27240 **CHANGE HISTORY**

27241 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

27242 **Issue 6**

27243 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 27244 implementation does not support the Synchronized Input and Output option.

27245 The `fdatasync()` function is marked as part of the Synchronized Input and Output option.

**fdetach()**27246 **NAME**27247 fdetach — detach a name from a STREAMS-based file descriptor (**STREAMS**)27248 **SYNOPSIS**

```
27249 OB XSR #include <stropts.h>
27250 int fdetach(const char *path);
```

27251 **DESCRIPTION**

27252 The *fdetach()* function shall detach a STREAMS-based file from the file to which it was attached  
 27253 by a previous call to *fattach()*. The *path* argument points to the pathname of the attached  
 27254 STREAMS file. The process shall have appropriate privileges or be the owner of the file. A  
 27255 successful call to *fdetach()* shall cause all pathnames that named the attached STREAMS file to  
 27256 again name the file to which the STREAMS file was attached. All subsequent operations on *path*  
 27257 shall operate on the underlying file and not on the STREAMS file.

27258 All open file descriptions established while the STREAMS file was attached to the file referenced  
 27259 by *path* shall still refer to the STREAMS file after the *fdetach()* has taken effect.

27260 If there are no open file descriptors or other references to the STREAMS file, then a successful  
 27261 call to *fdetach()* shall be equivalent to performing the last *close()* on the attached file.

27262 **RETURN VALUE**

27263 Upon successful completion, *fdetach()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 27264 indicate the error.

27265 **ERRORS**

27266 The *fdetach()* function shall fail if:

- |       |                |                                                                                                                                                                                                                                                                                                                                    |
|-------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 27267 | [EACCES]       | Search permission is denied on a component of the path prefix.                                                                                                                                                                                                                                                                     |
| 27268 | [EINVAL]       | The <i>path</i> argument names a file that is not currently attached.                                                                                                                                                                                                                                                              |
| 27269 | [ELOOP]        | A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.                                                                                                                                                                                                                                         |
| 27270 |                |                                                                                                                                                                                                                                                                                                                                    |
| 27271 | [ENAMETOOLONG] | The length of a component of a pathname is longer than {NAME_MAX}.                                                                                                                                                                                                                                                                 |
| 27272 |                |                                                                                                                                                                                                                                                                                                                                    |
| 27273 | [ENOENT]       | A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.                                                                                                                                                                                                                                       |
| 27274 | [ENOTDIR]      | A component of the path prefix is not a directory, or the <i>path</i> argument contains at least one non- <i>&lt;slash&gt;</i> character and ends with one or more trailing <i>&lt;slash&gt;</i> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory. |
| 27275 |                |                                                                                                                                                                                                                                                                                                                                    |
| 27276 |                |                                                                                                                                                                                                                                                                                                                                    |
| 27277 |                |                                                                                                                                                                                                                                                                                                                                    |
| 27278 | [EPERM]        | The effective user ID is not the owner of <i>path</i> and the process does not have appropriate privileges.                                                                                                                                                                                                                        |
| 27279 |                |                                                                                                                                                                                                                                                                                                                                    |

27280 The *fdetach()* function may fail if:

- |       |                |                                                                                                                                                               |
|-------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 27281 | [ELOOP]        | More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.                                                        |
| 27282 |                |                                                                                                                                                               |
| 27283 | [ENAMETOOLONG] | The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}. |
| 27284 |                |                                                                                                                                                               |
| 27285 |                |                                                                                                                                                               |
| 27286 |                |                                                                                                                                                               |

27287 **EXAMPLES**27288 **Detaching a File**

27289 The following example detaches the STREAMS-based file **/tmp/named-STREAM** from the file to  
 27290 which it was attached by a previous, successful call to *fattach()*. Subsequent calls to open this  
 27291 file refer to the underlying file, not to the STREAMS file.

```
27292 #include <stropts.h>
27293 ...
27294     char *filename = "/tmp/named-STREAM";
27295     int ret;
27296
27297     ret = fdetach(filename);
```

27297 **APPLICATION USAGE**

27298 None.

27299 **RATIONALE**

27300 None.

27301 **FUTURE DIRECTIONS**

27302 The *fdetach()* function may be removed in a future version.

27303 **SEE ALSO**

27304 *fattach()*

27305 XBD <*stropts.h*>

27306 **CHANGE HISTORY**

27307 First released in Issue 4, Version 2.

27308 **Issue 5**

27309 Moved from X/OPEN UNIX extension to BASE.

27310 **Issue 6**

27311 The normative text is updated to avoid use of the term “must” for application requirements.

27312 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
 27313 [ELOOP] error condition is added.

27314 **Issue 7**

27315 Austin Group Interpretation 1003.1-2001 #143 is applied.

27316 The *fdetach()* function is marked obsolescent.

27317 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
 27318 pathname exists but is not a directory or a symbolic link to a directory.

**fdim()**27319 **NAME**27320 `fdim`, `fdimf`, `fdiml` — compute positive difference between two floating-point numbers27321 **SYNOPSIS**

```
27322 #include <math.h>
27323 double fdim(double x, double y);
27324 float fdimf(float x, float y);
27325 long double fdiml(long double x, long double y);
```

27326 **DESCRIPTION**

27327 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27328 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27329 volume of POSIX.1-2008 defers to the ISO C standard.

27330 These functions shall determine the positive difference between their arguments. If  $x$  is greater  
 27331 than  $y$ ,  $x-y$  is returned. If  $x$  is less than or equal to  $y$ ,  $+0$  is returned.

27332 An application wishing to check for error situations should set `errno` to zero and call  
 27333 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or  
 27334 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-  
 27335 zero, an error has occurred.

27336 **RETURN VALUE**

27337 Upon successful completion, these functions shall return the positive difference value.

27338 If  $x-y$  is positive and overflows, a range error shall occur and `fdim()`, `fdimf()`, and `fdiml()` shall  
 27339 return the value of the macro `HUGE_VAL`, `HUGE_VALF`, and `HUGE_VALL`, respectively.

27340 XSI If  $x-y$  is positive and underflows, a range error may occur, and either  $(x-y)$  (if representable), or  
 27341 `0.0` (if supported), or an implementation-defined value shall be returned.

27342 MX If  $x$  or  $y$  is NaN, a NaN shall be returned.

27343 **ERRORS**27344 The `fdim()` function shall fail if:

27345 Range Error The result overflows.

27346 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,  
 27347 then `errno` shall be set to `[ERANGE]`. If the integer expression  
 27348 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the overflow  
 27349 floating-point exception shall be raised.

27350 The `fdim()` function may fail if:

27351 Range Error The result underflows.

27352 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,  
 27353 then `errno` shall be set to `[ERANGE]`. If the integer expression  
 27354 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the underflow  
 27355 floating-point exception shall be raised.

27356 **EXAMPLES**

27357 None.

27358 **APPLICATION USAGE**

27359 On implementations supporting IEEE Std 754-1985,  $x-y$  cannot underflow, and hence the 0.0  
27360 return value is shaded as an extension for implementations supporting the XSI option rather  
27361 than an MX extension.

27362 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
27363 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

27364 **RATIONALE**

27365 None.

27366 **FUTURE DIRECTIONS**

27367 None.

27368 **SEE ALSO**27369 [feclearexcept\(\)](#), [fetestexcept\(\)](#), [fmax\(\)](#), [fmin\(\)](#)27370 [Section 4.19](#) (on page 116), [<math.h>](#)27371 **CHANGE HISTORY**

27372 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**fdopen()**27373 **NAME**27374 `fdopen` — associate a stream with a file descriptor27375 **SYNOPSIS**

```
27376 CX #include <stdio.h>
27377 FILE *fdopen(int fildev, const char *mode);
```

27378 **DESCRIPTION**27379 The `fdopen()` function shall associate a stream with a file descriptor.27380 The *mode* argument is a character string having one of the following values:27381 *r* or *rb* Open a file for reading.27382 *w* or *wb* Open a file for writing.27383 *a* or *ab* Open a file for writing at end-of-file.27384 *r+* or *rb+* or *r+b* Open a file for update (reading and writing).27385 *w+* or *wb+* or *w+b* Open a file for update (reading and writing).27386 *a+* or *ab+* or *a+b* Open a file for update (reading and writing) at end-of-file.27387 The meaning of these flags is exactly as specified in `fopen()`, except that modes beginning with *w*  
27388 shall not cause truncation of the file.27389 Additional values for the *mode* argument may be supported by an implementation.27390 The application shall ensure that the mode of the stream as expressed by the *mode* argument is  
27391 allowed by the file access mode of the open file description to which *fildev* refers. The file  
27392 position indicator associated with the new stream is set to the position indicated by the file offset  
27393 associated with the file descriptor.27394 The error and end-of-file indicators for the stream shall be cleared. The `fdopen()` function may  
27395 cause the last data access timestamp of the underlying file to be marked for update.27396 SHM If *fildev* refers to a shared memory object, the result of the `fdopen()` function is unspecified.27397 TYM If *fildev* refers to a typed memory object, the result of the `fdopen()` function is unspecified.27398 The `fdopen()` function shall preserve the offset maximum previously set for the open file  
27399 description corresponding to *fildev*.27400 **RETURN VALUE**27401 Upon successful completion, `fdopen()` shall return a pointer to a stream; otherwise, a null pointer  
27402 shall be returned and *errno* set to indicate the error.27403 **ERRORS**27404 The `fdopen()` function shall fail if:

27405 [EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

27406 The `fdopen()` function may fail if:27407 [EBADF] The *fildev* argument is not a valid file descriptor.27408 [EINVAL] The *mode* argument is not a valid mode.

27409 [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

27410 [ENOMEM] Insufficient space to allocate a buffer.

#### 27411 EXAMPLES

27412 None.

#### 27413 APPLICATION USAGE

27414 File descriptors are obtained from calls like *open()*, *dup()*, *creat()*, or *pipe()*, which open files but  
27415 do not return streams.

#### 27416 RATIONALE

27417 The file descriptor may have been obtained from *open()*, *creat()*, *pipe()*, *dup()*, *fcntl()*, or *socket()*;  
27418 inherited through *fork()*, *posix\_spawn()*, or *exec*; or perhaps obtained by other means.

27419 The meanings of the *mode* arguments of *fdopen()* and *fopen()* differ. With *fdopen()*, open for write  
27420 (*w* or *w+*) does not truncate, and append (*a* or *a+*) cannot create for writing. The *mode* argument  
27421 formats that include *a b* are allowed for consistency with the ISO C standard function *fopen()*.  
27422 The *b* has no effect on the resulting stream. Although not explicitly required by this volume of  
27423 POSIX.1-2008, a good implementation of append (*a*) mode would cause the O\_APPEND flag to  
27424 be set.

#### 27425 FUTURE DIRECTIONS

27426 None.

#### 27427 SEE ALSO

27428 [Section 2.5.1](#) (on page 491), *fclose()*, *fmemopen()*, *fopen()*, *open()*, *open\_memstream()*,  
27429 *posix\_spawn()*, *socket()*

27430 XBD <stdio.h>

#### 27431 CHANGE HISTORY

27432 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 27433 Issue 5

27434 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

27435 Large File Summit extensions are added.

#### 27436 Issue 6

27437 The following new requirements on POSIX implementations derive from alignment with the  
27438 Single UNIX Specification:

- 27439 • In the DESCRIPTION, the use and setting of the *mode* argument are changed to include  
27440 binary streams.
- 27441 • In the DESCRIPTION, text is added for large file support to indicate setting of the offset  
27442 maximum in the open file description.
- 27443 • All errors identified in the ERRORS section are added.
- 27444 • In the DESCRIPTION, text is added that the *fdopen()* function may cause *st\_atime* to be  
27445 updated.

27446 The following changes were made to align with the IEEE P1003.1a draft standard:

- 27447 • Clarification is added that it is the responsibility of the application to ensure that the mode  
27448 is compatible with the open file descriptor.

27449 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
27450 *fdopen()* results are unspecified for typed memory objects.

**fdopen()**

- 27451 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/30 is applied, making corrections to the  
27452 RATIONALE.
- 27453 **Issue 7**
- 27454 SD5-XSH-ERN-149 is applied, adding the {STREAM\_MAX} [EMFILE] error condition.
- 27455 Changes are made related to support for finegrained timestamps.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

27456 **NAME**27457 `fdopendir, opendir` — open directory associated with file descriptor27458 **SYNOPSIS**

```
27459 #include <dirent.h>
27460 DIR *fdopendir(int fd);
27461 DIR *opendir(const char *dirname);
```

27462 **DESCRIPTION**

27463 The `fdopendir()` function shall be equivalent to the `opendir()` function except that the directory is  
 27464 specified by a file descriptor rather than by a name. The file offset associated with the file  
 27465 descriptor at the time of the call determines which entries are returned.

27466 Upon successful return from `fdopendir()`, the file descriptor is under the control of the system,  
 27467 and if any attempt is made to close the file descriptor, or to modify the state of the associated  
 27468 description, other than by means of `closedir()`, `readdir()`, `readdir_r()`, or `rewinddir()`, the behavior  
 27469 is undefined. Upon calling `closedir()` the file descriptor shall be closed.

27470 It is unspecified whether the `FD_CLOEXEC` flag will be set on the file descriptor by a successful  
 27471 call to `fdopendir()`.

27472 The `opendir()` function shall open a directory stream corresponding to the directory named by  
 27473 the `dirname` argument. The directory stream is positioned at the first entry. If the type **DIR**  
 27474 is implemented using a file descriptor, applications shall only be able to open up to a total of  
 27475 `{OPEN_MAX}` files and directories.

27476 If the type **DIR** is implemented using a file descriptor, the descriptor shall be obtained as if the  
 27477 `O_DIRECTORY` flag was passed to `open()`.

27478 **RETURN VALUE**

27479 Upon successful completion, these functions shall return a pointer to an object of type **DIR**.  
 27480 Otherwise, these functions shall return a null pointer and set `errno` to indicate the error.

27481 **ERRORS**

27482 The `fdopendir()` function shall fail if:

27483 [EBADF] The `fd` argument is not a valid file descriptor open for reading.

27484 [ENOTDIR] The descriptor `fd` is not associated with a directory.

27485 The `opendir()` function shall fail if:

27486 [EACCES] Search permission is denied for the component of the path prefix of `dirname` or  
 27487 read permission is denied for `dirname`.

27488 [ELOOP] A loop exists in symbolic links encountered during resolution of the `dirname`  
 27489 argument.

27490 [ENAMETOOLONG] The length of a component of a pathname is longer than `{NAME_MAX}`.

27492 [ENOENT] A component of `dirname` does not name an existing directory or `dirname` is an  
 27493 empty string.

27494 [ENOTDIR] A component of `dirname` is not a directory.

**fdopendir()**

- 27495 The *opendir()* function may fail if:
- 27496 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
27497 resolution of the *dirname* argument.
- 27498 [EMFILE] All file descriptors available to the process are currently open.
- 27499 [ENAMETOOLONG]  
27500 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
27501 symbolic link produced an intermediate result with a length that exceeds  
27502 {PATH\_MAX}.
- 27503 [ENFILE] Too many files are currently open in the system.

27504 **EXAMPLES**27505 **Open a Directory Stream**

27506 The following program fragment demonstrates how the *opendir()* function is used.

```
27507 #include <dirent.h>
27508 ...
27509     DIR *dir;
27510     struct dirent *dp;
27511 ...
27512     if ((dir = opendir (".")) == NULL) {
27513         perror ("Cannot open .");
27514         exit (1);
27515     }
27516     while ((dp = readdir (dir)) != NULL) {
27517         ...
```

27518 **Find And Open a File**

27519 The following program searches through a given directory looking for files whose name does  
27520 not begin with a dot and whose size is larger than 1 MiB.

```
27521 #include <stdio.h>
27522 #include <dirent.h>
27523 #include <fcntl.h>
27524 #include <sys/stat.h>
27525 #include <stdint.h>
27526 #include <stdlib.h>
27527 #include <unistd.h>
27528 int
27529 main(int argc, char *argv[])
27530 {
27531     struct stat statbuf;
27532     DIR *d;
27533     struct dirent *dp;
27534     int dfd, ffd;
27535     if ((d = fdopendir((dfd = open("./tmp", O_RDONLY))) == NULL) {
27536         fprintf(stderr, "Cannot open ./tmp directory\n");
27537         exit(1);
```

```

27538     }
27539     while ((dp = readdir(d)) != NULL) {
27540         if (dp->d_name[0] == '.')
27541             continue;
27542         /* there is a possible race condition here as the file
27543          * could be renamed between the readdir and the open */
27544         if ((ffd = openat(dfd, dp->d_name, O_RDONLY)) == -1) {
27545             perror(dp->d_name);
27546             continue;
27547         }
27548         if (fstat(ffd, &statbuf) == 0 && statbuf.st_size > (1024*1024)) {
27549             /* found it ... */
27550             printf("%s: %jdK\n", dp->d_name,
27551                 (intmax_t)(statbuf.st_size / 1024));
27552         }
27553         close(ffd);
27554     }
27555     closedir(d); // note this implicitly closes dfd
27556     return 0;
27557 }

```

#### 27558 APPLICATION USAGE

27559 The *opendir()* function should be used in conjunction with *readdir()*, *closedir()*, and *rewinddir()* to  
 27560 examine the contents of the directory (see the EXAMPLES section in *readdir()*). This method is  
 27561 recommended for portability.

#### 27562 RATIONALE

27563 The purpose of the *fdopendir()* function is to enable opening files in directories other than the  
 27564 current working directory without exposure to race conditions. Any part of the path of a file  
 27565 could be changed in parallel to a call to *opendir()*, resulting in unspecified behavior.

27566 Based on historical implementations, the rules about file descriptors apply to directory streams  
 27567 as well. However, this volume of POSIX.1-2008 does not mandate that the directory stream be  
 27568 implemented using file descriptors. The description of *closedir()* clarifies that if a file descriptor  
 27569 is used for the directory stream, it is mandatory that *closedir()* deallocate the file descriptor.  
 27570 When a file descriptor is used to implement the directory stream, it behaves as if the  
 27571 FD\_CLOEXEC had been set for the file descriptor.

27572 The directory entries for dot and dot-dot are optional. This volume of POSIX.1-2008 does not  
 27573 provide a way to test *a priori* for their existence because an application that is portable must be  
 27574 written to look for (and usually ignore) those entries. Writing code that presumes that they are  
 27575 the first two entries does not always work, as many implementations permit them to be other  
 27576 than the first two entries, with a “normal” entry preceding them. There is negligible value in  
 27577 providing a way to determine what the implementation does because the code to deal with dot  
 27578 and dot-dot must be written in any case and because such a flag would add to the list of those  
 27579 flags (which has proven in itself to be objectionable) and might be abused.

27580 Since the structure and buffer allocation, if any, for directory operations are defined by the  
 27581 implementation, this volume of POSIX.1-2008 imposes no portability requirements for erroneous  
 27582 program constructs, erroneous data, or the use of unspecified values such as the use or  
 27583 referencing of a *dirp* value or a **dirent** structure value after a directory stream has been closed or  
 27584 after a *fork()* or one of the *exec* function calls.

**fdopendir()**27585 **FUTURE DIRECTIONS**

27586 None.

27587 **SEE ALSO**27588 *closedir()*, *dirfd()*, *fstatat()*, *open()*, *readdir()*, *rewinddir()*, *symlink()*27589 XBD **<dirent.h>**, **<sys/types.h>**27590 **CHANGE HISTORY**

27591 First released in Issue 2.

27592 **Issue 6**27593 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.27594 The following new requirements on POSIX implementations derive from alignment with the  
27595 Single UNIX Specification:

- 27596 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was  
27597 required for conforming implementations of previous POSIX specifications, it was not  
27598 required for UNIX applications.
- 27599 • The [ELOOP] mandatory error condition is added.
- 27600 • A second [ENAMETOOLONG] is added as an optional error condition.

27601 The following changes were made to align with the IEEE P1003.1a draft standard:

- 27602 • The [ELOOP] optional error condition is added.

27603 **Issue 7**

27604 Austin Group Interpretation 1003.1-2001 #143 is applied.

27605 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

27606 The *fdopendir()* function is added from The Open Group Technical Standard, 2006, Extended API  
27607 Set Part 2.

27608 An additional example is added.

27609 **NAME**27610 `feclearexcept` — clear floating-point exception27611 **SYNOPSIS**27612 `#include <fenv.h>`27613 `int feclearexcept(int excepts);`27614 **DESCRIPTION**27615 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
27616 conflict between the requirements described here and the ISO C standard is unintentional. This  
27617 volume of POSIX.1-2008 defers to the ISO C standard.27618 The `feclearexcept()` function shall attempt to clear the supported floating-point exceptions  
27619 represented by *excepts*.27620 **RETURN VALUE**27621 If the argument is zero or if all the specified exceptions were successfully cleared, `feclearexcept()`  
27622 shall return zero. Otherwise, it shall return a non-zero value.27623 **ERRORS**

27624 No errors are defined.

27625 **EXAMPLES**

27626 None.

27627 **APPLICATION USAGE**

27628 None.

**fegetenv()**27639 **NAME**

27640 fegetenv, fesetenv — get and set current floating-point environment

27641 **SYNOPSIS**

```
27642 #include <fenv.h>
27643 int fegetenv(fenv_t *envp);
27644 int fesetenv(const fenv_t *envp);
```

27645 **DESCRIPTION**

27646 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 27647 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27648 volume of POSIX.1-2008 defers to the ISO C standard.

27649 The *fegetenv()* function shall attempt to store the current floating-point environment in the object  
 27650 pointed to by *envp*.

27651 The *fesetenv()* function shall attempt to establish the floating-point environment represented by  
 27652 the object pointed to by *envp*. The argument *envp* shall point to an object set by a call to  
 27653 *fegetenv()* or *fehldexcept()*, or equal a floating-point environment macro. The *fesetenv()* function  
 27654 does not raise floating-point exceptions, but only installs the state of the floating-point status  
 27655 flags represented through its argument.

27656 **RETURN VALUE**

27657 If the representation was successfully stored, *fegetenv()* shall return zero. Otherwise, it shall  
 27658 return a non-zero value. If the environment was successfully established, *fesetenv()* shall return  
 27659 zero. Otherwise, it shall return a non-zero value.

27660 **ERRORS**

27661 No errors are defined.

27662 **EXAMPLES**

27663 None.

27664 **APPLICATION USAGE**

27665 None.

27666 **RATIONALE**

27667 None.

27668 **FUTURE DIRECTIONS**

27673 **CHANGE HISTORY**

27674 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

27675 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

27676 **NAME**

27677 fegetexceptflag, fesetexceptflag — get and set floating-point status flags

27678 **SYNOPSIS**

27679 #include &lt;fenv.h&gt;

27680 int fegetexceptflag(fexcept\_t \*flagp, int excepts);

27681 int fesetexceptflag(const fexcept\_t \*flagp, int excepts);

27682 **DESCRIPTION**

27683 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 27684 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27685 volume of POSIX.1-2008 defers to the ISO C standard.

27686 The *fegetexceptflag()* function shall attempt to store an implementation-defined representation of  
 27687 the states of the floating-point status flags indicated by the argument *excepts* in the object  
 27688 pointed to by the argument *flagp*.

27689 The *fesetexceptflag()* function shall attempt to set the floating-point status flags indicated by the  
 27690 argument *excepts* to the states stored in the object pointed to by *flagp*. The value pointed to by  
 27691 *flagp* shall have been set by a previous call to *fegetexceptflag()* whose second argument  
 27692 represented at least those floating-point exceptions represented by the argument *excepts*. This  
 27693 function does not raise floating-point exceptions, but only sets the state of the flags.

27694 **RETURN VALUE**

27695 If the representation was successfully stored, *fegetexceptflag()* shall return zero. Otherwise, it  
 27696 shall return a non-zero value. If the *excepts* argument is zero or if all the specified exceptions  
 27697 were successfully set, *fesetexceptflag()* shall return zero. Otherwise, it shall return a non-zero  
 27698 value.

27699 **ERRORS**

27700 No errors are defined.

27701 **EXAMPLES**

27702 None.

27703 **APPLICATION USAGE**

27704 None.

27705 **RATIONALE**

27706 None.

27707 **FUTURE DIRECTIONS**

27708 None.

27709 **SEE ALSO**27710 *feclearexcept()*, *feraiseexcept()*, *fetestexcept()*

27711 XBD &lt;fenv.h&gt;

27712 **CHANGE HISTORY**

27713 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

27714 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

**fegetround()**27715 **NAME**

27716 fegetround, fesetround — get and set current rounding direction

27717 **SYNOPSIS**

```
27718 #include <fenv.h>
27719 int fegetround(void);
27720 int fesetround(int round);
```

27721 **DESCRIPTION**

27722 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27723 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27724 volume of POSIX.1-2008 defers to the ISO C standard.

27725 The *fegetround()* function shall get the current rounding direction.

27726 The *fesetround()* function shall establish the rounding direction represented by its argument  
 27727 *round*. If the argument is not equal to the value of a rounding direction macro, the rounding  
 27728 direction is not changed.

27729 **RETURN VALUE**

27730 The *fegetround()* function shall return the value of the rounding direction macro representing the  
 27731 current rounding direction or a negative value if there is no such rounding direction macro or  
 27732 the current rounding direction is not determinable.

27733 The *fesetround()* function shall return a zero value if and only if the requested rounding direction  
 27734 was established.

27735 **ERRORS**

27736 No errors are defined.

27737 **EXAMPLES**

27738 The following example saves, sets, and restores the rounding direction, reporting an error and  
 27739 aborting if setting the rounding direction fails:

```
27740 #include <fenv.h>
27741 #include <assert.h>
27742 void f(int round_dir)
27743 {
27744     #pragma STDC FENV_ACCESS ON
27745     int save_round;
27746     int setround_ok;
27747     save_round = fegetround();
27748     setround_ok = fesetround(round_dir);
27749     assert(setround_ok == 0);
27750     /* ... */
27751     fesetround(save_round);
27752     /* ... */
27753 }
```

27754 **APPLICATION USAGE**

27755 None.

27756 **RATIONALE**

27757 None.

27758 **FUTURE DIRECTIONS**

27759 None.

27760 **SEE ALSO**27761 XBD [<fenv.h>](#)27762 **CHANGE HISTORY**

27763 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**feholdexcept()**27765 **NAME**

27766 feholdexcept — save current floating-point environment

27767 **SYNOPSIS**

27768 #include &lt;fenv.h&gt;

27769 int feholdexcept(fenv\_t \*envp);

27770 **DESCRIPTION**27771 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
27772 conflict between the requirements described here and the ISO C standard is unintentional. This  
27773 volume of POSIX.1-2008 defers to the ISO C standard.27774 The *feholdexcept()* function shall save the current floating-point environment in the object  
27775 pointed to by *envp*, clear the floating-point status flags, and then install a non-stop (continue on  
27776 floating-point exceptions) mode, if available, for all floating-point exceptions.27777 **RETURN VALUE**27778 The *feholdexcept()* function shall return zero if and only if non-stop floating-point exception  
27779 handling was successfully installed.27780 **ERRORS**

27781 No errors are defined.

27782 **EXAMPLES**

27783 None.

27784 **APPLICATION USAGE**

27785 None.

27786 **RATIONALE**27787 The *feholdexcept()* function should be effective on typical IEC 60559:1989 standard  
27788 implementations which have the default non-stop mode and at least one other mode for trap  
27789 handling or aborting. If the implementation provides only the non-stop mode, then installing the  
27790 non-stop mode is trivial.27791 **FUTURE DIRECTIONS**

27792 None.

27793 **SEE ALSO**27794 [fegetenv\(\)](#), [feupdateenv\(\)](#)27795 XBD [<fenv.h>](#)27796 **CHANGE HISTORY**

27797 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

27798 **NAME**

27799 feof — test end-of-file indicator on a stream

27800 **SYNOPSIS**

27801 #include &lt;stdio.h&gt;

27802 int feof(FILE \*stream);

27803 **DESCRIPTION**

27804 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27805 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27806 volume of POSIX.1-2008 defers to the ISO C standard.

27807 The *feof()* function shall test the end-of-file indicator for the stream pointed to by *stream*.27808 **RETURN VALUE**27809 The *feof()* function shall return non-zero if and only if the end-of-file indicator is set for *stream*.27810 **ERRORS**

27811 No errors are defined.

27812 **EXAMPLES**

27813 None.

27814 **APPLICATION USAGE**

27815 None.

27816 **RATIONALE**

27817 None.

27818 **FUTURE DIRECTIONS**

27819 None.

27820 **SEE ALSO**27821 *clearerr()*, *ferror()*, *fopen()*

27823 **CHANGE HISTORY**

27824 First released in Issue 1. Derived from Issue 1 of the SVID.

**feraiseexcept()**27825 **NAME**27826 `feraiseexcept` — raise floating-point exception27827 **SYNOPSIS**

```
27828 #include <fenv.h>
27829 int feraiseexcept(int excepts);
```

27830 **DESCRIPTION**

27831 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27832 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27833 volume of POSIX.1-2008 defers to the ISO C standard.

27834 The *feraiseexcept()* function shall attempt to raise the supported floating-point exceptions  
 27835 represented by the argument *excepts*. The order in which these floating-point exceptions are  
 27836 raised is unspecified. Whether the *feraiseexcept()* function additionally raises the inexact floating-  
 27837 point exception whenever it raises the overflow or underflow floating-point exception is  
 27838 implementation-defined.

27839 **RETURN VALUE**

27840 If the argument is zero or if all the specified exceptions were successfully raised, *feraiseexcept()*  
 27841 shall return zero. Otherwise, it shall return a non-zero value.

27842 **ERRORS**

27843 No errors are defined.

27844 **EXAMPLES**

27845 None.

27846 **APPLICATION USAGE**

27847 The effect is intended to be similar to that of floating-point exceptions raised by arithmetic  
 27848 operations. Hence, enabled traps for floating-point exceptions raised by this function are taken.

27849 **RATIONALE**

27850 Raising overflow or underflow is allowed to also raise inexact because on some architectures the  
 27851 only practical way to raise an exception is to execute an instruction that has the exception as a  
 27852 side-effect. The function is not restricted to accept only valid coincident expressions for atomic  
 27853 operations, so the function can be used to raise exceptions accrued over several operations.

27854 **FUTURE DIRECTIONS**

27855 None.

27910 **NAME**27911 `fetestexcept` — test floating-point exception flags27912 **SYNOPSIS**27913 `#include <fenv.h>`27914 `int fetestexcept(int excepts);`27915 **DESCRIPTION**27916 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
27917 conflict between the requirements described here and the ISO C standard is unintentional. This  
27918 volume of POSIX.1-2008 defers to the ISO C standard.27919 The `fetestexcept()` function shall determine which of a specified subset of the floating-point  
27920 exception flags are currently set. The `excepts` argument specifies the floating-point status flags to  
27921 be queried.27922 **RETURN VALUE**27923 The `fetestexcept()` function shall return the value of the bitwise-inclusive OR of the floating-point  
27924 exception macros corresponding to the currently set floating-point exceptions included in  
27925 `excepts`.27926 **ERRORS**

27927 No errors are defined.

27928 **EXAMPLES**27929 The following example calls function `f()` if an invalid exception is set, and then function `g()` if an  
27930 overflow exception is set:27931 `#include <fenv.h>`  
27932 `/* ... */`  
27933 `{`  
27934  `#pragma STDC FENV_ACCESS ON`  
27935  `int set_excepts;`  
27936  `feclearexcept(FE_INVALID | FE_OVERFLOW);`  
27937  `// maybe raise exceptions`  
27938  `set_excepts = fetestexcept(FE_INVALID | FE_OVERFLOW);`  
27939  `if (set_excepts & FE_INVALID) f();`  
27940  `if (set_excepts & FE_OVERFLOW) g();`  
27941  `/* ... */`  
27942 `}`27943 **APPLICATION USAGE**

27944 None.

27945 **RATIONALE**

27946 None.

27947 **FUTURE DIRECTIONS**

27948 None.

## **fetestexcept()**

27952 **CHANGE HISTORY**

27953 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

27954 **NAME**

27955 feupdateenv — update floating-point environment

27956 **SYNOPSIS**

```
27957 #include <fenv.h>
27958 int feupdateenv(const fenv_t *envp);
```

27959 **DESCRIPTION**

27960 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 27961 conflict between the requirements described here and the ISO C standard is unintentional. This  
 27962 volume of POSIX.1-2008 defers to the ISO C standard.

27963 The *feupdateenv()* function shall attempt to save the currently raised floating-point exceptions in  
 27964 its automatic storage, attempt to install the floating-point environment represented by the object  
 27965 pointed to by *envp*, and then attempt to raise the saved floating-point exceptions. The argument  
 27966 *envp* shall point to an object set by a call to *fehldexcept()* or *fegetenv()*, or equal a floating-point  
 27967 environment macro.

27968 **RETURN VALUE**

27969 The *feupdateenv()* function shall return a zero value if and only if all the required actions were  
 27970 successfully carried out.

27971 **ERRORS**

27972 No errors are defined.

27973 **EXAMPLES**

27974 The following example shows sample code to hide spurious underflow floating-point  
 27975 exceptions:

```
27976 #include <fenv.h>
27977 double f(double x)
27978 {
27979     #pragma STDC FENV_ACCESS ON
27980     double result;
27981     fenv_t save_env;
27982     fehldexcept(&save_env);
27983     // compute result
27984     if (/* test spurious underflow */)
27985         feclearexcept(FE_UNDERFLOW);
27986     feupdateenv(&save_env);
27987     return result;
27988 }
```

27989 **APPLICATION USAGE**

27990 None.

27991 **RATIONALE**

27992 None.

27993 **FUTURE DIRECTIONS**

27994 None.

27995 **SEE ALSO**

*System Interfaces***fexecve**28001 **NAME**

28002       fexecve — execute a file

28003 **SYNOPSIS**

28004       #include &lt;unistd.h&gt;

28005       int fexecve(int *fd*, char \*const *argv*[], char \*const *envp*[]);28006 **DESCRIPTION**28007       Refer to *exec*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**fflush()**28008 **NAME**

28009 fflush — flush a stream

28010 **SYNOPSIS**

28011 #include &lt;stdio.h&gt;

28012 int fflush(FILE \*stream);

28013 **DESCRIPTION**

28014 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 28015 conflict between the requirements described here and the ISO C standard is unintentional. This  
 28016 volume of POSIX.1-2008 defers to the ISO C standard.

28017 If *stream* points to an output stream or an update stream in which the most recent operation was  
 28018 CX not input, *fflush()* shall cause any unwritten data for that stream to be written to the file, and the  
 28019 last data modification and last file status change timestamps of the underlying file shall be  
 28020 marked for update.

28021 If *stream* is a null pointer, *fflush()* shall perform this flushing action on all streams for which the  
 28022 behavior is defined above.

28023 CX For a stream open for reading, if the file is not already at EOF, and the file is one capable of  
 28024 seeking, the file offset of the underlying open file description shall be adjusted so that the next  
 28025 operation on the open file description deals with the byte after the last one read from or written  
 28026 to the stream being flushed.

28027 **RETURN VALUE**

28028 Upon successful completion, *fflush()* shall return 0; otherwise, it shall set the error indicator for  
 28029 CX the stream, return EOF, and set *errno* to indicate the error.

28030 **ERRORS**28031 The *fflush()* function shall fail if:

28032 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and  
 28033 the thread would be delayed in the write operation.

28034 CX [EBADF] The file descriptor underlying *stream* is not valid.

28035 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

28036 XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the  
 28037 process.

28038 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the  
 28039 offset maximum associated with the corresponding stream.

28040 CX [EINTR] The *fflush()* function was interrupted by a signal.

28041 CX [EIO] The process is a member of a background process group attempting to write to  
 28042 its controlling terminal, TOSTOP is set, the process is neither ignoring nor  
 28043 blocking SIGTTOU, and the process group of the process is orphaned. This  
 28044 error may also be returned under implementation-defined conditions.

28045 CX [ENOMEM] The underlying stream was created by *open\_memstream()* or  
 28046 *open\_wmemstream()* and insufficient memory is available.

28047 CX [ENOSPC] There was no free space remaining on the device containing the file or in the  
 28048 buffer used by the *fmemopen()* function.

28049 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
28050 any process. A SIGPIPE signal shall also be sent to the thread.

28051 The *fflush()* function may fail if:

28052 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
28053 capabilities of the device.

## 28054 EXAMPLES

### 28055 Sending Prompts to Standard Output

28056 The following example uses *printf()* calls to print a series of prompts for information the user  
28057 must enter from standard input. The *fflush()* calls force the output to standard output. The  
28058 *fflush()* function is used because standard output is usually buffered and the prompt may not  
28059 immediately be printed on the output or terminal. The *getline()* function calls read strings from  
28060 standard input and place the results in variables, for use later in the program.

```
28061 char *user;
28062 char *oldpasswd;
28063 char *newpasswd;
28064 ssize_t llen;
28065 size_t blen;
28066 struct termios term;
28067 tcflag_t saveflag;

28068 printf("User name: ");
28069 fflush(stdout);
28070 blen = 0;
28071 llen = getline(&user, &blen, stdin);
28072 user[llen-1] = 0;
28073 tcgetattr(fileno(stdin), &term);
28074 saveflag = term.c_lflag;
28075 term.c_lflag &= ~ECHO;
28076 tcsetattr(fileno(stdin), TCSANOW, &term);
28077 printf("Old password: ");
28078 fflush(stdout);
28079 blen = 0;
28080 llen = getline(&oldpasswd, &blen, stdin);
28081 oldpasswd[llen-1] = 0;

28082 printf("\nNew password: ");
28083 fflush(stdout);
28084 blen = 0;
28085 llen = getline(&newpasswd, &blen, stdin);
28086 newpasswd[llen-1] = 0;
28087 term.c_lflag = saveflag;
28088 tcsetattr(fileno(stdin), TCSANOW, &term);
28089 free(user);
28090 free(oldpasswd);
28091 free(newpasswd);
```

**fflush()**28092 **APPLICATION USAGE**

28093 None.

28094 **RATIONALE**

28095 Data buffered by the system may make determining the validity of the position of the current  
 28096 file descriptor impractical. Thus, enforcing the repositioning of the file descriptor after *fflush()*  
 28097 on streams open for *read()* is not mandated by POSIX.1-2008.

28098 **FUTURE DIRECTIONS**

28099 None.

28100 **SEE ALSO**28101 *fnmemopen()*, *getrlimit()*, *open\_memstream()*, *ulimit()*28102 XBD `<stdio.h>`28103 **CHANGE HISTORY**

28104 First released in Issue 1. Derived from Issue 1 of the SVID.

28105 **Issue 5**

28106 Large File Summit extensions are added.

28107 **Issue 6**

28108 Extensions beyond the ISO C standard are marked.

28109 The following new requirements on POSIX implementations derive from alignment with the  
 28110 Single UNIX Specification:

- 28111 • The [EFBIG] error is added as part of the large file support extensions.
- 28112 • The [ENXIO] optional error condition is added.

28113 The RETURN VALUE section is updated to note that the error indicator shall be set for the  
 28114 stream. This is for alignment with the ISO/IEC 9899:1999 standard.

28115 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/31 is applied, updating the [EAGAIN]  
 28116 error in the ERRORS section from “the process would be delayed” to “the thread would be  
 28117 delayed”.

28118 **Issue 7**

28119 Austin Group Interpretation 1003.1-2001 #002 is applied, clarifying the interaction of file  
 28120 descriptors and streams.

28121 The [ENOSPC] error condition is updated and the [ENOMEM] error is added from The Open  
 28122 Group Technical Standard, 2006, Extended API Set Part 1.

28123 The EXAMPLES section is revised.

28124 Changes are made related to support for finegrained timestamps.

28125 **NAME**

28126 ffs — find first set bit

28127 **SYNOPSIS**

```
28128 XSI #include <strings.h>
28129 int ffs(int i);
```

28130 **DESCRIPTION**

28131 The *ffs()* function shall find the first bit set (beginning with the least significant bit) in *i*, and  
 28132 return the index of that bit. Bits are numbered starting at one (the least significant bit).

28133 **RETURN VALUE**

28134 The *ffs()* function shall return the index of the first bit set. If *i* is 0, then *ffs()* shall return 0.

28135 **ERRORS**

28136 No errors are defined.

28137 **EXAMPLES**

28138 None.

28139 **APPLICATION USAGE**

28140 None.

28141 **RATIONALE**

28142 None.

28143 **FUTURE DIRECTIONS**

28144 None.

28145 **SEE ALSO**

28146 XBD [<strings.h>](#)

28147 **CHANGE HISTORY**

28148 First released in Issue 4, Version 2.

28149 **Issue 5**

28150 Moved from X/OPEN UNIX extension to BASE.

**fgetc()**28151 **NAME**28152 `fgetc` — get a byte from a stream28153 **SYNOPSIS**28154 `#include <stdio.h>`28155 `int fgetc(FILE *stream);`28156 **DESCRIPTION**28157 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
28158 conflict between the requirements described here and the ISO C standard is unintentional. This  
28159 volume of POSIX.1-2008 defers to the ISO C standard.28160 If the end-of-file indicator for the input stream pointed to by *stream* is not set and a next byte is  
28161 present, the *fgetc()* function shall obtain the next byte as an **unsigned char** converted to an **int**,  
28162 from the input stream pointed to by *stream*, and advance the associated file position indicator for  
28163 the stream (if defined). Since *fgetc()* operates on bytes, reading a character consisting of multiple  
28164 bytes (or “a multi-byte character”) may require multiple calls to *fgetc()*.28165 CX The *fgetc()* function may mark the last data access timestamp of the file associated with *stream*  
28166 for update. The last data access timestamp shall be marked for update by the first successful  
28167 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or  
28168 *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.28169 **RETURN VALUE**28170 Upon successful completion, *fgetc()* shall return the next byte from the input stream pointed to  
28171 by *stream*. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the  
28172 end-of-file indicator for the stream shall be set and *fgetc()* shall return EOF. If a read error occurs,  
28173 CX the error indicator for the stream shall be set, *fgetc()* shall return EOF, and shall set *errno* to  
28174 indicate the error.28175 **ERRORS**28176 The *fgetc()* function shall fail if data needs to be read and:28177 CX **[EAGAIN]** The `O_NONBLOCK` flag is set for the file descriptor underlying *stream* and  
28178 the thread would be delayed in the *fgetc()* operation.28179 CX **[EBADF]** The file descriptor underlying *stream* is not a valid file descriptor open for  
28180 reading.28181 CX **[EINTR]** The read operation was terminated due to the receipt of a signal, and no data  
28182 was transferred.28183 CX **[EIO]** A physical I/O error has occurred, or the process is in a background process  
28184 group attempting to read from its controlling terminal, and either the process  
28185 is ignoring or blocking the SIGTTIN signal or the process group is orphaned.  
28186 This error may also be generated for implementation-defined reasons.28187 CX **[EOVERFLOW]** The file is a regular file and an attempt was made to read at or beyond the  
28188 offset maximum associated with the corresponding stream.28189 The *fgetc()* function may fail if:28190 CX **[ENOMEM]** Insufficient storage space is available.28191 CX **[ENXIO]** A request was made of a nonexistent device, or the request was outside the  
28192 capabilities of the device.

28193 **EXAMPLES**

28194 None.

28195 **APPLICATION USAGE**

28196 If the integer value returned by *fgetc()* is stored into a variable of type **char** and then compared  
 28197 against the integer constant EOF, the comparison may never succeed, because sign-extension of  
 28198 a variable of type **char** on widening to integer is implementation-defined.

28199 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an  
 28200 end-of-file condition.

28201 **RATIONALE**

28202 None.

28203 **FUTURE DIRECTIONS**

28204 None.

28205 **SEE ALSO**28206 *feof()*, *ferror()*, *fgets()*, *fread()*, *fscanf()*, *getchar()*, *getc()*, *gets()*, *ungetc()*

28207 XBD &lt;stdio.h&gt;

28208 **CHANGE HISTORY**

28209 First released in Issue 1. Derived from Issue 1 of the SVID.

28210 **Issue 5**

28211 Large File Summit extensions are added.

28212 **Issue 6**

28213 Extensions beyond the ISO C standard are marked.

28214 The following new requirements on POSIX implementations derive from alignment with the  
 28215 Single UNIX Specification:

- 28216 • The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- 28217 • The [ENOMEM] and [ENXIO] optional error conditions are added.

28218 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 28219 • The DESCRIPTION is updated to clarify the behavior when the end-of-file indicator for the  
 28220 input stream is not set.
- 28221 • The RETURN VALUE section is updated to note that the error indicator shall be set for the  
 28222 stream.

28223 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/32 is applied, updating the [EAGAIN]  
 28224 error in the ERRORS section from “the process would be delayed” to “the thread would be  
 28225 delayed”.

28226 **Issue 7**

28227 Austin Group Interpretation 1003.1-2001 #051 is applied, updating the list of functions that mark  
 28228 the last data access timestamp for update.

**fgetpos()**28229 **NAME**28230 `fgetpos` — get current file position information28231 **SYNOPSIS**28232 `#include <stdio.h>`28233 `int fgetpos(FILE *restrict stream, fpos_t *restrict pos);`28234 **DESCRIPTION**28235 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
28236 conflict between the requirements described here and the ISO C standard is unintentional. This  
28237 volume of POSIX.1-2008 defers to the ISO C standard.28238 The `fgetpos()` function shall store the current values of the parse state (if any) and file position  
28239 indicator for the stream pointed to by `stream` in the object pointed to by `pos`. The value stored  
28240 contains unspecified information usable by `fsetpos()` for repositioning the stream to its position  
28241 at the time of the call to `fgetpos()`.28242 **RETURN VALUE**28243 Upon successful completion, `fgetpos()` shall return 0; otherwise, it shall return a non-zero value  
28244 and set `errno` to indicate the error.28245 **ERRORS**28246 The `fgetpos()` function shall fail if:28247 CX [EOVERFLOW] The current value of the file position cannot be represented correctly in an  
28248 object of type `fpos_t`.28249 The `fgetpos()` function may fail if:28250 CX [EBADF] The file descriptor underlying `stream` is not valid.28251 CX [ESPIPE] The file descriptor underlying `stream` is associated with a pipe, FIFO, or socket.28252 **EXAMPLES**

28253 None.

28254 **APPLICATION USAGE**

28255 None.

28256 **RATIONALE**

28257 None.

28258 **FUTURE DIRECTIONS**

28259 None.

28260 **SEE ALSO**28261 `fopen()`, `ftell()`, `rewind()`, `ungetc()`28262 XBD `<stdio.h>`28263 **CHANGE HISTORY**

28264 First released in Issue 4. Derived from the ISO C standard.

28265 **Issue 5**

28266 Large File Summit extensions are added.

28267 **Issue 6**

28268 Extensions beyond the ISO C standard are marked.

28269 The following new requirements on POSIX implementations derive from alignment with the  
28270 Single UNIX Specification:

28271 • The [EBADF] and [ESPIPE] optional error conditions are added.

28272 An additional [ESPIPE] error condition is added for sockets.

28273 The prototype for *fgetpos()* is changed for alignment with the ISO/IEC 9899:1999 standard.

**fgets()**28274 **NAME**

28275           fgets — get a string from a stream

28276 **SYNOPSIS**

28277           #include &lt;stdio.h&gt;

28278           char \*fgets(char \*restrict *s*, int *n*, FILE \*restrict *stream*);28279 **DESCRIPTION**28280 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
28281 conflict between the requirements described here and the ISO C standard is unintentional. This  
28282 volume of POSIX.1-2008 defers to the ISO C standard.28283       The *fgets()* function shall read bytes from *stream* into the array pointed to by *s*, until *n*–1 bytes  
28284 are read, or a <newline> is read and transferred to *s*, or an end-of-file condition is encountered.  
28285 The string is then terminated with a null byte.28286 CX       The *fgets()* function may mark the last data access timestamp of the file associated with *stream*  
28287 for update. The last data access timestamp shall be marked for update by the first successful  
28288 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or  
28289 *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.28290 **RETURN VALUE**28291       Upon successful completion, *fgets()* shall return *s*. If the stream is at end-of-file, the end-of-file  
28292 indicator for the stream shall be set and *fgets()* shall return a null pointer. If a read error occurs,  
28293 CX       the error indicator for the stream shall be set, *fgets()* shall return a null pointer, and shall set  
28294 *errno* to indicate the error.28295 **ERRORS**28296       Refer to *fgetc()*.28297 **EXAMPLES**28298       **Reading Input**28299       The following example uses *fgets()* to read each line of input. {LINE\_MAX}, which defines the  
28300 maximum size of the input line, is defined in the <limits.h> header.28301       #include <stdio.h>  
28302       ...  
28303       char line[LINE\_MAX];  
28304       ...  
28305       while (fgets(line, LINE\_MAX, fp) != NULL) {  
28306       ...  
28307       }  
28308       .28309 **APPLICATION USAGE**

28310       None.

28311 **RATIONALE**

28312       None.

28313 **FUTURE DIRECTIONS**

28314       None.

28315 **SEE ALSO**28316 *fggetc()*, *fopen()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *gets()*, *ungetc()*

28321 Extensions beyond the ISO C standard are marked.

28322 The prototype for *fgets()* is changed for alignment with the ISO/IEC 9899:1999 standard.28323 **Issue 7**28324 Austin Group Interpretation 1003.1-2001 #051 is applied, updating the list of functions that mark  
28325 the last data access timestamp for update.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**fgetwc()**28326 **NAME**28327 `fgetwc` — get a wide-character code from a stream28328 **SYNOPSIS**28329 `#include <stdio.h>`28330 `#include <wchar.h>`28331 `wint_t fgetwc(FILE *stream);`28332 **DESCRIPTION**28333 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
28334 conflict between the requirements described here and the ISO C standard is unintentional. This  
28335 volume of POSIX.1-2008 defers to the ISO C standard.28336 The `fgetwc()` function shall obtain the next character (if present) from the input stream pointed to  
28337 by `stream`, convert that to the corresponding wide-character code, and advance the associated file  
28338 position indicator for the stream (if defined).

28339 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

28340 CX The `fgetwc()` function may mark the last data access timestamp of the file associated with `stream`  
28341 for update. The last data access timestamp shall be marked for update by the first successful  
28342 execution of `fgetwc()`, `fgetws()`, `fwscanf()`, `getwc()`, `getwchar()`, `ofwscanf()`, `vfwscanf()`, or `wscanf()`  
28343 using `stream` that returns data not supplied by a prior call to `ungetwc()`.28344 **RETURN VALUE**28345 Upon successful completion, the `fgetwc()` function shall return the wide-character code of the  
28346 character read from the input stream pointed to by `stream` converted to a type `wint_t`. If the end-  
28347 of-file indicator for the stream is set, or if the stream is at end-of-file, the end-of-file indicator for  
28348 the stream shall be set and `fgetwc()` shall return WEOF. If a read error occurs, the error indicator  
28349 CX for the stream shall be set, `fgetwc()` shall return WEOF, and shall set `errno` to indicate the error. If  
28350 an encoding error occurs, the error indicator for the stream shall be set, `fgetwc()` shall return  
28351 WEOF, and shall set `errno` to indicate the error.28352 **ERRORS**28353 The `fgetwc()` function shall fail if data needs to be read and:28354 CX **[EAGAIN]** The `O_NONBLOCK` flag is set for the file descriptor underlying `stream` and  
28355 the thread would be delayed in the `fgetwc()` operation.28356 CX **[EBADF]** The file descriptor underlying `stream` is not a valid file descriptor open for  
28357 reading.28358 **[EILSEQ]** The data obtained from the input stream does not form a valid character.28359 CX **[EINTR]** The read operation was terminated due to the receipt of a signal, and no data  
28360 was transferred.28361 CX **[EIO]** A physical I/O error has occurred, or the process is in a background process  
28362 group attempting to read from its controlling terminal, and either the process  
28363 is ignoring or blocking the SIGTTIN signal or the process group is orphaned.  
28364 This error may also be generated for implementation-defined reasons.28365 CX **[EOVERFLOW]** The file is a regular file and an attempt was made to read at or beyond the  
28366 offset maximum associated with the corresponding stream.

28367 The *fgetwc()* function may fail if:

28368 CX [ENOMEM] Insufficient storage space is available.

28369 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
28370 capabilities of the device.

#### 28371 EXAMPLES

28372 None.

#### 28373 APPLICATION USAGE

28374 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an  
28375 end-of-file condition.

#### 28376 RATIONALE

28377 None.

#### 28383 CHANGE HISTORY

28384 First released in Issue 4. Derived from the MSE working draft.

#### 28385 Issue 5

28386 The Optional Header (OH) marking is removed from <stdio.h>.

28387 Large File Summit extensions are added.

#### 28388 Issue 6

28389 Extensions beyond the ISO C standard are marked.

28390 The following new requirements on POSIX implementations derive from alignment with the  
28391 Single UNIX Specification:

- 28392 • The [EIO] and [Eoverflow] mandatory error conditions are added.
- 28393 • The [ENOMEM] and [ENXIO] optional error conditions are added.

28394 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/33 is applied, updating the [EAGAIN]  
28395 error in the ERRORS section from “the process would be delayed” to “the thread would be  
28396 delayed”.

#### 28397 Issue 7

28398 Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.

28399 Changes are made related to support for finegrained timestamps.

**fgetws()**28400 **NAME**28401 `fgetws` — get a wide-character string from a stream28402 **SYNOPSIS**28403 `#include <stdio.h>`28404 `#include <wchar.h>`28405 `wchar_t *fgetws(wchar_t *restrict ws, int n,`  
28406 `FILE *restrict stream);`28407 **DESCRIPTION**28408 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
28409 conflict between the requirements described here and the ISO C standard is unintentional. This  
28410 volume of POSIX.1-2008 defers to the ISO C standard.28411 The `fgetws()` function shall read characters from the *stream*, convert these to the corresponding  
28412 wide-character codes, place them in the `wchar_t` array pointed to by *ws*, until *n*–1 characters are  
28413 read, or a <newline> is read, converted, and transferred to *ws*, or an end-of-file condition is  
28414 encountered. The wide-character string, *ws*, shall then be terminated with a null wide-character  
28415 code.

28416 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

28417 **CX** The `fgetws()` function may mark the last data access timestamp of the file associated with *stream*  
28418 for update. The last data access timestamp shall be marked for update by the first successful  
28419 execution of `fgetwc()`, `fgetws()`, `fwscanf()`, `getwc()`, `getwchar()`, `vwscanf()`, `vwsscanf()`, or `wscanf()`  
28420 using *stream* that returns data not supplied by a prior call to `ungetwc()`.28421 **RETURN VALUE**28422 Upon successful completion, `fgetws()` shall return *ws*. If the end-of-file indicator for the stream is  
28423 set, or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and  
28424 `fgetws()` shall return a null pointer. If a read error occurs, the error indicator for the stream shall  
28425 **CX** be set, `fgetws()` shall return a null pointer, and shall set *errno* to indicate the error.28426 **ERRORS**28427 Refer to `fgetwc()`.28428 **EXAMPLES**

28429 None.

28430 **APPLICATION USAGE**

28431 None.

28432 **RATIONALE**

28433 None.

28434 **FUTURE DIRECTIONS**

28435 None.

**fileno()**28449 **NAME**28450 `fileno` — map a stream pointer to a file descriptor28451 **SYNOPSIS**

```
28452 CX #include <stdio.h>
28453 int fileno(FILE *stream);
```

28454 **DESCRIPTION**

28455 The `fileno()` function shall return the integer file descriptor associated with the stream pointed to  
 28456 by `stream`.

28457 **RETURN VALUE**

28458 Upon successful completion, `fileno()` shall return the integer value of the file descriptor  
 28459 associated with `stream`. Otherwise, the value `-1` shall be returned and `errno` set to indicate the  
 28460 error.

28461 **ERRORS**28462 The `fileno()` function may fail if:

28463 [EBADF] The `stream` argument is not a valid stream, or the stream is not associated with  
 28464 a file.

28465 **EXAMPLES**

28466 None.

28467 **APPLICATION USAGE**

28468 None.

28469 **RATIONALE**

28470 Without some specification of which file descriptors are associated with these streams, it is  
 28471 impossible for an application to set up the streams for another application it starts with `fork()`  
 28472 and `exec`. In particular, it would not be possible to write a portable version of the `sh` command  
 28473 interpreter (although there may be other constraints that would prevent that portability).

28474 **FUTURE DIRECTIONS**

28475 None.

28476 **SEE ALSO**28477 Section 2.5.1 (on page 491), `dirfd()`, `fdopen()`, `fopen()`, `stdin`28478 XBD `<stdio.h>`28479 **CHANGE HISTORY**

28480 First released in Issue 1. Derived from Issue 1 of the SVID.

28481 **Issue 6**

28482 The following new requirements on POSIX implementations derive from alignment with the  
 28483 Single UNIX Specification:

- 28484 • The [EBADF] optional error condition is added.

28485 **Issue 7**

28486 SD5-XBD-ERN-99 is applied, changing the definition of the [EBADF] error.

28487 **NAME**

28488 flockfile, ftrylockfile, funlockfile — stdio locking functions

28489 **SYNOPSIS**

```
28490 CX #include <stdio.h>
28491 void flockfile(FILE *file);
28492 int ftrylockfile(FILE *file);
28493 void funlockfile(FILE *file);
```

28494 **DESCRIPTION**

28495 These functions shall provide for explicit application-level locking of stdio (**FILE \***) objects.  
 28496 These functions can be used by a thread to delineate a sequence of I/O statements that are  
 28497 executed as a unit.

28498 The *flockfile()* function shall acquire for a thread ownership of a (**FILE \***) object.

28499 The *ftrylockfile()* function shall acquire for a thread ownership of a (**FILE \***) object if the object is  
 28500 available; *ftrylockfile()* is a non-blocking version of *flockfile()*.

28501 The *funlockfile()* function shall relinquish the ownership granted to the thread. The behavior is  
 28502 undefined if a thread other than the current owner calls the *funlockfile()* function.

28503 The functions shall behave as if there is a lock count associated with each (**FILE \***) object. This  
 28504 count is implicitly initialized to zero when the (**FILE \***) object is created. The (**FILE \***) object is  
 28505 unlocked when the count is zero. When the count is positive, a single thread owns the (**FILE \***)  
 28506 object. When the *flockfile()* function is called, if the count is zero or if the count is positive and  
 28507 the caller owns the (**FILE \***) object, the count shall be incremented. Otherwise, the calling thread  
 28508 shall be suspended, waiting for the count to return to zero. Each call to *funlockfile()* shall  
 28509 decrement the count. This allows matching calls to *flockfile()* (or successful calls to *ftrylockfile()*)  
 28510 and *funlockfile()* to be nested.

28511 All functions that reference (**FILE \***) objects shall behave as if they use *flockfile()* and *funlockfile()*  
 28512 internally to obtain ownership of these (**FILE \***) objects.

28513 **RETURN VALUE**

28514 None for *flockfile()* and *funlockfile()*.

28515 The *ftrylockfile()* function shall return zero for success and non-zero to indicate that the lock  
 28516 cannot be acquired.

28517 **ERRORS**

28518 No errors are defined.

28519 **EXAMPLES**

28520 None.

28521 **APPLICATION USAGE**

28522 Applications using these functions may be subject to priority inversion, as discussed in XBD  
 28523 [Section 3.285](#) (on page 79).

28524 **RATIONALE**

28525 The *flockfile()* and *funlockfile()* functions provide an orthogonal mutual-exclusion lock for each  
 28526 **FILE**. The *ftrylockfile()* function provides a non-blocking attempt to acquire a file lock,  
 28527 analogous to *pthread\_mutex\_trylock()*.

28528 These locks behave as if they are the same as those used internally by *stdio* for thread-safety.  
 28529 This both provides thread-safety of these functions without requiring a second level of internal  
 28530 locking and allows functions in *stdio* to be implemented in terms of other *stdio* functions.

**flockfile()**

28531 Application developers and implementors should be aware that there are potential deadlock  
 28532 problems on **FILE** objects. For example, the line-buffered flushing semantics of *stdio* (requested  
 28533 via `{_IOLBF}`) require that certain input operations sometimes cause the buffered contents of  
 28534 implementation-defined line-buffered output streams to be flushed. If two threads each hold the  
 28535 lock on the other's **FILE**, deadlock ensues. This type of deadlock can be avoided by acquiring  
 28536 **FILE** locks in a consistent order. In particular, the line-buffered output stream deadlock can  
 28537 typically be avoided by acquiring locks on input streams before locks on output streams if a  
 28538 thread would be acquiring both.

28539 In summary, threads sharing *stdio* streams with other threads can use *flockfile()* and *funlockfile()*  
 28540 to cause sequences of I/O performed by a single thread to be kept bundled. The only case where  
 28541 the use of *flockfile()* and *funlockfile()* is required is to provide a scope protecting uses of the  
 28542 `*_unlocked` functions/macros. This moves the cost/performance tradeoff to the optimal point.

28543 **FUTURE DIRECTIONS**

28544 None.

28545 **SEE ALSO**28546 [\*getc\\_unlocked\(\)\*](#)28547 XBD [Section 3.285](#) (on page 79), [`<stdio.h>`](#)28548 **CHANGE HISTORY**

28549 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

28550 **Issue 6**

28551 These functions are marked as part of the Thread-Safe Functions option.

28552 **Issue 7**28553 The *flockfile()*, *ftrylockfile()*, and *funlockfile()* functions are moved from the Thread-Safe Functions  
 28554 option to the Base.

28555 **NAME**

28556 floor, floorf, floorl — floor function

28557 **SYNOPSIS**

```
28558 #include <math.h>
28559 double floor(double x);
28560 float floorf(float x);
28561 long double floorl(long double x);
```

28562 **DESCRIPTION**

28563 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 28564 conflict between the requirements described here and the ISO C standard is unintentional. This  
 28565 volume of POSIX.1-2008 defers to the ISO C standard.

28566 These functions shall compute the largest integral value not greater than  $x$ .

28567 An application wishing to check for error situations should set *errno* to zero and call  
 28568 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 28569 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 28570 zero, an error has occurred.

28571 **RETURN VALUE**

28572 Upon successful completion, these functions shall return the largest integral value not greater  
 28573 than  $x$ , expressed as a **double**, **float**, or **long double**, as appropriate for the return type of the  
 28574 function.

28575 MX If  $x$  is NaN, a NaN shall be returned.

28576 If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.

28577 XSI If the correct value would cause overflow, a range error shall occur and *floor()*, *floorf()*, and  
 28578 *floorl()* shall return the value of the macro `-HUGE_VAL`, `-HUGE_VALF`, and `-HUGE_VALL`,  
 28579 respectively.

28580 **ERRORS**

28581 These functions shall fail if:

28582 XSI **Range Error** The result would cause an overflow.

28583 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 28584 then *errno* shall be set to [ERANGE]. If the integer expression  
 28585 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 28586 floating-point exception shall be raised.

28587 **EXAMPLES**

28588 None.

28589 **APPLICATION USAGE**

28590 The integral value returned by these functions might not be expressible as an **int** or **long**. The  
 28591 return value should be tested before assigning it to an integer type to avoid the undefined  
 28592 results of an integer overflow.

28593 The *floor()* function can only overflow when the floating-point representation has  
 28594 `DBL_MANT_DIG > DBL_MAX_EXP`.

28595 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 28596 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**floor()**28597 **RATIONALE**

28598 None.

28599 **FUTURE DIRECTIONS**

28600 None.

28601 **SEE ALSO**28602 *ceil()*, *feclearexcept()*, *fetestexcept()*, *isnan()*28603 [Section 4.19](#) (on page 116), `<math.h>`28604 **CHANGE HISTORY**

28605 First released in Issue 1. Derived from Issue 1 of the SVID.

28606 **Issue 5**28607 The DESCRIPTION is updated to indicate how an application should check for an error. This  
28608 text was previously published in the APPLICATION USAGE section.28609 **Issue 6**28610 The *floorf()* and *floorl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.28611 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
28612 revised to align with the ISO/IEC 9899:1999 standard.28613 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
28614 marked.

28615 **NAME**

28616 fma, fmaf, fmal — floating-point multiply-add

28617 **SYNOPSIS**

28618 #include &lt;math.h&gt;

28619 double fma(double x, double y, double z);

28620 float fmaf(float x, float y, float z);

28621 long double fmal(long double x, long double y, long double z);

28622 **DESCRIPTION**28623 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
28624 conflict between the requirements described here and the ISO C standard is unintentional. This  
28625 volume of POSIX.1-2008 defers to the ISO C standard.28626 These functions shall compute  $(x * y) + z$ , rounded as one ternary operation; they shall compute  
28627 the value (as if) to infinite precision and round once to the result format, according to the  
28628 rounding mode characterized by the value of FLT\_ROUNDS.28629 An application wishing to check for error situations should set *errno* to zero and call  
28630 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
28631 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
28632 zero, an error has occurred.28633 **RETURN VALUE**28634 Upon successful completion, these functions shall return  $(x * y) + z$ , rounded as one ternary  
28635 operation.28636 **MX** If the result overflows or underflows, a range error may occur. On systems that support the IEC  
28637 60559 Floating-Point option, if the result overflows a range error shall occur.28638 If *x* or *y* are NaN, a NaN shall be returned.28639 If *x* multiplied by *y* is an exact infinity and *z* is also an infinity but with the opposite sign, a  
28640 domain error shall occur, and either a NaN (if supported), or an implementation-defined value  
28641 shall be returned.28642 If one of *x* and *y* is infinite, the other is zero, and *z* is not a NaN, a domain error shall occur, and  
28643 either a NaN (if supported), or an implementation-defined value shall be returned.28644 If one of *x* and *y* is infinite, the other is zero, and *z* is a NaN, a NaN shall be returned and a  
28645 domain error may occur.28646 If  $x*y$  is not  $0*Inf$  nor  $Inf*0$  and *z* is a NaN, a NaN shall be returned.28647 **ERRORS**

28648 These functions shall fail if:

28649 **MX** **Domain Error** The value of  $x*y+z$  is invalid, or the value  $x*y$  is invalid and *z* is not a NaN.28650 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
28651 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
28652 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
28653 shall be raised.28654 **MX** **Range Error** The result overflows.28655 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
28656 then *errno* shall be set to [ERANGE]. If the integer expression  
28657 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
28658 floating-point exception shall be raised.

**fma()**

28659 These functions may fail if:

|       |    |                     |                                                                                                                                                                                                                                                                                                                            |
|-------|----|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28660 | MX | <b>Domain Error</b> | The value $x*y$ is invalid and $z$ is a NaN.<br><br>If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero, then <i>errno</i> shall be set to [EDOM]. If the integer expression ( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised. |
| 28665 |    | <b>Range Error</b>  | The result underflows.<br><br>If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero, then <i>errno</i> shall be set to [ERANGE]. If the integer expression ( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.                   |
| 28670 |    | <b>Range Error</b>  | The result overflows.<br><br>If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero, then <i>errno</i> shall be set to [ERANGE]. If the integer expression ( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.                     |

28675 **EXAMPLES**

28676 None.

28677 **APPLICATION USAGE**

28678 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
28679 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

28680 **RATIONALE**

28681 In many cases, clever use of floating (*fused*) multiply-add leads to much improved code; but its  
28682 unexpected use by the compiler can undermine carefully written code. The FP\_CONTRACT  
28683 macro can be used to disallow use of floating multiply-add; and the *fma()* function guarantees  
28684 its use where desired. Many current machines provide hardware floating multiply-add  
28685 instructions; software implementation can be used for others.

28686 **FUTURE DIRECTIONS**

28687 None.

28728 **CHANGE HISTORY**

28729 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

28730 **Issue 7**

28731 Austin Group Interpretation 1003.1-2001 #007 is applied.

**fmemopen()**28732 **NAME**28733 `fmemopen` — open a memory buffer stream28734 **SYNOPSIS**

```
28735 CX #include <stdio.h>
28736 FILE *fmemopen(void *restrict buf, size_t size,
28737               const char *restrict mode);
```

28738 **DESCRIPTION**

28739 The `fmemopen()` function shall associate the buffer given by the `buf` and `size` arguments with a  
 28740 stream. The `buf` argument shall be either a null pointer or point to a buffer that is at least `size`  
 28741 bytes long.

28742 The `mode` argument is a character string having one of the following values:

|       |                                                         |                                                                                                                    |
|-------|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| 28743 | <code>r</code> or <code>rb</code>                       | Open the stream for reading.                                                                                       |
| 28744 | <code>w</code> or <code>wb</code>                       | Open the stream for writing.                                                                                       |
| 28745 | <code>a</code> or <code>ab</code>                       | Append; open the stream for writing at the first null byte.                                                        |
| 28746 | <code>r+</code> or <code>rb+</code> or <code>r+b</code> | Open the stream for update (reading and writing).                                                                  |
| 28747 | <code>w+</code> or <code>wb+</code> or <code>w+b</code> | Open the stream for update (reading and writing). Truncate the buffer<br>28748 contents.                           |
| 28749 | <code>a+</code> or <code>ab+</code> or <code>a+b</code> | Append; open the stream for update (reading and writing); the initial<br>28750 position is at the first null byte. |

28751 The character 'b' shall have no effect.

28752 If a null pointer is specified as the `buf` argument, `fmemopen()` shall allocate `size` bytes of memory  
 28753 as if by a call to `malloc()`. This buffer shall be automatically freed when the stream is closed.  
 28754 Because this feature is only useful when the stream is opened for updating (because there is no  
 28755 way to get a pointer to the buffer) the `fmemopen()` call may fail if the `mode` argument does not  
 28756 include a '+'. .

28757 The stream maintains a current position in the buffer. This position is initially set to either the  
 28758 beginning of the buffer (for `r` and `w` modes) or to the first null byte in the buffer (for `a` modes). If  
 28759 no null byte is found in append mode, the initial position is set to one byte after the end of the  
 28760 buffer.

28761 If `buf` is a null pointer, the initial position shall always be set to the beginning of the buffer.

28762 The stream also maintains the size of the current buffer contents. For modes `r` and `r+` the size is  
 28763 set to the value given by the `size` argument. For modes `w` and `w+` the initial size is zero and for  
 28764 modes `a` and `a+` the initial size is either the position of the first null byte in the buffer or the value  
 28765 of the `size` argument if no null byte is found.

28766 A read operation on the stream cannot advance the current buffer position beyond the current  
 28767 buffer size. Reaching the buffer size in a read operation counts as "end-of-file". Null bytes in the  
 28768 buffer have no special meaning for reads. The read operation starts at the current buffer position  
 28769 of the stream.

28770 A write operation starts either at the current position of the stream (if mode has not specified  
 28771 'a' as the first character) or at the current size of the stream (if mode had 'a' as the first  
 28772 character). If the current position at the end of the write is larger than the current buffer size, the  
 28773 current buffer size is set to the current position. A write operation on the stream cannot advance  
 28774 the current buffer size beyond the size given in the `size` argument.

28775 When a stream open for writing is flushed or closed, a null byte is written at the current position  
 28776 or at the end of the buffer, depending on the size of the contents. If a stream open for update is  
 28777 flushed or closed and the last write has advanced the current buffer size, a null byte is written at  
 28778 the end of the buffer if it fits.

28779 An attempt to seek a memory buffer stream to a negative position or to a position larger than the  
 28780 buffer size given in the *size* argument shall fail.

#### 28781 RETURN VALUE

28782 Upon successful completion, *fmemopen()* shall return a pointer to the object controlling the  
 28783 stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

#### 28784 ERRORS

28785 The *fmemopen()* function shall fail if:

28786 [EINVAL] The *size* argument specifies a buffer size of zero.

28787 The *fmemopen()* function may fail if:

28788 [EINVAL] The value of the *mode* argument is not valid.

28789 [EINVAL] The *buf* argument is a null pointer and the *mode* argument does not include a  
 28790 '+' character.

28791 [ENOMEM] The *buf* argument is a null pointer and the allocation of a buffer of length *size*  
 28792 has failed.

28793 [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

#### 28794 EXAMPLES

```
28795 #include <stdio.h>
28796 #include <string.h>
28797 static char buffer[] = "foobar";
28798 int
28799 main (void)
28800 {
28801     int ch;
28802     FILE *stream;
28803     stream = fmemopen(buffer, strlen (buffer), "r");
28804     if (stream == NULL)
28805         /* handle error */;
28806     while ((ch = fgetc(stream)) != EOF)
28807         printf("Got %c\n", ch);
28808     fclose(stream);
28809     return (0);
28810 }
```

28811 This program produces the following output:

```
28812 Got f
28813 Got o
28814 Got o
28815 Got b
28816 Got a
28817 Got r
```

**fmemopen()***System Interfaces*28818 **APPLICATION USAGE**

28819 None.

28820 **RATIONALE**28821 This interface has been introduced to eliminate many of the errors encountered in the  
28822 construction of strings, notably overflowing of strings. This interface prevents overflow.28823 **FUTURE DIRECTIONS**

28863 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

28864 **Issue 7**

28865 Austin Group Interpretation 1003.1-2001 #008 is applied.

**fmod()**28866 **NAME**28867 `fmod, fmodf, fmodl` — floating-point remainder value function28868 **SYNOPSIS**28869 `#include <math.h>`28870 `double fmod(double x, double y);`28871 `float fmodf(float x, float y);`28872 `long double fmodl(long double x, long double y);`28873 **DESCRIPTION**28874 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
28875 conflict between the requirements described here and the ISO C standard is unintentional. This  
28876 volume of POSIX.1-2008 defers to the ISO C standard.28877 These functions shall return the floating-point remainder of the division of  $x$  by  $y$ .28878 An application wishing to check for error situations should set *errno* to zero and call  
28879 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
28880 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
28881 zero, an error has occurred.28882 **RETURN VALUE**28883 These functions shall return the value  $x-i*y$ , for some integer  $i$  such that, if  $y$  is non-zero, the  
28884 result has the same sign as  $x$  and magnitude less than the magnitude of  $y$ .28885 If the correct value would cause underflow, and is not representable, a range error may occur,  
28886 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.28887 **MX** If  $x$  or  $y$  is NaN, a NaN shall be returned.28888 If  $y$  is zero, a domain error shall occur, and either a NaN (if supported), or an implementation-  
28889 defined value shall be returned.28890 If  $x$  is infinite, a domain error shall occur, and either a NaN (if supported), or an  
28891 implementation-defined value shall be returned.28892 If  $x$  is  $\pm 0$  and  $y$  is not zero,  $\pm 0$  shall be returned.28893 If  $x$  is not infinite and  $y$  is  $\pm \text{Inf}$ ,  $x$  shall be returned.28894 If the correct value would cause underflow, and is representable, a range error may occur and  
28895 the correct value shall be returned.28896 **ERRORS**

28897 These functions shall fail if:

28898 **MX** **Domain Error** The  $x$  argument is infinite or  $y$  is zero.28899 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
28900 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
28901 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
28902 shall be raised.

28903 These functions may fail if:

28904 **Range Error** The result underflows.28905 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
28906 then *errno* shall be set to [ERANGE]. If the integer expression  
28907 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
28908 floating-point exception shall be raised.

28909 **EXAMPLES**

28910 None.

28911 **APPLICATION USAGE**28912 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
28913 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.28914 **RATIONALE**

28915 None.

28916 **FUTURE DIRECTIONS**

28917 None.

28921 **CHANGE HISTORY**

28922 First released in Issue 1. Derived from Issue 1 of the SVID.

28923 **Issue 5**28924 The DESCRIPTION is updated to indicate how an application should check for an error. This  
28925 text was previously published in the APPLICATION USAGE section.28926 **Issue 6**28927 The behavior for when the *y* argument is zero is now defined.28928 The *fmodf()* and *fmodl()* functions are added for alignment with the ISO/IEC 9899:1999  
28929 standard.28930 The DESCRIPTION, RETURN VALUE ERRORS, and APPLICATION USAGE sections are  
28931 revised to align with the ISO/IEC 9899:1999 standard.28932 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
28933 marked.

**fmtmsg()**28934 **NAME**28935 `fmtmsg` — display a message in the specified format on standard error and/or a system console28936 **SYNOPSIS**

```
28937 XSI #include <fmtmsg.h>
28938
28938 int fmtmsg(long classification, const char *label, int severity,
28939            const char *text, const char *action, const char *tag);
```

28940 **DESCRIPTION**28941 The `fmtmsg()` function shall display messages in a specified format instead of the traditional  
28942 `printf()` function.28943 Based on a message's classification component, `fmtmsg()` shall write a formatted message either  
28944 to standard error, to the console, or to both.28945 A formatted message consists of up to five components as defined below. The component  
28946 *classification* is not part of a message displayed to the user, but defines the source of the message  
28947 and directs the display of the formatted message.28948 *classification* Contains the sum of identifying values constructed from the constants defined  
28949 below. Any one identifier from a subclass may be used in combination with a  
28950 single identifier from a different subclass. Two or more identifiers from the  
28951 same subclass should not be used together, with the exception of identifiers  
28952 from the display subclass. (Both display subclass identifiers may be used so  
28953 that messages can be displayed to both standard error and the system  
28954 console.)28955 **Major Classifications**28956 Identifies the source of the condition. Identifiers are: MM\_HARD  
28957 (hardware), MM\_SOFT (software), and MM\_FIRM (firmware).28958 **Message Source Subclassifications**28959 Identifies the type of software in which the problem is detected.  
28960 Identifiers are: MM\_APPL (application), MM\_UTIL (utility), and  
28961 MM\_OPSYS (operating system).28962 **Display Subclassifications**28963 Indicates where the message is to be displayed. Identifiers are:  
28964 MM\_PRINT to display the message on the standard error stream,  
28965 MM\_CONSOLE to display the message on the system console. One or  
28966 both identifiers may be used.28967 **Status Subclassifications**28968 Indicates whether the application can recover from the condition.  
28969 Identifiers are: MM\_RECOVER (recoverable) and MM\_NRECOV (non-  
28970 recoverable).28971 An additional identifier, MM\_NULLMC, indicates that no classification  
28972 component is supplied for the message.28973 *label* Identifies the source of the message. The format is two fields separated by a  
28974 <colon>. The first field is up to 10 bytes, the second is up to 14 bytes.28975 *severity* Indicates the seriousness of the condition. Identifiers for the levels of *severity*  
28976 are:

|       |               |            |                                                                                                                                                                                                                     |
|-------|---------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28977 |               | MM_HALT    | Indicates that the application has encountered a severe fault and is halting. Produces the string "HALT".                                                                                                           |
| 28978 |               |            |                                                                                                                                                                                                                     |
| 28979 |               | MM_ERROR   | Indicates that the application has detected a fault. Produces the string "ERROR".                                                                                                                                   |
| 28980 |               |            |                                                                                                                                                                                                                     |
| 28981 |               | MM_WARNING | Indicates a condition that is out of the ordinary, that might be a problem, and should be watched. Produces the string "WARNING".                                                                                   |
| 28982 |               |            |                                                                                                                                                                                                                     |
| 28983 |               |            |                                                                                                                                                                                                                     |
| 28984 |               | MM_INFO    | Provides information about a condition that is not in error. Produces the string "INFO".                                                                                                                            |
| 28985 |               |            |                                                                                                                                                                                                                     |
| 28986 |               | MM_NOSEV   | Indicates that no severity level is supplied for the message.                                                                                                                                                       |
| 28987 | <i>text</i>   |            | Describes the error condition that produced the message. The character string is not limited to a specific size. If the character string is empty, then the text produced is unspecified.                           |
| 28988 |               |            |                                                                                                                                                                                                                     |
| 28989 |               |            |                                                                                                                                                                                                                     |
| 28990 | <i>action</i> |            | Describes the first step to be taken in the error-recovery process. The <i>fmtmsg()</i> function precedes the action string with the prefix: "TO FIX:". The <i>action</i> string is not limited to a specific size. |
| 28991 |               |            |                                                                                                                                                                                                                     |
| 28992 |               |            |                                                                                                                                                                                                                     |
| 28993 | <i>tag</i>    |            | An identifier that references on-line documentation for the message. Suggested usage is that <i>tag</i> includes the <i>label</i> and a unique identifying number. A sample <i>tag</i> is "XSI:cat:146".            |
| 28994 |               |            |                                                                                                                                                                                                                     |
| 28995 |               |            |                                                                                                                                                                                                                     |

28996 The *MSGVERB* environment variable (for message verbosity) shall determine for *fmtmsg()*  
 28997 which message components it is to select when writing messages to standard error. The value of  
 28998 *MSGVERB* shall be a <colon>-separated list of optional keywords. Valid keywords are: *label*,  
 28999 *severity*, *text*, *action*, and *tag*. If *MSGVERB* contains a keyword for a component and the  
 29000 component's value is not the component's null value, *fmtmsg()* shall include that component in  
 29001 the message when writing the message to standard error. If *MSGVERB* does not include a  
 29002 keyword for a message component, that component shall not be included in the display of the  
 29003 message. The keywords may appear in any order. If *MSGVERB* is not defined, if its value is the  
 29004 null string, if its value is not of the correct format, or if it contains keywords other than the valid  
 29005 ones listed above, *fmtmsg()* shall select all components.

