Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of the joint technical committee is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

Amendment 3 to ISO/IEC 8824-1:2002 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 6, *Telecommunications and information exchange between systems*, in collaboration with ITU-T. The identical text is published as ITU-T Rec. X.680:2002/Amd.3.

INTERNATIONAL STANDARD
ITU-T RECOMMENDATIONInformation technology – Abstract Syntax Notation One (ASN.1):
Specification of basic notation

Amendment 3

Time type support

1) Contents

Update the Contents as follows:

3.5 <i>bis</i>	Representation of dates and times
11.15 <i>bis</i>	The simple character string lexical item
11.15 <i>ter</i>	The time value character string lexical item
11.15 <i>quat</i>	XML time value character string item
11.15 <i>quin</i>	The property and setting names lexical item
34 <i>bis</i>	The time type
34 <i>bis.1</i>	General
34 <i>bis.2</i>	Time properties and settings of time abstract values
34 <i>bis.3</i>	Basic value notation and XML value notation for time abstract values with specified property settings
34 <i>bis.4</i>	Useful time types
47.10	Property settings
47.11	Duration range
47.12	Time point range
47.13	Recurrence range
Annex A <i>bis</i>	The defined time types
A <i>bis.1</i>	General
A <i>bis.2</i>	The ASN.1 defined types module
E.2 <i>bis</i>	Value notation and property settings (TIME type and useful time types)
E.2 <i>bis.1</i>	Date
E.2 <i>bis.2</i>	Time of day
E.2 <i>bis.3</i>	Date and time of day
E.2 <i>bis.4</i>	Time interval
E.2 <i>bis.5</i>	Recurring interval
Annex G <i>bis</i>	Tutorial annex on the TIME type
G <i>bis.1</i>	The collections of ASN.1 types for times and dates
G <i>bis.2</i>	ISO 8601 key concepts
G <i>bis.3</i>	Abstract values of the TIME type
G <i>bis.4</i>	Time properties of the time abstract values
G <i>bis.5</i>	Value notation

ISO/IEC 8824-1:2002/Amd.3:2006 (E)

- G *bis*.6 Use of the ASN.1 subtype notation
- G *bis*.7 The property settings subtype notation
- Annex G *ter* Analysing **TIME** type value notation
- G *ter*.1 General
- G *ter*.2 Analysing the full string
- G *ter*.3 Analysis of a string containing an interval
- G *ter*.4 Analysis of a string containing a date
- G *ter*.5 Analysis of a string containing a year
- G *ter*.6 Analysis of a string containing a century
- G *ter*.7 Analysis of a string containing a time
- G *ter*.8 Analysis of a string containing a simple time

2) Introduction

Insert before "Clauses 35 to 40 ...":

Clause 34 *bis* and Annex A *bis* define the types that provide support for ISO 8601.

Insert before "Annex B ..."

Annex A *bis* forms an integral part of this Recommendation | International Standard, and defines an ASN.1 module containing the definition of a set of time types providing the full functionality of ISO 8601. These types can be imported from this ASN.1 module by an application designer if the useful time types specified in clause 34 *bis* are not adequate for the application.

Insert before "Annex H ..."

Annex G *bis* does not form an integral part of this Recommendation | International Standard and provides a tutorial introduction to ISO 8601 and to the **TIME** type. It is recommended that this be read before the normative text.

Annex G *ter* does not form an integral part of this Recommendation | International Standard and provides information on how to identify the time properties of an abstract value from an instance of value notation.

3) Subclause 2.2

Replace ISO 8601:2000 with ISO 8601:2004.

4) New subclause 3.5 *bis*

Insert the following after 3.5:

3.5 *bis* Representation of dates and times

This Recommendation | International Standard uses the following terms defined in ISO 8601:

- a) basic format;
- b) calendar date;
- c) common year;
- d) duration;
- e) extended format;
- f) Gregorian calendar;
- g) instant;
- h) leap second;
- i) leap year;

- j) local time;
- k) ordinal date;
- l) recurring time interval
- m) time axis;
- n) time interval;
- o) time point;
- p) time-scale;
- q) UTC;
- r) week date.

5) Subclause 3.6

Add the following definitions to 3.6, in the appropriate position:

3.6.2 bis additional time type: A type defined as a subtype of the time type (see 3.6.71 *quin*) by applying the property setting subtype notation to the time type or to a useful or defined time type.

3.6.18 ter defined time type: A type defined in Annex A *bis* as a subtype of the time type (see 3.6.71 *quin*) that is intended for importation by application designers when needed for their application.

3.6.63 bis setting (of a time property): One of a number of values that can be associated with a given time property (see 3.6.71 *quat* and the note in G *bis*.4.2).

NOTE – Any time property that applies to a particular time abstract value has only a single setting.

3.6.71 bis time abstract value: An abstract value of the time type.

3.6.71 ter time component: Part of the definition of a time abstract value that specifies a part of that abstract value.

NOTE – Examples of time components are a date component (that would have a year component), a time-of-day component, or a time difference component.

3.6.71 quat time property (of a time abstract value): One of a number of terms used to describe a time abstract value (see 3.6.71 *bis*).

NOTE – The time properties that can be used to describe a time abstract value often depend on the setting of some other time property of that abstract value. The time properties are listed in Table 5 *bis*, column 1.

3.6.71 quin time type: The **TIME** type that supports all the abstract values implicitly defined by ISO 8601.

3.6.76 bis useful time type: A built-in type defined as a subtype of the time type (see 3.6.71 *quin*) that is intended for direct use by application designers.

6) Subclause 8.4

In clause 8.4, modify Table 1 as follows:

Replace UNIVERSAL 14-15 with:

UNIVERSAL 14 The time type

UNIVERSAL 15 Reserved for future editions of this Recommendation | International Standard

Replace UNIVERSAL 23-24 with:

UNIVERSAL 23-24 **UTCTime** and **GeneralizedTime**

Replace UNIVERSAL 31-... with:

UNIVERSAL 31-34 **DATE**, **TIME-OF-DAY**, **DATE-TIME** and **DURATION** respectively.

UNIVERSAL 35-... Reserved for future editions of this Recommendation | International Standard

7) New subclauses 11.15 bis, 11.15 ter, 11.15 quat and 11.15 quin

Insert new 11.15 bis, 11.15 ter, 11.15 quat and 11.15 quin after 11.15 as follows:

11.15 bis The simple character string lexical item

Name of item – simplestring

A "simplestring" shall consist of one or more ISO/IEC 10646-1 characters whose character code is in the range 32 to 126, preceded and followed by a QUOTATION MARK (34) character ("). It shall not contain a QUOTATION MARK (34) character ("). The "simplestring" may span more than one line of text, in which case any characters representing end-of-line shall be treated as spacing characters. In analysing an instance of use of this notation, a "simplestring" is distinguished from a "cstring" by the context in which it appears.

NOTE – The "simplestring" lexical item is only used in the subtype notation of the time type.

11.15 ter Time value character strings

Name of item – tstring

A "tstring" shall consist of one or more of the characters:

0 1 2 3 4 5 6 7 8 9 + - : . , / C D H M R P S T W Y Z

preceded and followed by a QUOTATION MARK (34) character (").

NOTE – The "tstring" lexical item is only used in the value notation for the time type.

11.15 quat XML time value character string item

Name of item – xmltstring

An "xmltstring" shall consist of one or more of the characters:

0 1 2 3 4 5 6 7 8 9 + - : . , / C D H M R P S T W Y Z

NOTE – The "xmltstring" lexical item is only used in the XML value notation of the time type.

11.15 quin The property and setting names lexical item

Name of item – psname

A "psname" shall consist of an arbitrary number (one or more) of letters, digits and hyphens. The initial character shall be an upper-case letter. A hyphen shall not be the last character. A hyphen shall not be immediately followed by another hyphen.

NOTE – The "psname" lexical item is only used in the contents of the "simplestring" used in the subtype notation for the time type.

8) Subclause 11.27

Add the following reserved words to 11.27, in their alphabetical position:

DATE DATE-TIME DURATION SETTINGS TIME TIME-OF-DAY

9) Subclause 16.2

In 16.2, add the following lines to the production "BuiltinType":

After "ChoiceType":

| DateType
| DateTimeType
| DurationType

After "PrefixedType":

| TimeType
| TimeOfDayType

10) Subclause 16.2

In 16.2, add the following lines to the references to defining clauses:

After "ChoiceType":

DateType	34 bis.4.1
DateTimeType	34 bis.4.3
DurationType	34 bis.4.4

After "PrefixedType":

TimeType	34 bis.1.1
TimeOfDayType	34 bis.4.2

11) Subclause 16.9

In 16.9, add the following line to the production "BuiltinValue":

After "PrefixedValue":

| TimeValue

12) Subclause 16.10

In 16.10, add the following line to the production "XMLBuiltinValue":

After "XMLPrefixedValue":

| XMLTimeValue

13) New clause 34 bis

Insert a new 34 bis after clause 34 as follows:

34 bis The time type**34 bis.1 General**

34 bis.1.1 The time type (see 3.6.71 *quin*) shall be referenced by the notation "TimeType":

TimeType ::= TIME

34 bis.1.2 The tag for types defined by this notation is universal class, number 14.

