used on a layout node in order to define the color transform that is to be applied to the node. *end example*]

Attributes	Description

name (Name)	A name given to the style label. This name can be referenced by layout nodes in order to apply the style label to the layout node.
	
	[*Example*: Consider the following example of a styleLbl in DiagramML:
	`<dgm:styleLbl name="exampleStyleLabel">`
	…
	`</dgm:styleLbl>`
	
	In this example we see a style label defined with the name `exampleStyleLabel` defined. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_CTStyleLabel) is located in §A.5.3. *end note*]

21.4.4.11 title (Title)

The name or title given to the color definition header.

Attributes	Description
lang (Language)	The natural language of the title or description of a color transform definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.
val (Description Value)	A string used for a description of a color transform definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_CTName) is located in §A.5.3. *end note*]

21.4.4.12 txEffectClrLst (Text Effect Color List)

This element defines a list of colors which are used as text effect colors in the color transform. The text effect colors define the color of the text effects used on a given node in a diagram

[*Example*: Consider the following example of a txEffectClrLst in DiagramML:

```
<dgm:txEffectClrLst meth="repeat">
     <a:schemeClr val="dk2"/>
</dgm:txEffectClrLst>
```

In this example the txEffectClrLst contains a single scheme color and is utilizing the repeat method for color application. *end example*]

Attributes	Description

hueDir (Hue Direction)	The direction around the color wheel the hue shift (if defined) occurs.
	
	[*Example*: Consider the following example of a hueDir in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example an lnClrLst is defined with a hue direction defined as clockwise. *end*

Attributes	Description
	example] The possible values for this attribute are defined by the ST_HueDir simple type (§21.4.7.38).

meth (Color Application Method Type)	The method used to apply the color transform.
	
	[*Example*: Consider the following example of a meth in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`<a:schemeClr val="dk2">`
	`<a:tint val="60000"/>`
	`</a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example and lnClrLst is defined using the repeat color application method. *end example*]
	
	The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§21.4.7.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Colors) is located in §A.5.3. *end note*]

21.4.4.13 txFillClrLst (Text Fill Color List)

This element defines a list of colors which are used as text colors in the color transform. The text colors define the color of the text used in a given node in a diagram

[*Example*: Consider the following example of a txFillClrLst in DiagramML:

```
<dgm:txFillClrLst meth="repeat">
    <a:schemeClr val="dk2"/>
</dgm:txFillClrLst>
```

In this example the txFillClrLst contains a single scheme color and is utilizing the repeat method for color application. *end example*]

Attributes	Description

hueDir (Hue Direction)	The direction around the color wheel the hue shift (if defined) occurs.
	
	[*Example*: Consider the following example of a hueDir in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`<a:schemeClr val="dk2">`
	`<a:tint val="60000"/>`

Attributes	Description
	</a:schemeClr> </dgm:lnClrLst> In this example an lnClrLst is defined with a hue direction defined as clockwise. *end example*] The possible values for this attribute are defined by the ST_HueDir simple type (§21.4.7.38).
meth (Color Application Method Type)	The method used to apply the color transform. [*Example*: Consider the following example of a meth in use: <dgm:lnClrLst hueDir="cw" meth="repeat"> <a:schemeClr val="dk2"> <a:tint val="60000"/> </a:schemeClr> </dgm:lnClrLst> In this example and lnClrLst is defined using the repeat color application method. *end example*] The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§21.4.7.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Colors) is located in §A.5.3. *end note*]

21.4.4.14 txLinClrLst (Text Line Color List)

This element defines a list of colors which are used as text line colors in the color transform. The text line colors define the color of the line on text used in a given node in a diagram

[*Example*: Consider the following example of a txLinClrLst in DiagramML:

```
<dgm:txLinClrLst meth="repeat">
    <a:schemeClr val="dk2"/>
</dgm:txLinClrLst>
```

In this example the txLinClrLst contains a single scheme color and is utilizing the repeat method for color application. *end example*]

Attributes	Description
hueDir (Hue Direction)	The direction around the color wheel the hue shift (if defined) occurs. [*Example*: Consider the following example of a hueDir in use:

Attributes	Description
	<dgm:lnClrLst hueDir="cw" meth="repeat"> <a:schemeClr val="dk2"> <a:tint val="60000"/> </a:schemeClr> </dgm:lnClrLst> In this example an lnClrLst is defined with a hue direction defined as clockwise. *end example*] The possible values for this attribute are defined by the ST_HueDir simple type (§21.4.7.38).
meth (Color Application Method Type)	The method used to apply the color transform. [*Example*: Consider the following example of a meth in use: <dgm:lnClrLst hueDir="cw" meth="repeat"> <a:schemeClr val="dk2"> <a:tint val="60000"/> </a:schemeClr> </dgm:lnClrLst> In this example and lnClrLst is defined using the repeat color application method. *end example*] The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§21.4.7.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Colors) is located in §A.5.3. *end note*]

21.4.5 Style Definitions

This section describes the styling information to be associated with a diagram.

21.4.5.1 cat (Category)

The category in the user interface where this quick style displays in the user interface.

[*Example*: Consider the following example of a cat in use in DiagramML:

```
<catLst>
    <cat type="3D" pri="11100"/>
</catLst>
```

In this example we see a 3D category type being defined with a priority of 11100. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
pri (Priority)	The priority within the category for this style determines the order in which it displays in the user interface. Lower numbers are displayed at the beginning of the list. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
type (Category Type)	Category type. This is used to organize the quick style in the user interface. The possible values for this attribute are defined by the W3C XML Schema anyURI datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SDCategory) is located in §A.5.3. *end note*]

21.4.5.2 catLst (Category List)

This element is simply a list of categories.

[*Example*: Consider the following example of a catLst in use in DiagramML:

```
<catLst>
    <cat type="Simple" pri="10000"/>
    <cat type="3D" pri="11100"/>
</catLst>
```

In this example two categories defined in the category list. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_SDCategories) is located in §A.5.3. *end note*]

21.4.5.3 desc (Style Label Description)

This element defines a description for a style label definition. The description is simply a string describing the characteristics of the style label definition.

[*Example*: Consider the following example of the desc element in DiagramML:

```
<desc lang="" val="3-D Style 1"/>
```

In this example we define the description to be `3-D Style 1`. *end example*]

Attributes	Description
lang (Natural Language)	The natural language of the title or description of this quick style. The possible values for this attribute are defined by the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
val (Description Value)	The string used for the description. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SDDescription) is located in §A.5.3. *end note*]

21.4.5.4 presLayoutVars (Presentation Layout Variables)

This element specified the layout property set. This set of properties determine different aspects concerning the layout of a diagram. All of the elements associated with enabling or disabling aspects of the user interface are also defined here.

[*Note*: The W3C XML Schema definition of this element's content model (CT_LayoutVariablePropertySet) is located in §A.5.3. *end note*]

21.4.5.5 scene3d (3-D Scene)

The 3-D scene which consists of a camera, a light rig, and an optional backdrop to catch shadows.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Scene3D) is located in §A.4.1. *end note*]

21.4.5.6 sp3d (3-D Shape Properties)

A set of 3-D properties which a shape can contain.

Attributes	Description
contourW (Contour Width) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Defines the width of the contour on the shape. [*Example*: Consider the following example of a contourW in use within the sp3d element: `<a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"><a:bevelT w="254000" h="254000"/><a:bevelB w="254000" h="254000"/><a:extrusionClr><a:srgbClr val="FF0000"/></a:extrusionClr><a:contourClr><a:schemeClr val="accent3"/></a:contourClr></a:sp3d>`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	In this example, we see a countourW defined as `50800`. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
extrusionH (Extrusion Height) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Defines the height of the extrusion applied to the shape. [*Example*: Consider the following example of an extrusionH in use within the sp3d element: `<a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"><a:bevelT w="254000" h="254000"/><a:bevelB w="254000" h="254000"/><a:extrusionClr><a:srgbClr val="FF0000"/></a:extrusionClr><a:contourClr><a:schemeClr val="accent3"/></a:contourClr></a:sp3d>` In this example, we see a extrusionH defined as `165100`. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
prstMaterial (Preset Material Type) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Defines the preset material which is combined with the lighting properties to give the final look and feel of a shape. [*Example*: Consider the following example of a prstMaterial in use within the sp3d element: `<a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"><a:bevelT w="254000" h="254000"/><a:bevelB w="254000" h="254000"/><a:extrusionClr><a:srgbClr val="FF0000"/></a:extrusionClr><a:contourClr><a:schemeClr val="accent3"/></a:contourClr></a:sp3d>` In this example, we see a prstMaterial defined as `plastic`. *end example*] The possible values for this attribute are defined by the ST_PresetMaterialType simple

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	type (§20.1.10.49).
z (Shape Depth) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Defines the z coordinate for the 3D shape. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Shape3D) is located in §A.4.1. *end note*]

21.4.5.7 styleDef (Style Definition)

This element is the root tag for a style definition.

[*Example*: Consider the following example of a styleDef in DiagramML:

```
<dgm:styleDef
xmlns:dgm="http://schemas.openxmlformats.org/drawingml/2006/diagram"
xmlns:a="http://schemas.openxmlformats.org/drawingml/2006/main"
uniqueId="urn:microsoft.com/office/officeart/2005/8/quickstyle/3d1"
minVer="12.0">
    <dgm:title lang="" val="3-D Style 1"/>
    <dgm:desc lang="" val="3-D Style 1"/>
    <dgm:catLst>
          <dgm:cat type="3D" pri="11100"/>
    </dgm:catLst>
    <dgm:scene3d>
          <a:camera prst="orthographicFront"/>
          <a:lightRig rig="threePt" dir="t"/>
    </dgm:scene3d>
    <dgm:style>
                    …
    </dgm:style>
    <dgm:styleLbl name="node0">
          <dgm:scene3d>
                <a:camera prst="orthographicFront"/>
                <a:lightRig rig="flat" dir="t"/>
          </dgm:scene3d>
          <dgm:sp3d prstMaterial="flat">
                <a:bevelT w="120900" h="88900"/>
                <a:bevelB w="88900" h="31750" prst="angle"/>
          </dgm:sp3d>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
            <dgm:txPr/>
            <dgm:style>
                  <a:lnRef idx="0">
                        <a:scrgbClr r="0" g="0" b="0"/>
                  </a:lnRef>
                  <a:fillRef idx="3">
                        <a:scrgbClr r="0" g="0" b="0"/>
                  </a:fillRef>
                  <a:effectRef idx="2">
                        <a:scrgbClr r="0" g="0" b="0"/>
                  </a:effectRef>
                  <a:fontRef idx="minor">
                        <a:schemeClr val="lt1"/>
                  </a:fontRef>
            </dgm:style>
      </dgm:styleLbl>
…
</dgm:styleDef>
```

In this example we see a styleDef being defined along with many properties. *end example*]

Attributes	Description

minVer (Minimum Version)	The minimum product version that can support this quick style.
	
	[*Example*: Consider the following example of a styleDef in DiagramML:
	
	`<styleDef uniqueId="urn:quickstyle/3d1" minVer="12.0">`
	
	…
	
	`</styleDef>`
	
	In this example we see the `minVer` defined to be `12.0`. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema string datatype.

uniqueId (Unique Style ID)	Unique ID that identifies a style. [*Example*: Consider the following example of a styleDef in DiagramML: `<styleDef uniqueId="urn:quickstyle/3d1" minVer="12.0">` …

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	</styleDef> In this example we see the uniqueId defined to be urn:quickstyle/3d1. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_StyleDefinition) is located in §A.5.3. *end note*]

21.4.5.8 styleDefHdr (Style Definition Header)

This element specifies header information associated with a style definition. The header information is used by an application to preprocess required data in order to help with possible performance concerns associated with an initial full load of a color transform definition.

[*Example*: Consider the following example of a styleDefHdr element within DiagramML:

```
<styleDefHdr uniqueId="urn:quicktyle/3d1">
    <title val="3D" />
    <desc val="" />
    <catLst>
        <cat type="3D" pri="10100" />
    </catLst>
</ styleDefHdr >
```

In this example we see a style definition header which defines a title and category for a set of style definitions. *end example*]

Attributes	Description
minVer (Minimum Version)	The minimum product version that can support this quick style. The possible values for this attribute are defined by the W3C XML Schema string datatype.
resId (Resource ID)	This attribute is the id which associates this header to the actual style definition part. The possible values for this attribute are defined by the W3C XML Schema int datatype.
uniqueId (Unique Style ID)	This attribute defines a unique identifier for the associated style definition. The possible values for this attribute are defined by the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_StyleDefinitionHeader) is located in §A.5.3. *end note*]

21.4.5.9 styleDefHdrLst (List of Style Definition Headers)

This element is simply a list of style definition headers and is used to consolidate multiple headers into one group.

[*Note*: The W3C XML Schema definition of this element's content model (CT_StyleDefinitionHeaderLst) is located in §A.5.3. *end note*]

21.4.5.10 styleLbl (Style Label)

This element defines the actual style which is applied to a node in a diagram The style is referenced from within layout node. The style label contains formatting (without defining color) such as the 3D properties and text properties associated with a shape.

[*Example*: Consider the following example of a styleLbl in DiagramML:

```
<styleLbl name="node0">
    <scene3d>
          <camera prst="orthographicFront"/>
          <lightRig rig="flat" dir="t"/>
    </scene3d>
    <sp3d prstMaterial="flat">
          <bevelT w="120900" h="88900"/>
          <bevelB w="88900" h="31750" prst="angle"/>
    </sp3d>
    <txPr/>
    <style>
          <lnRef idx="0">
                <scrgbClr r="0" g="0" b="0"/>
          </lnRef>
          <fillRef idx="3">
                <scrgbClr r="0" g="0" b="0"/>
          </fillRef>
          <effectRef idx="2">
                <scrgbClr r="0" g="0" b="0"/>
          </effectRef>
          <fontRef idx="minor">
                <schemeClr val="lt1"/>
          </fontRef>
    </style>
</styleLbl>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

In this example we see a styleLbl defined which sets 3D properties for the scene, shape 3D properties, line, fill, effect and font properties. *end example*]

Attributes	Description
name (Style Name)	The name of the style. This apears as the tooltip in the user interface. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_StyleLabel) is located in §A.5.3. *end note*]

21.4.5.11 title (Title)

This element defines the title given to a style definition header. The title is simply a name for the style definition.

[*Example*: Consider the following example of title being used in DiagramML:

```
<styleDefHdr uniqueId="urn:quickstyle/3d1" minVer="12.0">
     <title val="My Title"/>
     <desc val="My Description"/>

     …

</styleDefHdr>
```

In this example we see the title being set to `My Title`. *end example*]

Attributes	Description
lang (Natural Language)	The natural language of the title or description of this quick style. The possible values for this attribute are defined by the W3C XML Schema string datatype.
val (Description Value)	The string used for the description. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_SDName) is located in §A.5.3. *end note*]

21.4.5.12 txPr (Text Properties)

This element defines special text formatting that can be applied to text through a style label.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextProps) is located in §A.5.3. *end note*]

21.4.6 Layout Definition

This section specifies the node layout information to be associated with a diagram.

21.4.6.1 animLvl (Level Animation)

This variable is used to indicate the animate by level string which is displayed to a user in the user interface.

[*Example*: Consider the following example of animLvl in use in DiagramML:

```
<varLst>
     <chMax val="1" />
     <dir val="norm" />
     <animLvl val="ctr" />
     <resizeHandles val="exact" />
</varLst>
```

In this example we see that the animLvl is set to `ctr`. This is being defined in a radial type diagram which allows the user to specify that animation is to start at the center of the diagram. *end example*]

Attributes	Description
val (Level Animation Value)	This attribute indicates the string to use for level animation in the user interface. The possible values for this attribute are defined by the ST_AnimLvlStr simple type (§21.4.7.2).

[*Note*: The W3C XML Schema definition of this element's content model (CT_AnimLvl) is located in §A.5.3. *end note*]

21.4.6.2 animOne (One by One Animation String)

This variable is used to indicate the string to use for one-by-one animation in the user interface. This is used primarily when defining hierarchical diagrams to specify different ways animations applies to different levels of the diagram.

[*Example*: Consider the following example of animOne used in a hierarchical type diagram:

```
<varLst>
     <chPref val="1" />
     <dir val="norm" />
     <animOne val="branch" />
     <animLvl val="lvl" />
     <resizeHandles val="exact" />
</varLst>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

In this example we see that the animOne element is defined to animate the diagram per branch. *end example*]

Attributes	Description
val (One By One Animation Value)	Specifies the type of one-by-one animation to use for a diagram. The possible values for this attribute are defined by the ST_AnimOneStr simple type (§21.4.7.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_AnimOne) is located in §A.5.3. *end note*]

21.4.6.3 bulletEnabled (Show Insert Bullet)

This element is used to indicate when to enable the 'Insert Bullet' button in the user interface.

[*Example*: Consider the following example of bulletEnabled in DiagramML:

```
<varLst>
    <bulletEnabled val="true" />
</varLst>
```

In this example we see that the insert button in the user interface is to be enabled when the focus is within the containing layout node. *end example*]

Attributes	Description
val (Show Insert Bullet Value)	This attribute is used to indicate when to enable the 'Insert Bullet' button. A value of `true` enables the insert bullet button. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_BulletEnabled) is located in §A.5.3. *end note*]

21.4.6.4 chMax (Maximum Children)

This element is used to indicate when to enable and disable the user interface components associated with adding a new shape to a diagram. This element defines a max number of nodes a diagram can support through the user interface directly.

[*Example*: Consider the following example of chMax usage in DiagramML:

```
<varLst>
    <chMax val="5"/>
    <dir val="norm"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
    <resizeHandles val="exact" />
</varLst>
```

In this example we define the user interface to only be enabled to insert five nodes. *end example*]

Attributes	Description
val (Maximum Children Value)	This attribute indicates the maximum number of children the node can have before the user interface should be disabled. A value of -1 indicates an infinite number of children. Default value is -1. The possible values for this attribute are defined by the ST_NodeCount simple type (§21.4.7.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ChildMax) is located in §A.5.3. *end note*]

21.4.6.5 chPref (Preferred Number of Children)

This variable indicates the number of children that the current node prefers to have. This determines what the next action of the 'Add Shape' button should be in the user interface.

[*Example*: Consider the following example of chPref being used in DiagramML:

```
<varLst>
    <chMax val="3" />
    <chPref val="1" />
    <dir val="norm" />
    <animLvl val="lvl" />
    <resizeHandles val="rel" />
</varLst>
```

In this example, chPref is set to a single node and the user interface disables after a single node has been inserted. *end example*]

Attributes	Description
val (Preferred Number of Children Value)	This attribute indicates the number of children that the current node prefers to have. This determines what the next action of the 'Add Shape' button should be. A value of -1 indicates an infinite number of children. Default value is -1. The possible values for this attribute are defined by the ST_NodeCount simple type (§21.4.7.44).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ChildPref) is located in §A.5.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

21.4.6.6 dir (Diagram Direction)

This element indicates whether the diagram should switch direction. This element provides the ability to define different behavior for diagrams considering LTR or RTL directions.

Attributes	Description
val (Diagram Direction Value)	This variable indicates whether the diagram should switch direction. The possible values for this attribute are defined by the ST_Direction simple type (§21.4.7.26).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Direction) is located in §A.5.3. *end note*]

21.4.6.7 hierBranch (Organization Chart Branch Style)

This element defines the layout style of a branch in an organizational chart.

[*Example*: Consider the following example of hierBranch being used in DiagramML:

```
<varLst>
    <hierBranch val="init" />
</varLst>
```

In this example the value of hierBranch is defined as `init` which is a kind of not set state, or initial state. *end example*]

Attributes	Description
val (Organization Chart Branch Style Value)	The value of this attribute indicates the layout style of a branch in an organization chart. The default value is `std`. The possible values for this attribute are defined by the ST_HierBranchStyle simple type (§21.4.7.37).

[*Note*: The W3C XML Schema definition of this element's content model (CT_HierBranchStyle) is located in §A.5.3. *end note*]

21.4.6.8 orgChart (Show Organization Chart User Interface)

This element is used to indicate when to show user interface controls specifically associated with organizational charts such as being able to add an assistant to a selected node.

[*Example*: Consider the following example of orgChart used in DiagramML:

```
<varLst>
    <orgChart val="true" />
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
    <chPref val="1" />
    <dir val="norm" />
    <animOne val="branch" />
    <animLvl val="lvl" />
    <resizeHandles val="rel" />
  </varLst>
```

In this example we set the orgChart value to `true` indicating that the organizational chart specific user interface controls are to be enabled when the containing diagram is used. *end example*]

Attributes	Description
val (Show Organization Chart User Interface Value)	This attribute value specifies when to show the 'Insert Assistant' user interface control and the 'Change Layout' user interface for this diagram. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_OrgChart) is located in §A.5.3. *end note*]

21.4.7 Simple Types

This is the complete list of simple types dedicated to DrawingML – Diagrams.

21.4.7.1 ST_AlgorithmType (Algorithm Types)

Types of available algorithms.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
composite (Composite)	The composite algorithm specifies the size and position for all child layout nodes. You can use it to create graphics with a predetermined layout or in combination with other algorithms to create more complex shapes.
conn (Connector Algorithm)	The connector algorithm lays out and routes connecting lines, arrows, and shapes between layout nodes.
cycle (Cycle Algorithm)	The cycle algorithm lays out child layout nodes around a circle or portion of a circle using equal angle spacing.
hierChild (Hierarchy Child Algorithm)	The hierarchy child algorithm works with the hierRoot algorithm to create hierarchical tree layouts. This algorithm aligns and positions its child layout nodes in

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
	a linear path under the hierRoot layout node.
hierRoot (Hierarchy Root Algorithm)	The hierarchy root algorithm works with the hierChild algorithm to create hierarchical tree layouts. The hierRoot algorithm aligns and positions the hierRoot layout node in relation to the hierChild layout nodes.
lin (Linear Algorithm)	The linear algorithm lays out child layout nodes along a linear path.
pyra (Pyramid Algorithm)	The pyramid algorithm lays out child layout nodes along a vertical path and works with the trapezoid shape to create a pyramid.
snake (Snake Algorithm)	The snake algorithm lays out child layout nodes along a linear path in two dimensions, allowing the linear flow to continue across multiple rows or columns.
sp (Space Algorithm)	The space algorithm is used to specify a minimum space between other layout nodes or as an indication to do nothing with the layout node's size and position.
tx (Text Algorithm)	The text algorithm sizes text to fit inside a shape and controls its margins and alignment.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AlgorithmType) is located in §A.5.3. *end note*]

21.4.7.2 ST_AnimLvlStr (Animation Level String Definition)

This simple type specifies the possible values for the string that should be displayed by a consumer for level animation of this diagram.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (From Center Animation)	This value specifies that the consumer shall allow "From Center At Once" or "From Center One by One" animation styles for this diagram.
lvl (By Level Animation)	This value specifies that the consumer shall display "By Level" animation types for this diagram.
none (Disable Level At Once)	This value specifies that the consumer shall disable level at once animation.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AnimLvlStr) is located in §A.5.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

21.4.7.3 ST_AnimOneStr (One by One Animation Value Definition)

This simple type defines the possible values for the string to use for one by one animation in the UI. Default value is one.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
branch (By Branch One By One)	This value specifies that the one by one animation string in the user interface should read "By Branch One By One".
none (Disable One-by-One)	This value specifies that the consumer should disable one by one animation.
one (One By One)	This value specifies that the one by one animation string in the user interface should read "One By One".

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AnimOneStr) is located in §A.5.3. *end note*]

21.4.7.4 ST_ArrowheadStyle (Arrowhead Styles)

This simple type defines different arrowhead style types for connectors.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
arr (Arrowhead Present)	Specifies that an arrowhead is to be used on the connector.
auto (Auto)	Specifies that the algorithm defines if an arrowhead is to be used on a connector.
noArr (No Arrowhead)	Specifies no arrowhead is to be used on the connector.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ArrowheadStyle) is located in §A.5.3. *end note*]

21.4.7.5 ST_AutoTextRotation (Auto Text Rotation)

This simple type defines how text rotates within a shape when the shape is rotated by an algorithm during layout.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
grav (Gravity)	Specifies that when the angle of the text hits the threshold of 90 degrees and 180 degrees, the text rotates by 180 degrees.
none (None)	Specifies that text always rotates with the shape.
upr (Upright)	Specifies that when the text angle hits 45, 135, 225, or 315 degree thresholds, then it rotates by negative 90 degrees.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AutoTextRotation) is located in §A.5.3. *end note*]

21.4.7.6 ST_AxisType (Axis Type)

This simple type defines different node sets in relation to the current context node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ancst (Ancestor)	Specifies a set of nodes between the current context node and the root node, including the root node. [*Example*: Consider the following example  *end example*]
ancstOrSelf (Ancestor or Self)	Specifies a set of nodes between the current context node and the root node, including the root node and the context node. [*Example*: Consider the following example

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
	 *end example*]
ch (Child)	Specifies a set of children of the current context node. [*Example*: Consider the following example  *end example*]
des (Descendant)	Specifies a set of all nodes beneath the current context node. [*Example*: Consider the following example 
STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
	end example]
desOrSelf (Descendant or Self)	Specifies a set of all nodes beneath the current context node, including the context node. [*Example*: Consider the following example  *end example*]
follow (Follow)	Specifies the set of nodes which are peers after the context node and all descendants of the peers. [*Example*: Consider the following example  *end example*]
followSib (Follow Sibling)	Specifies the set of nodes which are peers after the context node. [*Example*: Consider the following example

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
	 *end example*]
none (None)	Specifies no node.
par (Parent)	Specifies the parent node. [*Example*: Consider the following example  *end example*]
preced (Preceding)	Specifies the set of nodes which are peers before the context node and all the descendants of the peers. [*Example*: Consider the following example

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
	 *end example*]
precedSib (Preceding Sibling)	Specifies the set of nodes which are peers before the context node. [*Example*: Consider the following example  *end example*]
root (Root)	Specifies the top-most node of the diagram. [*Example*: Consider the following example 
STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
	end example]
self (Self)	Specifies the calling context node. [*Example*: Consider the following example  *end example*]

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AxisType) is located in §A.5.3. *end note*]

21.4.7.7 ST_AxisTypes (Axis Type List)

This simple type represents a list of axis types.

This simple type allows a list of items of the ST_AxisType simple type (§21.4.7.6).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_AxisTypes) is located in §A.5.3. *end note*]

21.4.7.8 ST_BendPoint (Bend Point)

This simple type defines where a bend is to occur within a connection between two nodes.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
beg (Beginning)	The bend is to occur at the beginning of the connection.
def (Default)	The default bend is used. By default connections bend in the center.
end (End)	The bend is to occur at the end of the connection.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BendPoint) is located in §A.5.3. *end note*]

21.4.7.9 ST_Booleans (Boolean List.)

A list of booleans.

This simple type allows a list of items of the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Booleans) is located in §A.5.3. *end note*]

21.4.7.10 ST_BoolOperator (Boolean Constraint)

This simple type specified Boolean operations which can be applied to compare constraints.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
equ (Equal)	Equal operator.
gte (Greater Than or Equal to)	Specifies the greater than or equal to Boolean operator.
lte (Less Than or Equal to)	Specifies the less than or equal to Boolean operator.
none (None)	Specifies a none Boolean operator

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BoolOperator) is located in §A.5.3. *end note*]

21.4.7.11 ST_Breakpoint (Breakpoint)

This simple type defines at what point the wrapping of nodes occurs for the snake algorithm.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bal (Balanced)	Specifies that the number of nodes in every row and every column should be equal.
endCnv (End of Canvas)	Specifies that nodes are added to the next column or row after filling the current column or row's space.
fixed (Fixed)	Specifies to use a user defined number of nodes in a column or row.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Breakpoint) is located in §A.5.3. *end note*]

21.4.7.12 ST_CenterShapeMapping (Center Shape Mapping)

This simple type defines the behavior of the cycle algorithm.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
fNode (First Node)	Specifies a node which is always in the center of a cycle diagram.
none (None)	Specifies the normal layout of a cycle diagram.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CenterShapeMapping) is located in §A.5.3. *end note*]

21.4.7.13 ST_ChildAlignment (Child Alignment)

This simple type defines how to align a node in its allocated space.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Bottom)	Specifies to align the node to the bottom.
l (Left)	Specifies to align the node to the left.
r (Right)	Specifies to align the node to the right.
t (Top)	Specifies to align the node to the top.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ChildAlignment) is located in §A.5.3. *end note*]

21.4.7.14 ST_ChildDirection (Child Direction)

This simple type defines the layout direction of child nodes related to a specific parent node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
horz (Horizontal)	Specifies that the child nodes are to be laid out

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
	horizontally.
vert (Vertical)	Specifies that the child nodes are to be laid out vertically.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ChildDirection) is located in §A.5.3. *end note*]

21.4.7.15 ST_ChildOrderType (Child Order)

This simple type specifies the child order for a given layout node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Bottom)	Child order along the bottom.
t (Top)	Top child order.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ChildOrderType) is located in §A.5.3. *end note*]

21.4.7.16 ST_ClrAppMethod (Color Application Method Type)

This simple type defines the way a given set of colors is applied to a set of nodes or items across a diagram.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
cycle (Cycle)	The colors apply from A to B to A if A and B were the colors present. [*Example*: Consider the following image as an example of cycle applied to a diagram:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
	 In this example, the color A is applied to node 1 and node 10. Color B is considered the node color between A and A across the diagram. Colors interpolate across the diagram from A to B back to A. *end example*]
repeat (Repeat)	The colors apply from A through B to A through B if A through B were the colors present. [*Example*: Consider the following image as an example of repeat applied to a diagram:  In this example, the color A is applied to node 1, the next color to node 2, and so on through color B, then this coloring is repeated until there are no more nodes to color. *end example*]
span (Span)	The colors interpolate from A to B across the entire diagram if A and B were the colors present. [*Example*: Consider the following image as an example of span applied to a diagram:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
	 In this example, the color A is applied to node 1, the color B is applied to node 10 and the colors applied to nodes 2 through 9 are interpolated between colors A and B. *end example*]

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ClrAppMethod) is located in §A.5.3. *end note*]

21.4.7.17 ST_ConnectorDimension (Connector Dimension)

This simple type defines the dimensionality of the connection between two nodes.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
1D (1 Dimension)	Specifies a one dimensional connection, or rather a line.
2D (2 Dimensions)	Specifies a two dimensional connection which has both width and height.
cust (Custom)	Specifies a custom connection type.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ConnectorDimension) is located in §A.5.3. *end note*]

21.4.7.18 ST_ConnectorPoint (Connector Point)

This simple type defines different connection sites available on a node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (Auto)	Specifies that the algorithm determines the best connection site to use.
bCtr (Bottom Center)	Specifies that the bottom, center connection site is to be used.
bL (Bottom Left)	Specifies that the bottom, left connection site is to be used.
bR (Bottom Right)	Specifies that the bottom right connection site is to be used.
ctr (Center)	Specifies that the center connection site is to be used.
midL (Middle Left)	Specifies that the middle left connection site is to be used.
midR (Middle Right)	Specifies that the middle right connection site is to be used.
radial (Radial)	Specifies connections along a radial path to support the use of connections in cycle diagrams.
tCtr (Top Center)	Specifies that the top center connection site is to be used.
tL (Top Left)	Specifies that the top left connection site is to be used.
tR (Top Right)	Specifies that the top right connection site is to be used.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ConnectorPoint) is located in §A.5.3. *end note*]

21.4.7.19 ST_ConnectorRouting (Connector Routing)

This simple type defines how the routing of a connection between two nodes is supposed to progress from node 1 to node 2.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bend (Bending)	Specifies a bending connection which bends at a right angle.
curve (Curve)	Specifies a connection which is curved.
longCurve (Long Curve)	Specifies a connection that is curved that has a greater radius than a simple curved connection.
stra (Straight)	Specifies a straight connection.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ConnectorRouting) is located in §A.5.3. *end note*]

21.4.7.20 ST_ConstraintRelationship (Constraint Relationship)

This simple type specifies the types of constraint relationships which are present and can be used.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ch (Child)	The constraint should reference a child node.
des (Descendant)	The layout node can map to the descendants of the data point.
self (Self)	The layout node maps to the current data point.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ConstraintRelationship) is located in §A.5.3. *end note*]

21.4.7.21 ST_ConstraintType (Constraint Type)

This simple type defines the list of possible constraints available for use.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
alignOff (Alignment Offset)	This value defines the alignment offset for a node.
b (Bottom)	The bottom of the node.
begMarg (Beginning Margin)	Specifies the beginning margin.
begPad (Beginning Padding)	Specifies the beginning padding.
bendDist (Bending Distance)	Specifies the distance from the start of a connector to a bend in the connector.
bMarg (Bottom Margin)	Specifies the bottom margin.
bOff (Bottom Offset)	Specifies the bottom offset.
connDist (Connection Distance)	Specifies the connection distance.
ctrX (Center Height)	Specifies the center of the height.
ctrXOff (Center X Offset)	Specifies the center x coordinate offset.
ctrY (Center Width)	Specifies the center of the width.
ctrYOff (Center Y Offset)	Specifies the center y coordinate offset.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
diam (Diameter)	Specifies the diameter.
endMarg (End Margin)	Specifies the ending margin.
endPad (End Padding)	Specifies the end padding.
h (Height)	Specifies the height.
hArH (Arrowhead Height)	Specifies the height of the arrowhead portion of the connector.
hOff (Height Offset)	Specifies the amount to offset the height.
l (Left)	Specifies the left constraint.
lMarg (Left Margin)	Specifies the left margin.
lOff (Left Offset)	Specifies the left offset.
none (Unknown)	Unknown constraint.
primFontSz (Primary Font Size)	The primary font size.
pyraAcctRatio (Pyramid Accent Ratio)	Specifies the fraction of the width of the diagram that is reserved for the fly outs at their shortest distance.
r (Right)	Specifies the right constraint.
rMarg (Right Margin)	Specifies the right margin constraint.
rOff (Right Offset)	Specifies the right offset constraint.
secFontSz (Secondary Font Size)	The secondary font size.
secSibSp (Secondary Sibling Spacing)	The secondary sibling spacing.
sibSp (Sibling Spacing)	Specifies the minimum distance between sibling shapes.
sp (Spacing)	Specifies the spacing defined.
stemThick (Stem Thickness)	Specifies the thickness of the arrow's shaft.
t (Top)	Specifies the top constraint.
tMarg (Top Margin)	Top margin constraint.
tOff (Top Offset)	Top offset constraint.
userA (User Defined A)	User defined information.
userB (User Defined B)	User defined information.
userC (User Defined C)	User defined information.
userD (User Defined D)	User defined information.
userE (User Defined E)	User defined information.
userF (User Defined F)	User defined information.
userG (User Defined G)	User defined information.
userH (User Defined H)	User defined information.
userI (User Defined I)	User defined information.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
userJ (User Defined J)	User defined information.
userK (User Defined K)	User defined information.
userL (User Defined L)	User defined information.
userM (User Defined M)	User defined information.
userN (User Defined N)	User defined information.
userO (User Defined O)	User defined information.
userP (User Defined P)	User defined information.
userQ (User Defined Q)	User defined information.
userR (User Defined R)	User defined information.
userS (User Defined S)	User defined information.
userT (User Defined T)	User defined information.
userU (User Defined U)	User defined information.
userV (User Defined V)	User defined information.
userW (User Defined W)	User defined information.
userX (User Defined X)	User defined information.
userY (User Defined Y)	User defined information.
userZ (User Defined Z)	User defined information.
w (Width)	The width parameter.
wArH (Arrowhead Width)	Specifies the width of the arrowhead portion of the connector.
wOff (Width Offset)	Offsets the width by the specified amount.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ConstraintType) is located in §A.5.3. *end note*]

21.4.7.22 ST_ContinueDirection (Continue Direction)

This simple type specifies the behavior of the direction that additional nodes are added to new rows or columns in the snake algorithm.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
revDir (Reverse Direction)	Specifies that the direction is to be revered on a subsequent row or column. [*Example*: Consider the following diagram as an

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
	example of reverse direction  *end example*]
sameDir (Same Direction)	Specifies that the direction is to be maintained on a subsequent row or column. [*Example*: Consider the following diagram as an example of same direction  *end example*]

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ContinueDirection) is located in §A.5.3. *end note*]

21.4.7.23 ST_CxnType (Connection Type)

This simple type defines the different types of relationships that can be defined between two nodes.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
parOf (Parent Of)	This defines a parent-child relationship in the sense that node X is a parent of node Y.
presOf (Presentation Of)	A presentation type relationship. This type of relationship exists to actually present data.
presParOf (Presentation Parent Of)	A relationship defining a parent of a presentation node.
unknownRelationship (Unknown Relationship)	The type of relationship is unknown.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CxnType) is located in §A.5.3. *end note*]

21.4.7.24 ST_DiagramHorizontalAlignment (Horizontal Alignment)

This simple type defines the horizontal alignment.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (Center)	Specifies center alignment.
l (Left)	Specifies left alignment.
none (None)	Specifies no alignment defined.
r (Right)	Specifies right alignment.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DiagramHorizontalAlignment) is located in §A.5.3. *end note*]

21.4.7.25 ST_DiagramTextAlignment (Text Alignment)

This simple type defines alignment types for text within a node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (Center)	Specifies center aligned text.
l (Left)	Specifies left aligned text.
r (Right)	Specifies right aligned text.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_DiagramTextAlignment) is located in §A.5.3. *end note*]

21.4.7.26 ST_Direction (Diagram Direction Definition)

This simple type defines the possible values for a diagram's direction when displayed in an application.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
norm (Normal Direction)	This value specifies that the direction of the diagram should not be switched.
rev (Reversed Direction)	This value specifies that the direction of the diagram should be switched.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Direction) is located in §A.5.3. *end note*]

21.4.7.27 ST_ElementType (Data Point Type)

This simple type defines the different types of data points which are supported.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (All)	Defined as utilizing all of the nodes.
asst (Assistant)	The assistant nodes.
doc (Document)	Specifies the a node on the document level.
node (Node)	Data nodes that are children of other data nodes.
nonAsst (Non Assistant)	Selects all of the non-assistant nodes.
nonNorm (Non Normal)	Selects the non-normal elements.
norm (Normal)	Selects a normal elements.
parTrans (Parent Transition)	The transition associated with the parent node.
pres (Presentation)	This refers to a presentation node.
sibTrans (Sibling Transition)	Use only sibling transitions between data nodes. These transitions represent sibling relationships between nodes, and are frequently mapped to arrows between shapes in the drawing. A sibTrans value is sometimes used to create white space between nodes.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ElementType) is located in §A.5.3. *end note*]

21.4.7.28 ST_ElementTypes (Diagram Layout Node Type List)

A list of diagram layout node types.