29006 *MSGVERB* shall determine which components are selected for display to standard error. All  
 29007 message components shall be included in console messages.

#### 29008 RETURN VALUE

29009 The *fmtmsg()* function shall return one of the following values:

|       |          |                                                                                           |
|-------|----------|-------------------------------------------------------------------------------------------|
| 29010 | MM_OK    | The function succeeded.                                                                   |
| 29011 | MM_NOTOK | The function failed completely.                                                           |
| 29012 | MM_NOMSG | The function was unable to generate a message on standard error, but otherwise succeeded. |
| 29013 |          |                                                                                           |
| 29014 | MM_NOCON | The function was unable to generate a console message, but otherwise succeeded.           |
| 29015 |          |                                                                                           |

#### 29016 ERRORS

29017 None.

**fmtmsg()**29018 **EXAMPLES**

29019 1. The following example of *fmtmsg()*:

```
29020 fmtmsg(MM_PRINT, "XSI:cat", MM_ERROR, "illegal option",
29021 "refer to cat in user's reference manual", "XSI:cat:001")
```

29022 produces a complete message in the specified message format:

```
29023 XSI:cat: ERROR: illegal option
29024 TO FIX: refer to cat in user's reference manual XSI:cat:001
```

29025 2. When the environment variable *MSGVERB* is set as follows:

```
29026 MSGVERB=severity:text:action
```

29027 and Example 1 is used, *fmtmsg()* produces:

```
29028 ERROR: illegal option
29029 TO FIX: refer to cat in user's reference manual
```

29030 **APPLICATION USAGE**

29031 One or more message components may be systematically omitted from messages generated by  
29032 an application by using the null value of the argument for that component.

29033 **RATIONALE**

29034 None.

29035 **FUTURE DIRECTIONS**

29036 None.

29037 **SEE ALSO**

29038 [\*fprintf\(\)\*](#)

29040 **CHANGE HISTORY**

29041 First released in Issue 4, Version 2.

29042 **Issue 5**

29043 Moved from X/OPEN UNIX extension to BASE.

29044 **NAME**

29045 fnmatch — match a filename or a pathname

29046 **SYNOPSIS**

29047 #include &lt;fnmatch.h&gt;

29048 int fnmatch(const char \*pattern, const char \*string, int flags);

29049 **DESCRIPTION**

29050 The *fnmatch()* function shall match patterns as described in XCU Section 2.13.1 (on page 2332)  
 29051 and Section 2.13.2 (on page 2332). It checks the string specified by the *string* argument to see if it  
 29052 matches the pattern specified by the *pattern* argument.

29053 The *flags* argument shall modify the interpretation of *pattern* and *string*. It is the bitwise-  
 29054 inclusive OR of zero or more of the flags defined in <fnmatch.h>. If the FNM\_PATHNAME flag  
 29055 is set in *flags*, then a <slash> character ('/') in *string* shall be explicitly matched by a <slash> in  
 29056 *pattern*; it shall not be matched by either the <asterisk> or <question-mark> special characters,  
 29057 nor by a bracket expression. If the FNM\_PATHNAME flag is not set, the <slash> character shall  
 29058 be treated as an ordinary character.

29059 If FNM\_NOESCAPE is not set in *flags*, a <backslash> character in *pattern* followed by any other  
 29060 character shall match that second character in *string*. In particular, "\\\" shall match a  
 29061 <backslash> in *string*. If FNM\_NOESCAPE is set, a <backslash> character shall be treated as an  
 29062 ordinary character.

29063 If FNM\_PERIOD is set in *flags*, then a leading <period> ('.') in *string* shall match a <period> in  
 29064 *pattern*; as described by rule 2 in XCU Section 2.13.3 (on page 2333) where the location of  
 29065 "leading" is indicated by the value of FNM\_PATHNAME:

- 29066 • If FNM\_PATHNAME is set, a <period> is "leading" if it is the first character in *string* or if  
 29067 it immediately follows a <slash>.
- 29068 • If FNM\_PATHNAME is not set, a <period> is "leading" only if it is the first character of  
 29069 *string*.

29070 If FNM\_PERIOD is not set, then no special restrictions are placed on matching a period.

29071 **RETURN VALUE**

29072 If *string* matches the pattern specified by *pattern*, then *fnmatch()* shall return 0. If there is no  
 29073 match, *fnmatch()* shall return FNM\_NOMATCH, which is defined in <fnmatch.h>. If an error  
 29074 occurs, *fnmatch()* shall return another non-zero value.

29075 **ERRORS**

29076 No errors are defined.

29077 **EXAMPLES**

29078 None.

29079 **APPLICATION USAGE**

29080 The *fnmatch()* function has two major uses. It could be used by an application or utility that  
 29081 needs to read a directory and apply a pattern against each entry. The *find* utility is an example of  
 29082 this. It can also be used by the *pax* utility to process its *pattern* operands, or by applications that  
 29083 need to match strings in a similar manner.

29084 The name *fnmatch()* is intended to imply *filename* match, rather than *pathname* match. The  
 29085 default action of this function is to match filenames, rather than pathnames, since it gives no  
 29086 special significance to the <slash> character. With the FNM\_PATHNAME flag, *fnmatch()* does  
 29087 match pathnames, but without tilde expansion, parameter expansion, or special treatment for a  
 29088 <period> at the beginning of a filename.

**fnmatch()**29089 **RATIONALE**

29090 This function replaced the REG\_FILENAME flag of *regcomp()* in early proposals of this volume  
29091 of POSIX.1-2008. It provides virtually the same functionality as the *regcomp()* and *regexec()*  
29092 functions using the REG\_FILENAME and REG\_FSLASH flags (the REG\_FSLASH flag was  
29093 proposed for *regcomp()*, and would have had the opposite effect from FNM\_PATHNAME), but  
29094 with a simpler function and less system overhead.

29095 **FUTURE DIRECTIONS**

29096 None.

29100 **CHANGE HISTORY**

29101 First released in Issue 4. Derived from the ISO POSIX-2 standard.

29102 **Issue 5**

29103 Moved from POSIX2 C-language Binding to BASE.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

29104 **NAME**

29105 fopen — open a stream

29106 **SYNOPSIS**

29107 #include &lt;stdio.h&gt;

29108 FILE \*fopen(const char \*restrict filename, const char \*restrict mode);

29109 **DESCRIPTION**

29110 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29111 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29112 volume of POSIX.1-2008 defers to the ISO C standard.

29113 The *fopen()* function shall open the file whose pathname is the string pointed to by *filename*, and  
 29114 associates a stream with it.

29115 The *mode* argument points to a string. If the string is one of the following, the file shall be opened  
 29116 in the indicated mode. Otherwise, the behavior is undefined.

29117 *r* or *rb* Open file for reading.

29118 *w* or *wb* Truncate to zero length or create file for writing.

29119 *a* or *ab* Append; open or create file for writing at end-of-file.

29120 *r+* or *rb+* or *r+b* Open file for update (reading and writing).

29121 *w+* or *wb+* or *w+b* Truncate to zero length or create file for update.

29122 *a+* or *ab+* or *a+b* Append; open or create file for update, writing at end-of-file.

29123 CX The character 'b' shall have no effect, but is allowed for ISO C standard conformance. Opening  
 29124 a file with read mode (*r* as the first character in the *mode* argument) shall fail if the file does not  
 29125 exist or cannot be read.

29126 Opening a file with append mode (*a* as the first character in the *mode* argument) shall cause all  
 29127 subsequent writes to the file to be forced to the then current end-of-file, regardless of intervening  
 29128 calls to *fseek()*.

29129 When a file is opened with update mode ('+' as the second or third character in the *mode*  
 29130 argument), both input and output may be performed on the associated stream. However, the  
 29131 application shall ensure that output is not directly followed by input without an intervening call  
 29132 to *fflush()* or to a file positioning function (*fseek()*, *fsetpos()*, or *rewind()*), and input is not directly  
 29133 followed by output without an intervening call to a file positioning function, unless the input  
 29134 operation encounters end-of-file.

29135 When opened, a stream is fully buffered if and only if it can be determined not to refer to an  
 29136 interactive device. The error and end-of-file indicators for the stream shall be cleared.

29137 CX If *mode* is *w*, *wb*, *a*, *ab*, *w+*, *wb+*, *w+b*, *a+*, *ab+*, or *a+b*, and the file did not previously exist, upon  
 29138 successful completion, *fopen()* shall mark for update the last data access, last data modification,  
 29139 and last file status change timestamps of the file and the last file status change and last data  
 29140 modification timestamps of the parent directory.

29141 If *mode* is *w*, *wb*, *a*, *ab*, *w+*, *wb+*, *w+b*, *a+*, *ab+*, or *a+b*, and the file did not previously exist, the  
 29142 *fopen()* function shall create a file as if it called the *creat()* function with a value appropriate for  
 29143 the *path* argument interpreted from *filename* and a value of S\_IRUSR | S\_IWUSR | S\_IRGRP |  
 29144 S\_IWGRP | S\_IROTH | S\_IWOTH for the *mode* argument.

29145 If *mode* is *w*, *wb*, *w+*, *wb+*, or *w+b*, and the file did previously exist, upon successful completion,  
 29146 *fopen()* shall mark for update the last data modification and last file status change timestamps of

# fopen()

29147 the file.

29148 XSI After a successful call to the *fopen()* function, the orientation of the stream shall be cleared, the

29149 encoding rule shall be cleared, and the associated *mbstate\_t* object shall be set to describe an

29150 initial conversion state.

29151 CX The file descriptor associated with the opened stream shall be allocated and opened as if by a

29152 call to *open()* with the following flags:

| <i>fopen()</i> Mode                   | <i>open()</i> Flags       |
|---------------------------------------|---------------------------|
| <i>r</i> or <i>rb</i>                 | O_RDONLY                  |
| <i>w</i> or <i>wb</i>                 | O_WRONLY O_CREAT O_TRUNC  |
| <i>a</i> or <i>ab</i>                 | O_WRONLY O_CREAT O_APPEND |
| <i>r+</i> or <i>rb+</i> or <i>r+b</i> | O_RDWR                    |
| <i>w+</i> or <i>wb+</i> or <i>w+b</i> | O_RDWR O_CREAT O_TRUNC    |
| <i>a+</i> or <i>ab+</i> or <i>a+b</i> | O_RDWR O_CREAT O_APPEND   |

## RETURN VALUE

29160 Upon successful completion, *fopen()* shall return a pointer to the object controlling the stream.

29161

29162 CX Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

## ERRORS

29163 The *fopen()* function shall fail if:

29165 CX [EACCES] Search permission is denied on a component of the path prefix, or the file

29166 exists and the permissions specified by *mode* are denied, or the file does not

29167 exist and write permission is denied for the parent directory of the file to be

29168 created.

29169 CX [EINTR] A signal was caught during *fopen()*.

29170 CX [EISDIR] The named file is a directory and *mode* requires write access.

29171 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*

29172 argument.

29173 CX [EMFILE] All file descriptors available to the process are currently open.

29174 CX [EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

29175 CX [ENAMETOOLONG]

29176 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a

29177 symbolic link produced an intermediate result with a length that exceeds

29178 {PATH\_MAX}.

29179 CX [ENFILE] The maximum allowable number of files is currently open in the system.

29180 CX [ENOENT] A component of *filename* does not name an existing file or *filename* is an empty

29181 string.

29182 CX [ENOSPC] The directory or file system that would contain the new file cannot be

29183 expanded, the file does not exist, and the file was to be created.

29184 CX [ENOTDIR] A component of the path prefix is not a directory, or the *filename* argument

29185 contains at least one non-*<slash>* character and ends with one or more trailing

29186 *<slash>* characters and the last pathname component names an existing file

29187 that is neither a directory nor a symbolic link to a directory.

- 29188 CX [ENXIO] The named file is a character special or block special file, and the device  
29189 associated with this special file does not exist.
- 29190 CX [EOVERFLOW] The named file is a regular file and the size of the file cannot be represented  
29191 correctly in an object of type `off_t`.
- 29192 CX [EROFS] The named file resides on a read-only file system and *mode* requires write  
29193 access.
- 29194 The *fopen()* function may fail if:
- 29195 CX [EINVAL] The value of the *mode* argument is not valid.
- 29196 CX [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
29197 resolution of the *path* argument.
- 29198 CX [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.
- 29199 CX [ENAMETOOLONG]  
29200 The length of a component of a pathname is longer than {NAME\_MAX}.
- 29201 CX [ENOMEM] Insufficient storage space is available.
- 29202 CX [ETXTBSY] The file is a pure procedure (shared text) file that is being executed and *mode*  
29203 requires write access.

## 29204 EXAMPLES

### 29205 Opening a File

29206 The following example tries to open the file named **file** for reading. The *fopen()* function returns  
29207 a file pointer that is used in subsequent *fgets()* and *fclose()* calls. If the program cannot open the  
29208 file, it just ignores it.

```
29209 #include <stdio.h>
29210 ...
29211 FILE *fp;
29212 ...
29213 void rgrep(const char *file)
29214 {
29215     ...
29216     if ((fp = fopen(file, "r")) == NULL)
29217         return;
29218     ...
29219 }
```

### 29220 APPLICATION USAGE

29221 None.

### 29222 RATIONALE

29223 None.

### 29224 FUTURE DIRECTIONS

29225 None.

**fopen()**29229 **CHANGE HISTORY**

29230 First released in Issue 1. Derived from Issue 1 of the SVID.

29231 **Issue 5**

29232 Large File Summit extensions are added.

29233 **Issue 6**

29234 Extensions beyond the ISO C standard are marked.

29235 The following new requirements on POSIX implementations derive from alignment with the  
29236 Single UNIX Specification:

- 29237 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open  
29238 file description. This change is to support large files.
- 29239 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support  
29240 large files.
- 29241 • The [ELOOP] mandatory error condition is added.
- 29242 • The [EINVAL], [EMFILE], [ENAMETOOLONG], [ENOMEM], and [ETXTBSY] optional  
29243 error conditions are added.

29244 The normative text is updated to avoid use of the term “must” for application requirements.

29245 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 29246 • The prototype for *fopen()* is updated.
- 29247 • The DESCRIPTION is updated to note that if the argument *mode* points to a string other  
29248 than those listed, then the behavior is undefined.

29249 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
29250 [ELOOP] error condition is added.

29251 **Issue 7**

29252 Austin Group Interpretation 1003.1-2001 #025 is applied, clarifying the file creation mode.

29253 Austin Group Interpretation 1003.1-2001 #143 is applied.

29254 Austin Group Interpretation 1003.1-2001 #159 is applied, clarifying requirements for the flags set  
29255 on the open file description.

29256 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

29257 SD5-XSH-ERN-149 is applied, changing the {STREAM\_MAX} [EMFILE] error condition from a  
29258 “may fail” to a “shall fail”.

29259 Changes are made related to support for finegrained timestamps.

29260 **NAME**

29261 fork — create a new process

29262 **SYNOPSIS**

29263 #include &lt;unistd.h&gt;

29264 pid\_t fork(void);

29265 **DESCRIPTION**29266 The *fork()* function shall create a new process. The new process (child process) shall be an exact  
29267 copy of the calling process (parent process) except as detailed below:

- 29268 • The child process shall have a unique process ID.
- 29269 • The child process ID also shall not match any active process group ID.
- 29270 • The child process shall have a different parent process ID, which shall be the process ID of  
29271 the calling process.
- 29272 • The child process shall have its own copy of the parent's file descriptors. Each of the  
29273 child's file descriptors shall refer to the same open file description with the corresponding  
29274 file descriptor of the parent.
- 29275 • The child process shall have its own copy of the parent's open directory streams. Each  
29276 open directory stream in the child process may share directory stream positioning with the  
29277 corresponding directory stream of the parent.
- 29278 • The child process shall have its own copy of the parent's message catalog descriptors.
- 29279 • The child process values of *tms\_utime*, *tms\_stime*, *tms\_cutime*, and *tms\_cstime* shall be set to  
29280 0.
- 29281 • The time left until an alarm clock signal shall be reset to zero, and the alarm, if any, shall be  
29282 canceled; see *alarm()*.
- 29283 XSI • All *semadj* values shall be cleared.
- 29284 • File locks set by the parent process shall not be inherited by the child process.
- 29285 • The set of signals pending for the child process shall be initialized to the empty set.
- 29286 XSI • Interval timers shall be reset in the child process.
- 29287 • Any semaphores that are open in the parent process shall also be open in the child process.
- 29288 ML • The child process shall not inherit any address space memory locks established by the  
29289 parent process via calls to *mlockall()* or *mlock()*.
- 29290 • Memory mappings created in the parent shall be retained in the child process.  
29291 MAP\_PRIVATE mappings inherited from the parent shall also be MAP\_PRIVATE  
29292 mappings in the child, and any modifications to the data in these mappings made by the  
29293 parent prior to calling *fork()* shall be visible to the child. Any modifications to the data in  
29294 MAP\_PRIVATE mappings made by the parent after *fork()* returns shall be visible only to  
29295 the parent. Modifications to the data in MAP\_PRIVATE mappings made by the child shall  
29296 be visible only to the child.
- 29297 PS • For the SCHED\_FIFO and SCHED\_RR scheduling policies, the child process shall inherit  
29298 the policy and priority settings of the parent process during a *fork()* function. For other  
29299 scheduling policies, the policy and priority settings on *fork()* are implementation-defined.

**fork()**

- 29300
- Per-process timers created by the parent shall not be inherited by the child process.
- 29301 MSG
- The child process shall have its own copy of the message queue descriptors of the parent. Each of the message descriptors of the child shall refer to the same open message queue description as the corresponding message descriptor of the parent.
- 29302
- 29303
- 29304
- No asynchronous input or asynchronous output operations shall be inherited by the child process. Any use of asynchronous control blocks created by the parent produces undefined behavior.
- 29305
- 29306
- 29307
- A process shall be created with a single thread. If a multi-threaded process calls *fork()*, the new process shall contain a replica of the calling thread and its entire address space, possibly including the states of mutexes and other resources. Consequently, to avoid errors, the child process may only execute async-signal-safe operations until such time as one of the *exec* functions is called. Fork handlers may be established by means of the *pthread\_atfork()* function in order to maintain application invariants across *fork()* calls.
- 29308
- 29309
- 29310
- 29311
- 29312
- 29313
- 29314
- 29315
- When the application calls *fork()* from a signal handler and any of the fork handlers registered by *pthread\_atfork()* calls a function that is not async-signal-safe, the behavior is undefined.
- 29316 OB TRC TRI
- If the Trace option and the Trace Inherit option are both supported:
- 29317
- 29318
- 29319
- 29320
- 29321
- 29322
- 29323
- If the calling process was being traced in a trace stream that had its inheritance policy set to *POSIX\_TRACE\_INHERITED*, the child process shall be traced into that trace stream, and the child process shall inherit the parent's mapping of trace event names to trace event type identifiers. If the trace stream in which the calling process was being traced had its inheritance policy set to *POSIX\_TRACE\_CLOSE\_FOR\_CHILD*, the child process shall not be traced into that trace stream. The inheritance policy is set by a call to the *posix\_trace\_attr\_setinherited()* function.
- 29324 OB TRC
- If the Trace option is supported, but the Trace Inherit option is not supported:
- 29325
- The child process shall not be traced into any of the trace streams of its parent process.
- 29326 OB TRC
- If the Trace option is supported, the child process of a trace controller process shall not control the trace streams controlled by its parent process.
- 29327
- 29328 CPT
- The initial value of the CPU-time clock of the child process shall be set to zero.
- 29329 TCT
- The initial value of the CPU-time clock of the single thread of the child process shall be set to zero.
- 29330
- 29331
- 29332
- 29333
- All other process characteristics defined by POSIX.1-2008 shall be the same in the parent and child processes. The inheritance of process characteristics not defined by POSIX.1-2008 is unspecified by POSIX.1-2008.
- 29334
- 29335
- After *fork()*, both the parent and the child processes shall be capable of executing independently before either one terminates.
- 29336 **RETURN VALUE**
- 29337
- 29338
- 29339
- 29340
- Upon successful completion, *fork()* shall return 0 to the child process and shall return the process ID of the child process to the parent process. Both processes shall continue to execute from the *fork()* function. Otherwise, -1 shall be returned to the parent process, no child process shall be created, and *errno* shall be set to indicate the error.

29341 **ERRORS**29342 The *fork()* function shall fail if:

29343 [EAGAIN] The system lacked the necessary resources to create another process, or the  
 29344 system-imposed limit on the total number of processes under execution  
 29345 system-wide or by a single user {CHILD\_MAX} would be exceeded.

29346 The *fork()* function may fail if:

29347 [ENOMEM] Insufficient storage space is available.

29348 **EXAMPLES**

29349 None.

29350 **APPLICATION USAGE**

29351 None.

29352 **RATIONALE**

29353 Many historical implementations have timing windows where a signal sent to a process group  
 29354 (for example, an interactive SIGINT) just prior to or during execution of *fork()* is delivered to the  
 29355 parent following the *fork()* but not to the child because the *fork()* code clears the child's set of  
 29356 pending signals. This volume of POSIX.1-2008 does not require, or even permit, this behavior.  
 29357 However, it is pragmatic to expect that problems of this nature may continue to exist in  
 29358 implementations that appear to conform to this volume of POSIX.1-2008 and pass available  
 29359 verification suites. This behavior is only a consequence of the implementation failing to make  
 29360 the interval between signal generation and delivery totally invisible. From the application's  
 29361 perspective, a *fork()* call should appear atomic. A signal that is generated prior to the *fork()*  
 29362 should be delivered prior to the *fork()*. A signal sent to the process group after the *fork()* should  
 29363 be delivered to both parent and child. The implementation may actually initialize internal data  
 29364 structures corresponding to the child's set of pending signals to include signals sent to the  
 29365 process group during the *fork()*. Since the *fork()* call can be considered as atomic from the  
 29366 application's perspective, the set would be initialized as empty and such signals would have  
 29367 arrived after the *fork()*; see also `<signal.h>`.

29368 One approach that has been suggested to address the problem of signal inheritance across *fork()*  
 29369 is to add an [EINTR] error, which would be returned when a signal is detected during the call.  
 29370 While this is preferable to losing signals, it was not considered an optimal solution. Although it  
 29371 is not recommended for this purpose, such an error would be an allowable extension for an  
 29372 implementation.

29373 The [ENOMEM] error value is reserved for those implementations that detect and distinguish  
 29374 such a condition. This condition occurs when an implementation detects that there is not enough  
 29375 memory to create the process. This is intended to be returned when [EAGAIN] is inappropriate  
 29376 because there can never be enough memory (either primary or secondary storage) to perform  
 29377 the operation. Since *fork()* duplicates an existing process, this must be a condition where there is  
 29378 sufficient memory for one such process, but not for two. Many historical implementations  
 29379 actually return [ENOMEM] due to temporary lack of memory, a case that is not generally  
 29380 distinct from [EAGAIN] from the perspective of a conforming application.

29381 Part of the reason for including the optional error [ENOMEM] is because the SVID specifies it  
 29382 and it should be reserved for the error condition specified there. The condition is not applicable  
 29383 on many implementations.

29384 IEEE Std 1003.1-1988 neglected to require concurrent execution of the parent and child of *fork()*.  
 29385 A system that single-threads processes was clearly not intended and is considered an  
 29386 unacceptable "toy implementation" of this volume of POSIX.1-2008. The only objection  
 29387 anticipated to the phrase "executing independently" is testability, but this assertion should be

**fork()**

29388 testable. Such tests require that both the parent and child can block on a detectable action of the  
 29389 other, such as a write to a pipe or a signal. An interactive exchange of such actions should be  
 29390 possible for the system to conform to the intent of this volume of POSIX.1-2008.

29391 The [EAGAIN] error exists to warn applications that such a condition might occur. Whether it  
 29392 occurs or not is not in any practical sense under the control of the application because the  
 29393 condition is usually a consequence of the user's use of the system, not of the application's code.  
 29394 Thus, no application can or should rely upon its occurrence under any circumstances, nor  
 29395 should the exact semantics of what concept of "user" is used be of concern to the application  
 29396 developer. Validation writers should be cognizant of this limitation.

29397 There are two reasons why POSIX programmers call *fork()*. One reason is to create a new thread  
 29398 of control within the same program (which was originally only possible in POSIX by creating a  
 29399 new process); the other is to create a new process running a different program. In the latter case,  
 29400 the call to *fork()* is soon followed by a call to one of the *exec* functions.

29401 The general problem with making *fork()* work in a multi-threaded world is what to do with all  
 29402 of the threads. There are two alternatives. One is to copy all of the threads into the new process.  
 29403 This causes the programmer or implementation to deal with threads that are suspended on  
 29404 system calls or that might be about to execute system calls that should not be executed in the  
 29405 new process. The other alternative is to copy only the thread that calls *fork()*. This creates the  
 29406 difficulty that the state of process-local resources is usually held in process memory. If a thread  
 29407 that is not calling *fork()* holds a resource, that resource is never released in the child process  
 29408 because the thread whose job it is to release the resource does not exist in the child process.

29409 When a programmer is writing a multi-threaded program, the first described use of *fork()*,  
 29410 creating new threads in the same program, is provided by the *pthread\_create()* function. The  
 29411 *fork()* function is thus used only to run new programs, and the effects of calling functions that  
 29412 require certain resources between the call to *fork()* and the call to an *exec* function are undefined.

29413 The addition of the *forkall()* function to the standard was considered and rejected. The *forkall()*  
 29414 function lets all the threads in the parent be duplicated in the child. This essentially duplicates  
 29415 the state of the parent in the child. This allows threads in the child to continue processing and  
 29416 allows locks and the state to be preserved without explicit *pthread\_atfork()* code. The calling  
 29417 process has to ensure that the threads processing state that is shared between the parent and  
 29418 child (that is, file descriptors or MAP\_SHARED memory) behaves properly after *forkall()*. For  
 29419 example, if a thread is reading a file descriptor in the parent when *forkall()* is called, then two  
 29420 threads (one in the parent and one in the child) are reading the file descriptor after the *forkall()*.  
 29421 If this is not desired behavior, the parent process has to synchronize with such threads before  
 29422 calling *forkall()*.

29423 While the *fork()* function is *async-signal-safe*, there is no way for an implementation to  
 29424 determine whether the fork handlers established by *pthread\_atfork()* are *async-signal-safe*. The  
 29425 fork handlers may attempt to execute portions of the implementation that are not *async-signal-*  
 29426 *safe*, such as those that are protected by mutexes, leading to a deadlock condition. It is therefore  
 29427 undefined for the fork handlers to execute functions that are not *async-signal-safe* when *fork()* is  
 29428 called from a signal handler.

29429 When *forkall()* is called, threads, other than the calling thread, that are in functions that can  
 29430 return with an [EINTR] error may have those functions return [EINTR] if the implementation  
 29431 cannot ensure that the function behaves correctly in the parent and child. In particular,  
 29432 *pthread\_cond\_wait()* and *pthread\_cond\_timedwait()* need to return in order to ensure that the  
 29433 condition has not changed. These functions can be awakened by a spurious condition wakeup  
 29434 rather than returning [EINTR].

29435 **FUTURE DIRECTIONS**

29436 None.

29437 **SEE ALSO**29438 *alarm()*, *exec*, *fcntl()*, *posix\_trace\_attr\_getinherited()*, *posix\_trace\_eventid\_equal()*, *pthread\_atfork()*,  
29439 *semop()*, *signal()*, *times()*29440 XBD Section 4.11 (on page 110), **<sys/types.h>**, **<unistd.h>**29441 **CHANGE HISTORY**

29442 First released in Issue 1. Derived from Issue 1 of the SVID.

29443 **Issue 5**29444 The DESCRIPTION is changed for alignment with the POSIX Realtime Extension and the POSIX  
29445 Threads Extension.29446 **Issue 6**29447 The following new requirements on POSIX implementations derive from alignment with the  
29448 Single UNIX Specification:

- 29449
- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was  
29450 required for conforming implementations of previous POSIX specifications, it was not  
29451 required for UNIX applications.

29452 The following changes were made to align with the IEEE P1003.1a draft standard:

- 29453
- The effect of *fork()* on a pending alarm call in the child process is clarified.

29454 The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

29455 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

29456 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/17 is applied, adding text to the  
29457 DESCRIPTION and RATIONALE relating to fork handlers registered by the *pthread\_atfork()*  
29458 function and async-signal safety.29459 **Issue 7**29460 Austin Group Interpretation 1003.1-2001 #080 is applied, clarifying the status of asynchronous  
29461 input and asynchronous output operations and asynchronous control lists in the DESCRIPTION.29462 Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, Timers,  
29463 and Threads options is moved to the Base.

29464 Functionality relating to message catalog descriptors is moved from the XSI option to the Base.

**fpathconf()**29465 **NAME**29466 `fpathconf`, `pathconf` — get configurable pathname variables29467 **SYNOPSIS**29468 `#include <unistd.h>`29469 `long fpathconf(int fildes, int name);`29470 `long pathconf(const char *path, int name);`29471 **DESCRIPTION**29472 The `fpathconf()` and `pathconf()` functions shall determine the current value of a configurable limit  
29473 or option (*variable*) that is associated with a file or directory.29474 For `pathconf()`, the *path* argument points to the pathname of a file or directory.29475 For `fpathconf()`, the *filde*s argument is an open file descriptor.29476 The *name* argument represents the variable to be queried relative to that file or directory.  
29477 Implementations shall support all of the variables listed in the following table and may support  
29478 others. The variables in the following table come from `<limits.h>` or `<unistd.h>` and the  
29479 symbolic constants, defined in `<unistd.h>`, are the corresponding values used for *name*.

| Variable                    | Value of <i>name</i>     | Requirements |
|-----------------------------|--------------------------|--------------|
| {FILESIZEBITS}              | _PC_FILESIZEBITS         | 3,4          |
| {LINK_MAX}                  | _PC_LINK_MAX             | 1            |

| _POSIX_TIMESTAMP_RESOLUTION | _PC_TIMESTAMP_RESOLUTION | 1            |

29502 **Requirements**

- 29503 1. If *path* or *filde*s refers to a directory, the value returned shall apply to the directory itself.
- 29504 2. If *path* or *filde*s does not refer to a terminal file, it is unspecified whether an  
29505 implementation supports an association of the variable name with the specified file.
- 29506 3. If *path* or *filde*s refers to a directory, the value returned shall apply to filenames within the  
29507 directory.

- 29508 4. If *path* or *fildev* does not refer to a directory, it is unspecified whether an implementation  
29509 supports an association of the variable name with the specified file.
- 29510 5. If *path* or *fildev* refers to a directory, the value returned shall be the maximum length of a  
29511 relative pathname when the specified directory is the working directory.
- 29512 6. If *path* refers to a FIFO, or *fildev* refers to a pipe or FIFO, the value returned shall apply to  
29513 the referenced object. If *path* or *fildev* refers to a directory, the value returned shall apply to  
29514 any FIFO that exists or can be created within the directory. If *path* or *fildev* refers to any  
29515 other type of file, it is unspecified whether an implementation supports an association of  
29516 the variable name with the specified file.
- 29517 7. If *path* or *fildev* refers to a directory, the value returned shall apply to any files, other than  
29518 directories, that exist or can be created within the directory.
- 29519 8. If *path* or *fildev* refers to a directory, it is unspecified whether an implementation supports  
29520 an association of the variable name with the specified file.
- 29521 9. If *path* or *fildev* refers to a directory, the value returned shall be the maximum length of the  
29522 string that a symbolic link in that directory can contain.
- 29523 10. If *path* or *fildev* does not refer to a regular file, it is unspecified whether an  
29524 implementation supports an association of the variable name with the specified file. If an  
29525 implementation supports such an association for other than a regular file, the value  
29526 returned is unspecified.

**RETURN VALUE**

29527 If *name* is an invalid value, both *pathconf()* and *fpathconf()* shall return  $-1$  and set *errno* to  
29528 indicate the error.  
29529

29530 If the variable corresponding to *name* is described in `<limits.h>` as a maximum or minimum  
29531 value and the variable has no limit for the path or file descriptor, both *pathconf()* and *fpathconf()*  
29532 shall return  $-1$  without changing *errno*. Note that indefinite limits do not imply infinite limits;  
29533 see `<limits.h>`.

29534 If the implementation needs to use *path* to determine the value of *name* and the implementation  
29535 does not support the association of *name* with the file specified by *path*, or if the process did not  
29536 have appropriate privileges to query the file specified by *path*, or *path* does not exist, *pathconf()*  
29537 shall return  $-1$  and set *errno* to indicate the error.

29538 If the implementation needs to use *fildev* to determine the value of *name* and the implementation  
29539 does not support the association of *name* with the file specified by *fildev*, or if *fildev* is an invalid  
29540 file descriptor, *fpathconf()* shall return  $-1$  and set *errno* to indicate the error.

29541 Otherwise, *pathconf()* or *fpathconf()* shall return the current variable value for the file or  
29542 directory without changing *errno*. The value returned shall not be more restrictive than the  
29543 corresponding value available to the application when it was compiled with the  
29544 implementation's `<limits.h>` or `<unistd.h>`.

29545 If the variable corresponding to *name* is dependent on an unsupported option, the results are  
29546 unspecified.

**ERRORS**

29547 The *pathconf()* function shall fail if:

29548 [EINVAL] The value of *name* is not valid.

**fpathconf()**

| 29581 | <b>APPLICATION USAGE</b> |                                                                                                                                                                                                                                                                                                                                                |
| 29582 |                          | Application developers should check whether an option, such as <code>_POSIX_ADVISORY_INFO</code> , is supported prior to obtaining and using values for related variables such as <code>{POSIX_ALLOC_SIZE_MIN}</code> .                                                                                                                        |
| 29583 |                          |                                                                                                                                                                                                                                                                                                                                                |
| 29584 |                          |                                                                                                                                                                                                                                                                                                                                                |
| 29585 | <b>RATIONALE</b>         |                                                                                                                                                                                                                                                                                                                                                |
| 29586 |                          | The <i>fpathconf()</i> function was proposed immediately after the <i>sysconf()</i> function when it was realized that some configurable values may differ across file system, directory, or device boundaries.                                                                                                                                |
| 29587 |                          |                                                                                                                                                                                                                                                                                                                                                |
| 29588 |                          |                                                                                                                                                                                                                                                                                                                                                |
| 29589 |                          | For example, <code>{NAME_MAX}</code> frequently changes between System V and BSD-based file systems; System V uses a maximum of 14, BSD 255. On an implementation that provides both types of file systems, an application would be forced to limit all pathname components to 14 bytes, as this                                               |
| 29590 |                          |                                                                                                                                                                                                                                                                                                                                                |
| 29591 |                          |                                                                                                                                                                                                                                                                                                                                                |

29592 would be the value specified in `<limits.h>` on such a system.

29593 Therefore, various useful values can be queried on any pathname or file descriptor, assuming  
29594 that appropriate privileges are in place.

29595 The value returned for the variable `{PATH_MAX}` indicates the longest relative pathname that  
29596 could be given if the specified directory is the current working directory of the process. A  
29597 process may not always be able to generate a name that long and use it if a subdirectory in the  
29598 pathname crosses into a more restrictive file system. Note that implementations are allowed to  
29599 accept pathnames longer than `{PATH_MAX}` bytes long, but are not allowed to return  
29600 pathnames longer than this unless the user specifies a larger buffer using a function that  
29601 provides a buffer size argument.

29602 The value returned for the variable `_POSIX_CHOWN_RESTRICTED` also applies to directories  
29603 that do not have file systems mounted on them. The value may change when crossing a mount  
29604 point, so applications that need to know should check for each directory. (An even easier check  
29605 is to try the `chown()` function and look for an error in case it happens.)

29606 Unlike the values returned by `sysconf()`, the pathname-oriented variables are potentially more  
29607 volatile and are not guaranteed to remain constant throughout the lifetime of the process. For  
29608 example, in between two calls to `pathconf()`, the file system in question may have been  
29609 unmounted and remounted with different characteristics.

29610 Also note that most of the errors are optional. If one of the variables always has the same value  
29611 on an implementation, the implementation need not look at `path` or `fildev` to return that value and  
29612 is, therefore, not required to detect any of the errors except the meaning of `[EINVAL]` that  
29613 indicates that the value of `name` is not valid for that variable.

29614 If the value of any of the limits is unspecified (logically infinite), they will not be defined in  
29615 `<limits.h>` and the `pathconf()` and `fpathconf()` functions return `-1` without changing `errno`. This  
29616 can be distinguished from the case of giving an unrecognized `name` argument because `errno` is set  
29617 to `[EINVAL]` in this case.

29618 Since `-1` is a valid return value for the `pathconf()` and `fpathconf()` functions, applications should  
29619 set `errno` to zero before calling them and check `errno` only if the return value is `-1`.

29620 For the case of `{SYMLINK_MAX}`, since both `pathconf()` and `open()` follow symbolic links, there  
29621 is no way that `path` or `fildev` could refer to a symbolic link.

29622 It was the intention of IEEE Std 1003.1d-1999 that the following variables:

29623 `{POSIX_ALLOC_SIZE_MIN}`  
29624 `{POSIX_REC_INCR_XFER_SIZE}`  
29625 `{POSIX_REC_MAX_XFER_SIZE}`  
29626 `{POSIX_REC_MIN_XFER_SIZE}`  
29627 `{POSIX_REC_XFER_ALIGN}`

29628 only applied to regular files, but Note 10 also permits implementation of the advisory semantics  
29629 on other file types unique to an implementation (for example, a character special device).

29630 The `[EOVERFLOW]` error for `_PC_TIMESTAMP_RESOLUTION` cannot occur on POSIX-  
29631 compliant file systems because POSIX requires a timestamp resolution no larger than one  
29632 second. Even on 32-bit systems, this can be represented without overflow.

**fpathconf()**29633 **FUTURE DIRECTIONS**

29634 None.

29635 **SEE ALSO**29636 *chown()*, *confstr()*, *sysconf()*29637 XBD *<limits.h>*, *<unistd.h>*29638 XCU *getconf*29639 **CHANGE HISTORY**

29640 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

29641 **Issue 5**

29642 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

29643 Large File Summit extensions are added.

29644 **Issue 6**29645 The following new requirements on POSIX implementations derive from alignment with the  
29646 Single UNIX Specification:

- 29647 • The DESCRIPTION is updated to include {FILESIZEBITS}.
- 29648 • The [ELOOP] mandatory error condition is added.
- 29649 • A second [ENAMETOOLONG] is added as an optional error condition.

29650 The following changes were made to align with the IEEE P1003.1a draft standard:

- 29651 • The `_PC_SYMLINK_MAX` entry is added to the table in the DESCRIPTION.

29652 The following *pathconf()* variables and their associated names are added for alignment with  
29653 IEEE Std 1003.1d-1999:

```
29654 {POSIX_ALLOC_SIZE_MIN}
29655 {POSIX_REC_INCR_XFER_SIZE}
29656 {POSIX_REC_MAX_XFER_SIZE}
29657 {POSIX_REC_MIN_XFER_SIZE}
29658 {POSIX_REC_XFER_ALIGN}
```

29659 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/18 is applied, changing the fourth  
29660 paragraph of the DESCRIPTION and removing shading and margin markers from the table.  
29661 This change is needed since implementations are required to support all of these symbols.

29662 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/34 is applied, adding the table entry for  
29663 POSIX2\_SYMLINKS in the DESCRIPTION.

29664 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/35 is applied, updating the  
29665 DESCRIPTION and RATIONALE sections to clarify behavior for the following variables:

```
29666 {POSIX_ALLOC_SIZE_MIN}
29667 {POSIX_REC_INCR_XFER_SIZE}
29668 {POSIX_REC_MAX_XFER_SIZE}
29669 {POSIX_REC_MIN_XFER_SIZE}
29670 {POSIX_REC_XFER_ALIGN}
```

29671 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/36 is applied, updating the RETURN  
29672 VALUE and APPLICATION USAGE sections to state that the results are unspecified if a variable  
29673 is dependent on an unsupported option, and advising application developers to check for

29674 supported options prior to obtaining and using such values.

29675 **Issue 7**

29676 Austin Group Interpretations 1003.1-2001 #143 and #160 are applied.

29677 Changes are made related to support for finegrained timestamps.

29678 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
29679 pathname exists but is not a directory or a symbolic link to a directory.

**fpclassify()**

System Interfaces

29680 **NAME**

29681 fpclassify — classify real floating type

29682 **SYNOPSIS**

29683 #include &lt;math.h&gt;

29684 int fpclassify(real-floating x);

29685 **DESCRIPTION**

29686 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 29687 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29688 volume of POSIX.1-2008 defers to the ISO C standard.

29689 The *fpclassify()* macro shall classify its argument value as NaN, infinite, normal, subnormal,  
 29690 zero, or into another implementation-defined category. First, an argument represented in a  
 29691 format wider than its semantic type is converted to its semantic type. Then classification is based  
 29692 on the type of the argument.

29693 **RETURN VALUE**

29694 The *fpclassify()* macro shall return the value of the number classification macro appropriate to  
 29695 the value of its argument.

29696 **ERRORS**

29697 No errors are defined.

29698 **EXAMPLES**

29699 None.

29700 **APPLICATION USAGE**

29701 None.

29702 **RATIONALE**

29703 None.

29704 **FUTURE DIRECTIONS**

29705 None.

29706 **SEE ALSO**29707 *isfinite()*, *isinf()*, *isnan()*, *isnormal()*, *signbit()*

29708 XBD &lt;math.h&gt;

29709 **CHANGE HISTORY**

29710 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

29711 **NAME**29712 `dprintf, fprintf, printf, snprintf, sprintf` — print formatted output29713 **SYNOPSIS**29714 `#include <stdio.h>`

```

29715 CX int dprintf(int fildes, const char *restrict format, ...);
29716 int fprintf(FILE *restrict stream, const char *restrict format, ...);
29717 int printf(const char *restrict format, ...);
29718 int snprintf(char *restrict s, size_t n,
29719     const char *restrict format, ...);
29720 int sprintf(char *restrict s, const char *restrict format, ...);

```

29721 **DESCRIPTION**

29722 CX Excluding `dprintf()`: The functionality described on this reference page is aligned with the ISO C  
 29723 standard. Any conflict between the requirements described here and the ISO C standard is  
 29724 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

29725 The `fprintf()` function shall place output on the named output *stream*. The `printf()` function shall  
 29726 place output on the standard output stream *stdout*. The `sprintf()` function shall place output  
 29727 followed by the null byte, `'\0'`, in consecutive bytes starting at *s*; it is the user's responsibility  
 29728 to ensure that enough space is available.

29729 CX The `dprintf()` function shall be equivalent to the `fprintf()` function, except that `dprintf()` shall  
 29730 write output to the file associated with the file descriptor specified by the *fildes* argument rather  
 29731 than place output on a stream.

29732 The `snprintf()` function shall be equivalent to `sprintf()`, with the addition of the *n* argument  
 29733 which states the size of the buffer referred to by *s*. If *n* is zero, nothing shall be written and *s*  
 29734 may be a null pointer. Otherwise, output bytes beyond the *n*-1st shall be discarded instead of  
 29735 being written to the array, and a null byte is written at the end of the bytes actually written into  
 29736 the array.

29737 If copying takes place between objects that overlap as a result of a call to `sprintf()` or `snprintf()`,  
 29738 the results are undefined.

29739 Each of these functions converts, formats, and prints its arguments under control of the *format*.  
 29740 The *format* is a character string, beginning and ending in its initial shift state, if any. The *format* is  
 29741 composed of zero or more directives: *ordinary characters*, which are simply copied to the output  
 29742 stream, and *conversion specifications*, each of which shall result in the fetching of zero or more  
 29743 arguments. The results are undefined if there are insufficient arguments for the *format*. If the  
 29744 *format* is exhausted while arguments remain, the excess arguments shall be evaluated but are  
 29745 otherwise ignored.

29746 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 29747 to the next unused argument. In this case, the conversion specifier character `%` (see below)  
 29748 is replaced by the sequence `"%n$"`, where *n* is a decimal integer in the range `[1, {NL_ARGMAX}]`,  
 29749 giving the position of the argument in the argument list. This feature provides for the definition  
 29750 of format strings that select arguments in an order appropriate to specific languages (see the  
 29751 EXAMPLES section).

29752 The *format* can contain either numbered argument conversion specifications (that is, `"%n$"` and  
 29753 `"*m$"`), or unnumbered argument conversion specifications (that is, `%` and `*`), but not both. The  
 29754 only exception to this is that `%%` can be mixed with the `"%n$"` form. The results of mixing  
 29755 numbered and unnumbered argument specifications in a *format* string are undefined. When  
 29756 numbered argument specifications are used, specifying the *N*th argument requires that all the  
 29757 leading arguments, from the first to the (*N*-1)th, are specified in the format string.

**fprintf()**

- 29758 In format strings containing the "%n\$" form of conversion specification, numbered arguments  
29759 in the argument list can be referenced from the format string as many times as required.
- 29760 In format strings containing the % form of conversion specification, each conversion specification  
29761 uses the first unused argument in the argument list.
- 29762 CX All forms of the *fprintf()* functions allow for the insertion of a language-dependent radix  
29763 character in the output string. The radix character is defined in the process' locale (category  
29764 LC\_NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the  
29765 radix character shall default to a <period> ('.').
- 29766 CX Each conversion specification is introduced by the '%' character or by the character sequence  
29767 "%n\$", after which the following appear in sequence:
- 29768 • Zero or more *flags* (in any order), which modify the meaning of the conversion  
29769 specification.
  - 29770 • An optional minimum *field width*. If the converted value has fewer bytes than the field  
29771 width, it shall be padded with <space> characters by default on the left; it shall be padded  
29772 on the right if the left-adjustment flag ('-'), described below, is given to the field width.  
29773 The field width takes the form of an <asterisk> ('\*'), described below, or a decimal  
29774 integer.
  - 29775 • An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u,  
29776 x, and X conversion specifiers; the number of digits to appear after the radix character for  
29777 the a, A, e, E, f, and F conversion specifiers; the maximum number of significant digits for  
29778 the g and G conversion specifiers; or the maximum number of bytes to be printed from a  
29779 XSI string in the s and S conversion specifiers. The precision takes the form of a <period>  
29780 ('.') followed either by an <asterisk> ('\*'), described below, or an optional decimal digit  
29781 string, where a null digit string is treated as zero. If a precision appears with any other  
29782 conversion specifier, the behavior is undefined.
  - 29783 • An optional length modifier that specifies the size of the argument.
  - 29784 • A *conversion specifier* character that indicates the type of conversion to be applied.
- 29785 A field width, or precision, or both, may be indicated by an <asterisk> ('\*'). In this case an  
29786 argument of type *int* supplies the field width or precision. Applications shall ensure that  
29787 arguments specifying field width, or precision, or both appear in that order before the argument,  
29788 if any, to be converted. A negative field width is taken as a '-' flag followed by a positive field  
29789 CX width. A negative precision is taken as if the precision were omitted. In *format* strings  
29790 containing the "%n\$" form of a conversion specification, a field width or precision may be  
29791 indicated by the sequence "\*m\$", where *m* is a decimal integer in the range [1,{NL\_ARGMAX}]  
29792 giving the position in the argument list (after the *format* argument) of an integer argument  
29793 containing the field width or precision, for example:
- 29794 `printf("%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);`
- 29795 The flag characters and their meanings are:
- 29796 CX ' (The <apostrophe>.) The integer portion of the result of a decimal conversion (%i, %d,  
29797 %u, %f, %F, %g, or %G) shall be formatted with thousands' grouping characters. For  
29798 other conversions the behavior is undefined. The non-monetary grouping character is  
29799 used.
- 29800 - The result of the conversion shall be left-justified within the field. The conversion is  
29801 right-justified if this flag is not specified.

|       |              |                                                                                                       |
|-------|--------------|-------------------------------------------------------------------------------------------------------|
| 29802 | +            | The result of a signed conversion shall always begin with a sign ('+' or '-'). The                    |
| 29803 |              | conversion shall begin with a sign only when a negative value is converted if this flag is            |
| 29804 |              | not specified.                                                                                        |
| 29805 | <space>      | If the first character of a signed conversion is not a sign or if a signed conversion results         |
| 29806 |              | in no characters, a <space> shall be prefixed to the result. This means that if the                   |
| 29807 |              | <space> and '+' flags both appear, the <space> flag shall be ignored.                                 |
| 29808 | #            | Specifies that the value is to be converted to an alternative form. For o conversion, it              |
| 29809 |              | increases the precision (if necessary) to force the first digit of the result to be zero. For x       |
| 29810 |              | or X conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A,         |
| 29811 |              | e, E, f, F, g, and G conversion specifiers, the result shall always contain a radix                   |
| 29812 |              | character, even if no digits follow the radix character. Without this flag, a radix                   |
| 29813 |              | character appears in the result of these conversions only if a digit follows it. For g and G          |
| 29814 |              | conversion specifiers, trailing zeros shall <i>not</i> be removed from the result as they             |
| 29815 |              | normally are. For other conversion specifiers, the behavior is undefined.                             |
| 29816 | 0            | For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros                 |
| 29817 |              | (following any indication of sign or base) are used to pad to the field width rather than             |
| 29818 |              | performing space padding, except when converting an infinity or NaN. If the '0' and                   |
| 29819 |              | '-' flags both appear, the '0' flag is ignored. For d, i, o, u, x, and X conversion                   |
| 29820 | CX           | specifiers, if a precision is specified, the '0' flag shall be ignored. If the '0' and                |
| 29821 |              | <apostrophe> flags both appear, the grouping characters are inserted before zero                      |
| 29822 |              | padding. For other conversions, the behavior is undefined.                                            |
| 29823 |              | The length modifiers and their meanings are:                                                          |
| 29824 | hh           | Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>signed char</b>   |
| 29825 |              | or <b>unsigned char</b> argument (the argument will have been promoted according to the               |
| 29826 |              | integer promotions, but its value shall be converted to <b>signed char</b> or <b>unsigned char</b>    |
| 29827 |              | before printing); or that a following n conversion specifier applies to a pointer to a                |
| 29828 |              | <b>signed char</b> argument.                                                                          |
| 29829 | h            | Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>short</b> or      |
| 29830 |              | <b>unsigned short</b> argument (the argument will have been promoted according to the                 |
| 29831 |              | integer promotions, but its value shall be converted to <b>short</b> or <b>unsigned short</b> before  |
| 29832 |              | printing); or that a following n conversion specifier applies to a pointer to a <b>short</b>          |
| 29833 |              | argument.                                                                                             |
| 29834 | l (ell)      | Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>long</b> or       |
| 29835 |              | <b>unsigned long</b> argument; that a following n conversion specifier applies to a pointer to        |
| 29836 |              | a <b>long</b> argument; that a following c conversion specifier applies to a <b>wint_t</b> argument;  |
| 29837 |              | that a following s conversion specifier applies to a pointer to a <b>wchar_t</b> argument; or         |
| 29838 |              | has no effect on a following a, A, e, E, f, F, g, or G conversion specifier.                          |
| 29839 | ll (ell-ell) |                                                                                                       |
| 29840 |              | Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>long long</b>     |
| 29841 |              | or <b>unsigned long long</b> argument; or that a following n conversion specifier applies to a        |
| 29842 |              | pointer to a <b>long long</b> argument.                                                               |
| 29843 | j            | Specifies that a following d, i, o, u, x, or X conversion specifier applies to an <b>intmax_t</b>     |
| 29844 |              | or <b>uintmax_t</b> argument; or that a following n conversion specifier applies to a pointer         |
| 29845 |              | to an <b>intmax_t</b> argument.                                                                       |
| 29846 | z            | Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>size_t</b> or the |
| 29847 |              | corresponding signed integer type argument; or that a following n conversion specifier                |
| 29848 |              | applies to a pointer to a signed integer type corresponding to a <b>size_t</b> argument.              |

**fprintf()**

|       |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 29849 | t                   | Specifies that a following <i>d</i> , <i>i</i> , <i>o</i> , <i>u</i> , <i>x</i> , or <i>X</i> conversion specifier applies to a <b>ptrdiff_t</b> or the corresponding <b>unsigned</b> type argument; or that a following <i>n</i> conversion specifier applies to a pointer to a <b>ptrdiff_t</b> argument.                                                                                                                                                                                                                                              |
| 29850 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 29851 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 29852 | L                   | Specifies that a following <i>a</i> , <i>A</i> , <i>e</i> , <i>E</i> , <i>f</i> , <i>F</i> , <i>g</i> , or <i>G</i> conversion specifier applies to a <b>long double</b> argument.                                                                                                                                                                                                                                                                                                                                                                       |
| 29853 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 29854 |                     | If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 29855 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 29871 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 29872 | <i>x</i>            | The <b>unsigned</b> argument shall be converted to unsigned hexadecimal format in the style " <i>ddd</i> "; the letters "abcdef" are used. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision is 1. The result of converting zero with an explicit precision of zero shall be no characters.                                                                                                                |
| 29873 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 29874 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 29876 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 29877 | <i>X</i>            | Equivalent to the <i>x</i> conversion specifier, except that letters "ABCDEF" are used instead of "abcdef".                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 29878 |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 29879 | <i>f</i> , <i>F</i> | The <b>double</b> argument shall be converted to decimal notation in the style "[ <i>-</i> ] <i>ddd</i> . <i>ddd</i> ", where the number of digits after the radix character is equal to the precision specification. If the precision is missing, it shall be taken as 6; if the precision is explicitly zero and no ' <i>#</i> ' flag is present, no radix character shall appear. If a radix character appears, at least one digit appears before it. The low-order digit shall be rounded in an implementation-defined manner.                       |

| 29901 | <b>g, G</b> | The <b>double</b> argument representing a floating-point number shall be converted in the                                      |
| 29902 |             | style <b>f</b> or <b>e</b> (or in the style <b>F</b> or <b>E</b> in the case of a <b>G</b> conversion specifier), depending on |
| 29903 |             | the value converted and the precision. Let <b>P</b> equal the precision if non-zero, 6 if the                                  |
| 29904 |             | precision is omitted, or 1 if the precision is zero. Then, if a conversion with style <b>E</b>                                 |
| 29905 |             | would have an exponent of <b>X</b> :                                                                                           |
| 29906 |             | — If $P > X \geq -4$ , the conversion shall be with style <b>f</b> (or <b>F</b> ) and precision $P - (X + 1)$ .                |
| 29907 |             | — Otherwise, the conversion shall be with style <b>e</b> (or <b>E</b> ) and precision $P - 1$ .                                |
| 29908 |             | Finally, unless the '#' flag is used, any trailing zeros shall be removed from the                                             |
| 29909 |             | fractional portion of the result and the decimal-point character shall be removed if there                                     |
| 29910 |             | is no fractional portion remaining.                                                                                            |
| 29911 |             | A <b>double</b> argument representing an infinity or NaN shall be converted in the style of                                    |
| 29912 |             | an <b>f</b> or <b>F</b> conversion specifier.                                                                                  |
| 29913 | <b>a, A</b> | A <b>double</b> argument representing a floating-point number shall be converted in the                                        |
| 29914 |             | style "[−]0xh.hhhhp±d", where there is one hexadecimal digit (which shall be non-                                              |
| 29915 |             | zero if the argument is a normalized floating-point number and is otherwise                                                    |
| 29916 |             | unspecified) before the decimal-point character and the number of hexadecimal digits                                           |
| 29917 |             | after it is equal to the precision; if the precision is missing and FLT_RADIX is a power                                       |
| 29918 |             | of 2, then the precision shall be sufficient for an exact representation of the value; if the                                  |
| 29919 |             | precision is missing and FLT_RADIX is not a power of 2, then the precision shall be                                            |
| 29920 |             | sufficient to distinguish values of type <b>double</b> , except that trailing zeros may be                                     |
| 29921 |             | omitted; if the precision is zero and the '#' flag is not specified, no decimal-point                                          |
| 29922 |             | character shall appear. The letters "abcdef" shall be used for a conversion and the                                            |
| 29923 |             | letters "ABCDEF" for A conversion. The A conversion specifier produces a number with                                           |
| 29924 |             | 'X' and 'P' instead of 'x' and 'p'. The exponent shall always contain at least one                                             |
| 29925 |             | digit, and only as many more digits as necessary to represent the decimal exponent of                                          |
| 29926 |             | 2. If the value is zero, the exponent shall be zero.                                                                           |
| 29927 |             | A <b>double</b> argument representing an infinity or NaN shall be converted in the style of                                    |
| 29928 |             | an <b>f</b> or <b>F</b> conversion specifier.                                                                                  |
| 29929 | <b>c</b>    | The <b>int</b> argument shall be converted to an <b>unsigned char</b> , and the resulting byte shall                           |
| 29930 |             | be written.                                                                                                                    |
| 29931 |             | If an <b>l</b> (ell) qualifier is present, the <b>wint_t</b> argument shall be converted as if by an <b>ls</b>                 |
| 29932 |             | conversion specification with no precision and an argument that points to a two-                                               |
| 29933 |             | element array of type <b>wchar_t</b> , the first element of which contains the <b>wint_t</b> argument                          |
| 29934 |             | to the <b>ls</b> conversion specification and the second element contains a null wide                                          |
| 29935 |             | character.                                                                                                                     |
| 29936 | <b>s</b>    | The argument shall be a pointer to an array of <b>char</b> . Bytes from the array shall be                                     |
| 29937 |             | written up to (but not including) any terminating null byte. If the precision is specified,                                    |
| 29938 |             | no more than that many bytes shall be written. If the precision is not specified or is                                         |
| 29939 |             | greater than the size of the array, the application shall ensure that the array contains a                                     |
| 29940 |             | null byte.                                                                                                                     |

**fprintf()**

|       |     |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------|-----|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 29941 |     |                | If an <code>l</code> (ell) qualifier is present, the argument shall be a pointer to an array of type <code>wchar_t</code> . Wide characters from the array shall be converted to characters (each as if by a call to the <code>wcrtomb()</code> function, with the conversion state described by an <code>mbstate_t</code> object initialized to zero before the first wide character is converted) up to and including a terminating null wide character. The resulting characters shall be written up to (but not including) the terminating null character (byte). If no precision is specified, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many characters (bytes) shall be written (including shift sequences, if any), and the array shall contain a null wide character if, to equal the character sequence length given by the precision, the function would need to access a wide character one past the end of the array. In no case shall a partial character be written. |
| 29942 |     |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 29943 |     |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 29944 |     |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 29973 |     |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 29974 |     |                | For the <code>e</code> , <code>E</code> , <code>f</code> , <code>F</code> , <code>g</code> , and <code>G</code> conversion specifiers, if the number of significant decimal digits is at most <code>DECIMAL_DIG</code> , then the result should be correctly rounded. If the number of significant decimal digits is more than <code>DECIMAL_DIG</code> but the source value is exactly representable with <code>DECIMAL_DIG</code> digits, then the result should be an exact representation with trailing zeros. Otherwise, the source value is bounded by two adjacent decimal strings $L < U$ , both having <code>DECIMAL_DIG</code> significant digits; the value of the resultant decimal string $D$ should satisfy $L \leq D \leq U$ , with the extra stipulation that the error should have a correct sign for the current rounding direction.                                                                                                                                                                                                               |

| 29980 |     |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 29981 |     |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 29982 | CX  |                | The last data modification and last file status change timestamps of the file shall be marked for update:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 29983 |     |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 29984 |     |                | 1. Between the call to a successful execution of <code>fprintf()</code> or <code>printf()</code> and the next successful completion of a call to <code>fflush()</code> or <code>fclose()</code> on the same stream or a call to <code>exit()</code> or <code>abort()</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 29985 |     |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

29986 2. Upon successful completion of a call to `dprintf()`

#### 29987 RETURN VALUE

29988 CX Upon successful completion, the `dprintf()`, `fprintf()`, and `printf()` functions shall return the  
29989 number of bytes transmitted.

29990 Upon successful completion, the `sprintf()` function shall return the number of bytes written to `s`  
29991 excluding the terminating null byte.

29992 Upon successful completion, the `snprintf()` function shall return the number of bytes that would  
29993 be written to `s` had `n` been sufficiently large excluding the terminating null byte.

29994 CX If an output error was encountered, these functions shall return a negative value and set `errno` to  
29995 indicate the error.

29996 If the value of `n` is zero on a call to `snprintf()`, nothing shall be written, the number of bytes that  
29997 would have been written had `n` been sufficiently large excluding the terminating null shall be  
29998 returned, and `s` may be a null pointer.

#### 29999 ERRORS

30000 CX For the conditions under which `dprintf()`, `fprintf()`, and `printf()` fail and may fail, refer to `fputc()`  
30001 or `fputwc()`.

30002 In addition, all forms of `fprintf()` shall fail if:

30003 CX [EILSEQ] A wide-character code that does not correspond to a valid character has been  
30004 detected.

30005 In addition, all forms of `fprintf()` may fail if:

30006 CX [EINVAL] There are insufficient arguments.

30007 The `dprintf()` function may fail if:

30008 [EBADF] The `files` argument is not a valid file descriptor.

30009 CX The `dprintf()`, `fprintf()`, and `printf()` functions may fail if:

30010 CX [ENOMEM] Insufficient storage space is available.

30011 The `snprintf()` function shall fail if:

30012 CX [EOVERFLOW] The value of `n` is greater than `{INT_MAX}` or the number of bytes needed to  
30013 hold the output excluding the terminating null is greater than `{INT_MAX}`.

#### 30014 EXAMPLES

##### 30015 Printing Language-Independent Date and Time

30016 The following statement can be used to print date and time using a language-independent  
30017 format:

```
30018 printf(format, weekday, month, day, hour, min);
```

30019 For American usage, `format` could be a pointer to the following string:

```
30020 "%s, %s %d, %d:%.2d\n"
```

30021 This example would produce the following message:

```
30022 Sunday, July 3, 10:02
```

30023 For German usage, `format` could be a pointer to the following string:

**fprintf()**

30024 "%1\$s, %3\$d. %2\$s, %4\$d:%5\$.2d\n"

30025 This definition of *format* would produce the following message:

30026 Sonntag, 3. Juli, 10:02

### 30027 **Printing File Information**

30028 The following example prints information about the type, permissions, and number of links of a  
30029 specific file in a directory.

30030 The first two calls to *printf()* use data decoded from a previous *stat()* call. The user-defined  
30031 *strperm()* function shall return a string similar to the one at the beginning of the output for the  
30032 following command:

30033 `ls -l`

30034 The next call to *printf()* outputs the owner's name if it is found using *getpwuid()*; the *getpwuid()*  
30035 function shall return a **passwd** structure from which the name of the user is extracted. If the user  
30036 name is not found, the program instead prints out the numeric value of the user ID.

30037 The next call prints out the group name if it is found using *getgrgid()*; *getgrgid()* is very similar  
30038 to *getpwuid()* except that it shall return group information based on the group number. Once  
30039 again, if the group is not found, the program prints the numeric value of the group for the entry.

30040 The final call to *printf()* prints the size of the file.

```
30041 #include <stdio.h>
30042 #include <sys/types.h>
30043 #include <pwd.h>
30044 #include <grp.h>
30045
30046 char *strperm (mode_t);
30047 ...
30048 struct stat statbuf;
30049 struct passwd *pwd;
30050 struct group *grp;
30051 ...
30052 printf("%10.10s", strperm (statbuf.st_mode));
30053 printf("%4d", statbuf.st_nlink);
30054
30055 if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
30056     printf(" %-8.8s", pwd->pw_name);
30057 else
30058     printf(" %-8ld", (long) statbuf.st_uid);
30059
30060 if ((grp = getgrgid(statbuf.st_gid)) != NULL)
30061     printf(" %-8.8s", grp->gr_name);
30062 else
30063     printf(" %-8ld", (long) statbuf.st_gid);
30064
30065 printf("%9jd", (intmax_t) statbuf.st_size);
30066 ...
```

30063 **Printing a Localized Date String**

30064 The following example gets a localized date string. The `nl_langinfo()` function shall return the  
 30065 localized date string, which specifies the order and layout of the date. The `strftime()` function  
 30066 takes this information and, using the `tm` structure for values, places the date and time  
 30067 information into `datestring`. The `printf()` function then outputs `datestring` and the name of the  
 30068 entry.

```
30069 #include <stdio.h>
30070 #include <time.h>
30071 #include <langinfo.h>
30072 ...
30073 struct dirent *dp;
30074 struct tm *tm;
30075 char datestring[256];
30076 ...
30077 strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);
30078 printf(" %s %s\n", datestring, dp->d_name);
30079 ...
```

30080 **Printing Error Information**

30081 The following example uses `fprintf()` to write error information to standard error.

30082 In the first group of calls, the program tries to open the password lock file named **LOCKFILE**. If  
 30083 the file already exists, this is an error, as indicated by the `O_EXCL` flag on the `open()` function. If  
 30084 the call fails, the program assumes that someone else is updating the password file, and the  
 30085 program exits.

30086 The next group of calls saves a new password file as the current password file by creating a link  
 30087 between **LOCKFILE** and the new password file **PASSWDFILE**.

```
30088 #include <sys/types.h>
30089 #include <sys/stat.h>
30090 #include <fcntl.h>
30091 #include <stdio.h>
30092 #include <stdlib.h>
30093 #include <unistd.h>
30094 #include <string.h>
30095 #include <errno.h>
30096 #define LOCKFILE "/etc/ptmp"
30097 #define PASSWDFILE "/etc/passwd"
30098 ...
30099 int pfd;
30100 ...
30101 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
30102             S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
30103 {
30104     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
30105     exit(1);
30106 }
30107 ...
30108 if (link(LOCKFILE, PASSWDFILE) == -1) {
```

**fprintf()**

```

30109         fprintf(stderr, "Link error: %s\n", strerror(errno));
30110         exit(1);
30111     }
30112     ...

```

**Printing Usage Information**

The following example checks to make sure the program has the necessary arguments, and uses *fprintf()* to print usage information if the expected number of arguments is not present.

```

30116     #include <stdio.h>
30117     #include <stdlib.h>
30118     ...
30119     char *Options = "hdbt1";
30120     ...
30121     if (argc < 2) {
30122         fprintf(stderr, "Usage: %s -%s <file\n", argv[0], Options); exit(1);
30123     }
30124     ...

```

**Formatting a Decimal String**

The following example prints a key and data pair on *stdout*. Note use of the <asterisk> ('\*') in the format string; this ensures the correct number of decimal places for the element based on the number of elements requested.

```

30129     #include <stdio.h>
30130     ...
30131     long i;
30132     char *keyst;
30133     int elementlen, len;
30134     ...
30135     while (len < elementlen) {
30136         ...
30137         printf("%s Element%0*ld\n", keyst, elementlen, i);
30138         ...
30139     }

```

**Creating a Filename**

The following example creates a filename using information from a previous *getpwnam()* function that returned the HOME directory of the user.

```

30143     #include <stdio.h>
30144     #include <sys/types.h>
30145     #include <unistd.h>
30146     ...
30147     char filename[PATH_MAX+1];
30148     struct passwd *pw;
30149     ...
30150     sprintf(filename, "%s/%d.out", pw->pw_dir, getpid());
30151     ...

```

30152 **Reporting an Event**

30153 The following example loops until an event has timed out. The *pause()* function waits forever  
 30154 unless it receives a signal. The *fprintf()* statement should never occur due to the possible return  
 30155 values of *pause()*.

```

30156 #include <stdio.h>
30157 #include <unistd.h>
30158 #include <string.h>
30159 #include <errno.h>
30160 ...
30161 while (!event_complete) {
30162     ...
30163     if (pause() != -1 || errno != EINTR)
30164         fprintf(stderr, "pause: unknown error: %s\n", strerror(errno));
30165 }
30166 ...

```

30167 **Printing Monetary Information**

30168 The following example uses *strfmon()* to convert a number and store it as a formatted monetary  
 30169 string named *convbuf*. If the first number is printed, the program prints the format and the  
 30170 description; otherwise, it just prints the number.

```

30171 #include <monetary.h>
30172 #include <stdio.h>
30173 ...
30174 struct tblfmt {
30175     char *format;
30176     char *description;
30177 };
30178 struct tblfmt table[] = {
30179     { "%n", "default formatting" },
30180     { "%11n", "right align within an 11 character field" },
30181     { "%#5n", "aligned columns for values up to 99 999" },
30182     { "%*#5n", "specify a fill character" },
30183     { "%=#5n", "fill characters do not use grouping" },
30184     { "%^#5n", "disable the grouping separator" },
30185     { "%^#5.0n", "round off to whole units" },
30186     { "%^#5.4n", "increase the precision" },
30187     { "%(#5n", "use an alternative pos/neg style" },
30188     { "%!(#5n", "disable the currency symbol" },
30189 };
30190 ...
30191 float input[3];
30192 int i, j;
30193 char convbuf[100];
30194 ...
30195 strfmon(convbuf, sizeof(convbuf), table[i].format, input[j]);
30196
30197 if (j == 0) {
30198     printf("%s%s%s\n", table[i].format,
30199         convbuf, table[i].description);

```

**fprintf()**

```

30199     }
30200     else {
30201         printf("%s\n", convbuf);
30202     }
30203     ...

```

**30204 Printing Wide Characters**

30205 The following example prints a series of wide characters. Suppose that "L '@ '" expands to three  
 30206 bytes:

```

30207     wchar_t wz [3] = L"@@";           // Zero-terminated
30208     wchar_t wn [3] = L"@@";           // Unterminated

30209     fprintf (stdout, "%ls", wz);      // Outputs 6 bytes
30210     fprintf (stdout, "%ls", wn);      // Undefined because wn has no terminator
30211     fprintf (stdout, "%4ls", wz);     // Outputs 3 bytes
30212     fprintf (stdout, "%4ls", wn);     // Outputs 3 bytes; no terminator needed
30213     fprintf (stdout, "%9ls", wz);     // Outputs 6 bytes
30214     fprintf (stdout, "%9ls", wn);     // Outputs 9 bytes; no terminator needed
30215     fprintf (stdout, "%10ls", wz);    // Outputs 6 bytes
30216     fprintf (stdout, "%10ls", wn);    // Undefined because wn has no terminator

```

30217 In the last line of the example, after processing three characters, nine bytes have been output.  
 30218 The fourth character must then be examined to determine whether it converts to one byte or  
 30219 more. If it converts to more than one byte, the output is only nine bytes. Since there is no fourth  
 30220 character in the array, the behavior is undefined.

**30221 APPLICATION USAGE**

30222 If the application calling *fprintf()* has any objects of type **wint\_t** or **wchar\_t**, it must also include  
 30223 the **<wchar.h>** header to have these objects defined.

**30224 RATIONALE**

30225 None.

**30226 FUTURE DIRECTIONS**

30227 None.

30230 XBD Chapter 7 (on page 135), **<stdio.h>**, **<wchar.h>**

**30231 CHANGE HISTORY**

30232 First released in Issue 1. Derived from Issue 1 of the SVID.

**30233 Issue 5**

30234 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the **l** (ell) qualifier can  
 30235 now be used with **c** and **s** conversion specifiers.

30236 The *snprintf()* function is new in Issue 5.

**30237 Issue 6**

30238 Extensions beyond the ISO C standard are marked.

30239 The normative text is updated to avoid use of the term "must" for application requirements.

- 30240 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:
- 30241 • The prototypes for *fprintf()*, *printf()*, *snprintf()*, and *sprintf()* are updated, and the XSI shading is removed from *snprintf()*.
  - 30242
  - 30243 • The description of *snprintf()* is aligned with the ISO C standard. Note that this supersedes the *snprintf()* description in The Open Group Base Resolution bwg98-006, which changed the behavior from Issue 5.
  - 30244
  - 30245
  - 30246 • The DESCRIPTION is updated.
- 30247 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” consistently.
- 30248
- 30249 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.
- 30250 An example of printing wide characters is added.
- 30251 **Issue 7**
- 30252 Austin Group Interpretation 1003.1-2001 #161 is applied, updating the DESCRIPTION of the 0 flag.
- 30253
- 30254 Austin Group Interpretation 1003.1-2001 #170 is applied.
- 30255 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #68 (SD5-XSH-ERN-70) is applied, revising the description of *g* and *G*.
- 30256
- 30257 SD5-XSH-ERN-174 is applied.
- 30258 The *dprintf()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.
- 30259
- 30260 Functionality relating to the *%n\$* form of conversion specification and the <apostrophe> flag is moved from the XSI option to the Base.
- 30261
- 30262 Changes are made related to support for finegrained timestamps.

**fputc()**30263 **NAME**30264 `fputc` — put a byte on a stream30265 **SYNOPSIS**30266 `#include <stdio.h>`30267 `int fputc(int c, FILE *stream);`30268 **DESCRIPTION**

30269 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 30270 conflict between the requirements described here and the ISO C standard is unintentional. This  
 30271 volume of POSIX.1-2008 defers to the ISO C standard.

30272 The `fputc()` function shall write the byte specified by `c` (converted to an **unsigned char**) to the  
 30273 output stream pointed to by `stream`, at the position indicated by the associated file-position  
 30274 indicator for the stream (if defined), and shall advance the indicator appropriately. If the file  
 30275 cannot support positioning requests, or if the stream was opened with append mode, the byte  
 30276 shall be appended to the output stream.

30277 CX The last data modification and last file status change timestamps of the file shall be marked for  
 30278 update between the successful execution of `fputc()` and the next successful completion of a call  
 30279 to `fflush()` or `fclose()` on the same stream or a call to `exit()` or `abort()`.

30280 **RETURN VALUE**

30281 Upon successful completion, `fputc()` shall return the value it has written. Otherwise, it shall  
 30282 CX return EOF, the error indicator for the stream shall be set, and `errno` shall be set to indicate the  
 30283 error.

30284 **ERRORS**

30285 The `fputc()` function shall fail if either the `stream` is unbuffered or the `stream`'s buffer needs to be  
 30286 flushed, and:

30287 CX **[EAGAIN]** The `O_NONBLOCK` flag is set for the file descriptor underlying `stream` and  
 30288 the thread would be delayed in the write operation.

30289 CX **[EBADF]** The file descriptor underlying `stream` is not a valid file descriptor open for  
 30290 writing.

30291 CX **[EFBIG]** An attempt was made to write to a file that exceeds the maximum file size.

30292 XSI **[EFBIG]** An attempt was made to write to a file that exceeds the file size limit of the  
 30293 process.

30294 CX **[EFBIG]** The file is a regular file and an attempt was made to write at or beyond the  
 30295 offset maximum.

30296 CX **[EINTR]** The write operation was terminated due to the receipt of a signal, and no data  
 30297 was transferred.

30298 CX **[EIO]** A physical I/O error has occurred, or the process is a member of a background  
 30299 process group attempting to write to its controlling terminal, `TOSTOP` is set,  
 30300 the process is neither ignoring nor blocking `SIGTTOU`, and the process group  
 30301 of the process is orphaned. This error may also be returned under  
 30302 implementation-defined conditions.

30303 CX **[ENOSPC]** There was no free space remaining on the device containing the file.

30304 CX **[EPIPE]** An attempt is made to write to a pipe or FIFO that is not open for reading by  
 30305 any process. A `SIGPIPE` signal shall also be sent to the thread.

30306 The *fputc()* function may fail if:

30307 CX [ENOMEM] Insufficient storage space is available.

30308 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.  
30309

#### 30321 CHANGE HISTORY

30322 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 30323 Issue 5

30324 Large File Summit extensions are added.

#### 30325 Issue 6

30326 Extensions beyond the ISO C standard are marked.

30327 The following new requirements on POSIX implementations derive from alignment with the  
30328 Single UNIX Specification:

- 30329 • The [EIO] and [EFBIG] mandatory error conditions are added.
- 30330 • The [ENOMEM] and [ENXIO] optional error conditions are added.

30331 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/37 is applied, updating the [EAGAIN]  
30332 error in the ERRORS section from “the process would be delayed” to “the thread would be  
30333 delayed”.

#### 30334 Issue 7

30335 Changes are made related to support for finegrained timestamps.

**fputs()**30336 **NAME**

30337 fputs — put a string on a stream

30338 **SYNOPSIS**

30339 #include &lt;stdio.h&gt;

30340 int fputs(const char \*restrict s, FILE \*restrict stream);

30341 **DESCRIPTION**30342 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
30343 conflict between the requirements described here and the ISO C standard is unintentional. This  
30344 volume of POSIX.1-2008 defers to the ISO C standard.30345 The *fputs()* function shall write the null-terminated string pointed to by *s* to the stream pointed  
30346 to by *stream*. The terminating null byte shall not be written.30347 CX The last data modification and last file status change timestamps of the file shall be marked for  
30348 update between the successful execution of *fputs()* and the next successful completion of a call  
30349 to *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.30350 **RETURN VALUE**30351 Upon successful completion, *fputs()* shall return a non-negative number. Otherwise, it shall  
30352 CX return EOF, set an error indicator for the stream, and set *errno* to indicate the error.30353 **ERRORS**30354 Refer to *fputc()*.30355 **EXAMPLES**30356 **Printing to Standard Output**30357 The following example gets the current time, converts it to a string using *localtime()* and  
30358 *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to  
30359 an event for which it is waiting.30360 #include <time.h>  
30361 #include <stdio.h>  
30362 ...  
30363 time\_t now;  
30364 int minutes\_to\_event;  
30365 ...  
30366 time(&now);  
30367 printf("The time is ");  
30368 fputs(asctime(localtime(&now)), stdout);  
30369 printf("There are still %d minutes to the event.\n",  
30370 minutes\_to\_event);  
3037130372 **APPLICATION USAGE**30373 The *puts()* function appends a <newline> while *fputs()* does not.30374 **RATIONALE**

**fputwc()**30388 **NAME**30389 `fputwc` — put a wide-character code on a stream30390 **SYNOPSIS**30391 `#include <stdio.h>`30392 `#include <wchar.h>`30393 `wint_t fputwc(wchar_t wc, FILE *stream);`30394 **DESCRIPTION**30395 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
30396 conflict between the requirements described here and the ISO C standard is unintentional. This  
30397 volume of POSIX.1-2008 defers to the ISO C standard.30398 The `fputwc()` function shall write the character corresponding to the wide-character code `wc` to  
30399 the output stream pointed to by `stream`, at the position indicated by the associated file-position  
30400 indicator for the stream (if defined), and advances the indicator appropriately. If the file cannot  
30401 support positioning requests, or if the stream was opened with append mode, the character is  
30402 appended to the output stream. If an error occurs while writing the character, the shift state of  
30403 the output file is left in an undefined state.30404 CX The last data modification and last file status change timestamps of the file shall be marked for  
30405 update between the successful execution of `fputwc()` and the next successful completion of a call  
30406 to `fflush()` or `fclose()` on the same stream or a call to `exit()` or `abort()`.30407 **RETURN VALUE**30408 Upon successful completion, `fputwc()` shall return `wc`. Otherwise, it shall return WEOF, the error  
30409 CX indicator for the stream shall be set, and `errno` shall be set to indicate the error.30410 **ERRORS**30411 The `fputwc()` function shall fail if either the stream is unbuffered or data in the `stream`'s buffer  
30412 needs to be written, and:30413 CX **[EAGAIN]** The `O_NONBLOCK` flag is set for the file descriptor underlying `stream` and  
30414 the thread would be delayed in the write operation.30415 CX **[EBADF]** The file descriptor underlying `stream` is not a valid file descriptor open for  
30416 writing.30417 CX **[EFBIG]** An attempt was made to write to a file that exceeds the maximum file size or  
30418 the file size limit of the process.30419 CX **[EFBIG]** The file is a regular file and an attempt was made to write at or beyond the  
30420 offset maximum associated with the corresponding stream.30421 **[EILSEQ]** The wide-character code `wc` does not correspond to a valid character.30422 CX **[EINTR]** The write operation was terminated due to the receipt of a signal, and no data  
30423 was transferred.30424 CX **[EIO]** A physical I/O error has occurred, or the process is a member of a background  
30425 process group attempting to write to its controlling terminal, `TOSTOP` is set,  
30426 the process is neither ignoring nor blocking `SIGTTOU`, and the process group  
30427 of the process is orphaned. This error may also be returned under  
30428 implementation-defined conditions.30429 CX **[ENOSPC]** There was no free space remaining on the device containing the file.