34 bis.1.3 The value of a time type shall be defined by the notation "TimeValue", or when used as an "XMLValue", by the notation "XMLTimeValue". The syntax of these notations is defined in 34 bis.3 as the contents of a "simplestring", using notation defined in ISO 8601, 3.4.

34 bis.2 Time properties and settings of time abstract values

34 bis.2.1 Table 5 bis specifies in column 1 the description and names of the time properties of time abstract values. In column 2, it specifies the names of the possible time property settings for the column 1 time property. Column 3 specifies (generally by reference to ISO 8601) the abstract values to which the time property is applicable, and that have the corresponding time property settings.

NOTE 1 – ASN.1 does not specify abstract values that are not supported by ISO 8601 representations.

NOTE 2 – The names of time properties and of their settings appear in the property assertions of the property settings subtype notation (see clause 47).

Table 5 bis – Properties and settings for time abstract values

Time property	Names of property settings	Abstract values that have this property setting
Basic nature of the abstract value Name: Basic Comment: The setting of this property identifies the basic nature of the abstract value. All time abstract values have this property.	Date	See ISO 8601, 4.1. All abstract values that are dates only.
	Time	See ISO 8601, 4.2. All abstract values that are a time-of-day only.
	Date-Time	See ISO 8601, 4.3. All abstract values that are a date and a time-of-day.
	Interval	See ISO 8601, 4.4. All the time interval abstract values.
	Rec-Interval	See ISO 8601, 4.5. All the recurring interval abstract values.
Time-scale and accuracy for a date Name: Date Comment: This applies only to an abstract value that includes identification of a date. It identifies the time-scale and accuracy of that date. NOTE – Any abstract value identifying more than one date (for example, an interval) has a single setting for Date that applies to both dates.	C (Century)	See ISO 8601, 4.1.2.3 c). All abstract values containing a date that represents only a century.
	Y (Year only)	See ISO 8601, 4.1.2.3 b). All abstract values containing a date that represents only a year.
	YM (Year-Month)	See ISO 8601, 4.1.2.3 a). All abstract values containing a date that uses the year-month time-scale.
	YMD (Year-Month-Day)	See ISO 8601, 4.1.2.2. All abstract values containing a date that uses the year-month-day time-scale.
	YD (Year-Day)	See ISO 8601, 4.1.3.2. All abstract values containing a date that uses the year-day time-scale.
	YW (Year-Week)	See ISO 8601, 4.1.4.3. All abstract values containing a date that uses the year-week time-scale.
	YWD (Year-Week-Day)	See ISO 8601, 4.1.4.2. All abstract values containing a date that uses the year-week-day time-scale.

Table 5 bis – Properties and settings for time abstract values

Time property	Names of property settings	Abstract values that have this property setting
<p>Type of associated year</p> <p>Name: Year</p> <p>Comment: This applies only to an abstract value that includes identification of one or more years or centuries. Its setting identifies whether the year (or century) identification is a "normal" year, a year in the proleptic Gregorian Calendar (see G bis.2.2), a year that is negative, or a year that requires more than four digits to represent it.</p> <p>NOTE – Any abstract value involving more than one year (for example, an interval) has a single setting for Year that applies to both years.</p>	Basic	All abstract values containing a year in the range 1582 to 9999 (or a century in the range 15 to 99).
	Proleptic	All abstract values containing a year in the range 0 to 1581 (or a century in the range 00 to 14). NOTE – In the proleptic Gregorian calendar, a year value of zero has a meaning which roughly corresponds to the year 1 BC (see G bis.2.2).
	Negative	All abstract values containing a year in the range –9999 to –0001 (or a century in the range –99 to –01).
	L5, L6, L7, etc., to infinity (Large)	All abstract values containing a year whose decimal representation requires 5, 6, 7, etc., digits (or a century whose decimal representation requires 3, 4, 5, etc., digits) respectively, whether positive or negative.
<p>Accuracy for a time</p> <p>Name: Time</p> <p>Comment: This applies only to an abstract value that includes identification of a time-of-day. It identifies the accuracy of that time-of-day.</p> <p>NOTE – Any abstract value identifying more than one time-of-day (for example, an interval) has a single setting for Time that applies to both the time-of-days.</p>	H (Hour)	See ISO 8601, 4.2.2.3 b). All abstract values containing a time-of-day to an accuracy of hours.
	HM (Hour-Minute)	See ISO 8601, 4.2.2.3 a). All abstract values containing a time-of-day to an accuracy of minutes.
	HMS (Hour-Minute-Second)	See ISO 8601, 4.2.2.2. All abstract values containing a time-of-day to an accuracy of seconds.
	HF1, HF2, HF3, etc., to infinity (Hour-decimal-fraction)	See ISO 8601, 4.2.2.4 c). All abstract values containing a time-of-day to an accuracy of hours to 1, 2, 3, etc., decimal places.
	HMF1, HMF2, HMF3, etc., to infinity (Hour-Minute-fraction)	See ISO 8601, 4.2.2.4 b). All abstract values containing a time-of-day to an accuracy of minutes to 1, 2, 3, etc., decimal places.
	HMSF1, HMSF2, HMSF3, etc., to infinity (Hour-Minute-Second-Fraction)	See ISO 8601, 4.2.2.4 a). All abstract values containing a time-of-day to an accuracy of seconds to 1, 2, 3, etc., decimal places.

Table 5 bis – Properties and settings for time abstract values

Time property	Names of property settings	Abstract values that have this property setting
<p>Local or UTC time-scale for a time Name: Local-or-UTC Comment: This applies only to an abstract value that includes identification of a time. It identifies the time-scale of that time (local time, UTC, or local time plus the difference from UTC). Time differences are determined by local administrations. ASN.1 supports time differences in the range –15 hours to +16 hours. The difference is positive if the local time is ahead of or equal to UTC (see ISO 8601, 5.2.4.1). See also G bis.2.11. NOTE – Any abstract value identifying more than one time (for example, an interval) has a single setting for Local-or-UTC that applies to both times.</p>	L (Local time only)	See 34 bis.2.2 and ISO 8601, 4.2.2 and 4.2.3. All abstract values containing a time-of-day that specifies local time only.
	Z (UTC only)	See ISO 8601, 4.2.4. All abstract values containing a time-of-day that specifies UTC and not local time.
	LD (Local time and the difference from UTC)	See ISO 8601, 4.2.5. All abstract values containing a time-of-day that specifies local time and the time (which may be negative) added to UTC to obtain local time.
<p>Form of interval specification Name: Interval-type Comment: This applies only to an abstract value that is an interval or a recurring interval. It identifies the form of interval specification (a start and an end point, a duration, a start point and a duration, or a duration with an end point).</p>	SE (Start and end points)	See ISO 8601, 4.4.1 a). All abstract values that specify an interval using a start and an end point.
	D (Duration only)	See ISO 8601, 4.4.1 b) and 4.4.3. All abstract values that specify an interval using only a duration.
	SD (Start point and duration)	See ISO 8601, 4.4.1 c). All abstract values that specify an interval using a start point and a duration.
	DE (Duration and end point)	See ISO 8601, 4.4.1 d). All abstract values that specify an interval using a duration and an end point.
<p>Nature of the start and/or end point specification Name: SE-point Comment: This applies only to intervals or recurring intervals using a start point or an end point or both. The setting of this property identifies the nature of the start point and/or end point that forms part of this abstract value. NOTE – All interval abstract values with both a start point and an end point have a single setting for this property, and for any associated properties related to date or time-of-day. There are no interval abstract values that have different forms of start point and end point. Thus all abstract values with both an interval start point and an interval end point have the same set of time components for the start point and the end point (but see Table 5 ter for value notation for the end-point). This is a difference from ISO 8601.</p>	Date	See ISO 8601, 4.1. All abstract values that specify start and/or end points using dates only.
	Time	See ISO 8601, 4.2. All abstract values that specify start and/or end points using time-of-day only.
	Date-Time	See ISO 8601, 4.3. All abstract values that specify start and/or end points using a date and a time-of-day.
<p>Recurrence specification Name: Recurrence Comment: This applies only to an abstract value that is a recurring interval. It identifies the agreed limits on the number of recurrences (or unlimited).</p>	Unlimited (No limit on the number of recurrences, expressed with an empty string for the number of recurrences)	See ISO 8601, 4.5. All abstract values representing an unlimited number of recurrences of an interval.
	R1, R2, R3, etc., to infinity (Number of recurrence digits)	See ISO 8601, 4.5. All abstract values representing recurrences of an interval that can be expressed in 1, 2, 3, etc., digits respectively.