This simple type allows a list of items of the ST_ElementType simple type (§21.4.7.27).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ElementTypes) is located in §A.5.3. *end note*]

21.4.7.29 ST_FallbackDimension (Fallback Dimension)

Specifies the dimensionality by which nodes can grow or shrink automatically.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
1D (1 Dimension)	Specifies that the node can grow or shrink by its height or its width, but not both.
2D (2 Dimensions)	Specifies that the node can grow or shrink by both height and width.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FallbackDimension) is located in §A.5.3. *end note*]

21.4.7.30 ST_FlowDirection (Flow Direction)

This simple type defines how the progression of new nodes are to be entered into the diagram.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
col (Column)	Specifies that the layout occurs in a column-based fashion. This would mean laying out the nodes from top to bottom, before moving left to right.
row (Row)	Specifies that the layout occurs in a row-based fashion. This would mean laying out the nodes from left to right before moving from top to bottom.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FlowDirection) is located in §A.5.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

21.4.7.31 ST_FunctionArgument (Function Argument)

Conditional expression function argument.

This simple type is a union of the following types:

- The ST_VariableType simple type (§21.4.7.64).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FunctionArgument) is located in §A.5.3. *end note*]

21.4.7.32 ST_FunctionOperator (Function Operator)

This simple type defines the condition expression functions which can be used to perform operations.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
equ (Equal)	Equal function operator.
gt (Greater Than)	Specifies the grater than function operator.
gte (Greater Than or Equal to)	Specifies the greater than or equal to function operator.
lt (Less Than)	Specifies the less than function operator.
lte (Less Than or Equal to)	Specifies the less than or equal to function operator.
neq (Not Equal To)	Specifies the not equal to function operator.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FunctionOperator) is located in §A.5.3. *end note*]

21.4.7.33 ST_FunctionType (Function Type)

This simple type defines the set of available conditional expression function types present for use.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
cnt (Count)	Specifies a count.
depth (Depth)	Specifies the depth.
maxDepth (Max Depth)	Defines the maximum depth.
pos (Position)	Retrieves the position of the node in the specified set of nodes.
posEven (Position Even)	Returns 1 if the specified node is at an even numbered

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
	position in the data model.
posOdd (Position Odd)	Returns 1 if the specified node is in an odd position in the data model.
revPos (Reverse Position)	Reverse position function.
var (Variable)	Used to reference a variable.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FunctionType) is located in §A.5.3. *end note*]

21.4.7.34 ST_FunctionValue (Function Value)

Conditional expression function value.

This simple type is a union of the following types:

- The ST_AnimLvlStr simple type (§21.4.7.2).
- The ST_AnimOneStr simple type (§21.4.7.3).
- The ST_Direction simple type (§21.4.7.26).
- The ST_HierBranchStyle simple type (§21.4.7.37).
- The ST_ResizeHandlesStr simple type (§21.4.7.54).
- The W3C XML Schema boolean datatype.
- The W3C XML Schema int datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FunctionValue) is located in §A.5.3. *end note*]

21.4.7.35 ST_GrowDirection (Grow Direction)

This simple type defines different starting locations for nodes within the snake algorithm.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bL (Bottom Left)	Specifies the placement of nodes is to start in the bottom left corner.
bR (Bottom Right)	Specifies the placement of nodes is to start in the bottom right corner.
tL (Top Left)	Specifies the placement of nodes is to start in the top left corner.
tR (Top Right)	Specifies the placement of nodes is to stat in the top right corner.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_GrowDirection) is located in §A.5.3. *end note*]

21.4.7.36 ST_HierarchyAlignment (Hierarchy Alignment)

This simple type defines different relative locations of child nodes and their descendants to a parent node within a hierarchy diagram.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bCtrCh (Bottom Center Child)	Specifies the child nodes are placed below the parent node and that they are center aligned to the parent node.
bCtrDes (Bottom Center Descendant)	Specifies the descendant nodes are placed below the parent node and that they are center aligned to the parent node.
bL (Bottom Left)	Specifies the child and descendant nodes are placed below the parent node and that the set is left aligned.
bR (Bottom Right)	Specifies the child and descendant nodes are placed below the parent node and the set is right aligned.
lB (Left Bottom)	Specifies the child and descendant nodes are placed to the left of the parent node and that the set is bottom aligned.
lCtrCh (Left Center Child)	Specifies the child nodes are placed to the left of the parent node and that the set is center aligned.
lCtrDes (Left Center Descendant)	Specifies the descendant nodes are placed to the left of the parent node and that the set is center aligned.
lT (Left Top)	Specifies the child and descendant nodes are placed to the left of the parent node and that the set is top aligned.
rB (Right Bottom)	Specifies the child and descendant nodes are placed to the right of the parent node and that the set is bottom aligned.
rCtrCh (Right Center Children)	Specifies the child nodes are placed to the right of the parent node and that the set is center aligned.
rCtrDes (Right Center Descendants)	Specifies the descendant nodes are placed to the right of the parent node and that the set is center aligned.
rT (Right Top)	Specifies the child and descendant nodes are placed to the right of the parent node and that the set is top

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
	aligned.
tCtrCh (Top Center Children)	Specifies the child nodes are placed above the parent node and that the set is center aligned.
tCtrDes (Top Center Descendants)	Specifies the descendant nodes are placed above the parent node and that the set is center aligned.
tL (Top Left)	Specifies the child and descendant nodes are placed above the parent node and that the set is left aligned.
tR (Top Right)	Specifies the child and descendant nodes are placed above the parent node and that the set is right aligned.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_HierarchyAlignment) is located in §A.5.3. *end note*]

21.4.7.37 ST_HierBranchStyle (Hierarchy Branch Style Definition)

This simple type specifies the possible values for the branch style of a hierarchy diagram.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
hang (Hanging)	The branch style is hanging from the parent. [*Example*: Consider the following image as an example of a hanging branch style:  *end example*]
init (Initial)	This means that the value has not been set.
l (Left)	The branch style falls off the left. [*Example*: Consider the following image as an example of a left hanging branch style:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
	 *end example*]
r (Right)	The branch style falls off the right. [*Example*: Consider the following image as an example of a right hanging branch style:  *end example*]
std (Standard)	The standard branch style is to be used. [*Example*: Consider the following image as an example of a standard hanging branch style:  *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_HierBranchStyle) is located in §A.5.3. *end note*]

21.4.7.38 ST_HueDir (Hue Direction)

When given two colors to interpolate between, one can go in one of two directions around the color wheel to perform the interpolation. This simple type defines that direction.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ccw (Counterclockwise Hue Direction)	A hue interpolation in the counterclockwise direction.
cw (Clockwise Hue Direction)	A hue interpolation in the clockwise direction.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_HueDir) is located in §A.5.3. *end note*]

21.4.7.39 ST_Index1 (1-Based Index)

A 1-based index.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Index1) is located in §A.5.3. *end note*]

21.4.7.40 ST_Ints (Integer List)

A list of integers.

This simple type allows a list of items of the W3C XML Schema int datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Ints) is located in §A.5.3. *end note*]

21.4.7.41 ST_LayoutShapeType (Layout Shape Type)

All of the available shape types.

This simple type is a union of the following types:

- The ST_OutputShapeType simple type (§21.4.7.48).
- The ST_ShapeType simple type (§20.1.10.55).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_LayoutShapeType) is located in §A.5.3. *end note*]

21.4.7.42 ST_LinearDirection (Linear Direction)

This simple type defines the direction of growth of new nodes.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
fromB (From Bottom)	Specifies growth to start from the bottom.
fromL (From Left)	Specifies growth to start from the left.
fromR (From Right)	Specifies growth to start from the right.
fromT (From Top)	Specifies growth to start from the Top

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_LinearDirection) is located in §A.5.3. *end note*]

21.4.7.43 ST_ModelId (Model Identifier)

The unique ID of the element within the data model. Model identifiers can be either longs or guids.

This simple type is a union of the following types:

- The ST_Guid simple type (§22.9.2.4).
- The W3C XML Schema int datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ModelId) is located in §A.5.3. *end note*]

21.4.7.44 ST_NodeCount (Number of Nodes Definition)

This simple type defines a count of the number of nodes for a property in a diagram. A value of -1 shall mean that the value is unbounded.

This simple type's contents are a restriction of the W3C XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -1.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_NodeCount) is located in §A.5.3. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

21.4.7.45 ST_NodeHorizontalAlignment (Node Horizontal Alignment)

This simple type defines the horizontal alignment of a node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (Center)	Specifies center alignment.
l (Left)	Specifies left alignment.
r (Right)	Specifies right alignment.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_NodeHorizontalAlignment) is located in §A.5.3. *end note*]

21.4.7.46 ST_NodeVerticalAlignment (Node Vertical Alignment)

This simple type defines the vertical alignment of a node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Bottom)	Specifies bottom alignment.
mid (Middle)	Specifies middle alignment.
t (Top)	Specifies top alignment.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_NodeVerticalAlignment) is located in §A.5.3. *end note*]

21.4.7.47 ST_Offset (Offset)

This simple type defines whether or not subsequent rows or columns in the snake algorithm are offset from the preceding row or column.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (Center)	Specifies no offset.
off (Offset)	Specifies that the nodes are shifted by some amount relative to the preceding row or column.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Offset) is located in §A.5.3. *end note*]

21.4.7.48 ST_OutputShapeType (Output Shape Type)

Shapes which are special specifically for a DrawingML diagram.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
conn (Connection)	Connection shape type.
none (None)	None.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_OutputShapeType) is located in §A.5.3. *end note*]

21.4.7.49 ST_ParameterId (Parameter Identifier)

This simple type defines algorithm parameters which can be modified in order to adjust the behavior of algorithms for use in layout nodes.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
alignTx (Text Alignment)	This value defines how the text is aligned in a node.
ar (Aspect Ratio)	Specifies the aspect ratio (width to height) of the composite node to use when determining child constraints. A value of 0 means leave the width and height constraints as is. The algorithm can temporarily shrink one dimension to achieve that ratio. [*Example*: If a composite node has a width constraint of 20 and height constraint of 10, and if ar=1.5, composite uses a width value of 15 to calculate the composite node's child constraints. However, the algorithm does not propagate this value to other nodes. *end example*]
autoTxRot (Auto Text Rotation)	Auto text rotation.
begPts (Beginning Points)	Beginning Points
begSty (Beginning Arrowhead Style)	Beginning Arrowhead Style
bendPt (Bend Point)	The bend point.
bkpt (Breakpoint)	Specifies the point at which the diagram starts to snake. The value bal specifies that snaking begin at an

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
	even number of rows and columns. The value fixed specifies that snaking begin at a fixed point. The value endCnv specifies that snaking begin when there is no more room for a shape in the row.
bkPtFixedVal (Breakpoint Fixed Value)	Specifies where the snake should break, if bkpt=fixed.
chAlign (Child Alignment)	Specifies the alignment of the children.
chDir (Child Direction)	The child direction.
connRout (Connection Route)	The route of the connection.
contDir (Continue Direction)	Specifies the direction of the subsequent row or column. [*Example*: If the algorithm initially places the nodes from left to right, revDir places the nodes in the next row from right to left. However if the algorithm uses contDir, the nodes on the next row are arranged from left to right. *end example*]
ctrShpMap (Center Shape Mapping)	Specifies where to place nodes in relation to the center circle.
dim (Connector Dimension)	Specifies the connector dimension.
dstNode (Destination Node)	Specifies the name of the layout node from which to end the connection from.
endPts (End Points)	Specifies the end points.
endSty (End Style)	Specifies the end style.
fallback (Fallback Scale)	1D specifies fallback. It only scales in one dimension. 2D specifies fallback. It scales in both dimensions equally.
flowDir (Flow Direction)	Specifies whether nodes are arranged in rows or columns.
grDir (Grow Direction)	Specifies from which corner the snake grows. [*Example*: If the algorithm uses a top left value, the snake grows from the top left. *end example*]
hierAlign (Hierarchy Alignment)	The alignment of the hierarchy.
horzAlign (Horizontal Alignment)	Aligns all the child nodes within the space reserved for the parent and adjusts child positions in the x direction.
linDir (Linear Direction)	Specifies the linear direction.
lnSpAfChP (Line Spacing After Children Paragraph)	Line spacing after children.
lnSpAfParP (Line Spacing After Parent Paragraph)	Line spacing after the parent.
lnSpCh (Line Spacing Children)	Line spacing of the children
lnSpPar (Line Spacing Parent)	Line spacing of the parent.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
nodeHorzAlign (Node Horizontal Alignment)	Specifies how child nodes are aligned within the extents of the canvas. [*Example*: You can align the tops of all the child nodes, but center all of them within the canvas. *end example*]
nodeVertAlign (Node Vertical Alignment)	Specifies how child nodes are aligned within the extents of the canvas. Same as nodeHorzAlign, but in the y direction.
off (Offset)	Specifies the offset.
parTxLTRAlign (Parent Text Left-to-Right Alignment)	Specifies the paragraph alignment of parent text when the shape has only parent text. This parameter applies when the text direction is left to right.
parTxRTLAlign (Parent Text Right-to-Left Alignment)	Specifies the paragraph alignment of parent text when the shape has only parent text. This parameter applies when the text direction is right to left.
pyraAcctBkgdNode (Pyramid Accent Background Node)	If pyramid has a composite child node, specifies the name of the node that is a child of the composite that makes up the child flyout shape. If the node specifies a shape of the nonIsoscelesTrapezoid autoshape, it modifies the adjust handles in order to fit the flyout flush against the side of the pyramid.
pyraAcctPos (Pyramid Accent Position)	Specifies the placement of the flyout grandchildren.
pyraAcctTxMar (Pyramid Accent Text Margin)	Specifies the placement of one edge of the child text (grandchild node). If the value is step, the text is against the edge of the pyramid. If the value is stack, the text aligns.
pyraAcctTxNode (Pyramid Accent Text Node)	If pyramid has a composite child node, specifies the child node that should hold the child text.
pyraLvlNode (Pyramid Level Node)	If pyramid has a composite child node, specifies the name of the node that is a child of the composite that makes up the pyramid itself. If the node specifies a trapezoid shape, it modifies the adjustment handles to construct a pyramid.
rotPath (Rotation Path)	The rotation path specified.
rtShortDist (Route Shortest Distance)	If true, the connector is routed through the shortest distance between the points.
secChAlign (Secondary Child Alignment)	The secondary child alignment.
secLinDir (Secondary Linear Direction)	The secondary linear direction.
shpTxLTRAlignCh (Shape Text Left-to-Right Alignment)	Specifies the paragraph alignment of all text within the shape when the shape contains both parent and child text. This parameter applies when the text direction is left to right.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
shpTxRTLAlignCh (Shape Text Right-to-Left Alignment)	Specifies the paragraph alignment of all text within the shape when the shape contains both parent and child text. This parameter applies when the text direction is right to left.
spanAng (Span Angle)	Specifies the angle the cycle spans. Final shapealign text is placed at stAng+spanAng, unless spanAng=360. In that case, the algorithm places the text so that shapes do not overlap.
srcNode (Source Node)	Specifies the name of the layout node from which to start the connection.
stAng (Start Angle)	Specifies the angle at which the first shape is placed. Angles are in degrees, measured clockwise from a line pointing straight upward from the center of the cycle.
stBulletLvl (Start Bullets At Level)	Specifies whether bullets start at the top level (1) or with children (2).
stElem (Start Element)	Specifies the point type of the layout node to use as the first shape in the cycle.
txAnchorHorz (Text Anchor Horizontal)	Specifies the y-axis position of the text area within a shape.
txAnchorHorzCh (Text Anchor Horizontal With Children)	Specifies that the definition can allow a different text anchoring on the x-axis, if child nodes exist in the shape.
txAnchorVert (Text Anchor Vertical)	Specifies the x-axis position of the text area within a shape.
txAnchorVertCh (Text Anchor Vertical With Children)	Specifies that the definition can allow a different text anchoring on the y-axis, if child nodes exist in the shape.
txBlDir (Text Block Direction)	Specifies whether the text block is vertical or horizontal.
txDir (Text Direction)	Specifies where the text of the first node starts.
vertAlign (Vertical Alignment)	Aligns all the child nodes within the space reserved for the parent and adjusts child positions in the y direction.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ParameterId) is located in §A.5.3. *end note*]

21.4.7.50 ST_ParameterVal (Parameter Values)

Specifies the list of parameter types that can be used by a diagram.

©ISO/IEC 2012 – All rights reserved

This simple type is a union of the following types:

- The ST_ArrowheadStyle simple type (§21.4.7.4).
- The ST_AutoTextRotation simple type (§21.4.7.5).
- The ST_BendPoint simple type (§21.4.7.8).
- The ST_Breakpoint simple type (§21.4.7.11).
- The ST_CenterShapeMapping simple type (§21.4.7.12).
- The ST_ChildAlignment simple type (§21.4.7.13).
- The ST_ChildDirection simple type (§21.4.7.14).
- The ST_ConnectorDimension simple type (§21.4.7.17).
- The ST_ConnectorPoint simple type (§21.4.7.18).
- The ST_ConnectorRouting simple type (§21.4.7.19).
- The ST_ContinueDirection simple type (§21.4.7.22).
- The ST_DiagramHorizontalAlignment simple type (§21.4.7.24).
- The ST_DiagramTextAlignment simple type (§21.4.7.25).
- The ST_FallbackDimension simple type (§21.4.7.29).
- The ST_FlowDirection simple type (§21.4.7.30).
- The ST_GrowDirection simple type (§21.4.7.35).
- The ST_HierarchyAlignment simple type (§21.4.7.36).
- The ST_LinearDirection simple type (§21.4.7.42).
- The ST_NodeHorizontalAlignment simple type (§21.4.7.45).
- The ST_NodeVerticalAlignment simple type (§21.4.7.46).
- The ST_Offset simple type (§21.4.7.47).
- The ST_PyramidAccentPosition simple type (§21.4.7.52).
- The ST_PyramidAccentTextMargin simple type (§21.4.7.53).
- The ST_RotationPath simple type (§21.4.7.55).
- The ST_SecondaryChildAlignment simple type (§21.4.7.56).
- The ST_SecondaryLinearDirection simple type (§21.4.7.57).
- The ST_StartingElement simple type (§21.4.7.58).
- The ST_TextAnchorHorizontal simple type (§21.4.7.59).
- The ST_TextAnchorVertical simple type (§21.4.7.60).
- The ST_TextBlockDirection simple type (§21.4.7.61).
- The ST_TextDirection simple type (§21.4.7.62).
- The ST_VerticalAlignment simple type (§21.4.7.65).
- The W3C XML Schema boolean datatype.
- The W3C XML Schema double datatype.
- The W3C XML Schema int datatype.
- The W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ParameterVal) is located in §A.5.3. *end note*]

21.4.7.51 ST_PtType (Point Type)

This simple type defines the different point types which can be utilized to create diagrams in DiagramML.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
asst (Assistant Element)	This point type is used in a hierarchy diagram to represent an assistant element.
doc (Document)	This point type specifies a document type point. This point type can be thought of as the root node associated with the document itself.
node (Node)	The node point type specifies a basic point type.
parTrans (Parent Transition)	This point type specifies a parent transition element.
pres (Presentation)	Specifies a presentation point type.
sibTrans (Sibling Transition)	This point type specifies a sibling transition element.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PtType) is located in §A.5.3. *end note*]

21.4.7.52 ST_PyramidAccentPosition (Pyramid Accent Position)

This simple type defines different positioning for the accent shapes which can be associated with a pyramid algorithm.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
aft (Pyramid Accent After)	Specifies that the accent shapes are to be placed to the right of the pyramid.
bef (Before)	Specifies that the accent shapes are to be placed to the left of the pyramid.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PyramidAccentPosition) is located in §A.5.3. *end note*]

21.4.7.53 ST_PyramidAccentTextMargin (Pyramid Accent Text Margin)

This simple type defines different ways to lay out text in the accent shape for a pyramid algorithm.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
stack (Stack)	Specifies that all accent shape text is to be left aligned. [*Example*: Consider the following example of a pyramid diagram  *end example*]
step (Step)	Specifies that all accent shape text is to be relative to the pyramid. [*Example*: Consider the following example of a pyramid diagram  *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PyramidAccentTextMargin) is located in §A.5.3. *end note*]

21.4.7.54 ST_ResizeHandlesStr (Resize Handle)

This simple type defines the possible behaviors when resizing shapes within a diagram. Because the size of the shape plays a large role in the overall layout of other nodes within the diagram, there are two ways resize can occur on a node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
exact (Exact)	This value specifies that the resize of the shape occurs and sizes exactly to the size the user defines, which causes all other shapes in the diagram to shrink or grow accordingly.
rel (Relative)	This value specifies that resize operations happen relatively. This means that the relative size difference between nodes is maintained before and after the resize operation.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ResizeHandlesStr) is located in §A.5.3. *end note*]

21.4.7.55 ST_RotationPath (Rotation Path)

This simple type defines rotation properties for nodes within the cycle algorithm.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
alongPath (Along Path)	Specifies that the nodes should rotate in relation to their placement along the cycle.
none (None)	Specifies that the nodes should not rotate.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_RotationPath) is located in §A.5.3. *end note*]

21.4.7.56 ST_SecondaryChildAlignment (Secondary Child Alignment)

This simple type defines different alignment properties of the both hanging layout type of the hierarchy algorithm.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Bottom)	Specifies that the children nodes should be bottom aligned.
l (Left)	Specifies that the children nodes should be left aligned.
none (None)	Specifies no alignment.
r (Right)	Specifies that the children nodes should be right aligned.
t (Top)	Specifies that the children nodes should be top aligned.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SecondaryChildAlignment) is located in §A.5.3. *end note*]

21.4.7.57 ST_SecondaryLinearDirection (Secondary Linear Direction)

This simple type defines different directions for the nodes in a both hanging layout in the hierarchy algorithm.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
fromB (From Bottom)	Specifies that the nodes begin from the bottom and move upward.
fromL (From Left)	Specifies that the nodes begin from the left and move right.
fromR (From Right)	Specifies that the nodes begin from the right and move left.
fromT (From Top)	Specifies that the nodes begin from the top and move downward.
none (None)	Specifies no direction.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SecondaryLinearDirection) is located in §A.5.3. *end note*]

21.4.7.58 ST_StartingElement (Starting Element)

This simple type defines behavior for the first node in a cycle algorithm.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
node (Node)	Specifies that a node should be placed first.
trans (Transition)	Specifies that a transition should be placed first.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_StartingElement) is located in §A.5.3. *end note*]

21.4.7.59 ST_TextAnchorHorizontal (Text Anchor Horizontal)

This simple type defines horizontal anchor points for text.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (Center)	Specifies text to be anchored to the center.
none (None)	Specifies no horizontal text anchor.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextAnchorHorizontal) is located in §A.5.3. *end note*]

21.4.7.60 ST_TextAnchorVertical (Text Anchor Vertical)

This simple type defines vertical anchor points for text.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Bottom)	Specifies text to be anchored to the bottom.
mid (Middle)	Specifies text to be anchored to the middle.
t (Top)	Specifies text to be anchored to the top.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextAnchorVertical) is located in §A.5.3. *end note*]

21.4.7.61 ST_TextBlockDirection (Text Block Direction)

This simple type defines different layout options for text within a node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
horz (Horizontal)	Specifies that the text is to be horizontal.
vert (Vertical Direction)	Specifies that the text is to be vertical.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextBlockDirection) is located in §A.5.3. *end note*]

21.4.7.62 ST_TextDirection (Text Direction)

This simple type defines different way the growth of additional text can occur within a node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
fromB (From Bottom)	Specifies additional text grows from the bottom.
fromT (From Top)	Specifies additional text grows from the top.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextDirection) is located in §A.5.3. *end note*]

21.4.7.63 ST_UnsignedInts (Unsigned Integer List)

A list of unsigned integers.

This simple type allows a list of items of the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_UnsignedInts) is located in §A.5.3. *end note*]

21.4.7.64 ST_VariableType (Variable Type)

Conditional expression variable type.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
animLvl (Animation Level)	Specifies the animation level
animOne (Animate One)	Specifies animate as one.
bulEnabled (Bullets Enabled)	Specifies bullets enabled.
chMax (Child Max)	The maximum number of children.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
chPref (Child Preference)	The preferred number of children.
dir (Direction)	Specifies the direction of the diagram.
hierBranch (Hierarchy Branch)	The hierarchy branch.
none (Unknown)	Unknown variable type.
orgChart (Organizational Chart Algorithm)	Algorithm that lays out an org chart.
resizeHandles (Resize Handles)	Specifies the resize handles.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_VariableType) is located in §A.5.3. *end note*]

21.4.7.65 ST_VerticalAlignment (Vertical Alignment)

This simple type defines different vertical alignment parameters.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Bottom)	Specifies bottom aligned.
mid (Middle)	Specifies middle aligned.
none (None)	Specifies no vertical alignment.
t (Top)	Specifies top aligned.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_VerticalAlignment) is located in §A.5.3. *end note*]

21.4.7.66 ST_PrSetCustVal (Property Set Customized Value)

This simple type defines customization percentage values for certain elements in DrawingML.

This simple type is a union of the following types:

The ST_Percentage simple type (§22.9.2.9).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PrSetCustVal) is located in §A.5.3. *end note*]

22. Shared MLs Reference Material

[No documentation has been entered for this section heading.]

22.1 Math

The following documentation specifies the XML representation of mathematical text for OOXML. This shared ML is known as that Office Math Markup Language (OMML). Mathematical text represented by OMML includes but is not limited to: equations, expressions, formulas, matrices, and other mathematical elements. The outermost OMML element of an instance of mathematical text in display mode is oMathPara, a math paragraph of one or more instances of mathematical text. Each instance of mathematical text inside the math paragraph is represented as a single oMath. Inside each oMath is a combination of mathematical runs (r) and objects or functions such as accents (acc) or fractions (f).

22.1.1 Table of Contents

This subclause is informative.

22.1.2 Elements 3594
22.1.2.1 acc (Accent) 3594
22.1.2.2 accPr (Accent Properties) 3595
22.1.2.3 aln (Alignment) 3595
22.1.2.4 alnScr (Align Scripts) 3597
22.1.2.5 argPr (Argument Properties) 3598
22.1.2.6 argSz (Argument Size) 3599
22.1.2.7 bar (Bar) 3601
22.1.2.8 barPr (Bar Properties) 3601
22.1.2.9 baseJc (Matrix Base Justification) 3602
22.1.2.10 begChr (Delimiter Beginning Character) 3605
22.1.2.11 borderBox (Border-Box Object) 3606
22.1.2.12 borderBoxPr (Border-Box Properties) 3606
22.1.2.13 box (Box Object) 3607
22.1.2.14 boxPr (Box Properties) 3607
22.1.2.15 brk (Break) 3608
22.1.2.16 brkBin (Break on Binary Operators) 3610
22.1.2.17 brkBinSub (Break on Binary Subtraction) 3611
22.1.2.18 cGp (Matrix Column Gap) 3612
22.1.2.19 cGpRule (Matrix Column Gap Rule) 3613
22.1.2.20 chr (Character) 3615
22.1.2.21 count (Matrix Column Count) 3616
22.1.2.22 cSp (Minimum Matrix Column Width) 3617
22.1.2.23 ctrlPr (Control Properties) 3618
22.1.2.24 d (Delimiter Object) 3619
22.1.2.25 defJc (Default Justification) 3620

22.1.3.11 ST_SpacingRule (Spacing Rule) 3711
22.1.3.12 ST_Style (Style) 3711
22.1.3.13 ST_TopBot (Top-Bottom) 3712
22.1.3.14 ST_UnSignedInteger (Unsigned integer.) 3712

End of informative text.

22.1.2 Elements

The following elements describe the contents of mathematical text.

22.1.2.1 acc (Accent)

This element specifies the accent function, consisting of a base and a combining diacritical mark. If accPr is omitted, the default accent is U+0302 (COMBINING CIRCUMFLEX ACCENT). [*Example*: Example accent functions are $\dot{a}$, $\acute{a}$, and $\tilde{a}$.

```
<m:acc>
  <m:accPr>
    <m:chr m:val="&#771;"/>
    <m:ctrlPr/>
  </m:accPr>
  <m:e>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:e>
</m:acc>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_Acc) is located in §A.6.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.1.2.2 accPr (Accent Properties)

This element specifies the properties of the Accent function. If chr is omitted, the default accent character is U+0302 (COMBINING CIRCUMFLEX ACCENT). [*Example*:

The diacritical mark ~ (tilde) is:

```
<m:accPr>
  <m:chr m:val="&#771;"/>
</m:accPr>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_AccPr) is located in §A.6.1. *end note*]

22.1.2.3 aln (Alignment)

This element specifies the alignment property on the box object. It is utilized only when the box is designated as an operator emulator. When 1 or true, this operator emulator serves as an alignment point; that is, designated alignment points in other equations can be aligned with it.

When the element is absent, the default is for the parent structure to not be an alignment point.

When the element is present and the val attribute is absent, the default value of the val attribute is 1 meaning that this property's parent structure is an alignment point.

[*Example*: For example, the following equation uses the operator emulator as an alignment point: $a == b$.

Its XML representation is as follows:

```
<m:oMath>
  <m:r>
    <m:t>a</m:t>
  </m:r>
  <m:box>
    <m:boxPr>
      <m:opEmu m:val="1"/>
      <m:aln m:val="1"/>
      <m:ctrlPr/>
    </m:boxPr>
    <m:e>
      <m:r>
        <m:t>==</m:t>
      </m:r>
    </m:e>
  </m:box>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
    <m:r>
      <m:t>b</m:t>
    </m:r>
  </m:oMath>
```

end example]

[*Example*:

Given the following equations:

$$a + b - c = 2$$
$$x - y + z = 3$$

Their associated XML represenation is as follows:

```
<m:oMathPara>
  <m:oMath>
    <m:r>
      <m:t>a+b</m:t>
    </m:r>
    <m:r>
      <m:rPr>
        <m:aln/>
      </m:rPr>
      <m:t>-c=2</m:t>
    </m:r>
    <m:r>
      <m:rPr>
        <m:sty m:val="p"/>
      </m:rPr>
      <w:br/>
    </m:r>
  </m:oMath>
  <m:oMath>
    <m:r>
      <m:t>x</m:t>
    </m:r>
    <m:r>
      <m:rPr>
        <m:aln/>
      </m:rPr>
      <m:t>-y+z=3</m:t>
    </m:r>
  </m:oMath>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
</m:oMathPara>
```

The subtraction symbols in each of the above equations have been identified as alignment points, so the equations are aligned at their subtraction symbols (because they are in the same Math paragraph).

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.4 alnScr (Align Scripts)

This element specifies the alignment of scripts in the subscript/superscript function. When `1` or `true`, subscripts and superscripts are aligned to each other. When `0` or `false`, they are kerned to the shape of the base. If this element is omitted, scripts are not aligned. In other words, when the element is absent, the default is for the sub-superscript object to not align the superscript and subscript with each other.

When the element is present and the val attribute is absent, the default value of the val attribute is 1 meaning that this property is applied.

[*Example*: Example (OFF): f_2^3, Example (ON): f_2^3.

The XML representation of the second example above is:

```
<m:sSubSup>
  <m:sSubSupPr>
    <m:alnScr   m:val="1"/>
  </m:sSubSupPr>
  <m:e>
    <m:r>
      <m:t>f</m:t>
    </m:r>
  </m:e>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
    <m:sub>
      <m:r>
        <m:rPr>
          <m:scr m:val="roman"/>
          <m:sty m:val="p"/>
        </m:rPr>
        <m:t>2</m:t>
      </m:r>
    </m:sub>
    <m:sup>
      <m:r>
        <m:rPr>
          <m:scr m:val="roman"/>
          <m:sty m:val="p"/>
        </m:rPr>
        <m:t>3</m:t>
      </m:r>
    </m:sup>
  </m:sSubSup>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.5 argPr (Argument Properties)

This element specifies any properties of the math argument. [*Example*: The XML below represents the argSz attribute on the base element e of a box:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<m:box>
  <m:boxPr>
    <m:noBreak m:val="0"/>
    <m:ctrlPr/>
  </m:boxPr>
  <m:e>
    <m:argPr>
      <m:argSz m:val="-1"/>
    </m:argPr>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:box>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathArgPr) is located in §A.6.1. *end note*]

22.1.2.6 argSz (Argument Size)

This element specifies the size, or script level, of an argument. If the element is omitted, the default argument size is 0.

Whether the element is absent or present without the val attribute, the default value of the val attribute is always `0`. However, this property does not specify an absolute size, rather it's absolute to it's starting size. Most arguments begin at the normal size which will be defined as `0` in the list below, but some begin, by default smaller or larger than the normal size. For instance, `1` represents that it is one size larger than normal, `2` represents that it is two sizes larger than normal, `-1` represents that it is one size smaller than normal, and `-2` represents that it is two sizes smaller than normal. The list below indicates the default starting sizes for each argument, if it is not in this list, then the size cannot be changed on that argument.

- box base: 0
- group-character base: 0
- lower limit limit: -1
- upper limit limit: -1
- n-ary operator subscript: -1
- n-ary operator superscript: -1
- radical degree: -2
- pre-sub-superscript subscript: -1
- pre-sub-superscript superscript: -1
- subscript subscript: -1
- sub-supersript subscript: -1

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

- sub-supersript superscript: -1
- superscript superscript: -1

[*Example*: The following example contains three runs: regular mathematical text, a box object with the base at script size (val=-1) and a box object with the base at script-script size (val=-2).

$$abc^{abc\ abc}$$

The XML below shows argSz used in the middle box.