30430 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
30431 any process. A SIGPIPE signal shall also be sent to the thread.

30432 The *fputwc()* function may fail if:

30433 CX [ENOMEM] Insufficient storage space is available.

30434 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
30435 capabilities of the device.

#### 30447 CHANGE HISTORY

30448 First released in Issue 4. Derived from the MSE working draft.

#### 30449 Issue 5

30450 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*  
30451 is changed from `wint_t` to `wchar_t`.

30452 The Optional Header (OH) marking is removed from `<stdio.h>`.

30453 Large File Summit extensions are added.

#### 30454 Issue 6

30455 Extensions beyond the ISO C standard are marked.

30456 The following new requirements on POSIX implementations derive from alignment with the  
30457 Single UNIX Specification:

- 30458 • The [EFBIG] and [EIO] mandatory error conditions are added.
- 30459 • The [ENOMEM] and [ENXIO] optional error conditions are added.

30460 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/38 is applied, updating the [EAGAIN]  
30461 error in the ERRORS section from “the process would be delayed” to “the thread would be  
30462 delayed”.

#### 30463 Issue 7

30464 Changes are made related to support for finegrained timestamps.

**fputws()**30465 **NAME**30466 `fputws` — put a wide-character string on a stream30467 **SYNOPSIS**30468 `#include <stdio.h>`30469 `#include <wchar.h>`30470 `int fputws(const wchar_t *restrict ws, FILE *restrict stream);`30471 **DESCRIPTION**30472 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
30473 conflict between the requirements described here and the ISO C standard is unintentional. This  
30474 volume of POSIX.1-2008 defers to the ISO C standard.30475 The `fputws()` function shall write a character string corresponding to the (null-terminated) wide-  
30476 character string pointed to by `ws` to the stream pointed to by `stream`. No character corresponding  
30477 to the terminating null wide-character code shall be written.30478 CX The last data modification and last file status change timestamps of the file shall be marked for  
30479 update between the successful execution of `fputws()` and the next successful completion of a call  
30480 to `fflush()` or `fclose()` on the same stream or a call to `exit()` or `abort()`.30481 **RETURN VALUE**30482 Upon successful completion, `fputws()` shall return a non-negative number. Otherwise, it shall  
30483 CX return `-1`, set an error indicator for the stream, and set `errno` to indicate the error.30484 **ERRORS**30485 Refer to `fputwc()`.30486 **EXAMPLES**

30487 None.

30488 **APPLICATION USAGE**30489 The `fputws()` function does not append a <newline>.30490 **RATIONALE**

30491 None.

30492 **FUTURE DIRECTIONS**

30493 None.

30494 **SEE ALSO**30495 `fopen()`30496 XBD `<stdio.h>`, `<wchar.h>`30497 **CHANGE HISTORY**

30498 First released in Issue 4. Derived from the MSE working draft.

30499 **Issue 5**30500 The Optional Header (OH) marking is removed from `<stdio.h>`.30501 **Issue 6**

30502 Extensions beyond the ISO C standard are marked.

30503 The `fputws()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.30504 **Issue 7**

30505 Changes are made related to support for finegrained timestamps.

30506 **NAME**

30507 fread — binary input

30508 **SYNOPSIS**

30509 #include &lt;stdio.h&gt;

30510 size\_t fread(void \*restrict ptr, size\_t size, size\_t nitems,  
30511 FILE \*restrict stream);30512 **DESCRIPTION**30513 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
30514 conflict between the requirements described here and the ISO C standard is unintentional. This  
30515 volume of POSIX.1-2008 defers to the ISO C standard.30516 The *fread()* function shall read into the array pointed to by *ptr* up to *nitems* elements whose size  
30517 is specified by *size* in bytes, from the stream pointed to by *stream*. For each object, *size* calls shall  
30518 be made to the *fgetc()* function and the results stored, in the order read, in an array of **unsigned**  
30519 **char** exactly overlaying the object. The file position indicator for the stream (if defined) shall be  
30520 advanced by the number of bytes successfully read. If an error occurs, the resulting value of the  
30521 file position indicator for the stream is unspecified. If a partial element is read, its value is  
30522 unspecified.30523 CX The *fread()* function may mark the last data access timestamp of the file associated with *stream*  
30524 for update. The last data access timestamp shall be marked for update by the first successful  
30525 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or  
30526 *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.30527 **RETURN VALUE**30528 Upon successful completion, *fread()* shall return the number of elements successfully read which  
30529 is less than *nitems* only if a read error or end-of-file is encountered. If *size* or *nitems* is 0, *fread()*  
30530 shall return 0 and the contents of the array and the state of the stream remain unchanged.30531 CX Otherwise, if a read error occurs, the error indicator for the stream shall be set, and *errno* shall  
30532 be set to indicate the error.30533 **ERRORS**30534 Refer to *fgetc()*.30535 **EXAMPLES**30536 **Reading from a Stream**30537 The following example reads a single element from the *fp* stream into the array pointed to by  
30538 *buf*.30539 #include <stdio.h>  
30540 .  
30541 size\_t bytes\_read;  
30542 char buf[100];  
30543 FILE \*fp;  
30544 ...  
30545 bytes\_read = fread(buf, sizeof(buf), 1, fp);  
30546 ...30547 **APPLICATION USAGE**30548 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an  
30549 end-of-file condition.30550 Because of possible differences in element length and byte ordering, files written using *fwrite()*

**fread()**

30551 are application-dependent, and possibly cannot be read using *fread()* by a different application  
30552 or by the same application on a different processor.

30553 **RATIONALE**  
30554 None.

30555 **FUTURE DIRECTIONS**  
30556 None.

30557 **SEE ALSO**  
30558 *feof()*, *ferror()*, *fgetc()*, *fopen()*, *fscanf()*, *getc()*, *gets()*  
30559 XBD `<stdio.h>`

30560 **CHANGE HISTORY**  
30561 First released in Issue 1. Derived from Issue 1 of the SVID.

30562 **Issue 6**  
30563 Extensions beyond the ISO C standard are marked.

30564 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 30565 • The *fread()* prototype is updated.
- 30566 • The DESCRIPTION is updated to describe how the bytes from a call to *fgetc()* are stored.

30567 **Issue 7**  
30568 Changes are made related to support for finegrained timestamps.

30569 **NAME**

30570 free — free allocated memory

30571 **SYNOPSIS**

30572 #include &lt;stdlib.h&gt;

30573 void free(void \*ptr);

30574 **DESCRIPTION**

30575 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 30576 conflict between the requirements described here and the ISO C standard is unintentional. This  
 30577 volume of POSIX.1-2008 defers to the ISO C standard.

30578 The *free()* function shall cause the space pointed to by *ptr* to be deallocated; that is, made  
 30579 available for further allocation. If *ptr* is a null pointer, no action shall occur. Otherwise, if the  
 30580 argument does not match a pointer earlier returned by a function in POSIX.1-2008 that allocates  
 30581 memory as if by *malloc()*, or if the space has been deallocated by a call to *free()* or *realloc()*, the  
 30582 behavior is undefined.

30583 Any use of a pointer that refers to freed space results in undefined behavior.

30584 **RETURN VALUE**30585 The *free()* function shall not return a value.30586 **ERRORS**

30587 No errors are defined.

30588 **EXAMPLES**

30589 None.

30590 **APPLICATION USAGE**

30591 There is now no requirement for the implementation to support the inclusion of &lt;malloc.h&gt;.

30592 **RATIONALE**

30593 None.

30594 **FUTURE DIRECTIONS**

30595 None.

30596 **SEE ALSO**30597 *calloc()*, *malloc()*, *posix\_memalign()*, *realloc()*

30598 XBD &lt;stdlib.h&gt;

30599 **CHANGE HISTORY**

30600 First released in Issue 1. Derived from Issue 1 of the SVID.

30601 **Issue 6**30602 Reference to the *valloc()* function is removed.30603 **Issue 7**

30604 The DESCRIPTION is updated to clarify that if the pointer returned is not by a function that  
 30605 allocates memory as if by *malloc()*, then the behavior is undefined.

**freeaddrinfo()**

System Interfaces

30606 **NAME**

30607 freeaddrinfo, getaddrinfo — get address information

30608 **SYNOPSIS**

```

30609 #include <sys/socket.h>
30610 #include <netdb.h>

30611 void freeaddrinfo(struct addrinfo *ai);
30612 int getaddrinfo(const char *restrict nodename,
30613               const char *restrict servname,
30614               const struct addrinfo *restrict hints,
30615               struct addrinfo **restrict res);

```

30616 **DESCRIPTION**

30617 The *freeaddrinfo()* function shall free one or more **addrinfo** structures returned by *getaddrinfo()*,  
 30618 along with any additional storage associated with those structures. If the *ai\_next* field of the  
 30619 structure is not null, the entire list of structures shall be freed. The *freeaddrinfo()* function shall  
 30620 support the freeing of arbitrary sublists of an **addrinfo** list originally returned by *getaddrinfo()*.

30621 The *getaddrinfo()* function shall translate the name of a service location (for example, a host  
 30622 name) and/or a service name and shall return a set of socket addresses and associated  
 30623 information to be used in creating a socket with which to address the specified service.

30624 **Note:** In many cases it is implemented by the Domain Name System, as documented in RFC 1034,  
 30625 RFC 1035, and RFC 1886.

30626 The *freeaddrinfo()* and *getaddrinfo()* functions shall be thread-safe.

30627 The *nodename* and *servname* arguments are either null pointers or pointers to null-terminated  
 30628 strings. One or both of these two arguments shall be supplied by the application as a non-null  
 30629 pointer.

30630 The format of a valid name depends on the address family or families. If a specific family is not  
 30631 given and the name could be interpreted as valid within multiple supported families, the  
 30632 implementation shall attempt to resolve the name in all supported families and, in absence of  
 30633 errors, one or more results shall be returned.

30634 If the *nodename* argument is not null, it can be a descriptive name or can be an address string. If  
 30635 IP6 the specified address family is AF\_INET, AF\_INET6, or AF\_UNSPEC, valid descriptive names  
 30636 include host names. If the specified address family is AF\_INET or AF\_UNSPEC, address strings  
 30637 using Internet standard dot notation as specified in *inet\_addr()* are valid.

30638 IP6 If the specified address family is AF\_INET6 or AF\_UNSPEC, standard IPv6 text forms described  
 30639 in *inet\_ntop()* are valid.

30640 If *nodename* is not null, the requested service location is named by *nodename*; otherwise, the  
 30641 requested service location is local to the caller.

30642 If *servname* is null, the call shall return network-level addresses for the specified *nodename*. If  
 30643 *servname* is not null, it is a null-terminated character string identifying the requested service.  
 30644 This can be either a descriptive name or a numeric representation suitable for use with the  
 30645 IP6 address family or families. If the specified address family is AF\_INET, AF\_INET6, or  
 30646 AF\_UNSPEC, the service can be specified as a string specifying a decimal port number.

30647 If the *hints* argument is not null, it refers to a structure containing input values that directs the  
 30648 operation by providing options and by limiting the returned information to a specific socket  
 30649 type, address family, and/or protocol, as described below. In this *hints* structure every member  
 30650 other than *ai\_flags*, *ai\_family*, *ai\_socktype*, and *ai\_protocol* shall be set to zero or a null pointer. A  
 30651 value of AF\_UNSPEC for *ai\_family* means that the caller shall accept any address family. A value

30652 of zero for *ai\_socktype* means that the caller shall accept any socket type. A value of zero for  
 30653 *ai\_protocol* means that the caller shall accept any protocol. If *hints* is a null pointer, the behavior  
 30654 shall be as if it referred to a structure containing the value zero for the *ai\_flags*, *ai\_socktype*, and  
 30655 *ai\_protocol* fields, and AF\_UNSPEC for the *ai\_family* field.

30656 The *ai\_flags* field to which the *hints* parameter points shall be set to zero or be the bitwise-  
 30657 inclusive OR of one or more of the values AI\_PASSIVE, AI\_CANONNAME,  
 30658 AI\_NUMERICHOST, AI\_NUMERICSERV, AI\_V4MAPPED, AI\_ALL, and AI\_ADDRCONFIG.

30659 If the AI\_PASSIVE flag is specified, the returned address information shall be suitable for use in  
 30660 binding a socket for accepting incoming connections for the specified service. In this case, if the  
 30661 *nodename* argument is null, then the IP address portion of the socket address structure shall be  
 30662 set to INADDR\_ANY for an IPv4 address or IN6ADDR\_ANY\_INIT for an IPv6 address. If the  
 30663 AI\_PASSIVE flag is not specified, the returned address information shall be suitable for a call to  
 30664 *connect()* (for a connection-mode protocol) or for a call to *connect()*, *sendto()*, or *sendmsg()* (for a  
 30665 connectionless protocol). In this case, if the *nodename* argument is null then the IP address  
 30666 portion of the socket address structure shall be set to the loopback address. The AI\_PASSIVE  
 30667 flag shall be ignored if the *nodename* argument is not null.

30668 If the AI\_CANONNAME flag is specified and the *nodename* argument is not null, the function  
 30669 shall attempt to determine the canonical name corresponding to *nodename* (for example, if  
 30670 *nodename* is an alias or shorthand notation for a complete name).

30671 **Note:** Since different implementations use different conceptual models, the terms “canonical name”  
 30672 and “alias” cannot be precisely defined for the general case. However, Domain Name System  
 30673 implementations are expected to interpret them as they are used in RFC 1034.

30674 A numeric host address string is not a “name”, and thus does not have a “canonical name”  
 30675 form; no address to host name translation is performed. See below for handling of the case  
 30676 where a canonical name cannot be obtained.

30677 If the AI\_NUMERICHOST flag is specified, then a non-null *nodename* string supplied shall be a  
 30678 numeric host address string. Otherwise, an [EAI\_NONAME] error is returned. This flag shall  
 30679 prevent any type of name resolution service (for example, the DNS) from being invoked.

30680 If the AI\_NUMERICSERV flag is specified, then a non-null *servname* string supplied shall be a  
 30681 numeric port string. Otherwise, an [EAI\_NONAME] error shall be returned. This flag shall  
 30682 prevent any type of name resolution service (for example, NIS+) from being invoked.

30683 IP6 If the AI\_V4MAPPED flag is specified along with an *ai\_family* of AF\_INET6, then *getaddrinfo()*  
 30684 shall return IPv4-mapped IPv6 addresses on finding no matching IPv6 addresses (*ai\_addrlen*  
 30685 shall be 16). The AI\_V4MAPPED flag shall be ignored unless *ai\_family* equals AF\_INET6. If the  
 30686 AI\_ALL flag is used with the AI\_V4MAPPED flag, then *getaddrinfo()* shall return all matching  
 30687 IPv6 and IPv4 addresses. The AI\_ALL flag without the AI\_V4MAPPED flag is ignored.

30688 If the AI\_ADDRCONFIG flag is specified, IPv4 addresses shall be returned only if an IPv4  
 30689 IP6 address is configured on the local system, and IPv6 addresses shall be returned only if an IPv6  
 30690 address is configured on the local system.

30691 The *ai\_socktype* field to which argument *hints* points specifies the socket type for the service, as  
 30692 defined in *socket()*. If a specific socket type is not given (for example, a value of zero) and the  
 30693 service name could be interpreted as valid with multiple supported socket types, the  
 30694 implementation shall attempt to resolve the service name for all supported socket types and, in  
 30695 the absence of errors, all possible results shall be returned. A non-zero socket type value shall  
 30696 limit the returned information to values with the specified socket type.

30697 If the *ai\_family* field to which *hints* points has the value AF\_UNSPEC, addresses shall be  
 30698 returned for use with any address family that can be used with the specified *nodename* and/or

**freeaddrinfo()**

30700 *servname*. Otherwise, addresses shall be returned for use only with the specified address family.  
 30701 If *ai\_family* is not AF\_UNSPEC and *ai\_protocol* is not zero, then addresses shall be returned for  
 30702 use only with the specified address family and protocol; the value of *ai\_protocol* shall be  
 30703 interpreted as in a call to the *socket()* function with the corresponding values of *ai\_family* and  
*ai\_protocol*.

30704 **RETURN VALUE**

30705 A zero return value for *getaddrinfo()* indicates successful completion; a non-zero return value  
 30706 indicates failure. The possible values for the failures are listed in the ERRORS section.

30707 Upon successful return of *getaddrinfo()*, the location to which *res* points shall refer to a linked list  
 30708 of **addrinfo** structures, each of which shall specify a socket address and information for use in  
 30709 creating a socket with which to use that socket address. The list shall include at least one  
 30710 **addrinfo** structure. The *ai\_next* field of each structure contains a pointer to the next structure on  
 30711 the list, or a null pointer if it is the last structure on the list. Each structure on the list shall  
 30712 include values for use with a call to the *socket()* function, and a socket address for use with the  
 30713 *connect()* function or, if the AI\_PASSIVE flag was specified, for use with the *bind()* function. The  
 30714 fields *ai\_family*, *ai\_socktype*, and *ai\_protocol* shall be usable as the arguments to the *socket()*  
 30715 function to create a socket suitable for use with the returned address. The fields *ai\_addr* and  
 30716 *ai\_addrlen* are usable as the arguments to the *connect()* or *bind()* functions with such a socket,  
 30717 according to the AI\_PASSIVE flag.

30718 If *nodename* is not null, and if requested by the AI\_CANONNAME flag, the *ai\_canonname* field of  
 30719 the first returned **addrinfo** structure shall point to a null-terminated string containing the  
 30720 canonical name corresponding to the input *nodename*; if the canonical name is not available, then  
 30721 *ai\_canonname* shall refer to the *nodename* argument or a string with the same contents. The  
 30722 contents of the *ai\_flags* field of the returned structures are undefined.

30723 All fields in socket address structures returned by *getaddrinfo()* that are not filled in through an  
 30724 explicit argument (for example, *sin6\_flowinfo*) shall be set to zero.

30725 **Note:** This makes it easier to compare socket address structures.

30726 **ERRORS**

30727 The *getaddrinfo()* function shall fail and return the corresponding error value if:

30728 [EAL\_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

30729 [EAL\_BADFLAGS] The *flags* parameter had an invalid value.  
 30730

30731 [EAL\_FAIL] A non-recoverable error occurred when attempting to resolve the name.

30732 [EAL\_FAMILY] The address family was not recognized.

30733 [EAL\_MEMORY] There was a memory allocation failure when trying to allocate storage for the  
 30734 return value.

30735 [EAL\_NONAME] The name does not resolve for the supplied parameters.

30736 Neither *nodename* nor *servname* were supplied. At least one of these shall be  
 30737 supplied.

30738 [EAL\_SERVICE] The service passed was not recognized for the specified socket type.

30739 [EAL\_SOCKETYPE] The intended socket type was not recognized.  
 30740

30741 [EAL\_SYSTEM] A system error occurred; the error code can be found in *errno*.

### 30742 EXAMPLES

30743 The following (incomplete) program demonstrates the use of *getaddrinfo()* to obtain the socket  
 30744 address structure(s) for the service named in the program's command-line argument. The  
 30745 program then loops through each of the address structures attempting to create and bind a  
 30746 socket to the address, until it performs a successful *bind()*.

```

30747 #include <stdio.h>
30748 #include <stdlib.h>
30749 #include <unistd.h>
30750 #include <string.h>
30751 #include <sys/socket.h>
30752 #include <netdb.h>

30753 int
30754 main(int argc, char *argv[])
30755 {
30756     struct addrinfo *result, *rp;
30757     int sfd, s;

30758     if (argc != 2) {
30759         fprintf(stderr, "Usage: %s port\n", argv[0]);
30760         exit(EXIT_FAILURE);
30761     }

30762     struct addrinfo hints = {};
30763     hints.ai_family = AF_UNSPEC;
30764     hints.ai_socktype = SOCK_DGRAM;
30765     hints.ai_flags = AI_PASSIVE;
30766     hints.ai_protocol = 0;

30767     s = getaddrinfo(NULL, argv[1], &hints, &result);
30768     if (s != 0) {
30769         fprintf(stderr, "getaddrinfo: %s\n", gai_strerror(s));
30770         exit(EXIT_FAILURE);
30771     }

30772     /* getaddrinfo() returns a list of address structures.
30773     Try each address until a successful bind().
30774     If socket(2) (or bind(2)) fails, close the socket
30775     and try the next address. */

30776     for (rp = result; rp != NULL; rp = rp->ai_next) {
30777         sfd = socket(rp->ai_family, rp->ai_socktype,
30778             rp->ai_protocol);
30779         if (sfd == -1)
30780             continue;

30781         if (bind(sfd, rp->ai_addr, rp->ai_addrlen) == 0)
30782             break; /* Success */

30783         close(sfd);
30784     }

30785     if (rp == NULL) { /* No address succeeded */
30786         fprintf(stderr, "Could not bind\n");

```

**freeaddrinfo()**

System Interfaces

```

30787         exit(EXIT_FAILURE);
30788     }
30789     freeaddrinfo(result);    /* No longer needed */
30790
30791     /* ... use socket bound to sfd ... */
30792 }

```

**APPLICATION USAGE**

30793 If the caller handles only TCP and not UDP, for example, then the *ai\_protocol* member of the *hints*  
 30794 structure should be set to IPPROTO\_TCP when *getaddrinfo()* is called.

30795 If the caller handles only IPv4 and not IPv6, then the *ai\_family* member of the *hints* structure  
 30796 should be set to AF\_INET when *getaddrinfo()* is called.

30797 The term “canonical name” is misleading; it is taken from the Domain Name System (RFC 2181).  
 30798 It should be noted that the canonical name is a result of alias processing, and not necessarily a  
 30799 unique attribute of a host, address, or set of addresses. See RFC 2181 for more discussion of this  
 30800 in the Domain Name System context.

**RATIONALE**

30801 None.  
 30802

**FUTURE DIRECTIONS**

30803 None.  
 30804

**CHANGE HISTORY**

30808 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

30810 The **restrict** keyword is added to the *getaddrinfo()* prototype for alignment with the  
 30811 ISO/IEC 9899:1999 standard.

30812 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/19 is applied, adding three notes to the  
 30813 DESCRIPTION and adding text to the APPLICATION USAGE related to the term “canonical  
 30814 name”. A reference to RFC 2181 is also added to the Informative References.

30815 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/20 is applied, making changes for  
 30816 alignment with IPv6. These include the following:

- 30817 • Adding AI\_V4MAPPED, AI\_ALL, and AI\_ADDRCONFIG to the allowed values for the  
 30818 *ai\_flags* field

- 30819 • Adding a description of AI\_ADDRCONFIG

- 30820 • Adding a description of the consequences of ignoring the AI\_PASSIVE flag.

30821 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/39 is applied, changing “corresponding  
 30822 value” to “corresponding error value” in the ERRORS section.

**Issue 7**

30824 Austin Group Interpretation 1003.1-2001 #013 is applied.

30825 Austin Group Interpretation 1003.1-2001 #146 is applied, updating the DESCRIPTION.

30826 An example is added.

30827 **NAME**30828            *freelocale* — free resources allocated for a locale object30829 **SYNOPSIS**

```
30830 CX      #include <locale.h>
30831          void freelocale(locale_t locobj);
```

30832 **DESCRIPTION**

30833        The *freelocale()* function shall cause the resources allocated for a locale object returned by a call  
 30834        to the *newlocale()* or *duplocale()* functions to be released.

30835        Any use of a locale object that has been freed results in undefined behavior.

30836 **RETURN VALUE**

30837            None.

30838 **ERRORS**

30839            None.

30840 **EXAMPLES**30841            **Freeing Up a Locale Object**

30842        The following example shows a code fragment to free a locale object created by *newlocale()*:

```
30843      #include <locale.h>
30844      ...
30845      /* Every locale object allocated with newlocale() should be
30846       * freed using freelocale():
30847       */
30848      locale_t loc;
30849      /* Get the locale. */
30850      loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", NULL);
30851      /* ... Use the locale object ... */
30852      ...
30853      /* Free the locale object resources. */
30854      freelocale (loc);
```

30855 **APPLICATION USAGE**

30856            None.

30857 **RATIONALE**

30858            None.

30859 **FUTURE DIRECTIONS**

30860            None.

30861 **SEE ALSO**30862            *duplocale()*, *newlocale()*, *uselocale()*30863            XBD [<locale.h>](#)

30866 **NAME**

30867 freopen — open a stream

30868 **SYNOPSIS**

30869 #include &lt;stdio.h&gt;

30870 FILE \*freopen(const char \*restrict filename, const char \*restrict mode,  
30871 FILE \*restrict stream);30872 **DESCRIPTION**30873 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
30874 conflict between the requirements described here and the ISO C standard is unintentional. This  
30875 volume of POSIX.1-2008 defers to the ISO C standard.30876 The *freopen()* function shall first attempt to flush the stream associated with *stream* as if by a call  
30877 to *fflush(stream)*. Failure to flush the stream successfully shall be ignored. If *filename* is not a null  
30878 pointer, *freopen()* shall close any file descriptor associated with *stream*. Failure to close the file  
30879 descriptor successfully shall be ignored. The error and end-of-file indicators for the stream shall  
30880 be cleared.30881 The *freopen()* function shall open the file whose pathname is the string pointed to by *filename*  
30882 and associate the stream pointed to by *stream* with it. The *mode* argument shall be used just as in  
30883 *fopen()*.

30884 The original stream shall be closed regardless of whether the subsequent open succeeds.

30885 If *filename* is a null pointer, the *freopen()* function shall attempt to change the mode of the stream  
30886 to that specified by *mode*, as if the name of the file currently associated with the stream had been  
30887 used. In this case, the file descriptor associated with the stream need not be closed if the call to  
30888 *freopen()* succeeds. It is implementation-defined which changes of mode are permitted (if any),  
30889 and under what circumstances.30890 XSI After a successful call to the *freopen()* function, the orientation of the stream shall be cleared, the  
30891 encoding rule shall be cleared, and the associated *mbstate\_t* object shall be set to describe an  
30892 initial conversion state.30893 CX If *filename* is not a null pointer, or if *filename* is a null pointer and the specified mode change  
30894 necessitates the file descriptor associated with the stream to be closed and reopened, the file  
30895 descriptor associated with the reopened stream shall be allocated and opened as if by a call to  
30896 *open()* with the following flags:

| <i>freopen()</i> Mode                 | <i>open()</i> Flags       |
|---------------------------------------|---------------------------|
| <i>r</i> or <i>rb</i>                 | O_RDONLY                  |
| <i>w</i> or <i>wb</i>                 | O_WRONLY O_CREAT O_TRUNC  |
| <i>a</i> or <i>ab</i>                 | O_WRONLY O_CREAT O_APPEND |
| <i>r+</i> or <i>rb+</i> or <i>r+b</i> | O_RDWR                    |
| <i>w+</i> or <i>wb+</i> or <i>w+b</i> | O_RDWR O_CREAT O_TRUNC    |
| <i>a+</i> or <i>ab+</i> or <i>a+b</i> | O_RDWR O_CREAT O_APPEND   |

30904 **RETURN VALUE**30905 Upon successful completion, *freopen()* shall return the value of *stream*. Otherwise, a null pointer  
30906 CX shall be returned, and *errno* shall be set to indicate the error.

**freopen()**30907 **ERRORS**30908 The *freopen()* function shall fail if:

- 30909 CX [EACCES] Search permission is denied on a component of the path prefix, or the file exists and the permissions specified by *mode* are denied, or the file does not exist and write permission is denied for the parent directory of the file to be created.
- 30910  
30911  
30912
- 30913 CX [EBADF] The file descriptor underlying the stream is not a valid file descriptor when *filename* is a null pointer.
- 30914
- 30915 CX [EINTR] A signal was caught during *freopen()*.
- 30916 CX [EISDIR] The named file is a directory and *mode* requires write access.
- 30917 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.
- 30918
- 30919 CX [EMFILE] All file descriptors available to the process are currently open.
- 30920 CX [ENAMETOOLONG]
- 30921 The length of a component of a pathname is longer than {NAME\_MAX}.
- 30922 CX [ENFILE] The maximum allowable number of files is currently open in the system.
- 30923 CX [ENOENT] A component of *filename* does not name an existing file or *filename* is an empty string.
- 30924
- 30925 CX [ENOSPC] The directory or file system that would contain the new file cannot be expanded, the file does not exist, and it was to be created.
- 30926
- 30927 CX [ENOTDIR] A component of the path prefix is not a directory, or the *filename* argument contains at least one non-`<slash>` character and ends with one or more trailing `<slash>` characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
- 30928  
30929  
30930
- 30931 CX [ENXIO] The named file is a character special or block special file, and the device associated with this special file does not exist.
- 30932
- 30933 CX [EOVERFLOW] The named file is a regular file and the size of the file cannot be represented correctly in an object of type `off_t`.
- 30934
- 30935 CX [EROFS] The named file resides on a read-only file system and *mode* requires write access.
- 30936

30937 The *freopen()* function may fail if:

- 30938 CX [EBADF] The mode with which the file descriptor underlying the stream was opened does not support the requested mode when *filename* is a null pointer.
- 30939
- 30940 CX [EINVAL] The value of the *mode* argument is not valid.
- 30941 CX [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during resolution of the *path* argument.
- 30942
- 30943 CX [ENAMETOOLONG]
- 30944 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH\_MAX}.
- 30945  
30946

- 30947 CX [ENOMEM] Insufficient storage space is available.
- 30948 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.
- 30949
- 30950 CX [ETXTBSY] The file is a pure procedure (shared text) file that is being executed and *mode* requires write access.
- 30951

## 30952 EXAMPLES

### 30953 Directing Standard Output to a File

30954 The following example logs all standard output to the `/tmp/logfile` file.

```
30955 #include <stdio.h>
30956 ...
30957 FILE *fp;
30958 ...
30959 fp = freopen ("/tmp/logfile", "a+", stdout);
30960 ...
```

## 30961 APPLICATION USAGE

30962 The `freopen()` function is typically used to attach the pre-opened *streams* associated with *stdin*, *stdout*, and *stderr* to other files.

30963

30964 Since implementations are not required to support any stream mode changes when the *filename* argument is `NULL`, portable applications cannot rely on the use of `freopen()` to change the stream mode, and use of this feature is discouraged. The feature was originally added to the ISO C standard in order to facilitate changing *stdin* and *stdout* to binary mode. Since a 'b' character in the mode has no effect on POSIX systems, this use of the feature is unnecessary in POSIX applications. However, even though the 'b' is ignored, a successful call to `freopen(NULL, "wb", stdout)` does have an effect. In particular, for regular files it truncates the file and sets the file-position indicator for the stream to the start of the file. It is possible that these side-effects are an unintended consequence of the way the feature is specified in the ISO/IEC 9899:1999 standard, but unless or until the ISO C standard is changed, applications which successfully call `freopen(NULL, "wb", stdout)` will behave in unexpected ways on conforming systems in situations such as:

```
30976 { appl file1; appl file2; } > file3
```

30977 which will result in `file3` containing only the output from the second invocation of `appl`.

## 30978 RATIONALE

30979 None.

## 30980 FUTURE DIRECTIONS

30981 None.

## 30985 CHANGE HISTORY

30986 First released in Issue 1. Derived from Issue 1 of the SVID.

**freopen()**30987 **Issue 5**

30988 The DESCRIPTION is updated to indicate that the orientation of the stream is cleared and the  
 30989 conversion state of the stream is set to an initial conversion state by a successful call to the  
 30990 *freopen()* function.

30991 Large File Summit extensions are added.

30992 **Issue 6**

30993 Extensions beyond the ISO C standard are marked.

30994 The following new requirements on POSIX implementations derive from alignment with the  
 30995 Single UNIX Specification:

- 30996 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open  
 30997 file description. This change is to support large files.
- 30998 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support  
 30999 large files.
- 31000 • The [ELOOP] mandatory error condition is added.
- 31001 • A second [ENAMETOOLONG] is added as an optional error condition.
- 31002 • The [EINVAL], [ENOMEM], [ENXIO], and [ETXTBSY] optional error conditions are added.

31003 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 31004 • The *freopen()* prototype is updated.
- 31005 • The DESCRIPTION is updated.

31006 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
 31007 [ELOOP] error condition is added.

31008 The DESCRIPTION is updated regarding failure to close, changing the “file” to “file descriptor”.

31009 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/40 is applied, adding the following  
 31010 sentence to the DESCRIPTION: “In this case, the file descriptor associated with the stream need  
 31011 not be closed if the call to *freopen()* succeeds.”.

31012 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/41 is applied, adding an mandatory  
 31013 [EBADF] error, and an optional [EBADF] error to the ERRORS section.

31014 **Issue 7**

31015 Austin Group Interpretation 1003.1-2001 #043 is applied, clarifying that the *freopen()* function  
 31016 allocates a file descriptor as per *open()*.

31017 Austin Group Interpretation 1003.1-2001 #143 is applied.

31018 Austin Group Interpretation 1003.1-2001 #159 is applied, clarifying requirements for the flags set  
 31019 on the open file description.

31020 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

31021 SD5-XSH-ERN-150 and SD5-XSH-ERN-219 are applied.

31022 **NAME**

31023 frexp, frexpf, frexpl — extract mantissa and exponent from a double precision number

31024 **SYNOPSIS**

31025 #include &lt;math.h&gt;

31026 double frexp(double num, int \*exp);

31027 float frexpf(float num, int \*exp);

31028 long double frexpl(long double num, int \*exp);

31029 **DESCRIPTION**31030 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
31031 conflict between the requirements described here and the ISO C standard is unintentional. This  
31032 volume of POSIX.1-2008 defers to the ISO C standard.31033 These functions shall break a floating-point number *num* into a normalized fraction and an  
31034 integral power of 2. The integer exponent shall be stored in the **int** object pointed to by *exp*.31035 **RETURN VALUE**31036 For finite arguments, these functions shall return the value *x*, such that *x* has a magnitude in the  
31037 interval  $[\frac{1}{2}, 1)$  or 0, and *num* equals *x* times 2 raised to the power *\*exp*.31038 **MX** If *num* is NaN, a NaN shall be returned, and the value of *\*exp* is unspecified.31039 If *num* is  $\pm 0$ ,  $\pm 0$  shall be returned, and the value of *\*exp* shall be 0.31040 If *num* is  $\pm \text{Inf}$ , *num* shall be returned, and the value of *\*exp* is unspecified.31041 **ERRORS**

31042 No errors are defined.

31043 **EXAMPLES**

31044 None.

31045 **APPLICATION USAGE**

31046 None.

31047 **RATIONALE**

31048 None.

31049 **FUTURE DIRECTIONS**

31050 None.

31051 **SEE ALSO**31052 *isnan()*, *ldexp()*, *modf()*

31053 XBD &lt;math.h&gt;

31054 **CHANGE HISTORY**

31055 First released in Issue 1. Derived from Issue 1 of the SVID.

31056 **Issue 5**31057 The DESCRIPTION is updated to indicate how an application should check for an error. This  
31058 text was previously published in the APPLICATION USAGE section.

**frexp()**31059 **Issue 6**

31060 The *frexpf()* and *frexpl()* functions are added for alignment with the ISO/IEC 9899:1999  
31061 standard.

31062 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
31063 revised to align with the ISO/IEC 9899:1999 standard.

31064 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
31065 marked.

## 31066 NAME

31067 fscanf, scanf, sscanf — convert formatted input

## 31068 SYNOPSIS

31069 #include &lt;stdio.h&gt;

31070 int fscanf(FILE \*restrict stream, const char \*restrict format, ...);

31071 int scanf(const char \*restrict format, ...);

31072 int sscanf(const char \*restrict s, const char \*restrict format, ...);

## 31073 DESCRIPTION

31074 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 31075 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31076 volume of POSIX.1-2008 defers to the ISO C standard.

31077 The *fscanf()* function shall read from the named input *stream*. The *scanf()* function shall read  
 31078 from the standard input stream *stdin*. The *sscanf()* function shall read from the string *s*. Each  
 31079 function reads bytes, interprets them according to a format, and stores the results in its  
 31080 arguments. Each expects, as arguments, a control string *format* described below, and a set of  
 31081 *pointer* arguments indicating where the converted input should be stored. The result is  
 31082 undefined if there are insufficient arguments for the format. If the format is exhausted while  
 31083 arguments remain, the excess arguments shall be evaluated but otherwise ignored.

31084 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 31085 to the next unused argument. In this case, the conversion specifier character % (see below) is  
 31086 replaced by the sequence "%*n*\$", where *n* is a decimal integer in the range [1, {NL\_ARGMAX}].  
 31087 This feature provides for the definition of format strings that select arguments in an order  
 31088 appropriate to specific languages. In format strings containing the "%*n*\$" form of conversion  
 31089 specifications, it is unspecified whether numbered arguments in the argument list can be  
 31090 referenced from the format string more than once.

31091 The *format* can contain either form of a conversion specification—that is, % or "%*n*\$"—but the  
 31092 two forms cannot be mixed within a single *format* string. The only exception to this is that %% or  
 31093 %\* can be mixed with the "%*n*\$" form. When numbered argument specifications are used,  
 31094 specifying the *N*th argument requires that all the leading arguments, from the first to the  
 31095 (*N*−1)th, are pointers.

31096 The *fscanf()* function in all its forms shall allow detection of a language-dependent radix  
 31097 character in the input string. The radix character is defined in the locale of the process (category  
 31098 LC\_NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the  
 31099 radix character shall default to a <period> ('.').

31100 The *format* is a character string, beginning and ending in its initial shift state, if any, composed  
 31101 of zero or more directives. Each directive is composed of one of the following: one or more  
 31102 white-space characters (<space>, <tab>, <newline>, <vertical-tab>, or <form-feed>); an ordinary  
 31103 character (neither '%' nor a white-space character); or a conversion specification. Each  
 31104 CX conversion specification is introduced by the character '%' or the character sequence "%*n*\$",  
 31105 after which the following appear in sequence:

- 31106 • An optional assignment-suppressing character '\*'.
- 31107 • An optional non-zero decimal integer that specifies the maximum field width.
- 31108 CX • An optional assignment-allocation character 'm'.
- 31109 • An option length modifier that specifies the size of the receiving object.

**fscanf()**

- 31110 • A *conversion specifier* character that specifies the type of conversion to be applied. The valid  
31111 conversion specifiers are described below.
- 31112 The *fscanf()* functions shall execute each directive of the format in turn. If a directive fails, as  
31113 detailed below, the function shall return. Failures are described as input failures (due to the  
31114 unavailability of input bytes) or matching failures (due to inappropriate input).
- 31115 A directive composed of one or more white-space characters shall be executed by reading input  
31116 until no more valid input can be read, or up to the first byte which is not a white-space character,  
31117 which remains unread.
- 31118 A directive that is an ordinary character shall be executed as follows: the next byte shall be read  
31119 from the input and compared with the byte that comprises the directive; if the comparison  
31120 shows that they are not equivalent, the directive shall fail, and the differing and subsequent  
31121 bytes shall remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a  
31122 character from being read, the directive shall fail.
- 31123 A directive that is a conversion specification defines a set of matching input sequences, as  
31124 described below for each conversion character. A conversion specification shall be executed in  
31125 the following steps.
- 31126 Input white-space characters (as specified by *isspace()*) shall be skipped, unless the conversion  
31127 specification includes a `[`, `c`, `C`, or `n` conversion specifier.
- 31128 An item shall be read from the input, unless the conversion specification includes an `n`  
31129 conversion specifier. An input item shall be defined as the longest sequence of input bytes (up to  
31130 any specified maximum field width, which may be measured in characters or bytes dependent  
31131 on the conversion specifier) which is an initial subsequence of a matching sequence. The first  
31132 byte, if any, after the input item shall remain unread. If the length of the input item is 0, the  
31133 execution of the conversion specification shall fail; this condition is a matching failure, unless  
31134 end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is  
31135 an input failure.
- 31136 Except in the case of a `%` conversion specifier, the input item (or, in the case of a `%n` conversion  
31137 specification, the count of input bytes) shall be converted to a type appropriate to the conversion  
31138 character. If the input item is not a matching sequence, the execution of the conversion  
31139 specification fails; this condition is a matching failure. Unless assignment suppression was  
31140 indicated by a `'*'`, the result of the conversion shall be placed in the object pointed to by the  
31141 first argument following the *format* argument that has not already received a conversion result if  
31142 CX the conversion specification is introduced by `%`, or in the *n*th argument if introduced by the  
31143 character sequence `"%n$"`. If this object does not have an appropriate type, or if the result of the  
31144 conversion cannot be represented in the space provided, the behavior is undefined.
- 31145 CX The `%c`, `%s`, and `%[` conversion specifiers shall accept an optional assignment-allocation  
31146 character `'m'`, which shall cause a memory buffer to be allocated to hold the string converted  
31147 including a terminating null character. In such a case, the argument corresponding to the  
31148 conversion specifier should be a reference to a pointer variable that will receive a pointer to the  
31149 allocated buffer. The system shall allocate a buffer as if *malloc()* had been called. The application  
31150 shall be responsible for freeing the memory after usage. If there is insufficient memory to  
31151 allocate a buffer, the function shall set *errno* to `[ENOMEM]` and a conversion error shall result. If  
31152 the function returns EOF, any memory successfully allocated for parameters using assignment-  
31153 allocation character `'m'` by this call shall be freed before the function returns.

- 31154 The length modifiers and their meanings are:
- 31155 hh Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an  
31156 argument with type pointer to **signed char** or **unsigned char**.
- 31157 h Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an  
31158 argument with type pointer to **short** or **unsigned short**.
- 31159 l (ell) Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an  
31160 argument with type pointer to **long** or **unsigned long**; that a following *a*, *A*, *e*, *E*, *f*, *F*,  
31161 *g*, or *G* conversion specifier applies to an argument with type pointer to **double**; or that  
31162 a following *c*, *s*, or *l* conversion specifier applies to an argument with type pointer to  
31163 **wchar\_t**. If the 'm' assignment-allocation character is specified, the conversion  
31164 applies to an argument with the type pointer to a pointer to **wchar\_t**.
- 31165 ll (ell-ell)  
31166 Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an  
31167 argument with type pointer to **long long** or **unsigned long long**.
- 31168 j Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an  
31169 argument with type pointer to **intmax\_t** or **uintmax\_t**.
- 31170 z Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an  
31171 argument with type pointer to **size\_t** or the corresponding signed integer type.
- 31172 t Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an  
31173 argument with type pointer to **ptrdiff\_t** or the corresponding **unsigned** type.
- 31174 L Specifies that a following *a*, *A*, *e*, *E*, *f*, *F*, *g*, or *G* conversion specifier applies to an  
31175 argument with type pointer to **long double**.
- 31176 If a length modifier appears with any conversion specifier other than as specified above, the  
31177 behavior is undefined.
- 31178 The following conversion specifiers are valid:
- 31179 d Matches an optionally signed decimal integer, whose format is the same as expected for  
31180 the subject sequence of *strtol()* with the value 10 for the *base* argument. In the absence  
31181 of a size modifier, the application shall ensure that the corresponding argument is a  
31182 pointer to **int**.
- 31183 i Matches an optionally signed integer, whose format is the same as expected for the  
31184 subject sequence of *strtol()* with 0 for the *base* argument. In the absence of a size  
31185 modifier, the application shall ensure that the corresponding argument is a pointer to  
31186 **int**.
- 31187 o Matches an optionally signed octal integer, whose format is the same as expected for  
31188 the subject sequence of *strtoul()* with the value 8 for the *base* argument. In the absence  
31189 of a size modifier, the application shall ensure that the corresponding argument is a  
31190 pointer to **unsigned**.
- 31191 u Matches an optionally signed decimal integer, whose format is the same as expected for  
31192 the subject sequence of *strtoul()* with the value 10 for the *base* argument. In the absence  
31193 of a size modifier, the application shall ensure that the corresponding argument is a  
31194 pointer to **unsigned**.
- 31195 x Matches an optionally signed hexadecimal integer, whose format is the same as  
31196 expected for the subject sequence of *strtoul()* with the value 16 for the *base* argument. In  
31197 the absence of a size modifier, the application shall ensure that the corresponding

**fscanf()**

| 31228 |            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 31229 |            | If an l (ell) qualifier is present, the input is a sequence of characters that begins in the initial shift state. Each character in the sequence shall be converted to a wide character as if by a call to the <i>mbrtowc</i> ( ) function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first character is converted. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of <b>wchar_t</b> large enough to accept the sequence and the terminating null wide character, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> . |

| 31249 | c   | Matches a sequence of bytes of the number specified by the field width (1 if no field width is present in the conversion specification). No null byte is added. The normal skip over white-space characters shall be suppressed in this case. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to the initial byte of an array of <b>char</b> , <b>signed char</b> , or <b>unsigned char</b> large enough to accept the sequence. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>char</b> .                                                                                                                             |
| 31250 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 31255 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 31256 |     | If an l (ell) qualifier is present, the input shall be a sequence of characters that begins in the initial shift state. Each character in the sequence is converted to a wide character as if by a call to the <i>mbrtowc()</i> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first character is converted. No null wide character is added. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of <b>wchar_t</b> large enough to accept the resulting sequence of wide characters. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> . |

| 31265 | p   | Matches an implementation-defined set of sequences, which shall be the same as the set of sequences that is produced by the %p conversion specification of the corresponding <i>fprintf()</i> functions. The application shall ensure that the corresponding argument is a pointer to a pointer to <b>void</b> . The interpretation of the input item is implementation-defined. If the input item is a value converted earlier during the same program execution, the pointer that results shall compare equal to that value; otherwise, the behavior of the %p conversion specification is undefined.                                                                                                                                                                  |

| 31271 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 31272 | n   | No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which shall be written the number of bytes read from the input so far by this call to the <i>fscanf()</i> functions. Execution of a %n conversion specification shall not increment the assignment count returned at the completion of execution of the function. No argument shall be converted, but one shall be consumed. If the conversion specification includes an assignment-suppressing character or a field width, the behavior is undefined.                                                                                                                                                                                               |
| 31273 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 31274 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 31286 |     | If end-of-file is encountered during input, conversion shall be terminated. If end-of-file occurs before any bytes matching the current conversion specification (except for %n) have been read (other than leading white-space characters, where permitted), execution of the current conversion specification shall terminate with an input failure. Otherwise, unless execution of the current conversion specification is terminated with a matching failure, execution of the following conversion specification (if any) shall be terminated with an input failure.                                                                                                                                                                                                |
| 31287 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 31288 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 31289 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 31290 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 31291 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**fscanf()**

31292 Reaching the end of the string in *sscanf()* shall be equivalent to encountering end-of-file for  
31293 *fscanf()*.

31294 If conversion terminates on a conflicting input, the offending input is left unread in the input.  
31295 Any trailing white space (including <newline> characters) shall be left unread unless matched  
31296 by a conversion specification. The success of literal matches and suppressed assignments is only  
31297 directly determinable via the %n conversion specification.

31298 CX The *fscanf()* and *scanf()* functions may mark the last data access timestamp of the file associated  
31299 with *stream* for update. The last data access timestamp shall be marked for update by the first  
31300 successful execution of *fgetc()*, *fgets()*, *fread()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*,  
31301 *fscanf()*, or *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

**RETURN VALUE**

31302 Upon successful completion, these functions shall return the number of successfully matched  
31303 and assigned input items; this number can be zero in the event of an early matching failure. If  
31304 the input ends before the first matching failure or conversion, EOF shall be returned. If any  
31305 error occurs, EOF shall be returned, and *errno* shall be set to indicate the error. If a read error  
31306 CX occurs, the error indicator for the stream shall be set.  
31307

**ERRORS**

31308 For the conditions under which the *fscanf()* functions fail and may fail, refer to *fgetc()* or  
31309 *fgetwc()*.  
31310

31311 In addition, the *fscanf()* function shall fail if:

31312 CX [EILSEQ] Input byte sequence does not form a valid character.

31313 [ENOMEM] Insufficient storage space is available.

31314 In addition, the *fscanf()* function may fail if:

31315 CX [EINVAL] There are insufficient arguments.

**EXAMPLES**

31316 The call:

```
31317 int i, n; float x; char name[50];
31318 n = scanf("%d%f%s", &i, &x, name);
```

31319 with the input line:

```
31320 25 54.32E-1 Hamster
```

31321 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string  
31322 "Hamster".

31323 The call:

```
31324 int i; float x; char name[50];
31325 (void) scanf("%2d%f*d %[0123456789]", &i, &x, name);
```

31326 with input:

```
31327 56789 0123 56a72
```

31328 assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to  
31329 *getchar()* shall return the character 'a'.  
31330

31331 **Reading Data into an Array**

31332 The following call uses *fscanf()* to read three floating-point numbers from standard input into  
31333 the *input* array.

```
31334 float input[3]; fscanf (stdin, "%f %f %f", input, input+1, input+2);
```

31335 **APPLICATION USAGE**

31336 If the application calling *fscanf()* has any objects of type **wint\_t** or **wchar\_t**, it must also include  
31337 the **<wchar.h>** header to have these objects defined.

31338 For functions that allocate memory as if by *malloc()*, the application should release such memory  
31339 when it is no longer required by a call to *free()*. For *fscanf()*, this is memory allocated via use of  
31340 the 'm' assignment-allocation character.

31341 **RATIONALE**

31342 This function is aligned with the ISO/IEC 9899:1999 standard, and in doing so a few "obvious"  
31343 things were not included. Specifically, the set of characters allowed in a scanset is limited to  
31344 single-byte characters. In other similar places, multi-byte characters have been permitted, but  
31345 for alignment with the ISO/IEC 9899:1999 standard, it has not been done here. Applications  
31346 needing this could use the corresponding wide-character functions to achieve the desired  
31347 results.

31348 **FUTURE DIRECTIONS**

31349 None.

31350 **SEE ALSO**

31351 *fprintf()*, *getc()*, *setlocale()*, *strtod()*, *strtol()*, *strtoul()*, *wcrtomb()*

31352 XBD Chapter 7 (on page 135), **<langinfo.h>**, **<stdio.h>**, **<wchar.h>**

31353 **CHANGE HISTORY**

31354 First released in Issue 1. Derived from Issue 1 of the SVID.

31355 **Issue 5**

31356 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the **l** (ell) qualifier is  
31357 now defined for the **c**, **s**, and **[** conversion specifiers.

31358 The DESCRIPTION is updated to indicate that if infinity and NaN can be generated by the  
31359 *fprintf()* family of functions, then they are recognized by the *fscanf()* family.

31360 **Issue 6**

31361 The Open Group Corrigenda U021/7 and U028/10 are applied. These correct several  
31362 occurrences of "characters" in the text which have been replaced with the term "bytes".

31363 The normative text is updated to avoid use of the term "must" for application requirements.

31364 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 31365 • The prototypes for *fscanf()*, *scanf()*, and *sscanf()* are updated.
- 31366 • The DESCRIPTION is updated.
- 31367 • The **hh**, **ll**, **j**, **t**, and **z** length modifiers are added.
- 31368 • The **a**, **A**, and **F** conversion characters are added.

31369 The DESCRIPTION is updated to use the terms "conversion specifier" and "conversion  
31370 specification" consistently.

**fscanf()**31371 **Issue 7**

- 31372 Austin Group Interpretation 1003.1-2001 #170 is applied.
- 31373 SD5-XSH-ERN-9 is applied, correcting *fscanf()* to *scanf()* in the DESCRIPTION.
- 31374 SD5-XSH-ERN-132 is applied, adding the assignment-allocation character 'm'.
- 31375 Functionality relating to the %n\$ form of conversion specification is moved from the XSI option  
31376 to the Base.
- 31377 Changes are made related to support for finegrained timestamps.
- 31378 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by  
31379 *malloc()*.

31380 **NAME**

31381           fseek, fseeko — reposition a file-position indicator in a stream

31382 **SYNOPSIS**

31383           #include &lt;stdio.h&gt;

31384           int fseek(FILE \*stream, long offset, int whence);

31385 CX        int fseeko(FILE \*stream, off\_t offset, int whence);

31386 **DESCRIPTION**31387 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
31388 conflict between the requirements described here and the ISO C standard is unintentional. This  
31389 volume of POSIX.1-2008 defers to the ISO C standard.31390        The *fseek()* function shall set the file-position indicator for the stream pointed to by *stream*. If a  
31391 read or write error occurs, the error indicator for the stream shall be set and *fseek()* fails.31392        The new position, measured in bytes from the beginning of the file, shall be obtained by adding  
31393 *offset* to the position specified by *whence*. The specified point is the beginning of the file for  
31394 SEEK\_SET, the current value of the file-position indicator for SEEK\_CUR, or end-of-file for  
31395 SEEK\_END.31396        If the stream is to be used with wide-character input/output functions, the application shall  
31397 ensure that *offset* is either 0 or a value returned by an earlier call to *ftell()* on the same stream and  
31398 *whence* is SEEK\_SET.31399        A successful call to *fseek()* shall clear the end-of-file indicator for the stream and undo any effects  
31400 of *ungetc()* and *ungetwc()* on the same stream. After an *fseek()* call, the next operation on an  
31401 update stream may be either input or output.31402 CX        If the most recent operation, other than *ftell()*, on a given stream is *fflush()*, the file offset in the  
31403 underlying open file description shall be adjusted to reflect the location specified by *fseek()*.31404        The *fseek()* function shall allow the file-position indicator to be set beyond the end of existing  
31405 data in the file. If data is later written at this point, subsequent reads of data in the gap shall  
31406 return bytes with the value 0 until data is actually written into the gap.31407        The behavior of *fseek()* on devices which are incapable of seeking is implementation-defined.  
31408 The value of the file offset associated with such a device is undefined.31409        If the stream is writable and buffered data had not been written to the underlying file, *fseek()*  
31410 shall cause the unwritten data to be written to the file and shall mark the last data modification  
31411 and last file status change timestamps of the file for update.31412        In a locale with state-dependent encoding, whether *fseek()* restores the stream's shift state is  
31413 implementation-defined.31414        The *fseeko()* function shall be equivalent to the *fseek()* function except that the *offset* argument is  
31415 of type **off\_t**.31416 **RETURN VALUE**31417 CX        The *fseek()* and *fseeko()* functions shall return 0 if they succeed.31418 CX        Otherwise, they shall return -1 and set *errno* to indicate the error.31419 **ERRORS**31420 CX        The *fseek()* and *fseeko()* functions shall fail if, either the *stream* is unbuffered or the *stream's*  
31421 buffer needed to be flushed, and the call to *fseek()* or *fseeko()* causes an underlying *lseek()* or  
31422 *write()* to be invoked, and:

**fseek()**

31461 XBD &lt;stdio.h&gt;

31462 **CHANGE HISTORY**

31463 First released in Issue 1. Derived from Issue 1 of the SVID.

31464 **Issue 5**

31465 Normative text previously in the APPLICATION USAGE section is moved to the  
31466 DESCRIPTION.

31467 Large File Summit extensions are added.

31468 **Issue 6**

31469 Extensions beyond the ISO C standard are marked.

31470 The following new requirements on POSIX implementations derive from alignment with the  
31471 Single UNIX Specification:

- 31472 • The *fseeko()* function is added.
- 31473 • The [EFBIG], [Eoverflow], and [ENXIO] mandatory error conditions are added.

31474 The following change is incorporated for alignment with the FIPS requirements:

- 31475 • The [EINTR] error is no longer an indication that the implementation does not report  
31476 partial transfers.

31477 The normative text is updated to avoid use of the term “must” for application requirements.

31478 The DESCRIPTION is updated to explicitly state that *seek()* sets the file-position indicator, and  
31479 then on error the error indicator is set and *fseek()* fails. This is for alignment with the  
31480 ISO/IEC 9899:1999 standard.

31481 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/42 is applied, updating the [EAGAIN]  
31482 error in the ERRORS section from “the process would be delayed” to “the thread would be  
31483 delayed”.

31484 **Issue 7**

31485 Changes are made related to support for finegrained timestamps.

**fsetpos()**31486 **NAME**31487 `fsetpos` — set current file position31488 **SYNOPSIS**31489 `#include <stdio.h>`31490 `int fsetpos(FILE *stream, const fpos_t *pos);`31491 **DESCRIPTION**31492 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
31493 conflict between the requirements described here and the ISO C standard is unintentional. This  
31494 volume of POSIX.1-2008 defers to the ISO C standard.31495 The `fsetpos()` function shall set the file position and state indicators for the stream pointed to by  
31496 `stream` according to the value of the object pointed to by `pos`, which the application shall ensure is  
31497 a value obtained from an earlier call to `fgetpos()` on the same stream. If a read or write error  
31498 occurs, the error indicator for the stream shall be set and `fsetpos()` fails.31499 A successful call to the `fsetpos()` function shall clear the end-of-file indicator for the stream and  
31500 undo any effects of `ungetc()` on the same stream. After an `fsetpos()` call, the next operation on an  
31501 update stream may be either input or output.31502 CX The behavior of `fsetpos()` on devices which are incapable of seeking is implementation-defined.  
31503 The value of the file offset associated with such a device is undefined.31504 **RETURN VALUE**31505 The `fsetpos()` function shall return 0 if it succeeds; otherwise, it shall return a non-zero value and  
31506 set `errno` to indicate the error.31507 **ERRORS**31508 CX The `fsetpos()` function shall fail if, either the `stream` is unbuffered or the `stream`'s buffer needed to  
31509 be flushed, and the call to `fsetpos()` causes an underlying `lseek()` or `write()` to be invoked, and:31510 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor and the thread would be  
31511 delayed in the write operation.31512 CX [EBADF] The file descriptor underlying the stream file is not open for writing or the  
31513 stream's buffer needed to be flushed and the file is not open.

31514 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

31515 XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the  
31516 process.31517 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the  
31518 offset maximum associated with the corresponding stream.31519 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data  
31520 was transferred.31521 CX [EIO] A physical I/O error has occurred, or the process is a member of a background  
31522 process group attempting to perform a `write()` to its controlling terminal,  
31523 TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the  
31524 process group of the process is orphaned. This error may also be returned  
31525 under implementation-defined conditions.

31526 CX [ENOSPC] There was no free space remaining on the device containing the file.

31527 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
31528 capabilities of the device.

31529 CX [EPIPE] An attempt was made to write to a pipe or FIFO that is not open for reading  
31530 by any process; a SIGPIPE signal shall also be sent to the thread.

31531 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO.

31542 XBD <stdio.h>

#### 31543 CHANGE HISTORY

31544 First released in Issue 4. Derived from the ISO C standard.

#### 31545 Issue 6

31546 Extensions beyond the ISO C standard are marked.

31547 An additional [ESPIPE] error condition is added for sockets.

31548 The normative text is updated to avoid use of the term “must” for application requirements.

31549 The DESCRIPTION is updated to clarify that the error indicator is set for the stream on a read or  
31550 write error. This is for alignment with the ISO/IEC 9899:1999 standard.

31551 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/21 is applied, deleting an erroneous  
31552 [EINVAL] error case from the ERRORS section.

31553 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/43 is applied, updating the [EAGAIN]  
31554 error in the ERRORS section from “the process would be delayed” to “the thread would be  
31555 delayed”.

#### 31556 Issue 7

31557 SD5-XSH-ERN-220 is applied.

**fstat()**31558 **NAME**31559 `fstat` — get file status31560 **SYNOPSIS**31561 `#include <sys/stat.h>`31562 `int fstat(int fildev, struct stat *buf);`31563 **DESCRIPTION**31564 The `fstat()` function shall obtain information about an open file associated with the file  
31565 descriptor *fildev*, and shall write it to the area pointed to by *buf*.31566 SHM If *fildev* references a shared memory object, the implementation shall update in the `stat` structure  
31567 pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
31568 S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
31569 valid. The implementation may update other fields and flags.31570 TYM If *fildev* references a typed memory object, the implementation shall update in the `stat` structure  
31571 pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
31572 S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
31573 valid. The implementation may update other fields and flags.31574 The *buf* argument is a pointer to a `stat` structure, as defined in `<sys/stat.h>`, into which  
31575 information is placed concerning the file.31576 For all other file types defined in this volume of POSIX.1-2008, the structure members *st\_mode*,  
31577 *st\_ino*, *st\_dev*, *st\_uid*, *st\_gid*, *st\_atim*, *st\_ctim*, and *st\_mtim* shall have meaningful values and the  
31578 value of the *st\_nlink* member shall be set to the number of links to the file.31579 An implementation that provides additional or alternative file access control mechanisms may,  
31580 under implementation-defined conditions, cause `fstat()` to fail.31581 The `fstat()` function shall update any time-related fields (as described in XBD Section 4.8, on  
31582 page 109), before writing into the `stat` structure.31583 **RETURN VALUE**31584 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
31585 indicate the error.31586 **ERRORS**31587 The `fstat()` function shall fail if:31588 [EBADF] The *fildev* argument is not a valid file descriptor.

31589 [EIO] An I/O error occurred while reading from the file system.

31590 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file  
31591 serial number cannot be represented correctly in the structure pointed to by  
31592 *buf*.31593 The `fstat()` function may fail if:31594 [EOVERFLOW] One of the values is too large to store into the structure pointed to by the *buf*  
31595 argument.

31596 **EXAMPLES**31597 **Obtaining File Status Information**

31598 The following example shows how to obtain file status information for a file named  
 31599 **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure. The  
 31600 **/home/cnd/mod1** file is opened with read/write privileges and is passed to the open file  
 31601 descriptor *fildes*.

```
31602 #include <sys/types.h>
31603 #include <sys/stat.h>
31604 #include <fcntl.h>

31605 struct stat buffer;
31606 int      status;
31607 ...
31608 fildes = open("/home/cnd/mod1", O_RDWR);
31609 status = fstat(fildes, &buffer);
```

31610 **APPLICATION USAGE**

31611 None.

31612 **RATIONALE**

31613 None.

31614 **FUTURE DIRECTIONS**

31615 None.

31616 **SEE ALSO**

31617 [fstatat\(\)](#)

31618 XBD [Section 4.8](#) (on page 109), [<sys/stat.h>](#), [<sys/types.h>](#)

31619 **CHANGE HISTORY**

31620 First released in Issue 1. Derived from Issue 1 of the SVID.

31621 **Issue 5**

31622 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

31623 Large File Summit extensions are added.

31624 **Issue 6**

31625 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

31626 The following new requirements on POSIX implementations derive from alignment with the  
 31627 Single UNIX Specification:

- 31628 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
 31629 required for conforming implementations of previous POSIX specifications, it was not  
 31630 required for UNIX applications.
- 31631 • The [EIO] mandatory error condition is added.
- 31632 • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
 31633 files.
- 31634 • The [EOVERFLOW] optional error condition is added.

31635 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
 31636 shared memory object semantics apply to typed memory objects.

**fstat()**31637 **Issue 7**

31638 XSH-SD5-ERN-161 is applied, updating the DESCRIPTION to clarify to which file types *st\_nlink*  
31639 applies.

31640 Changes are made related to support for finegrained timestamps.

## 31641 NAME

31642 fstatat, lstat, stat — get file status

## 31643 SYNOPSIS

```
31644 #include <sys/stat.h>
31645 int fstatat(int fd, const char *restrict path,
31646             struct stat *restrict buf, int flag);
31647 int lstat(const char *restrict path, struct stat *restrict buf);
31648 int stat(const char *restrict path, struct stat *restrict buf);
```

## 31649 DESCRIPTION

31650 The *stat()* function shall obtain information about the named file and write it to the area pointed  
 31651 to by the *buf* argument. The *path* argument points to a pathname naming a file. Read, write, or  
 31652 execute permission of the named file is not required. An implementation that provides  
 31653 additional or alternate file access control mechanisms may, under implementation-defined  
 31654 conditions, cause *stat()* to fail. In particular, the system may deny the existence of the file  
 31655 specified by *path*.

31656 If the named file is a symbolic link, the *stat()* function shall continue pathname resolution using  
 31657 the contents of the symbolic link, and shall return information pertaining to the resulting file if  
 31658 the file exists.

31659 The *buf* argument is a pointer to a **stat** structure, as defined in the `<sys/stat.h>` header, into  
 31660 which information is placed concerning the file.

31661 The *stat()* function shall update any time-related fields (as described in XBD Section 4.8, on page  
 31662 109), before writing into the **stat** structure.

31663 SHM If the named file is a shared memory object, the implementation shall update in the **stat** structure  
 31664 pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
 31665 S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
 31666 valid. The implementation may update other fields and flags.

31667 TYM If the named file is a typed memory object, the implementation shall update in the **stat** structure  
 31668 pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
 31669 S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
 31670 valid. The implementation may update other fields and flags.

31671 For all other file types defined in this volume of POSIX.1-2008, the structure members *st\_mode*,  
 31672 *st\_ino*, *st\_dev*, *st\_uid*, *st\_gid*, *st\_atim*, *st\_ctim*, and *st\_mtim* shall have meaningful values and the  
 31673 value of the member *st\_nlink* shall be set to the number of links to the file.

31674 The *lstat()* function shall be equivalent to *stat()*, except when *path* refers to a symbolic link. In  
 31675 that case *lstat()* shall return information about the link, while *stat()* shall return information  
 31676 about the file the link references.

31677 For symbolic links, the *st\_mode* member shall contain meaningful information when used with  
 31678 the file type macros. The file mode bits in *st\_mode* are unspecified. The structure members *st\_ino*,  
 31679 *st\_dev*, *st\_uid*, *st\_gid*, *st\_atim*, *st\_ctim*, and *st\_mtim* shall have meaningful values and the value of  
 31680 the *st\_nlink* member shall be set to the number of (hard) links to the symbolic link. The value of  
 31681 the *st\_size* member shall be set to the length of the pathname contained in the symbolic link not  
 31682 including any terminating null byte.

31683 The *fstatat()* function shall be equivalent to the *stat()* or *lstat()* function, depending on the value  
 31684 of *flag* (see below), except in the case where *path* specifies a relative path. In this case the status  
 31685 shall be retrieved from a file relative to the directory associated with the file descriptor *fd* instead  
 31686 of the current working directory. If the file descriptor was opened without O\_SEARCH, the

**fstatat()**

31687 function shall check whether directory searches are permitted using the current permissions of  
 31688 the directory underlying the file descriptor. If the file descriptor was opened with O\_SEARCH,  
 31689 the function shall not perform the check.

31690 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 31691 in **<fcntl.h>**:

31692 AT\_SYMLINK\_NOFOLLOW

31693 If *path* names a symbolic link, the status of the symbolic link is returned.

31694 If *fstatat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 31695 directory is used and the behavior shall be identical to a call to *stat()* or *lstat()* respectively,  
 31696 depending on whether or not the AT\_SYMLINK\_NOFOLLOW bit is set in *flag*.

**RETURN VALUE**

31697 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 31698 return -1 and set *errno* to indicate the error.

**ERRORS**

31700 These functions shall fail if:

31701 [EACCES] Search permission is denied for a component of the path prefix.

31702 [EIO] An error occurred while reading from the file system.

31703 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 31704 argument.

31705 [ENAMETOOLONG]

31706 The length of a component of a pathname is longer than {NAME\_MAX}.

31707 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

31708 [ENOTDIR] A component of the path prefix is not a directory, or the *path* argument  
 31709 contains at least one non-*<slash>* character and ends with one or more trailing  
 31710 *<slash>* characters and the last pathname component names an existing file  
 31711 that is neither a directory nor a symbolic link to a directory.

31712 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file  
 31713 serial number cannot be represented correctly in the structure pointed to by  
 31714 *buf*.

31715 The *fstatat()* function shall fail if:

31716 [EACCES] *fd* was not opened with O\_SEARCH and the permissions of the directory  
 31717 underlying *fd* do not permit directory searches.

31718 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
 31719 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.

31720 These functions may fail if:

31721 [ELOOP] More than {SYMLINK\_MAX} symbolic links were encountered during  
 31722 resolution of the *path* argument.

31723 [ENAMETOOLONG]

31724 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 31725 symbolic link produced an intermediate result with a length that exceeds  
 31726 {PATH\_MAX}.

- 31728 [Eoverflow] A value to be stored would overflow one of the members of the **stat** structure.
- 31729 The *fstatat()* function may fail if:
- 31730 [EINVAL] The value of the *flag* argument is not valid.
- 31731 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT\_FDCWD nor a  
31732 file descriptor associated with a directory.

31733 **EXAMPLES**31734 **Obtaining File Status Information**

31735 The following example shows how to obtain file status information for a file named  
31736 **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure.

```
31737 #include <sys/types.h>
31738 #include <sys/stat.h>
31739 #include <fcntl.h>

31740 struct stat buffer;
31741 int      status;
31742 ...
31743 status = stat("/home/cnd/mod1", &buffer);
```

31744 **Getting Directory Information**

31745 The following example fragment gets status information for each entry in a directory. The call to  
31746 the *stat()* function stores file information in the **stat** structure pointed to by *statbuf*. The lines  
31747 that follow the *stat()* call format the fields in the **stat** structure for presentation to the user of the  
31748 program.

```
31749 #include <sys/types.h>
31750 #include <sys/stat.h>
31751 #include <dirent.h>
31752 #include <pwd.h>
31753 #include <grp.h>
31754 #include <time.h>
31755 #include <locale.h>
31756 #include <langinfo.h>
31757 #include <stdio.h>
31758 #include <stdint.h>

31759 struct dirent *dp;
31760 struct stat   statbuf;
31761 struct passwd *pwd;
31762 struct group  *grp;
31763 struct tm     *tm;
31764 char          datestring[256];
31765 ...
31766 /* Loop through directory entries. */
31767 while ((dp = readdir(dir)) != NULL) {

31768     /* Get entry's information. */
31769     if (stat(dp->d_name, &statbuf) == -1)
31770         continue;
```

**fstatat()**

```

31771     /* Print out type, permissions, and number of links. */
31772     printf("%10.10s", sperm (statbuf.st_mode));
31773     printf("%4d", statbuf.st_nlink);

31774     /* Print out owner's name if it is found using getpwuid(). */
31775     if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
31776         printf(" %-8.8s", pwd->pw_name);
31777     else
31778         printf(" %-8d", statbuf.st_uid);

31779     /* Print out group name if it is found using getgrgid(). */
31780     if ((grp = getgrgid(statbuf.st_gid)) != NULL)
31781         printf(" %-8.8s", grp->gr_name);
31782     else
31783         printf(" %-8d", statbuf.st_gid);

31784     /* Print size of file. */
31785     printf(" %9jd", (intmax_t)statbuf.st_size);

31786     tm = localtime(&statbuf.st_mtime);

31787     /* Get localized date string. */
31788     strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);

31789     printf(" %s %s\n", datestring, dp->d_name);
31790 }

```

**Obtaining Symbolic Link Status Information**

The following example shows how to obtain status information for a symbolic link named **/modules/pass1**. The structure variable *buffer* is defined for the **stat** structure. If the *path* argument specified the filename for the file pointed to by the symbolic link (**/home/cnd/mod1**), the results of calling the function would be the same as those returned by a call to the *stat()* function.

```

31797 #include <sys/stat.h>
31798 struct stat buffer;
31799 int status;
31800 ...
31801 status = lstat("/modules/pass1", &buffer);

```

**APPLICATION USAGE**

None.

**RATIONALE**

The intent of the paragraph describing “additional or alternate file access control mechanisms” is to allow a secure implementation where a process with a label that does not dominate the file’s label cannot perform a *stat()* function. This is not related to read permission; a process with a label that dominates the file’s label does not need read permission. An implementation that supports write-up operations could fail *fstat()* function calls even though it has a valid file descriptor open for writing.

The *lstat()* function is not required to update the time-related fields if the named file is not a symbolic link. While the *st\_uid*, *st\_gid*, *st\_atim*, *st\_mtim*, and *st\_ctim* members of the **stat** structure may apply to a symbolic link, they are not required to do so. No functions in POSIX.1-2008 are required to maintain any of these time fields.

31815 The purpose of the *fstatat()* function is to obtain the status of files in directories other than the  
 31816 current working directory without exposure to race conditions. Any part of the path of a file  
 31817 could be changed in parallel to a call to *stat()*, resulting in unspecified behavior. By opening a  
 31818 file descriptor for the target directory and using the *fstatat()* function it can be guaranteed that  
 31819 the file for which status is returned is located relative to the desired directory.

#### 31820 FUTURE DIRECTIONS

31821 None.

#### 31825 CHANGE HISTORY

31826 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 31827 Issue 5

31828 Large File Summit extensions are added.

#### 31829 Issue 6

31830 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

31831 The following new requirements on POSIX implementations derive from alignment with the  
 31832 Single UNIX Specification:

- 31833 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
 31834 required for conforming implementations of previous POSIX specifications, it was not  
 31835 required for UNIX applications.
- 31836 • The [EIO] mandatory error condition is added.
- 31837 • The [ELOOP] mandatory error condition is added.
- 31838 • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
 31839 files.
- 31840 • The [ENAMETOOLONG] and the second [EOVERFLOW] optional error conditions are  
 31841 added.

31842 The following changes were made to align with the IEEE P1003.1a draft standard:

- 31843 • Details are added regarding the treatment of symbolic links.
- 31844 • The [ELOOP] optional error condition is added.

31845 The normative text is updated to avoid use of the term “must” for application requirements.

31846 The **restrict** keyword is added to the *stat()* prototype for alignment with the ISO/IEC 9899:1999  
 31847 standard.

#### 31848 Issue 7

31849 Austin Group Interpretation 1003.1-2001 #143 is applied.

31850 XSH-SD5-ERN-161 is applied, updating the DESCRIPTION to clarify to which file types *st\_nlink*  
 31851 applies.

31852 The *fstatat()* function is added from The Open Group Technical Standard, 2006, Extended API  
 31853 Set Part 2.

31854 Changes are made related to support for finegrained timestamps.

31855 The *lstat()* function is now required to return meaningful data for symbolic links in all **stat**

**fstatat()**

- 31856 structure fields, except for the permission bits of *st\_mode*.
- 31857 Changes are made to allow a directory to be opened for searching.
- 31858 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
31859 pathname exists but is not a directory or a symbolic link to a directory.

31860 **NAME**31861 `fstatvfs, statvfs` — get file system information31862 **SYNOPSIS**31863 `#include <sys/statvfs.h>`31864 `int fstatvfs(int fildev, struct statvfs *buf);`31865 `int statvfs(const char *restrict path, struct statvfs *restrict buf);`31866 **DESCRIPTION**31867 The `fstatvfs()` function shall obtain information about the file system containing the file  
31868 referenced by *fildev*.31869 The `statvfs()` function shall obtain information about the file system containing the file named by  
31870 *path*.31871 For both functions, the *buf* argument is a pointer to a **statvfs** structure that shall be filled. Read,  
31872 write, or execute permission of the named file is not required.31873 The following flags can be returned in the *f\_flag* member:31874 **ST\_RDONLY** Read-only file system.31875 **ST\_NOSUID** Setuid/setgid bits ignored by *exec*.31876 It is unspecified whether all members of the **statvfs** structure have meaningful values on all file  
31877 systems.31878 **RETURN VALUE**31879 Upon successful completion, `statvfs()` shall return 0. Otherwise, it shall return -1 and set *errno* to  
31880 indicate the error.31881 **ERRORS**31882 The `fstatvfs()` and `statvfs()` functions shall fail if:31883 **[EIO]** An I/O error occurred while reading the file system.31884 **[EINTR]** A signal was caught during execution of the function.31885 **[EOVERFLOW]** One of the values to be returned cannot be represented correctly in the  
31886 structure pointed to by *buf*.31887 The `fstatvfs()` function shall fail if:31888 **[EBADF]** The *fildev* argument is not an open file descriptor.31889 The `statvfs()` function shall fail if:31890 **[EACCES]** Search permission is denied on a component of the path prefix.31891 **[ELOOP]** A loop exists in symbolic links encountered during resolution of the *path*  
31892 argument.31893 **[ENAMETOOLONG]**

31894 The length of a component of a pathname is longer than {NAME\_MAX}.

31895 **[ENOENT]** A component of *path* does not name an existing file or *path* is an empty string.31896 **[ENOTDIR]** A component of the path prefix is not a directory, or the *path* argument  
31897 contains at least one non-`<slash>` character and ends with one or more trailing  
31898 `<slash>` characters and the last pathname component names an existing file  
31899 that is neither a directory nor a symbolic link to a directory.

**fstatvfs()**

- 31900 The *statvfs()* function may fail if:
- 31901 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
31902 resolution of the *path* argument.
- 31903 [ENAMETOOLONG]  
31904 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
31905 symbolic link produced an intermediate result with a length that exceeds  
31906 {PATH\_MAX}.

31907 **EXAMPLES**31908 **Obtaining File System Information Using fstatvfs()**

31909 The following example shows how to obtain file system information for the file system upon  
31910 which the file named **/home/cnd/mod1** resides, using the *fstatvfs()* function. The  
31911 **/home/cnd/mod1** file is opened with read/write privileges and the open file descriptor is passed  
31912 to the *fstatvfs()* function.

```
31913 #include <sys/statvfs.h>
31914 #include <fcntl.h>
31915
31916 struct statvfs buffer;
31917 int status;
31918 ...
31919 fildes = open("/home/cnd/mod1", O_RDWR);
31920 status = fstatvfs(fildes, &buffer);
```

31920 **Obtaining File System Information Using statvfs()**

31921 The following example shows how to obtain file system information for the file system upon  
31922 which the file named **/home/cnd/mod1** resides, using the *statvfs()* function.

```
31923 #include <sys/statvfs.h>
31924
31925 struct statvfs buffer;
31926 int status;
31927 ...
31928 status = statvfs("/home/cnd/mod1", &buffer);
```

31928 **APPLICATION USAGE**

31929 None.

31930 **RATIONALE**

31931 None.

31932 **FUTURE DIRECTIONS**

31933 None.

31934 **SEE ALSO**

31937 XBD [<sys/statvfs.h>](#)

31938 **CHANGE HISTORY**

31939 First released in Issue 4, Version 2.

31940 **Issue 5**

31941 Moved from X/OPEN UNIX extension to BASE.

31942 Large File Summit extensions are added.

31943 **Issue 6**

31944 The normative text is updated to avoid use of the term “must” for application requirements.

31945 The **restrict** keyword is added to the *statvfs()* prototype for alignment with the  
31946 ISO/IEC 9899: 1999 standard.

31947 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
31948 [ELOOP] error condition is added.

31949 **Issue 7**

31950 Austin Group Interpretation 1003.1-2001 #143 is applied.

31951 SD5-XSH-ERN-68 is applied, correcting the EXAMPLES section.

31952 The *fstatvfs()* and *statvfs()* functions are moved from the XSI option to the Base.

31953 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
31954 pathname exists but is not a directory or a symbolic link to a directory.