Table 5 bis – Properties and settings for time abstract values

Time property	Names of property settings	Abstract values that have this property setting
Midnight start or end of a day Name: <i>Midnight</i> Comment: This applies only to an abstract value that contains a time that represents midnight. It identifies whether this midnight value is the start of a day (often represented as 00:00:00) or the end of a day (often represented as 24:00:00).	Start (Start-of-day)	See ISO 8601, 4.2.3 a). An abstract value containing a time that represents midnight at the start of a day.
	End (End-of-day)	See ISO 8601, 4.2.3 b). An abstract value containing a time that represents midnight at the end of a day.
NOTE – ASN.1 does not support the use of start and end points of intervals that have different time properties, as there is only a single SE-point setting that governs the syntax of both the start point and the end-point. The start and end points are required to use the same time format. This is a difference from ISO 8601.		

34 bis.2.2 ISO 8601 provides two basic representations for midnight: "2400" for midnight at the end of a day and "0000" for midnight at the start of a day (with any second or fractional part of a second containing only zero digits). These are not considered different representations for a single abstract value, but as distinct abstract values.

NOTE 1 – This is because as a stand-alone time, they are clearly distinct and represent start of a day and end of a day. When used in conjunction with a day, "2400" on day x should be considered less than "0000" on day x+1, despite having exactly the same position on the time axis.

NOTE 2 – They have, respectively, the time property setting "**Midnight=End**" and "**Midnight=Start**".

NOTE 3 – As with other time points, there are infinitely many distinct abstract values that are midnight at the start and end of any particular day, depending on the accuracy of the seconds and fractional part of seconds. There are also further infinite sets of midnight abstract values based on the use of fractions of an hour or of a minute rather than of seconds. (All these fractional parts will be zero to various different accuracies if the abstract value is a midnight value.)

34 bis.2.3 ISO 8601 provides two basic representations for duration (either weeks, or some combination of years, months, days, hours, minutes and seconds) as a component of time intervals and recurring time intervals. Different strings representing durations in ISO 8601 are considered to represent different abstract values in ASN.1, except where the only difference is the omission or inclusion of a zero time component that does not change the duration (including the accuracy of the duration) being represented. Inclusion or omission of zero time components is fully specified in canonical encoding rules, and in all the encoding rules of ITU-T Rec. X.691 | ISO/IEC 8825-2. There are no time properties (other than "**Basic=Interval Interval-type=D**") associated with a duration, but restrictions can be applied to the time components of a duration, requiring them to be absent or limiting their value (see 34 bis.4.4).

NOTE 1 – There is an ISO 8601 requirement for prior agreement on the size of components (and particularly of fractional parts). This is normally handled by property settings for the different accuracies. However, in the case of **DURATION**, for simplicity, property settings were not introduced to determine the accuracy of the components. Instead, inner subtyping constraints on the equivalent sequence type can be applied, as specified in 34 bis.4.4, to record prior agreements on the components of a **DURATION**.

NOTE 2 – ISO 8601 requires that use of a weeks component shall not be combined with the use of any other date component (years, months, days), nor with the use of an hours, minutes, or seconds time component. This restriction is also applied in ASN.1 for consistency with ISO 8601.

34 bis.2.4 There is no defined order relation between the different **DURATION** abstract values unless they are expressed using a single time element (for example, weeks or months or days only), as there is no agreed international definition of a duration of one month or one year in terms of seconds.

34 bis.3 Basic value notation and XML value notation for time abstract values with specified property settings

34 bis.3.1 All time abstract values with the same time property settings have the same value notation, varied only by the values of year, month, week, day, hour, minute, second, etc. (on the associated time-scale) that are used to distinguish that abstract value from others with the same property settings.

34 bis.3.2 The value notations for the time type shall be "TimeValue" and "XMLTimeValue":

TimeValue ::= tstring

XMLTimeValue ::= xmltstring

The content of the "tstring" and of the "xmltstring" is defined in 34 bis.3.4 using the time component syntax that is defined in column 3 of Table 5 ter. Table 5 ter defines a number of possible notations for the different components (for example, the year component). The precise notation to be used depends on the property settings of the abstract value specified in column 2. Properties not listed in column 2 have no effect on the notation to be used for the component.

These time component notations are normally defined by reference to an ISO 8601 representation (with which they are conformant), but in order to avoid ambiguity in value notation, an additional **C** character is added to time components that designate a century and not a full year, as specified in column 3 of Table 5 *ter*.

34 bis.3.3 Table 5 *ter* specifies (in column 3) the value notation and XML value notation for time components (listed in column 1). Column 1 identifies a time component. Column 2 specifies the conditions in which a particular row is applicable, in terms of the settings of properties associated with abstract values. Column 3 specifies the notation to be used for that time component. The notation used in column 3 is that defined in ISO 8601, 3.4, with the addition of **C** as a century designator.

NOTE 1 – The ISO 8601 notation used in column 3 can be summarized as: **Y** is a year digit, **M** is a month digit or month designator, **D** is a day digit, **w** is a week digit, **h** is an hour digit, **m** is a minute digit, **s** is a second digit, **n** is any of 0 to 9, **±** is plus or minus, and underline represents zero or more repetitions (for example "±YYYYY"). The ISO 8601 notation is used in preference to any other notation used in this Recommendation | International Standard in order to make the linkage to ISO 8601 clear.

NOTE 2 – Annex G *bis.2* provides a tutorial on ISO 8601 key concepts that will help in understanding this notation. See also Annex E.2 *bis* for examples of the resulting value notation.

Table 5 *ter* – Value notation for time abstract values with specific properties and settings

Time component	Property	Value notation syntax
Year component	"Year=Basic" and "Date=C" or "Year=Proleptic" and "Date=C"	ISO 8601, 4.1.2.3 c) followed by the character LATIN CAPITAL LETTER C: [YYC]
Year component	"Year=Negative" and "Date=C" or "Year=Ln" and "Date=C"	ISO 8601, 4.1.2.4 d) followed by the character LATIN CAPITAL LETTER C: [±YYC] The number of repetitions of <u>Y</u> shall be zero for "Year=Negative" and equal to <i>n-2</i> for "Year=Ln".
Year component	"Year=Basic" and Date is not C or "Year=Proleptic" and Date is not C	ISO 8601, 4.1.2.2: [YYYY]
Year component	"Year=Negative" and Date is not C or "Year=Ln" and Date is not C	ISO 8601, 4.1.2.4 c): [± <u>Y</u> YYYY] The number of repetitions of <u>Y</u> shall be zero for "Y=Negative" and equal to <i>n-4</i> for "Y=Ln".
Month component	Any	ISO 8601, 4.1.2.3 a): [-MM]
Week component	Any	ISO 8601, 4.1.4.3: [-Www]
Day component	"Year=YMD"	ISO 8601, 4.1.2.2 Extended format: [-DD]
Day component	"Year=YD"	ISO 8601, 4.1.3.2 Extended format: [-DDD]
Day component	"Year=YWD"	ISO 8601, 4.1.4.2 Extended format: [-D]
Hours component	"Basic=Time" or "Basic=Interval" and "SE-point=Time" or "Basic=Rec-Interval" and "SE-point=Time"	ISO 8601, 4.2.2.3 b): [hh] The hours component value notation 24 shall always be used for the abstract value "midnight at end of day" and the hours component value notation 00 for "midnight at start of day".
Hours component	"Basic=DateTime" or "Basic=Interval" and "SE-point=DateTime" or "Basic=Rec-Interval" and "SE-point=DateTime"	ISO 8601, 4.3.2 Extended format: [Thh] The value notation T24 shall always be used for the hours component of the abstract value "midnight at end of day" and the value notation T00 for "midnight at start of day".

Table 5 *ter* – Value notation for time abstract values with specific properties and settings