```
<m:box>
  <m:boxPr>
    <m:noBreak m:val="0"/>
  </m:boxPr>
  <m:e>
    <m:argPr>
      <m:argSz m:val="-1"/>
    </m:argPr>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:box>
```

Because the size is set to -1 on the degree argument, the degree argument is 1 size smaller normal.

end example]

Attributes	Description
val (Value)	Specifies a value between -2 and 2 for the property defined by the parent XML element. The positive or negative sign specifies in which direction to change argument size; the absolute value specifies by how much. The table below represents two cases in which argument size can be changed: superscripts and boxes. In the superscript object a^{b^c}, by default the term c has script-script size. Should the user wish for the c to be shown at script size, `val` should be set to +1 (that is, one size larger). Should the user wish for c to be shown at text size, `val` should be set to +2 (that is, two sizes larger).

`val` of c in a^{b^c}	Display
Default	a^{b^c}
+1	a^{b^c}
+2	a^{b^c}

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
	<table><tr><th>val of abc</th><th>Display</th></tr><tr><td>Default</td><td>abc</td></tr><tr><td>-1</td><td>abc</td></tr><tr><td>-2</td><td>abc</td></tr></table> The possible values for this attribute are defined by the ST_Integer2 simple type (§22.1.3.5).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Integer2) is located in §A.6.1. *end note*]

22.1.2.7 bar (Bar)

This element specifies the bar function, consisting of a base argument and an overbar or underbar, as in $\overline{a}$ and $\underline{a}$.

[*Example*: The XML below demonstrates the overbar in use.

```
<m:bar>
  <m:barPr>
   <m:pos   m:val="top"/>
  </m:barPr>
  <m:e>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:e>
</m:bar>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_Bar) is located in §A.6.1. *end note*]

22.1.2.8 barPr (Bar Properties)

This element specifies properties of the bar function. If this element is omitted, the bar assumes its default location of top (the mathematical overbar). [*Example*:

$\underline{x}$ (x with an underbar) is represented by the following XML representation:

```
<m:bar>
  <m:barPr>
    <m:pos m:val="bot"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
    </m:barPr>
    <m:e>
      <m:r>
        <m:t>x</m:t>
      </m:r>
    </m:e>
  </m:bar>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_BarPr) is located in §A.6.1. *end note*]

22.1.2.9 baseJc (Matrix Base Justification)

This element specifies the justification of the matrix. Text outside of the matrix can be aligned with the bottom, top, or center of a matrix object. If this element is omitted, the matrix assumes center justification. In other words, whether the element is absent or present without the val attribute, the default of the val attribute is `center`.

[*Example*: This matrix has center baseJc: $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$

This matrix has top baseJc: $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$

This matrix has bottom baseJc: $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$

The XML below represents the matrix with top baseJC:

```
<m:d>
  <m:dPr>
    <m:shp  m:val="match"/>
  </m:dPr>
  <m:e>
    <m:m>
      <m:mPr>
        <m:baseJc m:val="top"/>
        <m:mcs>
          <m:mc>
            <m:mcPr>

              <m:count m:val="2"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
          <m:mcJc  m:val="center"/>
        </m:mcPr>
      </m:mc>
    </m:mcs>
  </m:mPr>
  <m:mr>
    <m:e>
      <m:r>
        <m:rPr>
          <m:scr  m:val="roman"/>
          <m:sty m:val="p"/>
        </m:rPr>
        <m:t>1</m:t>
      </m:r>
    </m:e>
    <m:e>
      <m:r>
        <m:rPr>
          <m:scr  m:val="roman"/>
          <m:sty  m:val="p"/>
        </m:rPr>
        <m:t>2</m:t>
      </m:r>
    </m:e>
  </m:mr>
  <m:mr>
    <m:e>
      <m:r>
        <m:rPr>
          <m:scr  m:val="roman"/>
          <m:sty  m:val="p"/>
        </m:rPr>
        <m:t>3</m:t>
      </m:r>
    </m:e>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
          <m:e>
            <m:r>
              <m:rPr>
                <m:scr  m:val="roman"/>
                <m:sty  m:val="p"/>
              </m:rPr>
              <m:t>4</m:t>
            </m:r>
          </m:e>
        </m:mr>
        <m:mr>
          <m:e>
            <m:r>
              <m:rPr>
                <m:scr  m:val="roman"/>
                <m:sty  m:val="p"/>
              </m:rPr>
              <m:t>5</m:t>
            </m:r>
          </m:e>
          <m:e>
            <m:r>
              <m:rPr>
                <m:scr  m:val="roman"/>
                <m:sty  m:val="p"/>
              </m:rPr>
              <m:t>6</m:t>
            </m:r>
          </m:e>
        </m:mr>
      </m:m>
    </m:e>
  </m:d>
```

Because the matrix base justification is top, the top row of the matrix is lined up with the baseline of the rest of the line.

end example]

Attributes	Description
val (Value)	Specifies the vertical justification parent element respect to surrounding text. Possible values are `top`, `bottom`, and `center`. [*Example*: The following examples illustrate baseJc on the matrix object m.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	This matrix has `center` baseJc: $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$ This matrix has `top` baseJc: $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$ This matrix has `bottom` baseJc: $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$ The possible values for this attribute are defined by the ST_YAlign simple type (§22.9.2.20).

[*Note*: The W3C XML Schema definition of this element's content model (CT_YAlign) is located in §A.6.1. *end note*]

22.1.2.10 begChr (Delimiter Beginning Character)

This element specifies the beginning, or opening, delimiter character. Mathematical delimiters are enclosing characters such as parentheses, brackets, and braces. If this element is omitted, the default begChr is '('. In other words, when the element is absent, the default is for the delimiter object beginning character to be Unicode character U+0028 (LEFT PARENTHESIS).

When the element is present and the val attribute is absent, the default of the val attribute is empty which means the delimiter object beginning character is absent.

[*Example*: In the following example, $\{a\}$ uses } and } as its enclosing characters:

```
<m:dPr>
  <m:begChr  m:val="{"/>
  <m:endChr m:val="}"/>
</m:dPr>
```

end example]

Attributes	Description

val (value)	Specifies the character used by the parent element. When it is omitted, the parent uses its assigned default.
	
	[*Example*: Accent object ã:
	
	`<m:accPr>`
	`  <m:chr m:val="̃"/>`
	`</m:accPr>`
	
	end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	The possible values for this attribute are defined by the ST_Char simple type (§22.1.3.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Char) is located in §A.6.1. *end note*]

22.1.2.11 borderBox (Border-Box Object)

This element specifies the Border Box object, consisting of a border drawn around an instance of mathematical text (such as a formula or equation), as in $\boxed{a^2 + b^2 = c^2}$. If borderBoxPr is omitted then the default behavior of borderBox is a rectangular border (as shown in the "abc" example below).

[*Example*: The following example shows the XML representation of the following Border Box: $\boxed{abc}$

```
<m:borderBox>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_BorderBox) is located in §A.6.1. *end note*]

22.1.2.12 borderBoxPr (Border-Box Properties)

This element specifies the properties of the Border Box object, which dictate the types of lines that can be drawn as part of the border. [*Example*: $\boxed{\cancel{a^2 + b^2 = c^2}}$ (Diagonal Strikethrough from Top Left) and $\overline{a^2 + b^2 = c^2}$ (no left or right edges). *end example*]

[*Example*:

$\underline{x}$ (left and bottom edges) is represented by the following XML:

```
<m:borderBox>
  <m:borderBoxPr>
<m:hideTop m:val="1"/>
    <m:hideRight m:val="1"/>
  </m:borderBoxPr>
  <m:e>
    <m:r>
      <m:t>x</m:t>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
      </m:r>
    </m:e>
  </m:borderBox>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_BorderBoxPr) is located in §A.6.1. *end note*]

22.1.2.13 box (Box Object)

This element specifies the box object, which is used to group components of an equation or other instance of mathematical text. A boxed object can (for example) serve as an operator emulator with or without an alignment point, serve as a line break point, have associated argSz, or be grouped such as not to allow line breaks within. If boxPr is omitted, all properties will be "false" by default.

[*Example*: The mathematical text $a == b$ uses a box around the double equal sign.

Its XML representation is as follows:

```
<m:r>
  <m:t>a</m:t>
</m:r>
<m:box>
  <m:boxPr>
    <m:opEmu    m:val="1"/>
    <m:aln/>
  </m:boxPr>
  <m:e>
      <m:r>
        <m:t>==</m:t>
      </m:r>
  </m:e>
</m:box>
<m:r>
  <m:t>b</m:t>
</m:r>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_Box) is located in §A.6.1. *end note*]

22.1.2.14 boxPr (Box Properties)

This element specifies properties of the Box object, for example, whether the Box serves as operator emulator with or without an alignment point, serves as a line break point, or receives the correct spacing for the mathematical differential. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

$a\ x\ b$ is partly represented by the following XML:

```
<m:box>
  <m:boxPr>
    <m:opEmu m:val="1"/>
  </m:boxPr>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </m:r>
  </m:e>
</m:box>
```

The x is set to be an operator emulator so it is given operator spacing around it.

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_BoxPr) is located in §A.6.1. *end note*]

22.1.2.15 brk (Break)

This element specifies whether there is a line break at the start of a run, or at the start of the Box object, such that the line wraps at the start of the run or box object. These user-defined line breaks occur when the XML tag `<m:brk/>` is encountered and does not follow a mathematical "order of precedence". If this element is omitted, a manual break is not inserted. In other words, when the element is absent, the default is for the parent structure to not manually break onto the next line. When the element is present and the val attribute is absent, the default of the val attribute is `0` meaning that this property's parent structure manually breaks onto the next line and is aligned with the beginning of the previous line.

The line may happen to wrap at this point if the mathematical text exceeds the column width. OMML does not specify behaviour for any kind of automatic line breaking. Instead it delegates this functionality to the underlying rendering engine similarly to how it does with the choice of operator spacing and the determination of whether an operator is unary or binary.

[*Example*: The following example includes a manual user-defined line break at the operator emulator:

$$a \\ == b$$

```
<m:r>
  <m:t>a</m:t>
</m:r>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<m:box>
  <m:boxPr>
    <m:opEmu    m:val="1"/>
    <m:brk/>
  </m:boxPr>
  <m:e>
    <m:r>
      <m:t>==</m:t>
    </m:r>
  </m:e>
</m:box>
<m:r>
  <m:t>b</m:t>
</m:r>
```

There is a break on the == symbol so a manual line break occurs right before the == symbol.

end example]

Attributes	Description
alnAt (Index of Operator to Align To)	Specifies the index of the operator on the previous line of mathematical text which shall be used as the alignment point for the current line of mathematical text . A line can be aligned to any operator on the previous line; this attribute specifies exactly which operator shall be the target of that alignment in cases where there are multiple operators. If alnAt is omitted, then all runs (r tag) that follow a brk tag will align with the left margin of the first run of mathematical text. [*Example*: For example, consider the break in this instance of mathematical text: $a + b + c + d + e$ $+ f + g$ The second line could theoretically be aligned to any of the four operators in the previous line. Specifying an alnAt value of 3 for the second line resolves this ambiguity; the second line is aligned to the third operator in the previous line. *end example*] The possible values for this attribute are defined by the ST_Integer255 simple type (§22.1.3.6).

[*Note*: The W3C XML Schema definition of this element's content model (CT_ManualBreak) is located in §A.6.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.1.2.16 brkBin (Break on Binary Operators)

This element specifies how binary operators are treated when they coincide with a line break. If this element is omitted, the line break occurs before the binary operator. That is, the binary operator is the first element on the wrapped line.

Whether the element is absent or present without the val attribute, the default of the val attribute is before.

[*Example*: For example:

$f(x) = a_{11} + a_{12} + \cdots + a_{nn}$

before

$f(x) = a_{11} + a_{12} + \cdots + a_{nn}$

after

$f(x) = a_{11} + a_{12} + \cdots + a_{nn}$

repeat

The above examples demonstrate how such an equation would look depending on the value of the brkBin document-property. These actual examples do not rely on the brkBin property of this document to maintain their configurations. This would be impossible because the brkBin property can only be set to one value for an entire document at any given time. Here we are demonstrating all three.

The XML below demonstrates brkBin in use under mathPr:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Attributes	Description
val (Value)	Specifies where to break on binary operators. Possible values are before, after, and repeat. The possible values for this attribute are defined by the ST_BreakBin simple type (§22.1.3.1).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_BreakBin) is located in §A.6.1. *end note*]

22.1.2.17 brkBinSub (Break on Binary Subtraction)

This element specifies how the subtraction operator is treated when it coincides with a line break, when brkBin is set to repeat. If this element is omitted, the subtraction operator is repeated before and after the break.

Whether the element is absent or present without the val attribute, the default of the val attribute is --.

[*Example*: The XML below demonstrates brkBinSub in use under mathPr:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

[*Example*:

Given the following XML representation using brkBinSub:

```
<m:brkBinSub m:val="-+"/>
```

Because the document option for break on binary subtraction is set to -+, any breaks in Math paragraphs on subtraction operators will display a – on the line before the break and a + on the line after the break.

end example]

Attributes	Description
val (Value)	Specifies how the subtraction operator is treated when it coincides with a line break, when `brkBin` is set to `repeat`. Possible values are `--`, `-+`, and `+-`. The possible values for this attribute are defined by the ST_BreakBinSub simple type (§22.1.3.2).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

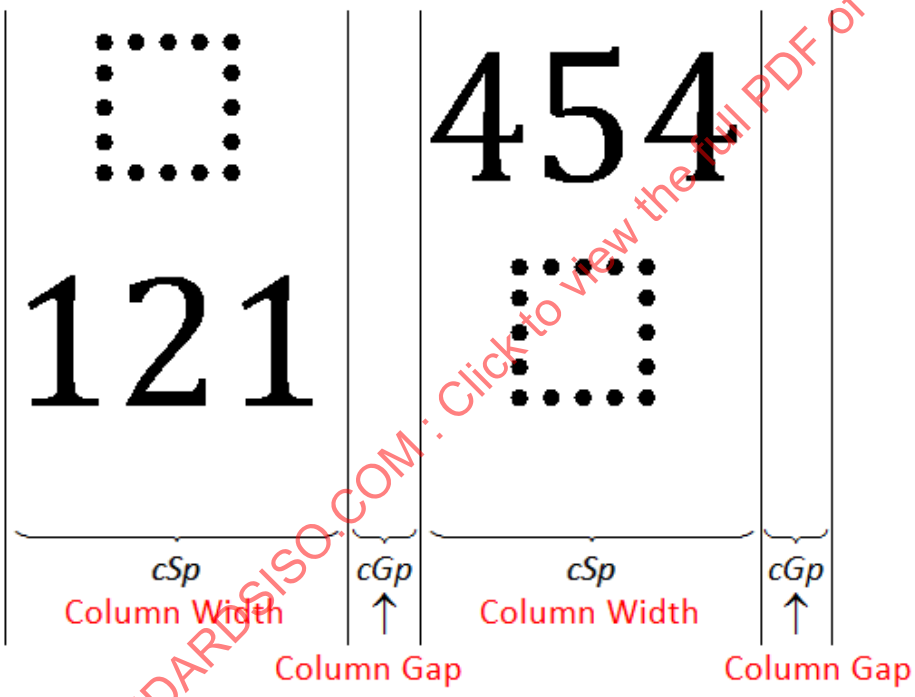
[*Note*: The W3C XML Schema definition of this element's content model (CT_BreakBinSub) is located in §A.6.1. *end note*]

22.1.2.18 cGp (Matrix Column Gap)

This element represents the (custom) column gap spacing information; the default value is `0` (which corresponds to 1 em). This value is interpreted differently depending on the value of cGpRule (§22.1.2.19). cGp is not used unless the value of cGpRule is 3 or 4. When cGpRule is omitted, the default spacing between matrix columns is 1 em (a val attribute value of `0`).

Whether the element is absent or present without the val attribute, the default of the val attribute is `0`.

The cGp gap spacing (also referred to as "Column Gap" or "Gap Width") is added to the cSp (Minimum Matrix Column Width) to determine the total Matrix Column Spacing (distance between the same edges of different columns). The following image depicts how cGp and cSp work together to define matrix column spacing in a 2x2 matrix:



STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Example*: With a cGpRule value of 4, the matrix: $\begin{matrix}1 & 2\\ 3 & 4\end{matrix}$ has 3 ems of spacing between columns (3 ems = 6 * 0.5 ems). The matrix properties that demonstrate this element in use are:

©ISO/IEC 2012 – All rights reserved

```
<m:mPr>
  <m:cGpRule  m:val="4"/>
  <m:cGp  m:val="6"/>
  <m:mcs>
    <m:mc>
      <m:mcPr>
        <m:count m:val="2"/>
        <m:mcJc m:val="center"/>

      </m:mcPr>
    </m:mc>
  </m:mcs>
</m:mPr>
```

end example]

See the documentation for cGpRule for more information about how cGp is interpreted for each value of cGpRule.

Attributes	Description
val (Value)	Specifies the amount of space between columns of the parent element (for cGp/cSp) or rows (for rSp). The manner in which this value is determined depends on the setting of the rule of the parent element. For cGp, if the rule is set to 3 (or "Exactly"), then the unit is interpreted as twips. If the rule is set to 4 (or "Multiple"), then the unit is interpreted as number of 0.5 em increments. For cSp, this value is measured in twips. There is no corresponding cSpRule. For rSp, if the rule is set to 3 (or "Exactly"), then the unit is interpreted as points. If the rule is set to 4 (or "Multiple"), then the unit is interpreted as half-lines. The possible values for this attribute are defined by the ST_UnSignedInteger simple type (§22.1.3.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_UnSignedInteger) is located in §A.6.1. *end note*]

22.1.2.19 cGpRule (Matrix Column Gap Rule)

This element specifies the type of gap (horizontal spacing) between columns of a matrix; the default is 0. Horizontal spacing units can be ems or points (stored as twips).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Whether the element is absent or present without the val attribute, the default of the val attribute is `0` (or single spacing gap).

[*Example*: The following matrix has double spacing (2 ems) between columns:

1 2
3 4

The XML that represents this property in use is:

```
<m:mPr>
  <m:cGpRule  m:val="2"/>
  <m:mcs>
    <m:mc>
      <m:mcPr>
        <m:count  m:val="2"/>
        <m:mcJc  m:val="center"/>

      </m:mcPr>
    </m:mc>
  </m:mcs>
</m:mPr>
```

end example]

Attributes	Description
val (Value)	Specifies the type of spacing between rows and/or columns. Possible values are 0, 1, 2, 3, or 4, whose definitions are contained in the following table:

Value	Column/Row Gap	Example
0	Single spacing gap (1 em)	1 2
1	1.5 spacing gap (1.5 ems)	1 2
2	2 spacing gap (2 ems)	1 2
3	Exactly (for columns, rely on value of cGp, measured in twips) (for rows, rely on value of rSp, measured in points)	1 2
4	Multiple (for columns, rely on value of cGp, measured in 0.5 em increments) (for rows, rely on value of rSp, measured in lines)	1 2

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_SpacingRule simple type (§22.1.3.11).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SpacingRule) is located in §A.6.1. *end note*]

22.1.2.20 chr (Character)

This element specifies the character to be attached to the base of an accent object, a group character object, or an n-ary operator object. When the parent element is accPr, the chr value should be within the range of (U+0300–U+036F) or (U+20D0–U+20EF). When the parent element is groupChrPr, the chr value should be a horizontal stretch character, such as U+2190 (LEFTWARD ARROW). When the parent element is naryPr, the chr value should be an n-ary operator such as U+222B (INTEGRAL).

When the element is present and the val attribute is absent, the default of the val attribute is empty which means the corresponding objects character is absent.

If this property is omitted for accPr, the default accent character is U+0302 (ACCENT, COMBINING CIRCUMFLEX). If this property is omitted for groupChrPr, the default character is U+23DF (BOTTOM CURLY BRACKET). If this property is omitted for naryPr, the default character is U+222B (INTEGRAL).

In other words, when the element is absent, the defaults are as follows:

- accent object – Unicode character U+0302 (ACCENT, COMBINING CIRCUMFLEX)
- group-character object – Unicode character U+23DF (BOTTOM CURLY BRACKET)
- n-ary operator object – Unicode character U+222B (INTEGRAL)

[*Example*: Examples of accent characters are the dot, hat, and arrow in the following cases: $\dot{a}\ \hat{a}\ \vec{a}$.

For example, the following XML represents the acc $\tilde{a}$.

```
<m:acc>
  <m:accPr>
    <m:chr m:val="&#771;"/>
  </m:accPr>
  <m:e>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:e>
</m:acc>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description

val (value)	Specifies the character used by the parent element. When it is omitted, the parent uses its assigned default.
	
	[*Example*: Accent object ã:
	
	`<m:accPr>`
	`  <m:chr m:val="̃"/>`
	`</m:accPr>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Char simple type (§22.1.3.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Char) is located in §A.6.1. *end note*]

22.1.2.21 count (Matrix Column Count)

This element specifies the number of columns to which a property applies.

Whether the element is absent or present without the val attribute, the default of the val attribute is 1.

[*Example*: The example below specifies that two of the columns in the matrix described by the XML have the `center` property.

```
<m:mPr>
  <m:cSp  m:val="120"/>
  <m:mcs>
    <m:mc>
      <m:mcPr>
        <m:count  m:val="2"/>
        <m:mcJc m:val="center"/>

      </m:mcPr>
    </m:mc>
  </m:mcs>
</m:mPr>
```

end example]

Attributes	Description
val (Value)	Specifies the number of columns to which a column property applies. [*Example*: A count attribute value of 3 specifies that the property applies to the next three columns of the matrix. *end example*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

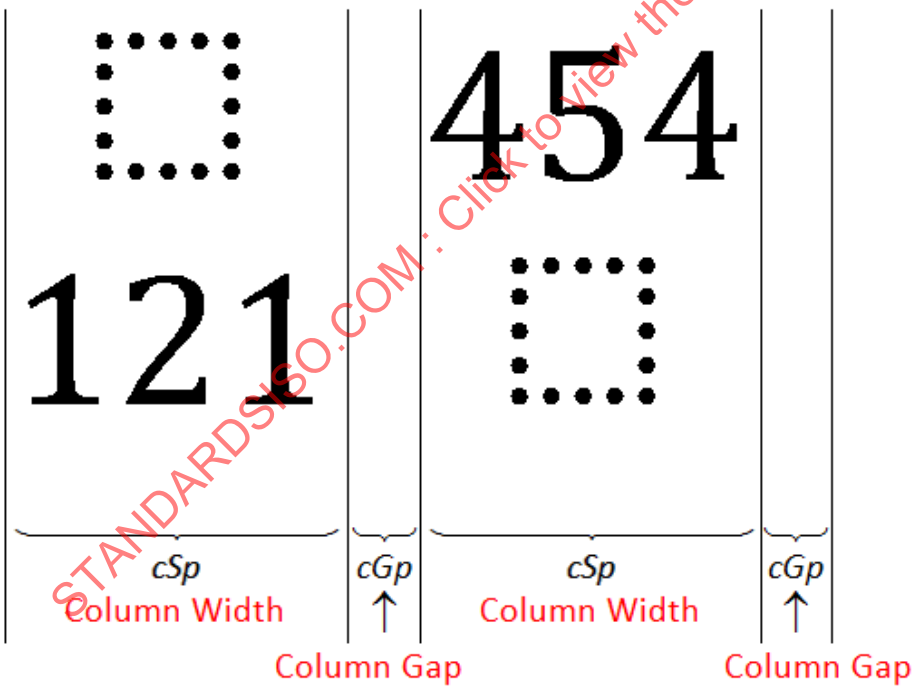
 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_Integer255 simple type (§22.1.3.6).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Integer255) is located in §A.6.1. *end note*]

22.1.2.22 cSp (Minimum Matrix Column Width)

This element specifies the minimum column width of a matrix. The actual column width of a matrix will be the greater of either the width of the column's widest argument or cSp. This additional spacing can be added to enhance appearance. If this element is omitted, the default minimum column width is 0. Whether the element is absent or present without the val attribute, the default of the val attribute is 0. The cGp gap spacing (also referred to as "Column Gap" or "Gap Width") is added to the cSp (Minimum Matrix Column Width) to determine the total Matrix Column Spacing (distance between the same edges of different columns). The value of cSp is interpreted as twips (a twip is 1/20th of a point). Therefore, a spacing of 1 point will be set by a cSp value of 20. This is the only use for cSp. There is no corresponding cSpRule. The following image depicts how cGp and cSp work together to define matrix column spacing in a 2x2 matrix:



STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Example*: The following XML specifies that there should never be fewer than 6 pts (120 twips) between adjacent column edges of the matrix:

©ISO/IEC 2012 – All rights reserved

1 2
3 4

```
<m:mPr>
  <m:cSp  m:val="120"/>
  <m:mcs>
    <m:mc>
      <m:mcPr>
        <m:count  m:val="2"/>
        <m:mcJc m:val="center"/>

      </m:mcPr>
    </m:mc>
  </m:mcs>
</m:mPr>
```

end example]

Attributes	Description
val (Value)	Specifies the amount of space between columns of the parent element (for cGp/cSp) or rows (for rSp). The manner in which this value is determined depends on the setting of the rule of the parent element. For cGp, if the rule is set to 3 (or "Exactly"), then the unit is interpreted as twips. If the rule is set to 4 (or "Multiple"), then the unit is interpreted as number of 0.5 em increments. For cSp, this value is measured in twips. There is no corresponding cSpRule. For rSp, if the rule is set to 3 (or "Exactly"), then the unit is interpreted as points. If the rule is set to 4 (or "Multiple"), then the unit is interpreted as half-lines. The possible values for this attribute are defined by the ST_UnSignedInteger simple type (§22.1.3.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_UnSignedInteger) is located in §A.6.1. *end note*]

22.1.2.23 ctrlPr (Control Properties)

This element specifies properties on control characters; that is, object characters that cannot be selected. Examples of control characters are n-ary operators (excluding their limits and bases), fraction bars (excluding the numerator and denominator), and grouping characters (excluding the base). ctrlPr allows formatting properties to be stored on these control characters. The control character inherits its formatting from the paragraph

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

formatting; ctrlPr contains the formatting differences between the control character and the paragraph formatting.

If this element is omitted, the character properties of the first control character are the same as the first character in the math object.

[*Example*: The example below shows that the control character is of font Cambria Math. All other formatting, such as text size and color, are the same as the paragraph.

```
<m:ctrlPr>
  <w:rPr>
    <w:rFonts w:ascii="Cambria Math" w:hAnsi="Cambria Math"/>
  </w:rPr>
</m:ctrlPr>
```

end example]

CtrlPr is also used to save properties on characters used in the built-down form of an instance of mathematical text that are not displayed in Professional form. For example, the mathematical text (in linear form) ∫_0^1 might have color on the _ or ^. Though these characters are not displayed in Professional form, their formatting is stored such that their formatting will roundtrip through build up and build down.

[*Note*: The W3C XML Schema definition of this element's content model (CT_CtrlPr) is located in §A.6.1. *end note*]

22.1.2.24 d (Delimiter Object)

This element specifies the delimiter object, consisting of opening and closing delimiters (such as parentheses, braces, brackets, and vertical bars), and an element contained inside. The delimiter may have more than one element, with a designated separator character between each element. [*Example*:

Delimiter with one base: (x^2)

Delimiter with more than one base and separators, whose XML is shown below: $(x^2|y^2)$

```
<m:d>
  <m:e>
    <m:sSup>
      <m:e>
        <m:r>
          <m:t>x</m:t>
        </m:r>
      </m:e>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
        <m:sup>
          <m:r>
            <m:rPr>
              <m:scr  m:val="roman"/>
              <m:sty  m:val="p"/>
            </m:rPr>
            <m:t>2</m:t>
          </m:r>
        </m:sup>
      </m:sSup>
    </m:e>
    <m:e>
      <m:sSup>
        <m:e>
          <m:r>
            <m:t>y</m:t>
          </m:r>
        </m:e>
        <m:sup>
          <m:r>
            <m:rPr>
              <m:scr m:val="roman"/>
              <m:sty  m:val="p"/>
            </m:rPr>
            <m:t>2</m:t>
          </m:r>
        </m:sup>
      </m:sSup>
    </m:e>
  </m:d>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_D) is located in §A.6.1. *end note*]

22.1.2.25 defJc (Default Justification)

This element specifies the default justification of display math, at the document level. Individual instances of mathematical text can overrule the default setting. If this element is omitted, the default justification is `centerGroup`. Whether the element is absent or present without the val attribute, the default of the val attribute is `centerGroup`.

Display math can be left justified, right justified, centered, or centered as a group. When display math is centered as a group, the mathematical text is left aligned within a block, and the entire block is centered with respect to column margins. If this element is omitted, the mathematical text is centered as a group.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Example*: The XML below demonstrates defJc in use:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Attributes	Description
val (Value)	Specifies the default justification of mathematical text in the document. Possible values are `center`, `centerGroup`, `left`, and `right`. The possible values for this attribute are defined by the ST_Jc simple type (§22.1.3.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathJc) is located in §A.6.1. *end note*]

22.1.2.26 deg (Degree)

This element specifies the degree in the mathematical radical. This element is optional. When omitted, the square root function, as in $\sqrt{x}$, is assumed. [*Example*:

The 3 in $\sqrt[3]{x}$ is represented by the XML below:

```
<m:rad>
  <m:deg>
    <m:r>
      <m:rPr>
        <m:scr   m:val="roman"/>
        <m:sty   m:val="p"/>
      </m:rPr>
      <m:t>3</m:t>
    </m:r>
  </m:deg>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
    <m:e>
      <m:r>
        <m:t>x</m:t>
      </m:r>
    </m:e>
  </m:rad>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathArg) is located in §A.6.1. *end note*]

22.1.2.27 degHide (Hide Degree)

This element specifies the per-object option to hide the degree of a radical. Every rad has a deg, but the deg can appear or not appear. When degHide is set to 1 or true, the degree is not shown, as in $\sqrt{x}$ (XML shown below). When degHide is omitted, the default is 0 or false; that is, the degree is not hidden. In other words, when the element is absent, the default value of the property is 0 meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is 1 meaning that this property is applied.

[*Example*:

```
  <m:rad>
    <m:radPr>
      <m:degHide  m:val="1"/>
    </m:radPr>
    <m:deg>
    </m:deg>
    <m:e>
      <m:r>
        <m:t>x</m:t>
      </m:r>
    </m:e>
  </m:rad>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of 1 or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of 0 or false specifies that the property shall be explicitly turned off. This is

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
	implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.28 den (Denominator)

This element specifies the denominator of a fraction. [*Example*: For example, the b in $^{a}/_{b}$:

```
<m:f>
  <m:fPr>
    <m:type  m:val="skw"/>
  </m:fPr>
  <m:num>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:num>
  <m:den>
    <m:r>
      <m:t>b</m:t>
    </m:r>
  </m:den>
</m:f>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathArg) is located in §A.6.1. *end note*]

22.1.2.29 diff (Differential)

The element specifies the differential property on box. When `1` or `true`, the box acts as a differential (e.g., dx in an integrand), and receives the appropriate horizontal spacing for the mathematical differential. When this property is omitted, the box is not treated as a differential.

When the element is absent, the default value of the property is `0` meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is 1 meaning that this property is applied.

[*Example*: The following example demonstrates a box set as differential in use, both in its proper form and in XML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

$$\int_0^1 x\,dx$$

          <m:scr  m:val="roman"/>
          <m:sty  m:val="p"/>
        </m:rPr>
        <m:t>1</m:t>
      </m:r>
  </m:sup>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </m:r>
    <m:box>
      <m:boxPr>
        <m:diff m:val="1"/>
      </m:boxPr>
      <m:e>
        <m:r>
          <m:t>dx</m:t>
        </m:r>
      </m:e>
    </m:box>
  </m:e>
</m:nary>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.30 dispDef (Use Display Math Defaults)

This element specifies the document-level property to overwrite paragraph settings for mathematical text. When omitted, this element is set to `1` or `true` and special math settings are applied. Whether the element is absent or present without the val attribute, the default of the val attribute is `1` meaning that this option is applied.

[*Example*: The XML below demonstrates dispDef in use:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.31 dPr (Delimiter Properties)

This element specifies the properties of d, including the enclosing and separating characters, and the properties that affect the shape of the delimiters. [*Example*:

$[a + b]$ is represented by the following XML:

```
<m:d>
  <m:dPr>
    <m:begChr m:val="["/>
    <m:endChr m:val="]"/>
  </m:dPr>
  <m:e>
    <m:r>
      <m:t>a+b</m:t>
    </m:r>
  </m:e>
</m:d>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_DPr) is located in §A.6.1. *end note*]

22.1.2.32 e (Element (Argument))

This tag, which is an abbreviation for "element", serves several functions (18 total) including that of the base argument of a mathematical object or function, the elements in an array, and the elements in boxes. If all subelements are omitted, this element specifies the presence of an empty argument. [*Example*: The numerator of this function is an empty argument: $\frac{}{2}$. *end example*] [*Note*: The tag was shortened to e to improve readability over "element". "Element" was preferred over "Base" because "Element" sounded more neutral and appropriate to its multiple uses. *end note*]

The following table shows the 18 different uses for e:

Parent Element	Use
acc	Accent base argument

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Parent Element	Use
bar	Argument to which the bar is applied
borderBox	Argument around which the border box is drawn
box	Argument inside the abstract box
d	Argument inside the delimiters
eqArr	Each instance of mathematical text in the single-column array
func	Math argument list of the function
groupChr	Group character base
limLow	Base of the lower limit
limUpp	Base of the upper limit
mr	Each element in the matrix row
nary	n-ary and, e.g., integrand for an integral, summand for a summation
phant	Argument for the phantom
rad	Radicand
sPre	Base of the prescript object
sSub	Base of the subscript object
sSubSup	Base of the subsup object
sSup	Base of the superscript object

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Example*: For example, the func $\sin x$ has fName sin and e x:

```
<m:func>
  <m:fName>
    <m:r>
      <m:t>sin</m:t>
    </m:r>
  </m:fName>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </m:r>
  </m:e>
</m:func>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathArg) is located in §A.6.1. *end note*]

©ISO/IEC 2012 – All rights reserved

22.1.2.33 endChr (Delimiter Ending Character)

This element specifies the ending, or closing, delimiter character. Mathematical delimiters are enclosing characters such as parentheses, brackets, and braces. If this element is omitted, the default endChr is ')'. In other words, when the element is absent, the default is for the delimiter object beginning character to be Unicode character U+0029 (RIGHT PARENTHESIS).

When the element is present and the val attribute is absent, the default of the val attribute is empty which means the delimiter object beginning character is absent.

[*Example*: In the following example, $\{a\}$ uses { and } as its enclosing characters:

```
<m:dPr>
  <m:begChr  m:val="{"/>
  <m:endChr m:val="}"/>
</m:dPr>
```

end example]

Attributes	Description

val (value)	Specifies the character used by the parent element. When it is omitted, the parent uses its assigned default.
	
	[*Example*: Accent object ã:
	
	`<m:accPr>`
	`  <m:chr m:val="̃"/>`
	`</m:accPr>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Char simple type (§22.1.3.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Char) is located in §A.6.1. *end note*]

22.1.2.34 eqArr (Array Object)

This element specifies the Array object (sometimes referred to as "Equation Array", despite its ability to hold mathematical text other than equations), an object consisting of one or more equations, expressions, or other mathematical text runs that can be vertically justified as a unit with respect to surrounding text on the line. Alignment of multiple points within each run of mathematical text can occur within the array through the use of align values and spacer values. An *align value* is an ampersand within the array which acts as an alignment point (as described in §22.1.2.3). A *spacer value* is an ampersand (represented by "&" in the example below) within the array which designates where space can be added in order to align the align values on different rows of the array. Within each argument in the array, every odd ampersand is an align value and every even

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

ampersand is a spacer value (as well, the beginning of each argument provides an implied spacer value). If eqArrPr is omitted then the default values for its properties will be used. These defaults are:

Property	Default Value
baseJc	“center”
ctrlPr	<The character property of the first control character will be the character property of the first character in the eqArr object >
maxDist	“0”
objDist	“0”
rSp	“0”
rSpRule	“0” <single>

[*Example*:

A simple array, $\begin{matrix} a=b+c \\ d+e=f \end{matrix}$, is represented as follows:

```
<m:eqArr>
  <m:e>
    <m:r>
      <m:t>a=b+c</m:t>
    </m:r>
  </m:e>
  <m:e>
    <m:r>
      <m:t>d+e=f</m:t>
    </m:r>
  </m:e>
</m:eqArr>
```

A more complex array with alignment points, e.g.:

$$\begin{aligned} x- \ y+ \ z= \ 10 \\ 3x+ \ y+2z= \ 34 \\ -5x+2y- \ z=-14 \end{aligned}$$

is represented as follows:

```
<m:eqArr>
    <m:e>
        <m:r>
            <m:t>&amp;x+&amp;&amp;y+&amp;&amp;z&amp;&amp;= &amp;&amp;10</m:t>
        </m:r>
    </m:e>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
        <m:e>
            <m:r>
                <m:t>3&amp;x+&amp;&amp;y+&amp;2&amp;z&amp;&amp;= &amp;&amp;34</m:t>
            </m:r>
        </m:e>
        <m:e>
            <m:r>
                <m:t>-5&amp;x+&amp;2&amp;y-&amp;&amp;z&amp;&amp;= &amp;&amp;-
14</m:t>
            </m:r>
        </m:e>
    </m:eqArr>
```

Notice that the variables, operators, and digits of the sums line up properly, as the align values line up between each argument by adding space at the position of each spacer value.

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_EqArr) is located in §A.6.1. *end note*]

22.1.2.35 eqArrPr (Array Properties)

This element specifies the properties of the array object, including the vertical justification of the object and layout inside the object. [*Example*:

$$\begin{aligned} 111a &= c \\ 111a + 111b &= 111c \\ b &= 111c \end{aligned}$$

```
<m:eqArr>
  <m:eqArrPr>
    <m:baseJc m:val="bottom"/>
  </m:eqArrPr>
  <m:e>
    <m:r>
      <m:t>111&amp;a&amp;&amp;&amp;&amp;&amp;&amp;=&amp;&amp;c</m:t>
    </m:r>
  </m:e>
  <m:e>
    <m:r>
      <m:t>111&amp;a&amp;&amp;+&amp;111&amp;b&amp;&amp;=&amp;111&amp;c</m:t>
    </m:r>
  </m:e>
  <m:e>
    <m:r>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
        <m:t>&amp;amp;amp;amp;amp;b&amp;amp;=&amp;amp;111&amp;amp;c</m:t>
      </m:r>
    </m:e>
  </m:eqArr>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_EqArrPr) is located in §A.6.1. *end note*]

22.1.2.36 f (Fraction Object)

This element specifies the fraction object, consisting of a numerator and denominator separated by a fraction bar. The fraction bar can be horizontal or diagonal, depending on the fraction properties. The fraction object is also used to represent the stack function, which places one element above another, with no fraction bar.
[*Example*: Examples of fractions are:

Bar Fraction: $\frac{a}{b}$

Skewed Fraction: a/b

Linear Fraction: a/b

No-Bar Fraction (Stack): $\binom{n}{k}$

The fraction a/b is represented as:

```
<m:f>
  <m:fPr>
    <m:type  m:val="skw"/>
  </m:fPr>
  <m:num>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:num>
  <m:den>
    <m:r>
      <m:t>b</m:t>
    </m:r>
  </m:den>
</m:f>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_F) is located in §A.6.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.1.2.37 fName (Function Name)

This element specifies the name of the function in the Function-Apply object func. For example, function names are sin and cos.

[*Example*: As an example, the func $\sin x$ has fName sin and e x:

```
<m:func>
  <m:fName>
    <m:r>
      <m:t>sin</m:t>
    </m:r>
  </m:fName>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </m:r>
  </m:e>
</m:func>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathArg) is located in §A.6.1. *end note*]

22.1.2.38 fPr (Fraction Properties)

This element specifies the properties of the fraction object f. Properties of the Fraction object include the type or style of the fraction. The fraction bar can be horizontal or diagonal, depending on the fraction properties. The fraction object is also used to represent the stack function, which places one element above another, with no fraction bar. [*Example*: Examples of fractions are:

Bar Fraction: $\frac{a}{b}$

Skewed Fraction: a/b

Linear Fraction: a/b

No-Bar Fraction (Stack): $\binom{n}{k}$

The linear fraction c/d is represented by the following XML:

```
<m:f>
  <m:fPr>
    <m:type m:val="lin"/>
  </m:fPr>
  <m:num>
    <m:r>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
        <m:t>c</m:t>
      </m:r>
    </m:num>
    <m:den>
      <m:r>
        <m:t>d</m:t>
      </m:r>
    </m:den>
  </m:f>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_FPr) is located in §A.6.1. *end note*]

22.1.2.39 func (Function Apply Object)

This element specifies the Function-Apply object, which consists of a function name and an argument element (e) acted upon. It is often applied using a form of linear format. For example, in the linear format described in Unicode Technical Article #28, this object is applied by using the Function Application character (U+2061). [*Example*: Examples of Function-Apply objects include: $\sin x$, $\tan^{-1} x^2$, and $\max_{0 \le x \le 1} xe^{-x^2}$.

As an example, the func $\sin x$ has fName sin and e x:

```
  <m:func>
    <m:fName>
      <m:r>
        <m:t>sin</m:t>
      </m:r>
    </m:fName>
    <m:e>
      <m:r>
        <m:t>x</m:t>
      </m:r>
    </m:e>
  </m:func>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_Func) is located in §A.6.1. *end note*]

22.1.2.40 funcPr (Function Properties)

This element specifies properties such as ctrlPr that can be stored on the function apply object func. [*Example*:

$tan\ x$ is represented by the following XML:

```
  <m:func>
    <m:funcPr/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
    <m:fName>
      <m:r>
        <m:rPr>
          <m:sty m:val="p"/>
        </m:rPr>
        <m:t>tan</m:t>
      </m:r>
    </m:fName>
    <m:e>
      <m:r>
        <m:t>x</m:t>
      </m:r>
    </m:e>
  </m:func>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_FuncPr) is located in §A.6.1. *end note*]

22.1.2.41 groupChr (Group-Character Object)

This element specifies the Group-Character object, consisting of a character drawn above or below text, often with the purpose of visually grouping items. [*Example*: The following example demonstrates the groupChr in use, both in its proper form and in XML:

$$\overbrace{x+x+\cdots}$$

```
  <m:groupChr>
    <m:groupChrPr>
      <m:chr  m:val="&#9182;"/>
      <m:pos  m:val="top"/>
    </m:groupChrPr>
    <m:e>
      <m:r>
        <m:t>x+x+&#22EF;</m:t>
      </m:r>
    </m:e>
  </m:groupChr>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_GroupChr) is located in §A.6.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.1.2.42 groupChrPr (Group-Character Properties)

This element specifies the properties of the Group-Character object groupChr. These properties can be used to specify the character placed above or below the argument, and the position of the character. When omitted, character ⏟ (U+23DF, BOTTOM CURLY BRACKET) is used as the chr and its pos is set to bot.

[*Example*:

$\overbrace{x+y}$ is represented by the following XML:

```
<m:groupChr>
  <m:groupChrPr>
    <m:chr m:val="⏞"/>
    <m:pos m:val="top"/>
    <m:vertJc m:val="bot"/>
  </m:groupChrPr>
  <m:e>
    <m:r>
      <m:t>x+y</m:t>
    </m:r>
  </m:e>
</m:groupChr>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_GroupChrPr) is located in §A.6.1. *end note*]

22.1.2.43 grow (n-ary Grow)

This element specifies the growth property of n-ary operators. When `0` or `false`, n-ary operators such as integrals and summations do not grow to match the size of their operand height. When `1` or `true`, the n-ary operator grows vertically to match its operand height. If this property is omitted, grow is set to `0`.

When the element is absent, the default value of the property when it is a child of a delimiter object is `1` (meaning that this property is applied) and when it is a child of an n-ary operator object it is `0` (meaning that this property is not applied).

When the element is present and the val attribute is absent, the default of the val attribute is `1` meaning that this property is applied.

[*Example*: The two integrals below demonstrate the difference between grow = `0` and grow = `1`.

$$\int_0^1 \frac{x^2}{x+y}dx \int_0^1 \frac{y^2}{x+y}dy$$

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

The XML that defines nary growth is:

```
<m:naryPr>
  <m:chr  m:val="&#8747;"/>
  <m:grow m:val="1"/>
</m:naryPr>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.44 hideBot (Hide Bottom Edge)

This element specifies the hidden or shown state of the bottom edge of borderBox. When this element is omitted, the bottom edge is shown. In other words, when the element is absent, the default value of the property is `0` meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is `1` meaning that this property is applied.

When applied, the bottom border is hidden, as in $\boxed{abc}$. [*Example*:

```
<m:borderBox>
  <m:borderBoxPr>
    <m:hideBot/>
  </m:borderBoxPr>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.47 hideTop (Hide Top Edge)

This element specifies the hidden or shown state of the top edge of borderBox. When this element is omitted, the edge is shown. In other words, when the element is absent, the default value of the property is `0` meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is `1` meaning that this property is applied.

When applied, the top border is hidden, as in $\boxed{abc}$. [*Example*:

```
<m:borderBox>
  <m:borderBoxPr>
    <m:hideTop/>
  </m:borderBoxPr>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.48 interSp (Inter-Equation Spacing)

This element specifies spacing between equations, expressions, or other instances of mathematical text within a display math paragraph, in twips.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§22.9.2.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TwipsMeasure) is located in §A.6.1. *end note*]

22.1.2.49 intLim (Integral Limit Locations)

This element specifies the document setting for the default placement of integral limits, when converted from a linear form to a two-dimensional output (professional form). Limits can be either centered above and below the integral, or positioned just to the right of the operator, as in:

$$\int_{a}^{b} x\,dx \quad \int_{a}^{b} x\,dx$$

When this integral object is written linearly, as ∫ _a^b, the placement of limits is ambiguous. intLim is a document-level property that specifies the default positioning. When this element is omitted, the default placement of integral limits is subSup (that is, the location of subscripts and superscripts, or just to the right of the base or operator). Whether the element is absent or present without the val attribute, the default of the val attribute is subSup.

[*Example*: The XML that specifies this property in use is:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Attributes	Description
val (Value)	Specifies the default location of limits on the parent object. Possible values are subSup

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
	and undOvr. The possible values for this attribute are defined by the ST_LimLoc simple type (§22.1.3.8).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LimLoc) is located in §A.6.1. *end note*]

22.1.2.50 intraSp (Intra-Equation Spacing)

This element specifies the spacing between adjacent display math paragraphs, in twips. If this element is omitted, no spacing is applied between adjacent math paragraphs.

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§22.9.2.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TwipsMeasure) is located in §A.6.1. *end note*]

22.1.2.51 jc (Justification)

This element specifies justification of the math paragraph (a series of adjacent instances of mathematical text within the same paragraph). A math paragraph can be Left Justified, Right Justified, Centered, or Centered as Group. If this element is omitted, the math paragraph is Centered as Group. Whether the element is absent or present without the val attribute, the default of the val attribute is centerGroup. This means that the instances of mathematical text can be aligned with respect to each other, but the entire group of mathematical text is centered as a whole. [*Example*: An example of Centered as Group is the following example, in which each equation is left-aligned, but the series is centered:

$$x = x_1 + x_2 + x_3 + \cdots$$
$$y = y_1 + y_2 + y_3 + y_4 + \cdots$$
$$z = z_1 + z_2 + z_3 + z_4 + z_5 + \cdots$$

The XML that demonstrates jc in use is:

```
<m:oMathParaPr>
  <m:jc m:val="centerGroup"/>
</m:oMathParaPr>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
val (Value)	Specifies the default justification of mathematical text in the document. Possible values are `center`, `centerGroup`, `left`, and `right`. The possible values for this attribute are defined by the ST_Jc simple type (§22.1.3.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathJc) is located in §A.6.1. *end note*]

22.1.2.52 lim (Limit)

This element specifies the lower limit of the limLow object and the upper limit of the limUpp function.

[*Example*: For example, the limit of the limLow $\lim_{n\to\infty}$ is $n \to \infty$. The XML that specifies this object is:

```
<m:limLow>
  <m:e>
    <m:r>
      <m:rPr>
        <m:scr m:val="roman"/>
        <m:sty  m:val="p"/>
      </m:rPr>
      <m:t>lim</m:t>
    </m:r>
  </m:e>
  <m:lim>
    <m:r>
      <m:t>n&#8594;&#8734;</m:t>
    </m:r>
  </m:lim>
</m:limLow>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathArg) is located in §A.6.1. *end note*]

22.1.2.53 limLoc (n-ary Limit Location)

This element specifies the location of limits in n-ary operators. Limits can be either centered above and below the n-ary operator (shown in the first summation below), or positioned just to the right of the operator (shown in the second summation below).

$$\sum_{i=0}^{n} x_n \sum_{i=0}^{n} x_n$$

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

When the element is absent, the default value of this property is ignored and the intLim (for integral n-ary operator objects) and naryLim (for all other n-ary operator objects) options are looked to for the limit placement.

Ultimately, when this element is omitted, the default location is undOvr in display mode and subSup otherwise. When the element is present and the val attribute is absent, the default of the val attribute undOvr. [*Example*: The XML representing the relevant properties of the second summation above (subSup) is:

```
<m:naryPr>
  <m:chr  m:val="&#8721;"/>
  <m:limLoc m:val="subSup"/>
  <m:grow m:val="1"/>
</m:naryPr>
```

end example]

Attributes	Description
val (Value)	Specifies the default location of limits on the parent object. Possible values are subSup and undOvr. The possible values for this attribute are defined by the ST_LimLoc simple type (§22.1.3.8).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LimLoc) is located in §A.6.1. *end note*]

22.1.2.54 limLow (Lower-Limit Object)

This element specifies the Lower-Limit object, consisting of text on the baseline and reduced-size text immediately below it. Examples of limLow include $\lim_{n\to\infty}$ and $\max_{0\le x\le 1}$. [*Example*: The XML that represents $\lim_{n\to\infty}$ is:

```
<m:limLow>
  <m:e>
    <m:r>
      <m:rPr>
        <m:scr m:val="roman"/>
        <m:sty  m:val="p"/>
      </m:rPr>
      <m:t>lim</m:t>
    </m:r>
  </m:e>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
    <m:lim>
      <m:r>
        <m:t>n&#8594;&#8734;</m:t>
      </m:r>
    </m:lim>
  </m:limLow>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_LimLow) is located in §A.6.1. *end note*]

22.1.2.55 limLowPr (Lower-Limit Properties)

This element specifies control properties (ctrlPr) that can be stored on the Lower Limit (limLow).

[*Example*:

$\lim_{a\to\infty}$ is represented by the following XML:

```
  <m:limLow>
    <m:limLowPr/>
    <m:e>
      <m:r>
        <m:t>lim</m:t>
      </m:r>
    </m:e>
    <m:lim>
      <m:r>
        <m:t>a→∞</m:t>
      </m:r>
    </m:lim>
  </m:limLow>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_LimLowPr) is located in §A.6.1. *end note*]

22.1.2.56 limUpp (Upper-Limit Object)

This element specifies the Upper-Limit object, consisting of text on the baseline and reduced-size text immediately above it. [*Example*: Examples of limUpp include $\overbrace{x+x+x}^{k \text{ times}}$ and $\stackrel{\text{def}}{=}$.

The XML that specifies the limUpp $\stackrel{\text{def}}{=}$ is:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<m:limUpp>
  <m:e>
    <m:r>
      <m:t>=</m:t>
    </m:r>
  </m:e>
  <m:lim>
    <m:r>
      <m:rPr>
        <m:nor/>
      </m:rPr>
      <m:t>def</m:t>
    </m:r>
  </m:lim>
</m:limUpp>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_LimUpp) is located in §A.6.1. *end note*]

22.1.2.57 limUppPr (Upper-Limit Properties)

This element specifies control properties (ctrlPr) that can be stored on the Upper Limit (limUpp).

[*Example*:

$\lim_{a \to \infty}$ is represented by the following XML:

```
<m:limUpp>
  <m:limUppPr/>
  <m:e>
    <m:r>
      <m:t>lim</m:t>
    </m:r>
  </m:e>
  <m:lim>
    <m:r>
      <m:t>a→∞</m:t>
    </m:r>
  </m:lim>
</m:limUpp>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this element's content model (CT_LimUppPr) is located in §A.6.1. *end note*]

22.1.2.58 lit (Literal)

This element specifies that the characters in the run are literal; that is, they are to be interpreted literally and not be built up based on any implied mathematical meaning. This is especially useful for operators or other special characters that signal a need for build up to an OMML reader. These characters are often encountered during a given instance of mathematical text when presented in a 1-dimensional linear format, such as the linear format defined by Unicode Technical Note #28 (Sargent 2006).

When the element is absent, the default value of the property is `0` meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is 1 meaning that this property is applied.

[*Example*: In the following XML, the + operator is treated literally and does not receive proper binary spacing:

```
<m:r>a</m:r>
<m:r>
  <m:rPr>
    <m:lit/>
  </m:rPr>
  <m:t>+</m:t>
</m:r>
<m:r>
  <m:t>b</m:t>
</m:r>
```

As another example, consider the following Office Open XML Math markup:

```
<m:r>
    <m:t>a</m:t>
</m:r>
<m:r>
    <m:rPr>
        <m:lit/>
    </m:rPr>
    <m:t>/</m:t>
</m:r>
<m:r>
    <m:t>b</m:t>
</m:r>
```

This would be displayed as: a/b. If built up, it would normally be converted to $\frac{a}{b}$; however, the presence of this element specifies that the solidus should be treated literally, resulting in a/b.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.59 lMargin (Left Margin)

This element specifies the left margin for math, in twips. If this element is omitted, no left margin is used. In other words, when the element is absent, the default value of the option is `0`.

When the element is present and the val attribute is absent, the default of the val attribute is `1440` (or 1 inch).

Math margins are added to the paragraph settings for margins. If the sum of lMargin and rMargin exceed the width available, lMargin should be ignored. [*Example*: The following XML demonstrates an lMargin setting of 1".

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="1440"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§22.9.2.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TwipsMeasure) is located in §A.6.1. *end note*]

22.1.2.60 m (Matrix Object)

This element specifies the Matrix object, consisting of one or more elements laid out in one or more rows and one or more columns. It is important to note that matrices do not have built in delimiters. Like other math elements, matrices are contained in a delimiter object (§22.1.2.24) when delimiters are desired. Empty arguments (see §22.1.2.32) can be used to create gaps in matrices. The plcHide tag (§22.1.2.83) can be used to indicate whether the empty arguments should be visible in the matrix (see the plcHide documentation for more information). If mPr is omitted, the values of baseJc, cGp, cGpRule, cSp, ctrlPr, mcs, plcHide, rSp, and rSpRule are shown in the following table:

Property	Default Value
baseJc	"center"
cGp	"0"
cGpRule	"0" <single>
cSp	"0"
ctrlPr	<The character property of the first control character shall be the character property of the first character in the m object >
mcs	<All columns will be vertically center aligned>
plcHide	"0"
rSp	"0"
rSpRule	"0" <single>

[*Example*: Examples of matrices are: $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$ and $\begin{bmatrix} 1 & \\ & 1 \end{bmatrix}$. Below is an example of a 2x2 matrix and its XML in its proper form (surrounding delimiters are not a property of the matrix and are only shown to demonstrate their relationship with a matrix. See the documentation for the d tag for XML examples of delimiters).

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```
<m:d>

          <m:r>
            <m:rPr>
              <m:scr  m:val="roman"/>
              <m:sty  m:val="p"/>
            </m:rPr>
            <m:t>4</m:t>
          </m:r >
        </m:e>
      </m:mr>
    </m:m>
  </m:d>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_M) is located in §A.6.1. *end note*]

22.1.2.61 mathFont (Math Font)

This element specifies the default math font to be used in the document. If this element is omitted, font substitution (§17.8.2) should be used to determine the most appropriate font for use throughout the document. [*Example*: The XML containing this property is:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="1440"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

[*Example*:

Given the following equation:

$a + b = c$

and the following XML:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<m:mathFont m:val="Cambria Math"/>
```

Because the document option for Math font is set to the mathematically enabled font Cambria Math, Math is formatted with that font.

end example]

Attributes	Description
val (value)	Specifies the default math font to be used in the document. The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (CT_String) is located in §A.6.1. *end note*]

22.1.2.62 mathPr (Math Properties)

This element specifies the document-level properties for all math in the document.

[*Example*:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

These are the default settings for the math properties element and its children.

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_MathPr) is located in §A.6.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

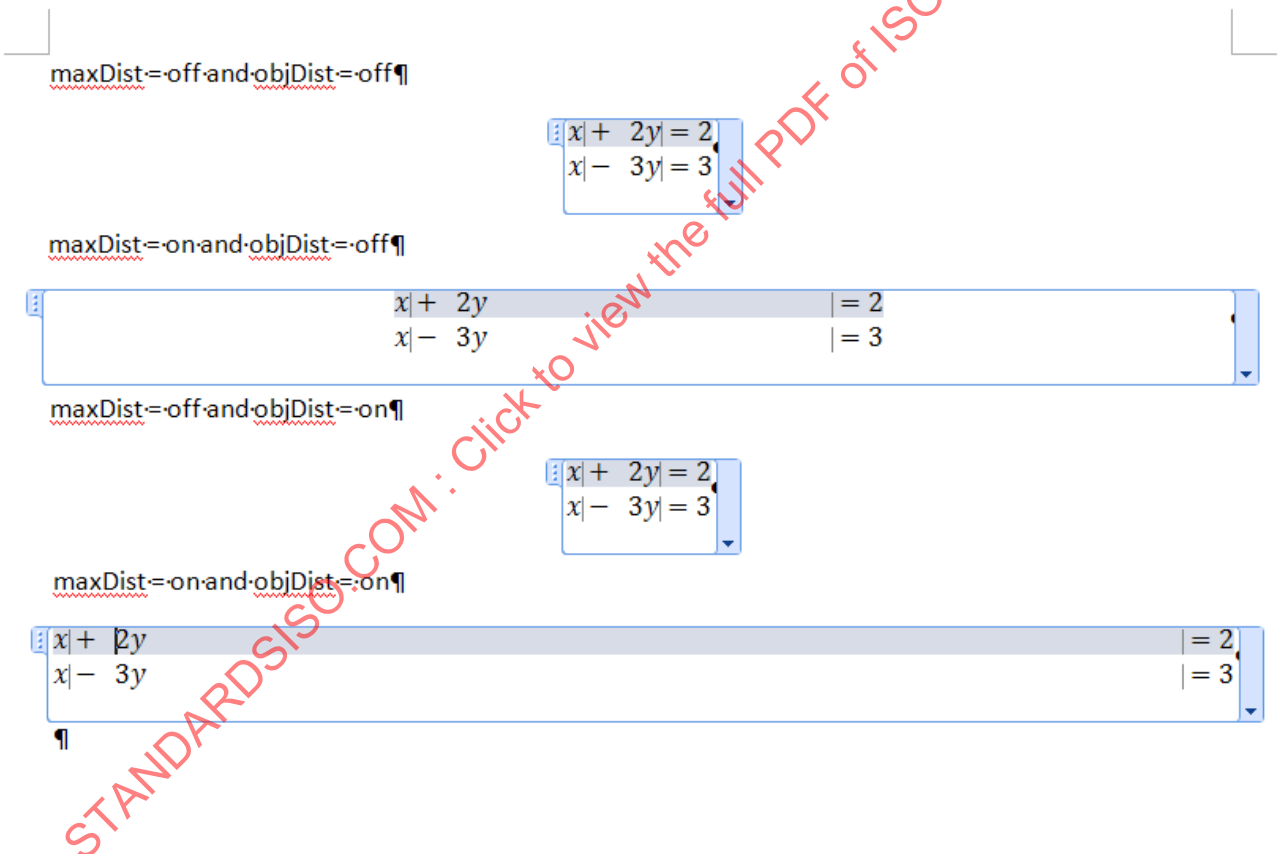
22.1.2.63 maxDist (Maximum Distribution)

This element specifies Array Maximum Distribution. When `1` or `true`, the array is spaced to the maximum width of the containing element (page, column, cell, etc.). The example image below illustrates an array expanded to fit the page, which is the containing element in this example. The maxDist option is commonly used with the objDist option. The objDist option is used to expand the distribution of mathematical text within the bounds of an array while not impacting the Array Distribution itself.

When the maxDist element is omitted, Array Maximum Distribution is off. In other words, when the element is absent, the default value of the property is `0` meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is `1` meaning that this property is applied.

[*Example*: The following diagram illustrates all four possible combinations of maxDist and objDist:



XML for the fourth example shown in the above image is:

```
<m:oMathPara>
  <m:oMath>
    <m:eqArr>
      <m:eqArrPr>
        <m:maxDist m:val="1" />
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
        <m:objDist m:val="1" />
      </m:eqArrPr>
      <m:e>
        <m:r>
          <m:t>x</m:t>
        </m:r>
        <m:r>
           <m:t>&+</m:t>
        </m:r>
        <m:r>
          <m:t>2y&=2</m:t>
        </m:r>
      </m:e>
      <m:e>
        <m:r>
          <m:t>x</m:t>
        </m:r>
        <m:r>
          <m:t>&-</m:t>
        </m:r>
        <m:r>
          <m:t>3y&=3</m:t>
        </m:r>
      </m:e>
    </m:eqArr>
  </m:oMath>
</m:oMathPara>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.1.2.64 mc (Matrix Column)

This element specifies a single column in a matrix m. [*Example*: An example of this element in use is:

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```
<m:m>
  <m:mPr>
    <m:mcs>
      <m:mc>
        <m:mcPr>
          <m:count m:val="2"/>
          <m:mcJc  m:val="center"/>

        </m:mcPr>
      </m:mc>
    </m:mcs>
  </m:mPr>
  <m:mr>
    <m:e>
      <m:r>
        <m:rPr>
          <m:scr  m:val="roman"/>
          <m:sty  m:val="p"/>
        </m:rPr>
        <m:t>1</m:t>
      </m:r >
    </m:e>
    <m:e>
      <m:r>
        <m:rPr>
          <m:scr  m:val="roman"/>
          <m:sty  m:val="p"/>
        </m:rPr>
        <m:t>2</m:t>
      </m:r >
    </m:e>
  </m:mr>

          </m:rPr>
          <m:t>4</m:t>
        </m:r >
      </m:e>
    </m:mr>
  </m:m>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_MC) is located in §A.6.1. *end note*]

22.1.2.65 mcJc (Matrix Column Justification)

This element specifies the justification of a matrix column (or group of matrix columns) mc. When this element is omitted, the column is centered. Whether the element is absent or present without the val attribute, the default of the val attribute is center. The matrix below has three columns. The leftmost column is left-justified, the rightmost column is right-justified, and the center column is centered: $\begin{pmatrix} 1 & 1 & 1 \\ 23 & 23 & 23 \\ 456 & 456 & 456 \end{pmatrix}$

[*Example*: A simple example of this property in use is a 2x2 matrix with both columns centered:

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```
  <m:m>
    <m:mPr>
      <m:mcs>
        <m:mc>
          <m:mcPr>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
            <m:count m:val="2"/>
            <m:mcJc  m:val="center"/>

          </m:mcPr>
        </m:mc>
      </m:mcs>
    </m:mPr>
    <m:mr>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>1</m:t>
        </m:r >
      </m:e>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>2</m:t>
        </m:r >
      </m:e>
    </m:mr>
    <m:mr>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>3</m:t>
        </m:r >
      </m:e>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>4</m:t>
        </m:r >
      </m:e>
    </m:mr>
  </m:m>
```

end example]

Attributes	Description

val (Value)	Specifies the horizontal alignment of the parent element. Possible values are `left`, `right`, and `center`. [*Example*:
	`<m:mcPr>`
	`  <m:mcJc  m:val="center"/>`
	`  <m:count m:val="2"/>`
	`</m:mcPr>`
	
	The possible values for this attribute are defined by the ST_XAlign simple type (§22.9.2.18).

[*Note*: The W3C XML Schema definition of this element's content model (CT_XAlign) is located in §A.6.1. *end note*]

22.1.2.66 mcPr (Matrix Column Properties)

This element specifies the properties of the matrix column mn, including the number of columns and the type of justification. [*Example*: As an extreme example, the following matrix has two columns that are left justified (count is 2) and three columns that are right justified (count is 3). $\begin{pmatrix} 1 & 1 & 1 & 1 & 1 \\ 23 & 23 & 23 & 23 & 23 \\ 456 & 456 & 456 & 456 & 456 \end{pmatrix}$ *end example*]

[*Example*:

$\begin{matrix} 1 & 2222 & 3 \\ 4444 & 5 & 6666 \end{matrix}$ is represented by the following XML:

```
  <m:m>
    <m:mPr>
      <m:mcs>
        <m:mc>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
          <m:mcPr>
            <m:count m:val="3"/>
            <m:mcJc m:val="right"/>
          </m:mcPr>
        </m:mc>
      </m:mcs>
    </m:mPr>
    <m:mr>
      <m:e>
        <m:r>
          <m:t>1</m:t>
        </m:r>
      </m:e>
      <m:e>
        <m:r>
          <m:t>2222</m:t>
        </m:r>
      </m:e>
      <m:e>
        <m:r>
          <m:t>3</m:t>
        </m:r>
      </m:e>
    </m:mr>
    <m:mr>
      <m:e>
        <m:r>
          <m:t>4444</m:t>
        </m:r>
      </m:e>
      <m:e>
        <m:r>
          <m:t>5</m:t>
        </m:r>
      </m:e>
      <m:e>
        <m:r>
          <m:t>6666</m:t>
        </m:r>
      </m:e>
    </m:mr>
  </m:m>
```

All three columns are right aligned.

            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>3</m:t>
        </m:r >
      </m:e>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>4</m:t>
        </m:r >
      </m:e>
    </m:mr>
  </m:m>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_MCS) is located in §A.6.1. *end note*]

22.1.2.68 mPr (Matrix Properties)

This element specifies properties of the matrix m, including the justification of the matrix and the layout of elements within the matrix. [*Example*:

$\begin{matrix} a+1 & 2+b \\ 3 & 4 \end{matrix}$ is represented by the following XML:

```
  <m:oMath>
    <m:r>
      <m:t>a+</m:t>
    </m:r>
    <m:m>
      <m:mPr>
        <m:baseJc m:val="top"/>
      </m:mPr>
      <m:mr>
        <m:e>
          <m:r>
            <m:t>1</m:t>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
          </m:r>
        </m:e>
        <m:e>
          <m:r>
            <m:t>2</m:t>
          </m:r>
        </m:e>
      </m:mr>
      <m:mr>
        <m:e>
          <m:r>
            <m:t>3</m:t>
          </m:r>
        </m:e>
        <m:e>
          <m:r>
            <m:t>4</m:t>
          </m:r>
        </m:e>
      </m:mr>
    </m:m>
    <m:r>
      <m:t>+b</m:t>
    </m:r>
  </m:oMath>
```

This top row of the matrix is aligned with the rest of the baseline.

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_MPr) is located in §A.6.1. *end note*]

22.1.2.69 mr (Matrix Row)

This element specifies a single row of the matrix m. [*Example*: An example of this element in use is the following example, a 2x2 matrix. There are two rows; the first contains the elements 1 and 2; the second contains 3 and 4.

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```
<m:m>
  <m:mPr>
    <m:mcs>

          </m:rPr>
          <m:t>4</m:t>
        </m:r >
      </m:e>
    </m:mr>
  </m:m>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_MR) is located in §A.6.1. *end note*]

22.1.2.70 nary (n-ary Operator Object)

This element specifies an n-ary object, consisting of an n-ary object, a base (or operand), and optional upper and lower limits. Examples of n-ary objects are: $\int_0^1 x\,dx$, $\sum_k \binom{n}{k}$, $\prod_{k=1}^{n} A_k$, and $\bigcup_{=1}^{m}(X_n \cap Y_n)$. [*Example*: The example below demonstrates an n-ary object in its proper form and XML representation:

$$\int_0^1 x\,dx$$

```
<m:nary>
  <m:naryPr>
    <m:chr m:val="&#8747;"/>
  </m:naryPr>
  <m:sub>
      <m:r>
        <m:rPr>
          <m:scr m:val="roman"/>
          <m:sty m:val="p"/>
        </m:rPr>
        <m:t>0</m:t>
      </m:r>
  </m:sub>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
    <m:sup>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>1</m:t>
        </m:r>
    </m:sup>
    <m:e>
      <m:r>
        <m:t>x</m:t>
      </m:r>
      <m:box>
        <m:boxPr>
          <m:diff  m:val="1"/>
        </m:boxPr>
        <m:e>
          <m:r>
            <m:t>dx</m:t>
          </m:r>
        </m:e>
      </m:box>
    </m:e>
  </m:nary>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_Nary) is located in §A.6.1. *end note*]

22.1.2.71 naryLim (n-ary Limit Location)

This element specifies the document setting for the default placement of n-ary limits other than integrals (since integrals are most often written as subSup and other n-ary operators are most often written as undOvr), when converted from a built down form to a two-dimensional output (professional form). Limits can be either centered above and below the n-ary operator, or positioned just to the right of the operator, as in:

$$\sum_{i=0}^{n} x_i \quad \sum_{i=0}^{n} x_i$$

When this summation object is written in built down form, as in $\sum_(i = 0)\hat{}n$, for example, the placement of limits is ambiguous. naryLim specifies this positioning. When this element is omitted, the default placement of n-ary limits is undOvr (that is, the location of lower and upper limits). Whether the element is absent or present without the val attribute, the default of the val attribute is undOvr.

[*Example*: An example XML of this element in use is:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Attributes	Description
val (Value)	Specifies the default location of limits on the parent object. Possible values are subSup and undOvr. The possible values for this attribute are defined by the ST_LimLoc simple type (§22.1.3.8).

[*Note*: The W3C XML Schema definition of this element's content model (CT_LimLoc) is located in §A.6.1. *end note*]

22.1.2.72 naryPr (n-ary Properties)

This element specifies the properties of the n-ary object.

These include the n-ary operator character that is used (using the chr element), the shape and height of the operator (using the grow element), the location of limits (using the limLoc element), and whether empty limits display a placeholder character or are hidden (using the subHide and supHide elements). [*Example*: N-ary operators include: $\sum$, $\int$, $\cup$, $\wedge$. *end example*]

[*Example*:

$\sum_{1}^{20} x$ is represented by the following XML:

```
<m:nary>
  <m:naryPr>
    <m:chr m:val="∑"/>
    <m:limLoc m:val="subSup"/>
  </m:naryPr>
  <m:sub>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
      <m:r>
        <m:t>1</m:t>
      </m:r>
    </m:sub>
    <m:sup>
      <m:r>
        <m:t>20</m:t>
      </m:r>
    </m:sup>
    <m:e>
      <m:r>
        <m:t>x</m:t>
      </m:r>
    </m:e>
  </m:nary>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NaryPr) is located in §A.6.1. *end note*]

22.1.2.73 noBreak (No Break)

This property specifies the "unbreakable" property on the Box object box. When `1` or `true`, no line breaks can occur within the box. This can be important for operator emulators that consist of more than one binary operator. When this element is not specified, breaks can occur inside box. Whether the element is absent or present without the val attribute, the default of the val attribute is 1 meaning that this property is applied.

[*Example*: Sample XML containing this element is below. In this box, breaks are allowed.

```
  <m:boxPr>
    <m:noBreak m:val="0"/>
  </m:boxPr>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.74 nor (Normal Text)

This element specifies that the run is normal text, i.e., math italics and math spacing are not applied. In a normal text run, no characters will trigger reformatting of a linear expression into a two-dimensional expression.

When the element is absent, the default value of the property is `0` meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is `1` meaning that this property is applied.

[*Example*: The example below illustrates three runs of normal text, along with the XML representation of the formula:

$$\text{rate} = \frac{\text{distance}}{\text{time}}$$

```
<m:r>
  <m:rPr>
    <m:nor/>
  </m:rPr>
  <m:t>rate</m:t>
</m:r>
<m:r>
  <m:t>=</m:t>
</m:r>
<m:f>
  <m:num>
    <m:r>
      <m:rPr>
        <m:nor/>
      </m:rPr>
      <m:t>distance</m:t>
    </m:r>
  </m:num>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
    <m:den>
      <m:r>
        <m:rPr>
          <m:nor/>
        </m:rPr>
        <m:t>time</m:t>
      </m:r>
    </m:den>
  </m:f>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.75 num (Numerator)

This element specifies the numerator of the Fraction object f. [*Example*: The a in $^{a}/_{b}$:

```
<m:f>
  <m:fPr>
    <m:type  m:val="skw"/>
  </m:fPr>
  <m:num>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:num>
  <m:den>
    <m:r>
      <m:t>b</m:t>
    </m:r>
  </m:den>
</m:f>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathArg) is located in §A.6.1. *end note*]

22.1.2.76 objDist (Object Distribution)

This element specifies Array Object Distribution. When `1` or `true`, the contents of the array are spaced to the maximum width of the array object. When this element is omitted, the array does not receive object distribution. In other words, when the element is absent, the default value of the property is `0` meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is 1 meaning that this property is applied.

[*Example*:

$$\begin{array}{lcl} 111a & = & c \\ 111a + 111b & = & 111c \\ b & = & 111c \end{array}$$

is represented by the following XML:

```
<m:eqArr>
  <m:eqArrPr>
<m:maxDist m:val="1"/>
    <m:objDist m:val="1"/>
  </m:eqArrPr>
  <m:e>
    <m:r>
      <m:t>111&amp;amp;a&amp;amp;&amp;amp;&amp;amp;&amp;amp;&amp;amp;=&amp;amp;&amp;amp;c</m:t>
    </m:r>
  </m:e>
  <m:e>
    <m:r>
      <m:t>111&amp;amp;a&amp;amp;&amp;amp;+&amp;amp;111&amp;amp;b&amp;amp;&amp;amp;=&amp;amp;111&amp;amp;c</m:t>
    </m:r>
  </m:e>
  <m:e>
    <m:r>
      <m:t>&amp;amp;&amp;amp;&amp;amp;&amp;amp;&amp;amp;b&amp;amp;&amp;amp;=&amp;amp;111&amp;amp;c</m:t>
    </m:r>
  </m:e>
</m:eqArr>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Because object distribution and maximum distribution are applied, the equation array is expanded to fill the width that is allowed and the columns are distributed horizontally within the object to the bounds of the object.