**fsync()**31955 **NAME**

31956 fsync — synchronize changes to a file

31957 **SYNOPSIS**

```
31958 FSC #include <unistd.h>
31959 int fsync(int fildes);
```

31960 **DESCRIPTION**

31961 The *fsync()* function shall request that all data for the open file descriptor named by *fildes* is to be  
 31962 transferred to the storage device associated with the file described by *fildes*. The nature of the  
 31963 transfer is implementation-defined. The *fsync()* function shall not return until the system has  
 31964 completed that action or until an error is detected.

31965 SIO If `_POSIX_SYNCHRONIZED_IO` is defined, the *fsync()* function shall force all currently queued  
 31966 I/O operations associated with the file indicated by file descriptor *fildes* to the synchronized I/O  
 31967 completion state. All I/O operations shall be completed as defined for synchronized I/O file  
 31968 integrity completion.

31969 **RETURN VALUE**

31970 Upon successful completion, *fsync()* shall return 0. Otherwise, -1 shall be returned and *errno* set  
 31971 to indicate the error. If the *fsync()* function fails, outstanding I/O operations are not guaranteed  
 31972 to have been completed.

31973 **ERRORS**31974 The *fsync()* function shall fail if:

- 31975 [EBADF] The *fildes* argument is not a valid descriptor.
- 31976 [EINTR] The *fsync()* function was interrupted by a signal.
- 31977 [EINVAL] The *fildes* argument does not refer to a file on which this operation is possible.
- 31978 [EIO] An I/O error occurred while reading from or writing to the file system.

31979 In the event that any of the queued I/O operations fail, *fsync()* shall return the error conditions  
 31980 defined for *read()* and *write()*.

31981 **EXAMPLES**

31982 None.

31983 **APPLICATION USAGE**

31984 The *fsync()* function should be used by programs which require modifications to a file to be  
 31985 completed before continuing; for example, a program which contains a simple transaction  
 31986 facility might use it to ensure that all modifications to a file or files caused by a transaction are  
 31987 recorded.

31988 **RATIONALE**

31989 The *fsync()* function is intended to force a physical write of data from the buffer cache, and to  
 31990 assure that after a system crash or other failure that all data up to the time of the *fsync()* call is  
 31991 recorded on the disk. Since the concepts of “buffer cache”, “system crash”, “physical write”, and  
 31992 “non-volatile storage” are not defined here, the wording has to be more abstract.

31993 If `_POSIX_SYNCHRONIZED_IO` is not defined, the wording relies heavily on the conformance  
 31994 document to tell the user what can be expected from the system. It is explicitly intended that a  
 31995 null implementation is permitted. This could be valid in the case where the system cannot assure  
 31996 non-volatile storage under any circumstances or when the system is highly fault-tolerant and the  
 31997 functionality is not required. In the middle ground between these extremes, *fsync()* might or  
 31998 might not actually cause data to be written where it is safe from a power failure. The

31999 conformance document should identify at least that one configuration exists (and how to obtain  
 32000 that configuration) where this can be assured for at least some files that the user can select to use  
 32001 for critical data. It is not intended that an exhaustive list is required, but rather sufficient  
 32002 information is provided so that if critical data needs to be saved, the user can determine how the  
 32003 system is to be configured to allow the data to be written to non-volatile storage.

32004 It is reasonable to assert that the key aspects of *fsync()* are unreasonable to test in a test suite.  
 32005 That does not make the function any less valuable, just more difficult to test. A formal  
 32006 conformance test should probably force a system crash (power shutdown) during the test for  
 32007 this condition, but it needs to be done in such a way that automated testing does not require this  
 32008 to be done except when a formal record of the results is being made. It would also not be  
 32009 unreasonable to omit testing for *fsync()*, allowing it to be treated as a quality-of-implementation  
 32010 issue.

#### 32011 FUTURE DIRECTIONS

32012 None.

#### 32013 SEE ALSO

32014 [sync\(\)](#)

32015 XBD [<unistd.h>](#)

#### 32016 CHANGE HISTORY

32017 First released in Issue 3.

#### 32018 Issue 5

32019 Aligned with *fsync()* in the POSIX Realtime Extension. Specifically, the DESCRIPTION and  
 32020 RETURN VALUE sections are much expanded, and the ERRORS section is updated to indicate  
 32021 that *fsync()* can return the error conditions defined for *read()* and *write()*.

#### 32022 Issue 6

32023 This function is marked as part of the File Synchronization option.

32024 The following new requirements on POSIX implementations derive from alignment with the  
 32025 Single UNIX Specification:

- 32026 • The [EINVAL] and [EIO] mandatory error conditions are added.

32027 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/44 is applied, applying an editorial  
 32028 rewording of the DESCRIPTION. No change in meaning is intended.

**ftell()**32029 **NAME**32030 `ftell, ftello` — return a file offset in a stream32031 **SYNOPSIS**32032 `#include <stdio.h>`32033 `long ftell(FILE *stream);`32034 CX `off_t ftello(FILE *stream);`32035 **DESCRIPTION**32036 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
32037 conflict between the requirements described here and the ISO C standard is unintentional. This  
32038 volume of POSIX.1-2008 defers to the ISO C standard.32039 The `ftell()` function shall obtain the current value of the file-position indicator for the stream  
32040 pointed to by `stream`.32041 CX The `ftello()` function shall be equivalent to `ftell()`, except that the return value is of type `off_t`.32042 **RETURN VALUE**32043 CX Upon successful completion, `ftell()` and `ftello()` shall return the current value of the file-position  
32044 indicator for the stream measured in bytes from the beginning of the file.32045 CX Otherwise, `ftell()` and `ftello()` shall return `-1`, cast to `long` and `off_t` respectively, and set `errno` to  
32046 indicate the error.32047 **ERRORS**32048 CX The `ftell()` and `ftello()` functions shall fail if:32049 CX [EBADF] The file descriptor underlying `stream` is not an open file descriptor.32050 CX [EOVERFLOW] For `ftell()`, the current file offset cannot be represented correctly in an object of  
32051 type `long`.32052 CX [EOVERFLOW] For `ftello()`, the current file offset cannot be represented correctly in an object  
32053 of type `off_t`.32054 CX [ESPIPE] The file descriptor underlying `stream` is associated with a pipe or FIFO.32055 The `ftell()` function may fail if:32056 CX [ESPIPE] The file descriptor underlying `stream` is associated with a socket.32057 **EXAMPLES**

32058 None.

32059 **APPLICATION USAGE**

32062 None.

32063 **FUTURE DIRECTIONS**

32064 None.

32065 **SEE ALSO**32066 `fgetpos()`, `fopen()`, `fseek()`, `lseek()`32067 XBD `<stdio.h>`

32068 **CHANGE HISTORY**

32069 First released in Issue 1. Derived from Issue 1 of the SVID.

32070 **Issue 5**

32071 Large File Summit extensions are added.

32072 **Issue 6**

32073 Extensions beyond the ISO C standard are marked.

32074 The following new requirements on POSIX implementations derive from alignment with the  
32075 Single UNIX Specification:

- 32076 • The *ftello()* function is added.
- 32077 • The [Eoverflow] error conditions are added.

32078 An additional [ESPIPE] error condition is added for sockets.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**ftok()**32079 **NAME**32080 `ftok` — generate an IPC key32081 **SYNOPSIS**

```
32082 xSI #include <sys/ipc.h>
32083 key_t ftok(const char *path, int id);
```

32084 **DESCRIPTION**

32085 The `ftok()` function shall return a key based on *path* and *id* that is usable in subsequent calls to  
 32086 `msgget()`, `semget()`, and `shmget()`. The application shall ensure that the *path* argument is the  
 32087 pathname of an existing file that the process is able to `stat()`.

32088 The `ftok()` function shall return the same key value for all paths that name the same file, when  
 32089 called with the same *id* value, and return different key values when called with different *id*  
 32090 values or with paths that name different files existing on the same file system at the same time. It  
 32091 is unspecified whether `ftok()` shall return the same key value when called again after the file  
 32092 named by *path* is removed and recreated with the same name.

32093 Only the low-order 8-bits of *id* are significant. The behavior of `ftok()` is unspecified if these bits  
 32094 are 0.

32095 **RETURN VALUE**

32096 Upon successful completion, `ftok()` shall return a key. Otherwise, `ftok()` shall return `(key_t)-1`  
 32097 and set `errno` to indicate the error.

32098 **ERRORS**

32099 The `ftok()` function shall fail if:

- 32100 [EACCES] Search permission is denied for a component of the path prefix.
- 32101 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 32102 argument.
- 32103 [ENAMETOOLONG]  
 32104 The length of a component of a pathname is longer than {NAME\_MAX}.
- 32105 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 32106 [ENOTDIR] A component of the path prefix is not a directory, or the *path* argument  
 32107 contains at least one non-`<slash>` character and ends with one or more trailing  
 32108 `<slash>` characters and the last pathname component names an existing file  
 32109 that is neither a directory nor a symbolic link to a directory.

32110 The `ftok()` function may fail if:

- 32111 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 32112 resolution of the *path* argument.
- 32113 [ENAMETOOLONG]  
 32114 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 32115 symbolic link produced an intermediate result with a length that exceeds  
 32116 {PATH\_MAX}.

32117 **EXAMPLES**32118 **Getting an IPC Key**

32119 The following example gets a unique key that can be used by the IPC functions *semget()*,  
 32120 *msgget()*, and *shmget()*. The key returned by *ftok()* for this example is based on the ID value *S*  
 32121 and the pathname */tmp*.

```
32122 #include <sys/ipc.h>
32123 ...
32124 key_t key;
32125 char *path = "/tmp";
32126 int id = 'S';
32127 key = ftok(path, id);
```

32128 **Saving an IPC Key**

32129 The following example gets a unique key based on the pathname */tmp* and the ID value *a*. It  
 32130 also assigns the value of the resulting key to the *semkey* variable so that it will be available to a  
 32131 later call to *semget()*, *msgget()*, or *shmget()*.

```
32132 #include <sys/ipc.h>
32133 ...
32134 key_t semkey;
32135 if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
32136     perror("IPC error: ftok"); exit(1);
32137 }
```

32138 **APPLICATION USAGE**

32139 For maximum portability, *id* should be a single-byte character.

32140 **RATIONALE**

32141 None.

32142 **FUTURE DIRECTIONS**

32143 None.

32144 **SEE ALSO**

32146 XBD *<sys/ipc.h>*

32147 **CHANGE HISTORY**

32148 First released in Issue 4, Version 2.

32149 **Issue 5**

32150 Moved from X/OPEN UNIX extension to BASE.

32151 **Issue 6**

32152 The normative text is updated to avoid use of the term “must” for application requirements.

32153 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
 32154 [ELOOP] error condition is added.

**ftok()**

32155 **Issue 7**

32156 Austin Group Interpretation 1003.1-2001 #143 is applied.

32157 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
32158 pathname exists but is not a directory or a symbolic link to a directory.

32159 **NAME**

32160 ftruncate — truncate a file to a specified length

32161 **SYNOPSIS**

32162 #include &lt;unistd.h&gt;

32163 int ftruncate(int *filde*s, off\_t *length*);32164 **DESCRIPTION**32165 If *filde*s is not a valid file descriptor open for writing, the *ftruncate*(*)* function shall fail.

32166 If *filde*s refers to a regular file, the *ftruncate*(*)* function shall cause the size of the file to be truncated to *length*. If the size of the file previously exceeded *length*, the extra data shall no longer be available to reads on the file. If the file previously was smaller than this size, *ftruncate*(*)* shall increase the size of the file. If the file size is increased, the extended area shall appear as if it were zero-filled. The value of the seek pointer shall not be modified by a call to *ftruncate*(*)*.

32172 Upon successful completion, if *filde*s refers to a regular file, *ftruncate*(*)* shall mark for update the last data modification and last file status change timestamps of the file and the S\_ISUID and S\_ISGID bits of the file mode may be cleared. If the *ftruncate*(*)* function is unsuccessful, the file is unaffected.

32176 XSI If the request would cause the file size to exceed the soft file size limit for the process, the request shall fail and the implementation shall generate the SIGXFSZ signal for the thread.

32178 If *filde*s refers to a directory, *ftruncate*(*)* shall fail.32179 If *filde*s refers to any other file type, except a shared memory object, the result is unspecified.

32180 SHM If *filde*s refers to a shared memory object, *ftruncate*(*)* shall set the size of the shared memory object to *length*.

32182 SHM If the effect of *ftruncate*(*)* is to decrease the size of a memory mapped file or a shared memory object and whole pages beyond the new end were previously mapped, then the whole pages beyond the new end shall be discarded.

32185 References to discarded pages shall result in the generation of a SIGBUS signal.

32186 If the effect of *ftruncate*(*)* is to increase the size of a memory object, it is unspecified whether the contents of any mapped pages between the old end-of-file and the new are flushed to the underlying object.

32189 **RETURN VALUE**

32190 Upon successful completion, *ftruncate*(*)* shall return 0; otherwise, -1 shall be returned and *errno* set to indicate the error.

32192 **ERRORS**32193 The *ftruncate*(*)* function shall fail if:

32194 [EINTR] A signal was caught during execution.

32195 [EINVAL] The *length* argument was less than 0.

32196 [EFBIG] or [EINVAL]

32197 The *length* argument was greater than the maximum file size.

32198 [EFBIG] The file is a regular file and *length* is greater than the offset maximum established in the open file description associated with *filde*s.

32199

**ftruncate()**

32200 [EIO] An I/O error occurred while reading from or writing to a file system.

32201 [EBADF] or [EINVAL]

32202 The *files* argument is not a file descriptor open for writing.

32203 **EXAMPLES**

32204 None.

32205 **APPLICATION USAGE**

32206 None.

32207 **RATIONALE**

32208 None.

32209 **FUTURE DIRECTIONS**

32210 None.

32211 **SEE ALSO**

32212 *open()*, *truncate()*

32213 XBD <*unistd.h*>

32214 **CHANGE HISTORY**

32215 First released in Issue 4, Version 2.

32216 **Issue 5**

32217 Moved from X/OPEN UNIX extension to BASE and aligned with *ftruncate()* in the POSIX  
32218 Realtime Extension. Specifically, the DESCRIPTION is extensively reworded and [EROFS] is  
32219 added to the list of mandatory errors that can be returned by *ftruncate()*.

32220 Large File Summit extensions are added.

32221 **Issue 6**

32222 The *truncate()* function is split out into a separate reference page.

32223 The following new requirements on POSIX implementations derive from alignment with the  
32224 Single UNIX Specification:

- 32225 • The DESCRIPTION is changed to indicate that if the file size is changed, and if the file is a  
32226 regular file, the S\_ISUID and S\_ISGID bits in the file mode may be cleared.

32227 The following changes were made to align with the IEEE P1003.1a draft standard:

- 32228 • The DESCRIPTION text is updated.

32229 XSI-conformant systems are required to increase the size of the file if the file was previously  
32230 smaller than the size requested.

32231 **Issue 7**

32232 Austin Group Interpretation 1003.1-2001 #056 is applied, revising the ERRORS section (although  
32233 the [EINVAL] “may fail” error was subsequently removed during review of the XSI option).

32234 Functionality relating to the Memory Protection and Memory Mapped Files options is moved to  
32235 the Base.

32236 The DESCRIPTION is updated so that a call to *ftruncate()* when the file is smaller than the size  
32237 requested will increase the size of the file. Previously, non-XSI-conforming implementations  
32238 were allowed to increase the size of the file or fail.

32239 Changes are made related to support for finegrained timestamps.

32240 **NAME**

32241 ftrylockfile — stdio locking functions

32242 **SYNOPSIS**

```
32243 CX #include <stdio.h>  
32244 int ftrylockfile(FILE *file);
```

32245 **DESCRIPTION**32246 Refer to *flockfile()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**ftw()**32247 **NAME**32248 **ftw** — traverse (walk) a file tree32249 **SYNOPSIS**

```
32250 OB XSI #include <ftw.h>
32251 int ftw(const char *path, int (*fn)(const char *,
32252     const struct stat *ptr, int flag), int ndirs);
```

32253 **DESCRIPTION**

32254 The *ftw()* function shall recursively descend the directory hierarchy rooted in *path*. For each  
 32255 object in the hierarchy, *ftw()* shall call the function pointed to by *fn*, passing it a pointer to a null-  
 32256 terminated character string containing the name of the object, a pointer to a **stat** structure  
 32257 containing information about the object, filled in as if *stat()* or *lstat()* had been called to retrieve  
 32258 the information. Possible values of the integer, defined in the **<ftw.h>** header, are:

32259 **FTW\_D** For a directory.32260 **FTW\_DNR** For a directory that cannot be read.32261 **FTW\_F** For a file.32262 **FTW\_SL** For a symbolic link (but see also **FTW\_NS** below).

32263 **FTW\_NS** For an object other than a symbolic link on which *stat()* could not successfully be  
 32264 executed. If the object is a symbolic link and *stat()* failed, it is unspecified whether  
 32265 *ftw()* passes **FTW\_SL** or **FTW\_NS** to the user-supplied function.

32266 If the integer is **FTW\_DNR**, descendants of that directory shall not be processed. If the integer is  
 32267 **FTW\_NS**, the **stat** structure contains undefined values. An example of an object that would  
 32268 cause **FTW\_NS** to be passed to the function pointed to by *fn* would be a file in a directory with  
 32269 read but without execute (search) permission.

32270 The *ftw()* function shall visit a directory before visiting any of its descendants.32271 The *ftw()* function shall use at most one file descriptor for each level in the tree.32272 The argument *ndirs* should be in the range [1, {**OPEN\_MAX**}].

32273 The tree traversal shall continue until either the tree is exhausted, an invocation of *fn* returns a  
 32274 non-zero value, or some error, other than [**EACCES**], is detected within *ftw()*.

32275 The *ndirs* argument shall specify the maximum number of directory streams or file descriptors  
 32276 or both available for use by *ftw()* while traversing the tree. When *ftw()* returns it shall close any  
 32277 directory streams and file descriptors it uses not counting any opened by the application-  
 32278 supplied *fn* function.

32279 The results are unspecified if the application-supplied *fn* function does not preserve the current  
 32280 working directory.

32281 The *ftw()* function need not be thread-safe.32282 **RETURN VALUE**

32283 If the tree is exhausted, *ftw()* shall return 0. If the function pointed to by *fn* returns a non-zero  
 32284 value, *ftw()* shall stop its tree traversal and return whatever value was returned by the function  
 32285 pointed to by *fn*. If *ftw()* detects an error, it shall return **-1** and set *errno* to indicate the error.

32286 If *ftw()* encounters an error other than [**EACCES**] (see **FTW\_DNR** and **FTW\_NS** above), it shall  
 32287 return **-1** and set *errno* to indicate the error. The external variable *errno* may contain any error  
 32288 value that is possible when a directory is opened or when one of the *stat* functions is executed on

32289 a directory or file.

### 32290 ERRORS

32291 The *ftw()* function shall fail if:

32292 [EACCES] Search permission is denied for any component of *path* or read permission is  
32293 denied for *path*.

32294 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
32295 argument.

32296 [ENAMETOOLONG]

32297 The length of a component of a pathname is longer than {NAME\_MAX}.

32298 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

32299 [ENOTDIR] A component of *path* is not a directory.

32300 [EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current  
32301 programming environment for one or more files found in the file hierarchy.

32302 The *ftw()* function may fail if:

32303 [EINVAL] The value of the *ndirs* argument is invalid.

32304 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
32305 resolution of the *path* argument.

32306 [ENAMETOOLONG]

32307 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
32308 symbolic link produced an intermediate result with a length that exceeds  
32309 {PATH\_MAX}.

32310 In addition, if the function pointed to by *fn* encounters system errors, *errno* may be set  
32311 accordingly.

### 32312 EXAMPLES

#### 32313 Walking a Directory Structure

32314 The following example walks the current directory structure, calling the *fn* function for every  
32315 directory entry, using at most 10 file descriptors:

```
32316 #include <ftw.h>
32317 ...
32318 if (ftw(".", fn, 10) != 0) {
32319     perror("ftw"); exit(2);
32320 }
```

### 32321 APPLICATION USAGE

32322 The *ftw()* function may allocate dynamic storage during its operation. If *ftw()* is forcibly  
32323 terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *fn*  
32324 or an interrupt routine, *ftw()* does not have a chance to free that storage, so it remains  
32325 permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has  
32326 occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next  
32327 invocation.

32328 Applications should use the *nftw()* function instead of the obsolescent *ftw()* function.

**ftw()**32329 **RATIONALE**

32330 None.

32331 **FUTURE DIRECTIONS**32332 The *ftw()* function may be removed in a future version.32333 **SEE ALSO**32334 *fdopendir()*, *fstatat()*, *longjmp()*, *nftw()*, *siglongjmp()*32335 XBD <*ftw.h*>, <*sys/stat.h*>32336 **CHANGE HISTORY**

32337 First released in Issue 1. Derived from Issue 1 of the SVID.

32338 **Issue 5**

32339 UX codings in the DESCRIPTION, RETURN VALUE, and ERRORS sections are changed to EX.

32340 **Issue 6**

32341 The ERRORS section is updated as follows:

- 32342 • The wording of the mandatory [ELOOP] error condition is updated.
- 32343 • A second optional [ELOOP] error condition is added.
- 32344 • The [EOVERFLOW] mandatory error condition is added.

32345 A note is added to the DESCRIPTION indicating that this function need not be reentrant, and  
 32346 that the results are unspecified if the application-supplied *fn* function does not preserve the  
 32347 current working directory.

32348 **Issue 7**

32349 Austin Group Interpretations 1003.1-2001 #143 and #156 are applied.

32350 SD5-XBD-ERN-61 is applied.

32351 The *ftw()* function is marked obsolescent.

32352 **NAME**

32353 funlockfile — stdio locking functions

32354 **SYNOPSIS**

```
32355 CX #include <stdio.h>  
32356 void funlockfile(FILE *file);
```

32357 **DESCRIPTION**32358 Refer to *flockfile()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**futimens()**32359 **NAME**

32360 futimens, utimensat, utimes — set file access and modification times

32361 **SYNOPSIS**

32362 #include &lt;sys/stat.h&gt;

32363 int futimens(int *fd*, const struct timespec *times*[2]);32364 int utimensat(int *fd*, const char \**path*, const struct timespec *times*[2],32365 int *flag*);

32366 XSI #include &lt;sys/time.h&gt;

32367 int utimes(const char \**path*, const struct timeval *times*[2]);32368 **DESCRIPTION**

32369 The *futimens()* and *utimensat()* functions shall set the access and modification times of a file to  
 32370 the values of the *times* argument. The *futimens()* function changes the times of the file associated  
 32371 with the file descriptor *fd*. The *utimensat()* function changes the times of the file pointed to by  
 32372 the *path* argument, relative to the directory associated with the file descriptor *fd*. Both functions  
 32373 allow time specifications accurate to the nanosecond.

32374 For *futimens()* and *utimensat()*, the *times* argument is an array of two **timespec** structures. The  
 32375 first array member represents the date and time of last access, and the second member  
 32376 represents the date and time of last modification. The times in the **timespec** structure are  
 32377 measured in seconds and nanoseconds since the Epoch. The file's relevant timestamp shall be set  
 32378 to the greatest value supported by the file system that is not greater than the specified time.

32379 If the *tv\_nsec* field of a **timespec** structure has the special value **UTIME\_NOW**, the file's relevant  
 32380 timestamp shall be set to the greatest value supported by the file system that is not greater than  
 32381 the current time. If the *tv\_nsec* field has the special value **UTIME\_OMIT**, the file's relevant  
 32382 timestamp shall not be changed. In either case, the *tv\_sec* field shall be ignored.

32383 If the *times* argument is a null pointer, both the access and modification timestamps shall be set  
 32384 to the greatest value supported by the file system that is not greater than the current time. If  
 32385 *utimensat()* is passed a relative path in the *path* argument, the file to be used shall be relative to  
 32386 the directory associated with the file descriptor *fd* instead of the current working directory. If the  
 32387 file descriptor was opened without **O\_SEARCH**, the function shall check whether directory  
 32388 searches are permitted using the current permissions of the directory underlying the file  
 32389 descriptor. If the file descriptor was opened with **O\_SEARCH**, the function shall not perform the  
 32390 check.

32391 If *utimensat()* is passed the special value **AT\_FDCWD** in the *fd* parameter, the current working  
 32392 directory shall be used.

32393 Only a process with the effective user ID equal to the user ID of the file, or with write access to  
 32394 the file, or with appropriate privileges may use *futimens()* or *utimensat()* with a null pointer as  
 32395 the *times* argument or with both *tv\_nsec* fields set to the special value **UTIME\_NOW**. Only a  
 32396 process with the effective user ID equal to the user ID of the file or with appropriate privileges  
 32397 may use *futimens()* or *utimensat()* with a non-null *times* argument that does not have both  
 32398 *tv\_nsec* fields set to **UTIME\_NOW** and does not have both *tv\_nsec* fields set to **UTIME\_OMIT**. If  
 32399 both *tv\_nsec* fields are set to **UTIME\_OMIT**, no ownership or permissions check shall be  
 32400 performed for the file, but other error conditions may still be detected (including **[EACCESS]**  
 32401 errors related to the path prefix).

32402 Values for the *flag* argument of *utimensat()* are constructed by a bitwise-inclusive OR of flags  
 32403 from the following list, defined in **<fcntl.h>**:

- 32404 AT\_SYMLINK\_NOFOLLOW  
 32405 If *path* names a symbolic link, then the access and modification times of the symbolic link  
 32406 are changed.
- 32407 Upon completion, *futimens()* and *utimensat()* shall mark the last file status change timestamp for  
 32408 update.
- 32409 The *utimes()* function shall be equivalent to the *utimensat()* function with the special value  
 32410 AT\_FDCWD as the *fd* argument and the *flag* argument set to zero, except that the *times* argument  
 32411 is a **timeval** structure rather than a **timespec** structure, and accuracy is only to the microsecond,  
 32412 not nanosecond, and rounding towards the nearest second may occur.
- 32413 **RETURN VALUE**
- 32414 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 32415 return -1 and set *errno* to indicate the error. If -1 is returned, the file times shall not be affected.
- 32416 **ERRORS**
- 32417 These functions shall fail if:
- 32418 [EACCES] The *times* argument is a null pointer, or both *tv\_nsec* values are UTIME\_NOW,  
 32419 and the effective user ID of the process does not match the owner of the file  
 32420 and write access is denied.
- 32421 [EINVAL] Either of the *times* argument structures specified a *tv\_nsec* value that was  
 32422 neither UTIME\_NOW nor UTIME\_OMIT, and was a value less than zero or  
 32423 greater than or equal to 1 000 million.
- 32424 [EINVAL] A new file timestamp would be a value whose *tv\_sec* component is not a value  
 32425 supported by the file system.
- 32426 [EPERM] The *times* argument is not a null pointer, does not have both *tv\_nsec* fields set  
 32427 to UTIME\_NOW, does not have both *tv\_nsec* fields set to UTIME\_OMIT, the  
 32428 calling process' effective user ID has write access to the file but does not match  
 32429 the owner of the file, and the calling process does not have appropriate  
 32430 privileges.
- 32431 [EROFS] The file system containing the file is read-only.
- 32432 The *futimens()* function shall fail if:
- 32433 [EBADF] The *fd* argument is not a valid file descriptor.
- 32434 The *utimensat()* function shall fail if:
- 32435 [EACCES] *fd* was not opened with O\_SEARCH and the permissions of the directory  
 32436 underlying *fd* do not permit directory searches.
- 32437 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
 32438 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.
- 32439 The *utimensat()* and *utimes()* functions shall fail if:
- 32440 [EACCES] Search permission is denied by a component of the path prefix.
- 32441 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 32442 argument.
- 32443 [ENAMETOOLONG]  
 32444 The length of a component of a pathname is longer than {NAME\_MAX}.

**futimens()**

System Interfaces

- 32445 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 32446 [ENOTDIR] A component of the path prefix is not a directory, or the *path* argument  
32447 contains at least one non-`<slash>` character and ends with one or more trailing  
32448 `<slash>` characters and the last pathname component names an existing file  
32449 that is neither a directory nor a symbolic link to a directory.
- 32450 The *utimensat()* and *utimes()* functions may fail if:
- 32451 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
32452 resolution of the *path* argument.
- 32453 [ENAMETOOLONG]  
32454 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
32455 symbolic link produced an intermediate result with a length that exceeds  
32456 {PATH\_MAX}.
- 32457 The *utimensat()* function may fail if:
- 32458 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT\_FDCWD nor a  
32459 file descriptor associated with a directory.

**EXAMPLES**

32460 None.

**APPLICATION USAGE**

32463 None.

**RATIONALE**

32465 The purpose of the *utimensat()* function is to set the access and modification time of files in  
32466 directories other than the current working directory without exposure to race conditions. Any  
32467 part of the path of a file could be changed in parallel to a call to *utimes()*, resulting in unspecified  
32468 behavior. By opening a file descriptor for the target directory and using the *utimensat()* function  
32469 it can be guaranteed that the changed file is located relative to the desired directory.

32470 The standard developers considered including a special case for the permissions required by  
32471 *utimensat()* when one *tv\_nsec* field is UTIME\_NOW and the other is UTIME\_OMIT. One  
32472 possibility would be to include this case in with the cases where *times* is a null pointer or both  
32473 fields are UTIME\_NOW, where the call is allowed if the process has write permission for the file.  
32474 However, associating write permission with an update to just the last data access timestamp  
32475 (which is normally updated by *read()*) did not seem appropriate. The other possibility would be  
32476 to specify that this one case is allowed if the process has read permission, but this was felt to be  
32477 too great a departure from the *utime()* and *utimes()* functions on which *utimensat()* is based. If  
32478 an application needs to set the last data access timestamp to the current time for a file on which  
32479 it has read permission but is not the owner, it can do so by opening the file, reading one or more  
32480 bytes (or reading a directory entry, if the file is a directory), and then closing it.

**FUTURE DIRECTIONS**

32482 None.

**SEE ALSO**32484 *read()*, *utime()*32485 XBD `<fcntl.h>`, `<sys/stat.h>`, `<sys/time.h>`

32486 **CHANGE HISTORY**

32487 First released in Issue 4, Version 2.

32488 **Issue 5**

32489 Moved from X/OPEN UNIX extension to BASE.

32490 **Issue 6**

32491 This function is marked LEGACY.

32492 The normative text is updated to avoid use of the term “must” for application requirements.

32493 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
32494 [ELOOP] error condition is added.32495 **Issue 7**

32496 Austin Group Interpretation 1003.1-2001 #143 is applied.

32497 The LEGACY marking is removed.

32498 The *utimensat()* function (renamed from *futimesat()*) is added from The Open Group Technical  
32499 Standard, 2006, Extended API Set Part 2, and changed to allow modifying a symbolic link by  
32500 adding a *flag* argument.32501 The *futimens()* function is added.

32502 Changes are made related to support for finegrained timestamps.

32503 Changes are made to allow a directory to be opened for searching.

32504 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
32505 pathname exists but is not a directory or a symbolic link to a directory.

**fwide()**32506 **NAME**32507 `fwide` — set stream orientation32508 **SYNOPSIS**32509 `#include <stdio.h>`32510 `#include <wchar.h>`32511 `int fwide(FILE *stream, int mode);`32512 **DESCRIPTION**32513 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
32514 conflict between the requirements described here and the ISO C standard is unintentional. This  
32515 volume of POSIX.1-2008 defers to the ISO C standard.32516 The `fwide()` function shall determine the orientation of the stream pointed to by `stream`. If `mode` is  
32517 greater than zero, the function first attempts to make the stream wide-oriented. If `mode` is less  
32518 than zero, the function first attempts to make the stream byte-oriented. Otherwise, `mode` is zero  
32519 and the function does not alter the orientation of the stream.32520 If the orientation of the stream has already been determined, `fwide()` shall not change it.32521 **CX** Since no return value is reserved to indicate an error, an application wishing to check for error  
32522 situations should set `errno` to 0, then call `fwide()`, then check `errno`, and if it is non-zero, assume  
32523 an error has occurred.32524 **RETURN VALUE**32525 The `fwide()` function shall return a value greater than zero if, after the call, the stream has wide-  
32526 orientation, a value less than zero if the stream has byte-orientation, or zero if the stream has no  
32527 orientation.32528 **ERRORS**32529 The `fwide()` function may fail if:32530 **CX** [EBADF] The `stream` argument is not a valid stream.32531 **EXAMPLES**

32532 None.

32533 **APPLICATION USAGE**32534 A call to `fwide()` with `mode` set to zero can be used to determine the current orientation of a  
32535 stream.32536 **RATIONALE**

32537 None.

32538 **FUTURE DIRECTIONS**

32539 None.

32540 **SEE ALSO**32541 XBD `<stdio.h>`, `<wchar.h>`32542 **CHANGE HISTORY**32543 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
32544 (E).32545 **Issue 6**

32546 Extensions beyond the ISO C standard are marked.

32547 **NAME**

32548 fwprintf, swprintf, wprintf — print formatted wide-character output

32549 **SYNOPSIS**

```

32550 #include <stdio.h>
32551 #include <wchar.h>

32552 int fwprintf(FILE *restrict stream, const wchar_t *restrict format, ...);
32553 int swprintf(wchar_t *restrict ws, size_t n,
32554             const wchar_t *restrict format, ...);
32555 int wprintf(const wchar_t *restrict format, ...);

```

32556 **DESCRIPTION**

32557 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 32558 conflict between the requirements described here and the ISO C standard is unintentional. This  
 32559 volume of POSIX.1-2008 defers to the ISO C standard.

32560 The *fwprintf()* function shall place output on the named output *stream*. The *wprintf()* function  
 32561 shall place output on the standard output stream *stdout*. The *swprintf()* function shall place  
 32562 output followed by the null wide character in consecutive wide characters starting at *\*ws*; no  
 32563 more than *n* wide characters shall be written, including a terminating null wide character, which  
 32564 is always added (unless *n* is zero).

32565 Each of these functions shall convert, format, and print its arguments under control of the *format*  
 32566 wide-character string. The *format* is composed of zero or more directives: *ordinary wide-characters*,  
 32567 which are simply copied to the output stream, and *conversion specifications*, each of which results  
 32568 in the fetching of zero or more arguments. The results are undefined if there are insufficient  
 32569 arguments for the *format*. If the *format* is exhausted while arguments remain, the excess  
 32570 arguments are evaluated but are otherwise ignored.

32571 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 32572 to the next unused argument. In this case, the conversion specifier wide character % (see below)  
 32573 is replaced by the sequence "%n\$", where *n* is a decimal integer in the range  
 32574 [1,{NL\_ARGMAX}], giving the position of the argument in the argument list. This feature  
 32575 provides for the definition of *format* wide-character strings that select arguments in an order  
 32576 appropriate to specific languages (see the EXAMPLES section).

32577 The *format* can contain either numbered argument specifications (that is, "%n\$" and "\*m\$"), or  
 32578 unnumbered argument conversion specifications (that is, % and \*), but not both. The only  
 32579 exception to this is that %% can be mixed with the "%n\$" form. The results of mixing numbered  
 32580 and unnumbered argument specifications in a *format* wide-character string are undefined. When  
 32581 numbered argument specifications are used, specifying the *N*th argument requires that all the  
 32582 leading arguments, from the first to the (*N*-1)th, are specified in the *format* wide-character string.

32583 In *format* wide-character strings containing the "%n\$" form of conversion specification,  
 32584 numbered arguments in the argument list can be referenced from the *format* wide-character  
 32585 string as many times as required.

32586 In *format* wide-character strings containing the % form of conversion specification, each  
 32587 argument in the argument list shall be used exactly once.

32588 CX All forms of the *fwprintf()* function allow for the insertion of a locale-dependent radix character  
 32589 in the output string, output as a wide-character value. The radix character is defined in the  
 32590 locale of the process (category *LC\_NUMERIC*). In the POSIX locale, or in a locale where the  
 32591 radix character is not defined, the radix character shall default to a <period> ('.').

## fwprintf()

- 32592 CX Each conversion specification is introduced by the ' % ' wide character or by the wide-character  
32593 sequence "%n\$", after which the following appear in sequence:
- 32594 • Zero or more *flags* (in any order), which modify the meaning of the conversion  
32595 specification.
  - 32596 • An optional minimum *field width*. If the converted value has fewer wide characters than  
32597 the field width, it shall be padded with <space> characters by default on the left; it shall be  
32598 padded on the right, if the left-adjustment flag (' - '), described below, is given to the field  
32599 width. The field width takes the form of an <asterisk> (' \* '), described below, or a decimal  
32600 integer.
  - 32601 • An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u,  
32602 x, and X conversion specifiers; the number of digits to appear after the radix character for  
32603 the a, A, e, E, f, and F conversion specifiers; the maximum number of significant digits for  
32604 the g and G conversion specifiers; or the maximum number of wide characters to be  
32605 printed from a string in the s conversion specifiers. The precision takes the form of a  
32606 <period> (' . ') followed either by an <asterisk> (' \* '), described below, or an optional  
32607 decimal digit string, where a null digit string is treated as 0. If a precision appears with any  
32608 other conversion wide character, the behavior is undefined.
  - 32609 • An optional length modifier that specifies the size of the argument.
  - 32610 • A *conversion specifier* wide character that indicates the type of conversion to be applied.
- 32611 A field width, or precision, or both, may be indicated by an <asterisk> (' \* '). In this case an  
32612 argument of type **int** supplies the field width or precision. Applications shall ensure that  
32613 arguments specifying field width, or precision, or both appear in that order before the argument,  
32614 if any, to be converted. A negative field width is taken as a ' - ' flag followed by a positive field  
32615 CX width. A negative precision is taken as if the precision were omitted. In *format* wide-character  
32616 strings containing the "%n\$" form of a conversion specification, a field width or precision may  
32617 be indicated by the sequence "\*m\$", where *m* is a decimal integer in the range  
32618 [1,{NL\_ARGMAX}] giving the position in the argument list (after the *format* argument) of an  
32619 integer argument containing the field width or precision, for example:
- ```
32620 wprintf(L"%1$d:%2$. *3$d:%4$. *3$d\n", hour, min, precision, sec);
```
- 32621 The flag wide characters and their meanings are:
- 32622 CX ' (The <apostrophe>.) The integer portion of the result of a decimal conversion (%i, %d,  
32623 %u, %f, %F, %g, or %G) shall be formatted with thousands' grouping wide characters. For  
32624 other conversions, the behavior is undefined. The numeric grouping wide character is  
32625 used.
  - 32626 - The result of the conversion shall be left-justified within the field. The conversion shall  
32627 be right-justified if this flag is not specified.
  - 32628 + The result of a signed conversion shall always begin with a sign (' + ' or ' - '). The  
32629 conversion shall begin with a sign only when a negative value is converted if this flag is  
32630 not specified.
  - 32631 <space> If the first wide character of a signed conversion is not a sign, or if a signed conversion  
32632 results in no wide characters, a <space> shall be prefixed to the result. This means that  
32633 if the <space> and ' + ' flags both appear, the <space> flag shall be ignored.
  - 32634 # Specifies that the value is to be converted to an alternative form. For o conversion, it  
32635 increases the precision (if necessary) to force the first digit of the result to be 0. For x or  
32636 X conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A, e,

32637		E, f, F, g, and G conversion specifiers, the result shall always contain a radix character, even if no digits follow it. Without this flag, a radix character appears in the result of these conversions only if a digit follows it. For g and G conversion specifiers, trailing zeros shall <i>not</i> be removed from the result as they normally are. For other conversion specifiers, the behavior is undefined.
32638		
32639		
32640		
32641		
32642	0	For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros (following any indication of sign or base) are used to pad to the field width rather than performing space padding, except when converting an infinity or NaN. If the '0' and '-' flags both appear, the '0' flag shall be ignored. For d, i, o, u, x, and X conversion specifiers, if a precision is specified, the '0' flag shall be ignored. If the '0' and <apostrophe> flags both appear, the grouping wide characters are inserted before zero padding. For other conversions, the behavior is undefined.
32643		
32644		
32645		
32646	CX	
32647		
32648		
32649		The length modifiers and their meanings are:
32650	hh	Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>signed char</b> or <b>unsigned char</b> argument (the argument will have been promoted according to the integer promotions, but its value shall be converted to <b>signed char</b> or <b>unsigned char</b> before printing); or that a following n conversion specifier applies to a pointer to a <b>signed char</b> argument.
32651		
32652		
32653		
32654		
32655	h	Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>short</b> or <b>unsigned short</b> argument (the argument will have been promoted according to the integer promotions, but its value shall be converted to <b>short</b> or <b>unsigned short</b> before printing); or that a following n conversion specifier applies to a pointer to a <b>short</b> argument.
32656		
32657		
32658		
32659		
32660	l (ell)	Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>long</b> or <b>unsigned long</b> argument; that a following n conversion specifier applies to a pointer to a <b>long</b> argument; that a following c conversion specifier applies to a <b>wint_t</b> argument; that a following s conversion specifier applies to a pointer to a <b>wchar_t</b> argument; or has no effect on a following a, A, e, E, f, F, g, or G conversion specifier.
32661		
32662		
32663		
32664		
32665	ll (ell-ell)	Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>long long</b> or <b>unsigned long long</b> argument; or that a following n conversion specifier applies to a pointer to a <b>long long</b> argument.
32666		
32667		
32668		
32669	j	Specifies that a following d, i, o, u, x, or X conversion specifier applies to an <b>intmax_t</b> or <b>uintmax_t</b> argument; or that a following n conversion specifier applies to a pointer to an <b>intmax_t</b> argument.
32670		
32671		
32672	z	Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>size_t</b> or the corresponding signed integer type argument; or that a following n conversion specifier applies to a pointer to a signed integer type corresponding to a <b>size_t</b> argument.
32673		
32674		
32675	t	Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>ptrdiff_t</b> or the corresponding <b>unsigned</b> type argument; or that a following n conversion specifier applies to a pointer to a <b>ptrdiff_t</b> argument.
32676		
32677		
32678	L	Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a <b>long double</b> argument.
32679		

## fwprintf()

32680		If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.
32681		
32682		The conversion specifiers and their meanings are:
32683	d, i	The <b>int</b> argument shall be converted to a signed decimal in the style "[ - ] dddd". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.
32684		
32685		
32686		
32687		
32688	o	The <b>unsigned</b> argument shall be converted to unsigned octal format in the style " dddd". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.
32689		
32690		
32691		
32692		
32693	u	The <b>unsigned</b> argument shall be converted to unsigned decimal format in the style " dddd". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.
32694		
32695		
32696		
32697		
32698	x	The <b>unsigned</b> argument shall be converted to unsigned hexadecimal format in the style " dddd"; the letters "abcdef" are used. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.
32699		
32700		
32701		
32702		
32703	X	Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead of "abcdef".
32704		
32705	f, F	The <b>double</b> argument shall be converted to decimal notation in the style "[ - ] ddd.ddd", where the number of digits after the radix character shall be equal to the precision specification. If the precision is missing, it shall be taken as 6; if the precision is explicitly zero and no '#' flag is present, no radix character shall appear. If a radix character appears, at least one digit shall appear before it. The value shall be rounded in an implementation-defined manner to the appropriate number of digits.
32706		
32707		
32708		
32709		
32710		
32711		A <b>double</b> argument representing an infinity shall be converted in one of the styles "[ - ] inf" or "[ - ] infinity"; which style is implementation-defined. A <b>double</b> argument representing a NaN shall be converted in one of the styles "[ - ] nan" or "[ - ] nan ( n-char-sequence )"; which style, and the meaning of any n-char-sequence, is implementation-defined. The F conversion specifier produces "INF", "INFINITY", or "NAN" instead of "inf", "infinity", or "nan", respectively.
32712		
32713		
32714		
32715		
32716		
32717	e, E	The <b>double</b> argument shall be converted in the style "[ - ] d. dde±dd", where there shall be one digit before the radix character (which is non-zero if the argument is non-zero) and the number of digits after it shall be equal to the precision; if the precision is missing, it shall be taken as 6; if the precision is zero and no '#' flag is present, no radix character shall appear. The value shall be rounded in an implementation-defined manner to the appropriate number of digits. The E conversion wide character shall produce a number with 'E' instead of 'e' introducing the exponent. The exponent shall always contain at least two digits. If the value is zero, the exponent shall be zero.
32718		
32719		
32720		
32721		
32722		
32723		
32724		
32725		A <b>double</b> argument representing an infinity or NaN shall be converted in the style of an f or F conversion specifier.
32726		

32727 32728 32729 32730 32731	g, G	The <b>double</b> argument representing a floating-point number shall be converted in the style <code>f</code> or <code>e</code> (or in the style <code>F</code> or <code>E</code> in the case of a <code>G</code> conversion specifier), depending on the value converted and the precision. Let <code>P</code> equal the precision if non-zero, 6 if the precision is omitted, or 1 if the precision is zero. Then, if a conversion with style <code>E</code> would have an exponent of <code>X</code> :
32732		— If $P > X \geq -4$ , the conversion shall be with style <code>f</code> (or <code>F</code> ) and precision $P - (X + 1)$ .
32733		— Otherwise, the conversion shall be with style <code>e</code> (or <code>E</code> ) and precision $P - 1$ .
32734 32735 32736		Finally, unless the <code>'#'</code> flag is used, any trailing zeros shall be removed from the fractional portion of the result and the decimal-point character shall be removed if there is no fractional portion remaining.
32737 32738		A <b>double</b> argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
32739 32740 32741 32742 32743 32744 32745 32746 32747 32748 32749 32750 32751 32752	a, A	A <b>double</b> argument representing a floating-point number shall be converted in the style <code>"[-]0xh.hhhhp±d"</code> , where there shall be one hexadecimal digit (which is non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point wide character and the number of hexadecimal digits after it shall be equal to the precision; if the precision is missing and <code>FLT_RADIX</code> is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and <code>FLT_RADIX</code> is not a power of 2, then the precision shall be sufficient to distinguish values of type <b>double</b> , except that trailing zeros may be omitted; if the precision is zero and the <code>'#'</code> flag is not specified, no decimal-point wide character shall appear. The letters <code>"abcdef"</code> are used for a conversion and the letters <code>"ABCDEF"</code> for A conversion. The A conversion specifier produces a number with <code>'X'</code> and <code>'P'</code> instead of <code>'x'</code> and <code>'p'</code> . The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero.
32753 32754		A <b>double</b> argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
32755 32756 32757	c	If no <code>l</code> (ell) qualifier is present, the <b>int</b> argument shall be converted to a wide character as if by calling the <code>btowc()</code> function and the resulting wide character shall be written. Otherwise, the <b>wint_t</b> argument shall be converted to <b>wchar_t</b> , and written.
32758 32759 32760 32761 32762 32763 32764 32765 32766	s	If no <code>l</code> (ell) qualifier is present, the application shall ensure that the argument is a pointer to a character array containing a character sequence beginning in the initial shift state. Characters from the array shall be converted as if by repeated calls to the <code>mbtowc()</code> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first character is converted, and written up to (but not including) the terminating null wide character. If the precision is specified, no more than that many wide characters shall be written. If the precision is not specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character.
32767 32768 32769 32770 32771 32772		If an <code>l</code> (ell) qualifier is present, the application shall ensure that the argument is a pointer to an array of type <b>wchar_t</b> . Wide characters from the array shall be written up to (but not including) a terminating null wide character. If no precision is specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many wide characters shall be written.

**fwprintf()**

32773	p	The application shall ensure that the argument is a pointer to <b>void</b> . The value of the pointer shall be converted to a sequence of printable wide characters in an implementation-defined manner.
32774		
32775		
32776	n	The application shall ensure that the argument is a pointer to an integer into which is written the number of wide characters written to the output so far by this call to one of the <i>fwprintf()</i> functions. No argument shall be converted, but one shall be consumed. If the conversion specification includes any flags, a field width, or a precision, the behavior is undefined.
32777		
32778		
32779		
32780		
32781	XSI	<b>C</b> Equivalent to <code>lc</code> .
32782	XSI	<b>S</b> Equivalent to <code>ls</code> .
32783	%	Output a <code>' %'</code> wide character; no argument shall be converted. The entire conversion specification shall be <code>%%</code> .
32784		
32785		If a conversion specification does not match one of the above forms, the behavior is undefined.
32786		In no case does a nonexistent or small field width cause truncation of a field; if the result of a conversion is wider than the field width, the field shall be expanded to contain the conversion result. Characters generated by <i>fwprintf()</i> and <i>wprintf()</i> shall be printed as if <i>fputwc()</i> had been called.
32787		
32788		
32789		
32790		For <i>a</i> and <i>A</i> conversions, if <code>FLT_RADIX</code> is not a power of 2 and the result is not exactly representable in the given precision, the result should be one of the two adjacent numbers in hexadecimal floating style with the given precision, with the extra stipulation that the error should have a correct sign for the current rounding direction.
32791		
32792		
32793		
32794		For <i>e</i> , <i>E</i> , <i>f</i> , <i>F</i> , <i>g</i> , and <i>G</i> conversion specifiers, if the number of significant decimal digits is at most <code>DECIMAL_DIG</code> , then the result should be correctly rounded. If the number of significant decimal digits is more than <code>DECIMAL_DIG</code> but the source value is exactly representable with <code>DECIMAL_DIG</code> digits, then the result should be an exact representation with trailing zeros. Otherwise, the source value is bounded by two adjacent decimal strings $L < U$ , both having <code>DECIMAL_DIG</code> significant digits; the value of the resultant decimal string <i>D</i> should satisfy $L \leq D \leq U$ , with the extra stipulation that the error should have a correct sign for the current rounding direction.
32795		
32796		
32797		
32798		
32799		
32800		
32801		
32802	CX	The last data modification and last file status change timestamps of the file shall be marked for update between the call to a successful execution of <i>fwprintf()</i> or <i>wprintf()</i> and the next successful completion of a call to <i>fflush()</i> or <i>fclose()</i> on the same stream, or a call to <i>exit()</i> or <i>abort()</i> .
32803		
32804		
32805		
32806		<b>RETURN VALUE</b>
32807		Upon successful completion, these functions shall return the number of wide characters transmitted, excluding the terminating null wide character in the case of <i>swprintf()</i> , or a negative
32808		value if an output error was encountered, and set <i>errno</i> to indicate the error.
32809	CX	
32810		If <i>n</i> or more wide characters were requested to be written, <i>swprintf()</i> shall return a negative
32811	CX	value, and set <i>errno</i> to indicate the error.
32812		<b>ERRORS</b>
32813		For the conditions under which <i>fwprintf()</i> and <i>wprintf()</i> fail and may fail, refer to <i>fputwc()</i> .
32814		In addition, all forms of <i>fwprintf()</i> shall fail if:
32815	CX	<b>[EILSEQ]</b> A wide-character code that does not correspond to a valid character has been
32816		detected.

32817 In addition, all forms of *fwprintf()* may fail if:

32818 CX [EINVAL] There are insufficient arguments.

32819 In addition, *fwprintf()* and *wprintf()* may fail if:

32820 CX [ENOMEM] Insufficient storage space is available.

32821 The *swprintf()* shall fail if:

32822 CX [EOVERFLOW] The value of *n* is greater than {INT\_MAX} or the number of bytes needed to  
32823 hold the output excluding the terminating null is greater than {INT\_MAX}.

#### 32824 EXAMPLES

32825 To print the language-independent date and time format, the following statement could be used:

```
32826 wprintf(format, weekday, month, day, hour, min);
```

32827 For American usage, *format* could be a pointer to the wide-character string:

```
32828 L"%s, %s %d, %d:%.2d\n"
```

32829 producing the message:

```
32830 Sunday, July 3, 10:02
```

32831 whereas for German usage, *format* could be a pointer to the wide-character string:

```
32832 L"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"
```

32833 producing the message:

```
32834 Sonntag, 3. Juli, 10:02
```

#### 32835 APPLICATION USAGE

32836 None.

#### 32837 RATIONALE

32838 None.

#### 32839 FUTURE DIRECTIONS

32840 None.

#### 32844 CHANGE HISTORY

32845 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
32846 (E).

#### 32847 Issue 6

32848 The Open Group Corrigendum U040/1 is applied to the RETURN VALUE section, describing  
32849 the case if *n* or more wide characters are requested to be written using *swprintf()*.

32850 The normative text is updated to avoid use of the term “must” for application requirements.

32851 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 32852 • The prototypes for *fwprintf()*, *swprintf()*, and *wprintf()* are updated.
- 32853 • The DESCRIPTION is updated.

**fwprintf()**

- 32854           • The `hh`, `ll`, `j`, `t`, and `z` length modifiers are added.
- 32855           • The `a`, `A`, and `F` conversion characters are added.
- 32856           • XSI shading is removed from the description of character string representations of infinity and NaN floating-point values.
- 32857
- 32858           The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” consistently.
- 32859
- 32860           ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.
- 32861   **Issue 7**
- 32862           Austin Group Interpretation 1003.1-2001 #161 is applied, updating the DESCRIPTION of the `0` flag.
- 32863
- 32864           Austin Group Interpretation 1003.1-2001 #170 is applied.
- 32865           ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #68 (SD5-XSH-ERN-70) is applied, revising the description of `g` and `G`.
- 32866
- 32867           Functionality relating to the “`%n$`” form of conversion specification and the `<apostrophe>` flag is moved from the XSI option to the Base.
- 32868
- 32869           The [Eoverflow] error is added for `swprintf()`.
- 32870           Changes are made related to support for finegrained timestamps.

32871 **NAME**

32872 fwrite — binary output

32873 **SYNOPSIS**

32874 #include &lt;stdio.h&gt;

32875 size\_t fwrite(const void \*restrict ptr, size\_t size, size\_t nitems,  
32876 FILE \*restrict stream);32877 **DESCRIPTION**32878 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
32879 conflict between the requirements described here and the ISO C standard is unintentional. This  
32880 volume of POSIX.1-2008 defers to the ISO C standard.32881 The *fwrite()* function shall write, from the array pointed to by *ptr*, up to *nitems* elements whose  
32882 size is specified by *size*, to the stream pointed to by *stream*. For each object, *size* calls shall be  
32883 made to the *fputc()* function, taking the values (in order) from an array of **unsigned char** exactly  
32884 overlaying the object. The file-position indicator for the stream (if defined) shall be advanced by  
32885 the number of bytes successfully written. If an error occurs, the resulting value of the file-  
32886 position indicator for the stream is unspecified.32887 CX The last data modification and last file status change timestamps of the file shall be marked for  
32888 update between the successful execution of *fwrite()* and the next successful completion of a call  
32889 to *fflush()* or *fclose()* on the same stream, or a call to *exit()* or *abort()*.32890 **RETURN VALUE**32891 The *fwrite()* function shall return the number of elements successfully written, which may be  
32892 less than *nitems* if a write error is encountered. If *size* or *nitems* is 0, *fwrite()* shall return 0 and the  
32893 state of the stream remains unchanged. Otherwise, if a write error occurs, the error indicator for  
32894 CX the stream shall be set, and *errno* shall be set to indicate the error.32895 **ERRORS**32896 Refer to *fputc()*.32897 **EXAMPLES**

32898 None.

32899 **APPLICATION USAGE**32900 Because of possible differences in element length and byte ordering, files written using *fwrite()*  
32901 are application-dependent, and possibly cannot be read using *fread()* by a different application  
32902 or by the same application on a different processor.32903 **RATIONALE**

32904 None.

32905 **FUTURE DIRECTIONS**

32906 None.

32907 **SEE ALSO**32908 *ferror()*, *fopen()*, *fprintf()*, *putc()*, *puts()*, *write()*

32909 XBD &lt;stdio.h&gt;

32910 **CHANGE HISTORY**

32911 First released in Issue 1. Derived from Issue 1 of the SVID.

**fwrite()**32912 **Issue 6**

32913 Extensions beyond the ISO C standard are marked.

32914 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 32915 • The *fwrite()* prototype is updated.
- 32916 • The DESCRIPTION is updated to clarify how the data is written out using *fputc()*.

32917 **Issue 7**

32918 Changes are made related to support for finegrained timestamps.

32919 **NAME**

32920 fwscanf, swscanf, wscanf — convert formatted wide-character input

32921 **SYNOPSIS**

32922 #include &lt;stdio.h&gt;

32923 #include &lt;wchar.h&gt;

32924 int fwscanf(FILE \*restrict stream, const wchar\_t \*restrict format, ...);

32925 int swscanf(const wchar\_t \*restrict ws,

32926 const wchar\_t \*restrict format, ...);

32927 int wscanf(const wchar\_t \*restrict format, ...);

32928 **DESCRIPTION**

32929 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 32930 conflict between the requirements described here and the ISO C standard is unintentional. This  
 32931 volume of POSIX.1-2008 defers to the ISO C standard.

32932 The *fwscanf()* function shall read from the named input *stream*. The *wscanf()* function shall read  
 32933 from the standard input stream *stdin*. The *swscanf()* function shall read from the wide-character  
 32934 string *ws*. Each function reads wide characters, interprets them according to a format, and stores  
 32935 the results in its arguments. Each expects, as arguments, a control wide-character string *format*  
 32936 described below, and a set of *pointer* arguments indicating where the converted input should be  
 32937 stored. The result is undefined if there are insufficient arguments for the format. If the *format* is  
 32938 exhausted while arguments remain, the excess arguments are evaluated but are otherwise  
 32939 ignored.

32940 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 32941 to the next unused argument. In this case, the conversion specifier wide character % (see below)  
 32942 is replaced by the sequence "%n\$", where *n* is a decimal integer in the range  
 32943 [1,{NL\_ARGMAX}]. This feature provides for the definition of *format* wide-character strings that  
 32944 select arguments in an order appropriate to specific languages. In *format* wide-character strings  
 32945 containing the "%n\$" form of conversion specifications, it is unspecified whether numbered  
 32946 arguments in the argument list can be referenced from the *format* wide-character string more  
 32947 than once.

32948 The *format* can contain either form of a conversion specification—that is, % or "%n\$"—but the  
 32949 two forms cannot normally be mixed within a single *format* wide-character string. The only  
 32950 exception to this is that %% or %\* can be mixed with the "%n\$" form. When numbered argument  
 32951 specifications are used, specifying the *N*th argument requires that all the leading arguments,  
 32952 from the first to the (*N*−1)th, are pointers.

32953 The *fwscanf()* function in all its forms allows for detection of a language-dependent radix  
 32954 character in the input string, encoded as a wide-character value. The radix character is defined  
 32955 in the locale of the process (category *LC\_NUMERIC*). In the POSIX locale, or in a locale where  
 32956 the radix character is not defined, the radix character shall default to a <period> ('.').

32957 The *format* is a wide-character string composed of zero or more directives. Each directive is  
 32958 composed of one of the following: one or more white-space wide characters (<space>, <tab>,  
 32959 <newline>, <vertical-tab>, or <form-feed>); an ordinary wide character (neither '%' nor a  
 32960 white-space character); or a conversion specification.

32961 CX Each conversion specification is introduced by the '%' or by the character sequence "%n\$",  
 32962 after which the following appear in sequence:

- 32963 • An optional assignment-suppressing character '\*'.

**fwscanf()**

- 32964
- An optional non-zero decimal integer that specifies the maximum field width.
- 32965 CX
- An optional assignment-allocation character 'm'.
- 32966
- An optional length modifier that specifies the size of the receiving object.
- 32967
- A conversion specifier wide character that specifies the type of conversion to be applied.
- 32968
- The valid conversion specifiers are described below.
- 32969
- The *fwscanf()* functions shall execute each directive of the format in turn. If a directive fails, as detailed below, the function shall return. Failures are described as input failures (due to the unavailability of input bytes) or matching failures (due to inappropriate input).
- 32970
- 32971
- 32972
- A directive composed of one or more white-space wide characters is executed by reading input until no more valid input can be read, or up to the first wide character which is not a white-space wide character, which remains unread.
- 32973
- 32974
- 32975
- A directive that is an ordinary wide character shall be executed as follows. The next wide character is read from the input and compared with the wide character that comprises the directive; if the comparison shows that they are not equivalent, the directive shall fail, and the differing and subsequent wide characters remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a wide character from being read, the directive shall fail.
- 32976
- 32977
- 32978
- 32979
- 32980
- A directive that is a conversion specification defines a set of matching input sequences, as described below for each conversion wide character. A conversion specification is executed in the following steps.
- 32981
- 32982
- 32983
- Input white-space wide characters (as specified by *iswspace()*) shall be skipped, unless the conversion specification includes a *l*, *c*, or *n* conversion specifier.
- 32984
- 32985
- An item shall be read from the input unless the conversion specification includes an *n* conversion specifier wide character. An input item is defined as the longest sequence of input wide characters, not exceeding any specified field width, which is an initial subsequence of a matching sequence. The first wide character, if any, after the input item shall remain unread. If the length of the input item is zero, the execution of the conversion specification shall fail; this condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is an input failure.
- 32986
- 32987
- 32988
- 32989
- 32990
- 32991
- 32992
- Except in the case of a *%* conversion specifier, the input item (or, in the case of a *%n* conversion specification, the count of input wide characters) shall be converted to a type appropriate to the conversion wide character. If the input item is not a matching sequence, the execution of the conversion specification shall fail; this condition is a matching failure. Unless assignment suppression was indicated by a *'\*'*, the result of the conversion shall be placed in the object pointed to by the first argument following the *format* argument that has not already received a conversion result if the conversion specification is introduced by *%*, or in the *n*th argument if introduced by the wide-character sequence "*%n\$*". If this object does not have an appropriate type, or if the result of the conversion cannot be represented in the space provided, the behavior is undefined.
- 32993
- 32994
- 32995
- 32996
- 32997
- 32998 CX
- 32999
- 33000
- 33001
- 33002 CX
- 33003
- 33004
- 33005
- 33006
- 33007
- 33008
- 33009
- The *%c*, *%s*, and *%[* conversion specifiers shall accept an optional assignment-allocation character 'm', which shall cause a memory buffer to be allocated to hold the wide-character string converted including a terminating null wide character. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. The system shall allocate a buffer as if *malloc()* had been called. The application shall be responsible for freeing the memory after usage. If there is insufficient memory to allocate a buffer, the function shall set *errno* to [ENOMEM] and a conversion error shall result. If the function returns EOF, any memory successfully allocated for

33010 parameters using assignment-allocation character 'm' by this call shall be freed before the  
33011 function returns.

33012 The length modifiers and their meanings are:

33013 hh Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
33014 argument with type pointer to **signed char** or **unsigned char**.

33015 h Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
33016 argument with type pointer to **short** or **unsigned short**.

33017 l (ell) Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
33018 argument with type pointer to **long** or **unsigned long**; that a following a, A, e, E, f, F,  
33019 g, or G conversion specifier applies to an argument with type pointer to **double**; or that  
33020 a following c, s, or [ conversion specifier applies to an argument with type pointer to  
33021 **wchar\_t**. If the 'm' assignment-allocation character is specified, the conversion  
33022 applies to an argument with the type pointer to a pointer to **wchar\_t**.

33023 ll (ell-ell)

33024 Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
33025 argument with type pointer to **long long** or **unsigned long long**.

33026 j Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
33027 argument with type pointer to **intmax\_t** or **uintmax\_t**.

33028 z Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
33029 argument with type pointer to **size\_t** or the corresponding signed integer type.

33030 t Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an  
33031 argument with type pointer to **ptrdiff\_t** or the corresponding **unsigned** type.

33032 L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an  
33033 argument with type pointer to **long double**.

33034 If a length modifier appears with any conversion specifier other than as specified above, the  
33035 behavior is undefined.

33036 The following conversion specifier wide characters are valid:

33037 d Matches an optionally signed decimal integer, whose format is the same as expected for  
33038 the subject sequence of *wcstol()* with the value 10 for the *base* argument. In the absence  
33039 of a size modifier, the application shall ensure that the corresponding argument is a  
33040 pointer to **int**.

33041 i Matches an optionally signed integer, whose format is the same as expected for the  
33042 subject sequence of *wcstol()* with 0 for the *base* argument. In the absence of a size  
33043 modifier, the application shall ensure that the corresponding argument is a pointer to  
33044 **int**.

33045 o Matches an optionally signed octal integer, whose format is the same as expected for  
33046 the subject sequence of *wcstoul()* with the value 8 for the *base* argument. In the absence  
33047 of a size modifier, the application shall ensure that the corresponding argument is a  
33048 pointer to **unsigned**.

33049 u Matches an optionally signed decimal integer, whose format is the same as expected for  
33050 the subject sequence of *wcstoul()* with the value 10 for the *base* argument. In the absence  
33051 of a size modifier, the application shall ensure that the corresponding argument is a  
33052 pointer to **unsigned**.

**fwscanf()**

33053	x	Matches an optionally signed hexadecimal integer, whose format is the same as expected for the subject sequence of <i>wcstoul()</i> with the value 16 for the <i>base</i> argument.
33054		
33055		In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to <b>unsigned</b> .
33056		
33057	a, e, f, g	
33058		Matches an optionally signed floating-point number, infinity, or NaN whose format is the same as expected for the subject sequence of <i>wcstod()</i> . In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to <b>float</b> .
33059		
33060		
33061		
33062		If the <i>fwprintf()</i> family of functions generates character string representations for infinity and NaN (a symbolic entity encoded in floating-point format) to support IEEE Std 754-1985, the <i>fwscanf()</i> family of functions shall recognize them as input.
33063		
33064		
33065	s	Matches a sequence of non-white-space wide characters. If no <b>l</b> (ell) qualifier is present, characters from the input field shall be converted as if by repeated calls to the <i>wcrtomb()</i> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first wide character is converted. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to a character array large enough to accept the sequence and the terminating null character, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> .
33066		
33067		
33068		
33069		
33070		
33071	CX	
33072		
33073		
33074		If the <b>l</b> (ell) qualifier is present and the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of <b>wchar_t</b> large enough to accept the sequence and the terminating null wide character, which shall be added automatically. If the <b>l</b> (ell) qualifier is present and the 'm' assignment-allocation character is present, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> .
33075		
33076		
33077	CX	
33078		
33079		
33080	[	Matches a non-empty sequence of wide characters from a set of expected wide characters (the <i>scanset</i> ). If no <b>l</b> (ell) qualifier is present, wide characters from the input field shall be converted as if by repeated calls to the <i>wcrtomb()</i> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first wide character is converted. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to a character array large enough to accept the sequence and the terminating null character, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> .
33081		
33082		
33083		
33084		
33085		
33086		
33087	CX	
33088		
33089		If an <b>l</b> (ell) qualifier is present and the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of <b>wchar_t</b> large enough to accept the sequence and the terminating null wide character. If an <b>l</b> (ell) qualifier is present and the 'm' assignment-allocation character is specified, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> .
33090		
33091		
33092	CX	
33093		
33094		
33095		The conversion specification includes all subsequent wide characters in the <i>format</i> string up to and including the matching <right-square-bracket> (' <b>]</b> '). The wide characters between the square brackets (the <i>scanlist</i> ) comprise the <i>scanset</i> , unless the wide character after the <left-square-bracket> is a <circumflex> (' <b>^</b> '), in which case the <i>scanset</i> contains all wide characters that do not appear in the <i>scanlist</i> between the <circumflex> and the <right-square-bracket>. If the conversion specification begins
33096		
33097		
33098		
33099		
33100		

33101			with "[ ]" or "[^]", the <right-square-bracket> is included in the scanlist and the
33102			next <right-square-bracket> is the matching <right-square-bracket> that ends the
33103			conversion specification; otherwise, the first <right-square-bracket> is the one that ends
33104			the conversion specification. If a '-' is in the scanlist and is not the first wide character,
33105			nor the second where the first wide character is a '^', nor the last wide character, the
33106			behavior is implementation-defined.
33107	c		Matches a sequence of wide characters of exactly the number specified by the field
33108			width (1 if no field width is present in the conversion specification).
33109			If no l (ell) length modifier is present, characters from the input field shall be converted
33110			as if by repeated calls to the <i>wcrtomb()</i> function, with the conversion state described by
33111			an <b>mbstate_t</b> object initialized to zero before the first wide character is converted. No
33112			null character is added. If the 'm' assignment-allocation character is not specified, the
33113			application shall ensure that the corresponding argument is a pointer to the initial
33114	CX		element of a character array large enough to accept the sequence. Otherwise, the
33115			application shall ensure that the corresponding argument is a pointer to a pointer to a
33116			<b>char</b> .
33117			No null wide character is added. If an l (ell) length modifier is present and the 'm'
33118			assignment-allocation character is not specified, the application shall ensure that the
33119			corresponding argument shall be a pointer to the initial element of an array of <b>wchar_t</b>
33120	CX		large enough to accept the sequence. If an l (ell) qualifier is present and the 'm'
33121			assignment-allocation character is specified, the application shall ensure that the
33122			corresponding argument is a pointer to a pointer to a <b>wchar_t</b> .
33123	p		Matches an implementation-defined set of sequences, which shall be the same as the set
33124			of sequences that is produced by the %p conversion specification of the corresponding
33125			<i>fwprintf()</i> functions. The application shall ensure that the corresponding argument is a
33126			pointer to a pointer to <b>void</b> . The interpretation of the input item is implementation-
33127			defined. If the input item is a value converted earlier during the same program
33128			execution, the pointer that results shall compare equal to that value; otherwise, the
33129			behavior of the %p conversion is undefined.
33130	n		No input is consumed. The application shall ensure that the corresponding argument is
33131			a pointer to the integer into which is to be written the number of wide characters read
33132			from the input so far by this call to the <i>fwscanf()</i> functions. Execution of a %n
33133			conversion specification shall not increment the assignment count returned at the
33134			completion of execution of the function. No argument shall be converted, but one shall
33135			be consumed. If the conversion specification includes an assignment-suppressing wide
33136			character or a field width, the behavior is undefined.
33137	XSI	C	Equivalent to lc.
33138	XSI	S	Equivalent to ls.
33139		%	Matches a single '%' wide character; no conversion or assignment shall occur. The
33140			complete conversion specification shall be %%.
33141			If a conversion specification is invalid, the behavior is undefined.
33142			The conversion specifiers A, E, F, G, and X are also valid and shall be equivalent to, respectively,
33143			a, e, f, g, and x.
33144			If end-of-file is encountered during input, conversion is terminated. If end-of-file occurs before
33145			any wide characters matching the current conversion specification (except for %n) have been
33146			read (other than leading white-space, where permitted), execution of the current conversion

**fwscanf()**

33147 specification shall terminate with an input failure. Otherwise, unless execution of the current  
 33148 conversion specification is terminated with a matching failure, execution of the following  
 33149 conversion specification (if any) shall be terminated with an input failure.

33150 Reaching the end of the string in *swscanf()* shall be equivalent to encountering end-of-file for  
 33151 *fwscanf()*.

33152 If conversion terminates on a conflicting input, the offending input shall be left unread in the  
 33153 input. Any trailing white space (including <newline>) shall be left unread unless matched by a  
 33154 conversion specification. The success of literal matches and suppressed assignments is only  
 33155 directly determinable via the %n conversion specification.

33156 CX The *fwscanf()* and *wscanf()* functions may mark the last data access timestamp of the file  
 33157 associated with *stream* for update. The last data access timestamp shall be marked for update by  
 33158 the first successful execution of *fgetwc()*, *fgetws()*, *fwscanf()*, *getwc()*, *getwchar()*, *vfwscanf()*,  
 33159 *vwscanf()*, or *wscanf()* using *stream* that returns data not supplied by a prior call to *ungetwc()*.

**RETURN VALUE**

33160 Upon successful completion, these functions shall return the number of successfully matched  
 33161 and assigned input items; this number can be zero in the event of an early matching failure. If  
 33162 the input ends before the first matching failure or conversion, EOF shall be returned. If any  
 33163 error occurs, EOF shall be returned, and *errno* shall be set to indicate the error. If a read error  
 33164 CX occurs, the error indicator for the stream shall be set.  
 33165

**ERRORS**

33166 For the conditions under which the *fwscanf()* functions shall fail and may fail, refer to *fgetwc()*.

33167 In addition, the *fwscanf()* function shall fail if:

33168 CX [EILSEQ] Input byte sequence does not form a valid character.

33169 [ENOMEM] Insufficient storage space is available.

33170 In addition, the *fwscanf()* function may fail if:

33171 CX [EINVAL] There are insufficient arguments.

**EXAMPLES**

33172 The call:

```
33173 int i, n; float x; char name[50];
33174 n = wscanf(L"%d%f%s", &i, &x, name);
```

33175 with the input line:

```
33176 25 54.32E-1 Hamster
```

33177 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string  
 33178 "Hamster".

33179 The call:

```
33180 int i; float x; char name[50];
33181 (void) wscanf(L"%2d%f*d %[0123456789]", &i, &x, name);
```

33182 with input:

```
33183 56789 0123 56a72
```

33184 assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to  
 33185 *getchar()* shall return the character 'a'.

33188 **APPLICATION USAGE**

33189 In format strings containing the ' % ' form of conversion specifications, each argument in the  
33190 argument list is used exactly once.

33191 For functions that allocate memory as if by *malloc()*, the application should release such memory  
33192 when it is no longer required by a call to *free()*. For *fwscanf()*, this is memory allocated via use of  
33193 the ' m ' assignment-allocation character.

33194 **RATIONALE**

33195 None.

33196 **FUTURE DIRECTIONS**

33197 None.

33198 **SEE ALSO**

33200 XBD Chapter 7 (on page 135), `<stdio.h>`, `<wchar.h>`

33201 **CHANGE HISTORY**

33202 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
33203 (E).

33204 **Issue 6**

33205 The normative text is updated to avoid use of the term "must" for application requirements.

33206 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 33207 • The prototypes for *fwscanf()* and *swscanf()* are updated.
- 33208 • The DESCRIPTION is updated.
- 33209 • The hh, ll, j, t, and z length modifiers are added.
- 33210 • The a, A, and F conversion characters are added.

33211 The DESCRIPTION is updated to use the terms "conversion specifier" and "conversion  
33212 specification" consistently.

33213 **Issue 7**

33214 Austin Group Interpretation 1003.1-2001 #170 is applied.

33215 SD5-XSH-ERN-132 is applied, adding the assignment-allocation character ' m '.

33216 Functionality relating to the "%n\$" form of conversion specification is moved from the XSI  
33217 option to the Base.

33218 Changes are made related to support for finegrained timestamps.

33219 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by  
33220 *malloc()*.

**gai\_strerror()**33221 **NAME**33222        **gai\_strerror** — address and name information error description33223 **SYNOPSIS**

33224        #include &lt;netdb.h&gt;

33225        const char \*gai\_strerror(int *ecode*);33226 **DESCRIPTION**33227        The *gai\_strerror()* function shall return a text string describing an error value for the *getaddrinfo()*  
33228        and *getnameinfo()* functions listed in the <netdb.h> header.33229        When the *ecode* argument is one of the following values listed in the <netdb.h> header:

33230	[EAL_AGAIN]	[EAL_NONAME]
33231	[EAL_BADFLAGS]	[EAL_OVERFLOW]
33232	[EAL_FAIL]	[EAL_SERVICE]
33233	[EAL_FAMILY]	[EAL_SOCKETTYPE]
33234	[EAL_MEMORY]	[EAL_SYSTEM]

33235        the function return value shall point to a string describing the error. If the argument is not one  
33236        of those values, the function shall return a pointer to a string whose contents indicate an  
33237        unknown error.

33238 **RETURN VALUE**33239        Upon successful completion, *gai\_strerror()* shall return a pointer to an implementation-defined  
33240        string.33241 **ERRORS**

33242        No errors are defined.

33243 **EXAMPLES**

33244        None.

**getc()**33271 **NAME**33272            **getc** — get a byte from a stream33273 **SYNOPSIS**

33274            #include &lt;stdio.h&gt;

33275            int getc(FILE \*stream);

33276 **DESCRIPTION**33277 **CX**            The functionality described on this reference page is aligned with the ISO C standard. Any  
33278 conflict between the requirements described here and the ISO C standard is unintentional. This  
33279 volume of POSIX.1-2008 defers to the ISO C standard.33280            The *getc()* function shall be equivalent to *fgetc()*, except that if it is implemented as a macro it  
33281 may evaluate *stream* more than once, so the argument should never be an expression with side-  
33282 effects.33283 **RETURN VALUE**33284            Refer to *fgetc()*.33285 **ERRORS**33286            Refer to *fgetc()*.33287 **EXAMPLES**

33288            None.

33289 **APPLICATION USAGE**33290            If the integer value returned by *getc()* is stored into a variable of type **char** and then compared  
33291 against the integer constant EOF, the comparison may never succeed, because sign-extension of  
33292 a variable of type **char** on widening to integer is implementation-defined.33293            Since it may be implemented as a macro, *getc()* may treat incorrectly a *stream* argument with  
33294 side-effects. In particular, *getc(\*f++)* does not necessarily work as expected. Therefore, use of this  
33295 function should be preceded by "#undef getc" in such situations; *fgetc()* could also be used.33296 **RATIONALE**

33297            None.

33298 **FUTURE DIRECTIONS**

33299            None.

33300 **SEE ALSO**33301            *fgetc()*

33302            XBD &lt;stdio.h&gt;

33303 **CHANGE HISTORY**

33304            First released in Issue 1. Derived from Issue 1 of the SVID.

33305 **NAME**

33306 `getc_unlocked`, `getchar_unlocked`, `putc_unlocked`, `putchar_unlocked` — `stdio` with explicit client  
 33307 locking

33308 **SYNOPSIS**

```
33309 CX #include <stdio.h>
33310
33310 int getc_unlocked(FILE *stream);
33311 int getchar_unlocked(void);
33312 int putc_unlocked(int c, FILE *stream);
33313 int putchar_unlocked(int c);
```

33314 **DESCRIPTION**

33315 Versions of the functions `getc()`, `getchar()`, `putc()`, and `putchar()` respectively named  
 33316 `getc_unlocked()`, `getchar_unlocked()`, `putc_unlocked()`, and `putchar_unlocked()` shall be provided  
 33317 which are functionally equivalent to the original versions, with the exception that they are not  
 33318 required to be implemented in a thread-safe manner. They may only safely be used within a  
 33319 scope protected by `flockfile()` (or `ftrylockfile()`) and `funlockfile()`. These functions may safely be  
 33320 used in a multi-threaded program if and only if they are called while the invoking thread owns  
 33321 the (FILE \*) object, as is the case after a successful call to the `flockfile()` or `ftrylockfile()` functions.

33322 **RETURN VALUE**

33323 See `getc()`, `getchar()`, `putc()`, and `putchar()`.

33324 **ERRORS**

33325 See `getc()`, `getchar()`, `putc()`, and `putchar()`.

33326 **EXAMPLES**

33327 None.

33328 **APPLICATION USAGE**

33329 Since they may be implemented as macros, `getc_unlocked()` and `putc_unlocked()` may treat  
 33330 incorrectly a `stream` argument with side-effects. In particular, `getc_unlocked(*f++)` and  
 33331 `putc_unlocked(*f++)` do not necessarily work as expected. Therefore, use of these functions in  
 33332 such situations should be preceded by the following statement as appropriate:

```
33333 #undef getc_unlocked
33334 #undef putc_unlocked
```

33335 **RATIONALE**

33336 Some I/O functions are typically implemented as macros for performance reasons (for example,  
 33337 `putc()` and `getc()`). For safety, they need to be synchronized, but it is often too expensive to  
 33338 synchronize on every character. Nevertheless, it was felt that the safety concerns were more  
 33339 important; consequently, the `getc()`, `getchar()`, `putc()`, and `putchar()` functions are required to be  
 33340 thread-safe. However, unlocked versions are also provided with names that clearly indicate the  
 33341 unsafe nature of their operation but can be used to exploit their higher performance. These  
 33342 unlocked versions can be safely used only within explicitly locked program regions, using  
 33343 exported locking primitives. In particular, a sequence such as:

```
33344 flockfile(fileptr);
33345 putc_unlocked('1', fileptr);
33346 putc_unlocked('\n', fileptr);
33347 fprintf(fileptr, "Line 2\n");
33348 funlockfile(fileptr);
```

**getc\_unlocked()**

33349 is permissible, and results in the text sequence:

33350 1  
33351 Line 2

33352 being printed without being interspersed with output from other threads.