Time component	Property	Value notation syntax
Minutes component	Any	ISO 8601, 4.3.2 Extended format: [:mm]
Seconds component	Any	ISO 8601, 4.3.2 Extended format: [:ss]
Decimal fraction component of hour, minute, or second	Any	ISO 8601, 4.2.2.4: [hh] or [hh], [mm] or [mm], or [ss] or [ss] NOTE – It is recommended that in any given ASN.1 module, the comma or full stop be consistently used for the decimal sign.
Decimal fraction component of year, month, week, or day in a duration (see <i>G bis.2.6</i> , Note)	"Basic=Interval" and "Interval-type=D" or "Basic=Interval" and "Interval-type=SD" or "Basic=Interval" and "Interval-type=DE"	ISO 8601, 4.4.3.2: [nn] or [nn] NOTE – It is recommended that in any given ASN.1 module, the comma or full stop be consistently used for the decimal sign.
UTC designator component	"Local-or-UTC=Z"	ISO 8601, 4.2.4: [Z]
Time difference component	"Local-or-UTC=LD"	ISO 8601, 4.2.5.2 Extended format: [±hh] or [±hh:mm] The time difference component shall be the exact time difference in minutes if it is not an exact multiple of hours. NOTE – This means that the minutes component has to be present unless the difference between local time and UTC is an integral number of hours.
Duration component	"Interval-type=D" or "Interval-type=SD" or "Interval-type=DE"	ISO 8601, 4.4.3.2: see <i>34 bis.3.6</i>
Time interval	"Interval-type=SE" or "Interval-type=SD" or "Interval-type=DE"	ISO 8601, 4.4 Extended formats: Start point component ("Interval-type=SE" or "Interval-type=SD") or duration component ("Interval-type=DE"), followed by [/], followed by duration component ("Interval-type=SD") or end point component ("Interval-type=SE" or "Interval-type=DE").
Start point component	Depends on SE-point setting	This is determined by the setting of SE-point , which shall be interpreted as a setting of the Basic property for representing this component. The Date , Year , Time , and Local-or-UTC property settings shall then be used to determine the format of the start point component.
End point component	Depends on SE-point setting	This is determined by the setting of SE-point , which shall be interpreted as a setting of the Basic property for representing this component. The Date , Year , Time , and Local-or-UTC property settings shall then be used to determine the format of the end point component. It is permissible (optionally) to omit the time difference component if the difference between UTC and local time for the end point is the same as the difference for the start point. NOTE – This is not as general as ISO 8601, but is restricted to these cases for simplicity.
Recurring time intervals	"Recurrence=Unlimited"	ISO 8601, 4.5 Extended format: [R/] followed by the time interval component.
Recurring time intervals	"Recurrence=R1", "Recurrence=R2", "Recurrence=R3", etc.	ISO 8601, 4.5 Extended format: [Rnn/] followed by the time interval component.

34 bis.3.4 The value of the "tstring" shall be the concatenation of the character encodings of the time components (determined by the settings of their properties in accordance with Table 5 *bis*), preceded and followed by a QUOTATION MARK (34) character (") as specified in 11.15 *ter*. The value of the "xmltstring" shall be the concatenation of the character encodings of the time components (determined by the settings of their properties in accordance with Table 5 *bis*), without surrounding QUOTATION MARK characters.

NOTE 1 – The value notation and XML value notation are canonical except for:

- a) the varying representations of duration; and
- b) the varying use of comma or full stop for the decimal separator; and
- c) the varying use of hours and minutes or hours only for time difference components that are an integral number of hours; and
- d) the inclusion or omission of a time difference component in the end point of an interval (with both a start point and an end point) when the time difference in the end point is the same as the time difference in the start point.

NOTE 2 – Examples of the value notation are provided in E.2 *bis*.

34 bis.3.5 The notations for the time components shall be concatenated in the order specified in ISO 8601.

NOTE – This means the most significant time component first and the zone designator (time difference component or **Z**) last.

34 bis.3.6 The basic value notation and the XML value notation for the duration component are specified in the following subclauses.

34 bis.3.6.1 The value notation shall be [P] (see ISO 8601, 4.4.3) followed by either:

- a) a year-month-day designation (see 34 *bis*.3.6.2) optionally followed by an hours-mins-sec designation (see 34 *bis*.3.6.3); or
- b) a week designation (see 34 *bis*.3.6.4); or
- c) an hours-mins-sec designation (see 34 *bis*.3.6.3).

34 bis.3.6.2 A year-month-day designation shall be one or more (in order) of:

- a) a year designation (see 34 *bis*.3.6.5);
- b) a month designation (see 34 *bis*.3.6.6);
- c) a day designation (see 34 *bis*.3.6.7).

34 bis.3.6.3 An hours-mins-secs designation shall be [T] followed by one or more (in order) of:

- a) an hours designation (see 34 *bis*.3.6.8); or
- b) a minutes designation (see 34 *bis*.3.6.9); or
- c) a seconds designation (see 34 *bis*.3.6.10).

34 bis.3.6.4 A week designation shall consist of one or more digits optionally followed by a fractional part (see 34 *bis*.3.6.12) followed by [W].

34 bis.3.6.5 A year designation shall consist of one or more digits optionally followed by a fractional part (see 34 *bis*.3.6.12) followed by [Y].

34 bis.3.6.6 A month designation shall consist of one or more digits optionally followed by a fractional part (see 34 *bis*.3.6.12) followed by [M].

34 bis.3.6.7 A day designation shall consist of one or more digits optionally followed by a fractional part (see 34 *bis*.3.6.12) followed by [D].

34 bis.3.6.8 An hours designation shall consist of one or more digits optionally followed by a fractional part (see 34 *bis*.3.6.12) followed by [H].

34 bis.3.6.9 A minutes designation shall consist of one or more digits optionally followed by a fractional part (see 34 *bis*.3.6.12) followed by [M].

34 bis.3.6.10 A seconds designation shall consist of one or more digits optionally followed by a fractional part (see 34 *bis*.3.6.12) followed by [S].

34 bis.3.6.11 The integral part of a designation shall not contain leading zeros unless it is the single digit zero, optionally followed by a fractional part. There shall be at least one digit in the integral part if there is a following fractional part.

34 bis.3.6.12 A fractional part shall consist of a decimal separator (which shall be either a full stop or a comma), followed by one or more decimal digits.

34 bis.3.6.13 If a designation contains a fractional part, there shall be no following designation.

34 bis.3.6.14 Value notations expressing a duration to different accuracies represent different abstract values.

EXAMPLE 1: The following value notations all represent different abstract values:

- a) **P29M** (or **P0Y29M**) -- 0 years, 29 months to an accuracy of 1 month.
- b) **P29M0D** (or **P0Y29M0D**) -- 0 years, 29 months, 0 days to an accuracy of 1 day.
- c) **P29MT0S** (or **P0Y29M0DT0H0M0S**) -- 0 years, 29 months, 0 days, 0 hours, 0 minutes, 0 seconds, to an accuracy of 1 second.
- d) **P29MT0.00H** (or **P0Y29M0DT0.00H**) -- 0 years, 29 months, 0 days, 0 hours, to an accuracy of one-hundredth of an hour.
- e) **P29MT0.000S** (or **P0Y29M0DT0H0M0.000S**) -- 0 years, 29 months, 0 days, 0 hours, 0 minutes, 0 seconds, to an accuracy of 1 millisecond.

EXAMPLE 2: The following value notations all represent the same abstract value (0 years, 29 months, 0 days, 0 hours, 0 minutes) to an accuracy of one-hundredth of a minute:

- a) **P0Y29M0DT0H0.00M**
- b) **P0Y29M0DT0.00M**
- c) **P0Y29MT0H0.00M**
- d) **P0Y29MT0.00M**
- e) **P29M0DT0H0.00M**
- f) **P29M0DT0.00M**
- g) **P29MT0H0.00M**
- h) **P29MT0.00M**

34 bis.4 Useful time types

The following useful time types are defined, and are expected to cover most normal requirements of application designers.

NOTE – These definitions use the property setting subtype notation specified in clause 47. Where alternative time-scales are required, for example, use of a Year and Day calendar, defined time types (see Annex A *bis*) can be used, or the property setting subtype notation can be used to define additional subtypes of the **TIME** type (see E.2 *bis* for examples of properties and settings that can be used).

34 bis.4.1 The date type shall be referenced by the notation:

DateType ::= DATE

and is defined as:

DATE ::= [UNIVERSAL 31] IMPLICIT TIME
(SETTINGS "Basic=Date Date=YMD Year=Basic")

34 bis.4.2 The time-of-day type shall be referenced by the notation:

TimeOfDayType ::= TIME-OF-DAY

and is defined as:

TIME-OF-DAY ::= [UNIVERSAL 32] IMPLICIT TIME
(SETTINGS "Basic=Time Time=HMS Local-or-UTC=L")

NOTE – This type allows midnight at start of day (00:00:00) as well as midnight at end of day (24:00:00).

34 bis.4.3 The date-time type shall be referenced by the notation:

DateTimeType ::= DATE-TIME

and is defined as:

DATE-TIME ::= [UNIVERSAL 33] IMPLICIT TIME
(SETTINGS "Basic=Date-Time Date=YMD Year=Basic Time=HMS
Local-or-UTC=L")

NOTE – This type allows midnight at start of day (00:00:00) as well as midnight at end of day (24:00:00).

34 bis.4.4 The duration type shall be referenced by the notation:

DurationType ::= DURATION

and is defined as:

**DURATION ::= [UNIVERSAL 34] IMPLICIT TIME
(SETTINGS "Basic=Interval Interval-type=D")**

Any subset of the **TIME** type, all of whose abstract values have the property settings "**Basic=Interval Interval-type=D**" (whether **UNIVERSAL 34** or **UNIVERSAL 14**), is called a duration subtype. This type can be constrained in accordance with the following subclauses.

34 bis.4.4.1 Inner subtyping constraints can be applied to any duration subtype using an equivalent sequence type (see 34 bis.4.4.2).

NOTE – The inner subtyping constraint applied to the equivalent sequence type can be used to forbid or to require particular time components in the duration type, or to place range constraints on the values of some or all time components of the duration type (see also 47.11.2).