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.77 oMath (Office Math)

This element specifies an instance of mathematical text. When used independently (not inside an oMathPara) with non-mathematical text preceding and/or following it, an independent oMath is interpreted as an inline math zone. All such math zones, including equations, expressions, arrays of equations or expressions, and formulas are represented by oMath blocks. When used in a display math zone (a math paragraph, oMathPara), oMath is a container for an instance of mathematical text that starts on its own line and is not an inline math zone. When an oMath block is part of a display math zone, it is not itself an inline math zone. When an oMath block is not part of a display math zone, it is interpreted as its own inline math zone. The contents of an oMath block do not differ between display zone containers and independent inline math zones.

[*Example*:

$1 + 1 = 2$

```
<m:oMath>
  <m:r>
    <m:t>1+1=2</m:t>
  </m:r>
</m:oMath>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMath) is located in §A.6.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.1.2.78 oMathPara (Office Math Paragraph)

This element specifies a math paragraph, or display math zone, that contains one or more oMath elements that are in display mode. The oMath containers of a display math zone are not themselves considered inline math zones..

[*Example*:

$1 + 1 = 2$
$2 + 2 = 4$ is represented by the following XML:

```
<m:oMathPara>
  <m:oMath>
    <m:r>
      <m:t>1+1=2</m:t>
    </m:r>
    <m:r>
      <w:br/>
    </m:r>
  </m:oMath>
  <m:oMath>
    <m:r>
      <m:t>2+2=4</m:t>
    </m:r>
  </m:oMath>
</m:oMathPara>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathPara) is located in §A.6.1. *end note*]

22.1.2.79 oMathParaPr (Office Math Paragraph Properties)

This property specifies properties of the math paragraph oMathPara, including justification jc.

[*Example*:

$1 + 1 = 2$
$2 + 2 = 4$ is represented by the following XML:

```
<m:oMathPara>
  <m:oMathParaPr>
    <m:jc m:val="right"/>
  </m:oMathParaPr>
  <m:oMath>
    <m:r>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
        <m:t>1+1=2</m:t>
      </m:r>
      <m:r>
        <w:br/>
      </m:r>
    </m:oMath>
    <m:oMath>
      <m:r>
        <m:t>2+2=4</m:t>
      </m:r>
    </m:oMath>
  </m:oMathPara>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathParaPr) is located in §A.6.1. *end note*]

22.1.2.80 opEmu (Operator Emulator)

This element specifies the Operator Emulator property on box. When 1 or `true`, the box and its contents behave as a single operator and inherit the properties of an operator. This means, for example, that the character can serve as a point for a line break and can be aligned to other operators. (For more details on the properties of an operator, see Unicode Technical Report #25, §3.2.2 and §3.2.3, and Unicode Technical Note #28.) Operator Emulators are often used when one or more glyphs combine to form an operator, such as $==$.

When the element is absent, the default value of the property is 0 meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is 1 meaning that this property is applied.

[*Example*: The following equation uses an Operator Emulator:

$$a == b$$

Its XML representation is as follows:

```
<m:r>
  <m:t>a</m:t>
</m:r>
<m:box>
  <m:boxPr>
    <m:opEmu m:val="1"/>
    <m:aln/>
  </m:boxPr>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
    <m:e>
      <m:r>
        <m:t>==</m:t>
      </m:r>
    </m:e>
  </m:box>
  <m:r>
    <m:t>b</m:t>
  </m:r>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.81 phant (Phantom Object)

This element specifies the phantom object. This object has two primary uses: adding the spacing of the phantom base element e without displaying that base; and suppressing part of the glyphfor spacing considerations.

[*Example*: In the right column below, the descender of the y is suppressed (set to zero) while in the left column, it is shown. The presence or absence of the descender changes the shape of the $\sqrt{y}$.

Without <m:phant> $\sqrt{y}$	With <m:phant> $\sqrt{y}$

`<m:rad>`
`  <m:radPr>`
`  <m:degHide m:val="1" />`
`  </m:radPr>`
`  <m:deg />`
`  <m:e>`
`  <m:r>`
`  <m:t>y</m:t>`
`  </m:r>`
`  </m:e>`
	`<m:rad>`
	`  <m:radPr>`
	`  <m:degHide m:val="1" />`
	`  </m:radPr>`
	`  <m:deg />`
	`  <m:e>`
	`  <m:phant>`
	`  <m:phantPr>`
	`  <m:zeroDesc m:val="1" />`
	`  </m:phantPr>`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

</m:rad>	<m:e> <m:r> <m:t>y</m:t> </m:r> </m:e> </m:phant> </m:e> </m:rad>

end example]

[*Note*: In typography, a *glyph* is the shape given in a particular typeface to a specific symbol. Most scripts share the notion of a baseline: an imaginary horizontal line on which characters rest. In some scripts, parts of glyphs lie below the baseline. The *descent* spans the distance between the baseline and the lowest descending glyph in a typeface, and the part of a glyph that descends below the baseline has the name *descender*. Conversely, the *ascent* spans the distance between the baseline and the top of the glyph that reaches farthest from the baseline. end note].

[*Note*: The W3C XML Schema definition of this element's content model (CT_Phant) is located in §A.6.1. *end note*]

22.1.2.82 phantPr (Phantom Properties)

This element specifies properties of the Phantom object, including whether the phantom is hidden or visible, and the amount of space that is taken into account when laying out text and objects around phantoms.

[*Note*: The W3C XML Schema definition of this element's content model (CT_PhantPr) is located in §A.6.1. *end note*]

22.1.2.83 plcHide (Hide Placeholders (Matrix))

This element specifies the Hide Placeholders property on a matrix m. When this property is on, placeholders do not appear in the matrix. If this element is omitted, placeholders do appear such that the locations where text can be inserted are made visible. In other words, when the element is absent, the default value of the property is 0 meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is 1 meaning that this property is applied.

[*Example*: The following two examples of matrices show the hidden (right matrix) and visible (left matrix) states of placeholders. The key difference between the placeholders in these matrices is that the left matrix contains visual representations for each placeholder in the matrix while the right matrix does not. However, the contents of each matrix remain the same between these two examples:

$$\begin{pmatrix} 1 & \square & \square \\ \square & 1 & \square \\ \square & \square & 1 \end{pmatrix}\begin{pmatrix} 1 & & \\ & 1 & \\ & & 1 \end{pmatrix}$$

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

The plcHide element does not specify how a placeholder should be visually represented. It only specifies whether placeholders should or should not be visualized. The above example (left) is only one possible visual representation.

In the matrix described by the XML below, placeholders will be hidden:

```
<m:mPr>
  <m:plcHide  m:val="1"/>
  <m:mcs>
    <m:mc>
      <m:mcPr>
        <m:mcJc m:val="center"/>
        <m:count  m:val="3"/>
      </m:mcPr>
    </m:mc>
  </m:mcs>
</m:mPr>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.84 pos (Position)

This element specifies the position of the bar or group character in the parent object; the default is `bot`. Whether the element is absent or present without the val attribute, the default of the val attribute is `bot`.

[*Example*: The XML representation for the mathematical overbar is:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
<m:bar>
  <m:barPr>
    <m:pos    m:val="top"/>
  </m:barPr>
  <m:e>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:e>
</m:bar>
```

end example]

Attributes	Description

val (Value)	Specifies the position of the parent element. Possible values are `top` and `bot`.
	
	[*Example*:
	`<m:barPr>`
	`  <m:pos  m:val="top"/>`
	`</m:barPr>`
	
	The possible values for this attribute are defined by the ST_TopBot simple type (§22.1.3.13).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TopBot) is located in §A.6.1. *end note*]

22.1.2.85 postSp (Post-Paragraph Spacing)

This element specifies the spacing after a math paragraph, in twips. If this element is omitted, no spacing is applied after the paragraph.

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§22.9.2.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TwipsMeasure) is located in §A.6.1. *end note*]

22.1.2.86 preSp (Pre-Paragraph Spacing)

This element specifies the spacing before a math paragraph, in twips. If this element is omitted, no spacing is applied before the paragraph.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§22.9.2.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TwipsMeasure) is located in §A.6.1. *end note*]

22.1.2.87 r (Run)

This element specifies a run of mathematical text.

[*Example*:

$j + k$ is represented by the following XML:

```
<m:oMath>
  <m:e>
    <m:r>
      <m:t>j+k</m:t>
    </m:r>
  </m:e>
</m:oMath>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_R) is located in §A.6.1. *end note*]

22.1.2.88 rad (Radical Object)

This element specifies the radical object, consisting of a radical, a base e, and an optional degree deg. [*Example*: Examples of rad are $\sqrt[3]{x}$ (XML shown below) and $\sqrt{x}$.

```
<m:rad>
  <m:deg>
     <m:r>
        <m:rPr>
           <m:scr    m:val="roman"/>
           <m:sty    m:val="p"/>
        </m:rPr>
        <m:t>3</m:t>
     </m:r>
  </m:deg>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
    <m:e>
      <m:r>
        <m:t>x</m:t>
      </m:r>
    </m:e>
  </m:rad>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_Rad) is located in §A.6.1. *end note*]

22.1.2.89 radPr (Radical Properties)

This element specifies properties of the Radical object rad, including the hidden or shown state of the degree deg. [*Example*:

$\sqrt{b}$ is represented by the following XML:

```
  <m:rad>
    <m:radPr>
      <m:degHide m:val="1"/>
    </m:radPr>
    <m:deg/>
    <m:e>
      <m:r>
        <m:t>b</m:t>
      </m:r>
    </m:e>
  </m:rad>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_RadPr) is located in §A.6.1. *end note*]

22.1.2.90 rMargin (Right Margin)

This element specifies the right margin for math, in twips. If this element is omitted, no right margin is used. In other words, when the element is absent, the default value of the option is 0. When the element is present and the val attribute is absent, the default of the val attribute is 1440 (or 1 inch).Math margins are added to the paragraph settings for margins. If the sum of lMargin and rMargin exceed the width available, lMargin should be ignored. If rMargin exceeds the width available, a default indent of 1440 twips should be used. [*Example*: The following XML demonstrates an rmargin setting of 1".

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="1440"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§22.9.2.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TwipsMeasure) is located in §A.6.1. *end note*]

22.1.2.91 rPr (Run Properties)

This element specifies the properties of the math run r.

[*Example*:

$\mathfrak{F} + \mathfrak{G}$ is represented by the following XML:

```
<m:r>
  <m:rPr>
    <m:scr m:val="fraktur"/>
    <m:sty m:val="b"/>
  </m:rPr>
  <m:t>F+G</m:t>
</m:r>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_RPR) is located in §A.6.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.1.2.92 rSp (Row Spacing (Array))

This element specifies spacing between rows of an array eqArr; it is used only when rSpRule is set to 3 (exactly; in which case the unit of measure is points) or 4 (Multiple; in which case the unit of measure is half-lines). If this element is omitted, single line spacing is used in the array, and no additional spacing is used in the layout of rows. Whether the element is absent or present without the val attribute, the default of the val attribute is 0.

[*Example*: Below are three examples of the same array, with single line spacing, 1.5 line spacing, and double line spacing:

$$\begin{pmatrix} x- & y+ & z= & 10 \\ 3x+ & y+2z= & & 34 \\ -5x+2y- & z= & & -14 \end{pmatrix} \begin{pmatrix} x- & y+ & z= & 10 \\ 3x+ & y+2z= & & 34 \\ -5x+2y- & z= & & -14 \end{pmatrix} \begin{pmatrix} x- & y+ & z= & 10 \\ 3x+ & y+2z= & & 34 \\ -5x+2y- & z= & & -14 \end{pmatrix}$$

The following eqArr $\begin{matrix} a=b+c \\ d+e=f \end{matrix}$ has rSp of 3 half-lines:

```
<m:eqArr>
  <m:eqArrPr>
    <m:rSpRule  m:val="4"/>
    <m:rSp m:val="3"/>
  </m:eqArrPr>
  <m:e>
    <m:r>
      <m:t>a=b+c</m:t>
    </m:r>
  </m:e>
  <m:e>
    <m:r>
      <m:t>d+e=f</m:t>
    </m:r>
  </m:e>
</m:eqArr>
```

end example]

Attributes	Description
val (Value)	Specifies the amount of space between columns of the parent element (for cGp/cSp) or rows (for rSp). The manner in which this value is determined depends on the setting of the rule of the parent element. For cGp, if the rule is set to 3 (or "Exactly"), then the unit is interpreted as twips. If the rule is set to 4 (or "Multiple"), then the unit is interpreted as number of 0.5 em increments.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	For cSp, this value is measured in twips. There is no corresponding cSpRule. For rSp, if the rule is set to 3 (or "Exactly"), then the unit is interpreted as points. If the rule is set to 4 (or "Multiple"), then the unit is interpreted as half-lines. The possible values for this attribute are defined by the ST_UnSignedInteger simple type (§22.1.3.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_UnSignedInteger) is located in §A.6.1. *end note*]

22.1.2.93 rSpRule (Row Spacing Rule)

This element specifies the type of vertical spacing between columns in a matrix. The following table demonstrates possible values of rSpRule along with their definitions and examples.

Value	Line spacing between rows	Example (non-normative)
0	Single line gap	1 2 3 4
1	1.5 line gap	1 2 3 4
2	2 line gap	1 2 3 4
3	Exactly (rely on value of rGp, measured in points)	1 2 3 4
4	Multiple (rely on value of rGp, measured in lines)	1 2 3 4

Whether the element is absent or present without the val attribute, the default of the val attribute is 0 (or single line gap).

[*Example*:

1 2
3 4

is represented by the following XML:

```
<m:m>
  <m:mPr>
    <m:rSpRule m:val="2"/>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
    </m:mPr>
    <m:mr>
      <m:e>
        <m:r>
          <m:t>1</m:t>
        </m:r>
      </m:e>
      <m:e>
        <m:r>
          <m:t>2</m:t>
        </m:r>
      </m:e>
    </m:mr>
    <m:mr>
      <m:e>
        <m:r>
          <m:t>3</m:t>
        </m:r>
      </m:e>
      <m:e>
        <m:r>
          <m:t>4</m:t>
        </m:r>
      </m:e>
    </m:mr>
  </m:m>
```

Because the row spacing rule is set to 2, there is twice as much space between the matrix rows as usual.

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
val (Value)	Specifies the type of spacing between rows and/or columns. Possible values are 0, 1, 2, 3, or 4, whose definitions are contained in the following table:

Value	Column/Row Gap	Example
0	Single spacing gap (1 em)	1 2
1	1.5 spacing gap (1.5 ems)	1 2
2	2 spacing gap (2 ems)	1 2
3	Exactly (for columns, rely on value of cGp, measured in twips) (for rows, rely on value of	1 2

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	<table><tr><td></td><td>rSp, measured in points)</td><td></td></tr><tr><td>4</td><td>Multiple (for columns, rely on value of cGp, measured in 0.5 em increments) (for rows, rely on value of rSp, measured in lines)</td><td>1 2</td></tr></table> The possible values for this attribute are defined by the ST_SpacingRule simple type (§22.1.3.11).

[*Note*: The W3C XML Schema definition of this element's content model (CT_SpacingRule) is located in §A.6.1. *end note*]

22.1.2.94 scr (Script)

This element describes the script applied to the characters in the run. The XML includes the Unicode value of the character (between U+0000 and U+007F), along with the script of the character. The application maps the value and script type to the appropriate Unicode range.

Whether the element is absent or present without the val attribute, the default of the val attribute is roman.

[*Example*: 𝔞𝕒

```
<m:r>
  <m:rPr>
    <m:scr m:val="fraktur"/>
    <m:sty m:val="p"/>
  </m:rPr>
  <m:t>a</m:t>
</m:r>
<m:r>
  <m:rPr>
    <m:scr m:val="double-struck"/>
    <m:sty m:val="p"/>
  </m:rPr>
  <m:t>a</m:t>
</m:r>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
val (Value)	Specifies the script type of the parent element. Possible values are: `double-struck`, `fraktur`, `monospace`, `roman`, `sans-serif`, and `script`. The possible values for this attribute are defined by the ST_Script simple type (§22.1.3.9).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Script) is located in §A.6.1. *end note*]

22.1.2.95 sepChr (Delimiter Separator Character)

This element specifies the character that separates base arguments e in the delimiter object d. If this element is omitted, the default sepChr is '|'. In other words, when the element is absent, the default is for the delimiter object separator character to be U+2502 (BOX DRAWINGS LIGHT VERTICAL).

When the element is present and the val attribute is absent, the default of the val attribute is empty which means the delimiter object separator character is absent.

[*Example*: Examples of d, each with a different sepChr, are: $(a_1|a_2)(a_1:a_2)(a_1;a_2)$. The following example sets COLON (:) as the separator character:

```
<m:dPr>
  <m:sepChr val="&#0058;"/>
</m:dPr>
```

end example]

Attributes	Description

val (value)	Specifies the character used by the parent element. When it is omitted, the parent uses its assigned default.
	
	[*Example*: Accent object ã:
	
	`<m:accPr>`
	`  <m:chr m:val="̃"/>`
	`</m:accPr>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Char simple type (§22.1.3.3).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Char) is located in §A.6.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

22.1.2.96 show (Phantom Show)

This element specifies the show property of the phantom phant. When `0` or `false`, the phant base e is hidden. If this element is omitted, the base e is shown. Whether the element is absent or present without the val attribute, the default of the val attribute is `1` meaning that this property is applied.

[*Example*: In the following example, there is a phantom of the fraction a/b in the second radical such that only the height is preserved. The fraction does not show.

$$\sqrt{\frac{a}{b}} = \sqrt{x}$$

```
<m:phantPr>
  <m:show  m:val="0"/>
  <m:zeroDesc m:val="1"/>
</m:phantPr>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.97 shp (Shape (Delimiters))

This element specifies the shape of delimiters in the delimiter object d. Delimiters can be centered around the math axis of the mathematical text and still be made to fit the entire height of their contents (see right-hand example below), or their height and shape can be altered to exactly match their contents (see left-hand example below). These settings significantly impact the shape of the mathematical text. When this element is omitted, delimiters are 'centered'. Whether the element is absent or present without the val attribute, the default of the val attribute is centered. [*Example*: In the examples below, delimiters will be matched to the exact shape of their contents contents on the left, and will be centered on the right:

Match Centered

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

$$a+b=\left(\frac{\frac{a}{b}}{\frac{z}{r}}+\frac{42}{z+y}\right)$$

```
<m:dPr>
  <m:shp  m:val="match"/>
</m:dPr>
```

$$a+b=\left(\frac{\frac{a}{b}}{\frac{z}{r}}+\frac{42}{z+y}\right)$$

```
<m:dPr>
  <m:shp  m:val="centered"/>
</m:dPr>
```

end example]

Attributes	Description
val (Value)	Specifies the shape of the parent element. Possible values are `match` and `centered`. The possible values for this attribute are defined by the ST_Shp simple type (§22.1.3.10).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Shp) is located in §A.6.1. *end note*]

22.1.2.98 smallFrac (Small Fraction)

This element specifies a reduced fraction size display math, such that the numerator and denominator are written in script size instead of at the size of regular text.

When the element is absent, the default value of the option is `0` meaning that this option is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is `1` meaning that this option is applied.

[*Example*: The XML containing this element in use is:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.99 sPre (Pre-Sub-Superscript Object)

This element specifies the Pre-Sub-Superscript object, which consists of a base e and a subscript and superscript placed to the left of the base, as in ${}_{1}^{2}A$. [*Example*: The XML that specifies this function is:

```
<m:sPre>
  <m:sub>
    <m:r>
      <m:t>1</m:t>
    </m:r>
  </m:sub>
  <m:sup>
    <m:r>
      <m:t>2</m:t>
    </m:r>
  </m:sup>
  <m:e>
    <m:r>
      <m:t>A</m:t>
    </m:r>
  </m:e>
</m:sPre>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_SPre) is located in §A.6.1. *end note*]

22.1.2.100 sPrePr (Pre-Sub-Superscript Properties)

This element specifies properties such as ctrlPr that can be stored on the Pre-Sub-Superscript object sPre.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Example*:

${}_{1}^{2}a$ is represented by the following XML:

```
<m:sPre>
  <m:sPrePr/>
  <m:sub>
    <m:r>
      <m:t>1</m:t>
    </m:r>
  </m:sub>
  <m:sup>
    <m:r>
      <m:t>2</m:t>
    </m:r>
  </m:sup>
  <m:e>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:e>
</m:sPre>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_SPrePr) is located in §A.6.1. *end note*]

22.1.2.101 sSub (Subscript Object)

This element specifies the subscript object sSub, which consists of a base e and a reduced-size scr placed below and to the right, as in x_n. [*Example*: The XML that specifies this object is:

```
<m:sSub>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </m:r>
  </m:e>
  <m:sub>
    <m:r>
      <m:t>n</m:t>
    </m:r>
  </m:sub>
</m:sSub>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_SSub) is located in §A.6.1. *end note*]

22.1.2.102 sSubPr (Subscript Properties)

This element specifies properties such as ctrlPr that can be stored on the Subscript object sSub.

[*Example*:

a_2 is represented by the following XML:

```
<m:sSub>
  <m:sSubPr/>
  <m:e>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:e>
  <m:sub>
    <m:r>
      <m:t>2</m:t>
    </m:r>
  </m:sub>
</m:sSub>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_SSubPr) is located in §A.6.1. *end note*]

22.1.2.103 sSubSup (Sub-Superscript Object)

This element specifies the sub-superscript object, which consists of a base e, a reduced-size scr placed below and to the right, and a reduced-size scr placed above and to the right, as in x_m^n.

[*Example*: The XML that specifies this function is:

```
<m:sSubSup>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </r>
  </m:e>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
    <m:sub>
      <m:r>
        <m:t>m</m:t>
      </r>
    </m:sub>
    <m:sup>
      <m:r>
        <m:t>n</m:t>
      </r>
    </m:sup>
  </m:sSubSup>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_SSubSup) is located in §A.6.1. *end note*]

22.1.2.104 sSubSupPr (Sub-Superscript Properties)

This element specifies properties of the Sub-Superscript object, including the alignment of scripts.

[*Example*:

f_{100}^{200} is represented by the following XML:

```
  <m:sSubSup>
    <m:sSubSupPr>
      <m:alnScr m:val="1"/>
    </m:sSubSupPr>
    <m:e>
      <m:r>
        <m:t>f</m:t>
      </m:r>
    </m:e>
    <m:sub>
      <m:r>
        <m:t>100</m:t>
      </m:r>
    </m:sub>
    <m:sup>
      <m:r>
        <m:t>200</m:t>
      </m:r>
    </m:sup>
  </m:sSubSup>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_SSubSupPr) is located in §A.6.1. *end note*]

22.1.2.105 sSup (Superscript Object)

This element specifies the superscript object sSup, which consists of a base e and a reduced-size scr placed above and to the right, as in x^n. [*Example*: The XML that specifies this object is:

```
<m:sSup>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </r>
  </m:e>
  <m:sup>
    <m:r>
      <m:t>n</m:t>
    </r>
  </m:sup>
</m:sSup>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_SSup) is located in §A.6.1. *end note*]

22.1.2.106 sSupPr (Superscript Properties)

This element specifies properties such as ctrlPr that can be stored on the Superscript object sSup.

[*Example*:

a^2 is represented by the following XML:

```
<m:sSup>
  <m:sSupPr/>
  <m:e>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:e>
  <m:sup>
    <m:r>
      <m:t>2</m:t>
    </m:r>
  </m:sup>
```

</m:sSup>*end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_SSupPr) is located in §A.6.1. *end note*]

22.1.2.107 strikeBLTR (Border Box Strikethrough Bottom-Left to Top-Right)

This element specifies the hidden or shown state of a strikethrough diagonal line from the bottom-left corner to the top-right corner of borderBox. When this element is omitted, the strikethrough is not drawn. In other words, when the element is absent, the default value of the property is `0` meaning that this property is not applied. When the element is present and the val attribute is absent, the default of the val attribute is `1` meaning that this property is applied.When applied, a strikethrough is drawn, as in ~~abc~~. [*Example*:

```
<m:borderBox>
  <m:borderBoxPr>
    <m:hideTop  m:val="1"/>
    <m:hideBot  m:val="1"/>
    <m:hideLeft  m:val="1"/>
    <m:hideRight  m:val="1"/>
    <m:strikeBLTR m:val="1"/>
  </m:borderBoxPr>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.108 strikeH (Border Box Strikethrough Horizontal)

This element specifies the hidden or shown state of a strikethrough horizontal line in borderBox. When this element is omitted, the strikethrough is not drawn. In other words, when the element is absent, the default value of the property is `0` meaning that this property is not applied. When the element is present and the val attribute is absent, the default of the val attribute is `1` meaning that this property is applied. When on, a horizontal strikethrough is drawn, as in ~~*abc*~~. [*Example*:

```
<m:borderBox>
  <m:borderBoxPr>
    <m:hideTop  m:val="1"/>
    <m:hideBot  m:val="1"/>
    <m:hideLeft  m:val="1"/>
    <m:hideRight  m:val="1"/>
    <m:strikeH m:val="1"/>
  </m:borderBoxPr>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

Attributes	Description

end example]

Attributes	Description
val (Value)	Specifies the style of the parent element. Possible values are `b` (bold), `i` (italic), `bi` (bold-italic), and `p` (plain). The possible values for this attribute are defined by the ST_Style simple type (§22.1.3.12).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Style) is located in §A.6.1. *end note*]

22.1.2.112 sub (Subscript (Pre-Sub-Superscript))

This element specifies the subscript of the Pre-Sub-Superscript object sPre. [*Example*: For example, the sub in the object ${}_{1}^{2}A$ is 1. An example of this element in use is:

```
<m:sPre>
   <m:sub>
    <m:r>
      <m:t>1</m:t>
    </m:r>
  </m:sub>
  <m:sup>
    <m:r>
      <m:t>2</m:t>
    </m:r>
  </m:sup>
  <m:e>
    <m:r>
      <m:t>A</m:t>
    </m:r>
  </m:e>
</m:sPre>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathArg) is located in §A.6.1. *end note*]

22.1.2.113 subHide (Hide Subscript (n-ary))

This element specifies the n-ary Hide Subscript property. When 1 or `true`, the lower limit does not appear, as in $\int^{\infty} \frac{x}{x+1} dx$. If this element is omitted, the lower limit appears.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

When this element is omitted, the default is `false`. In other words, When the element is absent, the default value of the property is `0` meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is `1` meaning that this property is applied.

[*Example*: An example of this element in use is:

```
<m:naryPr>
  <m:chr  m:val="&#8747;"/>
  <m:subHide m:val="1"/>
</m:naryPr>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.114 sup (Superscript (Superscript object))

This element specifies the superscript of the superscript object sSup. For example, the sup in the superscript object x^n is n. [*Example*: An example of this element in use is:

```
<m:sSup>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </m:r>
  </m:e>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
    <m:sup>
      <m:r>
        <m:t>n</m:t>
      </m:r>
    </m:sup>
  </m:sSup>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_OMathArg) is located in §A.6.1. *end note*]

22.1.2.115 supHide (Hide Superscript (n-ary))

This element specifies the n-ary Hide Superscript property. When `1` or `true`, the upper limit does not appear, as in $\int_0 \frac{x}{x+1} dx$. If this element is omitted, the lower limit appears.

When this element is omitted, the default is `false`. In other words, when the element is absent, the default value of the property is `0` meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is `1` meaning that this property is applied.

[*Example*: An example of this element in use is:

```
<m:naryPr>
  <m:chr  m:val="&#8747;"/>
  <m:supHide m:val="1"/>
</m:naryPr>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.1.2.116 t (Text)

This element specifies the text in a math run r.

[*Example*:

$J + K + a + j$ is represented by the following XML:

```
<m:oMath>
  <m:e>
    <m:r>
      <m:t>J+K+a+j</m:t>
    </m:r>
  </m:e>
</m:oMath>
```

end example]

Attributes	Description

xml:space (Content Contains Significant Whitespace)
 	
Namespace: http://www.w3.org/XML/1998/namespace
	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. [*Example*: Consider the following run contained within a WordprocessingML document:
	
	`<w:r>`
	`  <w:t>  significant whitespace  </w:t>`
	`</w:r>`
	
	Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is subject to the space preservation rules currently specified in that run's scope. *end example*]
	
	The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Text) is located in §A.6.1. *end note*]

22.1.2.117 transp (Transparent (Phantom))

This element specifies that the phantom is transparent for spacing. This means that if the contents of the phantom are belonging to a special spacing class (such as binary operators, relational operators, differentials, etc.), the contents of that phantom are taken into consideration when laying out text. If transparency is turned off, then the contents of the phantom are ignored during layout. When this element is omitted, transparency is `0` or `false`. In other words, when the element is absent, the default value of the property is `0` meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is `1` meaning that this property is applied.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

In the following example, transparency is not applied on the phantom around the differential term. $\int xdx$. The spacing is incorrect. In the following integral, the only difference is that transparency is applied: $\int x\,dx$. Now the spacing is correct.

[*Example*: An example of this element in XML is:

```
<m:phantPr>
  <m:zeroAsc  m:val="1"/>
  <m:zeroDesc  m:val="1"/>
  <m:transp  m:val="1"/>
</m:phantPr>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.118 type (Fraction type)

This element specifies the type of fraction f; the default is 'bar'. Whether the element is absent or present without the val attribute, the default of the val attribute is bar. Fractions types are:

Stacked Fraction: $\frac{a}{b}$

Skewed Fraction: a/b

Linear Fraction: a/b

Stack Object (No-Bar Fraction): $\begin{matrix} n \\ k \end{matrix}$

[Example:

c/d is represented by the following XML:

```
<m:f>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
    <m:fPr>
      <m:type m:val="skw"/>
    </m:fPr>
    <m:num>
      <m:r>
        <m:t>c</m:t>
      </m:r>
    </m:num>
    <m:den>
      <m:r>
        <m:t>d</m:t>
      </m:r>
    </m:den>
  </m:f>
```

end example]

Attributes	Description
val (Value)	Specifies the type of fraction. Possible values are `bar` (Bar Fraction), `lin` (Linear Fraction), `noBar` (No-Bar Fraction (Stack)), and `skw` (Skewed). The possible values for this attribute are defined by the ST_FType simple type (§22.1.3.4).

[*Note*: The W3C XML Schema definition of this element's content model (CT_FType) is located in §A.6.1. *end note*]

22.1.2.119 vertJc (Vertical Justification)

This element, combined with pos of groupChrPr, specifies the vertical layout of the groupChr object. Where pos specifies the position of the grouping character, vertJc specifies the alignment of the object with respect to the baseline. For example, when the group character is above the object, vertJc of `top` signifies that the top of the object falls on the baseline; when vertJc is set to `bot`, the bottom of the object is on the baseline. The table below demonstrates the four possible combinations of groupChr layout:

Pos	vertJc	Layout
`top`	`top`	$a \underset{bcd}{\longleftarrow} e$
`top`	`bot`	$a \overbrace{bcd} e$
`bot`	`top`	$a \underbrace{bcd} e$
`bot`	`bot`	$a \overset{yields}{\longrightarrow} b$

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

When the element is absent, the default value of the property is top.

When the element is present and the val attribute is absent, the default of the val attribute is bot.

[*Example*:

$a + \underbrace{b+c}_{} + d$ is represented by the following XML:

```
<m:oMath>
  <m:r>
    <m:t>a+</m:t>
  </m:r>
  <m:groupChr>
    <m:groupChrPr>
      <m:vertJc m:val="bot"/>
    </m:groupChrPr>
    <m:e>
      <m:r>
        <m:t>b+c</m:t>
      </m:r>
    </m:e>
  </m:groupChr>
  <m:r>
    <m:t>+d</m:t>
  </m:r>
</m:oMath>
```

Since the vertical justification property is set to bot on the group-character object, the bottom of the group-character object is aligned with the baseline.

end example]

Attributes	Description
val (Value)	Specifies the position of the parent element. Possible values are top and bot. [*Example*: <m:barPr> <m:pos m:val="top"/> </m:barPr> The possible values for this attribute are defined by the ST_TopBot simple type (§22.1.3.13).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_TopBot) is located in §A.6.1. *end note*]

22.1.2.120 wrapIndent (Wrap Indent)

This element specifies the indent of the wrapped line of an instance of mathematical text. The line or lines of a wrapped instance of mathematical text after the line break can either be indented by a specified amount from the left margin, or right aligned. The default indent is 1". In other words, whether the element is absent or present without the val attribute, the default of the val attribute is 1440 twips (or 1 inch).

[*Example*: The XML below demonstrates wrapIndent in use:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§22.9.2.14).

[*Note*: The W3C XML Schema definition of this element's content model (CT_TwipsMeasure) is located in §A.6.1. *end note*]

22.1.2.121 wrapRight (Wrap Right)

This element specifies the right justification of the wrapped line of an instance of mathematical text. The line or lines of a wrapped instance of mathematical text after the line break can either be indented by a specified amount from the left margin, or right aligned. If this element is present, the continuation is right aligned.

When the element is absent, the default value of the option is 0 meaning that this option is not applied.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

When the element is present and the val attribute is absent, the default of the val attribute is 1 meaning that this option is applied.

[*Example*: An example of this element in use is:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="0"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapRight/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of 1 or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.122 zeroAsc (Phantom Zero Ascent)

This element specifies that the phantom has zero ascent. The ascent of the contents of the phantom is not taken into account during layout. When this property is omitted, the phantom does have ascent (zero ascent is not applied).

When the element is absent, the default value of the property is `0` meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is 1 meaning that this property is applied.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

In the following example, the differential term is contained in a phantom that zero ascent. As a result, spacing is reduced between the tip of the "d" and the radical bar: $\sqrt{xdx}$. [*Example*:

```
<m:phantPr>
  <m:zeroAsc  m:val="1"/>
</m:phantPr>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `1` or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `0` or `false` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.123 zeroDesc (Phantom Zero Descent)

This element specifies that the phantom has zero descent. The descent of the contents of the phantom is not taken into account during layout. When this property is omitted, the phantom does have descent (zero descent is not applied).

When the element is absent, the default value of the property is `0` meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is `1` meaning that this property is applied.

[*Example*: In the following two examples, only the second has zero descent around the "y". Note that the radical is smaller than in the first case. $\sqrt{y}\sqrt{y}$

```
<m:phantPr>
  <m:zeroDesc  m:val="1"/>
</m:phantPr>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	A value of 1 or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of 0 or false specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.2.124 zeroWid (Phantom Zero Width)

This element specifies that the phantom has zero width. The width of the contents of the phantom is not taken into account during layout. When this property is omitted, the phantom does have width (zero width is not applied).

When the element is absent, the default value of the property is 0 meaning that this property is not applied.

When the element is present and the val attribute is absent, the default of the val attribute is 1 meaning that this property is applied.

[*Example*: In the folowing example, the second radical contains a phantom of the fraction a/b. The phantom has zero width, such that only the height grows to accommodate the hidden fraction: $\sqrt{\frac{a}{b}} = \sqrt{x}$

```
<m:phantPr>
  <m:show  m:val="0"/>
  <m:zeroDesc  m:val="1"/>
</m:phantPr>
```

end example]

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of 1 or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of 0 or false specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_OnOff) is located in §A.6.1. *end note*]

22.1.3 Simple Types

This is the complete list of simple types dedicated to Math.