33353 It would be wrong to have the standard names such as *getc()*, *putc()*, and so on, map to the  
33354 “faster, but unsafe” rather than the “slower, but safe” versions. In either case, you would still  
33355 want to inspect all uses of *getc()*, *putc()*, and so on, by hand when converting existing code.  
33356 Choosing the safe bindings as the default, at least, results in correct code and maintains the  
33357 “atomicity at the function” invariant. To do otherwise would introduce gratuitous  
33358 synchronization errors into converted code. Other routines that modify the *stdio* (FILE \*)  
33359 structures or buffers are also safely synchronized.

33360 Note that there is no need for functions of the form *getc\_locked()*, *putc\_locked()*, and so on, since  
33361 this is the functionality of *getc()*, *putc()*, *et al.* It would be inappropriate to use a feature test  
33362 macro to switch a macro definition of *getc()* between *getc\_locked()* and *getc\_unlocked()*, since the  
33363 ISO C standard requires an actual function to exist, a function whose behavior could not be  
33364 changed by the feature test macro. Also, providing both the *xxx\_locked()* and *xxx\_unlocked()*  
33365 forms leads to the confusion of whether the suffix describes the behavior of the function or the  
33366 circumstances under which it should be used.

33367 Three additional routines, *flockfile()*, *ftrylockfile()*, and *funlockfile()* (which may be macros), are  
33368 provided to allow the user to delineate a sequence of I/O statements that are executed  
33369 synchronously.

33370 The *ungetc()* function is infrequently called relative to the other functions/macros so no  
33371 unlocked variation is needed.

#### 33372 FUTURE DIRECTIONS

33373 None.

#### 33374 SEE ALSO

33375 *getc()*, *getchar()*, *putc()*, *putchar()*

33376 XBD <stdio.h>

#### 33377 CHANGE HISTORY

33378 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 33379 Issue 6

33380 These functions are marked as part of the Thread-Safe Functions option.

33381 The Open Group Corrigendum U030/2 is applied, adding APPLICATION USAGE describing  
33382 how applications should be written to avoid the case when the functions are implemented as  
33383 macros.

#### 33384 Issue 7

33385 The *getc\_unlocked()*, *getchar\_unlocked()*, *putc\_unlocked()*, and *putchar\_unlocked()* functions are  
33386 moved from the Thread-Safe Functions option to the Base.

33387 **NAME**33388            *getchar* — get a byte from a *stdin* stream33389 **SYNOPSIS**

33390            #include &lt;stdio.h&gt;

33391            int *getchar*(void);33392 **DESCRIPTION**33393 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
33394 conflict between the requirements described here and the ISO C standard is unintentional. This  
33395 volume of POSIX.1-2008 defers to the ISO C standard.33396            The *getchar*() function shall be equivalent to *getc(stdin)*.33397 **RETURN VALUE**33398            Refer to *fgetc*().33399 **ERRORS**33400            Refer to *fgetc*().33401 **EXAMPLES**

33402            None.

33403 **APPLICATION USAGE**33404            If the integer value returned by *getchar*() is stored into a variable of type **char** and then  
33405 compared against the integer constant EOF, the comparison may never succeed, because sign-  
33406 extension of a variable of type **char** on widening to integer is implementation-defined.33407 **RATIONALE**

33408            None.

33410            None.

33411 **SEE ALSO**33412            *getc*()

33413            XBD &lt;stdio.h&gt;

33414 **CHANGE HISTORY**

33415            First released in Issue 1. Derived from Issue 1 of the SVID.

**getchar\_unlocked()**

System Interfaces

33416 **NAME**

33417            getchar\_unlocked — stdio with explicit client locking

33418 **SYNOPSIS**

```
33419 CX        #include <stdio.h>  
33420            int getchar_unlocked(void);
```

33421 **DESCRIPTION**33422            Refer to *getc\_unlocked()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

33423 **NAME**33424 `getcwd` — get the pathname of the current working directory33425 **SYNOPSIS**

```
33426 #include <unistd.h>
33427 char *getcwd(char *buf, size_t size);
```

33428 **DESCRIPTION**

33429 The `getcwd()` function shall place an absolute pathname of the current working directory in the  
 33430 array pointed to by `buf`, and return `buf`. The pathname shall contain no components that are dot  
 33431 or dot-dot, or are symbolic links.

33432 If there are multiple pathnames that `getcwd()` could place in the array pointed to by `buf`, one  
 33433 beginning with a single <slash> character and one or more beginning with two <slash>  
 33434 characters, then `getcwd()` shall place the pathname beginning with a single <slash> character in  
 33435 the array. The pathname shall not contain any unnecessary <slash> characters after the leading  
 33436 one or two <slash> characters.

33437 The `size` argument is the size in bytes of the character array pointed to by the `buf` argument. If `buf`  
 33438 is a null pointer, the behavior of `getcwd()` is unspecified.

33439 **RETURN VALUE**

33440 Upon successful completion, `getcwd()` shall return the `buf` argument. Otherwise, `getcwd()` shall  
 33441 return a null pointer and set `errno` to indicate the error. The contents of the array pointed to by  
 33442 `buf` are then undefined.

33443 **ERRORS**

33444 The `getcwd()` function shall fail if:

33445	[EINVAL]	The <code>size</code> argument is 0.
33446	[ERANGE]	The <code>size</code> argument is greater than 0, but is smaller than the length of the string +1.

33448 The `getcwd()` function may fail if:

33449	[EACCES]	Search permission was denied for the current directory, or read or search permission was denied for a directory above the current directory in the file hierarchy.
33452	[ENOMEM]	Insufficient storage space is available.

33453 **EXAMPLES**

33454 The following example uses {PATH\_MAX} as the initial buffer size (unless it is indeterminate or  
 33455 very large), and calls `getcwd()` with progressively larger buffers until it does not give an  
 33456 [ERANGE] error.

```
33457 #include <stdlib.h>
33458 #include <errno.h>
33459 #include <unistd.h>
33460 ...
33461 long path_max;
33462 size_t size;
33463 char *buf;
33464 char *ptr;
33465 path_max = pathconf(".", _PC_PATH_MAX);
33466 if (path_max == -1)
```

**getcwd()**

```

33467         size = 1024;
33468     else if (path_max > 10240)
33469         size = 10240;
33470     else
33471         size = path_max;
33472     for (buf = ptr = NULL; ptr == NULL; size *= 2)
33473     {
33474         if ((buf = realloc(buf, size)) == NULL)
33475         {
33476             ... handle error ...
33477         }
33478         ptr = getcwd(buf, size);
33479         if (ptr == NULL && errno != ERANGE)
33480         {
33481             ... handle error ...
33482         }
33483     }
33484     free (buf);

```

**APPLICATION USAGE**

If the pathname obtained from *getcwd()* is longer than `{PATH_MAX}` bytes, it could produce an `[ENAMETOOLONG]` error if passed to *chdir()*. Therefore, in order to return to that directory it may be necessary to break the pathname into sections shorter than `{PATH_MAX}` bytes and call *chdir()* on each section in turn (the first section being an absolute pathname and subsequent sections being relative pathnames). A simpler way to handle saving and restoring the working directory when it may be deeper than `{PATH_MAX}` bytes in the file hierarchy is to use a file descriptor and *fchdir()*, rather than *getcwd()* and *chdir()*. However, the two methods do have some differences. The *fchdir()* approach causes the program to restore a working directory even if it has been renamed in the meantime, whereas the *chdir()* approach restores to a directory with the same name as the original, even if the directories were renamed in the meantime. Since the *fchdir()* approach does not access parent directories, it can succeed when *getcwd()* would fail due to permissions problems. In applications conforming to earlier versions of this standard, it was not possible to use the *fchdir()* approach when the working directory is searchable but not readable, as the only way to open a directory was with `O_RDONLY`, whereas the *getcwd()* approach can succeed in this case.

**RATIONALE**

Having *getcwd()* take no arguments and instead use the *malloc()* function to produce space for the returned argument was considered. The advantage is that *getcwd()* knows how big the working directory pathname is and can allocate an appropriate amount of space. But the programmer would have to use the *free()* function to free the resulting object, or each use of *getcwd()* would further reduce the available memory. Finally, *getcwd()* is taken from the SVID where it has the two arguments used in this volume of POSIX.1-2008.

The older function *getwd()* was rejected for use in this context because it had only a buffer argument and no *size* argument, and thus had no way to prevent overwriting the buffer, except to depend on the programmer to provide a large enough buffer.

On some implementations, if *buf* is a null pointer, *getcwd()* may obtain *size* bytes of memory using *malloc()*. In this case, the pointer returned by *getcwd()* may be used as the argument in a subsequent call to *free()*. Invoking *getcwd()* with *buf* as a null pointer is not recommended in conforming applications.

33515 Earlier implementations of `getcwd()` sometimes generated pathnames like  
 33516 `"../../../../subdirname"` internally, using them to explore the path of ancestor directories  
 33517 back to the root. If one of these internal pathnames exceeded `{PATH_MAX}` in length, the  
 33518 implementation could fail with `errno` set to `[ENAMETOOLONG]`. This is no longer allowed.

33519 If a program is operating in a directory where some (grand)parent directory does not permit  
 33520 reading, `getcwd()` may fail, as in most implementations it must read the directory to determine  
 33521 the name of the file. This can occur if search, but not read, permission is granted in an  
 33522 intermediate directory, or if the program is placed in that directory by some more privileged  
 33523 process (for example, login). Including the `[EACCES]` error condition makes the reporting of the  
 33524 error consistent and warns the application developer that `getcwd()` can fail for reasons beyond  
 33525 the control of the application developer or user. Some implementations can avoid this  
 33526 occurrence (for example, by implementing `getcwd()` using `pwd`, where `pwd` is a set-user-root  
 33527 process), thus the error was made optional. Since this volume of POSIX.1-2008 permits the  
 33528 addition of other errors, this would be a common addition and yet one that applications could  
 33529 not be expected to deal with without this addition.

#### 33530 FUTURE DIRECTIONS

33531 None.

#### 33535 CHANGE HISTORY

33536 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 33537 Issue 6

33538 The following new requirements on POSIX implementations derive from alignment with the  
 33539 Single UNIX Specification:

- 33540 • The `[ENOMEM]` optional error condition is added.

#### 33541 Issue 7

33542 Austin Group Interpretation 1003.1-2001 #140 is applied, changing the text for consistency with  
 33543 the `pwd` utility, adding text to address the case where the current directory is deeper in the file  
 33544 hierarchy than `{PATH_MAX}` bytes, and adding the requirements relating to pathnames  
 33545 beginning with two `<slash>` characters.

**getdate()**33546 **NAME**33547 `getdate` — convert user format date and time33548 **SYNOPSIS**

```
33549 XSI #include <time.h>
33550 struct tm *getdate(const char *string);
```

33551 **DESCRIPTION**

33552 The `getdate()` function shall convert a string representation of a date or time into a broken-down  
 33553 time.

33554 The external variable or macro `getdate_err`, which has type **int**, is used by `getdate()` to return error  
 33555 values. It is unspecified whether `getdate_err` is a macro or an identifier declared with external  
 33556 linkage, and whether or not it is a modifiable lvalue. If a macro definition is suppressed in order  
 33557 to access an actual object, or a program defines an identifier with the name `getdate_err`, the  
 33558 behavior is undefined.

33559 Templates are used to parse and interpret the input string. The templates are contained in a text  
 33560 file identified by the environment variable `DATEMSK`. The `DATEMSK` variable should be set to  
 33561 indicate the full pathname of the file that contains the templates. The first line in the template  
 33562 that matches the input specification is used for interpretation and conversion into the internal  
 33563 time format.

33564 The following conversion specifications shall be supported:

33565	<code>%%</code>	Equivalent to <code>%</code> .
33566	<code>%a</code>	Abbreviated weekday name.
33567	<code>%A</code>	Full weekday name.
33568	<code>%b</code>	Abbreviated month name.
33569	<code>%B</code>	Full month name.
33570	<code>%c</code>	Locale's appropriate date and time representation.
33571	<code>%C</code>	Century number [00,99]; leading zeros are permitted but not required.
33572	<code>%d</code>	Day of month [01,31]; the leading 0 is optional.
33573	<code>%D</code>	Date as <code>%m/%d/%y</code> .
33574	<code>%e</code>	Equivalent to <code>%d</code> .
33575	<code>%h</code>	Abbreviated month name.
33576	<code>%H</code>	Hour [00,23].
33577	<code>%I</code>	Hour [01,12].
33578	<code>%m</code>	Month number [01,12].
33579	<code>%M</code>	Minute [00,59].
33580	<code>%n</code>	Equivalent to <code>&lt;newline&gt;</code> .
33581	<code>%p</code>	Locale's equivalent of either AM or PM.
33582	<code>%r</code>	The locale's appropriate representation of time in AM and PM notation. In the POSIX 33583 locale, this shall be equivalent to <code>%I:%M:%S %p</code> .

33584	%R	Time as %H:%M.
33585	%S	Seconds [00,60]. The range goes to 60 (rather than stopping at 59) to allow positive leap seconds to be expressed. Since leap seconds cannot be predicted by any algorithm, leap second data must come from some external source.
33586		
33587		
33588	%t	Equivalent to <tab>.
33589	%T	Time as %H:%M:%S.
33590	%w	Weekday number (Sunday = [0,6]).
33591	%x	Locale's appropriate date representation.
33592	%X	Locale's appropriate time representation.
33593	%y	Year within century. When a century is not otherwise specified, values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.
33594		
33595		
33596	<b>Note:</b>	It is expected that in a future version of this standard the default century inferred from a 2-digit year will change. (This would apply to all commands accepting a 2-digit year as input.)
33597		
33598		
33599	%Y	Year as "ccyy" (for example, 2001).
33600	%Z	Timezone name or no characters if no timezone exists. If the timezone supplied by %Z is not the timezone that <i>getdate()</i> expects, an invalid input specification error shall result. The <i>getdate()</i> function calculates an expected timezone based on information supplied to the function (such as the hour, day, and month).
33601		
33602		
33603		
33604		The match between the template and input specification performed by <i>getdate()</i> shall be case-insensitive.
33605		
33606		The month and weekday names can consist of any combination of upper and lowercase letters. The process can request that the input date or time specification be in a specific language by setting the <i>LC_TIME</i> category (see <i>setlocale()</i> ).
33607		
33608		
33609		Leading zeros are not necessary for the descriptors that allow leading zeros. However, at most two digits are allowed for those descriptors, including leading zeros. Extra white space in either the template file or in <i>string</i> shall be ignored.
33610		
33611		
33612		The results are undefined if the conversion specifications %c, %x, and %X include unsupported conversion specifications.
33613		
33614		The following rules apply for converting the input specification into the internal format:
33615		• If %Z is being scanned, then <i>getdate()</i> shall initialize the broken-down time to be the current time in the scanned timezone. Otherwise, it shall initialize the broken-down time based on the current local time as if <i>localtime()</i> had been called.
33616		
33617		
33618		• If only the weekday is given, the day chosen shall be the day, starting with today and moving into the future, which first matches the named day.
33619		
33620		• If only the month (and no year) is given, the month chosen shall be the month, starting with the current month and moving into the future, which first matches the named month. The first day of the month shall be assumed if no day is given.
33621		
33622		
33623		• If no hour, minute, and second are given, the current hour, minute, and second shall be assumed.
33624		

**getdate()**

33625 • If no date is given, the hour chosen shall be the hour, starting with the current hour and  
33626 moving into the future, which first matches the named hour.

33627 If a conversion specification in the DATEMSK file does not correspond to one of the conversion  
33628 specifications above, the behavior is unspecified.

33629 The *getdate()* function need not be thread-safe.

**RETURN VALUE**

33631 Upon successful completion, *getdate()* shall return a pointer to a **struct tm**. Otherwise, it shall  
33632 return a null pointer and set *getdate\_err* to indicate the error.

**ERRORS**

33634 The *getdate()* function shall fail in the following cases, setting *getdate\_err* to the value shown in  
33635 the list below. Any changes to *errno* are unspecified.

- 33636 1. The DATEMSK environment variable is null or undefined.
- 33637 2. The template file cannot be opened for reading.
- 33638 3. Failed to get file status information.
- 33639 4. The template file is not a regular file.
- 33640 5. An I/O error is encountered while reading the template file.
- 33641 6. Memory allocation failed (not enough memory available).
- 33642 7. There is no line in the template that matches the input.
- 33643 8. Invalid input specification. For example, February 31; or a time is specified that cannot be  
33644 represented in a **time\_t** (representing the time in seconds since the Epoch).

**EXAMPLES**

- 33646 1. The following example shows the possible contents of a template:

```
33647 %m
33648 %A %B %d, %Y, %H:%M:%S
33649 %A
33650 %B
33651 %m/%d/%y %I %p
33652 %d, %m, %Y %H:%M
33653 at %A the %dst of %B in %Y
33654 run job at %I %p, %B %dnd
33655 %A den %d. %B %Y %H.%M Uhr
```

- 33656 2. The following are examples of valid input specifications for the template in Example 1:

```
33657 getdate("10/1/87 4 PM");
33658 getdate("Friday");
33659 getdate("Friday September 18, 1987, 10:30:30");
33660 getdate("24,9,1986 10:30");
33661 getdate("at monday the 1st of december in 1986");
33662 getdate("run job at 3 PM, december 2nd");
```

33663 If the *LC\_TIME* category is set to a German locale that includes *freitag* as a weekday name  
33664 and *oktober* as a month name, the following would be valid:

```
33665 getdate("freitag den 10. oktober 1986 10.30 Uhr");
```

- 33666 3. The following example shows how local date and time specification can be defined in the  
33667 template:

Invocation	Line in Template
33668 getdate ("11/27/86")	%m/%d/%y
33669 getdate ("27.11.86")	%d.%m.%y
33670 getdate ("86-11-27")	%y-%m-%d
33671 getdate ("Friday 12:00:00")	%A %H:%M:%S

- 33673 4. The following examples help to illustrate the above rules assuming that the current date  
33674 is Mon Sep 22 12:19:47 EDT 1986 and the *LC\_TIME* category is set to the default C locale:

Input	Line in Template	Date
33675 Mon	%a	Mon Sep 22 12:19:47 EDT 1986
33676 Sun	%a	Sun Sep 28 12:19:47 EDT 1986
33677 Fri	%a	Fri Sep 26 12:19:47 EDT 1986
33678 September	%B	Mon Sep 1 12:19:47 EDT 1986
33679 January	%B	Thu Jan 1 12:19:47 EST 1987
33680 December	%B	Mon Dec 1 12:19:47 EST 1986
33681 Sep Mon	%b %a	Mon Sep 1 12:19:47 EDT 1986
33682 Jan Fri	%b %a	Fri Jan 2 12:19:47 EST 1987
33683 Dec Mon	%b %a	Mon Dec 1 12:19:47 EST 1986
33684 Jan Wed 1989	%b %a %Y	Wed Jan 4 12:19:47 EST 1989
33685 Fri 9	%a %H	Fri Sep 26 09:00:00 EDT 1986
33686 Feb 10:30	%b %H:%S	Sun Feb 1 10:00:30 EST 1987
33687 10:30	%H:%M	Tue Sep 23 10:30:00 EDT 1986
33688 13:30	%H:%M	Mon Sep 22 13:30:00 EDT 1986

#### 33690 APPLICATION USAGE

33691 Although historical versions of *getdate()* did not require that `<time.h>` declare the external  
33692 variable *getdate\_err*, this volume of POSIX.1-2008 does require it. The standard developers  
33693 encourage applications to remove declarations of *getdate\_err* and instead incorporate the  
33694 declaration by including `<time.h>`.

33695 Applications should use %Y (4-digit years) in preference to %y (2-digit years).

#### 33696 RATIONALE

33697 In standard locales, the conversion specifications %c, %x, and %X do not include unsupported  
33698 conversion specifiers and so the text regarding results being undefined is not a problem in that  
33699 case.

#### 33700 FUTURE DIRECTIONS

33701 None.

#### 33702 SEE ALSO

33703 *ctime()*, *localtime()*, *setlocale()*, *strftime()*, *times()*

#### 33705 CHANGE HISTORY

33706 First released in Issue 4, Version 2.

**getdate()**

- 33707 **Issue 5**
- 33708 Moved from X/OPEN UNIX extension to BASE.
- 33709 The last paragraph of the DESCRIPTION is added.
- 33710 The %C conversion specification is added, and the exact meaning of the %y conversion specification is clarified in the DESCRIPTION.
- 33711
- 33712 A note indicating that this function need not be reentrant is added to the DESCRIPTION.
- 33713 The %R conversion specification is changed to follow historical practice.
- 33714 **Issue 6**
- 33715 The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time* functions.
- 33716
- 33717
- 33718 The description of %S is updated so that the valid range is [00,60] rather than [00,61].
- 33719 The DESCRIPTION is updated to refer to conversion specifications instead of field descriptors for consistency with other functions.
- 33720
- 33721 **Issue 7**
- 33722 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 33723 The description of the *getdate\_err* value is expanded.

33724 **NAME**33725 getdelim, getline — read a delimited record from *stream*33726 **SYNOPSIS**

```

33727 CX #include <stdio.h>
33728
33728 ssize_t getdelim(char **restrict lineptr, size_t *restrict n,
33729                 int delimiter, FILE *restrict stream);
33730
33730 ssize_t getline(char **restrict lineptr, size_t *restrict n,
33731                FILE *restrict stream);

```

33732 **DESCRIPTION**

33733 The *getdelim()* function shall read from *stream* until it encounters a character matching the  
 33734 *delimiter* character. The *delimiter* argument is an **int**, the value of which the application shall  
 33735 ensure is a character representable as an **unsigned char** of equal value that terminates the read  
 33736 process. If the *delimiter* argument has any other value, the behavior is undefined.

33737 The application shall ensure that *\*lineptr* is a valid argument that could be passed to the *free()*  
 33738 function. If *\*n* is non-zero, the application shall ensure that *\*lineptr* either points to an object of  
 33739 size at least *\*n* bytes, or is a null pointer.

33740 The size of the object pointed to by *\*lineptr* shall be increased to fit the incoming line, if it isn't  
 33741 already large enough, including room for the delimiter and a terminating NUL. The characters  
 33742 read, including any delimiter, shall be stored in the string pointed to by the *lineptr* argument,  
 33743 and a terminating NUL added when the delimiter or end of file is encountered.

33744 The *getline()* function shall be equivalent to the *getdelim()* function with the *delimiter* character  
 33745 equal to the <newline> character.

33746 The *getdelim()* and *getline()* functions may mark the last data access timestamp of the file  
 33747 associated with *stream* for update. The last data access timestamp shall be marked for update by  
 33748 the first successful execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*,  
 33749 *getline()*, *gets()*, or *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

33750 **RETURN VALUE**

33751 Upon successful completion, the *getline()* and *getdelim()* functions shall return the number of  
 33752 characters written into the buffer, including the delimiter character if one was encountered  
 33753 before EOF, but excluding the terminating NUL character. If no characters were read, and the  
 33754 end-of-file indicator for the stream is set, or if the stream is at end-of-file, the end-of-file indicator  
 33755 for the stream shall be set and the function shall return  $-1$ . If an error occurs, the error indicator  
 33756 for the stream shall be set, and the function shall return  $-1$  and set *errno* to indicate the error.

33757 **ERRORS**

33758 For the conditions under which the *getdelim()* and *getline()* functions shall fail and may fail, refer  
 33759 to *fgetc()*.

33760 In addition, these functions shall fail if:

33761 [EINVAL] *lineptr* or *n* is a null pointer.

33762 [ENOMEM] Insufficient memory is available.

33763 These functions may fail if:

33764 [EOVERFLOW] More than {SSIZE\_MAX} characters were read without encountering the  
 33765 *delimiter* character.

**getdelim()**33766 **EXAMPLES**

```

33767     #include <stdio.h>
33768     #include <stdlib.h>

33769     int main(void)
33770     {
33771         FILE *fp;
33772         char *line = NULL;
33773         size_t len = 0;
33774         ssize_t read;
33775         fp = fopen("/etc/motd", "r");
33776         if (fp == NULL)
33777             exit(1);
33778         while ((read = getline(&line, &len, fp)) != -1) {
33779             printf("Retrieved line of length %zu :\n", read);
33780             printf("%s", line);
33781         }
33782         if (ferror(fp)) {
33783             /* handle error */
33784         }
33785         free(line);
33786         fclose(fp);
33787         return 0;
33788     }

```

33789 **APPLICATION USAGE**

33790 Setting *\*lineptr* to a null pointer and *\*n* to zero are allowed and a recommended way to start  
 33791 parsing a file.

33792 The *ferror()* or *feof()* functions should be used to distinguish between an error condition and an  
 33793 end-of-file condition.

33794 Although a NUL terminator is always supplied after the line, note that *strlen(\*lineptr)* will be  
 33795 smaller than the return value if the line contains embedded NUL characters.

33796 **RATIONALE**

33797 These functions are widely used to solve the problem that the *fgets()* function has with long  
 33798 lines. The functions automatically enlarge the target buffers if needed. These are especially  
 33799 useful since they reduce code needed for applications.

33800 **FUTURE DIRECTIONS**

33801 None.

33829           XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

33830 **CHANGE HISTORY**

33831           First released in Issue 1. Derived from Issue 1 of the SVID.

33832 **Issue 6**

33833           In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

33834           The following new requirements on POSIX implementations derive from alignment with the  
33835           Single UNIX Specification:

- 33836           • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
33837           required for conforming implementations of previous POSIX specifications, it was not  
33838           required for UNIX applications.

**getenv()**33839 **NAME**33840 `getenv` — get value of an environment variable33841 **SYNOPSIS**33842 `#include <stdlib.h>`33843 `char *getenv(const char *name);`33844 **DESCRIPTION**

33845 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 33846 conflict between the requirements described here and the ISO C standard is unintentional. This  
 33847 volume of POSIX.1-2008 defers to the ISO C standard.

33848 The `getenv()` function shall search the environment of the calling process (see XBD Chapter 8, on  
 33849 page 173) for the environment variable `name` if it exists and return a pointer to the value of the  
 33850 environment variable. If the specified environment variable cannot be found, a null pointer shall  
 33851 be returned. The application shall ensure that it does not modify the string pointed to by the  
 33852 `getenv()` function.

33853 CX The string pointed to may be overwritten by a subsequent call to `getenv()`, `setenv()`, `unsetenv()`,  
 33854 XSI or `putenv()` but shall not be overwritten by a call to any other function in this volume of  
 33855 POSIX.1-2008.

33856 CX If the application modifies `environ` or the pointers to which it points, the behavior of `getenv()` is  
 33857 undefined.

33858 The `getenv()` function need not be thread-safe.

33859 **RETURN VALUE**

33860 Upon successful completion, `getenv()` shall return a pointer to a string containing the *value* for  
 33861 the specified `name`. If the specified `name` cannot be found in the environment of the calling  
 33862 process, a null pointer shall be returned.

33863 **ERRORS**

33864 No errors are defined.

33865 **EXAMPLES**33866 **Getting the Value of an Environment Variable**

33867 The following example gets the value of the `HOME` environment variable.

```
33868 #include <stdlib.h>
33869 ...
33870 const char *name = "HOME";
33871 char *value;
33872 value = getenv(name);
```

33873 **APPLICATION USAGE**

33874 None.

33875 **RATIONALE**

33876 The `clearenv()` function was considered but rejected. The `putenv()` function has now been  
 33877 included for alignment with the Single UNIX Specification.

33878 The `getenv()` function is inherently not thread-safe because it returns a value pointing to static  
 33879 data.

33880 Conforming applications are required not to modify `environ` directly, but to use only the  
 33881 functions described here to manipulate the process environment as an abstract object. Thus, the

33882 implementation of the environment access functions has complete control over the data  
 33883 structure used to represent the environment (subject to the requirement that *environ* be  
 33884 maintained as a list of strings with embedded <equals-sign> characters for applications that  
 33885 wish to scan the environment). This constraint allows the implementation to properly manage  
 33886 the memory it allocates, either by using allocated storage for all variables (copying them on the  
 33887 first invocation of *setenv()* or *unsetenv()*), or keeping track of which strings are currently in  
 33888 allocated space and which are not, via a separate table or some other means. This enables the  
 33889 implementation to free any allocated space used by strings (and perhaps the pointers to them)  
 33890 stored in *environ* when *unsetenv()* is called. A C runtime start-up procedure (that which invokes  
 33891 *main()* and perhaps initializes *environ*) can also initialize a flag indicating that none of the  
 33892 environment has yet been copied to allocated storage, or that the separate table has not yet been  
 33893 initialized.

33894 In fact, for higher performance of *getenv()*, the implementation could also maintain a separate  
 33895 copy of the environment in a data structure that could be searched much more quickly (such as  
 33896 an indexed hash table, or a binary tree), and update both it and the linear list at *environ* when  
 33897 *setenv()* or *unsetenv()* is invoked.

33898 Performance of *getenv()* can be important for applications which have large numbers of  
 33899 environment variables. Typically, applications like this use the environment as a resource  
 33900 database of user-configurable parameters. The fact that these variables are in the user's shell  
 33901 environment usually means that any other program that uses environment variables (such as *ls*,  
 33902 which attempts to use *COLUMNS*), or really almost any utility (*LANG*, *LC\_ALL*, and so on) is  
 33903 similarly slowed down by the linear search through the variables.

33904 An implementation that maintains separate data structures, or even one that manages the  
 33905 memory it consumes, is not currently required as it was thought it would reduce consensus  
 33906 among implementors who do not want to change their historical implementations.

#### 33907 FUTURE DIRECTIONS

33908 A future version may add one or more functions to access and modify the environment in a  
 33909 thread-safe manner.

#### 33910 SEE ALSO

33911 *exec*, *putenv()*, *setenv()*, *unsetenv()*

33912 XBD Chapter 8 (on page 173), <stdlib.h>

#### 33913 CHANGE HISTORY

33914 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 33915 Issue 5

33916 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
 33917 VALUE section.

33918 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

#### 33919 Issue 6

33920 The following changes were made to align with the IEEE P1003.1a draft standard:

- 33921 • References added to the new *setenv()* and *unsetenv()* functions.

33922 The normative text is updated to avoid use of the term "must" for application requirements.

#### 33923 Issue 7

33924 Austin Group Interpretation 1003.1-2001 #062 is applied, clarifying that a call to *putenv()* may  
 33925 also cause the string to be overwritten.

33926 Austin Group Interpretation 1003.1-2001 #148 is applied, adding the FUTURE DIRECTIONS.

**getenv()**

*System Interfaces*

33927

Austin Group Interpretation 1003.1-2001 #156 is applied.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**getgrgid()**33999 **NAME**34000 `getgrgid, getgrgid_r` — get group database entry for a group ID34001 **SYNOPSIS**

```
34002 #include <grp.h>
34003
34003 struct group *getgrgid(gid_t gid);
34004 int getgrgid_r(gid_t gid, struct group *grp, char *buffer,
34005               size_t bufsize, struct group **result);
```

34006 **DESCRIPTION**34007 The `getgrgid()` function shall search the group database for an entry with a matching *gid*.34008 The `getgrgid()` function need not be thread-safe.

34009 The `getgrgid_r()` function shall update the **group** structure pointed to by *grp* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the group database with a matching *gid*. Storage referenced by the group structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to `sysconf(_SC_GETGR_R_SIZE_MAX)` returns either `-1` without changing *errno* or an initial value suggested for the size of this buffer. A null pointer shall be returned at the location pointed to by *result* on error or if the requested entry is not found.

34016 **RETURN VALUE**

34017 Upon successful completion, `getgrgid()` shall return a pointer to a **struct group** with the structure defined in `<grp.h>` with a matching entry if one is found. The `getgrgid()` function shall return a null pointer if either the requested entry was not found, or an error occurred. On error, *errno* shall be set to indicate the error.

34021 The return value may point to a static area which is overwritten by a subsequent call to `getgrent()`, `getgrgid()`, or `getgrnam()`.

34023 If successful, the `getgrgid_r()` function shall return zero; otherwise, an error number shall be returned to indicate the error.

34025 **ERRORS**34026 The `getgrgid()` and `getgrgid_r()` functions may fail if:

34027 [EIO] An I/O error has occurred.

34028 [EINTR] A signal was caught during `getgrgid()`.

34029 [EMFILE] All file descriptors available to the process are currently open.

34030 [ENFILE] The maximum allowable number of files is currently open in the system.

34031 The `getgrgid_r()` function may fail if:34032 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be referenced by the resulting **group** structure.

34034 **EXAMPLES**

34035 Note that *sysconf*(*\_SC\_GETGR\_R\_SIZE\_MAX*) may return *-1* if there is no hard limit on the size  
 34036 of the buffer needed to store all the groups returned. This example shows how an application  
 34037 can allocate a buffer of sufficient size to work with *getgrgid\_r*().

```

34038 long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
34039 size_t len;
34040 if (initlen == -1)
34041     /* Default initial length. */
34042     len = 1024;
34043 else
34044     len = (size_t) initlen;
34045 struct group result;
34046 struct group *resultp;
34047 char *buffer = malloc(len);
34048 if (buffer == NULL)
34049     ...handle error...
34050 int e;
34051 while ((e = getgrgid_r(42, &result, buffer, len, &resultp)) == ERANGE)
34052     {
34053     size_t newlen = 2 * len;
34054     if (newlen < len)
34055         ...handle error...
34056     len = newlen;
34057     char *newbuffer = realloc(buffer, len);
34058     if (newbuffer == NULL)
34059         ...handle error...
34060     buffer = newbuffer;
34061     }
34062 if (e != 0)
34063     ...handle error...
34064 free (buffer);

```

34065 **Finding an Entry in the Group Database**

34066 The following example uses *getgrgid*() to search the group database for a group ID that was  
 34067 previously stored in a *stat* structure, then prints out the group name if it is found. If the group is  
 34068 not found, the program prints the numeric value of the group for the entry.

```

34069 #include <sys/types.h>
34070 #include <grp.h>
34071 #include <stdio.h>
34072 ...
34073 struct stat statbuf;
34074 struct group *grp;
34075 ...
34076 if ((grp = getgrgid(statbuf.st_gid)) != NULL)
34077     printf(" %-8.8s", grp->gr_name);
34078 else
34079     printf(" %-8d", statbuf.st_gid);
34080 ...

```

**getgrgid()**34081 **APPLICATION USAGE**

34082 Applications wishing to check for error situations should set *errno* to 0 before calling *getgrgid()*.  
 34083 If *errno* is set on return, an error occurred.

34084 The *getgrgid\_r()* function is thread-safe and shall return values in a user-supplied buffer instead  
 34085 of possibly using a static data area that may be overwritten by each call.

34086 Portable applications should take into account that it is usual for an implementation to return -1  
 34087 from *sysconf()* indicating that there is no maximum for `_SC_GETGR_R_SIZE_MAX`.

34088 **RATIONALE**

34089 None.

34090 **FUTURE DIRECTIONS**

34091 None.

34092 **SEE ALSO**

34093 *endgrent()*, *getgrnam()*, *sysconf()*

34094 XBD `<grp.h>`, `<sys/types.h>`

34095 **CHANGE HISTORY**

34096 First released in Issue 1. Derived from System V Release 2.0.

34097 **Issue 5**

34098 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
 34099 VALUE section.

34100 The *getgrgid\_r()* function is included for alignment with the POSIX Threads Extension.

34101 A note indicating that the *getgrgid()* function need not be reentrant is added to the  
 34102 DESCRIPTION.

34103 **Issue 6**

34104 The *getgrgid\_r()* function is marked as part of the Thread-Safe Functions option.

34105 The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION  
 34106 describing matching the *gid*.

34107 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

34108 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

34109 The following new requirements on POSIX implementations derive from alignment with the  
 34110 Single UNIX Specification:

34111 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
 34112 required for conforming implementations of previous POSIX specifications, it was not  
 34113 required for UNIX applications.

34114 • In the RETURN VALUE section, the requirement to set *errno* on error is added.

34115 • The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

34116 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
 34117 its avoidance of possibly using a static data area.

34118 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the  
 34119 buffer from *bufsize* characters to bytes.

34120 **Issue 7**

- 34121 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 34122 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.
- 34123 SD5-XSH-ERN-166 is applied.
- 34124 The *getgrgid\_r()* function is moved from the Thread-Safe Functions option to the Base.
- 34125 A minor addition is made to the EXAMPLES section, reminding the application developer to free memory allocated as if by *malloc()*.
- 34126

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**getgrnam()**34127 **NAME**34128 `getgrnam, getgrnam_r` — search group database for a name34129 **SYNOPSIS**

```
34130 #include <grp.h>
34131 struct group *getgrnam(const char *name);
34132 int getgrnam_r(const char *name, struct group *grp, char *buffer,
34133 size_t bufsize, struct group **result);
```

34134 **DESCRIPTION**34135 The `getgrnam()` function shall search the group database for an entry with a matching *name*.34136 The `getgrnam()` function need not be thread-safe.

34137 The `getgrnam_r()` function shall update the **group** structure pointed to by *grp* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the group database with a matching *name*. Storage referenced by the **group** structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to `sysconf(_SC_GETGR_R_SIZE_MAX)` returns either `-1` without changing *errno* or an initial value suggested for the size of this buffer. A null pointer is returned at the location pointed to by *result* on error or if the requested entry is not found.

34144 **RETURN VALUE**

34145 The `getgrnam()` function shall return a pointer to a **struct group** with the structure defined in `<grp.h>` with a matching entry if one is found. The `getgrnam()` function shall return a null pointer if either the requested entry was not found, or an error occurred. On error, *errno* shall be set to indicate the error.

34149 The return value may point to a static area which is overwritten by a subsequent call to `getgrent()`, `getgrgid()`, or `getgrnam()`.

34151 The `getgrnam_r()` function shall return zero on success or if the requested entry was not found and no error has occurred. If any error has occurred, an error number shall be returned to indicate the error.

34154 **ERRORS**34155 The `getgrnam()` and `getgrnam_r()` functions may fail if:

34156 [EIO] An I/O error has occurred.

34157 [EINTR] A signal was caught during `getgrnam()`.

34158 [EMFILE] All file descriptors available to the process are currently open.

34159 [ENFILE] The maximum allowable number of files is currently open in the system.

34160 The `getgrnam_r()` function may fail if:34161 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be referenced by the resulting **group** structure.

34163 **EXAMPLES**

34164 Note that `sysconf(_SC_GETGR_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size  
 34165 of the buffer needed to store all the groups returned. This example shows how an application  
 34166 can allocate a buffer of sufficient size to work with `getgrnam_r()`.

```

34167 long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
34168 size_t len;
34169 if (initlen == -1)
34170     /* Default initial length. */
34171     len = 1024;
34172 else
34173     len = (size_t) initlen;
34174 struct group result;
34175 struct group *resultp;
34176 char *buffer = malloc(len);
34177 if (buffer == NULL)
34178     ...handle error...
34179 int e;
34180 while ((e = getgrnam_r("somegroup", &result, buffer, len, &resultp))
34181        == ERANGE)
34182     {
34183     size_t newlen = 2 * len;
34184     if (newlen < len)
34185         ...handle error...
34186     len = newlen;
34187     char *newbuffer = realloc(buffer, len);
34188     if (newbuffer == NULL)
34189         ...handle error...
34190     buffer = newbuffer;
34191     }
34192 if (e != 0)
34193     ...handle error...
34194 free (buffer);

```

34195 **APPLICATION USAGE**

34196 Applications wishing to check for error situations should set `errno` to 0 before calling `getgrnam()`.  
 34197 If `errno` is set on return, an error occurred.

34198 The `getgrnam_r()` function is thread-safe and shall return values in a user-supplied buffer instead  
 34199 of possibly using a static data area that may be overwritten by each call.

34200 Portable applications should take into account that it is usual for an implementation to return `-1`  
 34201 from `sysconf()` indicating that there is no maximum for `_SC_GETGR_R_SIZE_MAX`.

34202 **RATIONALE**

34203 None.

34204 **FUTURE DIRECTIONS**

34205 None.

**getgrnam()****34209 CHANGE HISTORY**

34210 First released in Issue 1. Derived from System V Release 2.0.

**34211 Issue 5**

34212 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
34213 VALUE section.

34214 The *getgrnam\_r()* function is included for alignment with the POSIX Threads Extension.

34215 A note indicating that the *getgrnam()* function need not be reentrant is added to the  
34216 DESCRIPTION.

**34217 Issue 6**

34218 The *getgrnam\_r()* function is marked as part of the Thread-Safe Functions option.

34219 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

34220 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

34221 The following new requirements on POSIX implementations derive from alignment with the  
34222 Single UNIX Specification:

- 34223 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
34224 required for conforming implementations of previous POSIX specifications, it was not  
34225 required for UNIX applications.
- 34226 • In the RETURN VALUE section, the requirement to set *errno* on error is added.
- 34227 • The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

34228 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
34229 its avoidance of possibly using a static data area.

34230 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the  
34231 buffer from *bufsize* characters to bytes.

**34232 Issue 7**

34233 Austin Group Interpretation 1003.1-2001 #081 is applied, clarifying the RETURN VALUE section.

34234 Austin Group Interpretation 1003.1-2001 #156 is applied.

34235 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

34236 SD5-XSH-ERN-166 is applied.

34237 The *getgrnam\_r()* function is moved from the Thread-Safe Functions option to the Base.

34238 A minor addition is made to the EXAMPLES section, reminding the application developer to  
34239 free memory allocated as if by *malloc()*.

**34240 NAME**

34241 `getgroups` — get supplementary group IDs

**34242 SYNOPSIS**

```
34243 #include <unistd.h>
34244 int getgroups(int gidsetsize, gid_t grouplist[]);
```

**34245 DESCRIPTION**

34246 The `getgroups()` function shall fill in the array `grouplist` with the current supplementary group  
 34247 IDs of the calling process. It is implementation-defined whether `getgroups()` also returns the  
 34248 effective group ID in the `grouplist` array.

34249 The `gidsetsize` argument specifies the number of elements in the array `grouplist`. The actual  
 34250 number of group IDs stored in the array shall be returned. The values of array entries with  
 34251 indices greater than or equal to the value returned are undefined.

34252 If `gidsetsize` is 0, `getgroups()` shall return the number of group IDs that it would otherwise return  
 34253 without modifying the array pointed to by `grouplist`.

34254 If the effective group ID of the process is returned with the supplementary group IDs, the value  
 34255 returned shall always be greater than or equal to one and less than or equal to the value of  
 34256 `{NGROUPS_MAX}+1`.

**34257 RETURN VALUE**

34258 Upon successful completion, the number of supplementary group IDs shall be returned. A  
 34259 return value of `-1` indicates failure and `errno` shall be set to indicate the error.

**34260 ERRORS**

34261 The `getgroups()` function shall fail if:

34262 [EINVAL] The `gidsetsize` argument is non-zero and less than the number of group IDs  
 34263 that would have been returned.

**34264 EXAMPLES****34265 Getting the Supplementary Group IDs of the Calling Process**

34266 The following example places the current supplementary group IDs of the calling process into  
 34267 the `group` array.

```
34268 #include <sys/types.h>
34269 #include <unistd.h>
34270 ...
34271 gid_t *group;
34272 int ngroups;
34273 long ngroups_max;
34274 ngroups_max = sysconf(_SC_NGROUPS_MAX) + 1;
34275 group = (gid_t *)malloc(ngroups_max * sizeof(gid_t));
34276 ngroups = getgroups(ngroups_max, group);
```

**34277 APPLICATION USAGE**

34278 None.

**34279 RATIONALE**

34280 The related function `setgroups()` is a privileged operation and therefore is not covered by this  
 34281 volume of POSIX.1-2008.

34282 As implied by the definition of supplementary groups, the effective group ID may appear in the

**getgroups()**

34283 array returned by *getgroups()* or it may be returned only by *getegid()*. Duplication may exist, but  
 34284 the application needs to call *getegid()* to be sure of getting all of the information. Various  
 34285 implementation variations and administrative sequences cause the set of groups appearing in  
 34286 the result of *getgroups()* to vary in order and as to whether the effective group ID is included,  
 34287 even when the set of groups is the same (in the mathematical sense of “set”). (The history of a  
 34288 process and its parents could affect the details of the result.)

34289 Application developers should note that {NGROUPS\_MAX} is not necessarily a constant on all  
 34290 implementations.

**FUTURE DIRECTIONS**

34291 None.

**SEE ALSO**

34292 *getegid()*, *setgid()*

34293 XBD [<sys/types.h>](#), [<unistd.h>](#)

**CHANGE HISTORY**

34294 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 5**

34295 Normative text previously in the APPLICATION USAGE section is moved to the  
 34296 DESCRIPTION.

**Issue 6**

34297 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

34298 The following new requirements on POSIX implementations derive from alignment with the  
 34299 Single UNIX Specification:

- 34300 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
 34301 required for conforming implementations of previous POSIX specifications, it was not  
 34302 required for UNIX applications.
- 34303 • A return value of 0 is not permitted, because {NGROUPS\_MAX} cannot be 0. This is a FIPS  
 34304 requirement.

34305 The following changes were made to align with the IEEE P1003.1a draft standard:

- 34306 • An explanation is added that the effective group ID may be included in the supplementary  
 34307 group list.

*System Interfaces***gethostent()**

34313 **NAME**  
34314       gethostent — network host database functions

34315 **SYNOPSIS**  
34316       #include <netdb.h>  
34317       struct hostent \*gethostent(void);

34318 **DESCRIPTION**  
34319       Refer to *endhostent()*.

34344 **Issue 5**

34345       Moved from X/OPEN UNIX extension to BASE.

34346 **NAME**

34347       gethostname — get name of current host

34348 **SYNOPSIS**

34349       #include &lt;unistd.h&gt;

34350       int gethostname(char \*name, size\_t namelen);

34351 **DESCRIPTION**

34352       The *gethostname()* function shall return the standard host name for the current machine. The

34353       *namelen* argument shall specify the size of the array pointed to by the *name* argument. The

34354       returned name shall be null-terminated, except that if *namelen* is an insufficient length to hold

34355       the host name, then the returned name shall be truncated and it is unspecified whether the

34356       returned name is null-terminated.

34357       Host names are limited to {HOST\_NAME\_MAX} bytes.

34358 **RETURN VALUE**

34359       Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned.

34360 **ERRORS**

34361       No errors are defined.

34362 **EXAMPLES**

34363       None.

34367       None.

34368 **FUTURE DIRECTIONS**

34369       None.

34370 **SEE ALSO**34371       *gethostid()*, *uname()*

34372       XBD &lt;unistd.h&gt;

34373 **CHANGE HISTORY**

34374       First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

34375       The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter from

34376       *socklen\_t* to *size\_t*.

**getitimer()**34377 **NAME**34378 `getitimer, setitimer` — get and set value of interval timer34379 **SYNOPSIS**

```

34380 OB XSI #include <sys/time.h>
34381
34381 int getitimer(int which, struct itimerval *value);
34382 int setitimer(int which, const struct itimerval *restrict value,
34383              struct itimerval *restrict ovalue);

```

34384 **DESCRIPTION**

34385 The `getitimer()` function shall store the current value of the timer specified by *which* into the  
 34386 structure pointed to by *value*. The `setitimer()` function shall set the timer specified by *which* to the  
 34387 value specified in the structure pointed to by *value*, and if *ovalue* is not a null pointer, store the  
 34388 previous value of the timer in the structure pointed to by *ovalue*.

34389 A timer value is defined by the **itimerval** structure, specified in `<sys/time.h>`. If *it\_value* is non-  
 34390 zero, it shall indicate the time to the next timer expiration. If *it\_interval* is non-zero, it shall  
 34391 specify a value to be used in reloading *it\_value* when the timer expires. Setting *it\_value* to 0 shall  
 34392 disable a timer, regardless of the value of *it\_interval*. Setting *it\_interval* to 0 shall disable a timer  
 34393 after its next expiration (assuming *it\_value* is non-zero).

34394 Implementations may place limitations on the granularity of timer values. For each interval  
 34395 timer, if the requested timer value requires a finer granularity than the implementation supports,  
 34396 the actual timer value shall be rounded up to the next supported value.

34397 An XSI-conforming implementation provides each process with at least three interval timers,  
 34398 which are indicated by the *which* argument:

34399 **ITIMER\_PROF** Decrements both in process virtual time and when the system is running  
 34400 on behalf of the process. It is designed to be used by interpreters in  
 34401 statistically profiling the execution of interpreted programs. Each time the  
 34402 **ITIMER\_PROF** timer expires, the **SIGPROF** signal is delivered.

34403 **ITIMER\_REAL** Decrements in real time. A **SIGALRM** signal is delivered when this timer  
 34404 expires.

34405 **ITIMER\_VIRTUAL** Decrements in process virtual time. It runs only when the process is  
 34406 executing. A **SIGVTALRM** signal is delivered when it expires.

34407 The interaction between `setitimer()` and `alarm()` or `sleep()` is unspecified.

34408 **RETURN VALUE**

34409 Upon successful completion, `getitimer()` or `setitimer()` shall return 0; otherwise, -1 shall be  
 34410 returned and *errno* set to indicate the error.

34411 **ERRORS**

34412 The `setitimer()` function shall fail if:

34413 **[EINVAL]** The *value* argument is not in canonical form. (In canonical form, the number of  
 34414 microseconds is a non-negative integer less than 1 000 000 and the number of  
 34415 seconds is a non-negative integer.)

34416 The `getitimer()` and `setitimer()` functions may fail if:

34417 **[EINVAL]** The *which* argument is not recognized.

34418 **EXAMPLES**

34419 None.

34420 **APPLICATION USAGE**34421 Applications should use the *timer\_gettime()* and *timer\_settime()* functions instead of the  
34422 obsolescent *getitimer()* and *setitimer()* functions, respectively.34423 **RATIONALE**

34424 None.

34425 **FUTURE DIRECTIONS**34426 The *getitimer()* and *setitimer()* functions may be removed in a future version.34427 **SEE ALSO**34428 *alarm()*, *exec*, *sleep()*, *timer\_getoverrun()*34429 XBD [<signal.h>](#), [<sys/time.h>](#)34430 **CHANGE HISTORY**

34431 First released in Issue 4, Version 2.

34432 **Issue 5**

34433 Moved from X/OPEN UNIX extension to BASE.

34434 **Issue 6**34435 The **restrict** keyword is added to the *setitimer()* prototype for alignment with the  
34436 ISO/IEC 9899:1999 standard.34437 **Issue 7**34438 The *getitimer()* and *setitimer()* functions are marked obsolescent.

**getline()**34439 **NAME**34440 `getline` — read a delimited record from *stream*34441 **SYNOPSIS**

```
34442 CX #include <stdio.h>  
34443      ssize_t getline(char **restrict lineptr, size_t *restrict n,  
34444                  FILE *restrict stream);
```

34445 **DESCRIPTION**34446 Refer to *getdelim()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

34447 **NAME**34448 `getlogin, getlogin_r` — get login name34449 **SYNOPSIS**

```
34450 #include <unistd.h>
34451 char *getlogin(void);
34452 int getlogin_r(char *name, size_t namesize);
```

34453 **DESCRIPTION**

34454 The `getlogin()` function shall return a pointer to a string containing the user name associated by  
 34455 the login activity with the controlling terminal of the current process. If `getlogin()` returns a non-  
 34456 null pointer, then that pointer points to the name that the user logged in under, even if there are  
 34457 several login names with the same user ID.

34458 The `getlogin()` function need not be thread-safe.

34459 The `getlogin_r()` function shall put the name associated by the login activity with the controlling  
 34460 terminal of the current process in the character array pointed to by `name`. The array is `namesize`  
 34461 characters long and should have space for the name and the terminating null character. The  
 34462 maximum size of the login name is {LOGIN\_NAME\_MAX}.

34463 If `getlogin_r()` is successful, `name` points to the name the user used at login, even if there are  
 34464 several login names with the same user ID.

34465 **RETURN VALUE**

34466 Upon successful completion, `getlogin()` shall return a pointer to the login name or a null pointer  
 34467 if the user's login name cannot be found. Otherwise, it shall return a null pointer and set `errno` to  
 34468 indicate the error.

34469 The return value from `getlogin()` may point to static data whose content is overwritten by each  
 34470 call.

34471 If successful, the `getlogin_r()` function shall return zero; otherwise, an error number shall be  
 34472 returned to indicate the error.

34473 **ERRORS**

34474 These functions may fail if:

- 34475 [EMFILE] All file descriptors available to the process are currently open.
- 34476 [ENFILE] The maximum allowable number of files is currently open in the system.
- 34477 [ENXIO] The calling process has no controlling terminal.

34478 The `getlogin_r()` function may fail if:

- 34479 [ERANGE] The value of `namesize` is smaller than the length of the string to be returned  
 34480 including the terminating null character.

34481 **EXAMPLES**34482 **Getting the User Login Name**

34483 The following example calls the `getlogin()` function to obtain the name of the user associated  
 34484 with the calling process, and passes this information to the `getpwnam()` function to get the  
 34485 associated user database information.

```
34486 #include <unistd.h>
34487 #include <sys/types.h>
34488 #include <pwd.h>
```

**getlogin()**

```

34489     #include <stdio.h>
34490     ...
34491     char *lgn;
34492     struct passwd *pw;
34493     ...
34494     if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
34495         fprintf(stderr, "Get of user information failed.\n"); exit(1);
34496     }

```

**APPLICATION USAGE**

Three names associated with the current process can be determined: *getpwuid(geteuid())* shall return the name associated with the effective user ID of the process; *getlogin()* shall return the name associated with the current login activity; and *getpwuid(getuid())* shall return the name associated with the real user ID of the process.

The *getlogin\_r()* function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

**RATIONALE**

The *getlogin()* function returns a pointer to the user's login name. The same user ID may be shared by several login names. If it is desired to get the user database entry that is used during login, the result of *getlogin()* should be used to provide the argument to the *getpwnam()* function. (This might be used to determine the user's login shell, particularly where a single user has multiple login shells with distinct login names, but the same user ID.)

The information provided by the *cuserid()* function, which was originally defined in the POSIX.1-1988 standard and subsequently removed, can be obtained by the following:

```
getpwuid(geteuid())
```

while the information provided by historical implementations of *cuserid()* can be obtained by:

```
getpwuid(getuid())
```

The thread-safe version of this function places the user name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*getpwnam()*, *getpwuid()*, *geteuid()*, *getuid()*

XBD [<limits.h>](#), [<unistd.h>](#)

**CHANGE HISTORY**

First released in Issue 1. Derived from System V Release 2.0.

**Issue 5**

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getlogin\_r()* function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getlogin()* function need not be reentrant is added to the DESCRIPTION.

34531 **Issue 6**

34532 The *getlogin\_r()* function is marked as part of the Thread-Safe Functions option.

34533 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

34534 The following new requirements on POSIX implementations derive from alignment with the  
34535 Single UNIX Specification:

34536 • In the RETURN VALUE section, the requirement to set *errno* on error is added.

34537 • The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

34538 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
34539 its avoidance of possibly using a static data area.

34540 **Issue 7**

34541 Austin Group Interpretation 1003.1-2001 #156 is applied.

34542 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

34543 The *getlogin\_r()* function is moved from the Thread-Safe Functions option to the Base.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**getmsg()**34544 **NAME**34545 `getmsg, getpmsg` — receive next message from a STREAMS file (**STREAMS**)34546 **SYNOPSIS**

```

34547 OB XSR #include <stropts.h>
34548 int getmsg(int fildev, struct strbuf *restrict ctlptr,
34549           struct strbuf *restrict dataptr, int *restrict flagsp);
34550 int getpmsg(int fildev, struct strbuf *restrict ctlptr,
34551            struct strbuf *restrict dataptr, int *restrict bandp,
34552            int *restrict flagsp);

```

34553 **DESCRIPTION**

34554 The `getmsg()` function shall retrieve the contents of a message located at the head of the  
 34555 STREAM head read queue associated with a STREAMS file and place the contents into one or  
 34556 more buffers. The message contains either a data part, a control part, or both. The data and  
 34557 control parts of the message shall be placed into separate buffers, as described below. The  
 34558 semantics of each part are defined by the originator of the message.

34559 The `getpmsg()` function shall be equivalent to `getmsg()`, except that it provides finer control over  
 34560 the priority of the messages received. Except where noted, all requirements on `getmsg()` also  
 34561 pertain to `getpmsg()`.

34562 The *fildev* argument specifies a file descriptor referencing a STREAMS-based file.

34563 The *ctlptr* and *dataptr* arguments each point to a `strbuf` structure, in which the *buf* member points  
 34564 to a buffer in which the data or control information is to be placed, and the *maxlen* member  
 34565 indicates the maximum number of bytes this buffer can hold. On return, the *len* member shall  
 34566 contain the number of bytes of data or control information actually received. The *len* member  
 34567 shall be set to 0 if there is a zero-length control or data part and *len* shall be set to -1 if no data or  
 34568 control information is present in the message.

34569 When `getmsg()` is called, *flagsp* should point to an integer that indicates the type of message the  
 34570 process is able to receive. This is described further below.

34571 The *ctlptr* argument is used to hold the control part of the message, and *dataptr* is used to hold  
 34572 the data part of the message. If *ctlptr* (or *dataptr*) is a null pointer or the *maxlen* member is -1, the  
 34573 control (or data) part of the message shall not be processed and shall be left on the STREAM  
 34574 head read queue, and if the *ctlptr* (or *dataptr*) is not a null pointer, *len* shall be set to -1. If the  
 34575 *maxlen* member is set to 0 and there is a zero-length control (or data) part, that zero-length part  
 34576 shall be removed from the read queue and *len* shall be set to 0. If the *maxlen* member is set to 0  
 34577 and there are more than 0 bytes of control (or data) information, that information shall be left on  
 34578 the read queue and *len* shall be set to 0. If the *maxlen* member in *ctlptr* (or *dataptr*) is less than the  
 34579 control (or data) part of the message, *maxlen* bytes shall be retrieved. In this case, the remainder  
 34580 of the message shall be left on the STREAM head read queue and a non-zero return value shall  
 34581 be provided.

34582 By default, `getmsg()` shall process the first available message on the STREAM head read queue.  
 34583 However, a process may choose to retrieve only high-priority messages by setting the integer  
 34584 pointed to by *flagsp* to `RS_HIPRI`. In this case, `getmsg()` shall only process the next message if it is  
 34585 a high-priority message. When the integer pointed to by *flagsp* is 0, any available message shall  
 34586 be retrieved. In this case, on return, the integer pointed to by *flagsp* shall be set to `RS_HIPRI` if a  
 34587 high-priority message was retrieved, or 0 otherwise.

34588 For `getpmsg()`, the flags are different. The *flagsp* argument points to a bitmask with the following  
 34589 mutually-exclusive flags defined: `MSG_HIPRI`, `MSG_BAND`, and `MSG_ANY`. Like `getmsg()`,

34590 *getpmsg()* shall process the first available message on the STREAM head read queue. A process  
 34591 may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to  
 34592 MSG\_HIPRI and the integer pointed to by *bandp* to 0. In this case, *getpmsg()* shall only process  
 34593 the next message if it is a high-priority message. In a similar manner, a process may choose to  
 34594 retrieve a message from a particular priority band by setting the integer pointed to by *flagsp* to  
 34595 MSG\_BAND and the integer pointed to by *bandp* to the priority band of interest. In this case,  
 34596 *getpmsg()* shall only process the next message if it is in a priority band equal to, or greater than  
 34597 the integer pointed to by *bandp*, or if it is a high-priority message. If a process wants to get the  
 34598 first message off the queue, the integer pointed to by *flagsp* should be set to MSG\_ANY and the  
 34599 integer pointed to by *bandp* should be set to 0. On return, if the message retrieved was a high-  
 34600 priority message, the integer pointed to by *flagsp* shall be set to MSG\_HIPRI and the integer  
 34601 pointed to by *bandp* shall be set to 0. Otherwise, the integer pointed to by *flagsp* shall be set to  
 34602 MSG\_BAND and the integer pointed to by *bandp* shall be set to the priority band of the message.

34603 If O\_NONBLOCK is not set, *getmsg()* and *getpmsg()* shall block until a message of the type  
 34604 specified by *flagsp* is available at the front of the STREAM head read queue. If O\_NONBLOCK is  
 34605 set and a message of the specified type is not present at the front of the read queue, *getmsg()* and  
 34606 *getpmsg()* shall fail and set *errno* to [EAGAIN].

34607 If a hangup occurs on the STREAM from which messages are retrieved, *getmsg()* and *getpmsg()*  
 34608 shall continue to operate normally, as described above, until the STREAM head read queue is  
 34609 empty. Thereafter, they shall return 0 in the *len* members of *ctlptr* and *dataptr*.

#### 34610 RETURN VALUE

34611 Upon successful completion, *getmsg()* and *getpmsg()* shall return a non-negative value. A value  
 34612 of 0 indicates that a full message was read successfully. A return value of MORECTL indicates  
 34613 that more control information is waiting for retrieval. A return value of MOREDATA indicates  
 34614 that more data is waiting for retrieval. A return value of the bitwise-logical OR of MORECTL  
 34615 and MOREDATA indicates that both types of information remain. Subsequent *getmsg()* and  
 34616 *getpmsg()* calls shall retrieve the remainder of the message. However, if a message of higher  
 34617 priority has come in on the STREAM head read queue, the next call to *getmsg()* or *getpmsg()*  
 34618 shall retrieve that higher-priority message before retrieving the remainder of the previous  
 34619 message.

34620 If the high priority control part of the message is consumed, the message shall be placed back on  
 34621 the queue as a normal message of band 0. Subsequent *getmsg()* and *getpmsg()* calls shall retrieve  
 34622 the remainder of the message. If, however, a priority message arrives or already exists on the  
 34623 STREAM head, the subsequent call to *getmsg()* or *getpmsg()* shall retrieve the higher-priority  
 34624 message before retrieving the remainder of the message that was put back.

34625 Upon failure, *getmsg()* and *getpmsg()* shall return -1 and set *errno* to indicate the error.

#### 34626 ERRORS

34627 The *getmsg()* and *getpmsg()* functions shall fail if:

34628	[EAGAIN]	The O_NONBLOCK flag is set and no messages are available.
34629	[EBADF]	The <i>fildev</i> argument is not a valid file descriptor open for reading.
34630	[EBADMSG]	The queued message to be read is not valid for <i>getmsg()</i> or <i>getpmsg()</i> or a pending file descriptor is at the STREAM head.
34631		
34632	[EINTR]	A signal was caught during <i>getmsg()</i> or <i>getpmsg()</i> .
34633	[EINVAL]	An illegal value was specified by <i>flagsp</i> , or the STREAM or multiplexer referenced by <i>fildev</i> is linked (directly or indirectly) downstream from a multiplexer.
34634		
34635		

**getmsg()**

34636 [ENOSTR] A STREAM is not associated with *fildev*.

34637 In addition, *getmsg()* and *getpmsg()* shall fail if the STREAM head had processed an

34638 asynchronous error before the call. In this case, the value of *errno* does not reflect the result of

34639 *getmsg()* or *getpmsg()* but reflects the prior error.

34640 **EXAMPLES**34641 **Getting Any Message**

34642 In the following example, the value of *fd* is assumed to refer to an open STREAMS file. The call

34643 to *getmsg()* retrieves any available message on the associated STREAM-head read queue,

34644 returning control and data information to the buffers pointed to by *ctrlbuf* and *databuf*,

34645 respectively.

```
34646 #include <stropts.h>
34647 ...
34648 int fd;
34649 char ctrlbuf[128];
34650 char databuf[512];
34651 struct strbuf ctrl;
34652 struct strbuf data;
34653 int flags = 0;
34654 int ret;

34655 ctrl.buf = ctrlbuf;
34656 ctrl.maxlen = sizeof(ctrlbuf);

34657 data.buf = databuf;
34658 data.maxlen = sizeof(databuf);

34659 ret = getmsg (fd, &ctrl, &data, &flags);
```

34660 **Getting the First Message off the Queue**

34661 In the following example, the call to *getpmsg()* retrieves the first available message on the

34662 associated STREAM-head read queue.

```
34663 #include <stropts.h>
34664 ...
34665 int fd;
34666 char ctrlbuf[128];
34667 char databuf[512];
34668 struct strbuf ctrl;
34669 struct strbuf data;
34670 int band = 0;
34671 int flags = MSG_ANY;
34672 int ret;

34673 ctrl.buf = ctrlbuf;
34674 ctrl.maxlen = sizeof(ctrlbuf);

34675 data.buf = databuf;
34676 data.maxlen = sizeof(databuf);

34677 ret = getpmsg (fd, &ctrl, &data, &band, &flags);
```

**34678 APPLICATION USAGE**

34679 None.

**34680 RATIONALE**

34681 None.

**34682 FUTURE DIRECTIONS**

34683 The *getmsg()* and *getpmsg()* functions may be removed in a future version.

**34687 CHANGE HISTORY**

34688 First released in Issue 4, Version 2.

**34689 Issue 5**

34690 Moved from X/OPEN UNIX extension to BASE.

34691 A paragraph regarding “high-priority control parts of messages” is added to the RETURN  
34692 VALUE section.

**34693 Issue 6**

34694 This function is marked as part of the XSI STREAMS Option Group.

34695 The **restrict** keyword is added to the *getmsg()* and *getpmsg()* prototypes for alignment with the  
34696 ISO/IEC 9899:1999 standard.

**34697 Issue 7**

34698 The *getmsg()* and *getpmsg()* functions are marked obsolescent.

**getnameinfo()**34699 **NAME**34700 `getnameinfo` — get name information34701 **SYNOPSIS**34702 `#include <sys/socket.h>`34703 `#include <netdb.h>`

```
34704 int getnameinfo(const struct sockaddr *restrict sa, socklen_t salen,
34705                char *restrict node, socklen_t nodelen, char *restrict service,
34706                socklen_t servicelen, int flags);
```

34707 **DESCRIPTION**

34708 The `getnameinfo()` function shall translate a socket address to a node name and service location,  
 34709 all of which are defined as in `freeaddrinfo()`.

34710 The `sa` argument points to a socket address structure to be translated.

34711 IP6 If the socket address structure contains an IPv4-mapped IPv6 address or an IPv4-compatible  
 34712 IPv6 address, the implementation shall extract the embedded IPv4 address and lookup the node  
 34713 name for that IPv4 address.

34714 If the address is the IPv6 unspecified address ("`:::`"), a lookup shall not be performed and the  
 34715 behavior shall be the same as when the node's name cannot be located.

34716 If the `node` argument is non-NULL and the `nodelen` argument is non-zero, then the `node` argument  
 34717 points to a buffer able to contain up to `nodelen` characters that receives the node name as a null-  
 34718 terminated string. If the `node` argument is NULL or the `nodelen` argument is zero, the node name  
 34719 shall not be returned. If the node's name cannot be located, the numeric form of the address  
 34720 contained in the socket address structure pointed to by the `sa` argument is returned instead of its  
 34721 name.

34722 If the `service` argument is non-NULL and the `servicelen` argument is non-zero, then the `service`  
 34723 argument points to a buffer able to contain up to `servicelen` bytes that receives the service name  
 34724 as a null-terminated string. If the `service` argument is NULL or the `servicelen` argument is zero,  
 34725 the service name shall not be returned. If the service's name cannot be located, the numeric form  
 34726 of the service address (for example, its port number) shall be returned instead of its name.

34727 The `flags` argument is a flag that changes the default actions of the function. By default the fully-  
 34728 qualified domain name (FQDN) for the host shall be returned, but:

- 34729 • If the flag bit `NI_NOFQDN` is set, only the node name portion of the FQDN shall be  
 34730 returned for local hosts.
- 34731 • If the flag bit `NI_NUMERICHOST` is set, the numeric form of the address contained in the  
 34732 socket address structure pointed to by the `sa` argument shall be returned instead of its  
 34733 name.
- 34734 • If the flag bit `NI_NAMEREQD` is set, an error shall be returned if the host's name cannot  
 34735 be located.
- 34736 • If the flag bit `NI_NUMERICSERV` is set, the numeric form of the service address shall be  
 34737 returned (for example, its port number) instead of its name.
- 34738 • If the flag bit `NI_NUMERICSERVICE` is set, the numeric form of the scope identifier shall be  
 34739 returned (for example, interface index) instead of its name. This flag shall be ignored if the  
 34740 `sa` argument is not an IPv6 address.
- 34741 • If the flag bit `NI_DGRAM` is set, this indicates that the service is a datagram service  
 34742 (`SOCK_DGRAM`). The default behavior shall assume that the service is a stream service  
 34743 (`SOCK_STREAM`).

34744 **Notes:**

- 34745 1. The two NI\_NUMERICxxx flags are required to support the -n flag that many  
34746 commands provide.
- 34747 2. The NI\_DGRAM flag is required for the few AF\_INET and AF\_INET6 port numbers (for  
34748 example, [512,514]) that represent different services for UDP and TCP.

34749 The *getnameinfo()* function shall be thread-safe.

34750 **RETURN VALUE**

34751 A zero return value for *getnameinfo()* indicates successful completion; a non-zero return value  
34752 indicates failure. The possible values for the failures are listed in the ERRORS section.

34753 Upon successful completion, *getnameinfo()* shall return the *node* and *service* names, if requested,  
34754 in the buffers provided. The returned names are always null-terminated strings.

34755 **ERRORS**

34756 The *getnameinfo()* function shall fail and return the corresponding value if:

34757 [EAI\_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

34758 [EAI\_BADFLAGS]

34759 The *flags* had an invalid value.

34760 [EAI\_FAIL] A non-recoverable error occurred.

34761 [EAI\_FAMILY] The address family was not recognized or the address length was invalid for  
34762 the specified family.

34763 [EAI\_MEMORY] There was a memory allocation failure.

34764 [EAI\_NONAME] The name does not resolve for the supplied parameters.

34765 NI\_NAMEREQD is set and the host's name cannot be located, or both  
34766 *nodename* and *servname* were null.

34767 [EAI\_OVERFLOW]

34768 An argument buffer overflowed. The buffer pointed to by the *node* argument  
34769 or the *service* argument was too small.

34770 [EAI\_SYSTEM] A system error occurred. The error code can be found in *errno*.

34771 **EXAMPLES**

34772 None.

34773 **APPLICATION USAGE**

34774 If the returned values are to be used as part of any further name resolution (for example, passed  
34775 to *getaddrinfo()*), applications should provide buffers large enough to store any result possible on  
34776 the system.

34777 Given the IPv4-mapped IPv6 address "::ffff:1.2.3.4", the implementation performs a  
34778 lookup as if the socket address structure contains the IPv4 address "1.2.3.4".

34779 The IPv6 unspecified address ("::") and the IPv6 loopback address ("::1") are not  
34780 IPv4-compatible addresses.

34781 **RATIONALE**

34782 None.

**getnameinfo()**34783 **FUTURE DIRECTIONS**

34784 None.

**getopt()**34808 **NAME**34809 `getopt, optarg, opterr, optind, optopt` — command option parsing34810 **SYNOPSIS**

```
34811 #include <unistd.h>
34812 int getopt(int argc, char * const argv[], const char *optstring);
34813 extern char *optarg;
34814 extern int opterr, optind, optopt;
```

34815 **DESCRIPTION**

34816 The `getopt()` function is a command-line parser that shall follow Utility Syntax Guidelines 3, 4, 5,  
34817 6, 7, 9, and 10 in XBD Section 12.2 (on page 215).

34818 The parameters `argc` and `argv` are the argument count and argument array as passed to `main()`  
34819 (see `exec()`). The argument `optstring` is a string of recognized option characters; if a character is  
34820 followed by a <colon>, the option takes an argument. All option characters allowed by Utility  
34821 Syntax Guideline 3 are allowed in `optstring`. The implementation may accept other characters as  
34822 an extension.

34823 The variable `optind` is the index of the next element of the `argv[]` vector to be processed. It shall  
34824 be initialized to 1 by the system, and `getopt()` shall update it when it finishes with each element  
34825 of `argv[]`. When an element of `argv[]` contains multiple option characters, it is unspecified how  
34826 `getopt()` determines which options have already been processed.

34827 The `getopt()` function shall return the next option character (if one is found) from `argv` that  
34828 matches a character in `optstring`, if there is one that matches. If the option takes an argument,  
34829 `getopt()` shall set the variable `optarg` to point to the option-argument as follows:

- 34830 1. If the option was the last character in the string pointed to by an element of `argv`, then  
34831 `optarg` shall contain the next element of `argv`, and `optind` shall be incremented by 2. If the  
34832 resulting value of `optind` is greater than `argc`, this indicates a missing option-argument,  
34833 and `getopt()` shall return an error indication.
- 34834 2. Otherwise, `optarg` shall point to the string following the option character in that element  
34835 of `argv`, and `optind` shall be incremented by 1.

34836 If, when `getopt()` is called:

```
34837 argv[optind] is a null pointer
34838 *argv[optind] is not the character -
34839 argv[optind] points to the string "-"
```

34840 `getopt()` shall return `-1` without changing `optind`. If:

```
34841 argv[optind] points to the string "--"
```

34842 `getopt()` shall return `-1` after incrementing `optind`.

34843 If `getopt()` encounters an option character that is not contained in `optstring`, it shall return the  
34844 <question-mark> ('?') character. If it detects a missing option-argument, it shall return the  
34845 <colon> character (':') if the first character of `optstring` was a <colon>, or a <question-mark>  
34846 character ('?') otherwise. In either case, `getopt()` shall set the variable `optopt` to the option  
34847 character that caused the error. If the application has not set the variable `opterr` to 0 and the first  
34848 character of `optstring` is not a <colon>, `getopt()` shall also print a diagnostic message to `stderr`  
34849 in the format specified for the `getopts` utility.

34850 The `getopt()` function need not be thread-safe.

34851 **RETURN VALUE**

34852 The *getopt()* function shall return the next option character specified on the command line.

34853 A <colon> (':') shall be returned if *getopt()* detects a missing argument and the first character  
34854 of *optstring* was a <colon> (':').

34855 A <question-mark> ('?') shall be returned if *getopt()* encounters an option character not in  
34856 *optstring* or detects a missing argument and the first character of *optstring* was not a <colon>  
34857 (':').

34858 Otherwise, *getopt()* shall return -1 when all command line options are parsed.

34859 **ERRORS**

34860 No errors are defined.

34861 **EXAMPLES**34862 **Parsing Command Line Options**

34863 The following code fragment shows how you might process the arguments for a utility that can  
34864 take the mutually-exclusive options *a* and *b* and the options *f* and *o*, both of which require  
34865 arguments:

```
34866 #include <unistd.h>
34867
34868 int
34869 main(int argc, char *argv[ ])
34870 {
34871     int c;
34872     int bflg, aflag, errflag;
34873     char *ifile;
34874     char *ofile;
34875     extern char *optarg;
34876     extern int optind, optopt;
34877     . . .
34878     while ((c = getopt(argc, argv, ":abf:o:")) != -1) {
34879         switch(c)
34880         case 'a':
34881             if (bflg)
34882                 errflag++;
34883             else
34884                 aflag++;
34885             break;
34886         case 'b':
34887             if (aflag)
34888                 errflag++;
34889             else {
34890                 bflg++;
34891                 bproc();
34892             }
34893             break;
34894         case 'f':
34895             ifile = optarg;
34896             break;
34897         case 'o':
34898             ofile = optarg;
```

**getopt()**

```

34898         break;
34899         case ':': /* -f or -o without operand */
34900             fprintf(stderr,
34901                 "Option -%c requires an operand\n", optopt);
34902             errflg++;
34903             break;
34904         case '?':
34905             fprintf(stderr,
34906                 "Unrecognized option: -%c\n", optopt);
34907             errflg++;
34908     }
34909 }
34910 if (errflg) {
34911     fprintf(stderr, "usage: . . . ");
34912     exit(2);
34913 }
34914 for ( ; optind < argc; optind++) {
34915     if (access(argv[optind], R_OK)) {
34916         . . .
34917     }

```

34918 This code accepts any of the following as equivalent:

```

34919 cmd -ao arg path path
34920 cmd -a -o arg path path
34921 cmd -o arg -a path path
34922 cmd -a -o arg -- path path
34923 cmd -a -oarg path path
34924 cmd -aoarg path path

```

### 34925 **Checking Options and Arguments**

34926 The following example parses a set of command line options and prints messages to standard  
34927 output for each option and argument that it encounters.

```

34928 #include <unistd.h>
34929 #include <stdio.h>
34930 ...
34931 int c;
34932 char *filename;
34933 extern char *optarg;
34934 extern int optind, optopt, opterr;
34935 . . .
34936 while ((c = getopt(argc, argv, "abf:")) != -1) {
34937     switch(c) {
34938         case 'a':
34939             printf("a is set\n");
34940             break;
34941         case 'b':
34942             printf("b is set\n");
34943             break;
34944         case 'f':
34945             filename = optarg;

```

```

34946         printf("filename is %s\n", filename);
34947         break;
34948     case ':':
34949         printf("-%c without filename\n", optopt);
34950         break;
34951     case '?':
34952         printf("unknown arg %c\n", optopt);
34953         break;
34954     }
34955 }

```

### 34956 Selecting Options from the Command Line

34957 The following example selects the type of database routines the user wants to use based on the  
34958 *Options* argument.

```

34959 #include <unistd.h>
34960 #include <string.h>
34961 ...
34962 char *Options = "hdbt1";
34963 ...
34964 int dbtype, i;

34969 while ((c = getopt(argc, argv, Options)) != -1) {
34970     if ((st = strchr(Options, c)) != NULL) {
34971         dbtype = st - Options;
34972         break;
34973     }
34974 }

```

### 34975 APPLICATION USAGE

34976 The *getopt()* function is only required to support option characters included in Utility Syntax  
34977 Guideline 3. Many historical implementations of *getopt()* support other characters as options.  
34978 This is an allowed extension, but applications that use extensions are not maximally portable.  
34979 Note that support for multi-byte option characters is only possible when such characters can be  
34980 represented as type **int**.

### 34981 RATIONALE

34982 The *optopt* variable represents historical practice and allows the application to obtain the identity  
34983 of the invalid option.

34984 The description has been written to make it clear that *getopt()*, like the *getopts* utility, deals with  
34985 option-arguments whether separated from the option by <blank> characters or not. Note that  
34986 the requirements on *getopt()* and *getopts* are more stringent than the Utility Syntax Guidelines.

34987 The *getopt()* function shall return  $-1$ , rather than EOF, so that **<stdio.h>** is not required.

34988 The special significance of a <colon> as the first character of *optstring* makes *getopt()* consistent  
34989 with the *getopts* utility. It allows an application to make a distinction between a missing  
34990 argument and an incorrect option letter without having to examine the option letter. It is true  
34991 that a missing argument can only be detected in one case, but that is a case that has to be  
34992 considered.

35005 **NAME**

35006 getpeername — get the name of the peer socket

35007 **SYNOPSIS**

35008 #include &lt;sys/socket.h&gt;

35009 int getpeername(int *socket*, struct sockaddr \*restrict *address*,  
35010 socklen\_t \*restrict *address\_len*);35011 **DESCRIPTION**35012 The *getpeername()* function shall retrieve the peer address of the specified socket, store this  
35013 address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this  
35014 address in the object pointed to by the *address\_len* argument.35015 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,  
35016 the stored address shall be truncated.35017 If the protocol permits connections by unbound clients, and the peer is not bound, then the  
35018 value stored in the object pointed to by *address* is unspecified.35019 **RETURN VALUE**35020 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
35021 indicate the error.35022 **ERRORS**35023 The *getpeername()* function shall fail if:35024 [EBADF] The *socket* argument is not a valid file descriptor.

35025 [EINVAL] The socket has been shut down.

35026 [ENOTCONN] The socket is not connected or otherwise has not had the peer pre-specified.

35027 [ENOTSOCK] The *socket* argument does not refer to a socket.

35028 [EOPNOTSUPP] The operation is not supported for the socket protocol.