34 bis.4.4.2 The **DURATION-EQUIVALENT** equivalent sequence type is:

DURATION-EQUIVALENT ::= SEQUENCE {
 years **INTEGER (0..MAX) OPTIONAL,**
 months **INTEGER (0..MAX) OPTIONAL,**
 weeks **INTEGER (0..MAX) OPTIONAL,**
 days **INTEGER (0..MAX) OPTIONAL,**
 hours **INTEGER (0..MAX) OPTIONAL,**
 minutes **INTEGER (0..MAX) OPTIONAL,**
 seconds **INTEGER (0..MAX) OPTIONAL,**
 fractional-part **SEQUENCE {**
 number-of-digits **INTEGER(1..MAX),**
 fractional-value **INTEGER(0..MAX) } OPTIONAL }**

where the years component of the equivalent sequence type corresponds to the years time component of the abstract value of the duration type, and so on.

34 bis.4.4.3 Constraints placed on the components of the equivalent sequence type are constraints on the corresponding time components of the duration type.

NOTE 1 – The rules for duration types require that at least one of the time components be present (see 34 bis.2.3), but that no other time components be present when the week is present. Use of an inner subtyping constraint that violated these rules would be an illegal specification.

NOTE 2 – The fractional-part always applies to the least significant time component that is present in the abstract value.

34 bis.4.5 The basic value notation and the XML value notation for all the useful time types shall be the value notation for the **TIME** type (see 34 bis.3.2), restricted to notation for those abstract values that are present in the useful time type.

14) Clause 42

Replace clause 42 (retaining the heading) with:

NOTE – Earlier versions of this Recommendation | International Standard used different text (due to the evolution of the ISO time standards), but the technical content is unchanged from the first version of this Recommendation | International Standard.

42.1 This type shall be referenced by the name:

GeneralizedTime

42.2 The type consists of ~~values representing:~~

- a) ~~a calendar date, as defined in ISO 8601; and together with:~~
- b) ~~a time of day, to any of the precisions defined in ISO 8601, except for the hours value 24 which shall not be used; and~~
- e) ~~the local time differential factor as defined in ISO 8601.~~
- a) a local time of day, including midnight at the start of a day, but excluding midnight at the end of a day, to an accuracy of:
 - 1) hours, minutes, and seconds (or seconds and fractions of a second to any number of decimal places);
or
 - 2) hours and minutes (or minutes and fractions of a minute to any number of decimal places); or

- 3) hours (or hours and fractions of an hour to any number of decimal places); or
 b) a UTC time of day, including midnight at the start of a day, but excluding midnight at the end of a day, to any of the accuracies listed in a) above; or
 c) a local time of day as specified in a) above, together with the difference between local time and UTC.

NOTE – The time difference component is positive if the local time is ahead of UTC.

42.3 The type is defined, using ASN.1, as follows:

~~GeneralizedTime ::= [UNIVERSAL 24] IMPLICIT VisibleString~~

with the values of the **VisibleString** restricted to strings of characters which are either:

- a) a specification of a calendar date followed by a local time, consisting of:
 1) a string representing the calendar date (as specified in ISO 8601, with 4.1.2.2 – Basic format); followed by:
NOTE 1 – This specifies a four-digit representation of the year, a two-digit representation of the month and a two-digit representation of the day, without use of separators, followed by a string representing the time of day, as specified in ISO 8601, without separators other than decimal comma or decimal period (as provided for in ISO 8601), and with no terminating Z (as provided for in ISO 8601); or
 b) ~~the characters in a) above followed by an upper case letter Z; or~~
 c) ~~the characters in a) above followed by a string representing a local time differential, as specified in ISO 8601, without separators.~~

~~In case a), the time shall represent the local time. In case b), the time shall represent coordinated universal time. In case c), the part of the string formed as in case a) represents the local time (t_1), and the time differential (t_2) enables coordinated universal time to be determined as follows:~~

- ~~coordinated universal time 2) a string representing the time of day to an accuracy of one hour, one minute, one second, or fractions of a second (to any degree of accuracy), using either comma or full stop as the decimal sign (as specified in ISO 8601, 4.2.2.2 and 4.2.2.3 – Basic format); optionally followed by:~~
 3) a decimal fraction of a minute if seconds are omitted, or a decimal fraction of an hour if minutes and seconds are omitted (as specified in ISO 8601, 4.2.2.4); or
NOTE 2 – ISO 8601 specifies the use of either a comma or a full stop as the decimal sign. There are no other separators present. It is recommended that in any given ASN.1 specification, either comma or full stop be consistently used as the decimal sign.
 b) a specification of a calendar date and a UTC time consisting of the characters in a) above followed by an upper-case letter Z; or
 c) a specification of a calendar date, the local time, and the exact difference between local time and UTC as specified in ISO 8601, with the minutes component optionally omitted if the difference is an integral number of hours.

NOTE 3 – Early work on ASN.1 canonical encoding rules assumed that there was no actual concept of accuracy so that an abstract value that might be represented with a seconds component of 3.000 was regarded as the same abstract value as one that was represented with a seconds component of 3, and forbade the use of trailing zeros in canonical encoding fractional parts, and forbade the omission of seconds or minutes and seconds. It also supported only the use of UTC time, not local time or local time with a time difference component. This has not been changed in later editions of the ASN.1 standards, for backwards compatibility. The **TIME** type (introduced into ASN.1 in 2004) recognizes that abstract values can have an associated accuracy, and that (e.g.) the representations of seconds as 3.000 and 3 produces different abstract values, and that local time and UTC specifications represent different abstract values. The canonical encoding rules for **TIME** encode the full range of its abstract values, so use of **TIME** may be preferred in new specifications to the use of **GeneralizedTime**.

~~In case c), the part of the string formed as in case a) represents the local time (t_1), and the (signed) time difference (t_2) enables UTC to be determined. If t_2 is positive, local time is ahead of UTC. We can thus determine UTC as:~~

~~_____ UTC is $t_1 - t_2$~~

EXAMPLES

Case a)

"19851106210627.3"

~~local~~ Local time 6 minutes, 27.3 seconds after 9 pm on 6 November 1985.

Case b)

"19851106210627.3Z"

~~coordinated~~ Coordinated universal time as above.

Case c)

"19851106210627.3-0500"

~~local~~ Local time as in example a), with local time 5 hours ~~retarded in relation to~~ coordinated universal time.

Case d)

"198511062106.456"

Local time 6.456 minutes after 9 pm on 6 November 1985.

Case e)

"1985110621.14159"

Local time 0.14159 hours after 9 pm on 6 November 1985.

42.4 The tag shall be as defined in 42.3.

42.5 The value notation shall be the value notation for the **VisibleString** defined in 42.3.

15) Subclause 47.1

In 47.1, replace the first paragraph with:

A number of different forms of notation for "SubtypeElements" are provided. They are identified below, and their syntax and semantics are defined in the following subclauses. Table 9 and Table 9 *bis* summarizes which notations can be applied to which parent types. "SubtypeElements" not present in one of the tables means that the corresponding subtype element cannot be applied to any of the parent types listed in that table.

16) Subclause 47.1

In 47.1, add the following lines to the production "SubtypeElements":

After "PatternConstraint":

PropertySettings
DurationRange
TimePointRange
RecurrenceRange

17) Table 9

Replace Table 9 heading with:

Table 9 – Applicability of subtype value sets "SubtypeElements" to types other than the Time type

18) Table 9

Replace Table 9 row heading "Time types" with:

GeneralizedTime and UTCTime types

19) New Table 9 bis

Add a new Table 9 bis after Table 9 as follows:

Table 9 bis – Applicability of "SubtypeElements" to the Time type

Type (or derived from such a type by tagging or subtyping)	Single value	Contained subtype	Property settings	Duration range	Time point range	Recurrence range	Inner subtyping
Time type	Yes	Yes	Yes	Yes	Yes	Yes	(Note)
NOTE – Only allowed if all the abstract values of the parent type have the property settings " Basic=Interval Interval-type=D " (see 34 bis.4.4).							

20) New clauses 47.10, 47.11, 47.12, and 47.13

Insert new clauses 47.10, 47.11, 47.12, and 47.13 after subclause 47.9.2 as follows:

47.10 Property settings

47.10.1 The "PropertySettings" notation shall be:

PropertySettings ::= SETTINGS simplestring

47.10.2 The contents of the "simplestring" shall be "PropertySettingsList":

PropertySettingsList ::=

PropertyAndSettingPair

| PropertySettingsList PropertyAndSettingPair

PropertyAndSettingPair ::= PropertyName "=" SettingName

PropertyName ::= psname

SettingName ::= psname

47.10.3 The "PropertyName" shall be one of the time property names listed in column 1 of Table 5 bis, and shall appear at most once in the "PropertySettingsList".

47.10.4 The "SettingName" of a "PropertyAndSettingPair" shall be one of the property setting names that are listed in column 2 of Table 5 bis in the row that contains (in column 1) the "PropertyName" of that "PropertyAndSettingPair".