22.1.3.1 ST_BreakBin (Break Binary Operators)

This defines how to represent binary operators with respect to a line-wrapping break. The line can wrap before the operator or after the operator; alternately, the operator can appear both at the end of the first line and the beginning of the second.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
after (After)	When line-wrapping breaks occur on binary operators, the binary operator appears after the break (at the start of the next line).
before (Before)	When line-wrapping breaks occur on binary operators, the binary operator appears before the break (at the end of the first line).
repeat (Repeat)	When line-wrapping breaks occur on binary operators, the binary operator appears on both sides of the break (at the end of the first line and the start of the next line).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BreakBin) is located in §A.6.1. *end note*]

22.1.3.2 ST_BreakBinSub (Break on Binary Subtraction)

This simple type specifies how to represent subtraction on both sides of a line-wrapping break, when the Break Binary Operators option is set to repeat. The first character represents the sign at the end of the line with the break; the second represents the sign at the start of the wrapped line. Options are --, -+, and +-.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
+- (Plus Minus)	Repetition of subtraction sign after a line-wrapping break is plus on the first line and minus on the second line.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
-+ (Minus Plus)	Repetition of subtraction sign after a line-wrapping break is minus on the first line and plus on the second line.
-- (Minus Minus)	Repetition of subtraction sign after a line-wrapping break is minus on the first and second lines.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_BreakBinSub) is located in §A.6.1. *end note*]

22.1.3.3 ST_Char (Character)

This Simple Type specifies the single character used by the parent element.

[*Example*: In the following example, $\{a\}$ uses { and } as its enclosing characters, instead of the default (and).

```
<m:dPr>
  <m:begChr  m:val="{"/>
  <m:endChr m:val="}"/>
</m:dPr>
```

end example]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 1 characters.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Char) is located in §A.6.1. *end note*]

22.1.3.4 ST_FType (Fraction Type)

Fractions can be of type bar (horizontal fraction bar), skewed ("skw" - diagonal fraction bar with kerned and vertically adjusted numerator and denominator), linear ("lin" - diagonal fraction bar, takes up exactly one line of space), and the "stack" object ("noBar").

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bar (Bar Fraction)	Fraction with a horizontal fraction bar.
lin (Linear Fraction)	Fraction with slanted fraction bar, that takes up no

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
	additional vertical space.
noBar (No-Bar Fraction (Stack))	Stack object, which looks like a fraction with no fraction bar.
skw (Skewed)	Fraction with diagonal fraction bar.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FType) is located in §A.6.1. *end note*]

22.1.3.5 ST_Integer2 (Integer value (-2 to 2))

This simple type contains a value from (-2,+2) which specifies the size of the argument. The effects of each value are described by the referencing element.

This simple type's contents are a restriction of the W3C XML Schema integer datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -2.
- This simple type has a maximum value of less than or equal to 2.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Integer2) is located in §A.6.1. *end note*]

22.1.3.6 ST_Integer255 (Integer value (1 to 255))

This simple type specifies an integer value. The semantics of each value are discussed by the referencing element.

This simple type's contents are a restriction of the W3C XML Schema integer datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 255.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Integer255) is located in §A.6.1. *end note*]

22.1.3.7 ST_Jc (Justification)

This Simple Type specifies the justification of Math Paragraphs. Justification of the Math Paragraph can be Left, Right, Centered, or Centered as Group.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
center (Center (Text))	Centers each instance of mathematical text individually with respect to margins.
centerGroup (Centered as Group (Text))	Justifies instances of mathematical text with respect to each other, and centers the group of mathematical text (the Math Paragraph) with respect to the page.
left (Left Justification)	Left justification of Math Paragraph
right (Right)	Right Justification of Math Paragraph

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Jc) is located in §A.6.1. *end note*]

22.1.3.8 ST_LimLoc (Limit Location)

Limits can be in one of two positions: Under-Over (`undOvr` - above and below the base), and Subscript-Superscript (`subSup` - positioned to the side of the base, in the position of subscripts and superscripts).

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
subSup (Subscript-Superscript location)	Limits placed to the side of the base, as opposed to directly over and under.
undOvr (Under-Over location)	Limits placed to the directly above and below the base, as opposed to on the side.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_LimLoc) is located in §A.6.1. *end note*]

22.1.3.9 ST_Script (Script)

Script can be of type Roman, Script, Fraktur, Double-Struck, Sans-Serif, or Monospace.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
double-struck (double-struck)	Double-Struck Script Type
fraktur (Fraktur)	Fraktur Script Type
monospace (Monospace)	Monospace Script Type

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
roman (Roman)	Roman Script Type
sans-serif (Sans-Serif)	Sans-Serif Script Type
script (Script)	Script Type

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Script) is located in §A.6.1. *end note*]

22.1.3.10 ST_Shp (Shape (Delimiters))

Delimiters shape can be centered around the argument, or matched to the shape of the argument.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
centered (Centered (Delimiters))	Delimiters are centered around their argument.
match (Match)	Match shape of contents of delimiters.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Shp) is located in §A.6.1. *end note*]

22.1.3.11 ST_SpacingRule (Spacing Rule)

Integer value (0 to 4), representing the type of spacing between rows.

This simple type's contents are a restriction of the W3C XML Schema integer datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 4.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SpacingRule) is located in §A.6.1. *end note*]

22.1.3.12 ST_Style (Style)

Style of math can be plain, bold, italic, or bold-italic (p, bi, i, or bi).

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Bold)	Bold
bi (Bold-Italic)	Bold-Italic
i (Italic)	Italic
p (Plain)	Plain

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Style) is located in §A.6.1. *end note*]

22.1.3.13 ST_TopBot (Top-Bottom)

Possible values are `top` and `bot`.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bot (Bottom Alignment)	Aligns the bottom of the object to the baseline of the surrounding text.
top (Top)	Aligns the top row of the object to the baseline of the surrounding text.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TopBot) is located in §A.6.1. *end note*]

22.1.3.14 ST_UnSignedInteger (Unsigned integer.)

Unsigned Integer

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_UnSignedInteger) is located in §A.6.1. *end note*]

22.2 Extended Properties

Extended properties are a predefined set of metadata properties that are applicable to Office Open XML documents. These properties extend the set of core properties defined in Part 2: "Open Packaging Conventions" which are common to all packages.

Extended properties are stored within an Extended File Properties part with:

- Source Relationship: http://purl.oclc.org/ooxml/officeDocument/relationships/extendedProperties

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

- Content Type: application/vnd.openxmlformats-officedocument.extended-properties+xml

Each extended property is represented as an element in the extended properties part. Extended properties elements are non-repeatable and can be empty or omitted. If all extended property elements are omitted then the extended properties part can be excluded from a document.

[*Example*: A sample extended file properties part:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<Properties xmlns="http://…/extended-properties"
  xmlns:vt="http://…/docPropsVTypes">
..<Template>Sales Report.dotm</Template>
..<TotalTime>0</TotalTime>
..<Pages>1</Pages>
..<Words>166</Words>
..<Characters>948</Characters>
..<Application>Microsoft Office Word</Application>
..<DocSecurity>0</DocSecurity>
..<Lines>7</Lines>
..<Paragraphs>2</Paragraphs>
..<ScaleCrop>false</ScaleCrop>
..<Company>Northwind Traders</Company>
..<LinksUpToDate>false</LinksUpToDate>
..<CharactersWithSpaces>1112</CharactersWithSpaces>
..<SharedDoc>false</SharedDoc>
..<HyperlinksChanged>false</HyperlinksChanged>
..<AppVersion>12.0000</AppVersion>
</Properties>
```

end example]

22.2.1 Table of Contents

This subclause is informative.

22.2.2 Elements 3714
22.2.2.1 Application (Application Name) 3714
22.2.2.2 AppVersion (Application Version) 3714
22.2.2.3 Characters (Total Number of Characters) 3714
22.2.2.4 CharactersWithSpaces (Number of Characters (With Spaces)) 3715
22.2.2.5 Company (Name of Company) 3715
22.2.2.6 DigSig (Digital Signature) 3715
22.2.2.7 DocSecurity (Document Security) 3715
22.2.2.8 HeadingPairs (Heading Pairs) 3715
22.2.2.9 HiddenSlides (Number of Hidden Slides) 3716
22.2.2.10 HLinks (Hyperlink List) 3716

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.2.2.11 HyperlinkBase (Relative Hyperlink Base) 3716
22.2.2.12 HyperlinksChanged (Hyperlinks Changed) 3716
22.2.2.13 Lines (Number of Lines) 3717
22.2.2.14 LinksUpToDate (Links Up-to-Date) 3717
22.2.2.15 Manager (Name of Manager) 3717
22.2.2.16 MMClips (Total Number of Multimedia Clips) 3717
22.2.2.17 Notes (Number of Slides Containing Notes) 3717
22.2.2.18 Pages (Total Number of Pages) 3717
22.2.2.19 Paragraphs (Total Number of Paragraphs) 3717
22.2.2.20 PresentationFormat (Intended Format of Presentation) 3717
22.2.2.21 Properties (Application Specific File Properties) 3718
22.2.2.22 ScaleCrop (Thumbnail Display Mode) 3718
22.2.2.23 SharedDoc (Shared Document) 3718
22.2.2.24 Slides (Slides Metadata Element) 3718
22.2.2.25 Template (Name of Document Template) 3718
22.2.2.26 TitlesOfParts (Part Titles) 3718
22.2.2.27 TotalTime (Total Edit Time Metadata Element) 3719
22.2.2.28 Words (Word Count) 3719

End of informative text.

22.2.2 Elements

The following elements specify the contents of this namespace:

22.2.2.1 Application (Application Name)

This element specifies the name of the application that created this document.

The possible values for this element are defined by the W3C XML Schema string datatype.

22.2.2.2 AppVersion (Application Version)

This element specifies the version of the application which produced this document.

The content of this element shall be of the form XX.YYYY where X and Y represent numerical values, or the document shall be considered non-conformant.

[*Note*: The contents of this element do not represent absolute values, but rather qualify the contents of the Application element to differentiate between different versions of the same producer. Applications should use this information in an informative manner only (as document metadata). *end note*]

The possible values for this element are defined by the W3C XML Schema string datatype.

22.2.2.3 Characters (Total Number of Characters)

This element specifies the total number of characters in a document.

The possible values for this element are defined by the W3C XML Schema int datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.2.2.4 CharactersWithSpaces (Number of Characters (With Spaces))

This element specifies the last count of the number of characters (including spaces) in this document.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.2.2.5 Company (Name of Company)

This element specifies the name of a company associated with the document.

The possible values for this element are defined by the W3C XML Schema string datatype.

22.2.2.6 DigSig (Digital Signature)

This element contains the signature of a digitally signed document.

[*Note*: This property is a mechanism used by legacy documents to store the digital signature of its binary representation, and should be avoided in favor of the well-defined mechanism defined in Part 2. Any use of this property should be for legacy compatibility only, and is application-defined. *end note*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_DigSigBlob) is located in §A.6.2. *end note*]

22.2.2.7 DocSecurity (Document Security)

This metadata element specifies the security level of a document as a numeric value. Document security is defined as:

DocSecurity	Security Level
1	Document is password protected.
2	Document is recommended to be opened as read-only.
4	Document is enforced to be opened as read-only.
8	Document is locked for annotation.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.2.2.8 HeadingPairs (Heading Pairs)

Heading pairs indicates the grouping of document parts and the number of parts in each group. These parts are not document parts but conceptual representations of document sections.

[*Example*: A presentation composing of three slides with an applied theme can have the following HeadingPairs representation:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
<HeadingPairs>
  <vt:vector size="4" baseType="variant">
    <vt:variant>
      <vt:lpstr>Theme</vt:lpstr>
    </vt:variant>
    <vt:variant>
      <vt:i4>1</vt:i4>
    </vt:variant>
    <vt:variant>
      <vt:lpstr>Slide Titles</vt:lpstr>
    </vt:variant>
    <vt:variant>
      <vt:i4>3</vt:i4>
    </vt:variant>
  </vt:vector>
</HeadingPairs>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_VectorVariant) is located in §A.6.2. *end note*]

22.2.2.9 HiddenSlides (Number of Hidden Slides)

This element specifies the number of hidden slides in a presentation document.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.2.2.10 HLinks (Hyperlink List)

This element specifies the set of hyperlinks that were in this document when last saved.

[*Note*: The W3C XML Schema definition of this element's content model (CT_VectorVariant) is located in §A.6.2. *end note*]

22.2.2.11 HyperlinkBase (Relative Hyperlink Base)

This element specifies the base string used for evaluating relative hyperlinks in this document.

The possible values for this element are defined by the W3C XML Schema string datatype.

22.2.2.12 HyperlinksChanged (Hyperlinks Changed)

This element specifies that one or more hyperlinks in this part were updated exclusively in this part by a producer. The next producer to open this document shall update the hyperlink relationships with the new hyperlinks specified in this part.

The possible values for this element are defined by the W3C XML Schema boolean datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.2.2.13 Lines (Number of Lines)

This element specifies the total number of lines in a document when last saved by a conforming producer if applicable.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.2.2.14 LinksUpToDate (Links Up-to-Date)

This element indicates whether hyperlinks in a document are up-to-date. Set this element to TRUE to indicate that hyperlinks are updated. Set this element to FALSE to indicate that hyperlinks are outdated.

The possible values for this element are defined by the W3C XML Schema boolean datatype.

22.2.2.15 Manager (Name of Manager)

This element specifies the name of a supervisor associated with the document.

The possible values for this element are defined by the W3C XML Schema string datatype.

22.2.2.16 MMClips (Total Number of Multimedia Clips)

This element specifies the total number of sound or video clips that are present in the document.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.2.2.17 Notes (Number of Slides Containing Notes)

This element specifies the number of slides in a presentation containing notes.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.2.2.18 Pages (Total Number of Pages)

This element specifies the total number of pages of a document if applicable.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.2.2.19 Paragraphs (Total Number of Paragraphs)

This element specifies the total number of paragraphs found in a document if applicable.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.2.2.20 PresentationFormat (Intended Format of Presentation)

This element specifies the intended format for a presentation document. For example, a presentation intended to be shown on video has PresentationFormat "Video".

The possible values for this element are defined by the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.2.2.21 Properties (Application Specific File Properties)

This element specifies the application properties of a document. For properties of type string, NCR escape format (_xHHHH_) is used for any invalid XML characters.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Properties) is located in §A.6.2. *end note*]

22.2.2.22 ScaleCrop (Thumbnail Display Mode)

This element indicates the display mode of the document thumbnail. Set this element to TRUE to enable scaling of the document thumbnail to the display. Set this element to FALSE to enable cropping of the document thumbnail to show only sections that fits the display.

The possible values for this element are defined by the W3C XML Schema boolean datatype.

22.2.2.23 SharedDoc (Shared Document)

This element indicates if this document is currently shared between multiple producers. If this element is set to TRUE, producers should take care when updating the document.

The possible values for this element are defined by the W3C XML Schema boolean datatype.

22.2.2.24 Slides (Slides Metadata Element)

This element specifies the total number of slides in a presentation document.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.2.2.25 Template (Name of Document Template)

This element specifies the name of an external document template containing format and style information used to create the current document.

The possible values for this element are defined by the W3C XML Schema string datatype.

22.2.2.26 TitlesOfParts (Part Titles)

This element specifies the title of each document. These parts are not document parts but conceptual representations of document sections.

[*Example*: A presentation composing of three slides with an applied theme "Currency" can have the following TitlesofParts representation:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<TitlesofParts>
  <vt:vector size="4" baseType="lpstr">
    <vt:lpstr>Currency</vt:lpstr>
    <vt:lpstr>Slide 1</vt:lpstr>
    <vt:lpstr>Slide 2</vt:lpstr>
    <vt:lpstr>Slide 3</vt:lpstr>
  </vt:vector>
</TitlesofParts>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_VectorLpstr) is located in §A.6.2. *end note*]

22.2.2.27 TotalTime (Total Edit Time Metadata Element)

Total time that a document has been edited. The default time unit is minutes.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.2.2.28 Words (Word Count)

This element specifies the total number of words contained in a document when last saved.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.3 Custom Properties

Custom properties enable users to define custom metadata properties through a set of well-defined data types.

Custom properties are represented by property elements (§22.3.2.2) stored in the Custom File Properties part with:

- Source Relationship: http://purl.oclc.org/ooxml/officeDocument/relationships/customProperties
- Content Type: application/vnd.openxmlformats-officedocument.custom-properties+xml

Custom property elements are non-repeatable and can be empty or omitted. If all custom property elements are omitted then the custom properties part can be excluded from a document.

The type and value of custom properties are specified by child XML elements in the File Properties Variant Types namespace (discussed in detail in §22.4). User defined properties are uniquely identified through the name attribute of the property element. Custom properties can be associated with OLE document properties through the fmtid and pid attributes.

[*Example*: A custom OLE `Editor` property of type `string` can be defined as follows:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
<property fmtid="{D5CDD505-2E9C-101B-9397-08002B2CF9AE}" pid="2"
  name="Editor">
  <vt:lpwstr>John Smith</vt:lpwstr>
</property>
```

end example]

22.3.1 Table of Contents

This subclause is informative.

22.3.2 Elements 3720
22.3.2.1 Properties (Custom File Properties) 3720
22.3.2.2 property (Custom File Property) 3720

End of informative text.

22.3.2 Elements

This subclause specifies the set of elements that define this namespace:

22.3.2.1 Properties (Custom File Properties)

Parent element for the custom file properties part.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Properties) is located in §A.6.3. *end note*]

22.3.2.2 property (Custom File Property)

This element specifies a single custom file property. Custom file property type is defined through child elements in the File Properties Variant Type namespace. Custom file property value can be set by setting the appropriate Variant Type child element value.

Attributes	Description
fmtid (Format ID)	Uniquely relates a custom property with an OLE property. The value of this attribute is a Globally Unique Identifier in the form of {HHHHHHHH-HHHH-HHHH-HHHH-HHHHHHHHH} where each H is a hexidecimal. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).
linkTarget (Bookmark Link Target)	Specifies the name of a bookmark in the current document (for WordprocessingML), or a table or named cell (for SpreadsheetML) from which the value of this custom document property should be extracted. If this attribute is present, then any value under this element shall be considered a cache and replaced with the value of this bookmark (if present) on save. If the bookmark is not present, then this link shall be considered broken and the cached value shall be retained.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema string datatype.
name (Custom File Property Name)	Specifies the name of this custom file property. The possible values for this attribute are defined by the W3C XML Schema string datatype.
pid (Property ID)	Uniquely relates a custom property with an OLE property. The possible values for this attribute are defined by the W3C XML Schema int datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Property) is located in §A.6.3. *end note*]

22.4 Variant Types

This subclause specifies the set of data types which can be included within file properties that accept variant type structures.

22.4.1 Table of Contents

This subclause is informative.

22.4.2 Elements 3722
22.4.2.1 array (Array) 3722
22.4.2.2 blob (Binary Blob) 3723
22.4.2.3 bool (Boolean) 3723
22.4.2.4 bstr (Basic String) 3724
22.4.2.5 clsid (Class ID) 3724
22.4.2.6 cy (Currency) 3724
22.4.2.7 date (Date and Time) 3724
22.4.2.8 decimal (Decimal) 3724
22.4.2.9 empty (Empty) 3724
22.4.2.10 error (Error Status Code) 3725
22.4.2.11 filetime (File Time) 3725
22.4.2.12 i1 (1-Byte Signed Integer) 3725
22.4.2.13 i2 (2-Byte Signed Integer) 3725
22.4.2.14 i4 (4-Byte Signed Integer) 3725
22.4.2.15 i8 (8-Byte Signed Integer) 3725
22.4.2.16 int (Integer) 3725
22.4.2.17 lpstr (LPSTR) 3725
22.4.2.18 lpwstr (LPWSTR) 3726
22.4.2.19 null (Null) 3726
22.4.2.20 oblob (Binary Blob Object) 3726
22.4.2.21 ostorage (Binary Storage Object) 3726

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.4.2.22 ostream (Binary Stream Object) 3726
22.4.2.23 r4 (4-Byte Real Number) 3727
22.4.2.24 r8 (8-Byte Real Number) 3727
22.4.2.25 storage (Binary Storage) 3727
22.4.2.26 stream (Binary Stream) 3727
22.4.2.27 ui1 (1-Byte Unsigned Integer) 3727
22.4.2.28 ui2 (2-Byte Unsigned Integer) 3727
22.4.2.29 ui4 (4-Byte Unsigned Integer) 3727
22.4.2.30 ui8 (8-Byte Unsigned Integer) 3727
22.4.2.31 uint (Unsigned Integer) 3728
22.4.2.32 variant (Variant) 3728
22.4.2.33 vector (Vector) 3728
22.4.2.34 vstream (Binary Versioned Stream) 3729

22.4.3 Simple Types 3729

22.4.3.1 ST_ArrayBaseType (Array Base Type Simple Type) 3729
22.4.3.2 ST_Cy (Currency Simple Type) 3730
22.4.3.3 ST_Error (Error Status Code Simple Type) 3731
22.4.3.4 ST_VectorBaseType (Vector Base Type Simple Type) 3731

End of informative text.

22.4.2 Elements

The following elements define the contents of this namespace:

22.4.2.1 array (Array)

The array element defines the array variant type. Array contents shall be of uniform type as specified by the baseType attribute. The contents of an array are defined using repeated child elements of the appropriate variant type.

Multi-dimensional arrays can be defined by specifying the length of each dimension in the lBound and uBound attributes through the use of the "," delimiter. Child elements of multi-dimensional arrays are indexed along each dimension in the order the dimensions are declared.

In other words, the array shall be filled as follows:

- The first index shall be incremented to its maximum value [*Example*: [0,0,0] to [max,0,0] *end example*]
- The second index shall be incremented to its maximum value [*Example*: [0,1,0] to [0,max,0] *end example*]
- Subsequent indices shall be filled until all provided values have been added
- All other values shall have null values within the array (i.e. no default value shall be assumed).

[*Example*: A 2x3 variant type array of type "i4" is specified as follows:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<vt:array lBounds="0,0" uBounds="1,2" baseType="i4">
  <vt:i4>0</vt:i4>
  <vt:i4>1</vt:i4>
  <vt:i4>2</vt:i4>
  <vt:i4>3</vt:i4>
  <vt:i4>4</vt:i4>
</vt:array>
```

The resulting array: [0,0] = 0, [1,0] = 1, [0,1] = 2, [1,1] = 3, [0,2] = 4. *end example*]

Attributes	Description
baseType (Array Base Type)	The baseType attribute specifies the base variant type of an array. The allowed values are: variant, i1, i2, i4, int, ui1, ui2, ui4, uint, r4, r8, decimal, bstr, date, bool, cy, and error. The possible values for this attribute are defined by the ST_ArrayBaseType simple type (§22.4.3.1).
lBounds (Array Lower Bounds Attribute)	The lBounds attribute specifies the lower bound of an array in the format: #, #, # … # where each # represents an integer. The possible values for this attribute are defined by the W3C XML Schema int datatype.
uBounds (Array Upper Bounds Attribute)	The uBounds attribute specifies the upper bound of an array in the format: #, #, # … # where each # represents an integer. The possible values for this attribute are defined by the W3C XML Schema int datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Array) is located in §A.6.4. *end note*]

22.4.2.2 blob (Binary Blob)

This element specifies a base64 binary blob variant type.

This type is defined as follows: a DWORD count of bytes, followed by that many bytes of data. The byte count does not include the four bytes for the length of the count itself; an empty blob member would have a count of zero, followed by zero bytes.

The possible values for this element are defined by the W3C XML Schema base64Binary datatype.

22.4.2.3 bool (Boolean)

This element specifies a Boolean variant type.

The possible values for this element are defined by the W3C XML Schema boolean datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

22.4.2.4 bstr (Basic String)

This element defines a binary basic string variant type, which can store any valid Unicode character. Unicode characters that cannot be directly represented in XML as defined by the XML 1.0 specification, shall be escaped using the Unicode numerical character representation escape character format _xHHHH_, where H represents a hexadecimal character in the character's value. [*Example*: The Unicode character 8 is not permitted in an XML 1.0 document, so it shall be escaped as _x0008_. *end example*] To store the literal form of an escape sequence, the initial underscore shall itself be escaped (i.e. stored as _x005F_). [*Example*: The string literal `_x0008_` would be stored as `_x005F_x0008_`. *end example*]

The possible values for this element are defined by the W3C XML Schema string datatype.

22.4.2.5 clsid (Class ID)

This element specifies a class ID variant type. The value shall be a Globally Unique Identifier with format: {HHHHHHHH-HHHH-HHHH-HHHH-HHHHHHHH}.

The possible values for this element are defined by the ST_Guid simple type (§22.9.2.4).

[*Note*: The W3C XML Schema definition of this element's content model (ST_Guid) is located in §A.6.9. *end note*]

22.4.2.6 cy (Currency)

This element specifies a currency variant type with exactly four digits after the decimal point.

The possible values for this element are defined by the ST_Cy simple type (§22.4.3.2).

[*Note*: The W3C XML Schema definition of this element's content model (ST_Cy) is located in §A.6.4. *end note*]

22.4.2.7 date (Date and Time)

This element specifies a date variant type of type date-time as defined in RFC 3339.

The possible values for this element are defined by the W3C XML Schema dateTime datatype.

22.4.2.8 decimal (Decimal)

This element specifies a decimal variant type.

The possible values for this element are defined by the W3C XML Schema decimal datatype.

22.4.2.9 empty (Empty)

This element specifies an empty variant type. No values or child elements are allowed.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Empty) is located in §A.6.4. *end note*]

22.4.2.10 error (Error Status Code)

The error element specifies a 32-bit error status code variant type of the form 0xHHHHHHHH. Each H represents a hexadecimal digit.

The possible values for this element are defined by the ST_Error simple type (§22.4.3.3).

[*Note*: The W3C XML Schema definition of this element's content model (ST_Error) is located in §A.6.4. *end note*]

22.4.2.11 filetime (File Time)

This element specifies a file-time variant type of type date-time as defined in RFC 3339.

The possible values for this element are defined by the W3C XML Schema dateTime datatype.

22.4.2.12 i1 (1-Byte Signed Integer)

This element specifies a 1-byte signed integer variant type.

The possible values for this element are defined by the W3C XML Schema byte datatype.

22.4.2.13 i2 (2-Byte Signed Integer)

This element specifies a 2-byte signed integer variant type.

The possible values for this element are defined by the W3C XML Schema short datatype.

22.4.2.14 i4 (4-Byte Signed Integer)

This element specifies a 4-byte signed integer variant type.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.4.2.15 i8 (8-Byte Signed Integer)

This element specifies a 8-byte signed integer variant type.

The possible values for this element are defined by the W3C XML Schema long datatype.

22.4.2.16 int (Integer)

This element specifies an integer variant type.

The possible values for this element are defined by the W3C XML Schema int datatype.

22.4.2.17 lpstr (LPSTR)

This element specifies a string variant type. For all characters that cannot be represented in XML as defined by the XML 1.0 specification, the characters are escaped using the Unicode numerical character representation escape character format _xHHHH_, where H represents a hexadecimal character in the character's value.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

[*Example*: The Unicode character 8 is not permitted in an XML 1.0 document, so it must be escaped as _x0008_. *end example*]

The possible values for this element are defined by the W3C XML Schema string datatype.

22.4.2.18 lpwstr (LPWSTR)

This element specifies a string variant type. For all characters that cannot be represented in XML as defined by the XML 1.0 specification, the characters are escaped using the Unicode numerical character representation escape character format _xHHHH_, where H represents a hexadecimal character in the character's value. [*Example*: The Unicode character 8 is not permitted in an XML 1.0 document, so it must be escaped as _x0008_. *end example*]

The possible values for this element are defined by the W3C XML Schema string datatype.

22.4.2.19 null (Null)

This element specifies a null variant type.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Null) is located in §A.6.4. *end note*]

22.4.2.20 oblob (Binary Blob Object)

This element specifies a base64 binary blob object variant type.

This type is defined as follows: A blob member that contains a serialized object in the same representation that would appear in the ostream element. That is, a DWORD byte count (where the byte count does not include the size of itself) which is in the format of a class identifier followed by initialization data for that class.

The possible values for this element are defined by the W3C XML Schema base64Binary datatype.

22.4.2.21 ostorage (Binary Storage Object)

This element specifies a base64 binary storage object variant type.

This type is defined as follows: Identical to the storage element, but indicates that the designated storage shall contain a loadable object.

The possible values for this element are defined by the W3C XML Schema base64Binary datatype.

22.4.2.22 ostream (Binary Stream Object)

This element specifies a binary stream object variant type.

This type is defined as follows: Identical to the definition of the stream element, but indicates that the stream contains a serialized object, which is a CLSID – see the ST_Guid simple type (§22.9.2.4) – followed by initialization data for the specified class.

The possible values for this element are defined by the W3C XML Schema base64Binary datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.4.2.23 r4 (4-Byte Real Number)

This element specifies a 4-byte real number variant type.

The possible values for this element are defined by the W3C XML Schema float datatype.

22.4.2.24 r8 (8-Byte Real Number)

This element specifies a 8-byte real number variant type.

The possible values for this element are defined by the W3C XML Schema double datatype.

22.4.2.25 storage (Binary Storage)

This element specifies a binary storage variant type.

This type is defined as follows: Contains the base64-encoded data for a structured storage.

The possible values for this element are defined by the W3C XML Schema base64Binary datatype.

22.4.2.26 stream (Binary Stream)

This element specifies a binary stream variant type.

This type is defined as follows: Contains the base64-encoded data for a structured storage stream.

The possible values for this element are defined by the W3C XML Schema base64Binary datatype.

22.4.2.27 ui1 (1-Byte Unsigned Integer)

This element specifies a 1-byte unsigned integer variant type.

The possible values for this element are defined by the W3C XML Schema unsignedByte datatype.

22.4.2.28 ui2 (2-Byte Unsigned Integer)

This element specifies a 2-byte unsigned integer variant type.

The possible values for this element are defined by the W3C XML Schema unsignedShort datatype.

22.4.2.29 ui4 (4-Byte Unsigned Integer)

This element specifies a 4-byte unsigned integer variant type.

The possible values for this element are defined by the W3C XML Schema unsignedInt datatype.

22.4.2.30 ui8 (8-Byte Unsigned Integer)

This element specifies a 8-byte unsigned integer variant type.

The possible values for this element are defined by the W3C XML Schema unsignedLong datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

22.4.2.31 uint (Unsigned Integer)

This element specifies an unsigned integer variant type.

The possible values for this element are defined by the W3C XML Schema unsignedInt datatype.

22.4.2.32 variant (Variant)

This element can contain exactly 1 child element of any variant type. This element is only valid as a child element of a vector or array variant type.

[*Example*: A vector of variant types:

```
<vt:vector baseType="variant">
  <vt:variant>
    <vt:i4>12</vt:i4>
  </vt:variant>
  <vt:variant>
    <vt:lpstr>WorkSheets</vt:lpstr>
  </vt:variant>
</vt:vector>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_Variant) is located in §A.6.4. *end note*]

22.4.2.33 vector (Vector)

This element defines the vector variant type. Vector contents shall be of uniform type as specified by the baseType attribute. The contents of a vector are defined using repeated child elements of the appropriate variant type.

[*Example*: A vector of lpstr variant types:

```
<vt:vector baseType="lpstr">
  <vt:lpstr>One</vt:lpstr>
  <vt:lpstr>Two</vt:lpstr>
  <vt:lpstr>Three</vt:lpstr>
</vt:vector>
```

end example]

Attributes	Description
baseType (Vector Base Type)	The baseType attribute specifies the base variant type of a vector. The allowed values are: variant, i1, i2, i4, i8, ui1, ui2, ui4, ui8, r4, r8, lpstr, lpwstr, bstr, date, filetime, bool, cy, error, and clsid.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the ST_VectorBaseType simple type (§22.4.3.4).
size (Vector Size)	Specifies the number of elements in the vector. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Vector) is located in §A.6.4. *end note*]

22.4.2.34 vstream (Binary Versioned Stream)

This element specifies a binary versioned stream variant type.

This type is defined as follows: A stream element's content with a GUID version (the version attribute).

[*Note*: The W3C XML Schema definition of this element's content model (CT_Vstream) is located in §A.6.4. *end note*]

22.4.3 Simple Types

This is the complete list of simple types dedicated to Variant Types.

22.4.3.1 ST_ArrayBaseType (Array Base Type Simple Type)

The ST_ArrayBaseType simple type defines the allowed values for an array's baseType attribute as: variant, i1, i2, i4, int, ui1,ui2, ui4, uint, r4, r8, decimal, bstr, date, bool, cy, and error.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bool (Boolean Base Type)	Specifies that the variant type for the contents of a array shall be `bool`.
bstr (Basic String Base Type)	Specifies that the variant type for the contents of a array shall be `bstr`.
cy (Curency Base Type)	Specifies that the variant type for the contents of a array shall be `cy`.
date (Date and Time Base Type)	Specifies that the variant type for the contents of a array shall be `date`.
decimal (Decimal Base Type)	Specifies that the variant type for the contents of a array shall be `decimal`.
error (Error Status Code Base Type)	Specifies that the variant type for the contents of a

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
	array shall be `error`.
i1 (1-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a array shall be `i1`.
i2 (2-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a array shall be `i2`.
i4 (4-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a array shall be `i4`.
int (Integer Base Type)	Specifies that the variant type for the contents of a array shall be `int`.
r4 (4-Byte Real Number Base Type)	Specifies that the variant type for the contents of a array shall be `r4`.
r8 (8-Byte Real Number Base Type)	Specifies that the variant type for the contents of a array shall be `r8`.
ui1 (1-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a array shall be `ui1`.
ui2 (2-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a array shall be `ui2`.
ui4 (4-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a array shall be `ui4`.
uint (Unsigned Integer Base Type)	Specifies that the variant type for the contents of a array shall be `uint`.
variant (Variant Base Type)	Specifies that the variant type for the contents of a array shall be `variant`.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ArrayBaseType) is located in §A.6.4. *end note*]

22.4.3.2 ST_Cy (Currency Simple Type)

The ST_Cy simple type defines the cy element as a currency variant type with exactly four digits after the decimal point.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents shall match the following regular expression pattern: \s*[0-9]*\.[0-9]{4}\s*.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Cy) is located in §A.6.4. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.4.3.3 ST_Error (Error Status Code Simple Type)

The ST_Error simple type defines a 32-bit error status code variant type of the form 0xHHHHHHHH. Each H represents a hexadecimal.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents shall match the following regular expression pattern: \s*0x[0-9A-Za-z]{8}\s*.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Error) is located in §A.6.4. *end note*]

22.4.3.4 ST_VectorBaseType (Vector Base Type Simple Type)

The ST_VectorBaseType simple type defines the allowed values for a vector's baseType attribute as: variant, i1, i2, i4, i8, ui1, ui2, ui4, ui8, r4, r8, lpstr, lpwstr, bstr, date, filetime, bool, cy, error, and clsid.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bool (Boolean Base Type)	Specifies that the variant type for the contents of a vector shall be `bool`.
bstr (Basic String Base Type)	Specifies that the variant type for the contents of a vector shall be `bstr`.
clsid (Class ID Base Type)	Specifies that the variant type for the contents of a vector shall be `clsid`.
cy (Currency Base Type)	Specifies that the variant type for the contents of a vector shall be `cy`.
date (Date and Time Base Type)	Specifies that the variant type for the contents of a vector shall be `date`.
error (Error Status Code Base Type)	Specifies that the variant type for the contents of a vector shall be `error`.
filetime (File Time Base Type)	Specifies that the variant type for the contents of a vector shall be `filetime`.
i1 (Vector Base Type Enumeration Value)	Specifies that the variant type for the contents of a vector shall be `i1`.
i2 (2-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `i2`.
i4 (4-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `i4`.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
i8 (8-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `i8`.
lpstr (LPSTR Base Type)	Specifies that the variant type for the contents of a vector shall be `lpstr`.
lpwstr (LPWSTR Base Type)	Specifies that the variant type for the contents of a vector shall be `lpwstr`.
r4 (4-Byte Real Number Base Type)	Specifies that the variant type for the contents of a vector shall be `r4`.
r8 (8-Byte Real Number Base Type)	Specifies that the variant type for the contents of a vector shall be `r8`.
ui1 (1-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `ui1`.
ui2 (2-Byte Unisigned Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `ui2`.
ui4 (4-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `ui4`.
ui8 (8-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `ui8`.
variant (Variant Base Type)	Specifies that the variant type for the contents of a vector shall be `variant`.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_VectorBaseType) is located in §A.6.4. *end note*]

22.5 Custom XML Data Properties

This namespace defines the set of properties that can be associated with one or more custom XML parts within an Office Open XML document. A *custom XML part* is a part within an Office Open XML document, that contains arbitrary custom XML markup not necessarily defined by ISO/IEC 29500, and which is kept independent from the presentation-specific markup within the package.