35029 The *getpeername()* function may fail if:

35030 [ENOBUFS] Insufficient resources were available in the system to complete the call.

35180           XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

35181 **CHANGE HISTORY**

35182           First released in Issue 1. Derived from Issue 1 of the SVID.

35183 **Issue 6**

35184           In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

35185           The following new requirements on POSIX implementations derive from alignment with the  
35186           Single UNIX Specification:

- 35187           • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
35188           required for conforming implementations of previous POSIX specifications, it was not  
35189           required for UNIX applications.

**getpriority()**35190 **NAME**35191 `getpriority, setpriority` — get and set the nice value35192 **SYNOPSIS**

```
35193 XSI      #include <sys/resource.h>
35194
35194      int getpriority(int which, id_t who);
35195      int setpriority(int which, id_t who, int value);
```

35196 **DESCRIPTION**

35197 The `getpriority()` function shall obtain the nice value of a process, process group, or user. The  
 35198 `setpriority()` function shall set the nice value of a process, process group, or user to  
 35199 `value+{NZERO}`.

35200 Target processes are specified by the values of the `which` and `who` arguments. The `which`  
 35201 argument may be one of the following values: `PRIO_PROCESS`, `PRIO_PGRP`, or `PRIO_USER`,  
 35202 indicating that the `who` argument is to be interpreted as a process ID, a process group ID, or an  
 35203 effective user ID, respectively. A 0 value for the `who` argument specifies the current process,  
 35204 process group, or user.

35205 The nice value set with `setpriority()` shall be applied to the process. If the process is multi-  
 35206 threaded, the nice value shall affect all system scope threads in the process.

35207 If more than one process is specified, `getpriority()` shall return value `{NZERO}` less than the  
 35208 lowest nice value pertaining to any of the specified processes, and `setpriority()` shall set the nice  
 35209 values of all of the specified processes to `value+{NZERO}`.

35210 The default nice value is `{NZERO}`; lower nice values shall cause more favorable scheduling.  
 35211 While the range of valid nice values is `[0, {NZERO}*2-1]`, implementations may enforce more  
 35212 restrictive limits. If `value+{NZERO}` is less than the system's lowest supported nice value,  
 35213 `setpriority()` shall set the nice value to the lowest supported value; if `value+{NZERO}` is greater  
 35214 than the system's highest supported nice value, `setpriority()` shall set the nice value to the  
 35215 highest supported value.

35216 Only a process with appropriate privileges can lower its nice value.

35217 PS|TPS Any processes or threads using `SCHED_FIFO` or `SCHED_RR` shall be unaffected by a call to  
 35218 `setpriority()`. This is not considered an error. A process which subsequently reverts to  
 35219 `SCHED_OTHER` need not have its priority affected by such a `setpriority()` call.

35220 The effect of changing the nice value may vary depending on the process-scheduling algorithm  
 35221 in effect.

35222 Since `getpriority()` can return the value `-1` upon successful completion, it is necessary to set `errno`  
 35223 to 0 prior to a call to `getpriority()`. If `getpriority()` returns the value `-1`, then `errno` can be checked  
 35224 to see if an error occurred or if the value is a legitimate nice value.

35225 **RETURN VALUE**

35226 Upon successful completion, `getpriority()` shall return an integer in the range `-{NZERO}` to  
 35227 `{NZERO}-1`. Otherwise, `-1` shall be returned and `errno` set to indicate the error.

35228 Upon successful completion, `setpriority()` shall return 0; otherwise, `-1` shall be returned and `errno`  
 35229 set to indicate the error.

35230 **ERRORS**

35231 The *getpriority()* and *setpriority()* functions shall fail if:

35232 [ESRCH] No process could be located using the *which* and *who* argument values  
35233 specified.

35234 [EINVAL] The value of the *which* argument was not recognized, or the value of the *who*  
35235 argument is not a valid process ID, process group ID, or user ID.

35236 In addition, *setpriority()* may fail if:

35237 [EPERM] A process was located, but neither the real nor effective user ID of the  
35238 executing process match the effective user ID of the process whose nice value  
35239 is being changed.

35240 [EACCES] A request was made to change the nice value to a lower numeric value and the  
35241 current process does not have appropriate privileges.

35242 **EXAMPLES**35243 **Using *getpriority()***

35244 The following example returns the current scheduling priority for the process ID returned by the  
35245 call to *getpid()*.

```
35246 #include <sys/resource.h>
35247 ...
35248 int which = PRIO_PROCESS;
35249 id_t pid;
35250 int ret;

35251 pid = getpid();
35252 ret = getpriority(which, pid);
```

35253 **Using *setpriority()***

35254 The following example sets the priority for the current process ID to -20.

```
35255 #include <sys/resource.h>
35256 ...
35257 int which = PRIO_PROCESS;
35258 id_t pid;
35259 int priority = -20;
35260 int ret;

35261 pid = getpid();
35262 ret = setpriority(which, pid, priority);
```

35263 **APPLICATION USAGE**

35264 The *getpriority()* and *setpriority()* functions work with an offset nice value (nice value  
35265  $-\{\text{NZERO}\}$ ). The nice value is in the range  $[0, 2 * \{\text{NZERO}\} - 1]$ , while the return value for  
35266 *getpriority()* and the third parameter for *setpriority()* are in the range  $[-\{\text{NZERO}\}, \{\text{NZERO}\} - 1]$ .

35267 **RATIONALE**

35268 None.

**getpriority()**35269 **FUTURE DIRECTIONS**

35270 None.

35271 **SEE ALSO**35272 *nice()*, *sched\_get\_priority\_max()*, *sched\_setscheduler()*35273 XBD <[sys/resource.h](#)>35274 **CHANGE HISTORY**

35275 First released in Issue 4, Version 2.

35276 **Issue 5**

35277 Moved from X/OPEN UNIX extension to BASE.

35278 The DESCRIPTION is reworded in terms of the nice value rather than *priority* to avoid confusion  
35279 with functionality in the POSIX Realtime Extension.

35290 getpwent — get user database entry

35291 **SYNOPSIS**

```
35292 XSI #include <pwd.h>  
35293 struct passwd *getpwent(void);
```

35294 **DESCRIPTION**35295 Refer to *endpwent()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

35296 **NAME**35297 `getpwnam, getpwnam_r` — search user database for a name35298 **SYNOPSIS**

```
35299 #include <pwd.h>
35300 struct passwd *getpwnam(const char *name);
35301 int getpwnam_r(const char *name, struct passwd *pwd, char *buffer,
35302               size_t bufsize, struct passwd **result);
```

35303 **DESCRIPTION**35304 The `getpwnam()` function shall search the user database for an entry with a matching *name*.35305 The `getpwnam()` function need not be thread-safe.35306 Applications wishing to check for error situations should set *errno* to 0 before calling  
35307 `getpwnam()`. If `getpwnam()` returns a null pointer and *errno* is non-zero, an error occurred.

35308 The `getpwnam_r()` function shall update the **passwd** structure pointed to by *pwd* and store a  
35309 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry  
35310 from the user database with a matching *name*. Storage referenced by the structure is allocated  
35311 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to  
35312 `sysconf(_SC_GETPW_R_SIZE_MAX)` returns either -1 without changing *errno* or an initial value  
35313 suggested for the size of this buffer. A null pointer shall be returned at the location pointed to  
35314 by *result* on error or if the requested entry is not found.

35315 **RETURN VALUE**

35316 The `getpwnam()` function shall return a pointer to a **struct passwd** with the structure as defined  
35317 in `<pwd.h>` with a matching entry if found. A null pointer shall be returned if the requested  
35318 entry is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

35319 The return value may point to a static area which is overwritten by a subsequent call to  
35320 `getpwent()`, `getpwnam()`, or `getpwuid()`.

35321 The `getpwnam_r()` function shall return zero on success or if the requested entry was not found  
35322 and no error has occurred. If an error has occurred, an error number shall be returned to indicate  
35323 the error.

35324 **ERRORS**

35325 These functions may fail if:

35326 [EIO] An I/O error has occurred.

35327 [EINTR] A signal was caught during `getpwnam()`.

35328 [EMFILE] All file descriptors available to the process are currently open.

35329 [ENFILE] The maximum allowable number of files is currently open in the system.

35330 The `getpwnam_r()` function may fail if:

35331 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be  
35332 referenced by the resulting **passwd** structure.

**getpwnam()****EXAMPLES**

35333 Note that *sysconf*(*\_SC\_GETPW\_R\_SIZE\_MAX*) may return *-1* if there is no hard limit on the size  
 35334 of the buffer needed to store all the groups returned. This example shows how an application  
 35335 can allocate a buffer of sufficient size to work with *getpwnam\_r*(*).*  
 35336

```

35337 long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
35338 size_t len;
35339 if (initlen == -1)
35340     /* Default initial length. */
35341     len = 1024;
35342 else
35343     len = (size_t) initlen;
35344 struct passwd result;
35345 struct passwd *resultp;
35346 char *buffer = malloc(len);
35347 if (buffer == NULL)
35348     ...handle error...
35349 int e;
35350 while ((e = getpwnam_r("someuser", &result, buffer, len, &resultp))
35351     == ERANGE)
35352     {
35353     size_t newlen = 2 * len;
35354     if (newlen < len)
35355         ...handle error...
35356     len = newlen;
35357     char *newbuffer = realloc(buffer, len);
35358     if (newbuffer == NULL)
35359         ...handle error...
35360     buffer = newbuffer;
35361     }
35362 if (e != 0)
35363     ...handle error...
35364 free (buffer);

```

**Getting an Entry for the Login Name**

35365 The following example uses the *getlogin*(*)* function to return the name of the user who logged in;  
 35366 this information is passed to the *getpwnam*(*)* function to get the user database entry for that user.  
 35367

```

35368 #include <sys/types.h>
35369 #include <pwd.h>
35370 #include <unistd.h>
35371 #include <stdio.h>
35372 #include <stdlib.h>
35373 ...
35374 char *lgn;
35375 struct passwd *pw;
35376 ...
35377 if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
35378     fprintf(stderr, "Get of user information failed.\n"); exit(1);
35379 }
35380 ...

```

35381 **APPLICATION USAGE**

35382 Three names associated with the current process can be determined: *getpwuid(getuid())* returns  
 35383 the name associated with the effective user ID of the process; *getlogin()* returns the name  
 35384 associated with the current login activity; and *getpwuid(getuid())* returns the name associated  
 35385 with the real user ID of the process.

35386 The *getpwnam\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
 35387 possibly using a static data area that may be overwritten by each call.

35388 Portable applications should take into account that it is usual for an implementation to return  $-1$   
 35389 from *sysconf()* indicating that there is no maximum for `_SC_GETPW_R_SIZE_MAX`.

35390 **RATIONALE**

35391 None.

35392 **FUTURE DIRECTIONS**

35393 None.

35394 **SEE ALSO**

35395 *getpwuid()*, *sysconf()*

35396 XBD `<pwd.h>`, `<sys/types.h>`

35397 **CHANGE HISTORY**

35398 First released in Issue 1. Derived from System V Release 2.0.

35399 **Issue 5**

35400 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
 35401 VALUE section.

35402 The *getpwnam\_r()* function is included for alignment with the POSIX Threads Extension.

35403 A note indicating that the *getpwnam()* function need not be reentrant is added to the  
 35404 DESCRIPTION.

35405 **Issue 6**

35406 The *getpwnam\_r()* function is marked as part of the Thread-Safe Functions option.

35407 The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION  
 35408 describing matching the *name*.

35409 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

35410 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

35411 The following new requirements on POSIX implementations derive from alignment with the  
 35412 Single UNIX Specification:

35413 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
 35414 required for conforming implementations of previous POSIX specifications, it was not  
 35415 required for UNIX applications.

35416 • In the RETURN VALUE section, the requirement to set *errno* on error is added.

35417 • The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

35418 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
 35419 its avoidance of possibly using a static data area.

35420 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the  
 35421 buffer from *bufsize* characters to bytes.

**getpwnam()**35422 **Issue 7**

- 35423 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 35424 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.
- 35425 SD5-XSH-ERN-166 is applied.
- 35426 The *getpwnam\_r()* function is moved from the Thread-Safe Functions option to the Base.
- 35427 A minor addition is made to the EXAMPLES section, reminding the application developer to
- 35428 free memory allocated as if by *malloc()*.

35429 **NAME**35430 `getpwuid, getpwuid_r` — search user database for a user ID35431 **SYNOPSIS**

```
35432 #include <pwd.h>
35433 struct passwd *getpwuid(uid_t uid);
35434 int getpwuid_r(uid_t uid, struct passwd *pwd, char *buffer,
35435 size_t bufsize, struct passwd **result);
```

35436 **DESCRIPTION**35437 The `getpwuid()` function shall search the user database for an entry with a matching *uid*.35438 The `getpwuid()` function need not be thread-safe.

35439 Applications wishing to check for error situations should set *errno* to 0 before calling `getpwuid()`.  
 35440 If `getpwuid()` returns a null pointer and *errno* is set to non-zero, an error occurred.

35441 The `getpwuid_r()` function shall update the **passwd** structure pointed to by *pwd* and store a  
 35442 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry  
 35443 from the user database with a matching *uid*. Storage referenced by the structure is allocated  
 35444 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to  
 35445 `sysconf(_SC_GETPW_R_SIZE_MAX)` returns either `-1` without changing *errno* or an initial value  
 35446 suggested for the size of this buffer. A null pointer shall be returned at the location pointed to  
 35447 by *result* on error or if the requested entry is not found.

35448 **RETURN VALUE**

35449 The `getpwuid()` function shall return a pointer to a **struct passwd** with the structure as defined in  
 35450 `<pwd.h>` with a matching entry if found. A null pointer shall be returned if the requested entry  
 35451 is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

35452 The return value may point to a static area which is overwritten by a subsequent call to  
 35453 `getpwent()`, `getpwnam()`, or `getpwuid()`.

35454 If successful, the `getpwuid_r()` function shall return zero; otherwise, an error number shall be  
 35455 returned to indicate the error.

35456 **ERRORS**

35457 These functions may fail if:

35458 [EIO] An I/O error has occurred.

35459 [EINTR] A signal was caught during `getpwuid()`.

35460 [EMFILE] All file descriptors available to the process are currently open.

35461 [ENFILE] The maximum allowable number of files is currently open in the system.

35462 The `getpwuid_r()` function may fail if:

35463 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be  
 35464 referenced by the resulting **passwd** structure.

**getpwuid()**35465 **EXAMPLES**

35466 Note that *sysconf*(*\_SC\_GETPW\_R\_SIZE\_MAX*) may return -1 if there is no hard limit on the size  
 35467 of the buffer needed to store all the groups returned. This example shows how an application  
 35468 can allocate a buffer of sufficient size to work with *getpwuid\_r*().

```

35469     long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
35470     size_t len;
35471     if (initlen == -1)
35472         /* Default initial length. */
35473         len = 1024;
35474     else
35475         len = (size_t) initlen;
35476     struct passwd result;
35477     struct passwd *resultp;
35478     char *buffer = malloc(len);
35479     if (buffer == NULL)
35480         ...handle error...
35481     int e;
35482     while ((e = getpwuid_r(42, &result, buffer, len, &resultp)) == ERANGE)
35483     {
35484         size_t newlen = 2 * len;
35485         if (newlen < len)
35486             ...handle error...
35487         len = newlen;
35488         char *newbuffer = realloc(buffer, len);
35489         if (newbuffer == NULL)
35490             ...handle error...
35491         buffer = newbuffer;
35492     }
35493     if (e != 0)
35494         ...handle error...
35495     free (buffer);
  
```

35496 **Getting an Entry for the Root User**

35497 The following example gets the user database entry for the user with user ID 0 (root).

```

35498     #include <sys/types.h>
35499     #include <pwd.h>
35500     ...
35501     uid_t id = 0;
35502     struct passwd *pwd;
35503     pwd = getpwuid(id);
  
```

35504 **Finding the Name for the Effective User ID**

35505 The following example defines *pws* as a pointer to a structure of type **passwd**, which is used to  
 35506 store the structure pointer returned by the call to the *getpwuid()* function. The *geteuid()* function  
 35507 shall return the effective user ID of the calling process; this is used as the search criteria for the  
 35508 *getpwuid()* function. The call to *getpwuid()* shall return a pointer to the structure containing that  
 35509 user ID value.

```
35510 #include <unistd.h>
35511 #include <sys/types.h>
35512 #include <pwd.h>
35513 ...
35514 struct passwd *pws;
35515 pws = getpwuid(geteuid());
```

35516 **Finding an Entry in the User Database**

35517 The following example uses *getpwuid()* to search the user database for a user ID that was  
 35518 previously stored in a **stat** structure, then prints out the user name if it is found. If the user is not  
 35519 found, the program prints the numeric value of the user ID for the entry.

```
35520 #include <sys/types.h>
35521 #include <pwd.h>
35522 #include <stdio.h>
35523 ...
35524 struct stat statbuf;
35525 struct passwd *pwd;
35526 ...
35527 if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
35528     printf(" %-8.8s", pwd->pw_name);
35529 else
35530     printf(" %-8d", statbuf.st_uid);
```

35531 **APPLICATION USAGE**

35532 Three names associated with the current process can be determined: *getpwuid(geteuid())* returns  
 35533 the name associated with the effective user ID of the process; *getlogin()* returns the name  
 35534 associated with the current login activity; and *getpwuid(getuid())* returns the name associated  
 35535 with the real user ID of the process.

35536 The *getpwuid\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
 35537 possibly using a static data area that may be overwritten by each call.

35538 Portable applications should take into account that it is usual for an implementation to return `-1`  
 35539 from *sysconf()* indicating that there is no maximum for `_SC_GETPW_R_SIZE_MAX`.

35540 **RATIONALE**

35541 None.

35542 **FUTURE DIRECTIONS**

35543 None.

35544 **SEE ALSO**

## getpwuid()

35547 **CHANGE HISTORY**

35548 First released in Issue 1. Derived from System V Release 2.0.

35549 **Issue 5**

35550 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
35551 VALUE section.

35552 The *getpwuid\_r()* function is included for alignment with the POSIX Threads Extension.

35553 A note indicating that the *getpwuid()* function need not be reentrant is added to the  
35554 DESCRIPTION.

35555 **Issue 6**

35556 The *getpwuid\_r()* function is marked as part of the Thread-Safe Functions option.

35557 The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION  
35558 describing matching the *uid*.

35559 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

35560 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

35561 The following new requirements on POSIX implementations derive from alignment with the  
35562 Single UNIX Specification:

35563 

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
35564 required for conforming implementations of previous POSIX specifications, it was not  
35565 required for UNIX applications.

35566 

- In the RETURN VALUE section, the requirement to set *errno* on error is added.

35567 

- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

35568 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
35569 its avoidance of possibly using a static data area.

35570 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the  
35571 buffer from *bufsize* characters to bytes.

35572 **Issue 7**

35573 Austin Group Interpretation 1003.1-2001 #156 is applied.

35574 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

35575 SD5-XSH-ERN-166 is applied.

35576 The *getpwuid\_r()* function is moved from the Thread-Safe Functions option to the Base.

35577 A minor addition is made to the EXAMPLES section, reminding the application developer to  
35578 free memory allocated as if by *malloc()*.

35579 **NAME**

35580 getrlimit, setrlimit — control maximum resource consumption

35581 **SYNOPSIS**

```
35582 XSI #include <sys/resource.h>
35583 int getrlimit(int resource, struct rlimit *rlp);
35584 int setrlimit(int resource, const struct rlimit *rlp);
```

35585 **DESCRIPTION**

35586 The *getrlimit()* function shall get, and the *setrlimit()* function shall set, limits on the consumption  
 35587 of a variety of resources.

35588 Each call to either *getrlimit()* or *setrlimit()* identifies a specific resource to be operated upon as  
 35589 well as a resource limit. A resource limit is represented by an **rlimit** structure. The *rlim\_cur*  
 35590 member specifies the current or soft limit and the *rlim\_max* member specifies the maximum or  
 35591 hard limit. Soft limits may be changed by a process to any value that is less than or equal to the  
 35592 hard limit. A process may (irreversibly) lower its hard limit to any value that is greater than or  
 35593 equal to the soft limit. Only a process with appropriate privileges can raise a hard limit. Both  
 35594 hard and soft limits can be changed in a single call to *setrlimit()* subject to the constraints  
 35595 described above.

35596 The value RLIM\_INFINITY, defined in **<sys/resource.h>**, shall be considered to be larger than  
 35597 any other limit value. If a call to *getrlimit()* returns RLIM\_INFINITY for a resource, it means the  
 35598 implementation shall not enforce limits on that resource. Specifying RLIM\_INFINITY as any  
 35599 resource limit value on a successful call to *setrlimit()* shall inhibit enforcement of that resource  
 35600 limit.

35601 The following resources are defined:

35602	RLIMIT_CORE	This is the maximum size of a <b>core</b> file, in bytes, that may be created by a process. A limit of 0 shall prevent the creation of a <b>core</b> file. If this limit is exceeded, the writing of a <b>core</b> file shall terminate at this size.
35603		
35604		
35605	RLIMIT_CPU	This is the maximum amount of CPU time, in seconds, used by a process. If this limit is exceeded, SIGXCPU shall be generated for the process. If the process is catching or ignoring SIGXCPU, or all threads belonging to that process are blocking SIGXCPU, the behavior is unspecified.
35606		
35607		
35608		
35609	RLIMIT_DATA	This is the maximum size of a data segment of the process, in bytes. If this limit is exceeded, the <i>malloc()</i> function shall fail with <i>errno</i> set to [ENOMEM].
35610		
35611		
35612	RLIMIT_FSIZE	This is the maximum size of a file, in bytes, that may be created by a process. If a write or truncate operation would cause this limit to be exceeded, SIGXFSZ shall be generated for the thread. If the thread is blocking, or the process is catching or ignoring SIGXFSZ, continued attempts to increase the size of a file from end-of-file to beyond the limit shall fail with <i>errno</i> set to [EFBIG].
35613		
35614		
35615		
35616		
35617		
35618	RLIMIT_NOFILE	This is a number one greater than the maximum value that the system may assign to a newly-created descriptor. If this limit is exceeded, functions that allocate a file descriptor shall fail with <i>errno</i> set to [EMFILE]. This limit constrains the number of file descriptors that a process may allocate.
35619		
35620		
35621		
35622		

**getrlimit()**

35623	RLIMIT_STACK	This is the maximum size of the initial thread's stack, in bytes. The implementation does not automatically grow the stack beyond this limit.
35624		If this limit is exceeded, SIGSEGV shall be generated for the thread. If the
35625		thread is blocking SIGSEGV, or the process is ignoring or catching
35626		SIGSEGV and has not made arrangements to use an alternate stack, the
35627		disposition of SIGSEGV shall be set to SIG_DFL before it is generated.
35628		
35629	RLIMIT_AS	This is the maximum size of total available memory of the process, in
35630		bytes. If this limit is exceeded, the <i>malloc()</i> and <i>mmap()</i> functions shall fail
35631		with <i>errno</i> set to [ENOMEM]. In addition, the automatic stack growth
35632		fails with the effects outlined above.
35633		When using the <i>getrlimit()</i> function, if a resource limit can be represented correctly in an object
35634		of type <b>rlim_t</b> , then its representation is returned; otherwise, if the value of the resource limit is
35635		equal to that of the corresponding saved hard limit, the value returned shall be
35636		RLIM_SAVED_MAX; otherwise, the value returned shall be RLIM_SAVED_CUR.
35637		When using the <i>setrlimit()</i> function, if the requested new limit is RLIM_INFINITY, the new limit
35638		shall be "no limit"; otherwise, if the requested new limit is RLIM_SAVED_MAX, the new limit
35639		shall be the corresponding saved hard limit; otherwise, if the requested new limit is
35640		RLIM_SAVED_CUR, the new limit shall be the corresponding saved soft limit; otherwise, the
35641		new limit shall be the requested value. In addition, if the corresponding saved limit can be
35642		represented correctly in an object of type <b>rlim_t</b> then it shall be overwritten with the new limit.
35643		The result of setting a limit to RLIM_SAVED_MAX or RLIM_SAVED_CUR is unspecified unless
35644		a previous call to <i>getrlimit()</i> returned that value as the soft or hard limit for the corresponding
35645		resource limit.
35646		The determination of whether a limit can be correctly represented in an object of type <b>rlim_t</b> is
35647		implementation-defined. For example, some implementations permit a limit whose value is
35648		greater than RLIM_INFINITY and others do not.
35649		The <i>exec</i> family of functions shall cause resource limits to be saved.
35650	<b>RETURN VALUE</b>	
35651		Upon successful completion, <i>getrlimit()</i> and <i>setrlimit()</i> shall return 0. Otherwise, these functions
35652		shall return -1 and set <i>errno</i> to indicate the error.
35653	<b>ERRORS</b>	
35654		The <i>getrlimit()</i> and <i>setrlimit()</i> functions shall fail if:
35655	[EINVAL]	An invalid <i>resource</i> was specified; or in a <i>setrlimit()</i> call, the new <i>rlim_cur</i>
35656		exceeds the new <i>rlim_max</i> .
35657	[EPERM]	The limit specified to <i>setrlimit()</i> would have raised the maximum limit value,
35658		and the calling process does not have appropriate privileges.
35659		The <i>setrlimit()</i> function may fail if:
35660	[EINVAL]	The limit specified cannot be lowered because current usage is already higher
35661		than the limit.

35662 **EXAMPLES**

35663 None.

35664 **APPLICATION USAGE**35665 If a process attempts to set the hard limit or soft limit for RLIMIT\_NOFILE to less than the value  
35666 of {\_POSIX\_OPEN\_MAX} from <limits.h>, unexpected behavior may occur.35667 If a process attempts to set the hard limit or soft limit for RLIMIT\_NOFILE to less than the  
35668 highest currently open file descriptor +1, unexpected behavior may occur.35669 **RATIONALE**35670 It should be noted that RLIMIT\_STACK applies “at least” to the stack of the initial thread in the  
35671 process, and not to the sum of all the stacks in the process, as that would be very limiting unless  
35672 the value is so big as to provide no value at all with a single thread.35673 **FUTURE DIRECTIONS**

35674 None.

35675 **SEE ALSO**35676 *exec, fork(), malloc(), open(), sigaltstack(), sysconf(), ulimit()*

35677 XBD &lt;stropts.h&gt;, &lt;sys/resource.h&gt;

35678 **CHANGE HISTORY**

35679 First released in Issue 4, Version 2.

35680 **Issue 5**

35681 Moved from X/OPEN UNIX extension to BASE.

35682 An APPLICATION USAGE section is added.

35683 Large File Summit extensions are added.

35684 **Issue 6**35685 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/25 is applied, changing wording for  
35686 RLIMIT\_NOFILE in the DESCRIPTION related to functions that allocate a file descriptor failing  
35687 with [EMFILE]. Text is added to the APPLICATION USAGE section noting the consequences of  
35688 a process attempting to set the hard or soft limit for RLIMIT\_NOFILE less than the highest  
35689 currently open file descriptor +1.35690 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/46 is applied, updating the definition of  
35691 RLIMIT\_STACK in the DESCRIPTION from “the maximum size of a process stack” to “the  
35692 maximum size of the initial thread’s stack”. Text is added to the RATIONALE section.

**getrusage()**35693 **NAME**35694            **getrusage** — get information about resource utilization35695 **SYNOPSIS**

```
35696 XSI      #include <sys/resource.h>
35697         int getrusage(int who, struct rusage *r_usage);
```

35698 **DESCRIPTION**

35699        The *getrusage()* function shall provide measures of the resources used by the current process or  
35700        its terminated and waited-for child processes. If the value of the *who* argument is  
35701        RUSAGE\_SELF, information shall be returned about resources used by the current process. If the  
35702        value of the *who* argument is RUSAGE\_CHILDREN, information shall be returned about  
35703        resources used by the terminated and waited-for children of the current process. If the child is  
35704        never waited for (for example, if the parent has SA\_NOCLDWAIT set or sets SIGCHLD to  
35705        SIG\_IGN), the resource information for the child process is discarded and not included in the  
35706        resource information provided by *getrusage()*.

35707        The *r\_usage* argument is a pointer to an object of type **struct rusage** in which the returned  
35708        information is stored.

35709 **RETURN VALUE**

35710        Upon successful completion, *getrusage()* shall return 0; otherwise, -1 shall be returned and *errno*  
35711        set to indicate the error.

35712 **ERRORS**

35713        The *getrusage()* function shall fail if:

35714        [EINVAL]        The value of the *who* argument is not valid.

35715 **EXAMPLES**35716        **Using getrusage()**

35717        The following example returns information about the resources used by the current process.

```
35718     #include <sys/resource.h>
35719     ...
35720     int who = RUSAGE_SELF;
35721     struct rusage usage;
35722     int ret;
35723
35723     ret = getrusage(who, &usage);
```

35724 **APPLICATION USAGE**

**gets()**35737 **NAME**35738 gets — get a string from a *stdin* stream35739 **SYNOPSIS**

```
35740 OB #include <stdio.h>
35741 char *gets(char *s);
```

35742 **DESCRIPTION**

35743 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 35744 conflict between the requirements described here and the ISO C standard is unintentional. This  
 35745 volume of POSIX.1-2008 defers to the ISO C standard.

35746 The *gets()* function shall read bytes from the standard input stream, *stdin*, into the array pointed  
 35747 to by *s*, until a <newline> is read or an end-of-file condition is encountered. Any <newline> shall  
 35748 be discarded and a null byte shall be placed immediately after the last byte read into the array.

35749 CX The *gets()* function may mark the last data access timestamp of the file associated with *stream* for  
 35750 update. The last data access timestamp shall be marked for update by the first successful  
 35751 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *getdelim()*, *getline()*, *gets()*, or  
 35752 *scanf()* using *stream* that returns data not supplied by a prior call to *ungetc()*.

35753 **RETURN VALUE**

35754 Upon successful completion, *gets()* shall return *s*. If the end-of-file indicator for the stream is set,  
 35755 or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *gets()*  
 35756 shall return a null pointer. If a read error occurs, the error indicator for the stream shall be set,  
 35757 CX *gets()* shall return a null pointer, and set *errno* to indicate the error.

35758 **ERRORS**35759 Refer to *fgetc()*.35760 **EXAMPLES**

35761 None.

35762 **APPLICATION USAGE**

35763 Reading a line that overflows the array pointed to by *s* results in undefined behavior. The use of  
 35764 *fgets()* is recommended.

35765 Since the user cannot specify the length of the buffer passed to *gets()*, use of this function is  
 35766 discouraged. The length of the string read is unlimited. It is possible to overflow this buffer in  
 35767 such a way as to cause applications to fail, or possible system security violations.

35768 Applications should use the *fgets()* function instead of the obsolescent *gets()* function.

35769 **RATIONALE**

35770 The standard developers decided to mark the *gets()* function as obsolescent even though it is in  
 35771 the ISO C standard due to the possibility of buffer overflow.

35772 **FUTURE DIRECTIONS**35773 The *gets()* function may be removed in a future version.35774 **SEE ALSO**35775 *feof()*, *ferror()*, *fgets()*

35776 XBD &lt;stdio.h&gt;

35777 **CHANGE HISTORY**

35778 First released in Issue 1. Derived from Issue 1 of the SVID.

35779 **Issue 6**

35780 Extensions beyond the ISO C standard are marked.

35781 **Issue 7**

35782 Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.

35783 The *gets()* function is marked obsolescent.

35784 Changes are made related to support for finegrained timestamps.

**getsockopt()**35869 **NAME**35870 `getsockopt` — get the socket options35871 **SYNOPSIS**

```
35872 #include <sys/socket.h>
35873
35873 int getsockopt(int socket, int level, int option_name,
35874               void *restrict option_value, socklen_t *restrict option_len);
```

35875 **DESCRIPTION**35876 The `getsockopt()` function manipulates options associated with a socket.

35877 The `getsockopt()` function shall retrieve the value for the option specified by the `option_name`  
 35878 argument for the socket specified by the `socket` argument. If the size of the option value is greater  
 35879 than `option_len`, the value stored in the object pointed to by the `option_value` argument shall be  
 35880 silently truncated. Otherwise, the object pointed to by the `option_len` argument shall be modified  
 35881 to indicate the actual length of the value.

35882 The `level` argument specifies the protocol level at which the option resides. To retrieve options at  
 35883 the socket level, specify the `level` argument as `SOL_SOCKET`. To retrieve options at other levels,  
 35884 supply the appropriate level identifier for the protocol controlling the option. For example, to  
 35885 indicate that an option is interpreted by the TCP (Transmission Control Protocol), set `level` to  
 35886 `IPPROTO_TCP` as defined in the `<netinet/in.h>` header.

35887 The socket in use may require the process to have appropriate privileges to use the `getsockopt()`  
 35888 function.

35889 The `option_name` argument specifies a single option to be retrieved. It can be one of the socket-  
 35890 level options defined in `<sys/socket.h>` and described in Section 2.10.16 (on page 522).

35891 **RETURN VALUE**

35892 Upon successful completion, `getsockopt()` shall return 0; otherwise, `-1` shall be returned and `errno`  
 35893 set to indicate the error.

35894 **ERRORS**35895 The `getsockopt()` function shall fail if:

- 35896 [EBADF] The `socket` argument is not a valid file descriptor.
- 35897 [EINVAL] The specified option is invalid at the specified socket level.
- 35898 [ENOPROTOOPT]
- 35899 The option is not supported by the protocol.
- 35900 [ENOTSOCK] The `socket` argument does not refer to a socket.

35901 The `getsockopt()` function may fail if:

- 35902 [EACCES] The calling process does not have appropriate privileges.
- 35903 [EINVAL] The socket has been shut down.
- 35904 [ENOBUFS] Insufficient resources are available in the system to complete the function.

35905 **EXAMPLES**

35906 None.

35907 **APPLICATION USAGE**

35908 None.

35909 **RATIONALE**

35910 None.

35911 **FUTURE DIRECTIONS**

35912 None.

35913 **SEE ALSO**35914 [Section 2.10.16](#) (on page 522), *bind()*, *close()*, *endprotoent()*, *setsockopt()*, *socket()*35915 XBD [<sys/socket.h>](#), [<netinet/in.h>](#)35916 **CHANGE HISTORY**

35917 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

35918 The **restrict** keyword is added to the *getsockopt()* prototype for alignment with the  
35919 ISO/IEC 9899:1999 standard.35920 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/47 is applied, updating the description of  
35921 SO\_LINGER in the DESCRIPTION so that it blocks the calling thread rather than the process.35922 **Issue 7**35923 Austin Group Interpretation 1003.1-2001 #158 is applied, removing text relating to socket options  
35924 that is now in [Section 2.10.16](#) (on page 522).

**getsubopt()**35925 **NAME**35926 `getsubopt` — parse suboption arguments from a string35927 **SYNOPSIS**35928 `#include <stdlib.h>`35929 `int getsubopt(char **optionp, char * const *keylistp, char **valuep);`35930 **DESCRIPTION**35931 The `getsubopt()` function shall parse suboption arguments in a flag argument. Such options often  
35932 result from the use of `getopt()`.35933 The `getsubopt()` argument *optionp* is a pointer to a pointer to the option argument string. The  
35934 suboption arguments shall be separated by <comma> characters and each may consist of either  
35935 a single token, or a token-value pair separated by an <equals-sign>.35936 The *keylistp* argument shall be a pointer to a vector of strings. The end of the vector is identified  
35937 by a null pointer. Each entry in the vector is one of the possible tokens that might be found in  
35938 \**optionp*. Since <comma> characters delimit suboption arguments in *optionp*, they should not  
35939 appear in any of the strings pointed to by *keylistp*. Similarly, because an <equals-sign> separates  
35940 a token from its value, the application should not include an <equals-sign> in any of the strings  
35941 pointed to by *keylistp*.35942 The *valuep* argument is the address of a value string pointer.35943 If a <comma> appears in *optionp*, it shall be interpreted as a suboption separator. After <comma>  
35944 characters have been processed, if there are one or more <equals-sign> characters in a suboption  
35945 string, the first <equals-sign> in any suboption string shall be interpreted as a separator between  
35946 a token and a value. Subsequent <equals-sign> characters in a suboption string shall be  
35947 interpreted as part of the value.35948 If the string at \**optionp* contains only one suboption argument (equivalently, no <comma>  
35949 characters), `getsubopt()` shall update \**optionp* to point to the null character at the end of the  
35950 string. Otherwise, it shall isolate the suboption argument by replacing the <comma> separator  
35951 with a null character, and shall update \**optionp* to point to the start of the next suboption  
35952 argument. If the suboption argument has an associated value (equivalently, contains an <equals-  
35953 sign>), `getsubopt()` shall update \**valuep* to point to the value's first character. Otherwise, it shall  
35954 set \**valuep* to a null pointer. The calling application may use this information to determine  
35955 whether the presence or absence of a value for the suboption is an error.35956 Additionally, when `getsubopt()` fails to match the suboption argument with a token in the *keylistp*  
35957 array, the calling application should decide if this is an error, or if the unrecognized option  
35958 should be processed in another way.35959 **RETURN VALUE**35960 The `getsubopt()` function shall return the index of the matched token string, or -1 if no token  
35961 strings were matched.35962 **ERRORS**

35963 No errors are defined.

35964 **EXAMPLES**

```

35965     #include <stdio.h>
35966     #include <stdlib.h>

35967     int do_all;
35968     const char *type;
35969     int read_size;
35970     int write_size;
35971     int read_only;

35972     enum
35973     {
35974         RO_OPTION = 0,
35975         RW_OPTION,
35976         READ_SIZE_OPTION,
35977         WRITE_SIZE_OPTION
35978     };

35979     const char *mount_opts[] =
35980     {
35981         [RO_OPTION] = "ro",
35982         [RW_OPTION] = "rw",
35983         [READ_SIZE_OPTION] = "rsize",
35984         [WRITE_SIZE_OPTION] = "wsize",
35985         NULL
35986     };

35987     int
35988     main(int argc, char *argv[])
35989     {
35990         char *subopts, *value;
35991         int opt;

35992         while ((opt = getopt(argc, argv, "at:o:")) != -1)
35993             switch(opt)
35994             {
35995                 case 'a':
35996                     do_all = 1;
35997                     break;
35998                 case 't':
35999                     type = optarg;
36000                     break;
36001                 case 'o':
36002                     subopts = optarg;
36003                     while (*subopts != '\0')
36004                         switch(getsubopt(&subopts, mount_opts, &value))
36005                         {
36006                             case RO_OPTION:
36007                                 read_only = 1;
36008                                 break;
36009                             case RW_OPTION:
36010                                 read_only = 0;
36011                                 break;
36012                             case READ_SIZE_OPTION:

```

**getsubopt()**

```

36013         if (value == NULL)
36014             abort();
36015         read_size = atoi(value);
36016         break;
36017     case WRITE_SIZE_OPTION:
36018         if (value == NULL)
36019             abort();
36020         write_size = atoi(value);
36021         break;
36022     default:
36023         /* Unknown suboption. */
36024         printf("Unknown suboption '%s'\n", value);
36025         break;
36026     }
36027     break;
36028     default:
36029         abort();
36030     }
36031     /* Do the real work. */
36032     return 0;
36033 }

```

**Parsing Suboptions**

The following example uses the `getsubopt()` function to parse a *value* argument in the *optarg* external variable returned by a call to `getopt()`.

```

36037 #include <stdlib.h>
36038 ...
36039 char *tokens[] = {"HOME", "PATH", "LOGNAME", (char *) NULL };
36040 char *value;
36041 int opt, index;
36042 while ((opt = getopt(argc, argv, "e:")) != -1) {
36043     switch(opt) {
36044         case 'e':
36045             while ((index = getsubopt(&optarg, tokens, &value)) != -1) {
36046                 switch(index) {
36047                     ...
36048                 }
36049                 break;
36050             }
36051     }
36052 }
36053 ...

```

**gettimeofday()**36072 **NAME**

36073           gettimeofday — get the date and time

36074 **SYNOPSIS**

```
36075 OB XSI #include <sys/time.h>
36076 int gettimeofday(struct timeval *restrict tp, void *restrict tzp);
```

36077 **DESCRIPTION**

36078       The *gettimeofday()* function shall obtain the current time, expressed as seconds and microseconds  
 36079       since the Epoch, and store it in the **timeval** structure pointed to by *tp*. The resolution of the  
 36080       system clock is unspecified.

36081       If *tzp* is not a null pointer, the behavior is unspecified.

36082 **RETURN VALUE**

36083       The *gettimeofday()* function shall return 0 and no value shall be reserved to indicate an error.

36084 **ERRORS**

36085       No errors are defined.

36086 **EXAMPLES**

36087       None.

36088 **APPLICATION USAGE**

36089       Applications should use the *clock\_gettime()* function instead of the obsolescent *gettimeofday()*  
 36090       function.

36091 **RATIONALE**

36092       None.

36093 **FUTURE DIRECTIONS**

36094       The *gettimeofday()* function may be removed in a future version.

36095 **SEE ALSO**

36096       *clock\_getres()*, *ctime()*

36097       XBD <sys/time.h>

36098 **CHANGE HISTORY**

36099       First released in Issue 4, Version 2.

36100 **Issue 5**

36101       Moved from X/OPEN UNIX extension to BASE.

36102 **Issue 6**

36103       The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since  
 36104       00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time*  
 36105       functions.

36106       The **restrict** keyword is added to the *gettimeofday()* prototype for alignment with the  
 36107       ISO/IEC 9899:1999 standard.

36108 **Issue 7**

36109       The *gettimeofday()* function is marked obsolescent.

36110 **NAME**

36111           getuid — get a real user ID

36112 **SYNOPSIS**

36113           #include &lt;unistd.h&gt;

36114           uid\_t getuid(void);

36115 **DESCRIPTION**36116           The *getuid()* function shall return the real user ID of the calling process.36117 **RETURN VALUE**36118           The *getuid()* function shall always be successful and no return value is reserved to indicate the error.36120 **ERRORS**

36121           No errors are defined.

36122 **EXAMPLES**36123           **Setting the Effective User ID to the Real User ID**

36124           The following example sets the effective user ID and the real user ID of the current process to the real user ID of the caller.

```

36126           #include <unistd.h>
36127           #include <sys/types.h>
36128           ...
36129           setreuid(getuid(), getuid());
36130           ...

```

36131 **APPLICATION USAGE**

36132           None.

36133 **RATIONALE**

36134           None.

36135 **FUTURE DIRECTIONS**

36136           None.

36137 **SEE ALSO**36138           *getegid(), geteuid(), getgid(), setegid(), seteuid(), setgid(), setregid(), setreuid(), setuid()*

36139           XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

36140 **CHANGE HISTORY**

36141           First released in Issue 1. Derived from Issue 1 of the SVID.

36142 **Issue 6**

36143           In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

36144           The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 36146           • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

**getutxent()**36149 **NAME**

36150 getutxent, getutxid, getutxline — get user accounting database entries

36151 **SYNOPSIS**

```
36152 XSI #include <utmpx.h>
36153 struct utmpx *getutxent(void);
36154 struct utmpx *getutxid(const struct utmpx *id);
36155 struct utmpx *getutxline(const struct utmpx *line);
```

36156 **DESCRIPTION**36157 Refer to *endutxent()*.

36158 **NAME**36159 `getwc` — get a wide character from a stream36160 **SYNOPSIS**36161 `#include <stdio.h>`36162 `#include <wchar.h>`36163 `wint_t getwc(FILE *stream);`36164 **DESCRIPTION**

36165 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 36166 conflict between the requirements described here and the ISO C standard is unintentional. This  
 36167 volume of POSIX.1-2008 defers to the ISO C standard.

36168 The `getwc()` function shall be equivalent to `fgetwc()`, except that if it is implemented as a macro it  
 36169 may evaluate `stream` more than once, so the argument should never be an expression with side-  
 36170 effects.

36171 **RETURN VALUE**36172 Refer to `fgetwc()`.36173 **ERRORS**36174 Refer to `fgetwc()`.36175 **EXAMPLES**

36176 None.

36177 **APPLICATION USAGE**

36178 Since it may be implemented as a macro, `getwc()` may treat incorrectly a `stream` argument with  
 36179 side-effects. In particular, `getwc(*f++)` does not necessarily work as expected. Therefore, use of  
 36180 this function is not recommended; `fgetwc()` should be used instead.

36181 **RATIONALE**

36182 None.

36183 **FUTURE DIRECTIONS**

36184 None.

36185 **SEE ALSO**36186 `fgetwc()`36187 XBD `<stdio.h>`, `<wchar.h>`36188 **CHANGE HISTORY**

36189 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working  
 36190 draft.

36191 **Issue 5**36192 The Optional Header (OH) marking is removed from `<stdio.h>`.

## getwchar()

### 36193 NAME

36194 `getwchar` — get a wide character from a *stdin* stream

### 36195 SYNOPSIS

36196 `#include <wchar.h>`

36197 `wint_t getwchar(void);`

### 36198 DESCRIPTION

36199 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
36200 conflict between the requirements described here and the ISO C standard is unintentional. This  
36201 volume of POSIX.1-2008 defers to the ISO C standard.

36202 The `getwchar()` function shall be equivalent to `getwc(stdin)`.

### 36203 RETURN VALUE

36204 Refer to `fgetwc()`.

### 36205 ERRORS

36206 Refer to `fgetwc()`.

### 36207 EXAMPLES

36208 None.

### 36209 APPLICATION USAGE

36210 If the `wint_t` value returned by `getwchar()` is stored into a variable of type `wchar_t` and then  
36211 compared against the `wint_t` macro `WEOF`, the result may be incorrect. Only the `wint_t` type is  
36212 guaranteed to be able to represent any wide character and `WEOF`.

### 36213 RATIONALE

36214 None.

### 36215 FUTURE DIRECTIONS

36216 None.

### 36217 SEE ALSO

36218 `fgetwc()`, `getwc()`

36219 XBD `<wchar.h>`

### 36220 CHANGE HISTORY

36221 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working  
36222 draft.

36223 **NAME**

36224 glob, globfree — generate pathnames matching a pattern

36225 **SYNOPSIS**

```
36226 #include <glob.h>
36227 int glob(const char *restrict pattern, int flags,
36228         int (*errfunc)(const char *epath, int eerrno),
36229         glob_t *restrict pglob);
36230 void globfree(glob_t *pglob);
```

36231 **DESCRIPTION**

36232 The *glob()* function is a pathname generator that shall implement the rules defined in XCU  
 36233 Section 2.13 (on page 2332), with optional support for rule 3 in XCU Section 2.13.3 (on page  
 36234 2333).

36235 The structure type **glob\_t** is defined in **<glob.h>** and includes at least the following members:

Member Type	Member Name	Description
size_t	<i>gl_pathc</i>	Count of paths matched by <i>pattern</i> .
char **	<i>gl_pathv</i>	Pointer to a list of matched pathnames.
size_t	<i>gl_offs</i>	Slots to reserve at the beginning of <i>gl_pathv</i> .

36241 The argument *pattern* is a pointer to a pathname pattern to be expanded. The *glob()* function  
 36242 shall match all accessible pathnames against this pattern and develop a list of all pathnames that  
 36243 match. In order to have access to a pathname, *glob()* requires search permission on every  
 36244 component of a path except the last, and read permission on each directory of any filename  
 36245 component of *pattern* that contains any of the following special characters: '\*', '?', and '['.

36246 The *glob()* function shall store the number of matched pathnames into *pglob->gl\_pathc* and a  
 36247 pointer to a list of pointers to pathnames into *pglob->gl\_pathv*. The pathnames shall be in sort  
 36248 order as defined by the current setting of the *LC\_COLLATE* category; see XBD Section 7.3.2 (on  
 36249 page 146). The first pointer after the last pathname shall be a null pointer. If the pattern does not  
 36250 match any pathnames, the returned number of matched paths is set to 0, and the contents of  
 36251 *pglob->gl\_pathv* are implementation-defined.

36252 It is the caller's responsibility to create the structure pointed to by *pglob*. The *glob()* function  
 36253 shall allocate other space as needed, including the memory pointed to by *gl\_pathv*. The *globfree()*  
 36254 function shall free any space associated with *pglob* from a previous call to *glob()*.

36255 The *flags* argument is used to control the behavior of *glob()*. The value of *flags* is a bitwise-  
 36256 inclusive OR of zero or more of the following constants, which are defined in **<glob.h>**:

36257	<b>GLOB_APPEND</b>	Append pathnames generated to the ones from a previous call to <i>glob()</i> .
36258	<b>GLOB_DOOFFS</b>	Make use of <i>pglob-&gt;gl_offs</i> . If this flag is set, <i>pglob-&gt;gl_offs</i> is used to 36259 specify how many null pointers to add to the beginning of 36260 <i>pglob-&gt;gl_pathv</i> . In other words, <i>pglob-&gt;gl_pathv</i> shall point to 36261 <i>pglob-&gt;gl_offs</i> null pointers, followed by <i>pglob-&gt;gl_pathc</i> pathname 36262 pointers, followed by a null pointer.
36263	<b>GLOB_ERR</b>	Cause <i>glob()</i> to return when it encounters a directory that it cannot open 36264 or read. Ordinarily, <i>glob()</i> continues to find matches.
36265	<b>GLOB_MARK</b>	Each pathname that is a directory that matches <i>pattern</i> shall have a 36266 <b>&lt;slash&gt;</b> appended.

**glob()**

- 36267 GLOB\_NOCHECK Supports rule 3 in XCU Section 2.13.3 (on page 2333). If *pattern* does not  
 36268 match any pathname, then *glob()* shall return a list consisting of only  
 36269 *pattern*, and the number of matched pathnames is 1.
- 36270 GLOB\_NOESCAPE Disable backslash escaping.
- 36271 GLOB\_NOSORT Ordinarily, *glob()* sorts the matching pathnames according to the current  
 36272 setting of the *LC\_COLLATE* category; see XBD Section 7.3.2 (on page 146).  
 36273 When this flag is used, the order of pathnames returned is unspecified.

36274 The GLOB\_APPEND flag can be used to append a new set of pathnames to those found in a  
 36275 previous call to *glob()*. The following rules apply to applications when two or more calls to  
 36276 *glob()* are made with the same value of *pglob* and without intervening calls to *globfree()*:

- 36277 1. The first such call shall not set GLOB\_APPEND. All subsequent calls shall set it.
- 36278 2. All the calls shall set GLOB\_DOOFFS, or all shall not set it.
- 36279 3. After the second call, *pglob->gl\_pathv* points to a list containing the following:
  - 36280 a. Zero or more null pointers, as specified by GLOB\_DOOFFS and *pglob->gl\_offs*.
  - 36281 b. Pointers to the pathnames that were in the *pglob->gl\_pathv* list before the call, in  
 36282 the same order as before.
  - 36283 c. Pointers to the new pathnames generated by the second call, in the specified order.
- 36284 4. The count returned in *pglob->gl\_pathc* shall be the total number of pathnames from the  
 36285 two calls.
- 36286 5. The application can change any of the fields after a call to *glob()*. If it does, the  
 36287 application shall reset them to the original value before a subsequent call, using the same  
 36288 *pglob* value, to *globfree()* or *glob()* with the GLOB\_APPEND flag.

36289 If, during the search, a directory is encountered that cannot be opened or read and *errfunc* is not  
 36290 a null pointer, *glob()* calls (*\*errfunc()*) with two arguments:

- 36291 1. The *epath* argument is a pointer to the path that failed.
- 36292 2. The *eerrno* argument is the value of *errno* from the failure, as set by *opendir()*, *readdir()*, or  
 36293 *stat()*. (Other values may be used to report other errors not explicitly documented for  
 36294 those functions.)

36295 If (*\*errfunc()*) is called and returns non-zero, or if the GLOB\_ERR flag is set in *flags*, *glob()* shall  
 36296 stop the scan and return GLOB\_ABORTED after setting *gl\_pathc* and *gl\_pathv* in *pglob* to reflect  
 36297 the paths already scanned. If GLOB\_ERR is not set and either *errfunc* is a null pointer or  
 36298 (*\*errfunc()*) returns 0, the error shall be ignored.

36299 The *glob()* function shall not fail because of large files.

**RETURN VALUE**

36300 Upon successful completion, *glob()* shall return 0. The argument *pglob->gl\_pathc* shall return the  
 36301 number of matched pathnames and the argument *pglob->gl\_pathv* shall contain a pointer to a  
 36302 null-terminated list of matched and sorted pathnames. However, if *pglob->gl\_pathc* is 0, the  
 36303 content of *pglob->gl\_pathv* is undefined.

36304 The *globfree()* function shall not return a value.

36305 If *glob()* terminates due to an error, it shall return one of the non-zero constants defined in  
 36306 **<glob.h>**. The arguments *pglob->gl\_pathc* and *pglob->gl\_pathv* are still set as defined above.

36308 **ERRORS**

36309 The *glob()* function shall fail and return the corresponding value if:

- 36310 **GLOB\_ABORTED** The scan was stopped because **GLOB\_ERR** was set or (*\*errfunc()*)  
36311 returned non-zero.
- 36312 **GLOB\_NOMATCH** The pattern does not match any existing pathname, and  
36313 **GLOB\_NOCHECK** was not set in flags.
- 36314 **GLOB\_NOSPACE** An attempt to allocate memory failed.

36315 **EXAMPLES**

36316 One use of the **GLOB\_DOOFFS** flag is by applications that build an argument list for use with  
36317 *execv()*, *execve()*, or *execvp()*. Suppose, for example, that an application wants to do the  
36318 equivalent of:

```
36319 ls -l *.c
```

36320 but for some reason:

```
36321 system("ls -l *.c")
```

36322 is not acceptable. The application could obtain approximately the same result using the  
36323 sequence:

```
36324 globbuf.gl_offs = 2;
36325 glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
36326 globbuf.gl_pathv[0] = "ls";
36327 globbuf.gl_pathv[1] = "-l";
36328 execvp("ls", &globbuf.gl_pathv[0]);
```

36329 Using the same example:

```
36330 ls -l *.c *.h
```

36331 could be approximately simulated using **GLOB\_APPEND** as follows:

```
36332 globbuf.gl_offs = 2;
36333 glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
36334 glob("*.h", GLOB_DOOFFS|GLOB_APPEND, NULL, &globbuf);
36335 ...
```

36336 **APPLICATION USAGE**

36337 This function is not provided for the purpose of enabling utilities to perform pathname  
36338 expansion on their arguments, as this operation is performed by the shell, and utilities are  
36339 explicitly not expected to redo this. Instead, it is provided for applications that need to do  
36340 pathname expansion on strings obtained from other sources, such as a pattern typed by a user or  
36341 read from a file.

36342 If a utility needs to see if a pathname matches a given pattern, it can use *fnmatch()*.

36343 Note that *gl\_pathc* and *gl\_pathv* have meaning even if *glob()* fails. This allows *glob()* to report  
36344 partial results in the event of an error. However, if *gl\_pathc* is 0, *gl\_pathv* is unspecified even if  
36345 *glob()* did not return an error.

36346 The **GLOB\_NOCHECK** option could be used when an application wants to expand a pathname  
36347 if wildcards are specified, but wants to treat the pattern as just a string otherwise. The *sh* utility  
36348 might use this for option-arguments, for example.

36349 The new pathnames generated by a subsequent call with **GLOB\_APPEND** are not sorted  
36350 together with the previous pathnames. This mirrors the way that the shell handles pathname

**glob()**

36351 expansion when multiple expansions are done on a command line.

36352 Applications that need tilde and parameter expansion should use *wordexp()*.

**RATIONALE**

36354 It was claimed that the GLOB\_DOOFFS flag is unnecessary because it could be simulated using:

```
36355 new = (char **)malloc((n + pglob->gl_pathc + 1)
36356     * sizeof(char *));
36357 (void) memcpy(new+n, pglob->gl_pathv,
36358     pglob->gl_pathc * sizeof(char *));
36359 (void) memset(new, 0, n * sizeof(char *));
36360 free (pglob->gl_pathv);
36361 pglob->gl_pathv = new;
```

36362 However, this assumes that the memory pointed to by *gl\_pathv* is a block that was separately  
 36363 created using *malloc()*. This is not necessarily the case. An application should make no  
 36364 assumptions about how the memory referenced by fields in *pglob* was allocated. It might have  
 36365 been obtained from *malloc()* in a large chunk and then carved up within *glob()*, or it might have  
 36366 been created using a different memory allocator. It is not the intent of the standard developers to  
 36367 specify or imply how the memory used by *glob()* is managed.

36368 The GLOB\_APPEND flag would be used when an application wants to expand several different  
 36369 patterns into a single list.

**FUTURE DIRECTIONS**

36370 None.

**SEE ALSO**

**CHANGE HISTORY**

36376 First released in Issue 4. Derived from the ISO POSIX-2 standard.

**Issue 5**

36378 Moved from POSIX2 C-language Binding to BASE.

**Issue 6**

36380 The normative text is updated to avoid use of the term “must” for application requirements.

36381 The **restrict** keyword is added to the *glob()* prototype for alignment with the ISO/IEC 9899:1999  
 36382 standard.

36383 **NAME**

36384 gmtime, gmtime\_r — convert a time value to a broken-down UTC time

36385 **SYNOPSIS**

```
36386 #include <time.h>
36387 struct tm *gmtime(const time_t *timer);
36388 CX struct tm *gmtime_r(const time_t *restrict timer,
36389 struct tm *restrict result);
```

36390 **DESCRIPTION**

36391 CX For *gmtime()*: The functionality described on this reference page is aligned with the ISO C  
 36392 standard. Any conflict between the requirements described here and the ISO C standard is  
 36393 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

36394 The *gmtime()* function shall convert the time in seconds since the Epoch pointed to by *timer* into  
 36395 a broken-down time, expressed as Coordinated Universal Time (UTC).

36396 CX The relationship between a time in seconds since the Epoch used as an argument to *gmtime()*  
 36397 and the **tm** structure (defined in the **<time.h>** header) is that the result shall be as specified in  
 36398 the expression given in the definition of seconds since the Epoch (see XBD Section 4.15, on page  
 36399 113), where the names in the structure and in the expression correspond.

36400 The same relationship shall apply for *gmtime\_r()*.

36401 The *gmtime()* function need not be thread-safe.

36402 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static  
 36403 objects: a broken-down time structure and an array of type **char**. Execution of any of the  
 36404 functions may overwrite the information returned in either of these objects by any of the other  
 36405 functions.

36406 The *gmtime\_r()* function shall convert the time in seconds since the Epoch pointed to by *timer*  
 36407 into a broken-down time expressed as Coordinated Universal Time (UTC). The broken-down  
 36408 time is stored in the structure referred to by *result*. The *gmtime\_r()* function shall also return the  
 36409 address of the same structure.

36410 **RETURN VALUE**

36411 Upon successful completion, the *gmtime()* function shall return a pointer to a **struct tm**. If an  
 36412 CX error is detected, *gmtime()* shall return a null pointer and set *errno* to indicate the error.

36413 Upon successful completion, *gmtime\_r()* shall return the address of the structure pointed to by  
 36414 the argument *result*. If an error is detected, *gmtime\_r()* shall return a null pointer and set *errno* to  
 36415 indicate the error.

36416 **ERRORS**

36417 CX The *gmtime()* and *gmtime\_r()* functions shall fail if:

36418 CX [EOVERFLOW] The result cannot be represented.

**gmtime()**36419 **EXAMPLES**

36420 None.

36421 **APPLICATION USAGE**36422 The *gmtime\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
36423 possibly using a static data area that may be overwritten by each call.36424 **RATIONALE**

36425 None.

36426 **FUTURE DIRECTIONS**

36427 None.

36428 **SEE ALSO**36429 *asctime(), clock(), ctime(), difftime(), localtime(), mktime(), strftime(), strptime(), time(), utime()*36430 XBD Section 4.15 (on page 113), <[time.h](#)>36431 **CHANGE HISTORY**

36432 First released in Issue 1. Derived from Issue 1 of the SVID.

36433 **Issue 5**36434 A note indicating that the *gmtime()* function need not be reentrant is added to the  
36435 DESCRIPTION.36436 The *gmtime\_r()* function is included for alignment with the POSIX Threads Extension.36437 **Issue 6**36438 The *gmtime\_r()* function is marked as part of the Thread-Safe Functions option.

36439 Extensions beyond the ISO C standard are marked.

36440 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
36441 its avoidance of possibly using a static data area.36442 The **restrict** keyword is added to the *gmtime\_r()* prototype for alignment with the  
36443 ISO/IEC 9899: 1999 standard.36444 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/27 is applied, adding the [Eoverflow]  
36445 error.36446 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/48 is applied, updating the error handling  
36447 for *gmtime\_r()*.36448 **Issue 7**

36449 Austin Group Interpretation 1003.1-2001 #156 is applied.

36450 The *gmtime\_r()* function is moved from the Thread-Safe Functions option to the Base.

36451 **NAME**36452 `grantpt` — grant access to the slave pseudo-terminal device36453 **SYNOPSIS**

```
36454 XSI #include <stdlib.h>
36455 int grantpt(int fildes);
```

36456 **DESCRIPTION**

36457 The `grantpt()` function shall change the mode and ownership of the slave pseudo-terminal  
 36458 device associated with its master pseudo-terminal counterpart. The `fildes` argument is a file  
 36459 descriptor that refers to a master pseudo-terminal device. The user ID of the slave shall be set to  
 36460 the real UID of the calling process and the group ID shall be set to an unspecified group ID. The  
 36461 permission mode of the slave pseudo-terminal shall be set to readable and writable by the  
 36462 owner, and writable by the group.

36463 The behavior of the `grantpt()` function is unspecified if the application has installed a signal  
 36464 handler to catch SIGCHLD signals.

36465 **RETURN VALUE**

36466 Upon successful completion, `grantpt()` shall return 0; otherwise, it shall return -1 and set `errno` to  
 36467 indicate the error.

36468 **ERRORS**

36469 The `grantpt()` function may fail if:

- |       |          |  |
|-------|----------|--|
| 36470 | [EBADF]  | The <code>fildes</code> argument is not a valid open file descriptor.                    |
| 36471 | [EINVAL] | The <code>fildes</code> argument is not associated with a master pseudo-terminal device. |
| 36472 | [EACCES] | The corresponding slave pseudo-terminal device could not be accessed.                    |

36473 **EXAMPLES**

36484 **CHANGE HISTORY**

36485 First released in Issue 4, Version 2.

36486 **Issue 5**

36487 Moved from X/OPEN UNIX extension to BASE.

36488 The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

**hcreate()**36489 **NAME**36490 `hcreate`, `hdestroy`, `hsearch` — manage hash search table36491 **SYNOPSIS**

```

36492 XSI      #include <search.h>
36493
36493      int hcreate(size_t nel);
36494      void hdestroy(void);
36495      ENTRY *hsearch(ENTRY item, ACTION action);

```

36496 **DESCRIPTION**36497 The `hcreate()`, `hdestroy()`, and `hsearch()` functions shall manage hash search tables.

36498 The `hcreate()` function shall allocate sufficient space for the table, and the application shall ensure it is called before `hsearch()` is used. The `nel` argument is an estimate of the maximum number of entries that the table shall contain. This number may be adjusted upward by the algorithm in order to obtain certain mathematically favorable circumstances.

36502 The `hdestroy()` function shall dispose of the search table, and may be followed by another call to `hcreate()`. After the call to `hdestroy()`, the data can no longer be considered accessible.

36504 The `hsearch()` function is a hash-table search routine. It shall return a pointer into a hash table indicating the location at which an entry can be found. The `item` argument is a structure of type **ENTRY** (defined in the `<search.h>` header) containing two pointers: `item.key` points to the comparison key (a `char *`), and `item.data` (a `void *`) points to any other data to be associated with that key. The comparison function used by `hsearch()` is `strcmp()`. The `action` argument is a member of an enumeration type **ACTION** indicating the disposition of the entry if it cannot be found in the table. **ENTER** indicates that the item should be inserted in the table at an appropriate point. **FIND** indicates that no entry should be made. Unsuccessful resolution is indicated by the return of a null pointer.

36513 These functions need not be thread-safe.

36514 **RETURN VALUE**36515 The `hcreate()` function shall return 0 if it cannot allocate sufficient space for the table; otherwise, it shall return non-zero.36517 The `hdestroy()` function shall not return a value.36518 The `hsearch()` function shall return a null pointer if either the action is **FIND** and the item could not be found or the action is **ENTER** and the table is full.36520 **ERRORS**36521 The `hcreate()` and `hsearch()` functions may fail if:

36522 [ENOMEM] Insufficient storage space is available.

36523 **EXAMPLES**

36524 The following example reads in strings followed by two numbers and stores them in a hash table, discarding duplicates. It then reads in strings and finds the matching entry in the hash table and prints it out.

```

36527      #include <stdio.h>
36528      #include <search.h>
36529      #include <string.h>
36530
36530      struct info {          /* This is the info stored in the table */
36531          int age, room;    /* other than the key. */
36532      };

```

```

36533     #define NUM_EMPL    5000    /* # of elements in search table. */
36534     int main(void)
36535     {
36536         char string_space[NUM_EMPL*20]; /* Space to store strings. */
36537         struct info info_space[NUM_EMPL]; /* Space to store employee info. */
36538         char *str_ptr = string_space; /* Next space in string_space. */
36539         struct info *info_ptr = info_space;
36540                                     /* Next space in info_space. */
36541         ENTRY item;
36542         ENTRY *found_item; /* Name to look for in table. */
36543         char name_to_find[30];
36544
36545         int i = 0;
36546
36547         /* Create table; no error checking is performed. */
36548         (void) hcreate(NUM_EMPL);
36549         while (scanf("%s%d%d", str_ptr, &info_ptr->age,
36550                    &info_ptr->room) != EOF && i++ < NUM_EMPL) {
36551
36552             /* Put information in structure, and structure in item. */
36553             item.key = str_ptr;
36554             item.data = info_ptr;
36555             str_ptr += strlen(str_ptr) + 1;
36556             info_ptr++;
36557
36558             /* Put item into table. */
36559             (void) hsearch(item, ENTER);
36560         }
36561
36562         /* Access table. */
36563         item.key = name_to_find;
36564         while (scanf("%s", item.key) != EOF) {
36565             if ((found_item = hsearch(item, FIND)) != NULL) {
36566                 /* If item is in the table. */
36567                 (void) printf("found %s, age = %d, room = %d\n",
36568                               found_item->key,
36569                               ((struct info *)found_item->data)->age,
36570                               ((struct info *)found_item->data)->room);
36571             }
36572             else
36573                 (void) printf("no such employee %s\n", name_to_find);
36574         }
36575         return 0;
36576     }

```

**APPLICATION USAGE**

The *hcreate()* and *hsearch()* functions may use *malloc()* to allocate space.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

36587 **NAME**

36588        htonl, htons, ntohl, ntohs — convert values between host and network byte order

36589 **SYNOPSIS**

```
36590        #include <arpa/inet.h>
36591        uint32_t htonl(uint32_t hostlong);
36592        uint16_t htons(uint16_t hostshort);
36593        uint32_t ntohl(uint32_t netlong);
36594        uint16_t ntohs(uint16_t netshort);
```

36595 **DESCRIPTION**36596        These functions shall convert 16-bit and 32-bit quantities between network byte order and host  
36597        byte order.

36598        On some implementations, these functions are defined as macros.

36599        The `uint32_t` and `uint16_t` types are defined in `<inttypes.h>`.36600 **RETURN VALUE**36601        The `htonl()` and `htons()` functions shall return the argument value converted from host to  
36602        network byte order.36603        The `ntohl()` and `ntohs()` functions shall return the argument value converted from network to  
36604        host byte order.36605 **ERRORS**

36606        No errors are defined.

36607 **EXAMPLES**

36608        None.

36609 **APPLICATION USAGE**36610        These functions are most often used in conjunction with IPv4 addresses and ports as returned by  
36611        `gethostent()` and `getservent()`.36612 **RATIONALE**

36613        None.

36614 **FUTURE DIRECTIONS**

36615        None.

36616 **SEE ALSO**36617        `endhostent()`, `endservent()`36618        XBD `<arpa/inet.h>`, `<inttypes.h>`36619 **CHANGE HISTORY**

36620        First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

**hypot()**36621 **NAME**36622 `hypot, hypotf, hypotl` — Euclidean distance function36623 **SYNOPSIS**36624 `#include <math.h>`36625 `double hypot(double x, double y);`36626 `float hypotf(float x, float y);`36627 `long double hypotl(long double x, long double y);`36628 **DESCRIPTION**36629 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
36630 conflict between the requirements described here and the ISO C standard is unintentional. This  
36631 volume of POSIX.1-2008 defers to the ISO C standard.36632 These functions shall compute the value of the square root of  $x^2+y^2$  without undue overflow or  
36633 underflow.36634 An application wishing to check for error situations should set *errno* to zero and call  
36635 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
36636 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
36637 zero, an error has occurred.36638 **RETURN VALUE**36639 Upon successful completion, these functions shall return the length of the hypotenuse of a right-  
36640 angled triangle with sides of length *x* and *y*.36641 If the correct value would cause overflow, a range error shall occur and *hypot()*, *hypotf()*, and  
36642 *hypotl()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
36643 respectively.36644 **MX** If *x* or *y* is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned (even if one of *x* or *y* is NaN).36645 If *x* or *y* is NaN, and the other is not  $\pm\text{Inf}$ , a NaN shall be returned.36646 If both arguments are subnormal and the correct result is subnormal, a range error may occur  
36647 and the correct result is returned.36648 **ERRORS**

36649 These functions shall fail if:

36650 **Range Error** The result overflows.36651 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
36652 then *errno* shall be set to [ERANGE]. If the integer expression  
36653 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
36654 floating-point exception shall be raised.

36655 These functions may fail if:

36656 **MX** **Range Error** The result underflows.36657 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
36658 then *errno* shall be set to [ERANGE]. If the integer expression  
36659 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
36660 floating-point exception shall be raised.

36661 **EXAMPLES**

36662 See the EXAMPLES section in *atan2()*.

36663 **APPLICATION USAGE**

36664 *hypot(x,y)*, *hypot(y,x)*, and *hypot(x, -y)* are equivalent.

36665 *hypot(x, ±0)* is equivalent to *fabs(x)*.

36666 Underflow only happens when both *x* and *y* are subnormal and the (inexact) result is also subnormal.

36668 These functions take precautions against overflow during intermediate steps of the computation.

36669 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* & MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

36671 **RATIONALE**

36672 None.

36673 **FUTURE DIRECTIONS**

36674 None.

36678 **CHANGE HISTORY**

36679 First released in Issue 1. Derived from Issue 1 of the SVID.

36680 **Issue 5**

36681 The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

36683 **Issue 6**

36684 The *hypot()* function is no longer marked as an extension.

36685 The *hypotf()* and *hypotl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

36687 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

36689 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

36691 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/49 is applied, updating the EXAMPLES section.

**iconv()**36693 **NAME**36694 `iconv` — codeset conversion function36695 **SYNOPSIS**

```
36696 #include <iconv.h>
36697
36697 size_t iconv(iconv_t cd, char **restrict inbuf,
36698             size_t *restrict inbytesleft, char **restrict outbuf,
36699             size_t *restrict outbytesleft);
```

36700 **DESCRIPTION**

36701 The `iconv()` function shall convert the sequence of characters from one codeset, in the array  
 36702 specified by `inbuf`, into a sequence of corresponding characters in another codeset, in the array  
 36703 specified by `outbuf`. The codesets are those specified in the `iconv_open()` call that returned the  
 36704 conversion descriptor, `cd`. The `inbuf` argument points to a variable that points to the first  
 36705 character in the input buffer and `inbytesleft` indicates the number of bytes to the end of the buffer  
 36706 to be converted. The `outbuf` argument points to a variable that points to the first available byte in  
 36707 the output buffer and `outbytesleft` indicates the number of the available bytes to the end of the  
 36708 buffer.

36709 For state-dependent encodings, the conversion descriptor `cd` is placed into its initial shift state by  
 36710 a call for which `inbuf` is a null pointer, or for which `inbuf` points to a null pointer. When `iconv()`  
 36711 is called in this way, and if `outbuf` is not a null pointer or a pointer to a null pointer, and `outbytesleft`  
 36712 points to a positive value, `iconv()` shall place, into the output buffer, the byte sequence to change  
 36713 the output buffer to its initial shift state. If the output buffer is not large enough to hold the  
 36714 entire reset sequence, `iconv()` shall fail and set `errno` to [E2BIG]. Subsequent calls with `inbuf` as  
 36715 other than a null pointer or a pointer to a null pointer cause the conversion to take place from  
 36716 the current state of the conversion descriptor.

36717 If a sequence of input bytes does not form a valid character in the specified codeset, conversion  
 36718 shall stop after the previous successfully converted character. If the input buffer ends with an  
 36719 incomplete character or shift sequence, conversion shall stop after the previous successfully  
 36720 converted bytes. If the output buffer is not large enough to hold the entire converted input,  
 36721 conversion shall stop just prior to the input bytes that would cause the output buffer to  
 36722 overflow. The variable pointed to by `inbuf` shall be updated to point to the byte following the last  
 36723 byte successfully used in the conversion. The value pointed to by `inbytesleft` shall be  
 36724 decremented to reflect the number of bytes still not converted in the input buffer. The variable  
 36725 pointed to by `outbuf` shall be updated to point to the byte following the last byte of converted  
 36726 output data. The value pointed to by `outbytesleft` shall be decremented to reflect the number of  
 36727 bytes still available in the output buffer. For state-dependent encodings, the conversion  
 36728 descriptor shall be updated to reflect the shift state in effect at the end of the last successfully  
 36729 converted byte sequence.

36730 If `iconv()` encounters a character in the input buffer that is valid, but for which an identical  
 36731 character does not exist in the target codeset, `iconv()` shall perform an implementation-defined  
 36732 conversion on this character.

36733 **RETURN VALUE**

36734 The `iconv()` function shall update the variables pointed to by the arguments to reflect the extent  
 36735 of the conversion and return the number of non-identical conversions performed. If the entire  
 36736 string in the input buffer is converted, the value pointed to by `inbytesleft` shall be 0. If the input  
 36737 conversion is stopped due to any conditions mentioned above, the value pointed to by `inbytesleft`  
 36738 shall be non-zero and `errno` shall be set to indicate the condition. If an error occurs, `iconv()` shall  
 36739 return `(size_t)-1` and set `errno` to indicate the error.

36740 **ERRORS**36741 The *iconv()* function shall fail if:36742 [EILSEQ] Input conversion stopped due to an input byte that does not belong to the  
36743 input codeset.

36744 [E2BIG] Input conversion stopped due to lack of space in the output buffer.

36745 [EINVAL] Input conversion stopped due to an incomplete character or shift sequence at  
36746 the end of the input buffer.36747 The *iconv()* function may fail if:36748 [EBADF] The *cd* argument is not a valid open conversion descriptor.36749 **EXAMPLES**

36750 None.

36751 **APPLICATION USAGE**36752 The *inbuf* argument indirectly points to the memory area which contains the conversion input  
36753 data. The *outbuf* argument indirectly points to the memory area which is to contain the result of  
36754 the conversion. The objects indirectly pointed to by *inbuf* and *outbuf* are not restricted to  
36755 containing data that is directly representable in the ISO C standard language **char** data type. The  
36756 type of *inbuf* and *outbuf*, **char \*\***, does not imply that the objects pointed to are interpreted as  
36757 null-terminated C strings or arrays of characters. Any interpretation of a byte sequence that  
36758 represents a character in a given character set encoding scheme is done internally within the  
36759 codeset converters. For example, the area pointed to indirectly by *inbuf* and/or *outbuf* can  
36760 contain all zero octets that are not interpreted as string terminators but as coded character data  
36761 according to the respective codeset encoding scheme. The type of the data (**char**, **short**, **long**,  
36762 and so on) read or stored in the objects is not specified, but may be inferred for both the input and  
36763 output data by the converters determined by the *fromcode* and *toencode* arguments of *iconv\_open()*.36764 Regardless of the data type inferred by the converter, the size of the remaining space in both  
36765 input and output objects (the *inbytesleft* and *outbytesleft* arguments) is always measured in bytes.36766 For implementations that support the conversion of state-dependent encodings, the conversion  
36767 descriptor must be able to accurately reflect the shift-state in effect at the end of the last  
36768 successful conversion. It is not required that the conversion descriptor itself be updated, which  
36769 would require it to be a pointer type. Thus, implementations are free to implement the  
36770 descriptor as a handle (other than a pointer type) by which the conversion information can be  
36771 accessed and updated.36772 **RATIONALE**

36773 None.

36774 **FUTURE DIRECTIONS**

36775 None.

36818 iconv\_open — codeset conversion allocation function

36819 **SYNOPSIS**

36820 #include &lt;iconv.h&gt;

36821 iconv\_t iconv\_open(const char \*tocode, const char \*fromcode);

36822 **DESCRIPTION**

36823 The *iconv\_open()* function shall return a conversion descriptor that describes a conversion from  
 36824 the codeset specified by the string pointed to by the *fromcode* argument to the codeset specified  
 36825 by the string pointed to by the *tocode* argument. For state-dependent encodings, the conversion  
 36826 descriptor shall be in a codeset-dependent initial shift state, ready for immediate use with  
 36827 *iconv()*.

36828 Settings of *fromcode* and *tocode* and their permitted combinations are implementation-defined.36829 A conversion descriptor shall remain valid until it is closed by *iconv\_close()* or an implicit close.36830 If a file descriptor is used to implement conversion descriptors, the FD\_CLOEXEC flag shall be  
 36831 set; see <fcntl.h>.36832 **RETURN VALUE**

36833 Upon successful completion, *iconv\_open()* shall return a conversion descriptor for use on  
 36834 subsequent calls to *iconv()*. Otherwise, *iconv\_open()* shall return (**iconv\_t**)-1 and set *errno* to  
 36835 indicate the error.

36836 **ERRORS**36837 The *iconv\_open()* function may fail if:

36838 [EMFILE] All file descriptors available to the process are currently open.

36839 [ENFILE] Too many files are currently open in the system.

36840 [ENOMEM] Insufficient storage space is available.

36841 [EINVAL] The conversion specified by *fromcode* and *tocode* is not supported by the  
 36842 implementation.36843 **EXAMPLES**

36844 None.

36845 **APPLICATION USAGE**

36846 Some implementations of *iconv\_open()* use *malloc()* to allocate space for internal buffer areas.  
 36847 The *iconv\_open()* function may fail if there is insufficient storage space to accommodate these  
 36848 buffers.

36849 Conforming applications must assume that conversion descriptors are not valid after a call to  
 36850 one of the *exec* functions.36851 Application developers should consult the system documentation to determine the supported  
 36852 codesets and their naming schemes.36853 **RATIONALE**

36854 None.

36855 **FUTURE DIRECTIONS**

36856 None.

36857 **SEE ALSO**36858 *iconv()*, *iconv\_close()*36859 XBD [<fcntl.h>](#), [<iconv.h>](#)36860 **CHANGE HISTORY**

36861 First released in Issue 4. Derived from the HP-UX Manual.

36862 **Issue 7**

36863 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

36864 The *iconv\_open()* function is moved from the XSI option to the Base.

**if\_freenameindex()**

System Interfaces

36865 **NAME**36866 `if_freenameindex` — free memory allocated by `if_nameindex`36867 **SYNOPSIS**36868 `#include <net/if.h>`36869 `void if_freenameindex(struct if_nameindex *ptr);`36870 **DESCRIPTION**

36871 The `if_freenameindex()` function shall free the memory allocated by `if_nameindex()`. The `ptr`  
36872 argument shall be a pointer that was returned by `if_nameindex()`. After `if_freenameindex()` has  
36873 been called, the application shall not use the array of which `ptr` is the address.