47.10.5 An abstract value shall be included in the subtype if, and only if, it satisfies the following condition for all of the "PropertyAndSettingPair"s. Either:

- the abstract value does not have a property setting for the "PropertyName" (see columns 2 and 3 of Table 5 bis for the abstract values that have a property setting for a given "PropertyName"); or
- the abstract value has a property setting that is the same as the "SettingName".

NOTE – To assist with human readability, it is recommended, but not required, that the setting of the **Basic** time property be always included as the first "PropertyAndSettingPair".

EXAMPLE: **TIME(SETTINGS "Midnight=Start")** would produce a subset of the **TIME** type in which all abstract values are present (including those that represent dates only) except those that have the property setting "**Midnight=End**".

47.10.6 All abstract values of the **TIME** type have settings for the **Basic** time property (this is not true for other time properties). In order to prevent misleading notation in which a "PropertyAndSettingPair" has no effect on the resulting set of abstract values, some restrictions are placed on the "PropertyName"s that can be used with a specific setting of the **Basic** time property. The restrictions are listed in Table 9 ter.

NOTE – Table 9 ter is not an exhaustive set of rules for preventing the use of "PropertyAndSetting" pairs, some of which are redundant (which is not in general illegal).

Table 9 *ter* – Restrictions on use of property names with Basic property settings

Basic property setting	Prohibited property names with this Basic property setting
Date	Time, Local-or-UTC, Midnight, Interval-type, SE-point, Recurrence
Time	Date, Year, Interval-type, SE-point, Recurrence
Date-Time	Interval-type, SE-point, Recurrence
Interval	Recurrence
Rec-Interval	No restriction

47.11 Duration range

47.11.1 The "DurationRange" subtype notation shall be:

DurationRange ::= ValueRange

47.11.2 Both the "Value"s in the "ValueRange" shall identify a time abstract value (either by value notation or by a value reference) that is present in the subtype:

TIME (SETTINGS "Basic=Interval Interval-type=D")

47.11.3 Both the "Value"s in the "ValueRange" shall specify the duration using either:

- the same single time component to the same accuracy (no fractional part, or the same number of digits in the fractional part); or
- multiple time components that have identical values apart from the least significant time component (which may have different values, but shall have the same accuracy).

47.11.4 The selected duration abstract values are those that:

- have the same values for the identical time components of the two "Value"s in the "ValueRange"; and
- are within the specified range for the least significant time component of the two "Value"s in the "ValueRange"; and
- have the same accuracy as the least significant time component of the two "Value"s in the "ValueRange".

NOTE – This provides an alternative to the use of inner subtyping (see 34 *bis*.4.4) as a means of specifying a duration that uses only a single time component to a specified accuracy.

EXAMPLE: **TIME ("PT2M0.000S" .. "PT2M59.000S")** defines a **TIME** subtype that consists only of abstract values representing durations of 2 minutes and zero to 59 seconds, to an accuracy of one millisecond.

47.12 Time point range

47.12.1 The "TimePointRange" notation shall be:

TimePointRange ::= ValueRange

47.12.2 Both the "Value"s in the "ValueRange" shall identify a time abstract value (either value notation or a value reference) that is present in the subtype:

**TIME ((SETTINGS "Basic=Date")
| (SETTINGS "Basic=Time")
(SETTINGS "Basic=DateTime"))**

47.12.3 The two "Value"s in the "ValueRange" shall have identical settings for all time properties except the **Midnight** time property.

NOTE – This allows subtyping using, for example:

TIME ("00:00" .. "09:00")

or:

TIME ("21:00" .. "24:00").

47.12.4 This subtype notation selects from the parent type those abstract values that have identical settings for all time properties (except the **Midnight** time property) to those of the "Value"s in the "ValueRange", and that have values within the specified "ValueRange" (see 47.4).

NOTE – The requirement for all relevant abstract values to have identical settings for all time properties (except the **Midnight** time property) ensures that they are all using the same time-scale, and hence that an order relationship exists among them.

47.13 Recurrence range

47.13.1 The "RecurrenceRange" notation shall be:

RecurrenceRange ::= ValueRange

47.13.2 Both the "Value"s in the "ValueRange" shall be integer values.

47.13.3 For the purposes of ordering only, a time value with a property setting of "**Recurrence=Unlimited**" shall be treated as specifying an infinite number of repetitions (an integer value of **MAX**).

47.13.4 This subtype notation selects from the parent type those abstract values that are also present in the subtype:

TIME (SETTINGS "Basic=Rec-interval")

and that have recurrence values within the specified "ValueRange" (see 47.4).

21) New Annex A bis

Insert a new Annex A bis:

Annex A bis**The defined time types**

(This annex forms an integral part of this Recommendation | International Standard)

A bis.1 General

A bis.1.1 This annex contains an ASN.1 module that specifies the defined time types. These types can be imported into an ASN.1 specification and used in that specification, or can be used as a model for the definition of additional time types. They cannot be used without importation.

A bis.1.2 In some cases, the defined time types are only useful if subtyped with one of the date or time-of-day subsets (or both) specified in this module. Where this is the case, it is clearly stated in the definition of the type.

EXAMPLE: Use

APPLICATION-DATE-TIME ::= DATE-TIME (YEAR-MONTH-DAY-SUBSET) (SECONDS-SUBSET)

to define a date-time that is a year, month, day, hours, minutes, seconds. To use this, the type and the two subtypes have to be imported.

A bis.2 The ASN.1 defined time types module

```
DefinedTimeTypes {joint-iso-itu-t asn1(1) specification(0) modules(0) defined-types-
module(3)}
```

```
DEFINITIONS AUTOMATIC TAGS ::= BEGIN

Local-or-UTC=LD")
END
```

22) New clause E.2 bis

Insert new clause E.2 bis before clause E.3 as follows:

E.2 bis Value notation and property settings (TIME type and useful time types)

This subclause provides examples of value notation for the time type. The same value notation is used for the useful time types, but is restricted to denotation of abstract values that are present in those types. Each example gives a time abstract value in normal human notation, then a value assignment for that value, using a useful time type if there is one that contains it, otherwise using the **TIME** type. The following comment gives the settings needed to define a subtype of the **TIME** type that contains all similar abstract values.

E.2 bis.1 Date

EXAMPLES

Calendar date – 12 April 1985:

```
date1 DATE ::= "1985-04-12" -- Basic=Date Date=YMD Year=Basic
```

Ordinal date – 12 April 1985:

```
date2 TIME ::= "1985-102" -- Basic=Date Date=YD Year=Basic
```

Week date – Friday 12 April 1985:

```
date3 TIME ::= "1985-W15-5" -- Basic=Date Date=YWD Year=Basic
```

ISO/IEC 8824-1:2002/Amd.3:2006 (E)

Calendar week – 15th week of 1985:

```
date4 TIME ::= "1985-W15" -- Basic=Date Date=YW Year=Basic
```

Calendar month – April 1985:

```
date5 TIME ::= "1985-04" -- Basic=Date Date=YM Year=Basic
```

Calendar year – 1985:

```
date6 TIME ::= "1985" -- Basic=Date Date=Y Year=Basic
```

Calendar date – 12 April 1985:

```
date7 TIME ::= "+011985-04-12" -- Basic=Date Date=YMD Year=L6
```

The 12th April in the 2nd year before the year 0000:

```
date8 TIME ::= "-0002-04-12" -- Basic=Date Date=YMD Year=Negative
```

The 20th century:

```
date9 TIME ::= "19C" -- Basic=Date Date=C Year=Basic
```

E.2 bis.2 Time of day

EXAMPLES

27 minutes and 46 seconds past 15 hours:

```
time1 TIME-OF-DAY ::= "15:27:46"  
-- Basic=Time Time=HMS Local-or-UTC=L
```

To the nearest minute:

```
time2 TIME ::= "15:28"  
-- Basic=Time Time=HM Local-or-UTC=L
```

Local time with decimal fractions using comma – 27 minutes and 35 and a half second past 15 hours:

```
time3 TIME ::= "15:27:35,5"  
-- Basic=Time Time=HMSF1 Local-or-UTC=L
```

UTC – 20 minutes and 30 seconds past 23 hours:

```
time4 TIME ::= "23:20:30Z"  
-- Basic=Time Time=HMS Local-or-UTC=Z
```

To the nearest hour:

```
time5 TIME ::= "23Z"  
-- Basic=Time Time=H Local-or-UTC=Z
```

Local time of the day and the difference from UTC – 27 minutes 46 seconds past 15 hours locally in Geneva (one hour ahead of UTC):

```
time6 TIME ::= "15:27:46+01:00"  
-- Basic=Time Time=HMS Local-or-UTC=LD
```

Alternative value notation for the same abstract value:

```
time7 TIME ::= "15:27:46+01"  
-- Basic=Time Time=HMS Local-or-UTC=LD
```