[*Rationale*: It is often necessary to include custom XML semantics with an Office Open XML document, to store a complex set of properties (e.g., a document management system's metadata) along with the file. This mechanism allows this custom XML to be stored in the document in a way that is independent of the type of document and separate from the presentation markup—only the custom XML is stored in this part. *end rationale*]

The properties that can be applied to a custom XML part are:

- A part ID
- (optionally) One or more associated custom XML schemas

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.5.1 Table of Contents

This subclause is informative.

22.5.2 Elements 3733
22.5.2.1 datastoreItem (Custom XML Data Properties) 3733
22.5.2.2 schemaRef (Associated XML Schema) 3734
22.5.2.3 schemaRefs (Set of Associated XML Schemas) 3735

End of informative text.

22.5.2 Elements

The following information describes the elements in this namespace:

22.5.2.1 datastoreItem (Custom XML Data Properties)

This element specifies the properties for a single custom XML part inside of an Office Open XML document. The set of properties specified within this element are attached to the custom XML part that specifies a relationship to this part.

[*Example*: Consider the following content for a custom XML part properties part:

```
<ds:datastoreItem ds:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">
  <ds:schemaRefs>
    <ds:schemaRef ds:uri="http://www.example.com/exampleSchema" />
  </ds:schemaRefs>
</ds:datastoreItem>
```

The datastoreItem element contains the properties for the custom XML part that referenced it; specifically, a part ID of A67AC88A-A164-4ADE-8889-8826CE44DE6E, and a single XML Schema reference to a schema with a target namespace of http://www.example.com/exampleSchema. *end example*]

Attributes	Description

itemID (Custom XML Data ID)	Specifies a globally unique identifier (GUID) that uniquely identifies a single custom XML part within an Office Open XML document.
	
	Each itemID value shall be unique among all custom XML data parts in this document. If a document contains duplicate itemID values, then the first value should be persisted, and subsequent values should be reassigned.
	
	[*Example*: Consider the following content for a custom XML part properties part:
	
	`<w:datastoreItem w:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">`
	`…`
	`</w:datastoreItem>`

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description
	The itemID attribute specifies that the ID associated with the parent custom XML part is A67AC88A-A164-4ADE-8889-8826CE44DE6E. *end example*] The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).

[*Note*: The W3C XML Schema definition of this element's content model (CT_DatastoreItem) is located in §A.6.5. *end note*]

22.5.2.2 schemaRef (Associated XML Schema)

This element specifies a single XML schema that is associated with the custom XML data part. This XML schema is identified using its target namespace, and can be located via any means available to an application processing the contents of this file.

If the custom XML part cannot be validated using the specified XML schema when it is opened, then this reference can be omitted when the file is subsequently saved.

[*Example*: Consider the following content for a custom XML part properties part:

```
<ds:datastoreItem ds:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">
  <ds:schemaRefs>
    <ds:schemaRef ds:uri="http://www.example.com/exampleSchema" />
  </ds:schemaRefs>
</ds:datastoreItem>
```

The schemaRef element contains a single XML Schema reference to a schema with a target namespace of http://www.example.com/exampleSchema. Applications can then locate and utilize a schema for this namespace using any means available. *end example*]

Attributes	Description
uri (Target Namespace of Associated XML Schema)	Specifies the target namespace for the XML Schema associated with this schema reference. [*Example*: Consider the following content for a custom XML part properties part: … <w:schemaRef w:uri="http://www.example.com/schema1" /> <w:schemaRef w:uri="http://www.example.com/schema2" /> … The uri attribute specifies the target namespace of each XML schema reference: • http://www.example.com/schema1 • http://www.example.com/schema2

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	Applications can then locate and utilize a schema for these namespaces using any means available. *end example*] The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_DatastoreSchemaRef) is located in §A.6.5. *end note*]

22.5.2.3 schemaRefs (Set of Associated XML Schemas)

This element specifies the set of XML schemas that are associated with the parent custom XML part. Any number of XML schemas can be referenced, and this collection of schemas shall then be used to validate the contents of the corresponding custom XML part. If this element is present, then the set of XML schemas provided within should be used to validate the contents of the corresponding custom XML part (including the explicit presence of no child elements to specify that no custom XML schemas should be used even if one is present).

If this element is omitted, then applications can determine the set of XML schemas to be used to validate the contents of this part using any desired means.

[*Example*: Consider the following content for a custom XML part properties part:

```
<ds:datastoreItem ds:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">
  <ds:schemaRefs>
    <ds:schemaRef ds:uri="http://www.example.com/exampleSchema" />
  </ds:schemaRefs>
</ds:datastoreItem>
```

The schemaRefs element contains the set of XML Schema references that can be used to validate the contents of this part. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_DatastoreSchemaRefs) is located in §A.6.5. *end note*]

22.6 Bibliography

Within an Office Open XML document, it is possible to store an arbitrary amount of bibliographic data, the use of which can be determined by the application reading the content. This subclause defines the format and structure of that bibliographic data.

The outermost element of bibliographic data is Sources, which represents the collection of individual reference materials (Source) in the document.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.6.3 Simple Types 3771

22.6.3.1 ST_SourceType (Bibliographic Data Source Types) 3771

End of informative text.

22.6.2 Elements

The following elements define the contents of the Bibliography schema:

22.6.2.1 AbbreviatedCaseNumber (Abbreviated Case Number)

This element describes the abbreviated form of a case number. Typically, this field is used in the Case source type.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.2 AlbumTitle (Album Title)

This element specifies the title of an album. Typically, this field is used in the Sound recording source type. [*Example*:

```
<b:Source>
  <b:Tag>Bon96</b:Tag>
  <b:SourceType>SoundRecording</b:SourceType>
  <b:Author>
    <b:Performer>
      <b:NameList>
        <b:Person>
          <b:Last>Villaron</b:Last>
          <b:First>Shawn</b:First>
          <b:Middle>Alan</b:Middle>
        </b:Person>
      </b:NameList>
    </b:Performer>
  </b:Author>
  <b:Title>Title</b:Title>
  <b:Year>2004</b:Year>
  <b:City>London</b:City>
  <b:AlbumTitle>Album Title</b:AlbumTitle>
  <b:RefOrder>15</b:RefOrder>
  <b:Guid>{17722923-790D-47E7-BB5D-C5DC67FA83D6}</b:Guid>
  <b:LCID>0</b:LCID>
  <b:Comments>Comments</b:Comments>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.3 Artist (Artist)

This element specifies the artist of the source. Typically, this field is used in the Art and Sound Recording source types. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<b:Author>
  <b:Artist>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Artist>
</b:Author>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.4 Author (Contributors List)

This element specifies the contributors to the source. [*Example*:

```
<b:Author>
  <b:Author>
    <b:NameList>
      <b:Person>
        <b:Last>Rothschiller</b:Last>
        <b:First>Chad</b:First>
      </b:Person>
    </b:NameList>
  </b:Author>
  <b:Editor>
    <b:NameList>
      <b:Person>
        <b:Last>Jaeschke</b:Last>
        <b:First>Rex</b:First>
      </b:Person>
    </b:NameList>
  </b:Editor>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
    <b:Translator>
      <b:NameList>
        <b:Person>
          <b:Last>Davis</b:Last>
          <b:First>Tristan</b:First>
        </b:Person>
      </b:NameList>
    </b:Translator>
  </b:Author>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_AuthorType) is located in §A.6.6. *end note*]

22.6.2.5 Author (Author)

This element specifies the author of the source. [*Example*:

```
  <b:Author>
    <b:Author>
      <b:NameList>
        <b:Person>
          <b:Last>Jones</b:Last>
          <b:First>Brian</b:First>
        </b:Person>
      </b:NameList>
    </b:Author>
  </b:Author>
```

end example]

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameOrCorporateType) is located in §A.6.6. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.6.2.6 BookAuthor (Book Author)

This element specifies the author of a book, when the primary author has authored the book section. For example, if person X writes a chapter in a book by person Y, person X is the Author and person Y is the BookAuthor. [*Example*:

```
<b:Author>
  <b:BookAuthor>
    <b:NameList>
      <b:Person>
        <b:Last>Rothschiller</b:Last>
        <b:First>Chad</b:First>
      </b:Person>
    </b:NameList>
  </b:BookAuthor>
</b:Author>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.7 BookTitle (Book Title)

This element specifies the title of a book, when the source is a book section. In this case, the title of the book section is the primary title. For example, if X is the title of a chapter in a book entitled , X is the Title and Y is the BookTitle. [*Example*:

```
<b:Source>
   …
  <b:Year>1992</b:Year>
  <b:City>Paris</b:City>
  <b:Publisher>Publisher</b:Publisher>
  <b:Pages>51-84</b:Pages>
  <b:Comments>Comments</b:Comments>
  <b:BookTitle>Book Title</b:BookTitle>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.6.2.8 Broadcaster (Broadcaster)

This element specifies the broadcaster of a source. Typically, this field is used in the Interview source type. [*Example*:

```
<b:Source>
   …
  <b:ProgramTitle>Program Title</b:ProgramTitle>
  <b:Broadcaster>Broadcaster</b:Broadcaster>
  <b:Station>Station</b:Station>
  <b:RefOrder>1</b:RefOrder>
  <b:Title>Title (Interview)</b:Title>
  <b:BroadcastTitle>Broadcast Title</b:BroadcastTitle>
  <b:StateProvince>State or Province</b:StateProvince>
  <b:CountryRegion>Country or Region</b:CountryRegion>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.9 BroadcastTitle (Broadcast Title)

This element specifies the broadcast title of a source. Typically, this field is used in the Interview source type. [*Example*:

```
<b:Source>
   …
  <b:ProgramTitle>Program Title</b:ProgramTitle>
  <b:Broadcaster>Broadcaster</b:Broadcaster>
  <b:Station>Station</b:Station>
  <b:RefOrder>1</b:RefOrder>
  <b:Title>Title (Interview)</b:Title>
  <b:BroadcastTitle>Broadcast Title</b:BroadcastTitle>
  <b:StateProvince>State/Province</b:StateProvince>
  <b:CountryRegion>Country/Region</b:CountryRegion>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.6.2.10 CaseNumber (Case Number)

This element specifies the case number of a source. Typically, this field is used in the Case source type. [*Example*:

```
…
<b:Title>Title (Case)</b:Title>
<b:Year>Year</b:Year>
<b:City>Place Published</b:City>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:CaseNumber>Case Number</b:CaseNumber>
<b:Court>Court</b:Court>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.11 ChapterNumber (Chapter Number)

This element specifies the number or index of the chapter being referenced. [*Example*:

```
…
<b:BookTitle>Title</b:BookTitle>
<b:Pages>23-65</b:Pages>
<b:Comments>Comments</b:Comments>
<b:ChapterNumber>6</b:ChapterNumber>
<b:RefOrder>1</b:RefOrder>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.12 City (City)

This element specifies the city in which the source was published, printed, or manufactured. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
…
<b:Title>Title</b:Title>
<b:Year>1997</b:Year>
<b:City>London</b:City>
<b:Publisher>Publihser</b:Publisher>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.13 Comments (Comments)

This element specifies any additional comments about the source. The documentation style determines whether the comments appear in the bibliography. [*Example*:

```
…
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Comments>Comments</b:Comments>
<b:RefOrder>2</b:RefOrder>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.14 Compiler (Compiler)

This element specifies the person who compiled the information in a source. [*Example*:

```
<b:Author>
  <b:Compiler>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Compiler>
</b:Author>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.15 Composer (Composer)

This element specifies the composer of a sound recording. [*Example*:

```
<b:Author>
  <b:Composer>
    <b:NameList>
      <b:Person>
        <b:Last>Davis</b:Last>
        <b:First>Tristan</b:First>
      </b:Person>
    </b:NameList>
  </b:Composer>
</b:Author>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.16 Conductor (Conductor)

This element specifies the conductor of a source. Typically, this field is used in the sound recording source type. [*Example*:

```
<b:Author>
  <b:Conductor>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Conductor>
</b:Author>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.17 ConferenceName (Conference or Proceedings Name)

This element specifies the title of the proceedings from a conference. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
…
<b:Comments>Comments</b:Comments>
<b:ConferenceName>Conference Name</b:ConferenceName>
<b:RefOrder>9</b:RefOrder>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.18 Corporate (Corporate Author)

This element specifies the corporate author, performer, or any field that can be a name. The element is used when an organization, rather than a person, is used. [*Example*:

```
<b:Author>
  <b:Author>
    <b:Corporate>Corporate Author</b:Corporate>
  </b:Author>
</b:Author>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.19 Counsel (Counsel)

This element specifies the counsel, attorney, or attorneys in a case.

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.20 CountryRegion (Country or Region)

This element specifies the country or region of a source. [*Example*:

```
<b:Source>
   …
  <b:ProgramTitle>Program Title</b:ProgramTitle>
  <b:Broadcaster>Broadcaster</b:Broadcaster>
  <b:Station>Station</b:Station>
  <b:RefOrder>1</b:RefOrder>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
    <b:Title>Title (Interview)</b:Title>
    <b:BroadcastTitle>Broadcast Title</b:BroadcastTitle>
    <b:StateProvince>State or Province</b:StateProvince>
    <b:CountryRegion>Country or Region</b:CountryRegion>
  </b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.21 Court (Court)

This element specifies the court in which the case was presented. [*Example*:

```
…
<b:Year>1972</b:Year>
<b:CaseNumber>339 1018</b:CaseNumber>
<b:Court>Supreme Court</b:Court>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.22 Day (Day)

This element specifies the day on which a source was created or published. [*Example*:

```
…
<b:PeriodicalTitle>Periodical Title</b:PeriodicalTitle>
<b:Month>November</b:Month>
<b:Day>10</b:Day>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.6.2.23 DayAccessed (Day Accessed)

This element specifies the day of the month a source was accessed. [*Example*:

```
<b:MonthAccessed>October</b:MonthAccessed>
<b:DayAccessed>5</b:DayAccessed>
<b:YearAccessed>2000</b:YearAccessed>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.24 Department (Department)

This element specifies the department in which a source originated, or to which a source was submitted. Typically, this field is used in the Report source type, which includes theses and dissertations. [*Example*:

```
…
<b:Institution>Harvard University</b:Institution>
<b:ThesisType>Doctoral Dissertation</b:ThesisType>
<b:Department>Department of Mathematics</b:Department>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.25 Director (Director)

This element specifies the director of a source. Typically, this field is used in the Film source type. [*Example*:

```
<b:Author>
  <b:Director>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Director>
</b:Author>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.26 Distributor (Distributor)

This element specifies the distributor of a source. Typically, this field is used in the Performance and Film source types. [*Example*:

```
…
<b:Distributor>Distributor</b:Distributor>
<b:Country>United States</b:Country>
<b:RefOrder>19</b:RefOrder>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.27 Edition (Editor)

This element specifies the edition of a source. [*Example*:

```
…
<b:Pages>1-34</b:Pages>
<b:Edition>Edition</b:Edition>
<b:Issue>Issue</b:Issue>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.28 Editor (Editor)

This element specifies the editor of a source. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
<b:Author>
      <b:Editor>
        <b:NameList>
          <b:Person>
            <b:Last>Jaeschke</b:Last>
            <b:First>Rex</b:First>
          </b:Person>
        </b:NameList>
      </b:Editor>
</b:Author>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.29 First (Person's First, or Given, Name)

This element specifies a person's first name. [*Example*:

```
<b:Author>
  <b:Editor>
    <b:NameList>
      <b:Person>
        <b:Last>Jaeschke</b:Last>
        <b:First>Rex</b:First>
      </b:Person>
    </b:NameList>
  </b:Editor>
</b:Author>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.30 Guid (GUID)

This element specifies the GUID of a source. [*Example*:

```
<b:Source>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
    …
    <b:RefOrder>2</b:RefOrder>
    <b:Guid>{EE06CBFE-1989-4533-A274-D81DFA436D79}</b:Guid>
    <b:LCID>0</b:LCID>
  </b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.31 Institution (Institution)

This element specifies the institution of the source. Typically, this field is used in the Report source type, where it signifies the university or institute, and in the Art source type, where it signifies the museum or institution where the art is housed. [*Example*:

```
<b:Source>
    …
    <b:Institution>Harvard University</b:Institution>
    <b:ThesisType>Dissertation</b:ThesisType>
    <b:RefOrder>12</b:RefOrder>
    <b:Guid>{6CB80970-81D3-476D-90D5-5C9D64E77FAF}</b:Guid>
    <b:LCID>0</b:LCID>
  </b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.32 InternetSiteTitle (Internet Site Title)

This element specifies the title of an internet site. Typically, this field is used in the Internet Site and Document from Internet Site source types. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

```
…
<b:Title>Title</b:Title>
<b:InternetSiteTitle>Internet Site Title</b:InternetSiteTitle>
<b:Month>July</b:Month>
<b:Day>1</b:Day>
<b:Year>2001</b:Year>
<b:MonthAccessed>Sept.</b:MonthAccessed>
<b:DayAccessed>22</b:DayAccessed>
<b:YearAccessed>1999</b:YearAccessed>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.33 Interviewee (Interviewee)

This element specifies the person being interviewed. Typically, this field is used in the Interview source type. [*Example*:

```
<b:Interviewee>
  <b:NameList>
    <b:Person>
      <b:Last>Rothschiller</b:Last>
      <b:First>Chad</b:First>
    </b:Person>
  </b:NameList>
</b:Interviewee>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.34 Interviewer (Interviewer)

This element specifies the person conducting an interview. Typically, this field is used in the Interview source type. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<b:Interviewer>
  <b:NameList>
    <b:Person>
      <b:Last>Davis</b:Last>
      <b:First>Tristan</b:First>
     </b:Person>
  </b:NameList>
</b:Interviewer>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.35 Inventor (Inventor)

This element specifies the inventor of a source. Typically, this field is used in the Patent source type. [*Example*:

```
<b:Author>
  <b:Inventor>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Inventor>
</b:Author>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.36 Issue (Issue)

This element specifies the issue of a source. Typically, this field is used in the Journal Article and Article in Periodical source types. [*Example*:

```
<b:Source>
   …
  <b:Edition>Edition</b:Edition>
  <b:Issue>Issue</b:Issue>
  <b:RefOrder>28</b:RefOrder>
</b:Source>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.37 JournalName (Journal Name)

This element specifies the name of the journal. Typically, this field is used in the Journal Article source type. [*Example*:

```
…
<b:Title>Article Title</b:Title>
<b:Year>2000</b:Year>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>100</b:Volume>
<b:Comments>Comments</b:Comments>
<b:JournalName>Journal Name</b:JournalName>
<b:Pages>91-160</b:Pages>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.38 Last (Person's Last, or Family, Name)

This element specifies a person's last name. [*Example*:

```
<b:Author>
  <b:Editor>
    <b:NameList>
      <b:Person>
        <b:Last>Jaeschke</b:Last>
        <b:First>Tristan</b:First>
      </b:Person>
    </b:NameList>
  </b:Editor>
</b:Author>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.6.2.39 LCID (Locale ID)

This element specifies the locale ID of a source, representing the source's language. The set of locale IDs shall be as specified in §22.9.2.6. [*Example*:

```
<b:LCID>ja-JP</b:LCID>
```

end example]

The possible values for this element are defined by the ST_Lang simple type (§22.9.2.6).

[*Note*: The W3C XML Schema definition of this element's content model (ST_Lang) is located in §A.6.9. *end note*]

22.6.2.40 Medium (Medium)

This element specifies the medium on or in which a source was created. Typically, this field is used in the Electronic source, sound recording, and film source types. [*Example*:

```
<b:Source>
  …
  <b:LCID>0</b:LCID>
  <b:Medium>DVD</b:Medium>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.41 Middle (Person's Middle, or Other, Name)

This element specifies a person's middle name. [*Example*:

```
<b:Author>
  <b:Editor>
    <b:NameList>
      <b:Person>
        <b:Last>Villaron</b:Last>
        <b:First>Shawn</b:First>
        <b:Middle>Alan</b:Middle>
      </b:Person>
    </b:NameList>
  </b:Editor>
</b:Author>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.42 Month (Month)

This element specifies the month in which a source was created or published. [*Example*:

```
…
<b:PeriodicalTitle>Time</b:PeriodicalTitle>
<b:Month>November</b:Month>
<b:Day>10</b:Day>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.43 MonthAccessed (Month Accessed)

This element specifies the month during which the source was accessed. [*Example*:

```
…
<b:MonthAccessed>October</b:MonthAccessed>
<b:DayAccessed>5</b:DayAccessed>
<b:YearAccessed>2000</b:YearAccessed>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.44 NameList (Name List)

This element specifies a list containing one or more names of a type of contributor to a source, such as a list of authors, editors, or translators. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<b:Author>
  <b:Author>
    <b:NameList>
      <b:Person>
        <b:Last>Davis</b:Last>
        <b:First>Tristan</b:First>
      </b:Person>
    </b:NameList>
  </b:Author>
</b:Author>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameListType) is located in §A.6.6. *end note*]

22.6.2.45 NumberVolumes (Number of Volumes)

This element specifies the number of volumes a source contains. [*Example*:

```
<b:Source>
   …
  <b:NumberVolumes>10</b:NumberVolumes>
  <b:Comments>Comments</b:Comments>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.46 Pages (Pages)

This element specifies the page range being cited in a source. [*Example*:

```
…
<b:Title>Article Title</b:Title>
<b:Year>2000</b:Year>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>100</b:Volume>
<b:Comments>Comments</b:Comments>
<b:JournalName>Journal Name</b:JournalName>
<b:Pages>91-160</b:Pages>
…
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.47 PatentNumber (Patent Number)

This element specifies the patent number of a source. Typically, this field is used in the Patent source type. [*Example*:

```
<b:Source>
  …
  <b:PatentNumber>1,000,000</b:PatentNumber>
  <b:RefOrder>26</b:RefOrder>
  <b:Guid>{8295ABC5-2DFD-4FA7-A2A7-A748917C1755}</b:Guid>
  <b:LCID>0</b:LCID>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.48 Performer (Performer)

This element specifies the performer. Typically, this field is used in the sound recording, performance, and film source types. [*Example*:

```
<b:Performer>
  <b:NameList>
    <b:Person>
      <b:Last>Rothschiller</b:Last>
      <b:First>Chad</b:First>
    </b:Person>
  </b:NameList>
</b:Performer>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameOrCorporateType) is located in §A.6.6. *end note*]

22.6.2.49 PeriodicalTitle (Periodical Title)

This element specifies the title of a periodical. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
…
<b:PeriodicalTitle>Periodical Title</b:PeriodicalTitle>
<b:Month>July</b:Month>
<b:Day>1</b:Day>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.50 Person (Person)

This element specifies a person who contributed to a source. [*Example*:

```
<b:Author>
  <b:NameList>
    <b:Person>
      <b:Last>Villaron</b:Last>
      <b:First>Shawn</b:First>
      <b:Middle>Alan</b:Middle>
    </b:Person>
  </b:NameList>
</b:Author>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_PersonType) is located in §A.6.6. *end note*]

22.6.2.51 ProducerName (Producer Name)

This element specifies the person who produced a source. Typically, this field is used in the Internet site, Doc from internet site, Electronic source, Sound recording, Performance, and Film source types. [*Example*:

```
<b:ProducerName>
  <b:NameList>
    <b:Person>
      <b:Last>Rothschiller</b:Last>
      <b:First>Chad</b:First>
    </b:Person>
  </b:NameList>
</b:ProducerName>
```

end example]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.52 ProductionCompany (Production Company)

This element specifies the company that produced a source. Typically, this field is used in the Internet site, Document from internet site, Electronic source, Sound recording, Performance, and Film source types. [*Example*:

```
<b:Source>
    …
  <b:City>Chicago</b:City>
  <b:ProductionCompany>Production Company</b:ProductionCompany>
  <b:Medium>CD</b:Medium>
  <b:RefOrder>16</b:RefOrder>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.53 PublicationTitle (Publication Title)

This element specifies the title of the publication that contains the source. Typically, this field is used in the Electronic Source source type. [*Example*:

```
…
<b:Volume>Volume</b:Volume>
<b:PublicationTitle>Publication Title</b:PublicationTitle>
<b:Month>June</b:Month>
<b:Day>2</b:Day>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.54 Publisher (Publisher)

This element specifies the publisher of a source.

[*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
…
<b:City>London</b:City>
<b:Publisher>Publisher</b:Publisher>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>Volume</b:Volume>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.55 RecordingNumber (Recording Number)

This element specifies the recording number of a source. Typically, this field is used in the sound recording source type.

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.56 RefOrder (Reference Order)

This element specifies the reference order of a source. [*Example*:

```
<b:Source>
    …
  <b:City>Chicago</b:City>
  <b:ProductionCompany>Production Company</b:ProductionCompany>
  <b:Medium>CD</b:Medium>
  <b:RefOrder>16</b:RefOrder>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.57 Reporter (Reporter)

This element specifies the reporter of a source. Typically, this field is used in the Case source type. [*Example*:

```
<b:Source>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
    …
    <b:Reporter>Reporter</b:Reporter>
    <b:RefOrder>27</b:RefOrder>
    <b:Guid>{CE314AB7-E824-4D10-B295-044C68EBED27}</b:Guid>
    <b:LCID>0</b:LCID>
  </b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.58 ShortTitle (Short Title)

This element specifies the short title of a source. [*Example*:

```
…
<b:City>London</b:City>
<b:Publisher>Publisher</b:Publisher>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>Volume</b:Volume>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.59 Source (Source)

This element specifies the bibliography entry for a source or reference work. [*Example*:

```
<b:Source>
    …
    <b:NumberVolumes>10</b:NumberVolumes>
    <b:Comments>Comments</b:Comments>
  </b:Source>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_SourceType) is located in §A.6.6. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.6.2.60 Sources (Sources)

This element specifies the sources in a collection.

Attributes	Description
SelectedStyle (Selected Style)	Specifies the filename of a file which can be used to format the bibliographies and citations within this document. If this file is of an unknown form or cannot be located, then the other attributes on this element can be used to determine the format to use. [*Example*: `<b:Sources SelectedStyle="\APA.XSL" StyleName="APA" URI="http://purl.oclc.org/ooxml/bibliographicStyle/APA">` *end example*] The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).
StyleName (Documentation Style Name)	Specifies the name of the documentation style in which the bibliography and citations are formatted. The following values shall be well-defined:

Value	Reference
APA	American Psychological Association. http://www.apa.org/. Publication Manual of the American Psychological Association, Fifth Edition.
Chicago	Chicago Manual of Style, 15th Edition GB7714: GB7714-1987, Standardization Administration of China, 1987-05-05 (http://www.sac.gov.cn)
GOST - Name Soft	ГОСТ 7.1-2003 (GOST 7.1-2003) - The Federal Agency of the Russian Federation on Technical Regulating and Metrology - published by ИПК Издательство стандартов 2004
GOST - Title Sort	ГОСТ 7.1-2003 (GOST 7.1-2003) - The Federal Agency of the Russian Federation on Technical Regulating and Metrology - published by ИПК Издательство стандартов 2004
ISO 690 - First Element and Date	ISO 690-1987(E)-International Organization for Standardization-Second Edition 1987-08-15 (http://www.iso.org) ISO 690-2:1997(E)-International Organization for Standardization-First Edition 1997-11-15 (http://www.iso.org)
ISO 690 - Numerical Reference	ISO 690-1987(E)-International Organization for Standardization-Second Edition 1987-08-15 (http://www.iso.org) ISO 690-2:1997(E)-International Organization for Standardization-

22.6.2.62 StandardNumber (Standard Number)

This element specifies the standard number, such as ISBN or ISSN, of a source. [*Example*:

```
<b:Source>
   …
  <b:NumberVolumes>10</b:NumberVolumes>
  <b:StandardNumber>ISBN or ISSN</b:StandardNumber>
  <b:Comments>Comments</b:Comments>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.63 StateProvince (State or Province)

This element specifies the state or province in which a source was created or published. [*Example*:

```
<b:Source>
   …
  <b:ProgramTitle>Program Title</b:ProgramTitle>
  <b:Broadcaster>Broadcaster</b:Broadcaster>
  <b:Station>Station</b:Station>
  <b:RefOrder>1</b:RefOrder>
  <b:Title>Title (Interview)</b:Title>
  <b:BroadcastTitle>Broadcast Title</b:BroadcastTitle>
  <b:StateProvince>State/Province</b:StateProvince>
  <b:CountryRegion>Country/Region</b:CountryRegion>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.64 Station (Station)

This element specifies the station on which an interview was broadcasted. Typically, this field is used in the Interview source type. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
…
<b:Month>November</b:Month>
<b:Day>18</b:Day>
<b:Broadcaster>ABC</b:Broadcaster>
<b:Station>WABC</b:Station>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.65 Tag (Tag)

This element specifies the tag name of a source. [*Example*:

```
<b:Source>
  <b:Tag>New01</b:Tag>
  …
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.66 Theater (Theater)

This element specifies the theater in which a source was performed or viewed. Typically, this field is used in the Performer source type. [*Example*:

```
…
<b:Theater>Theater Name</b:Theater>
<b:Month>October</b:Month>
<b:Day>25</b:Day>
<b:RefOrder>19</b:RefOrder>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.6.2.67 ThesisType (Thesis Type)

This element specifies the type of report being cited, such as Thesis, Dissertation, or Book Report. Typically, this field is used in the Report source type. [*Example*:

```
…
<b:Institution>Harvard University</b:Institution>
<b:ThesisType>Doctoral Dissertation</b:ThesisType>
<b:Department>Department of Mathematics</b:Department>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.68 Title (Title)

This element specifies the title of a source. [*Example*:

```
…
</b:Author>
<b:Title>Title</b:Title>
<b:Year>2005</b:Year>
<b:City>Seattle</b:City>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.69 Translator (Translator)

This element specifies the translator of a source. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
<b:Author>
  <b:Translator>
    <b:NameList>
      <b:Person>
        <b:Last>Davis</b:Last>
        <b:First>Tristan</b:First>
      </b:Person>
    </b:NameList>
  </b:Translator>
</b:Author>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.70 Type (Patent Type)

This element specifies the type of patent. Typically, this field is used in the Patent source type.

[*Example*:

```
<Source>
  <b:Type>Patent Type</b:Type>
  <b:Guid>{8295ABC5-2DFD-4FA7-A2A7-A748917C1755}</b:Guid>
  <b:LCID>0</b:LCID>
</Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.71 URL (URL)

This element specifies the URL of the source. Typically, this field is used in the Internet Site and Document from Internet Site source types. [*Example*:

```
…
<b:MonthAccessed>September</b:MonthAccessed>
<b:DayAccessed>1</b:DayAccessed>
<b:YearAccessed>1998</b:YearAccessed>
<b:URL>URL</b:URL>
<b:RefOrder>29</b:RefOrder>
…
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.72 Version (Version)

This element specifies the version of the source. Typically, this field is used in the Internet Site and Document from Internet Site source types. [*Example*:

```
<b:Source>
    …
  <b:Version>3.0</b:Version>
  <b:RefOrder>31</b:RefOrder>
  <b:Guid>{F06D8D48-7FD7-4515-88E9-EC70AB9BE792}</b:Guid>
  <b:LCID>0</b:LCID>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.73 Volume (Volume)

This element specifies the volume of the source. [*Example*:

```
…
<b:Title>Article Title</b:Title>
<b:Year>2000</b:Year>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>100</b:Volume>
<b:Comments>Comments</b:Comments>
<b:JournalName>Journal Name</b:JournalName>
<b:Pages>91-160</b:Pages>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.6.2.74 Writer (Writer)

This element specifies the writer of the source. Typically, this field is used in the Performance and Film source types. [*Example*:

```
<b:Author>
  <b:Writer>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Writer>
</b:Author>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_NameType) is located in §A.6.6. *end note*]

22.6.2.75 Year (Year)

This element specifies the year in which a source was created or published.

[*Example*:

```
…
<b:Title>Title</b:Title>
<b:InternetSiteTitle>Internet Site Title</b:InternetSiteTitle>
<b:Month>July</b:Month>
<b:Day>1</b:Day>
<b:Year>2001</b:Year>
<b:MonthAccessed>Sept.</b:MonthAccessed>
<b:DayAccessed>22</b:DayAccessed>
<b:YearAccessed>1999</b:YearAccessed>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.2.76 YearAccessed (Year Accessed)

This element specifies the month during which the source was accessed. [*Example*:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
…
<b:Title>Title</b:Title>
<b:InternetSiteTitle>Internet Site Title</b:InternetSiteTitle>
<b:Month>July</b:Month>
<b:Day>1</b:Day>
<b:Year>2001</b:Year>
<b:MonthAccessed>Sept.</b:MonthAccessed>
<b:DayAccessed>22</b:DayAccessed>
<b:YearAccessed>1999</b:YearAccessed>
…
```

end example]

The possible values for this element are defined by the ST_String simple type (§22.9.2.13).

[*Note*: The W3C XML Schema definition of this element's content model (ST_String) is located in §A.6.9. *end note*]

22.6.3 Simple Types

This is the complete list of simple types dedicated to Bibliography.

22.6.3.1 ST_SourceType (Bibliographic Data Source Types)

This simple type specifies the possible types of sources that can be used within bibliographic data in an Office Open XML document.

[*Note:* The Office Open XML formats support a collection of predefined source types based on the categories most commonly used in various citation and bibliography style guidelines . The set of predefined source types can be extended as needed. The recommended approach for extending this set is to use the `Misc` type, and then leverage the methods described in ISO/IEC 29500-3 for extending the format with new attributes or elements. *end note.*]

This simple type's contents are a restriction of the ST_String datatype (§22.9.2.13).

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
Art (Art)	Art
ArticleInAPeriodical (Article in a Periodical)	Article in a Periodical
Book (Book)	Book
BookSection (Book Section)	Book Section
Case (Case)	Case
ConferenceProceedings (Conference Proceedings)	Conference Proceedings
DocumentFromInternetSite (Document from Internet Site)	Document from Internet Site

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
ElectronicSource (Electronic Source)	Electronic Source
Film (Film)	Film
InternetSite (Internet Site)	Internet Site
Interview (Interview)	Interview
JournalArticle (Journal Article)	Journal Article
Misc (Miscellaneous)	Miscellaneous
Patent (Patent)	Patent
Performance (Performance)	Performance
Report (Reporter)	Report
SoundRecording (Sound Recording)	Sound Recording

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_SourceType) is located in §A.6.6. *end note*]

22.7 Additional Characteristics

In order to allow producers of Office Open XML to describe specific contextual conditions under which the document was created, additional characteristics can be provided within the Additional Characteristics part using the syntax defined below.

The set of additional characteristics is designed to be an extensible list, and can provide a consumer with more information on how to interpret the file. ISO/IEC 29500 defines one set of characteristics; however, additional grammars can be created and associated with a unique URI via the vocabulary attribute.

22.7.1 Table of Contents

This subclause is informative.

22.7.2 Elements 3772
22.7.2.1 additionalCharacteristics (Set of Additional Characteristics) 3773
22.7.2.2 characteristic (Single Characteristic) 3773
22.7.3 Simple Types 3775
22.7.3.1 ST_Relation (Characteristic Relationship Types) 3775

End of informative text.

22.7.2 Elements

The following elements define the contents of the Additional Characteristics schema:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.7.2.1 additionalCharacteristics (Set of Additional Characteristics)

This element is the root element of the Additional Characteristics part and contains the list of additional characteristics for an Office Open XML document.

[*Example:* The following content in an Additional Characteristics part would specify that the producing spreadsheet application supports from 0 to 10,000 columns, and that column ranges should be interpreted accordingly:

```
<additionalCharacteristics>
  <characteristic name="numColumns" relation="le" val="10000"/>
  <characteristic name="numColumns" relation="ge" val="0"/>
</additionalCharacteristics>
```

end example]

[*Note*: The W3C XML Schema definition of this element's content model (CT_AdditionalCharacteristics) is located in §A.6.7. *end note*]

22.7.2.2 characteristic (Single Characteristic)

This element specifies a single characteristic. The type of characteristic is defined by the name attribute.