36874 **RETURN VALUE**

36875 None.

36876 **ERRORS**

36877 No errors are defined.

36878 **EXAMPLES**

36879 None.

36883 None.

36884 **FUTURE DIRECTIONS**

36885 None.

36886 **SEE ALSO**36887 `getsockopt()`, `if_indextoname()`, `if_nameindex()`, `if_nametoindex()`, `setsockopt()`36888 XBD `<net/if.h>`36889 **CHANGE HISTORY**

36890 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

**36891 NAME**

36892 `if_indextoname` — map a network interface index to its corresponding name

**36893 SYNOPSIS**

36894 `#include <net/if.h>`

36895 `char *if_indextoname(unsigned ifindex, char *ifname);`

**36896 DESCRIPTION**

36897 The `if_indextoname()` function shall map an interface index to its corresponding name.

36898 When this function is called, *ifname* shall point to a buffer of at least {IF\_NAMESIZE} bytes. The  
36899 function shall place in this buffer the name of the interface with index *ifindex*.

**36900 RETURN VALUE**

36901 If *ifindex* is an interface index, then the function shall return the value supplied in *ifname*, which  
36902 points to a buffer now containing the interface name. Otherwise, the function shall return a null  
36903 pointer and set *errno* to indicate the error.

**36904 ERRORS**

36905 The `if_indextoname()` function shall fail if:

36906 [ENXIO] The interface does not exist.

**36907 EXAMPLES**

36908 None.

**36909 APPLICATION USAGE**

36910 None.

**36911 RATIONALE**

36912 None.

**36913 FUTURE DIRECTIONS**

36914 None.

36917 XBD `<net/if.h>`

**36918 CHANGE HISTORY**

36919 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

36920 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/28 is applied, changing {IFNAMSIZ} to  
36921 {IF\_NAMESIZ} in the DESCRIPTION.

**if\_nameindex()**

System Interfaces

36922 **NAME**

36923 if\_nameindex — return all network interface names and indexes

36924 **SYNOPSIS**

```
36925 #include <net/if.h>
36926 struct if_nameindex *if_nameindex(void);
```

36927 **DESCRIPTION**

36928 The *if\_nameindex()* function shall return an array of *if\_nameindex* structures, one structure per  
 36929 interface. The end of the array is indicated by a structure with an *if\_index* field of zero and an  
 36930 *if\_name* field of NULL.

36931 Applications should call *if\_freenameindex()* to release the memory that may be dynamically  
 36932 allocated by this function, after they have finished using it.

36933 **RETURN VALUE**

36934 An array of structures identifying local interfaces. A null pointer is returned upon an error, with  
 36935 *errno* set to indicate the error.

36936 **ERRORS**

36937 The *if\_nameindex()* function may fail if:

36938 [ENOBUFS] Insufficient resources are available to complete the function.

36939 **EXAMPLES**

36940 None.

36941 **APPLICATION USAGE**

36942 None.

36943 **RATIONALE**

**36974 CHANGE HISTORY**

36975 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

**ilogb()**36976 **NAME**36977 `ilogb, ilogbf, ilogbl` — return an unbiased exponent36978 **SYNOPSIS**

```
36979 #include <math.h>
36980 int ilogb(double x);
36981 int ilogbf(float x);
36982 int ilogbl(long double x);
```

36983 **DESCRIPTION**

36984 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 36985 conflict between the requirements described here and the ISO C standard is unintentional. This  
 36986 volume of POSIX.1-2008 defers to the ISO C standard.

36987 These functions shall return the exponent part of their argument  $x$ . Formally, the return value is  
 36988 the integral part of  $\log_r |x|$  as a signed integral value, for non-zero  $x$ , where  $r$  is the radix of the  
 36989 machine's floating-point arithmetic, which is the value of `FLT_RADIX` defined in `<float.h>`.

36990 An application wishing to check for error situations should set `errno` to zero and call  
 36991 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or  
 36992 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-  
 36993 zero, an error has occurred.

36994 **RETURN VALUE**

36995 Upon successful completion, these functions shall return the exponent part of  $x$  as a signed  
 36996 integer value. They are equivalent to calling the corresponding `logb()` function and casting the  
 36997 returned value to type `int`.

36998 XSI If  $x$  is 0, the value `FP_ILOGB0` shall be returned. On XSI-conformant systems, a domain error  
 36999 shall occur;

37000 CX otherwise, a domain error may occur.

37001 XSI If  $x$  is  $\pm\text{Inf}$ , the value `{INT_MAX}` shall be returned. On XSI-conformant systems, a domain  
 37002 error shall occur;

37003 CX otherwise, a domain error may occur.

37004 XSI If  $x$  is a NaN, the value `FP_ILOGBNAN` shall be returned. On XSI-conformant systems, a  
 37005 domain error shall occur;

37006 CX otherwise, a domain error may occur.

37007 MX If the correct value is greater than `{INT_MAX}`, a domain error shall occur and an unspecified  
 37008 XSI value shall be returned. On XSI-conformant systems, a domain error shall occur and  
 37009 `{INT_MAX}` shall be returned.

37010 MX If the correct value is less than `{INT_MIN}`, a domain error shall occur and an unspecified value  
 37011 XSI shall be returned. On XSI-conformant systems, a domain error shall occur and `{INT_MIN}` shall  
 37012 be returned.

37013 **ERRORS**

37014 These functions shall fail if:

37015 XSI | MX **Domain Error** The correct value is not representable as an integer.

37016 XSI The  $x$  argument is zero, NaN, or  $\pm\text{Inf}$ .

37017 XSI | MX If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,  
 37018 then `errno` shall be set to `[EDOM]`. If the integer expression `(math_errhandling  
 37019 & MATH_ERREXCEPT)` is non-zero, then the invalid floating-point exception  
 37020 shall be raised.

37021 These functions may fail if:

37022 Domain Error The  $x$  argument is zero, NaN, or  $\pm\text{Inf}$ .

37023 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
37024 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling* &  
37025 MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
37026 shall be raised.

#### 37027 EXAMPLES

37028 None.

#### 37029 APPLICATION USAGE

37030 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
37031 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

#### 37032 RATIONALE

37033 The errors come from taking the expected floating-point value and converting it to **int**, which is  
37034 an invalid operation in IEEE Std 754-1985 (since overflow, infinity, and NaN are not  
37035 representable in a type **int**), so should be a domain error.

37036 There are no known implementations that overflow. For overflow to happen, {INT\_MAX} must  
37037 be less than  $\text{LDBL\_MAX\_EXP} \cdot \log_2(\text{FLT\_RADIX})$  or {INT\_MIN} must be greater than  
37038  $\text{LDBL\_MIN\_EXP} \cdot \log_2(\text{FLT\_RADIX})$  if subnormals are not supported, or {INT\_MIN} must be  
37039 greater than  $(\text{LDBL\_MIN\_EXP} - \text{LDBL\_MANT\_DIG}) \cdot \log_2(\text{FLT\_RADIX})$  if subnormals are  
37040 supported.

#### 37041 FUTURE DIRECTIONS

37042 None.

37112 **SEE ALSO**37113 `imaxabs()`37114 XBD `<inttypes.h>`37115 **CHANGE HISTORY**

37116 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**inet\_addr()**37117 **NAME**37118 `inet_addr, inet_ntoa` — IPv4 address manipulation37119 **SYNOPSIS**

```
37120 #include <arpa/inet.h>
37121 in_addr_t inet_addr(const char *cp);
37122 char *inet_ntoa(struct in_addr in);
```

37123 **DESCRIPTION**

37124 The `inet_addr()` function shall convert the string pointed to by `cp`, in the standard IPv4 dotted decimal notation, to an integer value suitable for use as an Internet address.

37126 The `inet_ntoa()` function shall convert the Internet host address specified by `in` to a string in the Internet standard dot notation.

37128 The `inet_ntoa()` function need not be thread-safe.

37129 All Internet addresses shall be returned in network order (bytes ordered from left to right).

37130 Values specified using IPv4 dotted decimal notation take one of the following forms:

37131 `a.b.c.d` When four parts are specified, each shall be interpreted as a byte of data and  
37132 assigned, from left to right, to the four bytes of an Internet address.

37133 `a.b.c` When a three-part address is specified, the last part shall be interpreted as a 16-bit  
37134 quantity and placed in the rightmost two bytes of the network address. This makes  
37135 the three-part address format convenient for specifying Class B network addresses  
37136 as "128.net.host".

37137 `a.b` When a two-part address is supplied, the last part shall be interpreted as a 24-bit  
37138 quantity and placed in the rightmost three bytes of the network address. This  
37139 makes the two-part address format convenient for specifying Class A network  
37140 addresses as "net.host".

37141 `a` When only one part is given, the value shall be stored directly in the network  
37142 address without any byte rearrangement.

37143 All numbers supplied as parts in IPv4 dotted decimal notation may be decimal, octal, or  
37144 hexadecimal, as specified in the ISO C standard (that is, a leading 0x or 0X implies hexadecimal;  
37145 otherwise, a leading '0' implies octal; otherwise, the number is interpreted as decimal).

37146 **RETURN VALUE**

37147 Upon successful completion, `inet_addr()` shall return the Internet address. Otherwise, it shall  
37148 return `(in_addr_t)(-1)`.

37149 The `inet_ntoa()` function shall return a pointer to the network address in Internet standard dot  
37150 notation.

37151 **ERRORS**

37152 No errors are defined.

37153 **EXAMPLES**

37154 None.

37155 **APPLICATION USAGE**37156 The return value of *inet\_ntoa()* may point to static data that may be overwritten by subsequent  
37157 calls to *inet\_ntoa()*.37158 **RATIONALE**

37159 None.

37160 **FUTURE DIRECTIONS**

**inet\_ntop()**37169 **NAME**37170 `inet_ntop, inet_pton` — convert IPv4 and IPv6 addresses between binary and text form37171 **SYNOPSIS**

```
37172 #include <arpa/inet.h>
37173
37174 const char *inet_ntop(int af, const void *restrict src,
37175 char *restrict dst, socklen_t size);
37176
37177 int inet_pton(int af, const char *restrict src, void *restrict dst);
```

37176 **DESCRIPTION**

37177 The `inet_ntop()` function shall convert a numeric address into a text string suitable for  
 37178 IP6 presentation. The `af` argument shall specify the family of the address. This can be `AF_INET` or  
 37179 `AF_INET6`. The `src` argument points to a buffer holding an IPv4 address if the `af` argument is  
 37180 IP6 `AF_INET`, or an IPv6 address if the `af` argument is `AF_INET6`; the address must be in network  
 37181 byte order. The `dst` argument points to a buffer where the function stores the resulting text string;  
 37182 it shall not be NULL. The `size` argument specifies the size of this buffer, which shall be large  
 37183 IP6 enough to hold the text string (`INET_ADDRSTRLEN` characters for IPv4,  
 37184 `INET6_ADDRSTRLEN` characters for IPv6).

37185 The `inet_pton()` function shall convert an address in its standard text presentation form into its  
 37186 IP6 numeric binary form. The `af` argument shall specify the family of the address. The `AF_INET` and  
 37187 `AF_INET6` address families shall be supported. The `src` argument points to the string being  
 37188 passed in. The `dst` argument points to a buffer into which the function stores the numeric  
 37189 IP6 address; this shall be large enough to hold the numeric address (32 bits for `AF_INET`, 128 bits  
 37190 for `AF_INET6`).

37191 If the `af` argument of `inet_pton()` is `AF_INET`, the `src` string shall be in the standard IPv4 dotted-  
 37192 decimal form:

37193 `ddd.ddd.ddd.ddd`

37194 where "ddd" is a one to three digit decimal number between 0 and 255 (see `inet_addr()`). The  
 37195 `inet_pton()` function does not accept other formats (such as the octal numbers, hexadecimal  
 37196 numbers, and fewer than four numbers that `inet_addr()` accepts).

37197 IP6 If the `af` argument of `inet_pton()` is `AF_INET6`, the `src` string shall be in one of the following  
 37198 standard IPv6 text forms:

- 37199 1. The preferred form is "`x:x:x:x:x:x:x:x`", where the 'x's are the hexadecimal values  
 37200 of the eight 16-bit pieces of the address. Leading zeros in individual fields can be  
 37201 omitted, but there shall be at least one numeral in every field.
- 37202 2. A string of contiguous zero fields in the preferred form can be shown as "`::`". The "`::`"  
 37203 can only appear once in an address. Unspecified addresses ("`0:0:0:0:0:0:0:0`") may  
 37204 be represented simply as "`::`".
- 37205 3. A third form that is sometimes more convenient when dealing with a mixed environment  
 37206 of IPv4 and IPv6 nodes is "`x:x:x:x:x:x.d.d.d.d`", where the 'x's are the  
 37207 hexadecimal values of the six high-order 16-bit pieces of the address, and the 'd's are the  
 37208 decimal values of the four low-order 8-bit pieces of the address (standard IPv4  
 37209 representation).

37210 **Note:** A more extensive description of the standard representations of IPv6 addresses can be found in  
 37211 RFC 2373.

37212 **RETURN VALUE**

37213 The *inet\_ntop()* function shall return a pointer to the buffer containing the text string if the  
 37214 conversion succeeds, and NULL otherwise, and set *errno* to indicate the error.

37215 The *inet\_pton()* function shall return 1 if the conversion succeeds, with the address pointed to by  
 37216 IP6 *dst* in network byte order. It shall return 0 if the input is not a valid IPv4 dotted-decimal string  
 37217 or a valid IPv6 address string, or -1 with *errno* set to [EAFNOSUPPORT] if the *af* argument is  
 37218 unknown.

37219 **ERRORS**

37220 The *inet\_ntop()* and *inet\_pton()* functions shall fail if:

37221 [EAFNOSUPPORT]

37222 The *af* argument is invalid.

37223 [ENOSPC] The size of the *inet\_ntop()* result buffer is inadequate.

37224 **EXAMPLES**

37225 None.

37226 **APPLICATION USAGE**

37227 None.

37228 **RATIONALE**

37229 None.

37230 **FUTURE DIRECTIONS**

37231 None.

37232 **SEE ALSO**

37233 XBD [<arpa/inet.h>](#)

37234 **CHANGE HISTORY**

37235 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37236 IPv6 extensions are marked.

37237 The **restrict** keyword is added to the *inet\_ntop()* and *inet\_pton()* prototypes for alignment with  
 37238 the ISO/IEC 9899:1999 standard.

37239 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/29 is applied, adding "the address must  
 37240 be in network byte order" to the end of the fourth sentence of the first paragraph in the  
 37241 DESCRIPTION.

**initstate()**37242 **NAME**37243 `initstate`, `random`, `setstate`, `srandom` — pseudo-random number functions37244 **SYNOPSIS**

```

37245 XSI #include <stdlib.h>
37246 char *initstate(unsigned seed, char *state, size_t size);
37247 long random(void);
37248 char *setstate(char *state);
37249 void srandom(unsigned seed);

```

37250 **DESCRIPTION**

37251 The `random()` function shall use a non-linear additive feedback random-number generator  
 37252 employing a default state array size of 31 **long** integers to return successive pseudo-random  
 37253 numbers in the range from 0 to  $2^{31}-1$ . The period of this random-number generator is  
 37254 approximately  $16 \times (2^{31}-1)$ . The size of the state array determines the period of the random-  
 37255 number generator. Increasing the state array size shall increase the period.

37256 With 256 bytes of state information, the period of the random-number generator shall be greater  
 37257 than  $2^{69}$ .

37258 Like `rand()`, `random()` shall produce by default a sequence of numbers that can be duplicated by  
 37259 calling `srandom()` with 1 as the seed.

37260 The `srandom()` function shall initialize the current state array using the value of `seed`.

37261 The `initstate()` and `setstate()` functions handle restarting and changing random-number  
 37262 generators. The `initstate()` function allows a state array, pointed to by the `state` argument, to be  
 37263 initialized for future use. The `size` argument, which specifies the size in bytes of the state array,  
 37264 shall be used by `initstate()` to decide what type of random-number generator to use; the larger  
 37265 the state array, the more random the numbers. Values for the amount of state information are 8,  
 37266 32, 64, 128, and 256 bytes. Other values greater than 8 bytes are rounded down to the nearest one  
 37267 of these values. If `initstate()` is called with  $8 \leq \text{size} < 32$ , then `random()` shall use a simple linear  
 37268 congruential random number generator. The `seed` argument specifies a starting point for the  
 37269 random-number sequence and provides for restarting at the same point. The `initstate()` function  
 37270 shall return a pointer to the previous state information array.

37271 If `initstate()` has not been called, then `random()` shall behave as though `initstate()` had been called  
 37272 with `seed=1` and `size=128`.

37273 Once a state has been initialized, `setstate()` allows switching between state arrays. The array  
 37274 defined by the `state` argument shall be used for further random-number generation until  
 37275 `initstate()` is called or `setstate()` is called again. The `setstate()` function shall return a pointer to the  
 37276 previous state array.

37277 **RETURN VALUE**

37278 If `initstate()` is called with `size` less than 8, it shall return NULL.

37279 The `random()` function shall return the generated pseudo-random number.

37280 The `srandom()` function shall not return a value.

37281 Upon successful completion, `initstate()` and `setstate()` shall return a pointer to the previous state  
 37282 array; otherwise, a null pointer shall be returned.

37283 **ERRORS**

37284 No errors are defined.

37285 **EXAMPLES**

37286 None.

37287 **APPLICATION USAGE**

37288 After initialization, a state array can be restarted at a different point in one of two ways:

- 37289 1. The *initstate()* function can be used, with the desired seed, state array, and size of the  
37290 array.
- 37291 2. The *setstate()* function, with the desired state, can be used, followed by *srandom()* with  
37292 the desired seed. The advantage of using both of these functions is that the size of the  
37293 state array does not have to be saved once it is initialized.

37294 Although some implementations of *random()* have written messages to standard error, such  
37295 implementations do not conform to POSIX.1-2008.

37296 Issue 5 restored the historical behavior of this function.

37297 Threaded applications should use *erand48()*, *nrand48()*, or *jrand48()* instead of *random()* when  
37298 an independent random number sequence in multiple threads is required.

37299 **RATIONALE**

37300 None.

37301 **FUTURE DIRECTIONS**

37302 None.

37303 **SEE ALSO**37304 *drand48()*, *rand()*37305 XBD `<stdlib.h>`37306 **CHANGE HISTORY**

37307 First released in Issue 4, Version 2.

37308 **Issue 5**

37309 Moved from X/OPEN UNIX extension to BASE.

37310 In the DESCRIPTION, the phrase “values smaller than 8” is replaced with “values greater than  
37311 or equal to 8, or less than 32”, “*size*<8” is replaced with “ $8 \leq \textit{size} < 32$ ”, and a new first paragraph  
37312 is added to the RETURN VALUE section. A note is added to the APPLICATION USAGE  
37313 indicating that these changes restore the historical behavior of the function.

37314 **Issue 6**

37315 In the DESCRIPTION, duplicate text “For values greater than or equal to 8 . . .” is removed.

37316 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/30 is applied, removing *rand\_r()* from the  
37317 list of suggested functions in the APPLICATION USAGE section.

37318 **Issue 7**37319 The type of the first argument to *setstate()* is changed from **const char \*** to **char \***.

**insque()**37320 **NAME**37321 `insque, remque` — insert or remove an element in a queue37322 **SYNOPSIS**

```

37323 XSI      #include <search.h>
37324         void insque(void *element, void *pred);
37325         void remque(void *element);

```

37326 **DESCRIPTION**

37327 The *insque()* and *remque()* functions shall manipulate queues built from doubly-linked lists. The  
 37328 queue can be either circular or linear. An application using *insque()* or *remque()* shall ensure it  
 37329 defines a structure in which the first two members of the structure are pointers to the same type  
 37330 of structure, and any further members are application-specific. The first member of the structure  
 37331 is a forward pointer to the next entry in the queue. The second member is a backward pointer to  
 37332 the previous entry in the queue. If the queue is linear, the queue is terminated with null  
 37333 pointers. The names of the structure and of the pointer members are not subject to any special  
 37334 restriction.

37335 The *insque()* function shall insert the element pointed to by *element* into a queue immediately  
 37336 after the element pointed to by *pred*.

37337 The *remque()* function shall remove the element pointed to by *element* from a queue.

37338 If the queue is to be used as a linear list, invoking *insque(&element, NULL)*, where *element* is the  
 37339 initial element of the queue, shall initialize the forward and backward pointers of *element* to null  
 37340 pointers.

37341 If the queue is to be used as a circular list, the application shall ensure it initializes the forward  
 37342 pointer and the backward pointer of the initial element of the queue to the element's own  
 37343 address.

37344 **RETURN VALUE**37345 The *insque()* and *remque()* functions do not return a value.37346 **ERRORS**

37347 No errors are defined.

37348 **EXAMPLES**37349 **Creating a Linear Linked List**

37350 The following example creates a linear linked list.

```

37351 #include <search.h>
37352 .
37353 struct myque element1;
37354 struct myque element2;
37355
37356 char *data1 = "DATA1";
37357 char *data2 = "DATA2";
37358 ...
37359 element1.data = data1;
37360 element2.data = data2;
37361
37362 insque (&element1, NULL);
37363 insque (&element2, &element1);

```

37362 **Creating a Circular Linked List**

37363 The following example creates a circular linked list.

```

37364 #include <search.h>
37365 ...
37366 struct myque element1;
37367 struct myque element2;

37368 char *data1 = "DATA1";
37369 char *data2 = "DATA2";
37370 ...
37371 element1.data = data1;
37372 element2.data = data2;

37373 element1.fwd = &element1;
37374 element1.bck = &element1;

37375 insque (&element2, &element1);

```

37376 **Removing an Element**37377 The following example removes the element pointed to by *element1*.

```

37378 #include <search.h>
37379 ...
37380 struct myque element1;
37381 ...
37382 remove (&element1);

```

37383 **APPLICATION USAGE**

37384 The historical implementations of these functions described the arguments as being of type  
 37385 **struct qelem \*** rather than as being of type **void \*** as defined here. In those implementations,  
 37386 **struct qelem** was commonly defined in **<search.h>** as:

```

37387 struct qelem {
37388     struct qelem *q_forw;
37389     struct qelem *q_back;
37390 };

```

37391 Applications using these functions, however, were never able to use this structure directly since  
 37392 it provided no room for the actual data contained in the elements. Most applications defined  
 37393 structures that contained the two pointers as the initial elements and also provided space for,  
 37394 pointers to, the object's data. Applications that used these functions to update more than one  
 37395 type of table also had the problem of specifying two or more different structures with the same  
 37396 name, if they literally used **struct qelem** as specified.

37397 As described here, the implementations were actually expecting a structure type where the first  
 37398 two members were forward and backward pointers to structures. With C compilers that didn't  
 37399 provide function prototypes, applications used structures as specified in the DESCRIPTION  
 37400 above and the compiler did what the application expected.

37401 If this method had been carried forward with an ISO C standard compiler and the historical  
 37402 function prototype, most applications would have to be modified to cast pointers to the  
 37403 structures actually used to be pointers to **struct qelem** to avoid compilation warnings. By  
 37404 specifying **void \*** as the argument type, applications do not need to change (unless they  
 37405 specifically referenced **struct qelem** and depended on it being defined in **<search.h>**).

**insque()**37406 **RATIONALE**

37407 None.

37408 **FUTURE DIRECTIONS**

37409 None.

37410 **SEE ALSO**37411 XBD [<search.h>](#)37412 **CHANGE HISTORY**

37413 First released in Issue 4, Version 2.

37414 **Issue 5**

37415 Moved from X/OPEN UNIX extension to BASE.

37416 **Issue 6**

37417 The normative text is updated to avoid use of the term “must” for application requirements.

37418 **NAME**37419 ioctl — control a STREAMS device (**STREAMS**)37420 **SYNOPSIS**

```
37421 OB XSR #include <stropts.h>
37422 int ioctl(int fildes, int request, ... /* arg */);
```

37423 **DESCRIPTION**

37424 The *ioctl()* function shall perform a variety of control functions on STREAMS devices. For non-  
 37425 STREAMS devices, the functions performed by this call are unspecified. The *request* argument  
 37426 and an optional third argument (with varying type) shall be passed to and interpreted by the  
 37427 appropriate part of the STREAM associated with *fildes*.

37428 The *fildes* argument is an open file descriptor that refers to a device.

37429 The *request* argument selects the control function to be performed and shall depend on the  
 37430 STREAMS device being addressed.

37431 The *arg* argument represents additional information that is needed by this specific STREAMS  
 37432 device to perform the requested function. The type of *arg* depends upon the particular control  
 37433 request, but it shall be either an integer or a pointer to a device-specific data structure.

37434 The *ioctl()* commands applicable to STREAMS, their arguments, and error conditions that apply  
 37435 to each individual command are described below.

37436 The following *ioctl()* commands, with error values indicated, are applicable to all STREAMS  
 37437 files:

37438 **I\_PUSH** Pushes the module whose name is pointed to by *arg* onto the top of the current  
 37439 STREAM, just below the STREAM head. It then calls the *open()* function of the  
 37440 newly-pushed module.

37441 The *ioctl()* function with the **I\_PUSH** command shall fail if:

37442 [EINVAL] Invalid module name.

37443 [ENXIO] Open function of new module failed.

37444 [ENXIO] Hangup received on *fildes*.

37445 **I\_POP** Removes the module just below the STREAM head of the STREAM pointed to  
 37446 by *fildes*. The *arg* argument should be 0 in an **I\_POP** request.

37447 The *ioctl()* function with the **I\_POP** command shall fail if:

37448 [EINVAL] No module present in the STREAM.

37449 [ENXIO] Hangup received on *fildes*.

37450 **I\_LOOK** Retrieves the name of the module just below the STREAM head of the  
 37451 STREAM pointed to by *fildes*, and places it in a character string pointed to by  
 37452 *arg*. The buffer pointed to by *arg* should be at least FMNAMESZ+1 bytes long,  
 37453 where FMNAMESZ is defined in **<stropts.h>**.

37454 The *ioctl()* function with the **I\_LOOK** command shall fail if:

37455 [EINVAL] No module present in the STREAM.

37456 **I\_FLUSH** Flushes read and/or write queues, depending on the value of *arg*. Valid *arg*  
 37457 values are:

**ioctl()**

37458	FLUSHR	Flush all read queues.
37459	FLUSHW	Flush all write queues.
37460	FLUSHRW	Flush all read and all write queues.
37461	The <i>ioctl()</i> function with the <code>I_FLUSH</code> command shall fail if:	
37462	[EINVAL]	Invalid <i>arg</i> value.
37463	[EAGAIN] or [ENOSR]	Unable to allocate buffers for flush message.
37464		
37465	[ENXIO]	Hangup received on <i>fildev</i> .
37466	I_FLUSHBAND	Flushes a particular band of messages. The <i>arg</i> argument points to a <b>bandinfo</b> structure. The <i>bi_flag</i> member may be one of <code>FLUSHR</code> , <code>FLUSHW</code> , or <code>FLUSHRW</code> as described above. The <i>bi_pri</i> member determines the priority band to be flushed.
37467		
37468		
37469		
37470	I_SETSIG	Requests that the STREAMS implementation send the SIGPOLL signal to the calling process when a particular event has occurred on the STREAM associated with <i>fildev</i> . <code>I_SETSIG</code> supports an asynchronous processing capability in STREAMS. The value of <i>arg</i> is a bitmask that specifies the events for which the process should be signaled. It is the bitwise-inclusive OR of any combination of the following constants:
37471		
37472		
37473		
37474		
37475		
37476	S_RDNORM	A normal (priority band set to 0) message has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
37477		
37478		
37479	S_RDBAND	A message with a non-zero priority band has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
37480		
37481		
37482	S_INPUT	A message, other than a high-priority message, has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
37483		
37484		
37485	S_HIPRI	A high-priority message is present on a STREAM head read queue. A signal shall be generated even if the message is of zero length.
37486		
37487		
37488	S_OUTPUT	The write queue for normal data (priority band 0) just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) normal data downstream.
37489		
37490		
37491		
37492	S_WRNORM	Equivalent to <code>S_OUTPUT</code> .
37493	S_WRBAND	The write queue for a non-zero priority band just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) priority data downstream.
37494		
37495		
37496		
37497	S_MSG	A STREAMS signal message that contains the SIGPOLL signal has reached the front of the STREAM head read queue.
37498		
37499		

37500		S_ERROR	Notification of an error condition has reached the STREAM head.
37501			
37502		S_HANGUP	Notification of a hangup has reached the STREAM head.
37503		S_BANDURG	When used in conjunction with S_RDBAND, SIGURG is generated instead of SIGPOLL when a priority message reaches the front of the STREAM head read queue.
37504			
37505			
37506			If <i>arg</i> is 0, the calling process shall be unregistered and shall not receive further SIGPOLL signals for the stream associated with <i>fildev</i> .
37507			
37508			Processes that wish to receive SIGPOLL signals shall ensure that they explicitly register to receive them using I_SETSIG. If several processes register to receive this signal for the same event on the same STREAM, each process shall be signaled when the event occurs.
37509			
37510			
37511			
37512			The <i>ioctl()</i> function with the I_SETSIG command shall fail if:
37513		[EINVAL]	The value of <i>arg</i> is invalid.
37514		[EINVAL]	The value of <i>arg</i> is 0 and the calling process is not registered to receive the SIGPOLL signal.
37515			
37516		[EAGAIN]	There were insufficient resources to store the signal request.
37517	I_GETSIG		Returns the events for which the calling process is currently registered to be sent a SIGPOLL signal. The events are returned as a bitmask in an <b>int</b> pointed to by <i>arg</i> , where the events are those specified in the description of I_SETSIG above.
37518			
37519			
37520			
37521			The <i>ioctl()</i> function with the I_GETSIG command shall fail if:
37522		[EINVAL]	Process is not registered to receive the SIGPOLL signal.
37523	I_FIND		Compares the names of all modules currently present in the STREAM to the name pointed to by <i>arg</i> , and returns 1 if the named module is present in the STREAM, or returns 0 if the named module is not present.
37524			
37525			
37526			The <i>ioctl()</i> function with the I_FIND command shall fail if:
37527		[EINVAL]	<i>arg</i> does not contain a valid module name.
37528	I_PEEK		Retrieves the information in the first message on the STREAM head read queue without taking the message off the queue. It is analogous to <i>getmsg()</i> except that this command does not remove the message from the queue. The <i>arg</i> argument points to a <b>strpeek</b> structure.
37529			
37530			
37531			
37532			The application shall ensure that the <i>maxlen</i> member in the <b>ctlbuf</b> and <b>datbuf</b> structures is set to the number of bytes of control information and/or data information, respectively, to retrieve. The <i>flags</i> member may be marked RS_HIPRI or 0, as described by <i>getmsg()</i> . If the process sets <i>flags</i> to RS_HIPRI, for example, I_PEEK shall only look for a high-priority message on the STREAM head read queue.
37533			
37534			
37535			
37536			
37537			
37538			I_PEEK returns 1 if a message was retrieved, and returns 0 if no message was found on the STREAM head read queue, or if the RS_HIPRI flag was set in <i>flags</i> and a high-priority message was not present on the STREAM head read queue. It does not wait for a message to arrive. On return, <b>ctlbuf</b> specifies information in the control buffer, <b>datbuf</b> specifies information in the data
37539			
37540			
37541			
37542			

**ioctl()**

37543		buffer, and <i>flags</i> contains the value RS_HIPRI or 0.
37544	I_SRDOPT	Sets the read mode using the value of the argument <i>arg</i> . Read modes are described in <i>read()</i> . Valid <i>arg</i> flags are:
37545		
37546	RNORM	Byte-stream mode, the default.
37547	RMSGD	Message-discard mode.
37548	RMSGN	Message-nondiscard mode.
37549		The bitwise-inclusive OR of RMSGD and RMSGN shall return [EINVAL]. The bitwise-inclusive OR of RNORM and either RMSGD or RMSGN shall result in the other flag overriding RNORM which is the default.
37550		
37551		
37552		In addition, treatment of control messages by the STREAM head may be changed by setting any of the following flags in <i>arg</i> :
37553		
37554	RPROTNORM	Fail <i>read()</i> with [EBADMSG] if a message containing a control part is at the front of the STREAM head read queue.
37555		
37556	RPROTDAT	Deliver the control part of a message as data when a process issues a <i>read()</i> .
37557		
37558	RPROTDIS	Discard the control part of a message, delivering any data portion, when a process issues a <i>read()</i> .
37559		
37560		The <i>ioctl()</i> function with the I_SRDOPT command shall fail if:
37561	[EINVAL]	The <i>arg</i> argument is not valid.
37562	I_GRDOPT	Returns the current read mode setting, as described above, in an <b>int</b> pointed to by the argument <i>arg</i> . Read modes are described in <i>read()</i> .
37563		
37564	I_NREAD	Counts the number of data bytes in the data part of the first message on the STREAM head read queue and places this value in the <b>int</b> pointed to by <i>arg</i> . The return value for the command shall be the number of messages on the STREAM head read queue. For example, if 0 is returned in <i>arg</i> , but the <i>ioctl()</i> return value is greater than 0, this indicates that a zero-length message is next on the queue.
37565		
37566		
37567		
37568		
37569		
37570	I_FDINSERT	Creates a message from specified buffer(s), adds information about another STREAM, and sends the message downstream. The message contains a control part and an optional data part. The data and control parts to be sent are distinguished by placement in separate buffers, as described below. The <i>arg</i> argument points to a <b>strfdinsert</b> structure.
37571		
37572		
37573		
37574		
37575		The application shall ensure that the <i>len</i> member in the <b>ctlbuf strbuf</b> structure is set to the size of a <b>t_uscalar_t</b> plus the number of bytes of control information to be sent with the message. The <i>fildev</i> member specifies the file descriptor of the other STREAM, and the <i>offset</i> member, which must be suitably aligned for use as a <b>t_uscalar_t</b> , specifies the offset from the start of the control buffer where I_FDINSERT shall store a <b>t_uscalar_t</b> whose interpretation is specific to the STREAM end. The application shall ensure that the <i>len</i> member in the <b>databuf strbuf</b> structure is set to the number of bytes of data information to be sent with the message, or to 0 if no data part is to be sent.
37576		
37577		
37578		
37579		
37580		
37581		
37582		
37583		
37584		
37585		The <i>flags</i> member specifies the type of message to be created. A normal message is created if <i>flags</i> is set to 0, and a high-priority message is created if
37586		

37587 37588 37589 37590 37591		<i>flags</i> is set to RS_HIPRI. For non-priority messages, I_FDINSERT shall block if the STREAM write queue is full due to internal flow control conditions. For priority messages, I_FDINSERT does not block on this condition. For non-priority messages, I_FDINSERT does not block when the write queue is full and O_NONBLOCK is set. Instead, it fails and sets <i>errno</i> to [EAGAIN].
37592 37593 37594 37595		I_FDINSERT also blocks, unless prevented by lack of internal resources, waiting for the availability of message blocks in the STREAM, regardless of priority or whether O_NONBLOCK has been specified. No partial message is sent.
37596		The <i>ioctl()</i> function with the I_FDINSERT command shall fail if:
37597 37598 37599	[EAGAIN]	A non-priority message is specified, the O_NONBLOCK flag is set, and the STREAM write queue is full due to internal flow control conditions.
37600	[EAGAIN] or [ENOSR]	
37601 37602		Buffers cannot be allocated for the message that is to be created.
37603	[EINVAL]	One of the following:
37604 37605		— The <i>fildev</i> member of the <b>strfdinsert</b> structure is not a valid, open STREAM file descriptor.
37606 37607		— The size of a <b>t_uscalar_t</b> plus <i>offset</i> is greater than the <i>len</i> member for the buffer specified through <b>ctlbuf</b> .
37608 37609		— The <i>offset</i> member does not specify a properly-aligned location in the data buffer.
37610		— An undefined value is stored in <i>flags</i> .
37611 37612 37613	[ENXIO]	Hangup received on the STREAM identified by either the <i>fildev</i> argument or the <i>fildev</i> member of the <b>strfdinsert</b> structure.
37614 37615 37616 37617 37618 37619 37620 37621	[ERANGE]	The <i>len</i> member for the buffer specified through <b>databuf</b> does not fall within the range specified by the maximum and minimum packet sizes of the topmost STREAM module; or the <i>len</i> member for the buffer specified through <b>databuf</b> is larger than the maximum configured size of the data part of a message; or the <i>len</i> member for the buffer specified through <b>ctlbuf</b> is larger than the maximum configured size of the control part of a message.
37622 37623	I_STR	Constructs an internal STREAMS <i>ioctl()</i> message from the data pointed to by <i>arg</i> , and sends that message downstream.
37624 37625 37626 37627 37628 37629		This mechanism is provided to send <i>ioctl()</i> requests to downstream modules and drivers. It allows information to be sent with <i>ioctl()</i> , and returns to the process any information sent upstream by the downstream recipient. I_STR shall block until the system responds with either a positive or negative acknowledgement message, or until the request times out after some period of time. If the request times out, it shall fail with <i>errno</i> set to [ETIME].
37630 37631		At most, one I_STR can be active on a STREAM. Further I_STR calls shall block until the active I_STR completes at the STREAM head. The default

**ioctl()**

37632		timeout interval for these requests is 15 seconds. The O_NONBLOCK flag has
37633		no effect on this call.
37634		To send requests downstream, the application shall ensure that <i>arg</i> points to a
37635		<b>strioc</b> structure.
37636		The <i>ic_cmd</i> member is the internal <i>ioctl()</i> command intended for a
37637		downstream module or driver and <i>ic_timeout</i> is the number of seconds
37638		(-1=infinite, 0=use implementation-defined timeout interval, >0=as specified)
37639		an I_STR request shall wait for acknowledgement before timing out. <i>ic_len</i> is
37640		the number of bytes in the data argument, and <i>ic_dp</i> is a pointer to the data
37641		argument. The <i>ic_len</i> member has two uses: on input, it contains the length of
37642		the data argument passed in, and on return from the command, it contains the
37643		number of bytes being returned to the process (the buffer pointed to by <i>ic_dp</i>
37644		should be large enough to contain the maximum amount of data that any
37645		module or the driver in the STREAM can return).
37646		The STREAM head shall convert the information pointed to by the <b>strioc</b>
37647		structure to an internal <i>ioctl()</i> command message and send it downstream.
37648		The <i>ioctl()</i> function with the I_STR command shall fail if:
37649		[EAGAIN] or [ENOSR]
37650		Unable to allocate buffers for the <i>ioctl()</i> message.
37651		[EINVAL] The <i>ic_len</i> member is less than 0 or larger than the
37652		maximum configured size of the data part of a message, or
37653		<i>ic_timeout</i> is less than -1.
37654		[ENXIO] Hangup received on <i>fil</i> .
37655		[ETIME] A downstream <i>ioctl()</i> timed out before acknowledgement
37656		was received.
37657		An I_STR can also fail while waiting for an acknowledgement if a message
37658		indicating an error or a hangup is received at the STREAM head. In addition,
37659		an error code can be returned in the positive or negative acknowledgement
37660		message, in the event the <i>ioctl()</i> command sent downstream fails. For these
37661		cases, I_STR shall fail with <i>errno</i> set to the value in the message.
37662	I_SWROPT	Sets the write mode using the value of the argument <i>arg</i> . Valid bit settings for
37663		<i>arg</i> are:
37664		SNDZERO Send a zero-length message downstream when a <i>write()</i> of 0
37665		bytes occurs. To not send a zero-length message when a
37666		<i>write()</i> of 0 bytes occurs, the application shall ensure that
37667		this bit is not set in <i>arg</i> (for example, <i>arg</i> would be set to 0).
37668		The <i>ioctl()</i> function with the I_SWROPT command shall fail if:
37669		[EINVAL] <i>arg</i> is not the above value.
37670	I_GWROPT	Returns the current write mode setting, as described above, in the <b>int</b> that is
37671		pointed to by the argument <i>arg</i> .
37672	I_SENDFD	Creates a new reference to the open file description associated with the file
37673		descriptor <i>arg</i> , and writes a message on the STREAMS-based pipe <i>fil</i>
37674		containing this reference, together with the user ID and group ID of the calling
37675		process.

37676		The <i>ioctl()</i> function with the <code>L_SENDFD</code> command shall fail if:
37677	[EAGAIN]	The sending STREAM is unable to allocate a message block to contain the file pointer; or the read queue of the receiving STREAM head is full and cannot accept the message sent by <code>L_SENDFD</code> .
37678		
37679		
37680		
37681	[EBADF]	The <i>arg</i> argument is not a valid, open file descriptor.
37682	[EINVAL]	The <i>fildev</i> argument is not connected to a STREAM pipe.
37683	[ENXIO]	Hangup received on <i>fildev</i> .
37684		The <i>ioctl()</i> function with the <code>L_SENDFD</code> command may fail if:
37685	[EINVAL]	The <i>arg</i> argument is equal to the <i>fildev</i> argument.
37686	<code>L_RECVFD</code>	Retrieves the reference to an open file description from a message written to a STREAMS-based pipe using the <code>L_SENDFD</code> command, and allocates a new file descriptor in the calling process that refers to this open file description. The <i>arg</i> argument is a pointer to a <code>strrecvfd</code> data structure as defined in <code>&lt;stropts.h&gt;</code> .
37687		
37688		
37689		
37690		
37691		The <i>fd</i> member is a file descriptor. The <i>uid</i> and <i>gid</i> members are the effective user ID and effective group ID, respectively, of the sending process.
37692		
37693		If <code>O_NONBLOCK</code> is not set, <code>L_RECVFD</code> shall block until a message is present at the STREAM head. If <code>O_NONBLOCK</code> is set, <code>L_RECVFD</code> shall fail with <i>errno</i> set to [EAGAIN] if no message is present at the STREAM head.
37694		
37695		
37696		If the message at the STREAM head is a message sent by an <code>L_SENDFD</code> , a new file descriptor shall be allocated for the open file descriptor referenced in the message. The new file descriptor is placed in the <i>fd</i> member of the <code>strrecvfd</code> structure pointed to by <i>arg</i> .
37697		
37698		
37699		
37700		The <i>ioctl()</i> function with the <code>L_RECVFD</code> command shall fail if:
37701	[EAGAIN]	A message is not present at the STREAM head read queue and the <code>O_NONBLOCK</code> flag is set.
37702		
37703	[EBADMSG]	The message at the STREAM head read queue is not a message containing a passed file descriptor.
37704		
37705	[EMFILE]	All file descriptors available to the process are currently open.
37706		
37707	[ENXIO]	Hangup received on <i>fildev</i> .
37708	<code>L_LIST</code>	Allows the process to list all the module names on the STREAM, up to and including the topmost driver name. If <i>arg</i> is a null pointer, the return value shall be the number of modules, including the driver, that are on the STREAM pointed to by <i>fildev</i> . This lets the process allocate enough space for the module names. Otherwise, it should point to a <code>str_list</code> structure.
37709		
37710		
37711		
37712		
37713		The <i>sl_nmods</i> member indicates the number of entries the process has allocated in the array. Upon return, the <i>sl_modlist</i> member of the <code>str_list</code> structure shall contain the list of module names, and the number of entries that have been filled into the <i>sl_modlist</i> array is found in the <i>sl_nmods</i> member (the number includes the number of modules including the driver). The return value from <i>ioctl()</i> shall be 0. The entries are filled in starting at the top of the
37714		
37715		
37716		
37717		
37718		

**ioctl()**

37719		STREAM and continuing downstream until either the end of the STREAM is reached, or the number of requested modules ( <i>sl_nmods</i> ) is satisfied.
37720		
37721		The <i>ioctl()</i> function with the <code>L_LIST</code> command shall fail if:
37722		[EINVAL]       The <i>sl_nmods</i> member is less than 1.
37723		[EAGAIN] or [ENOSR]
37724		Unable to allocate buffers.
37725	<code>I_ATMARK</code>	Allows the process to see if the message at the head of the STREAM head read queue is marked by some module downstream. The <i>arg</i> argument determines how the checking is done when there may be multiple marked messages on the STREAM head read queue. It may take on the following values:
37726		
37727		
37728		
37729		<code>ANYMARK</code> Check if the message is marked.
37730		<code>LASTMARK</code> Check if the message is the last one marked on the queue.
37731		The bitwise-inclusive OR of the flags <code>ANYMARK</code> and <code>LASTMARK</code> is permitted.
37732		
37733		The return value shall be 1 if the mark condition is satisfied; otherwise, the value shall be 0.
37734		
37735		The <i>ioctl()</i> function with the <code>I_ATMARK</code> command shall fail if:
37736		[EINVAL]       Invalid <i>arg</i> value.
37737	<code>I_CKBAND</code>	Checks if the message of a given priority band exists on the STREAM head read queue. This shall return 1 if a message of the given priority exists, 0 if no such message exists, or -1 on error. <i>arg</i> should be of type <code>int</code> .
37738		
37739		
37740		The <i>ioctl()</i> function with the <code>I_CKBAND</code> command shall fail if:
37741		[EINVAL]       Invalid <i>arg</i> value.
37742	<code>I_GETBAND</code>	Returns the priority band of the first message on the STREAM head read queue in the integer referenced by <i>arg</i> .
37743		
37744		The <i>ioctl()</i> function with the <code>I_GETBAND</code> command shall fail if:
37745		[ENODATA]     No message on the STREAM head read queue.
37746	<code>I_CANPUT</code>	Checks if a certain band is writable. <i>arg</i> is set to the priority band in question. The return value shall be 0 if the band is flow-controlled, 1 if the band is writable, or -1 on error.
37747		
37748		
37749		The <i>ioctl()</i> function with the <code>I_CANPUT</code> command shall fail if:
37750		[EINVAL]       Invalid <i>arg</i> value.
37751	<code>I_SETCLTIME</code>	This request allows the process to set the time the STREAM head shall delay when a STREAM is closing and there is data on the write queues. Before closing each module or driver, if there is data on its write queue, the STREAM head shall delay for the specified amount of time to allow the data to drain. If, after the delay, data is still present, it shall be flushed. The <i>arg</i> argument is a pointer to an integer specifying the number of milliseconds to delay, rounded up to the nearest valid value. If <code>I_SETCLTIME</code> is not performed on a STREAM, an implementation-defined default timeout interval is used.
37752		
37753		
37754		
37755		
37756		
37757		
37758		

37759 The *ioctl()* function with the `I_SETCLTIME` command shall fail if:

37760 [EINVAL] Invalid *arg* value.

37761 `I_GETCLTIME` Returns the close time delay in the integer pointed to by *arg*.

### 37762 Multiplexed STREAMS Configurations

37763 The following commands are used for connecting and disconnecting multiplexed STREAMS  
37764 configurations. These commands use an implementation-defined default timeout interval.

37765 `I_LINK` Connects two STREAMS, where *fildev* is the file descriptor of the STREAM  
37766 connected to the multiplexing driver, and *arg* is the file descriptor of the  
37767 STREAM connected to another driver. The STREAM designated by *arg* is  
37768 connected below the multiplexing driver. `I_LINK` requires the multiplexing  
37769 driver to send an acknowledgement message to the STREAM head regarding  
37770 the connection. This call shall return a multiplexer ID number (an identifier  
37771 used to disconnect the multiplexer; see `I_UNLINK`) on success, and `-1` on  
37772 failure.

37773 The *ioctl()* function with the `I_LINK` command shall fail if:

37774 [ENXIO] Hangup received on *fildev*.

37775 [ETIME] Timeout before acknowledgement message was received at  
37776 STREAM head.

37777 [EAGAIN] or [ENOSR]

37778 Unable to allocate STREAMS storage to perform the  
37779 `I_LINK`

37780 [EBADF] The *arg* argument is not a valid, open file descriptor.

37781 [EINVAL] The *fildev* argument does not support multiplexing; or *arg* is  
37782 not a STREAM or is already connected downstream from a  
37783 multiplexer; or the specified `I_LINK` operation would  
37784 connect the STREAM head in more than one place in the  
37785 multiplexed STREAM.

37786 An `I_LINK` can also fail while waiting for the multiplexing driver to  
37787 acknowledge the request, if a message indicating an error or a hangup is  
37788 received at the STREAM head of *fildev*. In addition, an error code can be  
37789 returned in the positive or negative acknowledgement message. For these  
37790 cases, `I_LINK` fails with *errno* set to the value in the message.

37791 `I_UNLINK` Disconnects the two STREAMS specified by *fildev* and *arg*. *fildev* is the file  
37792 descriptor of the STREAM connected to the multiplexing driver. The *arg*  
37793 argument is the multiplexer ID number that was returned by the `I_LINK`  
37794 *ioctl()* command when a STREAM was connected downstream from the  
37795 multiplexing driver. If *arg* is `MUXID_ALL`, then all STREAMS that were  
37796 connected to *fildev* shall be disconnected. As in `I_LINK`, this command requires  
37797 acknowledgement.

37798 The *ioctl()* function with the `I_UNLINK` command shall fail if:

37799 [ENXIO] Hangup received on *fildev*.

**ioctl()**

37800		[ETIME]	Timeout before acknowledgement message was received at STREAM head.
37801			
37802		[EAGAIN] or [ENOSR]	Unable to allocate buffers for the acknowledgement message.
37803			
37804			
37805		[EINVAL]	Invalid multiplexer ID number.
37806			An I_UNLINK can also fail while waiting for the multiplexing driver to acknowledge the request if a message indicating an error or a hangup is received at the STREAM head of <i>fildev</i> . In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_UNLINK shall fail with <i>errno</i> set to the value in the message.
37807			
37808			
37809			
37810			
37811	I_PLINK		Creates a <i>persistent connection</i> between two STREAMs, where <i>fildev</i> is the file descriptor of the STREAM connected to the multiplexing driver, and <i>arg</i> is the file descriptor of the STREAM connected to another driver. This call shall create a persistent connection which can exist even if the file descriptor <i>fildev</i> associated with the upper STREAM to the multiplexing driver is closed. The STREAM designated by <i>arg</i> gets connected via a persistent connection below the multiplexing driver. I_PLINK requires the multiplexing driver to send an acknowledgement message to the STREAM head. This call shall return a multiplexer ID number (an identifier that may be used to disconnect the multiplexer; see I_PUNLINK) on success, and -1 on failure.
37812			
37813			
37814			
37815			
37816			
37817			
37818			
37819			
37820			
37821			The <i>ioctl()</i> function with the I_PLINK command shall fail if:
37822		[ENXIO]	Hangup received on <i>fildev</i> .
37823		[ETIME]	Timeout before acknowledgement message was received at STREAM head.
37824			
37825		[EAGAIN] or [ENOSR]	Unable to allocate STREAMS storage to perform the I_PLINK.
37826			
37827			
37828		[EBADF]	The <i>arg</i> argument is not a valid, open file descriptor.
37829		[EINVAL]	The <i>fildev</i> argument does not support multiplexing; or <i>arg</i> is not a STREAM or is already connected downstream from a multiplexer; or the specified I_PLINK operation would connect the STREAM head in more than one place in the multiplexed STREAM.
37830			
37831			
37832			
37833			
37834			An I_PLINK can also fail while waiting for the multiplexing driver to acknowledge the request, if a message indicating an error or a hangup is received at the STREAM head of <i>fildev</i> . In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_PLINK shall fail with <i>errno</i> set to the value in the message.
37835			
37836			
37837			
37838			
37839	I_PUNLINK		Disconnects the two STREAMs specified by <i>fildev</i> and <i>arg</i> from a persistent connection. The <i>fildev</i> argument is the file descriptor of the STREAM connected to the multiplexing driver. The <i>arg</i> argument is the multiplexer ID number that was returned by the I_PLINK <i>ioctl()</i> command when a STREAM was connected downstream from the multiplexing driver. If <i>arg</i> is MUXID_ALL, then all STREAMs which are persistent connections to <i>fildev</i> shall be disconnected. As in I_PLINK, this command requires the multiplexing
37840			
37841			
37842			
37843			
37844			
37845			

- 37846 driver to acknowledge the request.
- 37847 The *ioctl()* function with the I\_PUNLINK command shall fail if:
- 37848 [ENXIO] Hangup received on *fildev*.
- 37849 [ETIME] Timeout before acknowledgement message was received at  
37850 STREAM head.
- 37851 [EAGAIN] or [ENOSR]  
37852 Unable to allocate buffers for the acknowledgement  
37853 message.
- 37854 [EINVAL] Invalid multiplexer ID number.
- 37855 An I\_PUNLINK can also fail while waiting for the multiplexing driver to  
37856 acknowledge the request if a message indicating an error or a hangup is  
37857 received at the STREAM head of *fildev*. In addition, an error code can be  
37858 returned in the positive or negative acknowledgement message. For these  
37859 cases, I\_PUNLINK shall fail with *errno* set to the value in the message.
- 37860 **RETURN VALUE**
- 37861 Upon successful completion, *ioctl()* shall return a value other than  $-1$  that depends upon the  
37862 STREAMS device control function. Otherwise, it shall return  $-1$  and set *errno* to indicate the  
37863 error.
- 37864 **ERRORS**
- 37865 Under the following general conditions, *ioctl()* shall fail if:
- 37866 [EBADF] The *fildev* argument is not a valid open file descriptor.
- 37867 [EINTR] A signal was caught during the *ioctl()* operation.
- 37868 [EINVAL] The STREAM or multiplexer referenced by *fildev* is linked (directly or  
37869 indirectly) downstream from a multiplexer.
- 37870 If an underlying device driver detects an error, then *ioctl()* shall fail if:
- 37871 [EINVAL] The *request* or *arg* argument is not valid for this device.
- 37872 [EIO] Some physical I/O error has occurred.
- 37873 [ENOTTY] The file associated with the *fildev* argument is not a STREAMS device that  
37874 accepts control functions.
- 37875 [ENXIO] The *request* and *arg* arguments are valid for this device driver, but the service  
37876 requested cannot be performed on this particular sub-device.
- 37877 [ENODEV] The *fildev* argument refers to a valid STREAMS device, but the corresponding  
37878 device driver does not support the *ioctl()* function.
- 37879 If a STREAM is connected downstream from a multiplexer, any *ioctl()* command except  
37880 I\_UNLINK and I\_PUNLINK shall set *errno* to [EINVAL].

**ioctl()**37881 **EXAMPLES**

37882 None.

37883 **APPLICATION USAGE**

37884 The implementation-defined timeout interval for STREAMS has historically been 15 seconds.

37885 **RATIONALE**

37886 None.

37887 **FUTURE DIRECTIONS**37888 The *ioctl()* function may be removed in a future version.37889 **SEE ALSO**37890 Section 2.6 (on page 494), *close()*, *fcntl()*, *getmsg()*, *open()*, *pipe()*, *poll()*, *putmsg()*, *read()*,  
37891 *sigaction()*, *write()*37892 XBD <*stropts.h*>37893 **CHANGE HISTORY**

37894 First released in Issue 4, Version 2.

37895 **Issue 5**

37896 Moved from X/OPEN UNIX extension to BASE.

37897 **Issue 6**37898 The Open Group Corrigendum U028/4 is applied, correcting text in the L\_FDINSERT [EINVAL]  
37899 case to refer to *ctlbuf*.

37900 This function is marked as part of the XSI STREAMS Option Group.

37901 The normative text is updated to avoid use of the term “must” for application requirements.

37902 **Issue 7**37903 Austin Group Interpretation 1003.1-2001 #155 is applied, adding a “may fail” [EINVAL] error  
37904 condition for the L\_SENDFD command.

37905 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

37906 The *ioctl()* function is marked obsolescent.

37907 **NAME**

37908 isalnum, isalnum\_l — test for an alphanumeric character

37909 **SYNOPSIS**

```
37910 #include <ctype.h>
37911 int isalnum(int c);
37912 CX int isalnum_l(int c, locale_t locale);
```

37913 **DESCRIPTION**

37914 CX For *isalnum()*: The functionality described on this reference page is aligned with the ISO C  
 37915 standard. Any conflict between the requirements described here and the ISO C standard is  
 37916 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

37917 CX The *isalnum()* and *isalnum\_l()* functions shall test whether *c* is a character of class **alpha** or  
 37918 CX **digit** in the current locale of the process, or in the locale represented by *locale*, respectively; see  
 37919 XBD Chapter 7 (on page 135).

37920 The *c* argument is an **int**, the value of which the application shall ensure is representable as an  
 37921 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the  
 37922 behavior is undefined.

37923 **RETURN VALUE**

37924 CX The *isalnum()* and *isalnum\_l()* functions shall return non-zero if *c* is an alphanumeric character;  
 37925 otherwise, they shall return 0.

37926 **ERRORS**

37927 The *isalnum\_l()* function may fail if:

37928 CX [EINVAL] *locale* is not a valid locale object handle.

37929 **EXAMPLES**

37930 None.

37931 **APPLICATION USAGE**

37932 To ensure applications portability, especially across natural languages, only these functions and  
 37933 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 37934 classification.

37935 **RATIONALE**

37936 None.

37937 **FUTURE DIRECTIONS**

37938 None.

37939 **SEE ALSO**

37940 *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,

37950 **NAME**

37951 isalpha, isalpha\_l — test for an alphabetic character

37952 **SYNOPSIS**

```
37953 #include <ctype.h>
37954 int isalpha(int c);
37955 CX int isalpha_l(int c, locale_t locale);
```

37956 **DESCRIPTION**

37957 CX For *isalpha()*: The functionality described on this reference page is aligned with the ISO C  
 37958 standard. Any conflict between the requirements described here and the ISO C standard is  
 37959 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

37960 CX The *isalpha()* and *isalpha\_l()* functions shall test whether *c* is a character of class **alpha** in the  
 37961 CX current locale of the process, or in the locale represented by *locale*, respectively; see XBD  
 37962 Chapter 7 (on page 135).

37963 The *c* argument is an **int**, the value of which the application shall ensure is representable as an  
 37964 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the  
 37965 behavior is undefined.

37966 **RETURN VALUE**

37967 CX The *isalpha()* and *isalpha\_l()* functions shall return non-zero if *c* is an alphabetic character;  
 37968 otherwise, they shall return 0.

37969 **ERRORS**

37970 The *isalpha\_l()* function may fail if:

37971 CX [EINVAL] *locale* is not a valid locale object handle.

37972 **EXAMPLES**

37973 None.

37974 **APPLICATION USAGE**

37975 To ensure applications portability, especially across natural languages, only these functions and  
 37976 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 37977 classification.

37978 **RATIONALE**

37979 None.

37980 **FUTURE DIRECTIONS**

37981 None.

37982 **SEE ALSO**

37993 **NAME**

37994 isascii — test for a 7-bit US-ASCII character

37995 **SYNOPSIS**

```
37996 OB XSI #include <ctype.h>  
37997 int isascii(int c);
```

37998 **DESCRIPTION**37999 The *isascii()* function shall test whether *c* is a 7-bit US-ASCII character code.38000 The *isascii()* function is defined on all integer values.38001 **RETURN VALUE**38002 The *isascii()* function shall return non-zero if *c* is a 7-bit US-ASCII character code between 0 and  
38003 octal 0177 inclusive; otherwise, it shall return 0.38004 **ERRORS**

38005 No errors are defined.

38006 **EXAMPLES**

38007 None.

38008 **APPLICATION USAGE**38009 The *isascii()* function cannot be used portably in a localized application.38010 **RATIONALE**

38011 None.

38012 **FUTURE DIRECTIONS**38013 The *isascii()* function may be removed in a future version.38014 **SEE ALSO**38015 XBD [<ctype.h>](#)38016 **CHANGE HISTORY**

38017 First released in Issue 1. Derived from Issue 1 of the SVID.

38018 **Issue 7**38019 The *isascii()* function is marked obsolescent.

**isastream()**38020 **NAME**

38021 isastream — test a file descriptor (STREAMS)

38022 **SYNOPSIS**

```
38023 OB XSR #include <stropts.h>  
38024 int isastream(int fildes);
```

38025 **DESCRIPTION**

38026 The *isastream()* function shall test whether *fildes*, an open file descriptor, is associated with a  
38027 STREAMS-based file.

38028 **RETURN VALUE**

38029 Upon successful completion, *isastream()* shall return 1 if *fildes* refers to a STREAMS-based file  
38030 and 0 if not. Otherwise, *isastream()* shall return -1 and set *errno* to indicate the error.

38031 **ERRORS**

38032 The *isastream()* function shall fail if:

38033 [EBADF] The *fildes* argument is not a valid open file descriptor.

38034 **EXAMPLES**

38035 None.

38036 **APPLICATION USAGE**

38037 None.

38038 **RATIONALE**

38039 None.

38040 **FUTURE DIRECTIONS**

38041 The *isastream()* function may be removed in a future version.

38042 **SEE ALSO**

38043 XBD <stropts.h>

38044 **CHANGE HISTORY**

38045 First released in Issue 4, Version 2.

38046 **Issue 5**

38047 Moved from X/OPEN UNIX extension to BASE.

38048 **Issue 7**

38049 The *isastream()* function is marked obsolescent.

38050 **NAME**

38051 isatty — test for a terminal device

38052 **SYNOPSIS**

38053 #include &lt;unistd.h&gt;

38054 int isatty(int *fildev*);38055 **DESCRIPTION**38056 The *isatty()* function shall test whether *fildev*, an open file descriptor, is associated with a  
38057 terminal device.38058 **RETURN VALUE**38059 The *isatty()* function shall return 1 if *fildev* is associated with a terminal; otherwise, it shall return  
38060 0 and may set *errno* to indicate the error.38061 **ERRORS**38062 The *isatty()* function may fail if:38063 [EBADF] The *fildev* argument is not a valid open file descriptor.38064 [ENOTTY] The file associated with the *fildev* argument is not a terminal.38065 **EXAMPLES**

38066 None.

38067 **APPLICATION USAGE**38068 The *isatty()* function does not necessarily indicate that a human being is available for interaction  
38069 via *fildev*. It is quite possible that non-terminal devices are connected to the communications  
38070 line.38071 **RATIONALE**

38072 None.

38073 **FUTURE DIRECTIONS**

38074 None.

38075 **SEE ALSO**

38076 XBD &lt;unistd.h&gt;

38077 **CHANGE HISTORY**

38078 First released in Issue 1. Derived from Issue 1 of the SVID.

38079 **Issue 6**38080 The following new requirements on POSIX implementations derive from alignment with the  
38081 Single UNIX Specification:

- 38082 • The optional setting of *errno* to indicate an error is added.
- 38083 • The [EBADF] and [ENOTTY] optional error conditions are added.

38084 **Issue 7**

38085 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

**isblank()**38086 **NAME**38087 `isblank, isblank_l` — test for a blank character38088 **SYNOPSIS**

```
38089 #include <ctype.h>
38090 int isblank(int c);
38091 CX int isblank_l(int c, locale_t locale);
```

38092 **DESCRIPTION**

38093 CX For `isblank()`: The functionality described on this reference page is aligned with the ISO C  
 38094 standard. Any conflict between the requirements described here and the ISO C standard is  
 38095 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38096 CX The `isblank()` and `isblank_l()` functions shall test whether `c` is a character of class **blank** in the  
 38097 CX current locale of the process, or in the locale represented by `locale`, respectively; see XBD  
 38098 Chapter 7 (on page 135).

38099 The `c` argument is a type **int**, the value of which the application shall ensure is a character  
 38100 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 38101 any other value, the behavior is undefined.

38102 **RETURN VALUE**

38103 CX The `isblank()` and `isblank_l()` functions shall return non-zero if `c` is a <blank>; otherwise, they  
 38104 shall return 0.

38105 **ERRORS**

38106 The `isblank_l()` function may fail if:

38107 CX [EINVAL] `locale` is not a valid locale object handle.

38108 **EXAMPLES**

38109 None.

38110 **APPLICATION USAGE**

38111 To ensure applications portability, especially across natural languages, only these functions and  
 38112 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 38113 classification.

38114 **RATIONALE**

38115 None.

38116 **FUTURE DIRECTIONS**

38117 None.

38118 **SEE ALSO**

38119 `isalnum()`, `isalpha()`, `iscntrl()`, `isdigit()`, `isgraph()`, `islower()`, `isprint()`, `ispunct()`, `isspace()`, `isupper()`,  
 38120 `isxdigit()`, `setlocale()`, `uselocale()`

38121 XBD Chapter 7 (on page 135), `<ctype.h>`, `<locale.h>`

38122 **CHANGE HISTORY**

38123 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

38124 **Issue 7**

38125 The `isblank_l()` function is added from The Open Group Technical Standard, 2006, Extended API  
 38126 Set Part 4.

38127 **NAME**

38128           iscntrl, iscntrl\_l — test for a control character

38129 **SYNOPSIS**

```
38130           #include <ctype.h>
38131           int iscntrl(int c);
38132 CX        int iscntrl_l(int c, locale_t locale);
```

38133 **DESCRIPTION**

38134 CX       For *iscntrl()*: The functionality described on this reference page is aligned with the ISO C  
38135 standard. Any conflict between the requirements described here and the ISO C standard is  
38136 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38137 CX       The *iscntrl()* and *iscntrl\_l()* functions shall test whether *c* is a character of class **cntrl** in the  
38138 CX       current locale of the process, or in the locale represented by *locale*, respectively; see XBD  
38139 Chapter 7 (on page 135).

38140       The *c* argument is a type **int**, the value of which the application shall ensure is a character  
38141 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
38142 any other value, the behavior is undefined.

38143 **RETURN VALUE**

38144 CX       The *iscntrl()* and *iscntrl\_l()* functions shall return non-zero if *c* is a control character; otherwise,  
38145 they shall return 0.

38146 **ERRORS**

38147       The *iscntrl\_l()* function may fail if:

38148 CX       [EINVAL] *locale* is not a valid locale object handle.

38149 **EXAMPLES**

38150       None.

38151 **APPLICATION USAGE**

38152       To ensure applications portability, especially across natural languages, only these functions and  
38153 the functions in the reference pages listed in the SEE ALSO section should be used for character  
38154 classification.

38155 **RATIONALE**

38156       None.

38157 **FUTURE DIRECTIONS**

38158       None.

38159 **SEE ALSO**

38160       *isalnum()*, *isalpha()*, *isblank()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*,

38170 **NAME**

38171 isdigit, isdigit\_l — test for a decimal digit

38172 **SYNOPSIS**

```
38173 #include <ctype.h>
38174 int isdigit(int c);
38175 CX int isdigit_l(int c, locale_t locale);
```

38176 **DESCRIPTION**

38177 CX For *isdigit()*: The functionality described on this reference page is aligned with the ISO C  
 38178 standard. Any conflict between the requirements described here and the ISO C standard is  
 38179 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38180 CX The *isdigit()* and *isdigit\_l()* functions shall test whether *c* is a character of class **digit** in the  
 38181 CX current locale of the process, or in the locale represented by *locale*, respectively; see XBD  
 38182 Chapter 7 (on page 135).

38183 The *c* argument is an **int**, the value of which the application shall ensure is a character  
 38184 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 38185 any other value, the behavior is undefined.

38186 **RETURN VALUE**

38187 CX The *isdigit()* and *isdigit\_l()* functions shall return non-zero if *c* is a decimal digit; otherwise,  
 38188 they shall return 0.

38189 **ERRORS**

38190 The *isdigit\_l()* function may fail if:

38191 CX [EINVAL] *locale* is not a valid locale object handle.

38192 **EXAMPLES**

38193 None.

38194 **APPLICATION USAGE**

38195 To ensure applications portability, especially across natural languages, only these functions and  
 38196 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 38197 classification.

38198 **RATIONALE**

38199 None.

38213 **NAME**

38214 isfinite — test for finite value

38215 **SYNOPSIS**

38216 #include &lt;math.h&gt;

38217 int isfinite(real-floating x);

38218 **DESCRIPTION**

38219 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 38220 conflict between the requirements described here and the ISO C standard is unintentional. This  
 38221 volume of POSIX.1-2008 defers to the ISO C standard.

38222 The *isfinite()* macro shall determine whether its argument has a finite value (zero, subnormal, or  
 38223 normal, and not infinite or NaN). First, an argument represented in a format wider than its  
 38224 semantic type is converted to its semantic type. Then determination is based on the type of the  
 38225 argument.

38226 **RETURN VALUE**38227 The *isfinite()* macro shall return a non-zero value if and only if its argument has a finite value.38228 **ERRORS**

38229 No errors are defined.

38230 **EXAMPLES**

38231 None.

38232 **APPLICATION USAGE**

38233 None.

38234 **RATIONALE**

38235 None.

38236 **FUTURE DIRECTIONS**

38237 None.

38238 **SEE ALSO**38239 *fpclassify()*, *isinf()*, *isnan()*, *isnormal()*, *signbit()*

38240 XBD &lt;math.h&gt;

38241 **CHANGE HISTORY**

38242 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**isgraph()**38243 **NAME**38244 `isgraph, isgraph_l` — test for a visible character38245 **SYNOPSIS**

```
38246 #include <ctype.h>
38247 int isgraph(int c);
38248 CX int isgraph_l(int c, locale_t locale);
```

38249 **DESCRIPTION**

38250 CX For `isgraph()`: The functionality described on this reference page is aligned with the ISO C  
 38251 standard. Any conflict between the requirements described here and the ISO C standard is  
 38252 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38253 CX The `isgraph()` and `isgraph_l()` functions shall test whether `c` is a character of class **graph** in the  
 38254 CX current locale of the process, or in the locale represented by `locale`, respectively; see XBD  
 38255 Chapter 7 (on page 135).

38256 The `c` argument is an **int**, the value of which the application shall ensure is a character  
 38257 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 38258 any other value, the behavior is undefined.

38259 **RETURN VALUE**

38260 CX The `isgraph()` and `isgraph_l()` functions shall return non-zero if `c` is a character with a visible  
 38261 representation; otherwise, they shall return 0.

38262 **ERRORS**

38263 The `isgraph_l()` function may fail if:

38264 CX [EINVAL] `locale` is not a valid locale object handle.

38265 **EXAMPLES**

38266 None.

38267 **APPLICATION USAGE**

38268 To ensure applications portability, especially across natural languages, only these functions and  
 38269 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 38270 classification.

38271 **RATIONALE**

38272 None.

38273 **FUTURE DIRECTIONS**

38274 None.

38275 **SEE ALSO**

38276 `isalnum()`, `isalpha()`, `isblank()`, `iscntrl()`, `isdigit()`, `islower()`, `isprint()`, `ispunct()`, `isspace()`, `isupper()`,

38279 **CHANGE HISTORY**

38280 First released in Issue 1. Derived from Issue 1 of the SVID.

38281 **Issue 6**

38282 The normative text is updated to avoid use of the term “must” for application requirements.

38283 **Issue 7**

38284 The *isgraph\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
38285 Set Part 4.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**isgreater()**38286 **NAME**38287 `isgreater` — test if  $x$  greater than  $y$ 38288 **SYNOPSIS**38289 `#include <math.h>`38290 `int isgreater(real-floating  $x$ , real-floating  $y$ );`38291 **DESCRIPTION**

38292 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 38293 conflict between the requirements described here and the ISO C standard is unintentional. This  
 38294 volume of POSIX.1-2008 defers to the ISO C standard.

38295 The `isgreater()` macro shall determine whether its first argument is greater than its second  
 38296 argument. The value of `isgreater( $x$ ,  $y$ )` shall be equal to  $(x) > (y)$ ; however, unlike  $(x) > (y)$ ,  
 38297 `isgreater( $x$ ,  $y$ )` shall not raise the invalid floating-point exception when  $x$  and  $y$  are unordered.

38298 **RETURN VALUE**38299 Upon successful completion, the `isgreater()` macro shall return the value of  $(x) > (y)$ .38300 If  $x$  or  $y$  is NaN, 0 shall be returned.38301 **ERRORS**

38302 No errors are defined.

38303 **EXAMPLES**

38304 None.

38305 **APPLICATION USAGE**

38306 The relational and equality operators support the usual mathematical relationships between  
 38307 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
 38308 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
 38309 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
 38310 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
 38311 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
 38312 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
 38313 indicates that the argument shall be an expression of **real-floating** type.

38314 **RATIONALE**

38315 None.

38316 **FUTURE DIRECTIONS**

38317 None.

38318 **SEE ALSO**38319 `isgreaterequal()`, `isless()`, `islessequal()`, `islessgreater()`, `isunordered()`38320 **XBD** `<math.h>`38321 **CHANGE HISTORY**

38322 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

38323 **NAME**38324 `isgreaterequal` — test if  $x$  is greater than or equal to  $y$ 38325 **SYNOPSIS**38326 `#include <math.h>`38327 `int isgreaterequal(real-floating  $x$ , real-floating  $y$ );`38328 **DESCRIPTION**38329 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
38330 conflict between the requirements described here and the ISO C standard is unintentional. This  
38331 volume of POSIX.1-2008 defers to the ISO C standard.38332 The `isgreaterequal()` macro shall determine whether its first argument is greater than or equal to  
38333 its second argument. The value of `isgreaterequal( $x$ ,  $y$ )` shall be equal to  $(x) \geq (y)$ ; however, unlike  
38334  $(x) \geq (y)$ , `isgreaterequal( $x$ ,  $y$ )` shall not raise the invalid floating-point exception when  $x$  and  $y$  are  
38335 unordered.38336 **RETURN VALUE**38337 Upon successful completion, the `isgreaterequal()` macro shall return the value of  $(x) \geq (y)$ .38338 If  $x$  or  $y$  is NaN, 0 shall be returned.38339 **ERRORS**

38340 No errors are defined.

38341 **EXAMPLES**

38342 None.

38343 **APPLICATION USAGE**38344 The relational and equality operators support the usual mathematical relationships between  
38345 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
38346 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
38347 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
38348 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
38349 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
38350 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
38351 indicates that the argument shall be an expression of **real-floating** type.38352 **RATIONALE**

38353 None.

38354 **FUTURE DIRECTIONS**

38355 None.

38499 **SEE ALSO**38500 `isgreater()`, `isgreaterequal()`, `isless()`, `islessequal()`, `isunordered()`38501 XBD `<math.h>`38502 **CHANGE HISTORY**

38503 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**islower()**38504 **NAME**38505 `islower, islower_l` — test for a lowercase letter38506 **SYNOPSIS**

```
38507     #include <ctype.h>
38508     int islower(int c);
38509 CX    int islower_l(int c, locale_t locale);
```

38510 **DESCRIPTION**

38511 CX For `islower()`: The functionality described on this reference page is aligned with the ISO C  
 38512 standard. Any conflict between the requirements described here and the ISO C standard is  
 38513 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38514 CX The `islower()` and `islower_l()` functions shall test whether `c` is a character of class **lower** in the  
 38515 CX current locale of the process, or in the locale represented by `locale`, respectively; see XBD  
 38516 Chapter 7 (on page 135).

38517 The `c` argument is an **int**, the value of which the application shall ensure is a character  
 38518 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 38519 any other value, the behavior is undefined.

38520 **RETURN VALUE**

38521 CX The `islower()` and `islower_l()` functions shall return non-zero if `c` is a lowercase letter; otherwise,  
 38522 they shall return 0.

38523 **ERRORS**

38524 The `islower_l()` function may fail if:

38525 CX [EINVAL] `locale` is not a valid locale object handle.

38526 **EXAMPLES**38527 **Testing for a Lowercase Letter**

38528 Two examples follow, the first using `islower()`, the second using multiple concurrent locales and  
 38529 `islower_l()`.

38530 The examples test whether the value is a lowercase letter, based on the locale of the user, then  
 38531 use it as part of a key value.

```
38532     /* Example 1 -- using islower() */
38533     #include <ctype.h>
38534     #include <stdlib.h>
38535     #include <locale.h>
38536     .
38537     char *keystr;
38538     int elementlen, len;
38539     char c;
38540     ...
38541     setlocale(LC_ALL, "");
38542     ...
38543     len = 0;
38544     while (len < elementlen) {
38545         c = (char) (rand() % 256);
38546         ...
38547         if (islower(c))
```

```

38548         keystr[len++] = c;
38549     }
38550     ...
38551     /* Example 2 -- using islower_l() */
38552     #include <ctype.h>
38553     #include <stdlib.h>
38554     #include <locale.h>
38555     ...
38556     char *keystr;
38557     int elementlen, len;
38558     char c;
38559     ...
38560     locale_t loc = newlocale (LC_ALL_MASK, "", (locale_t) 0);
38561     ...
38562     len = 0;
38563     while (len < elementlen) {
38564         c = (char) (rand() % 256);
38565         ...
38566         if (islower_l(c, loc))
38567             keystr[len++] = c;
38568     }
38569     ...

```

**38570 APPLICATION USAGE**

38571 To ensure applications portability, especially across natural languages, only these functions and  
38572 the functions in the reference pages listed in the SEE ALSO section should be used for character  
38573 classification.

**38574 RATIONALE**

38575 None.

**38576 FUTURE DIRECTIONS**

38577 None.

**ispunct()**38698 **NAME**38699 `ispunct, ispunct_l` — test for a punctuation character38700 **SYNOPSIS**

```
38701 #include <ctype.h>
38702 int ispunct(int c);
38703 CX int ispunct_l(int c, locale_t locale);
```

38704 **DESCRIPTION**

38705 CX For `ispunct()`: The functionality described on this reference page is aligned with the ISO C  
 38706 standard. Any conflict between the requirements described here and the ISO C standard is  
 38707 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38708 CX The `ispunct()` and `ispunct_l()` functions shall test whether `c` is a character of class **punct** in the  
 38709 CX current locale of the process, or in the locale represented by `locale`, respectively; see XBD  
 38710 Chapter 7 (on page 135).

38711 The `c` argument is an **int**, the value of which the application shall ensure is a character  
 38712 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 38713 any other value, the behavior is undefined.

38714 **RETURN VALUE**

38715 CX The `ispunct()` and `ispunct_l()` functions shall return non-zero if `c` is a punctuation character;  
 38716 otherwise, they shall return 0.

38717 **ERRORS**

38718 The `ispunct_l()` function may fail if:

38719 CX [EINVAL] `locale` is not a valid locale object handle.

38720 **EXAMPLES**

38721 None.

38722 **APPLICATION USAGE**

38723 To ensure applications portability, especially across natural languages, only these functions and  
 38724 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 38725 classification.

38726 **RATIONALE**

38727 None.

38728 **FUTURE DIRECTIONS**

38729 None.

38730 **SEE ALSO**

38731 `isalnum()`, `isalpha()`, `isblank()`, `iscntrl()`, `isdigit()`, `isgraph()`, `islower()`, `isprint()`, `isspace()`, `isupper()`,  
 38732 `isxdigit()`, `setlocale()`, `uselocale()`

**isspace()**38741 **NAME**38742 `isspace, isspace_l` — test for a white-space character38743 **SYNOPSIS**

```
38744 #include <ctype.h>
38745 int isspace(int c);
38746 CX int isspace_l(int c, locale_t locale);
```

38747 **DESCRIPTION**

38748 CX For `isspace()`: The functionality described on this reference page is aligned with the ISO C  
 38749 standard. Any conflict between the requirements described here and the ISO C standard is  
 38750 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38751 CX The `isspace()` and `isspace_l()` functions shall test whether `c` is a character of class **space** in the  
 38752 CX current locale of the process, or in the locale represented by `locale`, respectively; see XBD  
 38753 Chapter 7 (on page 135).

38754 The `c` argument is an **int**, the value of which the application shall ensure is a character  
 38755 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 38756 any other value, the behavior is undefined.

38757 **RETURN VALUE**

38758 CX The `isspace()` and `isspace_l()` functions shall return non-zero if `c` is a white-space character;  
 38759 otherwise, they shall return 0.

38760 **ERRORS**

38761 The `isspace_l()` function may fail if:

38762 CX [EINVAL] `locale` is not a valid locale object handle.

38763 **EXAMPLES**

38764 None.

38765 **APPLICATION USAGE**

38766 To ensure applications portability, especially across natural languages, only these functions and  
 38767 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 38768 classification.