27 minutes 46 seconds past 15 hours locally in New York (five hours behind UTC):

```
time8 TIME ::= "15:27:46-05:00"  
-- Basic=Time Time=HMS Local-or-UTC=LD
```

E.2 bis.3 Date and time of day

EXAMPLES

Combination of calendar date and local time of day:

```
date-time1 DATE-TIME ::= "1985-04-12T10:15:30"  
-- Basic=Date-Time Date=YMD Year=Basic Time=HMS
```

```
-- Local-or-UTC=L
```

Combination of ordinal date and UTC:

```
date-time2 TIME ::= "1985-102T23:50:30Z"
-- Basic=Date-Time Date=YD Year=Basic Time=HMS Local-or-UTC=Z
```

Combinations of week date and local time of the day:

```
date-time3 TIME ::= "1985-W14-5T23:50:30"
-- Basic=Date-Time Date=YWD Year=Basic Time=HMS
-- Local-or-UTC=L
```

E.2 bis.4 Time interval

EXAMPLES

A time interval starting at 20 minutes and 50 seconds past 23 hours on 12 April 1985 and ending at 30 minutes past 10 hours on 25 June 1985:

```
interval1 TIME ::= "1985-04-12T23:20:50/1985-06-25T10:30:00"
-- Basic=Interval Interval-type=SE SE-point=Date-Time
-- Date=YMD Year=Basic Time=HMS Local-or-UTC=L
```

A time interval starting at 12 April 1985 and ending on 25 June 1985:

```
interval2 TIME ::= "1985-04-12/1985-06-25"
-- Basic=Interval Interval-type=SE SE-point=Date
-- Date=YMD Year=Basic
```

Alternative value notation for the same abstract value:

```
interval3 TIME ::= "1985-04-12/1985-06-25"
-- Basic=Interval Interval-type=SE SE-point=Date
-- Date=YMD Year=Basic
```

A time interval of 2 years, 10 months, 15 days, 10 hours, 20 minutes and 30 seconds:

```
duration1 DURATION ::= "P2Y10M15DT10H20M30S"
-- Basic=Interval Interval-type=D
```

A time interval of 1 year and 6 months:

```
duration2 DURATION ::= "P1Y6M"
-- Basic=Interval Interval-type=D
```

A time interval of seventy-two hours:

```
duration3 DURATION ::= "PT72H"
-- Basic=Interval Interval-type=D
```

A time interval of 1 year, 2 months, 15 days and 12 hours, beginning on 12 April 1985 at 20 minutes past 23 hours:

```
interval4 TIME ::= "1985-04-12T23:20:00/P1Y2M15DT12H"
-- Basic=Interval Interval-type=SD SE-point=Date-Time
-- Date=YMD Year=Basic Time=HMS Local-or-UTC=L
```

A time interval of 1 year, 2 months, 15 days and 12 hours, ending on 12 April 1985 at 20 minutes past 23 hours:

```
interval5 TIME ::= "P1Y2M15DT12H/1985-04-12T23:20:00"
-- Basic=Interval Interval-type=DE SE-point=Date-Time
-- Date=YMD Year=Basic Time=HMS Local-or-UTC=L
```

E.2 bis.5 Recurring interval

EXAMPLES

Fifteen recurrences of a time interval of 2 years, 10 months, 15 days, 10 hours, 20 minutes and 30 seconds:

```
rec-int1 TIME ::= "R15/P2Y10M15DT10H20M30S"
-- Basic=Rec-Interval Recurrence=Unlimited Interval-type=D
```

An unbounded number of recurrences of a time interval of 2 years, 15 days, 10 hours, 20 minutes and 30 seconds:

```
rec-int2 TIME ::= "R/P2Y15DT10H20M30S"
-- Basic=Rec-Interval Recurrence=Unlimited Interval-type=D
```

Two recurrences of a time interval of 1 year and 6 months:

```
rec-int3 TIME ::= "R2/P1Y6M"
-- Basic=Rec-Interval Recurrence=Unlimited Interval-type=D
```

An unbounded number of occurrences of a time interval of 1 year, 2 months, 15 days and 12 hours of which the last occurrence ends at 12 April 1985 at 20 minutes and 50 seconds past 23 hours:

```
rec-int4 TIME ::= "R/P1Y2M15DT12H/1985-04-12T23:20:50"
-- Basic=Rec-Interval Recurrence=Unlimited Interval-type=DE
-- SE-point=Date-Time Date=YMD Year=Basic Time=HMS
-- Local-or-UTC=L
```

23) New clause E.4.8

Insert new clause E.4.8 after clause E.4.7 as follows:

E.4.8 Examples of subtyping the time type are present in 34 *bis*.4, and several useful settings are given in the comments in E.2 *bis*. Additional examples follow, with comments. Note that all examples of subtyping can also be applied to the useful time types, but will only select abstract values that are already present in those types. The main use of this notation is to provide variations on the useful time types.

EXAMPLES

```
My-Date ::= TIME
  (SETTINGS "Basic=Date Year=Basic Date=YD")
  -- A date type that uses years and days

My-Date1 ::= TIME
  (SETTINGS "Basic=Date Year=Basic Date=YD")
  ("2000-001" .. < "2011-001")
  -- A date type that uses years and days restricted to the
  -- period from the 1st Jan. AD 2000 to Dec. 31st AD 2010, inclusive.

My-Date2 ::= TIME
  ("2000-001" .. < "2011-001")
  -- The same date type as My-Date1, but this is probably less
  -- clear to a human user. It relies on the property settings
  -- being deduced from the value notation (see Annex G ter).

My-Illegal-Date ::= TIME
  ("1500-00" .. < "2011-00")
  -- The lower bound is a proleptic date, and the upper bound
  -- is a basic date, so they do not have the same properties,
  -- and this is illegal.

My-time-of-day-1 ::= TIME
  (SETTINGS "Basic=Time Time=HMS Local-or-UTC=L
  Midnight=Start")
  -- This is the same as TIME-OF-DAY, but midnight at the end of
  -- the day is excluded, with the only midnight being represented
  -- by the value notation "00:00:00".

My-time-of-day-2 ::= TIME
  (SETTINGS "Basic=Time Time=HMS Local-or-UTC=L
  Midnight=End")
  -- This is the same as TIME-OF-DAY, but midnight at the start of
  -- the day is excluded, with the only midnight being represented
  -- by the value notation "24:00:00".

My-time-of-day-3 ::= TIME
  (SETTINGS "Basic=Time Time=HMS Local-or-UTC=Z")
  -- This is the same as TIME-OF-DAY, but the time is UTC, not
  -- local time.
```

24) New Annexes *G bis* and *G ter*

Insert new Annexes *G bis* and *G ter* as follows:

Annex *G bis*

Tutorial annex on the **TIME** type

(This annex does not form an integral part of this Recommendation | International Standard)

G bis.1 The collections of ASN.1 types for times and dates

G bis.1.1 Historically, ASN.1 defined its own time type, **UTCTime**, as a "UsefulType", because it was based on specifying the contents of a **VisibleString** type. Later, **GeneralizedTime** was added, allowing a four-digit year, and defined by reference to a set of standards that were the predecessors of the first (1988) version of ISO 8601, to specify the contents of a **VisibleString**. (The other "UsefulType", defined by specifying the contents of a **GraphicString**, was **ObjectDescriptor**.) Traditionally, the so-called "UsefulType"s have used mixed upper-lower case letters for their type reference names, with the other built-in ASN.1 types using only upper-case letters. The useful types have, however, their own **UNIVERSAL** class tags, and can be referenced independently in Encoding Rules specifications.

G bis.1.2 While these types (**UTCTime**, **GeneralizedTime** and **ObjectDescriptor**) are undoubtedly useful, the separation of them from other types by the term "UsefulType"s (simply because they are defined in terms of other – character string – types), and the use of mixed upper-lower case in their type reference names has been increasingly recognized as a historical accident.

G bis.1.3 With the introduction of time types to support the 2004 version of ISO 8601, it was recognized that a primary time type (**TIME**) was needed, but that a number of commonly useful time types (**DATE**, **TIME-OF-DAY**, **DATE-TIME** and **DURATION**), defined as subsets of the basic **TIME** type (using the ASN.1 subtype notation), were needed. A decision was taken to call these "Useful time types", and to give them names that were all upper case, in order to minimize backwards compatibility problems, as they are new reserved words. They all have distinct **UNIVERSAL** class tags that are distinct from the tag of the **TIME** type (to enable optimized BER encodings), and are all listed under the production "BuiltinType" (see 16.2).

G bis.2 ISO 8601 key concepts

G bis.2.1 ISO 8601 provides the definitive reference for identification of instants of time and for their character representation. It forms the basis for the specification of the ASN.1 **TIME** type, both in terms of time-related concepts and in terms of actual representations used in ASN.1 value notation and in the Basic Encoding Rules (BER).