[*Example:* A producer can inform the consumer that the computations used to calculate the stored numbers in the formulas belong to a value space expressed by ranges of the binary mantissa and exponent. A consumer can optionally check those characteristics to determine whether, for example, the values should be recalculated. The XML for this would be:

```
<additionalCharacteristics>
  <characteristic name='precisionMantissa' relation='gt'
     val='-9007199254740992'/>
  <characteristic name='precisionMantissa' relation='lt'
     val='9007199254740992'/>
  <characteristic name='precisionExponent' relation='ge' val='-1075'/>
  <characteristic name='precisionExponent' relation='le' val='970'/>
</additionalCharacteristics>
```

end example]

Attributes	Description
name (Name of Characteristic)	Specifies the name of the characteristic. There are no constraints on the value of the name attribute, but each name shall be associated with a specific vocabulary via the vocabulary attribute. The values defined by ISO/IEC 29500 shall be associated with a null vocabulary value, and are as follows:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Attributes	Description

Name Value	Property Specified
numColumns	Number of Columns supported by the spreadsheet producer.
numRows	Number of Rows supported by the spreadsheet producer.
functionVersion	Version of the function specification used
precisionMantissa	Allowed values of the mantissa of numbers within spreadsheet cells/formulas when expressed in base 2.
precisionExponent	Allowed values of the exponent of numbers within spreadsheet cells/formulas when expressed in base 2.
numWorkbookColors	Number of Workbook colors
numConditionalFormatConditions	Number of condition format conditions on a workbook cell
nummaxSortLevels	Number of level of sorting on a range or table
numAutoFilterItems	Number of items shown in the Auto-filter dropdown
numDisplayCellChars	Number of characters that can display in a cell
numPrintCellChars	Number of characters per cell that Excel can print
numUnqiueCellStyles	Number of unique cell styles in a workbook (combinations of all cell formatting)
numFormulaLengthChars	Length of formulas in characters
numFormulaNestingLevel	Number of levels of formula nesting
numFunctionArguments	Number of arguments to a function
numPivotTableRows	Number of rows in a pivot table
numPivotTableColumns	Number of columns in a pivot table
numUniquePivotFieldItems	Number of unique items in a pivot field
numPivotTableMDXNameChars	Number of characters in a MDX name for a pivot table item
numPivotTableRelationChars	String length for a relationship pivot table
numPivotTableFieldLabelChars	Length of field labels in PivotTable including caption length limitations
numPivotTableFields	Number of fields in a pivot table
numSheetXRefArrayFormulas	The number of array formulas in a worksheet that can refer to another (given) worksheet

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema string datatype.

relation (Relationship of Value to Name)	Specifies how the contents of the value attribute should be interpreted in the context of this characteristic.
	
	[*Example:* The following would specify that the application supports from 0 to 10,000 columns, and that column ranges should be interpreted accordingly:
	
	`<additionalCharacteristics>`
	`  <characteristic name="numColumns" relation="le" val="10000"/>`
	`  <characteristic name="numColumns" relation="ge" val="0"/>`
	`</additionalCharacteristics>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Relation simple type (§22.7.3.1).

val (Characteristic Value)	Specifies the value of the characteristic. The possible values for this attribute are defined by the W3C XML Schema string datatype.
vocabulary (Characteristic Grammar)	Specifies a URI defining the characteristic grammar with which the name attribute value shall be interpreted. If this attribute is omitted, then the default grammar (as defined above) shall be used. The possible values for this attribute are defined by the W3C XML Schema anyURI datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Characteristic) is located in §A.6.7. *end note*]

22.7.3 Simple Types

This is the complete list of simple types dedicated to Additional Characteristics.

22.7.3.1 ST_Relation (Characteristic Relationship Types)

This simple type specifies the possible relationships between a characteristic's name and value attributes.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
eq (Equal To)	Equal to.
ge (Greater Than or Equal to)	Greater than or equal to.
gt (Greater Than)	Greater than.
le (Less Than or Equal To)	Less than or equal to.
lt (Less Than)	Less than.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Relation) is located in §A.6.7. *end note*]

22.8 Office Document Relationships

Within an Office Open XML document, it is necessary to be able to explicitly reference one part within the package from another [*Example*: A PresentationML Slide needs to be able to explicitly reference each picture within it to know where each one is anchored. *end example*]

In order to ensure that all such explicit relationship references are easily identifiable within a document, all such relationships are included within attributes in this namespace. This namespace therefore only serves to define attributes used throughout Office Open XML to create explicit relationships, and a single simple type for such attributes.

22.8.1 Table of Contents

This subclause is informative.

22.8.2 Simple Types 3776
22.8.2.1 ST_RelationshipId (Explicit Relationship ID) 3776

End of informative text.

22.8.2 Simple Types

This is the complete list of simple types dedicated to Office Document Relationships.

22.8.2.1 ST_RelationshipId (Explicit Relationship ID)

This simple type specifies the relationship ID in a part's relationship item which is the target of an explicit relationship from the parent XML element.

The kind of relationship which shall be the target of the relationship specified shall be determined based on the context of the parent XML element.

[*Example*: Consider the following markup in an Office Open XML document:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

```
<… r:id="rId5" />
```

The id attribute is of type ST_RelationshipID, and therefore the relationship with ID `rId5` must be the target of an explicit relationship from the source part, based on the context of the parent XML element. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_RelationshipId) is located in §A.6.8. *end note*]

22.9 Shared Simple Types

The following simple types represent common value formats used throughout Office Open XML, and have been centralized in order to ensure their usage remains consistent.

22.9.1 Table of Contents

This subclause is informative.

22.9.2 Simple Types 3777

22.9.2.1 ST_CalendarType (Calendar Types) 3778
22.9.2.2 ST_ConformanceClass (Document Conformance Class Value) 3779
22.9.2.3 ST_FixedPercentage (Fixed Percentage Value with Sign) 3780
22.9.2.4 ST_Guid (128-Bit GUID) 3780
22.9.2.5 ST_HexColorRGB (Hexadecimal Color Value) 3781
22.9.2.6 ST_Lang (Language Reference) 3782
22.9.2.7 ST_OnOff (On/Off Value) 3782
22.9.2.8 ST_Panose (Panose-1 Number) 3782
22.9.2.9 ST_Percentage (Percentage Value with Sign) 3783
22.9.2.10 ST_PositiveFixedPercentage (Positive Fixed Percentage Value with Sign) 3783
22.9.2.11 ST_PositivePercentage (Positive Percentage Value with Sign) 3784
22.9.2.12 ST_PositiveUniversalMeasure (Positive Universal Measurement) 3784
22.9.2.13 ST_String (String) 3784
22.9.2.14 ST_TwipsMeasure (Measurement in Twentieths of a Point) 3785
22.9.2.15 ST_UniversalMeasure (Universal Measurement) 3785
22.9.2.16 ST_UnsignedDecimalNumber (Unsigned Decimal Number Value) 3786
22.9.2.17 ST_VerticalAlignRun (Vertical Positioning Location) 3786
22.9.2.18 ST_XAlign (Horizontal Alignment Location) 3787
22.9.2.19 ST_Xstring (Escaped String) 3788
22.9.2.20 ST_YAlign (Vertical Alignment Location) 3789
22.9.2.21 ST_XmlName (XML Name) 3790

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

End of informative text.

22.9.2 Simple Types

This is the complete list of simple types dedicated to Shared Simple Types.

22.9.2.1 ST_CalendarType (Calendar Types)

This simple type specifies the possible types of calendars which can be used within the context of an Office Open XML document.

[*Example*: Consider the following structured document tag properties:

```
<w:sdtPr>
  <w:date w:fullDate="2006-01-01T06:30:00Z">
    <w:calendar w:val="gregorian"/>
  </w:date>
</w:sdtPr>
```

The calendar element specifies that the calendar type for a calendar which can be displayed in the document must be the Gregorian calendar format (`gregorian`). *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
gregorian (Gregorian)	Specifies that the Gregorian calendar, as defined in ISO 8601, shall be used. This calendar should be localized into the appropriate language.
gregorianArabic (Gregorian Arabic Calendar)	Specifies that the Gregorian calendar, as defined in ISO 8601, shall be used. The values for this calendar should be presented in Arabic.
gregorianMeFrench (Gregorian Middle East French Calendar)	Specifies that the Gregorian calendar, as defined in ISO 8601, shall be used. The values for this calendar should be presented in Middle East French.
gregorianUs (Gregorian English Calendar)	Specifies that the Gregorian calendar, as defined in ISO 8601, shall be used. The values for this calendar should be presented in English.
gregorianXlitEnglish (Gregorian Transliterated English)	Specifies that the Gregorian calendar, as defined in ISO 8601, shall be used. The values for this calendar should be the representation of the English strings in the corresponding Arabic characters (the Arabic transliteration of the English for the Gregorian calendar).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Enumeration Value	Description
gregorianXlitFrench (Gregorian Transliterated French)	Specifies that the Gregorian calendar, as defined in ISO 8601, shall be used. The values for this calendar should be the representation of the French strings in the corresponding Arabic characters (the Arabic transliteration of the French for the Gregorian calendar).
hebrew (Hebrew)	Specifies that the Hebrew lunar calendar, as described by the Gauss formula for Passover [Har'El, Zvi] and The Complete Restatement of Oral Law (Mishneh Torah), shall be used.
hijri (Hijri)	Specifies that the Hijri lunar calendar, as described by the Kingdom of Saudi Arabia, Ministry of Islamic Affairs, Endowments, Da'wah and Guidance, shall be used.
japan (Japanese Emperor Era)	Specifies that the Japanese Emperor Era calendar, as described by Japanese Industrial Standard JIS X 0301, shall be used.
korea (Korean Tangun Era)	Specifies that the Korean Tangun Era calendar, as described by Korean Law Enactment No. 4, shall be used.
none (No Calendar Type)	Specifies that no calendar should be used.
saka (Saka Era)	Specifies that the Saka Era calendar, as described by the Calendar Reform Committee of India, as part of the Indian Ephemeris and Nautical Almanac, shall be used.
taiwan (Taiwan)	Specifies that the Taiwanese calendar, as defined by the Chinese National Standard CNS 7648, shall be used.
thai (Thai)	Specifies that the Thai calendar, as defined by the Royal Decree of H.M. King Vajiravudh (Rama VI) in Royal Gazette B. E. 2456 (1913 A.D.) and by the decree of Prime Minister Phibunsongkhram (1941 A.D.) to start the year on the Gregorian January 1 and to map year zero to Gregorian year 543 B.C., shall be used.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_CalendarType) is located in §A.6.9. *end note*]

22.9.2.2 ST_ConformanceClass (Document Conformance Class Value)

This simple type specifies the conformance class to which a particular Office Open XML document conforms.

[*Example*: Consider the following SpreadsheetML Workbook part markup:

```
<workbook … conformance="transitional">
  …
</workbook>
```

This SpreadsheetML document has a conformance attribute value of `transitional`, therefore it conforms to the SML Transitional conformance class. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
strict (Office Open XML Strict)	Specifies that the document conforms to Office Open XML Strict.
transitional (Office Open XML Transitional)	Specifies that the document conforms to Office Open XML Transitional.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_ConformanceClass) is located in §A.6.9. *end note*]

22.9.2.3 ST_FixedPercentage (Fixed Percentage Value with Sign)

This simple type specifies that its contents will contain a percentage measurement from -100% up to and including 100%, including a trailing percent sign (U+0025).

[*Example*: Consider the following WordprocessingML fragment:

```
<w:tcPr>
  <w:tcW w:type="pct" w:w="33.3%" />
</w:pPr>
```

The value of the w attribute is the width of the associated table cell. *end example*]

This simple type's contents are a restriction of the ST_Percentage datatype (§22.9.2.9).

This simple type also specifies the following restrictions:

- This simple type's contents shall match the following regular expression pattern: -?((100)|([0-9][0-9]?))(\.[0-9][0-9]?)?%.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_FixedPercentage) is located in §A.6.9. *end note*]

22.9.2.4 ST_Guid (128-Bit GUID)

This simple type specifies that its values shall be a 128-bit globally unique identifier (GUID) value.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Example*: Consider the following WordprocessingML fragment for the properties of a single glossary document entry:

```
<w:docPartPr>
  …
  <w:guid w:val="{00000000-5BD2-4BC8-9F70-7020E1357FB2}" />
  …
</w:docPartPr>
```

The guid element specifies that the unique identifier associated with the parent entry shall be {00000000-5BD2-4BC8-9F70-7020E1357FB2}. This value can be used as needed by an application, for example, to uniquely identify a part regardless of its name. *end example*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type also specifies the following restrictions:

- This simple type's contents shall match the following regular expression pattern: \{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Guid) is located in §A.6.9. *end note*]

22.9.2.5 ST_HexColorRGB (Hexadecimal Color Value)

This simple type specifies that its contents shall contain a color value in RRGGBB hexadecimal format, specified using six hexadecimal digits. Each of the red, green, and blue color values, from 0-255, is encoded as two hexadecimal digits.

[*Example*: Consider a color defined as follows:

```
Red:    122
Green:  23
Blue:   209
```

The resulting RRGGBB value would be 7A17D1, as each color is transformed into its hexadecimal equivalent. *end example*]

This simple type's contents are a restriction of the W3C XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a length of exactly 6 hexadecimal digit(s).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_HexColorRGB) is located in §A.6.9. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

22.9.2.6 ST_Lang (Language Reference)

This simple type specifies that its contents contains a language identifier as defined by RFC 4646/BCP 47.

The contents of this language are interpreted based on the context of the parent XML element.

[*Example*: Consider a language code defined as follows :

```
<w:lang w:val="en-CA" />
```

This language is therefore specified as English (en) and Canada (CA), resulting in use of the English (Canada) language setting. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Lang) is located in §A.6.9. *end note*]

22.9.2.7 ST_OnOff (On/Off Value)

This simple type specifies a set of values for any binary (`true` or `false`) property defined in a WordprocessingML document.

A value of `1` or `true` specifies that the property shall be turned on. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

A value of `0` or `false` specifies that the property shall be explicitly turned off.

This simple type's contents are a restriction of the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_OnOff) is located in §A.6.9. *end note*]

22.9.2.8 ST_Panose (Panose-1 Number)

This simple type specifies a number consisting of 20 hexadecimal digits which defines the Panose-1 font classification.

[*Example*: Consider the following information stored for a single font:

```
<w:font w:name="Times New Roman">
  <w:panose1 w:val="02020603050405020304" />
  …
</w:font>
```

The panose1 element specifies its Panose-1 number via its val attribute value of `02020603050405020304`. *end example*]

This simple type's contents are a restriction of the W3C XML Schema hexBinary datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

This simple type also specifies the following restrictions:

- This simple type's contents have a length of exactly 20 hexadecimal digit(s).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Panose) is located in §A.6.9. *end note*]

22.9.2.9 ST_Percentage (Percentage Value with Sign)

This simple type specifies that its contents will contain a percentage measurement, with a trailing percent sign (U+0025).

[*Example*: Consider the following WordprocessingML fragment:

```
<w:tcPr>
  <w:tcW w:type="pct" w:w="33.3%" />
</w:pPr>
```

The value of the w attribute is the width of the associated table cell. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents shall match the following regular expression pattern: -?[0-9]+(\.[0-9]+)?%.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Percentage) is located in §A.6.9. *end note*]

22.9.2.10 ST_PositiveFixedPercentage (Positive Fixed Percentage Value with Sign)

This simple type specifies that its contents will contain a positive percentage measurement from 0% to 100% inclusive, including a trailing percent sign (U+0025).

[*Example*: Consider the following WordprocessingML fragment:

```
<w:tcPr>
  <w:tcW w:type="pct" w:w="33.3%" />
</w:pPr>
```

The value of the w attribute is the width of the associated table cell. *end example*]

This simple type's contents are a restriction of the ST_Percentage datatype (§22.9.2.9).

This simple type also specifies the following restrictions:

- This simple type's contents shall match the following regular expression pattern: ((100)|([0-9][0-9]?))(\.[0-9][0-9]?)?%.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PositiveFixedPercentage) is located in §A.6.9. *end note*]

22.9.2.11 ST_PositivePercentage (Positive Percentage Value with Sign)

This simple type specifies that its contents will contain a positive percentage measurement, including a trailing percent sign (U+0025).

[*Example*: Consider the following WordprocessingML fragment:

```
<w:tcPr>
  <w:tcW w:type="pct" w:w="33.3%" />
</w:pPr>
```

The value of the w attribute is the width of the associated table cell. *end example*]

This simple type's contents are a restriction of the ST_Percentage datatype (§22.9.2.9).

This simple type also specifies the following restrictions:

- This simple type's contents shall match the following regular expression pattern: [0-9]+(\.[0-9]+)?%.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PositivePercentage) is located in §A.6.9. *end note*]

22.9.2.12 ST_PositiveUniversalMeasure (Positive Universal Measurement)

This simple type specifies that its contents will contain a measurement expressed using one of common measure units. The content of this type is a positive decimal number immediately followed by a unit identifier. Unit identifiers are case sensitive and shall be in lowercase. Conforming applications are not required to preserve units of measure between loading and saving a particular document.

The same set of units of measure as in ST_UniversalMeasure type (§22.9.2.15) shall be supported.

This simple type's contents are a restriction of the ST_UniversalMeasure datatype (§22.9.2.15).

This simple type also specifies the following restrictions:

- This simple type's contents shall match the following regular expression pattern: [0-9]+(\.[0-9]+)?(mm|cm|in|pt|pc|pi).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_PositiveUniversalMeasure) is located in §A.6.9. *end note*]

22.9.2.13 ST_String (String)

This simple type specifies that its contents contains a string.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_String) is located in §A.6.9. *end note*]

22.9.2.14 ST_TwipsMeasure (Measurement in Twentieths of a Point)

This simple type specifies that its contents contain wither:

- A positive whole number, whose contents consist of a measurement in twentieths of a point (equivalent to 1/1440th of an inch), or
- A positive decimal number immediately following by a unit identifier.

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example*: Consider an attribute value of `720` whose type is ST_TwipsMeasure. This attribute value specifies a size of one-half of an inch or 36 points (`720` twentieths of a point = 36 points = 0.5 inches). *end example*]

[*Example*: Consider an attribute value of `12.7mm` whose type is ST_HpsMeasure. This attribute value specifies a size of 0.0127 meter or one-half of an inch or 36 points. *end example*]

This simple type is a union of the following types:

- The ST_PositiveUniversalMeasure simple type (§22.9.2.12).
- The ST_UnsignedDecimalNumber simple type (§22.9.2.16).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TwipsMeasure) is located in §A.6.9. *end note*]

22.9.2.15 ST_UniversalMeasure (Universal Measurement)

This simple type specifies that its contents will contain measurement expressed using one of common measure units. The content of this type is a decimal number immediately followed by a unit identifier. Unit identifiers are case sensitive and shall be in lowercase. Conforming applications are not required to preserve units of measure between loading and saving a particular document.

The following table lists units of measure which are allowed together with their definition based on existing standard or expressed as a conversion from other unit of measure.

Unit Identifier	Definition
`cm`	As defined in ISO 31.
`mm`	As defined in ISO 31.
`in`	1 in = 2.54 cm (informative)
`pt`	1 pt = 1/72 in (informative)
`pc`	1 pc = 12 pt (informative)
`pi`	1 pi = 12 pt (informative)

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents shall match the following regular expression pattern: -?[0-9]+(\.[0-9]+)?(mm|cm|in|pt|pc|pi).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_UniversalMeasure) is located in §A.6.9. *end note*]

22.9.2.16 ST_UnsignedDecimalNumber (Unsigned Decimal Number Value)

This simple type specifies that its contents contain a positive whole decimal number, whose contents are interpreted based on the context of the parent XML element.

[*Example*: Consider the following WordprocessingML fragment:

```
<w:pPr>
  <w:divId w:val="1512645511" />
</w:pPr>
```

The value of the val attribute is the ID of the associated HTML div.

However, consider the following fragment:

```
<w:ilvl w:val="1">
  …
</w:ilvl>
```

In this case, the decimal number in the val attribute is the ID of the associated numbering level. In each case, the decimal number value is interpreted in the context of the parent element. *end example*]

This simple type's contents are a restriction of the W3C XML Schema unsignedLong datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_UnsignedDecimalNumber) is located in §A.6.9. *end note*]

22.9.2.17 ST_VerticalAlignRun (Vertical Positioning Location)

This simple type specifies possible values for the alignment of the contents of this run in relation to the default appearance of the run's text. This allows the text to be repositioned as subscript or superscript without altering the font size of the run properties.

[*Example*: Consider a run which must be positioning as superscript when displaying its contents. This requirement would be specified using the following WordprocessingML:

```
<w:rPr>
  <w:vertAlign w:val="superscript" />
</w:rPr>
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

The resulting run is positioned as `superscript`, therefore it is rendered in a smaller size above the default baseline location for the contents of the run. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
baseline (Regular Vertical Positioning)	Specifies that the text in the parent run shall be located at the baseline and presented in the same size as surrounding text.
subscript (Subscript)	Specifies that this text should be subscript. This setting shall lower the text in this run below the baseline and change it to a smaller size, if a smaller size is available.
superscript (Superscript)	Specifies that this text should be superscript. This setting shall raise the text in this run above the baseline and change it to a smaller size, if a smaller size is available.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_VerticalAlignRun) is located in §A.6.9. *end note*]

22.9.2.18 ST_XAlign (Horizontal Alignment Location)

This simple type specifies the set of possible relative horizontal positions for the parent floating object. This relative position is specified relative to the horizontal anchor specified by the parent object.

[*Example*: Consider the following WordprocessingML fragment specifying a text frame:

```
<w:p>
  <w:pPr>
    <w:framePr w:w="2419" w:h="2189" w:hRule="atLeast" w:hSpace="187"
w:wrap="around" w:vAnchor="text" w:hAnchor="page" w:xAlign="left" w:y="73" />
  </w:pPr>
  <w:r>
    <w:t>Text Frame Content.</w:t>
  </w:r>
</w:p>
```

This text frame specifies by the presence of the xAlign attribute to align the frame on the `left` side of the anchor object, in this case, the page. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
center (Centered Horizontally)	Specifies that the parent object shall be centered with respect to the anchor settings. [*Example*: Centered on the page horizontally. *end example*]
inside (Inside)	Specifies that the parent object shall be inside of the anchor object. [*Example*: Inside the text margin horizontally. *end example*]
left (Left Aligned Horizontally)	Specifies that the parent object shall be left aligned with respect to the anchor settings. [*Example*: Left aligned on the page horizontally. *end example*]
outside (Outside)	Specifies that the parent object shall be outside of the anchor object. [*Example*: Outside the text margin horizontally. *end example*]
right (Right Aligned Horizontally)	Specifies that the parent object shall be right aligned with respect to the anchor settings. [*Example*: Right aligned on the page horizontally. *end example*]

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_XAlign) is located in §A.6.9. *end note*]

22.9.2.19 ST_Xstring (Escaped String)

String of characters with support for escaped invalid-XML characters.

For all characters which cannot be represented in XML as defined by the XML 1.0 specification, the characters are escaped using the Unicode numerical character representation escape character format _xHHHH_, where H represents a hexadecimal character in the character's value. [*Example*: The Unicode character 8 is not permitted in an XML 1.0 document, so it must be escaped as _x0008_. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_Xstring) is located in §A.6.9. *end note*]

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

 ©ISO/IEC 2012 – All rights reserved

22.9.2.20 ST_YAlign (Vertical Alignment Location)

This simple type specifies the set of possible relative vertical positions for the parent floating object. This relative position is specified relative to the vertical anchor specified by the parent object.

[*Example*: Consider the following WordprocessingML fragment specifying a text frame:

```
<w:p>
  <w:pPr>
    <w:framePr w:w="2419" w:h="2189" w:hRule="atLeast" w:hSpace="187"
w:wrap="around" w:vAnchor="margin" w:hAnchor="page" w:x="1643" w:y="73"
w:yAlign="center" />
  </w:pPr>
  <w:r>
    <w:t>Text Frame Content.</w:t>
  </w:r>
</w:p>
```

This text frame specifies by the presence of the yAlign attribute to vertically align the frame in the `center` of the anchor object, in this case, the `margin`. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bottom (Bottom)	Specifies that the parent object shall be vertically aligned to the bottom edge of the anchor object. [*Example*: At the bottom of the current paragraph. *end example*]
center (Centered Vertically)	Specifies that the parent object shall be vertically centered with respect to the anchor object. Shall not be used with the baseJc element. [*Example*: Centered on the page vertically. *end example*]
inline (In line with Text)	Specifies that the parent object shall be vertically aligned in line with the surrounding text (i.e. shall not allow any text wrapping around it when positioned in the document. Shall not be used with the baseJc element.
inside (Inside Anchor Extents)	Specifies that the parent object shall be vertically aligned to the edge of the anchor object, and positioned inside that object. Shall not be used with the baseJc element.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

Enumeration Value	Description
	[*Example*: Inside the text margins vertically. *end example*]
outside (Outside Anchor Extents)	Specifies that the parent object shall be vertically aligned to the edge of the anchor object, and positioned outside that object. Shall not be used with the baseJc element. [*Example*: Outside the text margins vertically. *end example*]
top (Top)	Specifies that the parent object shall be vertically aligned to the top edge of the anchor object . [*Example*: At the top of the current paragraph. *end example*]

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_YAlign) is located in §A.6.9. *end note*]

22.9.2.21 ST_XmlName (XML Name)

This simple type shall contain an XML non-colonized name (NCName).

[*Example*: Consider the following WordprocessingML fragment for the properties of a single custom XML element:

```
<w:customXmlPr>
<w:attr w:name="company" w:uri="http://schemas.openxmlformats.org/2006/example"
… />
</w: customXmlPr>
```

The attr element specifies that the NCName associated with the attribute name shall be company. *end example*]

This simple type's contents are a restriction of the W3C XML Schema NCName datatype.

23. Custom XML Schema References

This namespace defines the set of properties which define the location and properties associated with one or more custom XML schemas which have been stored within the contents of a Office Open XML document. Collectively, the set of schemas associated with a document's custom XML markup are referred to as that document's *schema library*. The schema library then stores the set of unique XML namespaces used within the document's custom XML markup, and allows applications to 'tag' these namespaces with appropriate metadata.

23.1 Table of Contents

This subclause is informative.

23.2 Elements 3791
23.2.1 schema (Custom XML Schema Reference) 3791
23.2.2 schemaLibrary (Embedded Custom XML Schema Supplementary Data) 3793

End of informative text.

23.2 Elements

The following information describes the elements in this namespace:

23.2.1 schema (Custom XML Schema Reference)

This element specifies the properties associated with a single XML namespace, for which all known XML schemas shall be loaded in order to validate the custom XML markup stored within this document. These properties can be used appropriately to locate custom XML schema(s) for use with the document. ISO/IEC 29500 does not require any particular XML schema language.

[*Note:* Some examples of XML schema languages that might be used to implement Custom XML Mappings include:

- W3C XML Schema - http://www.w3.org/XML/Schema
- RELAX NG – ISO/IEC 19757-2
- Schematron – ISO/IEC 19757-3
- NVDL – ISO/IEC 19757-4

end note]

[*Example*: Consider a WordprocessingML document which contains custom XML markup in the http://www.example.com namespace. The following content would be displayed in the document's schema library data:

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
<sl:schemaLibrary>
  <sl:schema sl:uri="http://www.example.com" sl:schemaLocation="c:\example.xsd"
/>
</sl:schemaLibrary>
```

The schema element contains the properties for this one XML namespace: in this case, a namespace URI of `http://www.example.com` and a file location of `c:\example.xsd`. *end example*]

[*Note*: This element is not intended to reintroduce transitional schema into the strict conformance class. *end note*]

Attributes	Description

manifestLocation (Supplementary XML File Location)	Specifies the location of a supplementary XML file which can be downloaded and parsed when this document is loaded in order to provide additional application-defined capabilities. The contents of this file are application-defined.
	
	[*Example*: Consider a WordprocessingML document which contains custom XML markup in the http://www.example.com namespace, which is associated with a resource file located at `http://www.example.com/resource.xml`. The following content would be displayed in the document's schema library data:
	
	`<sl:schemaLibrary>`
	`  <sl:schema sl:uri="http://www.example.com"`
	`sl:manifestLocation= "http://www.example.com/resource.xml" />`
	`</sl:schemaLibrary>`
	
	The manifestLocation attribute contains `http://www.example.com/manifest.xml` which is the location of a resource file that can be downloaded for use when this namespace is used. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema string datatype.

schemaLanguage (Schema Language)	Specifies the media type or the root namespace of the schema language.
	
	[*Example*:
	
	`<sl:schema …`
	`schemaLanguage="http:/relaxng.org/ns/structure/1.0" />`
	
	end example]
	
	The possible values for this attribute are defined by the W3C XML Schema token datatype.

schemaLocation (Custom XML Schema Location)	Specifies the location of the XML schema file which should be downloaded and parsed when this document is loaded.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

©ISO/IEC 2012 – All rights reserved

Attributes	Description

	[*Example*: Consider a WordprocessingML document which contains custom XML markup in the http://www.example.com namespace, which is defined by an XML schema located at `c:\example.xsd`. The following content would be displayed in the document's schema library data:
	
	`<sl:schemaLibrary>`
	`  <sl:schema sl:uri="http://www.example.com" sl:schemaLocation=`
	`"c:\example.xsd" />`
	`</sl:schemaLibrary>`
	
	The schemaLocation attribute contains `c:\example.xsd` which is the location of the XML schema file used when this namespace is used. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema string datatype.

uri (Custom XML Schema Namespace)	Specifies the target namespace for the XML Schema associated with this schema reference.
	
	[*Example*: Consider the following content for custom XML namespace data:
	
	…
	`<sl:schema w:uri="http://www.example.com/schema1" />`
	`<sl:schema w:uri="http://www.example.com/schema2" />`
	…
	
	The uri attribute specifies the target namespace of each XML schema reference:
	• `http://www.example.com/schema1`
	• `http://www.example.com/schema2`
	
	Applications can then locate and utilize a schema for these namespaces using any means available. *end example*]
	
	The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model (CT_Schema) is located in §A.7. *end note*]

23.2.2 schemaLibrary (Embedded Custom XML Schema Supplementary Data)

This element specifies the set of XML namespaces which have been associated with the contents of the custom XML markup within the current Office Open XML document. Each unique namespace which is referenced within the document can be referenced within this element by a single schema element, regardless of the number of constituent XML schemas which comprise that namespace.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

[*Example*: Consider a WordprocessingML document which contains custom XML markup in two distinct namespaces: the http://www.example.com namespace and the http://www.example2.com namespace. If the first namespace is defined by a single XML schema, and the second is defined by five XML schemas (which are cross-referenced using the appropriate XML Schema syntax), the following content would be displayed in the document's schema library XML:

```
<sl:schemaLibrary>
  <sl:schema … />
  <sl:schema … />
</sl:schemaLibrary>
```

The schemaLibrary element contains only two schema elements even though there are six XML schemas in use, as there are only two distinct namespaces for which data is stored. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model (CT_SchemaLibrary) is located in §A.7. *end note*]

Annex A.
(normative)
Schemas – W3C XML Schema

This Office Open XML specification includes a family of schemas defined using the W3C XML Schema 1.0 syntax. The normative definitions of these schemas follow below, and they also reside in an accompanying file named OfficeOpenXML-XMLSchema-Strict.zip, which is distributed in electronic form.

A.1 WordprocessingML

This schema is available in the file wml.xsd.

```
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns:m="http://purl.oclc.org/ooxml/officeDocument/math"
  xmlns:r="http://purl.oclc.org/ooxml/officeDocument/relationships"
  xmlns:sl="http://purl.oclc.org/ooxml/schemaLibrary/main"
  xmlns:wp="http://purl.oclc.org/ooxml/drawingml/wordprocessingDrawing"
  xmlns="http://purl.oclc.org/ooxml/wordprocessingml/main"
  xmlns:s="http://purl.oclc.org/ooxml/officeDocument/sharedTypes" elementFormDefault="qualified"
  attributeFormDefault="qualified" blockDefault="#all"
  targetNamespace="http://purl.oclc.org/ooxml/wordprocessingml/main">
    <xsd:import namespace="http://purl.oclc.org/ooxml/drawingml/wordprocessingDrawing"
      schemaLocation="dml-wordprocessingDrawing.xsd"/>
    <xsd:import namespace="http://purl.oclc.org/ooxml/officeDocument/math" schemaLocation="shared-
      math.xsd"/>
    <xsd:import namespace="http://purl.oclc.org/ooxml/officeDocument/relationships"
      schemaLocation="shared-relationshipReference.xsd"/>
    <xsd:import namespace="http://purl.oclc.org/ooxml/officeDocument/sharedTypes"
      schemaLocation="shared-commonSimpleTypes.xsd"/>
    <xsd:import namespace=" http://purl.oclc.org/ooxml/schemaLibrary/main " schemaLocation="shared-
      customXmlSchemaProperties.xsd"/>
    <xsd:import namespace="http://www.w3.org/XML/1998/namespace"/>
    <xsd:complexType name="CT_Empty"/>
    <xsd:complexType name="CT_OnOff">
       <xsd:attribute name="val" type="s:ST_OnOff"/>
    </xsd:complexType>
    <xsd:simpleType name="ST_LongHexNumber">
       <xsd:restriction base="xsd:hexBinary">
          <xsd:length value="4"/>
       </xsd:restriction>
    </xsd:simpleType>
    <xsd:complexType name="CT_LongHexNumber">
       <xsd:attribute name="val" type="ST_LongHexNumber" use="required"/>
    </xsd:complexType>
    <xsd:simpleType name="ST_ShortHexNumber">
```

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC 29500-1:2012

```
        <xsd:restriction base="xsd:hexBinary">
            <xsd:length value="2"/>
        </xsd:restriction>
    </xsd:simpleType>
    <xsd:simpleType name="ST_UcharHexNumber">
        <xsd:restriction base="xsd:hexBinary">
            <xsd:length value="1"/>
        </xsd:restriction>
    </xsd:simpleType>
    <xsd:complexType name="CT_Charset">
        <xsd:attribute name="characterSet" type="s:ST_String" use="optional"/>
    </xsd:complexType>
    <xsd:simpleType name="ST_DecimalNumberOrPercent">
        <xsd:union memberTypes="s:ST_Percentage"/>
    </xsd:simpleType>
    <xsd:simpleType name="ST_DecimalNumber">
        <xsd:restriction base="xsd:integer"/>
    </xsd:simpleType>
    <xsd:complexType name="CT_DecimalNumber">
        <xsd:attribute name="val" type="ST_DecimalNumber" use="required"/>
    </xsd:complexType>
    <xsd:complexType name="CT_UnsignedDecimalNumber">
        <xsd:attribute name="val" type="s:ST_UnsignedDecimalNumber" use="required"/>
    </xsd:complexType>
    <xsd:complexType name="CT_DecimalNumberOrPrecent">
        <xsd:attribute name="val" type="ST_DecimalNumberOrPercent" use="required"/>
    </xsd:complexType>
    <xsd:complexType name="CT_TwipsMeasure">
        <xsd:attribute name="val" type="s:ST_TwipsMeasure" use="required"/>
    </xsd:complexType>
    <xsd:simpleType name="ST_SignedTwipsMeasure">
        <xsd:union memberTypes="xsd:integer s:ST_UniversalMeasure"/>
    </xsd:simpleType>
    <xsd:complexType name="CT_SignedTwipsMeasure">
        <xsd:attribute name="val" type="ST_SignedTwipsMeasure" use="required"/>
    </xsd:complexType>
    <xsd:simpleType name="ST_PixelsMeasure">
        <xsd:restriction base="s:ST_UnsignedDecimalNumber"/>
    </xsd:simpleType>
    <xsd:complexType name="CT_PixelsMeasure">
        <xsd:attribute name="val" type="ST_PixelsMeasure" use="required"/>
    </xsd:complexType>
    <xsd:simpleType name="ST_HpsMeasure">
        <xsd:union memberTypes="s:ST_UnsignedDecimalNumber s:ST_PositiveUniversalMeasure"/>
    </xsd:simpleType>
    <xsd:complexType name="CT_HpsMeasure">
        <xsd:attribute name="val" type="ST_HpsMeasure" use="required"/>
    </xsd:complexType>
    <xsd:simpleType name="ST_SignedHpsMeasure">
        <xsd:union memberTypes="xsd:integer s:ST_UniversalMeasure"/>
    </xsd:simpleType>
    <xsd:complexType name="CT_SignedHpsMeasure">
        <xsd:attribute name="val" type="ST_SignedHpsMeasure" use="required"/>
```