G bis.2.2 ISO 8601 is based entirely on the Gregorian calendar introduced in 1582, together with the so-called proleptic Gregorian calendar that extends the Gregorian calendar sequentially backwards in time from 1582, using the normal rules for the definition of common (non-leap) years and leap years. There is in general no easy way to determine a date AD or BC using the Julian calendar from a date specified using the proleptic Gregorian calendar, but in particular the year 1 AD is roughly (but not exactly) in alignment with year 1 proleptic Gregorian, and the year 1 BC (the preceding year) is roughly (but not exactly) in alignment with year 0 proleptic Gregorian.

G bis.2.3 Key definitions and concepts in ISO 8601 include the concept of multiple time-scales for the time axis. Each time-scale consists of an ordered set of marks on the time axis. Each mark represents a time point (an instant of time).

G bis.2.4 Three main time-scales are defined in ISO 8601.

G bis.2.4.1 The first is called the calendar date time-scale. This has marks corresponding to calendar years, calendar months, and the ordinal number of a day within its calendar month (days are numbered 01 to 28, 29, 30 or 31, depending on the month).

G bis.2.4.2 The second is called the ordinal date time-scale. This has marks corresponding to calendar years, and the ordinal number of a day within its calendar year (days are numbered 001 for Jan. 1st to 365 or 366, depending on the year).

G bis.2.4.3 The third is called the week date time-scale. This has marks corresponding to calendar years, the ordinal number of a week within that calendar year, and the ordinal number of a day within that week (with day 1 being Monday). Weeks are numbered 01 to 52 or 53 (depending on the year), with week 01 being defined as the week containing Jan. 4th, and the last week of the previous year being defined as the previous week to that (which is why some years contain 53 weeks).

G bis.2.5 Between the day marks on each time-scale are hour, minute, and second marks. However, the time axis is a continuum of instants of time, and all three of the time-scales also contain marks that are everywhere dense on the time axis.

NOTE – Another way of expressing this is to say that between any two marks there are infinitely more other marks, each identifying a decimal fraction of a second to arbitrarily large accuracy.

G bis.2.6 A variation on the calendar date time-scale is a time-scale in which seconds are not represented, but between each minute time point are infinitely more other marks representing decimal fractions of that minute to arbitrarily large accuracy. The same is true for decimal fractions of an hour.

NOTE – There is no concept in ISO 8601 of specifying a time point using decimal fractions of a day or any larger unit of time, although decimal fractions of a year, a month, a week or a day can be used in specifying a duration.

G bis.2.7 Because the rational number $1/60$ does not have a terminating decimal representation, there are some time points on the time-scale using seconds that cannot be expressed as time points on the time-scale using fractions of a minute, in any finite representation.

G bis.2.8 Similarly, it is not possible to identify which mark for a day on one time-scale corresponds to the mark for a day on a different time-scale, without knowledge of which years are leap years. A similar problem arises with leap seconds with the identification of time intervals using scales based on a start point and an end point, or on a start point and a duration (in seconds, say), or on a duration and an end point.

G bis.2.9 ISO 8601 also recognizes the concept of identification of marks with varying accuracy. Thus on any given time-scale there can be different marks at the same time point, one specifying it as (for example) 3.100 seconds and the other specifying it as 3.1 seconds.

NOTE – In earlier ASN.1 work on time types (**UTCTime** and **GeneralizedTime**), the issue of having separate abstract values for the same time point expressed with different accuracies was not addressed. In the case of the **TIME** type, marks on the time axis that have different accuracy, but that are placed at the same time point, are firmly identified as distinct abstract values. Thus an abstract value that might be represented by 3.100 is distinct from one that might be represented by 3.1, and may carry different application semantics.

G bis.2.10 Control of the accuracy used, and of some other aspects of ISO 8601, is stated in ISO 8601 to be "by mutual agreement". In general, where ISO 8601 identifies areas requiring mutual agreement, notations are provided in ASN.1 for an application designer to specify in the ASN.1 type definition the mutual agreements that are to be assumed. This is done by selecting subsets of the multiple infinities of abstract values in the **TIME** type, using time properties associated with each time abstract value.

G bis.2.11 ISO 8601 recognizes the concept of time difference. This is the difference between local time and UTC for a particular World Time Zone. There is no international authority for agreement on or recording of time differences for different World Time Zones. This is a matter for local administrations, although HM Nautical Almanac Office (UK) attempts to maintain an authoritative record of currently assigned time differences for all parts of the world. As at 2005, time differences in the range -12 to $+14$ have been defined by various local administrations. To allow for possible future changes, ASN.1 supports time differences in the range -15 to $+16$ (only).

G bis.3 Abstract values of the TIME type

G bis.3.1 Each mark on each time-scale, with each accuracy, is identified as a distinct abstract value of the **TIME** type, and thus has a distinct ASN.1 value notation and distinct encodings in all ASN.1 Encoding Rules.

G bis.3.2 ISO 8601 is predominantly concerned with the identification of time points, but distinguishes between identification of date only, of time of day only, and of date and time. These different identifications also produce distinct abstract values in the **TIME** type.

G bis.3.3 Within the identification of time of day, local time or UTC or both can be used. Again, these different identifications produce distinct and unrelated abstract values because of the different time-scales that are being used (and will generally carry different application semantics).

G bis.3.4 Another feature of ISO 8601 is the identification of time intervals using either a start and end point (which can be identified using any of the various time-scales), a duration, or a duration with either a start or an end point. Again, these provide four main sets of abstract values that are distinct from abstract values representing time points, but with many subsets of those main sets of time intervals, depending on the abstract values used in the specification of the start and end point of the time interval, or the time components used in specifying a duration.

NOTE – In ASN.1, it is not possible to use different time-scales for the start point and end point of a time interval. This is for simplicity of specification, and is not expected to be a problem for application designers.

G bis.3.5 Finally, ISO 8601 has the concept of specifying a recurring time interval. Recurring time intervals map into abstract values that are distinct from those representing time intervals and time points.

G bis.4 Time properties of the time abstract values

G bis.4.1 It is possible to identify sets of time abstract values that have common time properties. Some time properties (such as whether it is a time point, a time interval, or a recurring time interval) apply to all time abstract values. Other time properties, such as whether a time interval is expressed as a start point and a duration, or by a duration and an end point (for example), apply only to time abstract values that are time intervals. Similarly, the time property indicating whether a time abstract value represents local time, UTC or both, applies only to time abstract values with at least one component related to time-of-day.

G bis.4.2 Clause 34 *bis.2* and Table 5 *bis* specify the complete set of time properties that can be associated with a time abstract value, and the possible settings for each of those time properties. The setting of a time property can be used in the subtype notation to select subsets of the **TIME** type, all of whose abstract values have the same setting for a given time property.

NOTE – The term "setting of a time property" rather than "value of a time property" is used to avoid confusion with the use of "value" in the term "abstract value".

G bis.4.3 The presence of some time properties on a time abstract value is dependent on the setting of other time properties, as outlined above.

G bis.4.4 In the subtype notation, abstract values of the **TIME** type are specified using a list of time property and setting pairs. There are restrictions on the combinations of time properties and settings that can be specified (see 47.10.6), but the order of the property and setting pairs does not matter (but see G *bis.4.5*). An abstract value of the **TIME** type is included in the subtype if and only if it has the specified setting for all the listed properties that are applicable to it. As usual, it is an illegal ASN.1 specification if the resulting set of abstract values assigned to a type reference is empty (although empty sets are not prohibited in set arithmetic).

G bis.4.5 To provide clarity for human readers, and to avoid errors, it is recommended, but not required, that the order of specification of property and setting pairs proceeds from major properties (such as "**Basic=Date-Time**") to more detailed properties (such as "**TIME=HMS**"). This would generally mean a specification of time property and setting pairs in the order of Table 5 *bis*. This convention is used in all examples in this Recommendation | International Standard (see 34 *bis.4*, E.2 *bis* and E.4.8).

G bis.4.6 It is important for interval specification, and for subtyping using value ranges, to have an order relationship on the abstract values of the **TIME** type. In general, there is an order relationship between abstract values representing time points (based on their position on the time axis) if, and only if, they all have the same time property settings. Similarly, the number of seconds between two time point abstract values can in general only be determined if they have the same property settings. This means that time points used in some of the subtype notations and in interval specification are required to have the same property settings. An order relationship is defined for durations only if they have the same accuracy and differ only in a single time component (see 47.11).

G bis.5 Value notation

G bis.5.1 The value notation (and encoding) for an abstract value depends on its associated time properties and their settings. The value notation is specified in 34 *bis.3*.

G bis.5.2 ISO 8601 in general specifies two separate (character-based) representations, called a basic format and an extended format, for identifying marks in a time-scale.

G bis.5.3 In general, the basic format is a simple string of digits, with non-digit separators (such as a decimal separator) only where needed to provide unambiguous representations within commonly useful subsets of the abstract values implied by ISO 8601. This format is not used by ASN.1 value notation.

NOTE – For example, in the basic format, the string 2020 represents both the year 2020 and also the time 8:20 pm.