38769 **RATIONALE**

38770 None.

38771 **FUTURE DIRECTIONS**

38772 None.

38773 **SEE ALSO**

38774 `isalnum()`, `isalpha()`, `iscntrl()`, `isdigit()`, `isgraph()`, `islower()`, `isprint()`, `ispunct()`, `isupper()`,  
 38775 `issdigit()`, `setlocale()`, `uselocale()`

38776 XBD Chapter 7 (on page 135), `<ctype.h>`, `<locale.h>`

38777 **CHANGE HISTORY**

38778 First released in Issue 1. Derived from Issue 1 of the SVID.

38779 **Issue 6**

38780 The normative text is updated to avoid use of the term “must” for application requirements.

38781 **Issue 7**

38782 The *isspace\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
38783 Set Part 4.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**isunordered()**38784 **NAME**38785 `isunordered` — test if arguments are unordered38786 **SYNOPSIS**38787 `#include <math.h>`38788 `int isunordered(real-floating x, real-floating y);`38789 **DESCRIPTION**38790 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
38791 conflict between the requirements described here and the ISO C standard is unintentional. This  
38792 volume of POSIX.1-2008 defers to the ISO C standard.38793 The `isunordered()` macro shall determine whether its arguments are unordered.38794 **RETURN VALUE**38795 Upon successful completion, the `isunordered()` macro shall return 1 if its arguments are  
38796 unordered, and 0 otherwise.38797 If `x` or `y` is NaN, 1 shall be returned.38798 **ERRORS**

38799 No errors are defined.

38800 **EXAMPLES**

38801 None.

38802 **APPLICATION USAGE**38803 The relational and equality operators support the usual mathematical relationships between  
38804 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,  
38805 greater, and equal) is true. Relational operators may raise the invalid floating-point exception  
38806 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the  
38807 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)  
38808 version of a relational operator. It facilitates writing efficient code that accounts for NaNs  
38809 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**  
38810 indicates that the argument shall be an expression of **real-floating** type.38811 **RATIONALE**

38812 None.

38813 **FUTURE DIRECTIONS**

38814 None.

38815 **SEE ALSO**38816 `isgreater()`, `isgreaterequal()`, `isless()`, `islessequal()`, `islessgreater()`38817 XBD `<math.h>`38818 **CHANGE HISTORY**

38819 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

38820 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/50 is applied, correcting the RETURN  
38821 VALUE section when `x` or `y` is NaN.

38822 **NAME**

38823 isupper, isupper\_l — test for an uppercase letter

38824 **SYNOPSIS**

```
38825 #include <ctype.h>
38826 int isupper(int c);
38827 CX int isupper_l(int c, locale_t locale);
```

38828 **DESCRIPTION**

38829 CX For *isupper()*: The functionality described on this reference page is aligned with the ISO C  
 38830 standard. Any conflict between the requirements described here and the ISO C standard is  
 38831 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

38832 CX The *isupper()* and *isupper\_l()* functions shall test whether *c* is a character of class **upper** in the  
 38833 CX current locale of the process, or in the locale represented by *locale*, respectively; see XBD  
 38834 Chapter 7 (on page 135).

38835 The *c* argument is an **int**, the value of which the application shall ensure is a character  
 38836 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 38837 any other value, the behavior is undefined.

38838 **RETURN VALUE**

38839 CX The *isupper()* and *isupper\_l()* functions shall return non-zero if *c* is an uppercase letter;  
 38840 otherwise, they shall return 0.

38841 **ERRORS**

38842 The *isupper\_l()* function may fail if:

38843 CX [EINVAL] *locale* is not a valid locale object handle.

38844 **EXAMPLES**

38845 None.

38846 **APPLICATION USAGE**

38847 To ensure applications portability, especially across natural languages, only these functions and  
 38848 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 38849 classification.

38850 **RATIONALE**

38851 None.

38852 **FUTURE DIRECTIONS**

38853 None.

38854 **SEE ALSO**

38855 *isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*,

38858 **CHANGE HISTORY**

38859 First released in Issue 1. Derived from Issue 1 of the SVID.

38860 **Issue 6**

38861 The normative text is updated to avoid use of the term “must” for application requirements.

## isupper()

38862 **Issue 7**

38863

38864

The *isupper\_1()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

38865 **NAME**

38866 iswalnum, iswalnum\_l — test for an alphanumeric wide-character code

38867 **SYNOPSIS**

38868 #include &lt;wctype.h&gt;

38869 int iswalnum(wint\_t wc);

38870 CX int iswalnum\_l(wint\_t wc, locale\_t locale);

38871 **DESCRIPTION**38872 CX For *iswalnum()*: The functionality described on this reference page is aligned with the ISO C  
38873 standard. Any conflict between the requirements described here and the ISO C standard is  
38874 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.38875 CX The *iswalnum()* and *iswalnum\_l()* functions shall test whether *wc* is a wide-character code  
38876 CX representing a character of class **alpha** or **digit** in the current locale of the process, or in the  
38877 locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).38878 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character  
38879 code corresponding to a valid character in the current locale, or equal to the value of the macro  
38880 WEOF. If the argument has any other value, the behavior is undefined.38881 **RETURN VALUE**38882 CX The *iswalnum()* and *iswalnum\_l()* functions shall return non-zero if *wc* is an alphanumeric  
38883 wide-character code; otherwise, they shall return 0.38884 **ERRORS**38885 The *iswalnum\_l()* function may fail if:38886 CX [EINVAL] *locale* is not a valid locale object handle.38887 **EXAMPLES**

38888 None.

38889 **APPLICATION USAGE**38890 To ensure applications portability, especially across natural languages, only these functions and  
38891 the functions in the reference pages listed in the SEE ALSO section should be used for character  
38892 classification.38893 **RATIONALE**

38894 None.

38895 **FUTURE DIRECTIONS**

38896 None.

38897 **SEE ALSO**38898 *iswalalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,

38900 XBD Chapter 7 (on page 135), &lt;locale.h&gt;, &lt;stdio.h&gt;, &lt;wctype.h&gt;

38901 **CHANGE HISTORY**

38902 First released as a World-wide Portability Interface in Issue 4.

38903 **Issue 5**38904 The following change has been made in this version for alignment with  
38905 ISO/IEC 9899:1990/Amendment 1:1995 (E):

**iswalnum()**

38906 • The SYNOPSIS has been changed to indicate that this function and associated data types  
38907 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

38908 **Issue 6**

38909 The normative text is updated to avoid use of the term “must” for application requirements.

38910 **Issue 7**

38911 The *iswalnum\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
38912 API Set Part 4.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

38913 **NAME**

38914 iswalpha, iswalpha\_l — test for an alphabetic wide-character code

38915 **SYNOPSIS**

38916 #include &lt;wctype.h&gt;

38917 int iswalpha(wint\_t wc);

38918 CX int iswalpha\_l(wint\_t wc, locale\_t locale);

38919 **DESCRIPTION**38920 CX For *iswalpha()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.38923 CX The *iswalpha()* and *iswalpha\_l()* functions shall test whether *wc* is a wide-character code representing a character of class **alpha** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).38926 The *wc* argument is a **wint\_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.38929 **RETURN VALUE**38930 CX The *iswalpha()* and *iswalpha\_l()* functions shall return non-zero if *wc* is an alphabetic wide-character code; otherwise, they shall return 0.38932 **ERRORS**38933 The *iswalpha\_l()* function may fail if:38934 CX [EINVAL] *locale* is not a valid locale object handle.38935 **EXAMPLES**

38936 None.

38937 **APPLICATION USAGE**

38938 To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

38941 **RATIONALE**

38942 None.

38943 **FUTURE DIRECTIONS**

38944 None.

38945 **SEE ALSO**38946 *iswalnum()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,

**iswctype()**39050 **NAME**39051 `iswctype, iswctype_l` — test character for a specified class39052 **SYNOPSIS**

```
39053     #include <wctype.h>
39054     int iswctype(wint_t wc, wctype_t charclass);
39055 CX    int iswctype_l(wint_t wc, wctype_t charclass,
39056                    locale_t locale);
```

39057 **DESCRIPTION**

39058 CX For `iswctype()`: The functionality described on this reference page is aligned with the ISO C  
 39059 standard. Any conflict between the requirements described here and the ISO C standard is  
 39060 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39061 CX The `iswctype()` and `iswctype_l()` functions shall determine whether the wide-character code `wc`  
 39062 CX has the character class `charclass`, returning true or false. The `iswctype()` and `iswctype_l()`  
 39063 functions are defined on WEOF and wide-character codes corresponding to the valid character  
 39064 CX encodings in the current locale, or in the locale represented by `locale`, respectively. If the `wc`  
 39065 argument is not in the domain of the function, the result is undefined. If the value of `charclass` is  
 39066 invalid (that is, not obtained by a call to `wctype()` or `charclass` is invalidated by a subsequent call  
 39067 to `setlocale()` that has affected category `LC_CTYPE`) the result is unspecified.

39068 **RETURN VALUE**

39069 CX The `iswctype()` and `iswctype_l()` functions shall return non-zero (true) if and only if `wc` has the  
 39070 CX property described by `charclass`. If `charclass` is 0, these functions shall return 0.

39071 **ERRORS**39072 The `iswctype_l()` function may fail if:

39073 CX **[EINVAL]** `locale` is not a valid locale object handle.

39074 **EXAMPLES**39075 **Testing for a Valid Character**

```
39076     #include <wctype.h>
39077     ...
39078     int yes_or_no;
39079     wint_t wc;
39080     wctype_t valid_class;
39081     ...
39082     if ((valid_class=wctype("vowel")) == (wctype_t)0)
39083         /* Invalid character class. */
39084         yes_or_no=iswctype(wc, valid_class);
```

39085 **APPLICATION USAGE**

39086 The twelve strings "alnum", "alpha", "blank", "cntrl", "digit", "graph", "lower",  
 39087 "print", "punct", "space", "upper", and "xdigit" are reserved for the standard  
 39088 character classes. In the table below, the functions in the left column are equivalent to the  
 39089 functions in the right column.

39090	<code>iswalnum(wc)</code>	<code>iswctype(wc, wctype("alnum"))</code>

39120 *iswspace(), iswupper(), iswxdigit(), setlocale(), uselocale(), wctype()*39121 XBD `<locale.h>`, `<wctype.h>`**39122 CHANGE HISTORY**

39123 First released as World-wide Portability Interfaces in Issue 4.

**39124 Issue 5**39125 The following change has been made in this version for alignment with  
39126 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 39127 • The SYNOPSIS has been changed to indicate that this function and associated data types  
39128 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

**39129 Issue 6**39130 The behavior of  $n=0$  is now described.

39131 An example is added.

39132 A new function, `iswblank()`, is added to the list in the APPLICATION USAGE.**39133 Issue 7**39134 The `iswctype_l()` function is added from The Open Group Technical Standard, 2006, Extended  
39135 API Set Part 4.

**iswdigit()**39136 **NAME**39137 `iswdigit, iswdigit_l` — test for a decimal digit wide-character code39138 **SYNOPSIS**39139 `#include <wctype.h>`39140 `int iswdigit(wint_t wc);`39141 CX `int iswdigit_l(wint_t wc, locale_t locale);`39142 **DESCRIPTION**39143 CX For `iswdigit()`: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.39146 CX The `iswdigit()` and `iswdigit_l()` functions shall test whether `wc` is a wide-character code representing a character of class **digit** in the current locale of the process, or in the locale represented by `locale`, respectively; see XBD Chapter 7 (on page 135).39149 The `wc` argument is a **wint\_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.39152 **RETURN VALUE**39153 CX The `iswdigit()` and `iswdigit_l()` functions shall return non-zero if `wc` is a decimal digit wide-character code; otherwise, they shall return 0.39155 **ERRORS**39156 The `iswdigit_l()` function may fail if:39157 CX `[EINVAL]` `locale` is not a valid locale object handle.39158 **EXAMPLES**

39159 None.

39160 **APPLICATION USAGE**

39161 To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

39164 **RATIONALE**

39165 None.

39166 **FUTURE DIRECTIONS**

39167 None.

39168 **SEE ALSO**39169 `iswalnum()`, `iswalphabeta()`, `iswcntrl()`, `iswctype()`, `iswgraph()`, `iswlower()`, `iswprint()`, `iswpunct()`, `iswspace()`, `iswupper()`, `iswxdigit()`, `setlocale()`, `uselocale()`39171 XBD Chapter 7 (on page 135), `<locale.h>`, `<wctype.h>`39172 **CHANGE HISTORY**

39173 First released in Issue 4.

39174 **Issue 5**39175 The following change has been made in this version for alignment with ISO/IEC 9899: 1990/Amendment 1: 1995 (E):  
39176

- 39177                   • The SYNOPSIS has been changed to indicate that this function and associated data types  
39178                   are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.
- 39179 **Issue 6**  
39180                   The normative text is updated to avoid use of the term “must” for application requirements.
- 39181 **Issue 7**  
39182                   The *iswdigit\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
39183                   API Set Part 4.

**isxdigit()**39520 **NAME**39521 `isxdigit, isxdigit_l` — test for a hexadecimal digit39522 **SYNOPSIS**

```
39523     #include <ctype.h>
39524     int isxdigit(int c);
39525 CX    int isxdigit_l(int c, locale_t locale);
```

39526 **DESCRIPTION**

39527 CX For `isxdigit()`: The functionality described on this reference page is aligned with the ISO C  
 39528 standard. Any conflict between the requirements described here and the ISO C standard is  
 39529 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

39530 CX The `isxdigit()` and `isxdigit_l()` functions shall test whether `c` is a character of class **xdigit** in the  
 39531 CX current locale of the process, or in the locale represented by `locale`, respectively; see XBD  
 39532 Chapter 7 (on page 135).

39533 The `c` argument is an **int**, the value of which the application shall ensure is a character  
 39534 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has  
 39535 any other value, the behavior is undefined.

39536 **RETURN VALUE**

39537 CX The `isxdigit()` and `isxdigit_l()` functions shall return non-zero if `c` is a hexadecimal digit;  
 39538 otherwise, they shall return 0.

39539 **ERRORS**

39540 The `isxdigit_l()` function may fail if:

39541 CX **[EINVAL]** `locale` is not a valid locale object handle.

39542 **EXAMPLES**

39543 None.

39544 **APPLICATION USAGE**

39545 To ensure applications portability, especially across natural languages, only these functions and  
 39546 the functions in the reference pages listed in the SEE ALSO section should be used for character  
 39547 classification.

39548 **RATIONALE**

39549 None.

39550 **FUTURE DIRECTIONS**

39551 None.

**j0()**39563 **NAME**39564 `j0, j1, jn` — Bessel functions of the first kind39565 **SYNOPSIS**

```
39566 xSI #include <math.h>
39567 double j0(double x);
39568 double j1(double x);
39569 double jn(int n, double x);
```

39570 **DESCRIPTION**

39571 The `j0()`, `j1()`, and `jn()` functions shall compute Bessel functions of  $x$  of the first kind of orders 0,  
 39572 1, and  $n$ , respectively.

39573 An application wishing to check for error situations should set `errno` to zero and call  
 39574 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or  
 39575 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-  
 39576 zero, an error has occurred.

39577 **RETURN VALUE**

39578 Upon successful completion, these functions shall return the relevant Bessel value of  $x$  of the  
 39579 first kind.

39580 If the  $x$  argument is too large in magnitude, or the correct result would cause underflow, 0 shall  
 39581 be returned and a range error may occur.

39582 If  $x$  is NaN, a NaN shall be returned.

39583 **ERRORS**

39584 These functions may fail if:

39585 **Range Error** The value of  $x$  was too large in magnitude, or an underflow occurred.

39586 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,  
 39587 then `errno` shall be set to [ERANGE]. If the integer expression  
 39588 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the underflow  
 39589 floating-point exception shall be raised.

39590 No other errors shall occur.

39591 **EXAMPLES**

39592 None.

39593 **APPLICATION USAGE**

39594 On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling &  
 39595 MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

39596 **RATIONALE**

39597 None.

39598 **FUTURE DIRECTIONS**

39599 None.

39600 **SEE ALSO**

39601 `feclearexcept()`, `fetestexcept()`, `isnan()`, `y0()`

39602 XBD Section 4.19 (on page 116), `<math.h>`

39603 **CHANGE HISTORY**

39604 First released in Issue 1. Derived from Issue 1 of the SVID.

39605 **Issue 5**

39606 The DESCRIPTION is updated to indicate how an application should check for an error. This  
39607 text was previously published in the APPLICATION USAGE section.

39608 **Issue 6**

39609 The may fail [EDOM] error is removed for the case for NaN.

39610 The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling  
39611 with the ISO/IEC 9899:1999 standard.

## System Interfaces

**kill()**39619 **NAME**

39620 kill — send a signal to a process or a group of processes

39621 **SYNOPSIS**

```
39622 CX #include <signal.h>
39623 int kill(pid_t pid, int sig);
```

39624 **DESCRIPTION**

39625 The *kill()* function shall send a signal to a process or a group of processes specified by *pid*. The  
 39626 signal to be sent is specified by *sig* and is either one from the list given in **<signal.h>** or 0. If *sig* is  
 39627 0 (the null signal), error checking is performed but no signal is actually sent. The null signal can  
 39628 be used to check the validity of *pid*.

39629 For a process to have permission to send a signal to a process designated by *pid*, unless the  
 39630 sending process has appropriate privileges, the real or effective user ID of the sending process  
 39631 shall match the real or saved set-user-ID of the receiving process.

39632 If *pid* is greater than 0, *sig* shall be sent to the process whose process ID is equal to *pid*.

39633 If *pid* is 0, *sig* shall be sent to all processes (excluding an unspecified set of system processes)  
 39634 whose process group ID is equal to the process group ID of the sender, and for which the process  
 39635 has permission to send a signal.

39636 If *pid* is -1, *sig* shall be sent to all processes (excluding an unspecified set of system processes) for  
 39637 which the process has permission to send that signal.

39638 If *pid* is negative, but not -1, *sig* shall be sent to all processes (excluding an unspecified set of  
 39639 system processes) whose process group ID is equal to the absolute value of *pid*, and for which  
 39640 the process has permission to send a signal.

39641 If the value of *pid* causes *sig* to be generated for the sending process, and if *sig* is not blocked for  
 39642 the calling thread and if no other thread has *sig* unblocked or is waiting in a *sigwait()* function  
 39643 for *sig*, either *sig* or at least one pending unblocked signal shall be delivered to the sending  
 39644 thread before *kill()* returns.

39645 The user ID tests described above shall not be applied when sending SIGCONT to a process that  
 39646 is a member of the same session as the sending process.

39647 An implementation that provides extended security controls may impose further  
 39648 implementation-defined restrictions on the sending of signals, including the null signal. In  
 39649 particular, the system may deny the existence of some or all of the processes specified by *pid*.

39650 The *kill()* function is successful if the process has permission to send *sig* to any of the processes  
 39651 specified by *pid*. If *kill()* fails, no signal shall be sent.

39652 **RETURN VALUE**

39653 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 39654 indicate the error.

39655 **ERRORS**

39656 The *kill()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 39657 | [EINVAL] | The value of the <i>sig</i> argument is an invalid or unsupported signal number.  |
| 39658 | [EPERM]  | The process does not have permission to send the signal to any receiving process. |
| 39659 |          |   |

**kill()**

39660 [ESRCH] No process or process group can be found corresponding to that specified by  
 39661 *pid*.

39662 **EXAMPLES**

39663 None.

39664 **APPLICATION USAGE**

39665 None.

39666 **RATIONALE**

39667 The semantics for permission checking for *kill()* differed between System V and most other  
 39668 implementations, such as Version 7 or 4.3 BSD. The semantics chosen for this volume of  
 39669 POSIX.1-2008 agree with System V. Specifically, a set-user-ID process cannot protect itself  
 39670 against signals (or at least not against SIGKILL) unless it changes its real user ID. This choice  
 39671 allows the user who starts an application to send it signals even if it changes its effective user ID.  
 39672 The other semantics give more power to an application that wants to protect itself from the user  
 39673 who ran it.

39674 Some implementations provide semantic extensions to the *kill()* function when the absolute  
 39675 value of *pid* is greater than some maximum, or otherwise special value. Negative values are a  
 39676 flag to *kill()*. Since most implementations return [ESRCH] in this case, this behavior is not  
 39677 included in this volume of POSIX.1-2008, although a conforming implementation could provide  
 39678 such an extension.

39679 The unspecified processes to which a signal cannot be sent may include the scheduler or *init*.

39680 There was initially strong sentiment to specify that, if *pid* specifies that a signal be sent to the  
 39681 calling process and that signal is not blocked, that signal would be delivered before *kill()*  
 39682 returns. This would permit a process to call *kill()* and be guaranteed that the call never return.  
 39683 However, historical implementations that provide only the *signal()* function make only the  
 39684 weaker guarantee in this volume of POSIX.1-2008, because they only deliver one signal each  
 39685 time a process enters the kernel. Modifications to such implementations to support the  
 39686 *sigaction()* function generally require entry to the kernel following return from a signal-catching  
 39687 function, in order to restore the signal mask. Such modifications have the effect of satisfying the  
 39688 stronger requirement, at least when *sigaction()* is used, but not necessarily when *signal()* is used.  
 39689 The standard developers considered making the stronger requirement except when *signal()* is  
 39690 used, but felt this would be unnecessarily complex. Implementors are encouraged to meet the  
 39691 stronger requirement whenever possible. In practice, the weaker requirement is the same, except  
 39692 in the rare case when two signals arrive during a very short window. This reasoning also applies  
 39693 to a similar requirement for *sigprocmask()*.

39694 In 4.2 BSD, the SIGCONT signal can be sent to any descendant process regardless of user-ID  
 39695 security checks. This allows a job control shell to continue a job even if processes in the job have  
 39696 altered their user IDs (as in the *su* command). In keeping with the addition of the concept of  
 39697 sessions, similar functionality is provided by allowing the SIGCONT signal to be sent to any  
 39698 process in the same session regardless of user ID security checks. This is less restrictive than BSD  
 39699 in the sense that ancestor processes (in the same session) can now be the recipient. It is more  
 39700 restrictive than BSD in the sense that descendant processes that form new sessions are now  
 39701 subject to the user ID checks. A similar relaxation of security is not necessary for the other job  
 39702 control signals since those signals are typically sent by the terminal driver in recognition of  
 39703 special characters being typed; the terminal driver bypasses all security checks.

39704 In secure implementations, a process may be restricted from sending a signal to a process having  
 39705 a different security label. In order to prevent the existence or nonexistence of a process from  
 39706 being used as a covert channel, such processes should appear nonexistent to the sender; that is,  
 39707 [ESRCH] should be returned, rather than [EPERM], if *pid* refers only to such processes.

39708 Existing implementations vary on the result of a *kill()* with *pid* indicating an inactive process (a  
 39709 terminated process that has not been waited for by its parent). Some indicate success on such a  
 39710 call (subject to permission checking), while others give an error of [ESRCH]. Since the definition  
 39711 of process lifetime in this volume of POSIX.1-2008 covers inactive processes, the [ESRCH] error  
 39712 as described is inappropriate in this case. In particular, this means that an application cannot  
 39713 have a parent process check for termination of a particular child with *kill()*. (Usually this is done  
 39714 with the null signal; this can be done reliably with *waitpid()*.)

39715 There is some belief that the name *kill()* is misleading, since the function is not always intended  
 39716 to cause process termination. However, the name is common to all historical implementations,  
 39717 and any change would be in conflict with the goal of minimal changes to existing application  
 39718 code.

#### 39719 FUTURE DIRECTIONS

39720 None.

#### 39721 SEE ALSO

39723 XBD <signal.h>, <sys/types.h>

#### 39724 CHANGE HISTORY

39725 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 39726 Issue 5

39727 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

#### 39728 Issue 6

39729 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

39730 The following new requirements on POSIX implementations derive from alignment with the  
 39731 Single UNIX Specification:

- 39732 • In the DESCRIPTION, the second paragraph is reworded to indicate that the saved set-  
 39733 user-ID of the calling process is checked in place of its effective user ID. This is a FIPS  
 39734 requirement.
- 39735 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
 39736 required for conforming implementations of previous POSIX specifications, it was not  
 39737 required for UNIX applications.
- 39738 • The behavior when *pid* is  $-1$  is now specified. It was previously explicitly unspecified in  
 39739 the POSIX.1-1988 standard.

39740 The normative text is updated to avoid use of the term “must” for application requirements.

39741 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/51 is applied, correcting the RATIONALE  
 39742 section.

**killpg()**39743 **NAME**

39744 killpg — send a signal to a process group

39745 **SYNOPSIS**

```
39746 XSI #include <signal.h>
39747 int killpg(pid_t pgrp, int sig);
```

39748 **DESCRIPTION**39749 The *killpg()* function shall send the signal specified by *sig* to the process group specified by *pgrp*.39750 If *pgrp* is greater than 1, *killpg(pgrp, sig)* shall be equivalent to *kill(-pgrp, sig)*. If *pgrp* is less than or  
39751 equal to 1, the behavior of *killpg()* is undefined.39752 **RETURN VALUE**39753 Refer to *kill()*.39754 **ERRORS**39755 Refer to *kill()*.39756 **EXAMPLES**39757 **Sending a Signal to All Other Members of a Process Group**39758 The following example shows how the calling process could send a signal to all other members  
39759 of its process group. To prevent itself from receiving the signal it first makes itself immune to the  
39760 signal by ignoring it.

```
39761 #include <signal.h>
39762 #include <unistd.h>
39763 ...
39764     if (signal(SIGUSR1, SIG_IGN) == SIG_ERR)
39765         /* Handle error */;
39766     if (killpg(getpgrp(), SIGUSR1) == -1)
39767         /* Handle error */;
```

39825 SD5-XSH-ERN-152 is applied, correcting the RETURN VALUE section.

**lchown()**39826 **NAME**39827 `lchown` — change the owner and group of a symbolic link39828 **SYNOPSIS**39829 `#include <unistd.h>`39830 `int lchown(const char *path, uid_t owner, gid_t group);`39831 **DESCRIPTION**

39832 The `lchown()` function shall be equivalent to `chown()`, except in the case where the named file is a  
 39833 symbolic link. In this case, `lchown()` shall change the ownership of the symbolic link file itself,  
 39834 while `chown()` changes the ownership of the file or directory to which the symbolic link refers.

39835 **RETURN VALUE**

39836 Upon successful completion, `lchown()` shall return 0. Otherwise, it shall return `-1` and set `errno` to  
 39837 indicate an error.

39838 **ERRORS**39839 The `lchown()` function shall fail if:39840 [EACCES] Search permission is denied on a component of the path prefix of `path`.

39841 [EINVAL] The owner or group ID is not a value supported by the implementation.

39842 [ELOOP] A loop exists in symbolic links encountered during resolution of the `path`  
 39843 argument.

39844 [ENAMETOOLONG]

39845 The length of a component of a pathname is longer than `{NAME_MAX}`.39846 [ENOENT] A component of `path` does not name an existing file or `path` is an empty string.

39847 [ENOTDIR] A component of the path prefix is not a directory, or the `path` argument  
 39848 contains at least one non-`<slash>` character and ends with one or more trailing  
 39849 `<slash>` characters and the last pathname component names an existing file  
 39850 that is neither a directory nor a symbolic link to a directory.

39851 [EPERM] The effective user ID does not match the owner of the file and the process does  
 39852 not have appropriate privileges.

39853 [EROFS] The file resides on a read-only file system.

39854 The `lchown()` function may fail if:

39855 [EIO] An I/O error occurred while reading or writing to the file system.

39856 [EINTR] A signal was caught during execution of the function.

39857 [ELOOP] More than `{SYMLOOP_MAX}` symbolic links were encountered during  
 39858 resolution of the `path` argument.

39859 [ENAMETOOLONG]

39860 The length of a pathname exceeds `{PATH_MAX}`, or pathname resolution of a  
 39861 symbolic link produced an intermediate result with a length that exceeds  
 39862 `{PATH_MAX}`.

39863 **EXAMPLES**39864 **Changing the Current Owner of a File**

39865 The following example shows how to change the ownership of the symbolic link named  
39866 **/modules/pass1** to the user ID associated with "jones" and the group ID associated with "cnd".

39867 The numeric value for the user ID is obtained by using the *getpwnam()* function. The numeric  
39868 value for the group ID is obtained by using the *getgrnam()* function.

```
39869 #include <sys/types.h>
39870 #include <unistd.h>
39871 #include <pwd.h>
39872 #include <grp.h>

39873 struct passwd *pwd;
39874 struct group *grp;
39875 char *path = "/modules/pass1";
39876 ...
39877 pwd = getpwnam("jones");
39878 grp = getgrnam("cnd");
39879 lchown(path, pwd->pw_uid, grp->gr_gid);
```

39880 **APPLICATION USAGE**

39881 On implementations which support symbolic links as directory entries rather than files, *lchown()*  
39882 may fail.

39883 **RATIONALE**

39884 None.

39885 **FUTURE DIRECTIONS**

39886 None.

39887 **SEE ALSO**

39888 *chown()*, *symlink()*

39889 XBD **<unistd.h>**

39890 **CHANGE HISTORY**

39891 First released in Issue 4, Version 2.

39892 **Issue 5**

39893 Moved from X/OPEN UNIX extension to BASE.

39894 **Issue 6**

39895 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
39896 [ELOOP] error condition is added.

39897 The Open Group Base Resolution bwg2001-013 is applied, adding wording to the  
39898 APPLICATION USAGE.

39899 **Issue 7**

39900 Austin Group Interpretation 1003.1-2001 #143 is applied.

39901 The *lchown()* function is moved from the XSI option to the Base.

39902 The [EOPNOTSUPP] error is removed.

## lchown()

39903  
39904

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

39905 **NAME**

39906 lcong48 — seed a uniformly distributed pseudo-random signed long integer generator

39907 **SYNOPSIS**

```
39908 XSI #include <stdlib.h>  
39909 void lcong48(unsigned short param[7]);
```

39910 **DESCRIPTION**39911 Refer to *drand48()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**ldexp()**39912 **NAME**

39913 ldexp, ldexpf, ldexpl — load exponent of a floating-point number

39914 **SYNOPSIS**

```
39915 #include <math.h>
39916 double ldexp(double x, int exp);
39917 float ldexpf(float x, int exp);
39918 long double ldexpl(long double x, int exp);
```

39919 **DESCRIPTION**

39920 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 39921 conflict between the requirements described here and the ISO C standard is unintentional. This  
 39922 volume of POSIX.1-2008 defers to the ISO C standard.

39923 These functions shall compute the quantity  $x * 2^{exp}$ .

39924 An application wishing to check for error situations should set *errno* to zero and call  
 39925 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 39926 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 39927 zero, an error has occurred.

39928 **RETURN VALUE**39929 Upon successful completion, these functions shall return *x* multiplied by 2, raised to the power  
39930 *exp*.

39931 If these functions would cause overflow, a range error shall occur and *ldexp()*, *ldexpf()*, and  
 39932 *ldexpl()* shall return  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL (according to the sign of  
 39933 *x*), respectively.

39934 If the correct value would cause underflow, and is not representable, a range error may occur,  
 39935 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.

39936 **MX** If *x* is NaN, a NaN shall be returned.39937 If *x* is  $\pm 0$  or  $\pm$ Inf, *x* shall be returned.39938 If *exp* is 0, *x* shall be returned.

39939 If the correct value would cause underflow, and is representable, a range error may occur and  
 39940 the correct value shall be returned.

39941 **ERRORS**

39942 These functions shall fail if:

39943 **Range Error** The result overflows.

39944 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 39945 then *errno* shall be set to [ERANGE]. If the integer expression  
 39946 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 39947 floating-point exception shall be raised.

39948 These functions may fail if:

39949 **Range Error** The result underflows.

39950 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 39951 then *errno* shall be set to [ERANGE]. If the integer expression  
 39952 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 39953 floating-point exception shall be raised.

39954 **EXAMPLES**

39955 None.

39956 **APPLICATION USAGE**39957 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
39958 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.39959 **RATIONALE**

39960 None.

39961 **FUTURE DIRECTIONS**

39962 None.

39963 **SEE ALSO**39964 [feclearexcept\(\)](#), [fetestexcept\(\)](#), [frexp\(\)](#), [isnan\(\)](#)39965 XBD Section 4.19 (on page 116), [<math.h>](#)39966 **CHANGE HISTORY**

39967 First released in Issue 1. Derived from Issue 1 of the SVID.

39968 **Issue 5**39969 The DESCRIPTION is updated to indicate how an application should check for an error. This  
39970 text was previously published in the APPLICATION USAGE section.39971 **Issue 6**39972 The *ldexpf()* and *ldexpl()* functions are added for alignment with the ISO/IEC 9899:1999  
39973 standard.39974 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
39975 revised to align with the ISO/IEC 9899:1999 standard.39976 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
39977 marked.

**ldiv()**39978 **NAME**39979 `ldiv, lldiv` — compute quotient and remainder of a long division39980 **SYNOPSIS**

```
39981 #include <stdlib.h>
39982
39982 ldiv_t ldiv(long numer, long denom);
39983 lldiv_t lldiv(long long numer, long long denom);
```

39984 **DESCRIPTION**

39985 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 39986 conflict between the requirements described here and the ISO C standard is unintentional. This  
 39987 volume of POSIX.1-2008 defers to the ISO C standard.

39988 These functions shall compute the quotient and remainder of the division of the numerator  
 39989 *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the **long**  
 39990 integer (for the *ldiv()* function) or **long long** integer (for the *lldiv()* function) of lesser magnitude  
 39991 that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is  
 39992 undefined; otherwise, *quot \* denom + rem* shall equal *numer*.

39993 **RETURN VALUE**

39994 The *ldiv()* function shall return a structure of type **ldiv\_t**, comprising both the quotient and the  
 39995 remainder. The structure shall include the following members, in any order:

```
39996 long quot; /* Quotient */
39997 long rem; /* Remainder */
```

39998 The *lldiv()* function shall return a structure of type **lldiv\_t**, comprising both the quotient and the  
 39999 remainder. The structure shall include the following members, in any order:

```
40000 long long quot; /* Quotient */
40001 long long rem; /* Remainder */
```

40002 **ERRORS**

40003 No errors are defined.

40004 **EXAMPLES**

40005 None.

40006 **APPLICATION USAGE**

40007 None.

40008 **RATIONALE**

40009 None.

40010 **FUTURE DIRECTIONS**

40011 None.

40012 **SEE ALSO**40013 [div\(\)](#)40014 XBD [<stdlib.h>](#)40015 **CHANGE HISTORY**

40016 First released in Issue 4. Derived from the ISO C standard.

40017 **Issue 6**40018 The *lldiv()* function is added for alignment with the ISO/IEC 9899:1999 standard.

40019 **NAME**

40020 lfind — find entry in a linear search table

40021 **SYNOPSIS**

```
40022 XSI #include <search.h>
40023 void *lfind(const void *key, const void *base, size_t *nel,
40024 size_t width, int (*compar)(const void *, const void *));
```

40025 **DESCRIPTION**40026 Refer to *lsearch()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**lgamma()**40027 **NAME**

40028 lgamma, lgammaf, lgammal, signgam — log gamma function

40029 **SYNOPSIS**

```
40030 #include <math.h>
40031 double lgamma(double x);
40032 float lgammaf(float x);
40033 long double lgammal(long double x);
40034 XSI extern int signgam;
```

40035 **DESCRIPTION**

40036 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 40037 conflict between the requirements described here and the ISO C standard is unintentional. This  
 40038 volume of POSIX.1-2008 defers to the ISO C standard.

40039 These functions shall compute  $\log_e |\Gamma(x)|$  where  $\Gamma(x)$  is defined as  $\int_0^{\infty} e^{-t} t^{x-1} dt$ . The argument  $x$   
 40040 need not be a non-positive integer ( $\Gamma(x)$  is defined over the reals, except the non-positive  
 40041 integers).

40042 XSI If  $x$  is NaN,  $-\text{Inf}$ , or a negative integer, the value of *signgam* is unspecified.

40043 CX These functions need not be thread-safe.

40044 An application wishing to check for error situations should set *errno* to zero and call  
 40045 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 40046 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 40047 zero, an error has occurred.

40048 **RETURN VALUE**

40049 Upon successful completion, these functions shall return the logarithmic gamma of  $x$ .

40050 If  $x$  is a non-positive integer, a pole error shall occur and *lgamma()*, *lgammaf()*, and *lgammal()*  
 40051 shall return  $+\text{HUGE\_VAL}$ ,  $+\text{HUGE\_VALF}$ , and  $+\text{HUGE\_VALL}$ , respectively.

40052 If the correct value would cause overflow, a range error shall occur and *lgamma()*, *lgammaf()*,  
 40053 and *lgammal()* shall return  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$  (having the same  
 40054 sign as the correct value), respectively.

40055 MX If  $x$  is NaN, a NaN shall be returned.

40056 If  $x$  is 1 or 2,  $+0$  shall be returned.

40057 If  $x$  is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

40058 **ERRORS**

40059 These functions shall fail if:

40060 Pole Error The  $x$  argument is a negative integer or zero.

40061 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 40062 then *errno* shall be set to [ERANGE]. If the integer expression  
 40063 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 40064 floating-point exception shall be raised.

40065 Range Error The result overflows.

40066 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 40067 then *errno* shall be set to [ERANGE]. If the integer expression

40068  $(math\_errhandling$  & MATH\_ERREXCEPT) is non-zero, then the overflow  
40069 floating-point exception shall be raised.

40070 **EXAMPLES**

40071 None.

40072 **APPLICATION USAGE**

40073 On error, the expressions  $(math\_errhandling$  & MATH\_ERRNO) and  $(math\_errhandling$  &  
40074 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

40075 **RATIONALE**

40076 None.

40077 **FUTURE DIRECTIONS**

40078 None.

40079 **SEE ALSO**

40080 *exp()*, *feclearexcept()*, *fetestexcept()*, *isnan()*

40081 XBD Section 4.19 (on page 116), <math.h>

40082 **CHANGE HISTORY**

40083 First released in Issue 3.

40084 **Issue 5**

40085 The DESCRIPTION is updated to indicate how an application should check for an error. This  
40086 text was previously published in the APPLICATION USAGE section.

40087 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

40088 **Issue 6**

40089 The *lgamma()* function is no longer marked as an extension.

40090 The *lgammaf()* and *lgammal()* functions are added for alignment with the ISO/IEC 9899:1999  
40091 standard.

40092 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
40093 revised to align with the ISO/IEC 9899:1999 standard.

40094 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
40095 marked.

40096 Functionality relating to the XSI option is marked.

40097 **Issue 7**

40098 Austin Group Interpretation 1003.1-2001 #156 is applied.

40099 The DESCRIPTION is clarified regarding the value of *signgam* when *x* is Nan,  $-\text{Inf}$ , or a negative  
40100 integer.

**link()**40101 **NAME**40102 `link, linkat` — link one file to another file relative to two directory file descriptors40103 **SYNOPSIS**

```
40104 #include <unistd.h>
40105 int link(const char *path1, const char *path2);
40106 int linkat(int fd1, const char *path1, int fd2, const char *path2,
40107           int flag);
```

40108 **DESCRIPTION**40109 The `link()` function shall create a new link (directory entry) for the existing file, `path1`.

40110 The `path1` argument points to a pathname naming an existing file. The `path2` argument points to a pathname naming the new directory entry to be created. The `link()` function shall atomically create a new link for the existing file and the link count of the file shall be incremented by one.

40113 If `path1` names a directory, `link()` shall fail unless the process has appropriate privileges and the implementation supports using `link()` on directories.

40115 If `path1` names a symbolic link, it is implementation-defined whether `link()` follows the symbolic link, or creates a new link to the symbolic link itself.

40117 Upon successful completion, `link()` shall mark for update the last file status change timestamp of the file. Also, the last data modification and last file status change timestamps of the directory that contains the new entry shall be marked for update.

40120 If `link()` fails, no link shall be created and the link count of the file shall remain unchanged.

40121 The implementation may require that the calling process has permission to access the existing file.

40123 The `linkat()` function shall be equivalent to the `link()` function except in the case where either `path1` or `path2` or both are relative paths. In this case a relative path `path1` is interpreted relative to the directory associated with the file descriptor `fd1` instead of the current working directory and similarly for `path2` and the file descriptor `fd2`. If the file descriptor was opened without `O_SEARCH`, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with `O_SEARCH`, the function shall not perform the check.

40130 Values for `flag` are constructed by a bitwise-inclusive OR of flags from the following list, defined in `<fcntl.h>`:

40132 `AT_SYMLINK_FOLLOW`40133 If `path1` names a symbolic link, a new link for the target of the symbolic link is created.

40134 If `linkat()` is passed the special value `AT_FDCWD` in the `fd1` or `fd2` parameter, the current working directory is used for the respective `path` argument. If both `fd1` and `fd2` have value `AT_FDCWD`, the behavior shall be identical to a call to `link()`.

40137 If the `AT_SYMLINK_FOLLOW` flag is clear in the `flag` argument and the `path1` argument names a symbolic link, a new link is created for the symbolic link `path1` and not its target.

40139 **RETURN VALUE**

40140 Upon successful completion, these functions shall return 0. Otherwise, these functions shall return `-1` and set `errno` to indicate the error.

40142 **ERRORS**

40143 These functions shall fail if:

40144 [EACCES] A component of either path prefix denies search permission, or the requested  
 40145 link requires writing in a directory that denies write permission, or the calling  
 40146 process does not have permission to access the existing file and this is required  
 40147 by the implementation.

40148 [EEXIST] The *path2* argument resolves to an existing directory entry or refers to a  
 40149 symbolic link.

40150 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path1* or  
 40151 *path2* argument.

40152 [EMLINK] The number of links to the file named by *path1* would exceed {LINK\_MAX}.

40153 [ENAMETOOLONG]

40154 The length of a component of a pathname is longer than {NAME\_MAX}.

40155 [ENOENT] A component of either path prefix does not exist; the file named by *path1* does  
 40156 not exist; or *path1* or *path2* points to an empty string.

40157 [ENOSPC] The directory to contain the link cannot be extended.

40158 [ENOTDIR] A component of either path prefix is not a directory, or the *path1* argument  
 40159 contains at least one non-`<slash>` character and ends with one or more trailing  
 40160 `<slash>` characters and the last pathname component names an existing file  
 40161 that is neither a directory nor a symbolic link to a directory.

40162 [EPERM] The file named by *path1* is a directory and either the calling process does not  
 40163 have appropriate privileges or the implementation prohibits using *link()* on  
 40164 directories.

40165 [EROFS] The requested link requires writing in a directory on a read-only file system.

40166 [EXDEV] The link named by *path2* and the file named by *path1* are on different file  
 40167 systems and the implementation does not support links between file systems.

40168 OB XSR [EXDEV] *path1* refers to a named STREAM.

40169 The *linkat()* function shall fail if:

40170 [EBADF] The *path1* or *path2* argument does not specify an absolute path and the *fd1* or  
 40171 *fd2* argument, respectively, is neither AT\_FDCWD nor a valid file descriptor  
 40172 open for reading.

40173 These functions may fail if:

40174 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 40175 resolution of the *path1* or *path2* argument.

40176 [ENAMETOOLONG]

40177 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 40178 symbolic link produced an intermediate result with a length that exceeds  
 40179 {PATH\_MAX}.

**link()**

40180 The *linkat()* function may fail if:

40181 [EINVAL] The value of the *flag* argument is not valid.

40182 [ENOTDIR] The *path1* or *path2* argument is not an absolute path and *fd1* or *fd2*,  
40183 respectively, is neither AT\_FDCWD nor a file descriptor associated with a  
40184 directory.

40185 **EXAMPLES**40186 **Creating a Link to a File**

40187 The following example shows how to create a link to a file named **/home/cnd/mod1** by creating  
40188 a new directory entry named **/modules/pass1**.

```
40189 #include <unistd.h>
40190
40191 char *path1 = "/home/cnd/mod1";
40192 char *path2 = "/modules/pass1";
40193 int status;
40194 ...
40195 status = link (path1, path2);
```

40195 **Creating a Link to a File Within a Program**

40196 In the following program example, the *link()* function links the **/etc/passwd** file (defined as  
40197 **PASSWDFILE**) to a file named **/etc/opasswd** (defined as **SAVEFILE**), which is used to save the  
40198 current password file. Then, after removing the current password file (defined as  
40199 **PASSWDFILE**), the new password file is saved as the current password file using the *link()*  
40200 function again.

```
40201 #include <unistd.h>
40202
40203 #define LOCKFILE "/etc/passwd"
40204 #define PASSWDFILE "/etc/passwd"
40205 #define SAVEFILE "/etc/opasswd"
40206 ...
40207 /* Save current password file */
40208 link (PASSWDFILE, SAVEFILE);
40209
40210 /* Remove current password file. */
40211 unlink (PASSWDFILE);
40212
40213 /* Save new password file as current password file. */
40214 link (LOCKFILE, PASSWDFILE);
```

40212 **APPLICATION USAGE**

40213 Some implementations do allow links between file systems.

40214 If *path1* refers to a symbolic link, application developers should use *linkat()* with appropriate  
40215 flags to select whether or not the symbolic link should be resolved.

40216 **RATIONALE**

40217 Linking to a directory is restricted to the superuser in most historical implementations because  
40218 this capability may produce loops in the file hierarchy or otherwise corrupt the file system. This  
40219 volume of POSIX.1-2008 continues that philosophy by prohibiting *link()* and *unlink()* from  
40220 doing this. Other functions could do it if the implementor designed such an extension.

40221 Some historical implementations allow linking of files on different file systems. Wording was

40222 added to explicitly allow this optional behavior.

40223 The exception for cross-file system links is intended to apply only to links that are  
40224 programmatically indistinguishable from “hard” links.

40225 The purpose of the *linkat()* function is to link files in directories other than the current working  
40226 directory without exposure to race conditions. Any part of the path of a file could be changed in  
40227 parallel to a call to *link()*, resulting in unspecified behavior. By opening a file descriptor for the  
40228 directory of both the existing file and the target location and using the *linkat()* function it can be  
40229 guaranteed that the both filenames are in the desired directories.

40230 The AT\_SYMLINK\_FOLLOW flag allows for implementing both common behaviors of the  
40231 *link()* function. The POSIX specification requires that if *path1* is a symbolic link, a new link for  
40232 the target of the symbolic link is created. Many systems by default or as an alternative provide a  
40233 mechanism to avoid the implicit symbolic link lookup and create a new link for the symbolic  
40234 link itself.

40235 Earlier versions of this standard specified only the *link()* function, and required it to behave like  
40236 *linkat()* with the AT\_SYMLINK\_FOLLOW flag. However, historical practice from SVR4 and  
40237 Linux kernels had *link()* behaving like *linkat()* with no flags, and many systems that attempted  
40238 to provide a conforming *link()* function did so in a way that was rarely used, and when it was  
40239 used did not conform to the standard (e.g., by not being atomic, or by dereferencing the  
40240 symbolic link incorrectly). Since applications could not rely on *link()* following links in practice,  
40241 the *linkat()* function was added taking a flag to specify the desired behavior for the application.

#### 40242 FUTURE DIRECTIONS

40243 None.

#### 40244 SEE ALSO

40245 *rename()*, *symlink()*, *unlink()*

40246 XBD <fcntl.h>, <unistd.h>

#### 40247 CHANGE HISTORY

40248 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 40249 Issue 6

40250 The following new requirements on POSIX implementations derive from alignment with the  
40251 Single UNIX Specification:

- 40252 • The [ELOOP] mandatory error condition is added.
- 40253 • A second [ENAMETOOLONG] is added as an optional error condition.

40254 The following changes were made to align with the IEEE P1003.1a draft standard:

- 40255 • An explanation is added of the action when *path2* refers to a symbolic link.
- 40256 • The [ELOOP] optional error condition is added.

#### 40257 Issue 7

40258 Austin Group Interpretation 1003.1-2001 #143 is applied.

40259 SD5-XSH-ERN-93 is applied, adding RATIONALE.

40260 The *linkat()* function is added from The Open Group Technical Standard, 2006, Extended API Set  
40261 Part 2.

40262 Functionality relating to XSI STREAMS is marked obsolescent.

40263 Changes are made related to support for finegrained timestamps.

**link()**

40264

The [EOPNOTSUPP] error is removed.

40265 **NAME**

40266       lio\_listio — list directed I/O

40267 **SYNOPSIS**

40268       #include &lt;aio.h&gt;

40269       int lio\_listio(int mode, struct aiocb \*restrict const list[restrict],  
40270                    int nent, struct sigevent \*restrict sig);40271 **DESCRIPTION**40272       The *lio\_listio()* function shall initiate a list of I/O requests with a single function call.40273       The *mode* argument takes one of the values LIO\_WAIT or LIO\_NOWAIT declared in <aio.h> and  
40274       determines whether the function returns when the I/O operations have been completed, or as  
40275       soon as the operations have been queued. If the *mode* argument is LIO\_WAIT, the function shall  
40276       wait until all I/O is complete and the *sig* argument shall be ignored.40277       If the *mode* argument is LIO\_NOWAIT, the function shall return immediately, and asynchronous  
40278       notification shall occur, according to the *sig* argument, when all the I/O operations complete. If  
40279       *sig* is NULL, then no asynchronous notification shall occur. If *sig* is not NULL, asynchronous  
40280       notification occurs as specified in Section 2.4.1 (on page 484) when all the requests in *list* have  
40281       completed.40282       The I/O requests enumerated by *list* are submitted in an unspecified order.40283       The *list* argument is an array of pointers to **aiocb** structures. The array contains *nent* elements.  
40284       The array may contain NULL elements, which shall be ignored.40285       If the buffer pointed to by *list* or the **aiocb** structures pointed to by the elements of the array *list*  
40286       become illegal addresses before all asynchronous I/O completed and, if necessary, the  
40287       notification is sent, then the behavior is undefined. If the buffers pointed to by the *aio\_buf*  
40288       member of the **aiocb** structure pointed to by the elements of the array *list* become illegal  
40289       addresses prior to the asynchronous I/O associated with that **aiocb** structure being completed,  
40290       the behavior is undefined.40291       The *aio\_lio\_opcode* field of each **aiocb** structure specifies the operation to be performed. The  
40292       supported operations are LIO\_READ, LIO\_WRITE, and LIO\_NOP; these symbols are defined in  
40293       <aio.h>. The LIO\_NOP operation causes the list entry to be ignored. If the *aio\_lio\_opcode*  
40294       element is equal to LIO\_READ, then an I/O operation is submitted as if by a call to *aio\_read()*  
40295       with the *aio\_cbp* equal to the address of the **aiocb** structure. If the *aio\_lio\_opcode* element is equal to  
40296       LIO\_WRITE, then an I/O operation is submitted as if by a call to *aio\_write()* with the *aio\_cbp*  
40297       equal to the address of the **aiocb** structure.40298       The *aio\_fildes* member specifies the file descriptor on which the operation is to be performed.40299       The *aio\_buf* member specifies the address of the buffer to or from which the data is transferred.40300       The *aio\_nbytes* member specifies the number of bytes of data to be transferred.40301       The members of the **aiocb** structure further describe the I/O operation to be performed, in a  
40302       manner identical to that of the corresponding **aiocb** structure when used by the *aio\_read()* and  
40303       *aio\_write()* functions.40304       The *nent* argument specifies how many elements are members of the list; that is, the length of the  
40305       array.40306       The behavior of this function is altered according to the definitions of synchronized I/O data  
40307       integrity completion and synchronized I/O file integrity completion if synchronized I/O is  
40308       enabled on the file associated with *aio\_fildes*.

**lio\_listio()**

40309 For regular files, no data transfer shall occur past the offset maximum established in the open  
40310 file description associated with *aiocbp*→*aio\_fildes*.

40311 If *sig*→*sigev\_notify* is SIGEV\_THREAD and *sig*→*sigev\_notify\_attributes* is a non-null pointer and  
40312 the block pointed to by this pointer becomes an illegal address prior to all asynchronous I/O  
40313 being completed, then the behavior is undefined.

**RETURN VALUE**

40314 If the *mode* argument has the value LIO\_NOWAIT, the *lio\_listio()* function shall return the value  
40315 zero if the I/O operations are successfully queued; otherwise, the function shall return the value  
40316 -1 and set *errno* to indicate the error.  
40317

40318 If the *mode* argument has the value LIO\_WAIT, the *lio\_listio()* function shall return the value zero  
40319 when all the indicated I/O has completed successfully. Otherwise, *lio\_listio()* shall return a value  
40320 of -1 and set *errno* to indicate the error.

40321 In either case, the return value only indicates the success or failure of the *lio\_listio()* call itself,  
40322 not the status of the individual I/O requests. In some cases one or more of the I/O requests  
40323 contained in the list may fail. Failure of an individual request does not prevent completion of  
40324 any other individual request. To determine the outcome of each I/O request, the application  
40325 shall examine the error status associated with each **aiocb** control block. The error statuses so  
40326 returned are identical to those returned as the result of an *aio\_read()* or *aio\_write()* function.

**ERRORS**

40327 The *lio\_listio()* function shall fail if:

40328 [EAGAIN] The resources necessary to queue all the I/O requests were not available. The  
40329 application may check the error status for each **aiocb** to determine the  
40330 individual request(s) that failed.  
40331

40332 [EAGAIN] The number of entries indicated by *nent* would cause the system-wide limit  
40333 {AIO\_MAX} to be exceeded.

40334 [EINVAL] The *mode* argument is not a proper value, or the value of *nent* was greater than  
40335 {AIO\_LISTIO\_MAX}.

40336 [EINTR] A signal was delivered while waiting for all I/O requests to complete during  
40337 an LIO\_WAIT operation. Note that, since each I/O operation invoked by  
40338 *lio\_listio()* may possibly provoke a signal when it completes, this error return  
40339 may be caused by the completion of one (or more) of the very I/O operations  
40340 being awaited. Outstanding I/O requests are not canceled, and the application  
40341 shall examine each list element to determine whether the request was  
40342 initiated, canceled, or completed.

40343 [EIO] One or more of the individual I/O operations failed. The application may  
40344 check the error status for each **aiocb** structure to determine the individual  
40345 request(s) that failed.

40346 In addition to the errors returned by the *lio\_listio()* function, if the *lio\_listio()* function succeeds  
40347 or fails with errors of [EAGAIN], [EINTR], or [EIO], then some of the I/O specified by the list  
40348 may have been initiated. If the *lio\_listio()* function fails with an error code other than [EAGAIN],  
40349 [EINTR], or [EIO], no operations from the list shall have been initiated. The I/O operation  
40350 indicated by each list element can encounter errors specific to the individual read or write  
40351 function being performed. In this event, the error status for each **aiocb** control block contains the  
40352 associated error code. The error codes that can be set are the same as would be set by a *read()* or  
40353 *write()* function, with the following additional error codes possible:

- 40354 [EAGAIN] The requested I/O operation was not queued due to resource limitations.
- 40355 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit  
40356 *aio\_cancel()* request.
- 40357 [EFBIG] The *aioctx->aio\_lio\_opcode* is LIO\_WRITE, the file is a regular file,  
40358 *aioctx->aio\_nbytes* is greater than 0, and the *aioctx->aio\_offset* is greater than or  
40359 equal to the offset maximum in the open file description associated with  
40360 *aioctx->aio\_fildes*.
- 40361 [EINPROGRESS] The requested I/O is in progress.
- 40362 [EOVERFLOW] The *aioctx->aio\_lio\_opcode* is LIO\_READ, the file is a regular file,  
40363 *aioctx->aio\_nbytes* is greater than 0, and the *aioctx->aio\_offset* is before the  
40364 end-of-file and is greater than or equal to the offset maximum in the open file  
40365 description associated with *aioctx->aio\_fildes*.

**EXAMPLES**

40366 None.

**APPLICATION USAGE**

40368 None.

**RATIONALE**

40371 Although it may appear that there are inconsistencies in the specified circumstances for error  
40372 codes, the [EIO] error condition applies when any circumstance relating to an individual  
40373 operation makes that operation fail. This might be due to a badly formulated request (for  
40374 example, the *aio\_lio\_opcode* field is invalid, and *aio\_error()* returns [EINVAL]) or might arise from  
40375 application behavior (for example, the file descriptor is closed before the operation is initiated,  
40376 and *aio\_error()* returns [EBADF]).

40377 The limitation on the set of error codes returned when operations from the list shall have been  
40378 initiated enables applications to know when operations have been started and whether  
40379 *aio\_error()* is valid for a specific operation.

**FUTURE DIRECTIONS**

40380 None.

**SEE ALSO**

40383 *aio\_read()*, *aio\_write()*, *aio\_error()*, *aio\_return()*, *aio\_cancel()*, *close()*, *exec*, *exit()*, *fork()*, *lseek()*,  
40384 *read()*

40385 XBD <[aio.h](#)>

**CHANGE HISTORY**

40387 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

40388 Large File Summit extensions are added.

**Issue 6**

40390 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
40391 implementation does not support the Asynchronous Input and Output option.

40392 The *lio\_listio()* function is marked as part of the Asynchronous Input and Output option.

40393 The following new requirements on POSIX implementations derive from alignment with the  
40394 Single UNIX Specification:

**lio\_listio()**

- 40395 • In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs  
40396 past the offset maximum established in the open file description associated with  
40397 *aiocbp*→*aio\_fildes*. This change is to support large files.
- 40398 • The [EBIG] and [EOVERFLOW] error conditions are defined. This change is to support  
40399 large files.
- 40400 The normative text is updated to avoid use of the term “must” for application requirements.
- 40401 The **restrict** keyword is added to the *lio\_listio()* prototype for alignment with the  
40402 ISO/IEC 9899: 1999 standard.
- 40403 **Issue 6**
- 40404 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/53 is applied, adding new text for  
40405 symmetry with the *aio\_read()* and *aio\_write()* functions to the DESCRIPTION.
- 40406 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/54 is applied, adding text to the  
40407 DESCRIPTION making it explicit that the user is required to keep the structure pointed to by  
40408 *sig*→*sigev\_notify\_attributes* valid until the last asynchronous operation finished and the  
40409 notification has been sent.
- 40410 **Issue 7**
- 40411 The *lio\_listio()* function is moved from the Asynchronous Input and Output option to the Base.

40412 **NAME**

40413 listen — listen for socket connections and limit the queue of incoming connections

40414 **SYNOPSIS**

```
40415 #include <sys/socket.h>
40416 int listen(int socket, int backlog);
```

40417 **DESCRIPTION**

40418 The *listen()* function shall mark a connection-mode socket, specified by the *socket* argument, as  
 40419 accepting connections.

40420 The *backlog* argument provides a hint to the implementation which the implementation shall use  
 40421 to limit the number of outstanding connections in the socket's listen queue. Implementations  
 40422 may impose a limit on *backlog* and silently reduce the specified value. Normally, a larger *backlog*  
 40423 argument value shall result in a larger or equal length of the listen queue. Implementations shall  
 40424 support values of *backlog* up to SOMAXCONN, defined in *<sys/socket.h>*.

40425 The implementation may include incomplete connections in its listen queue. The limits on the  
 40426 number of incomplete connections and completed connections queued may be different.

40427 The implementation may have an upper limit on the length of the listen queue—either global or  
 40428 per accepting socket. If *backlog* exceeds this limit, the length of the listen queue is set to the limit.

40429 If *listen()* is called with a *backlog* argument value that is less than 0, the function behaves as if it  
 40430 had been called with a *backlog* argument value of 0.

40431 A *backlog* argument of 0 may allow the socket to accept connections, in which case the length of  
 40432 the listen queue may be set to an implementation-defined minimum value.

40433 The socket in use may require the process to have appropriate privileges to use the *listen()*  
 40434 function.

40435 **RETURN VALUE**

40436 Upon successful completions, *listen()* shall return 0; otherwise, -1 shall be returned and *errno* set  
 40437 to indicate the error.

40438 **ERRORS**

40439 The *listen()* function shall fail if:

40440 [EBADF] The *socket* argument is not a valid file descriptor.

40441 [EDESTADDRREQ]

40442 The socket is not bound to a local address, and the protocol does not support  
 40443 listening on an unbound socket.

40444 [EINVAL] The *socket* is already connected.

40445 [ENOTSOCK] The *socket* argument does not refer to a socket.

40446 [EOPNOTSUPP] The socket protocol does not support *listen()*.

40447 The *listen()* function may fail if:

40448 [EACCES] The calling process does not have appropriate privileges.

40449 [EINVAL] The *socket* has been shut down.

40450 [ENOBUFS] Insufficient resources are available in the system to complete the call.

40480 **NAME**

40481 llrint, llrintf, llrintl — round to the nearest integer value using current rounding direction

40482 **SYNOPSIS**

```
40483 #include <math.h>
40484 long long llrint(double x);
40485 long long llrintf(float x);
40486 long long llrintl(long double x);
```

40487 **DESCRIPTION**

40488 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 40489 conflict between the requirements described here and the ISO C standard is unintentional. This  
 40490 volume of POSIX.1-2008 defers to the ISO C standard.

40491 These functions shall round their argument to the nearest integer value, rounding according to  
 40492 the current rounding direction.

40493 An application wishing to check for error situations should set *errno* to zero and call  
 40494 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 40495 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 40496 zero, an error has occurred.

40497 **RETURN VALUE**

40498 Upon successful completion, these functions shall return the rounded integer value.

40499 MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

40500 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

40501 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

40502 If the correct value is positive and too large to represent as a **long long**, an unspecified value  
 40503 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error  
 40504 shall occur;

40505 CX otherwise, a domain error may occur.

40506 If the correct value is negative and too large to represent as a **long long**, an unspecified value  
 40507 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error  
 40508 shall occur;

40509 CX otherwise, a domain error may occur.

40510 **ERRORS**

40511 These functions shall fail if:

40512 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
 40513 integer.

40514 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 40515 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 40516 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 40517 shall be raised.

40518 These functions may fail if:

40519 **Domain Error** The correct value is not representable as an integer.

40520 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 40521 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 40522 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 40523 shall be raised.

## llrint()

### 40524 EXAMPLES

40525 None.

### 40526 APPLICATION USAGE

40527 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
40528 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

### 40529 RATIONALE

40530 These functions provide floating-to-integer conversions. They round according to the current  
40531 rounding direction. If the rounded value is outside the range of the return type, the numeric  
40532 result is unspecified and the invalid floating-point exception is raised. When they raise no other  
40533 floating-point exception and the result differs from the argument, they raise the inexact floating-  
40534 point exception.

### 40535 FUTURE DIRECTIONS

40536 None.

### 40537 SEE ALSO

40538 [fclearexcept\(\)](#), [fetestexcept\(\)](#), [lrint\(\)](#)

### 40540 CHANGE HISTORY

40541 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

### 40542 Issue 7

40543 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #53 is applied.

40544 **NAME**

40545 llround, llroundf, llroundl — round to nearest integer value

40546 **SYNOPSIS**

```
40547 #include <math.h>
40548 long long llround(double x);
40549 long long llroundf(float x);
40550 long long llroundl(long double x);
```

40551 **DESCRIPTION**

40552 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 40553 conflict between the requirements described here and the ISO C standard is unintentional. This  
 40554 volume of POSIX.1-2008 defers to the ISO C standard.

40555 These functions shall round their argument to the nearest integer value, rounding halfway cases  
 40556 away from zero, regardless of the current rounding direction.

40557 An application wishing to check for error situations should set *errno* to zero and call  
 40558 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 40559 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 40560 zero, an error has occurred.

40561 **RETURN VALUE**

40562 Upon successful completion, these functions shall return the rounded integer value.

40563 MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

40564 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

40565 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

40566 If the correct value is positive and too large to represent as a **long long**, an unspecified value  
 40567 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error  
 40568 shall occur;

40569 CX otherwise, a domain error may occur.

40570 If the correct value is negative and too large to represent as a **long long**, an unspecified value  
 40571 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error  
 40572 shall occur;

40573 CX otherwise, a domain error may occur.

40574 **ERRORS**

40575 These functions shall fail if:

40576 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
 40577 integer.

40578 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 40579 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 40580 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 40581 shall be raised.

40582 These functions may fail if:

40583 **Domain Error** The correct value is not representable as an integer.

40584 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 40585 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 40586 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 40587 shall be raised.

**llround()**40588 **EXAMPLES**

40589 None.

40590 **APPLICATION USAGE**40591 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
40592 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.40593 **RATIONALE**40594 These functions differ from the *llrint()* functions in that the default rounding direction for the  
40595 *llround()* functions round halfway cases away from zero and need not raise the inexact floating-  
40596 point exception for non-integer arguments that round to within the range of the return type.40597 **FUTURE DIRECTIONS**

40598 None.

40599 **SEE ALSO**40600 [feclearexcept\(\)](#), [fetestexcept\(\)](#), [lround\(\)](#)40601 XBD Section 4.19 (on page 116), [<math.h>](#)40602 **CHANGE HISTORY**

40603 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

40604 **Issue 7**

40605 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #54 (SD5-XSH-ERN-75) is applied.

40606 **NAME**

40607 localeconv — return locale-specific information

40608 **SYNOPSIS**

40609 #include &lt;locale.h&gt;

40610 struct lconv \*localeconv(void);

40611 **DESCRIPTION**

40612 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 40613 conflict between the requirements described here and the ISO C standard is unintentional. This  
 40614 volume of POSIX.1-2008 defers to the ISO C standard.

40615 The *localeconv()* function shall set the components of an object with the type **struct lconv** with  
 40616 the values appropriate for the formatting of numeric quantities (monetary and otherwise)  
 40617 according to the rules of the current locale.

40618 The members of the structure with type **char \*** are pointers to strings, any of which (except  
 40619 **decimal\_point**) can point to "", to indicate that the value is not available in the current locale or  
 40620 is of zero length. The members with type **char** are non-negative numbers, any of which can be  
 40621 {CHAR\_MAX} to indicate that the value is not available in the current locale.

40622 The members include the following:

40623 **char \*decimal\_point**

40624 The radix character used to format non-monetary quantities.

40625 **char \*thousands\_sep**

40626 The character used to separate groups of digits before the decimal-point character in  
 40627 formatted non-monetary quantities.

40628 **char \*grouping**

40629 A string whose elements taken as one-byte integer values indicate the size of each group of  
 40630 digits in formatted non-monetary quantities.

40631 **char \*int\_curr\_symbol**

40632 The international currency symbol applicable to the current locale. The first three characters  
 40633 contain the alphabetic international currency symbol in accordance with those specified in  
 40634 the ISO 4217:2001 standard. The fourth character (immediately preceding the null byte) is  
 40635 the character used to separate the international currency symbol from the monetary  
 40636 quantity.

40637 **char \*currency\_symbol**

40638 The local currency symbol applicable to the current locale.

40639 **char \*mon\_decimal\_point**

40640 The radix character used to format monetary quantities.

40641 **char \*mon\_thousands\_sep**

40642 The separator for groups of digits before the decimal-point in formatted monetary  
 40643 quantities.

40644 **char \*mon\_grouping**

40645 A string whose elements taken as one-byte integer values indicate the size of each group of  
 40646 digits in formatted monetary quantities.

40647 **char \*positive\_sign**

40648 The string used to indicate a non-negative valued formatted monetary quantity.

**localeconv()**

40649	<b>char *negative_sign</b>
40650	The string used to indicate a negative valued formatted monetary quantity.
40651	<b>char int_frac_digits</b>
40652	The number of fractional digits (those after the decimal-point) to be displayed in an
40653	internationally formatted monetary quantity.
40654	<b>char frac_digits</b>
40655	The number of fractional digits (those after the decimal-point) to be displayed in a
40656	formatted monetary quantity.
40657	<b>char p_cs_precedes</b>
40658	Set to 1 if the <b>currency_symbol</b> precedes the value for a non-negative formatted monetary
40659	quantity. Set to 0 if the symbol succeeds the value.
40660	<b>char p_sep_by_space</b>
40661	Set to a value indicating the separation of the <b>currency_symbol</b> , the sign string, and the
40662	value for a non-negative formatted monetary quantity.
40663	<b>char n_cs_precedes</b>
40664	Set to 1 if the <b>currency_symbol</b> precedes the value for a negative formatted monetary
40665	quantity. Set to 0 if the symbol succeeds the value.
40666	<b>char n_sep_by_space</b>
40667	Set to a value indicating the separation of the <b>currency_symbol</b> , the sign string, and the
40668	value for a negative formatted monetary quantity.
40669	<b>char p_sign_posn</b>
40670	Set to a value indicating the positioning of the <b>positive_sign</b> for a non-negative formatted
40671	monetary quantity.
40672	<b>char n_sign_posn</b>
40673	Set to a value indicating the positioning of the <b>negative_sign</b> for a negative formatted
40674	monetary quantity.
40675	<b>char int_p_cs_precedes</b>
40676	Set to 1 or 0 if the <b>int_curr_symbol</b> respectively precedes or succeeds the value for a non-
40677	negative internationally formatted monetary quantity.
40678	<b>char int_n_cs_precedes</b>
40679	Set to 1 or 0 if the <b>int_curr_symbol</b> respectively precedes or succeeds the value for a
40680	negative internationally formatted monetary quantity.
40681	<b>char int_p_sep_by_space</b>
40682	Set to a value indicating the separation of the <b>int_curr_symbol</b> , the sign string, and the
40683	value for a non-negative internationally formatted monetary quantity.
40684	<b>char int_n_sep_by_space</b>
40685	Set to a value indicating the separation of the <b>int_curr_symbol</b> , the sign string, and the
40686	value for a negative internationally formatted monetary quantity.
40687	<b>char int_p_sign_posn</b>
40688	Set to a value indicating the positioning of the <b>positive_sign</b> for a non-negative
40689	internationally formatted monetary quantity.
40690	<b>char int_n_sign_posn</b>
40691	Set to a value indicating the positioning of the <b>negative_sign</b> for a negative internationally
40692	formatted monetary quantity.

- 40693 The elements of **grouping** and **mon\_grouping** are interpreted according to the following:
- 40694 {CHAR\_MAX} No further grouping is to be performed.
- 40695 0 The previous element is to be repeatedly used for the remainder of the digits.
- 40696 *other* The integer value is the number of digits that comprise the current group. The  
40697 next element is examined to determine the size of the next group of digits  
40698 before the current group.
- 40699 The values of **p\_sep\_by\_space**, **n\_sep\_by\_space**, **int\_p\_sep\_by\_space**, and **int\_n\_sep\_by\_space**  
40700 are interpreted according to the following:
- 40701 0 No space separates the currency symbol and value.
- 40702 1 If the currency symbol and sign string are adjacent, a space separates them from the value;  
40703 otherwise, a space separates the currency symbol from the value.
- 40704 2 If the currency symbol and sign string are adjacent, a space separates them; otherwise, a  
40705 space separates the sign string from the value.
- 40706 For **int\_p\_sep\_by\_space** and **int\_n\_sep\_by\_space**, the fourth character of **int\_curr\_symbol** is  
40707 used instead of a space.
- 40708 The values of **p\_sign\_posn**, **n\_sign\_posn**, **int\_p\_sign\_posn**, and **int\_n\_sign\_posn** are  
40709 interpreted according to the following:
- 40710 0 Parentheses surround the quantity and **currency\_symbol** or **int\_curr\_symbol**.
- 40711 1 The sign string precedes the quantity and **currency\_symbol** or **int\_curr\_symbol**.
- 40712 2 The sign string succeeds the quantity and **currency\_symbol** or **int\_curr\_symbol**.
- 40713 3 The sign string immediately precedes the **currency\_symbol** or **int\_curr\_symbol**.
- 40714 4 The sign string immediately succeeds the **currency\_symbol** or **int\_curr\_symbol**.
- 40715 The implementation shall behave as if no function in this volume of POSIX.1-2008 calls  
40716 *localeconv()*.
- 40717 CX **The *localeconv()* function need not be thread-safe.**
- 40718 **RETURN VALUE**
- 40719 The *localeconv()* function shall return a pointer to the filled-in object. The application shall not  
40720 modify the structure pointed to by the return value which may be overwritten by a subsequent  
40721 call to *localeconv()*. In addition, calls to *setlocale()* with the categories *LC\_ALL*, *LC\_MONETARY*,  
40722 or *LC\_NUMERIC* or calls to *uselocale()* which change the categories *LC\_MONETARY* or  
40723 *LC\_NUMERIC* may overwrite the contents of the structure.
- 40724 **ERRORS**
- 40725 No errors are defined.

# localeconv()

40726 **EXAMPLES**

40727 None.

40728 **APPLICATION USAGE**

40729 The following table illustrates the rules which may be used by four countries to format  
40730 monetary quantities.

Country	Positive Format	Negative Format	International Format
Italy	€1.230	-€1.230	EUR.1.230
Netherlands	€ 1.234,56	€ -1.234,56	EUR 1.234,56
Norway	kr1.234,56	kr1.234,56-	NOK 1.234,56
Switzerland	SFrs.1,234.56	SFrs.1,234.56C	CHF 1,234.56

40736 For these four countries, the respective values for the monetary members of the structure  
40737 returned by *localeconv()* are:

	Italy	Netherlands	Norway	Switzerland
40738 <b>int_curr_symbol</b>	"EUR. "	"EUR "	"NOK "	"CHF "
40739 <b>currency_symbol</b>	"€. "	"€"	"kr"	"SFrs. "
40740 <b>mon_decimal_point</b>	" "	", "	", "	". "
40741 <b>mon_thousands_sep</b>	". "	". "	". "	", "
40742 <b>mon_grouping</b>	"\3"	"\3"	"\3"	"\3"
40743 <b>positive_sign</b>	" "	" "	" "	" "
40744 <b>negative_sign</b>	"-"	" "	"-"	"C"
40745 <b>int_frac_digits</b>	0	2	2	2
40746 <b>frac_digits</b>	0	2	2	2
40747 <b>p_cs_precedes</b>	1	1	1	1
40748 <b>p_sep_by_space</b>	0	1	0	0
40749 <b>n_cs_precedes</b>	1	1	1	1
40750 <b>n_sep_by_space</b>	0	1	0	0
40751 <b>p_sign_posn</b>	1	1	1	1
40752 <b>n_sign_posn</b>	1	4	2	2
40753 <b>int_p_cs_precedes</b>	1	1	1	1
40754 <b>int_n_cs_precedes</b>	1	1	1	1
40755 <b>int_p_sep_by_space</b>	0	0	0	0
40756 <b>int_n_sep_by_space</b>	0	0	0	0
40757 <b>int_p_sign_posn</b>	1	1	1	1
40758 <b>int_n_sign_posn</b>	1	4	4	2

40760 **RATIONALE**

40761 None.

40768 **CHANGE HISTORY**

40769 First released in Issue 4. Derived from the ANSI C standard.

40770 **Issue 6**

40771 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

40772 The RETURN VALUE section is rewritten to avoid use of the term “must”.

40773 This reference page is updated for alignment with the ISO/IEC 9899:1999 standard.

40774 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

40775 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/31 is applied, removing references to **int\_curr\_symbol** and updating the descriptions of **p\_sep\_by\_space** and **n\_sep\_by\_space**. These changes are for alignment with the ISO C standard.

40778 **Issue 7**

40779 Austin Group Interpretation 1003.1-2001 #156 is applied.

40780 The definitions of **int\_curr\_symbol** and **currency\_symbol** are updated.

40781 The examples in the APPLICATION USAGE section are updated.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**localtime()**40782 **NAME**40783 `localtime, localtime_r` — convert a time value to a broken-down local time40784 **SYNOPSIS**40785 `#include <time.h>`40786 `struct tm *localtime(const time_t *timer);`40787 CX `struct tm *localtime_r(const time_t *restrict timer,`  
40788 `struct tm *restrict result);`40789 **DESCRIPTION**40790 CX For `localtime()`: The functionality described on this reference page is aligned with the ISO C  
40791 standard. Any conflict between the requirements described here and the ISO C standard is  
40792 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.40793 The `localtime()` function shall convert the time in seconds since the Epoch pointed to by `timer`  
40794 into a broken-down time, expressed as a local time. The function corrects for the timezone and  
40795 CX any seasonal time adjustments. Local timezone information is used as though `localtime()` calls  
40796 `tzset()`.40797 The relationship between a time in seconds since the Epoch used as an argument to `localtime()`  
40798 and the `tm` structure (defined in the `<time.h>` header) is that the result shall be as specified in  
40799 the expression given in the definition of seconds since the Epoch (see XBD Section 4.15, on page  
40800 113) corrected for timezone and any seasonal time adjustments, where the names in the structure  
40801 and in the expression correspond.40802 The same relationship shall apply for `localtime_r()`.40803 The `localtime()` function need not be thread-safe.40804 The `asctime()`, `ctime()`, `gmtime()`, and `localtime()` functions shall return values in one of two static  
40805 objects: a broken-down time structure and an array of type `char`. Execution of any of the  
40806 functions may overwrite the information returned in either of these objects by any of the other  
40807 functions.40808 The `localtime_r()` function shall convert the time in seconds since the Epoch pointed to by `timer`  
40809 into a broken-down time stored in the structure to which `result` points. The `localtime_r()` function  
40810 shall also return a pointer to that same structure.40811 Unlike `localtime()`, the `localtime_r()` function is not required to set `tzname`. If `localtime_r()` does  
40812 not set `tzname`, it shall not set `daylight` and shall not set `timezone`.40813 **RETURN VALUE**40814 Upon successful completion, the `localtime()` function shall return a pointer to the broken-down  
40815 CX time structure. If an error is detected, `localtime()` shall return a null pointer and set `errno` to  
40816 indicate the error.40817 Upon successful completion, `localtime_r()` shall return a pointer to the structure pointed to by the  
40818 argument `result`. If an error is detected, `localtime_r()` shall return a null pointer and set `errno` to  
40819 indicate the error.40820 **ERRORS**40821 CX The `localtime()` and `localtime_r()` functions shall fail if:

40822 CX [EOVERFLOW] The result cannot be represented.

## 40823 EXAMPLES

40824 **Getting the Local Date and Time**

40825 The following example uses the *time()* function to calculate the time elapsed, in seconds, since  
 40826 January 1, 1970 0:00 UTC (the Epoch), *localtime()* to convert that value to a broken-down time,  
 40827 and *asctime()* to convert the broken-down time values into a printable string.

```
40828 #include <stdio.h>
40829 #include <time.h>

40830 int main(void)
40831 {
40832     time_t result;

40833     result = time(NULL);
40834     printf("%s%ju secs since the Epoch\n",
40835           asctime(localtime(&result)),
40836           (uintmax_t)result);
40837     return(0);
40838 }
```

40839 This example writes the current time to *stdout* in a form like this:

```
40840 Wed Jun 26 10:32:15 1996
40841 835810335 secs since the Epoch
```

40842 **Getting the Modification Time for a File**

40843 The following example prints the last data modification timestamp in the local timezone for a  
 40844 given file.

```
40845 #include <stdio.h>
40846 #include <time.h>
40847 #include <sys/stat.h>

40848 int
40849 print_file_time(const char *filename)
40850 {
40851     struct stat statbuf;
40852     struct tm *tm;
40853     char timestr[BUFSIZ];

40854     if(stat(filename, &statbuf) == -1)
40855         return -1;
40856     if((tm = localtime(&statbuf.st_mtime)) == NULL)
40857         return -1;
40858     if(strftime(timestr, sizeof(timestr), "%Y-%m-%d %H:%M:%S", tm) == 0)
40859         return -1;
40860     printf("%s: %s.%09ld\n", filename, timestr, statbuf.st_mtim.tv_nsec);
40861     return 0;
40862 }
```

**localtime()**40863 **Timing an Event**

40864 The following example gets the current time, converts it to a string using *localtime()* and  
 40865 *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to  
 40866 an event being timed.

```
40867 #include <time.h>
40868 #include <stdio.h>
40869 ...
40870 time_t now;
40871 int minutes_to_event;
40872 ...
40873 time(&now);
40874 printf("The time is ");
40875 fputs(asctime(localtime(&now)), stdout);
40876 printf("There are still %d minutes to the event.\n",
40877     minutes_to_event);
40878 ...
```

40879 **APPLICATION USAGE**

40880 The *localtime\_r()* function is thread-safe and returns values in a user-supplied buffer instead of  
 40881 possibly using a static data area that may be overwritten by each call.

40882 **RATIONALE**

40883 None.

40884 **FUTURE DIRECTIONS**

40885 None.

40886 **SEE ALSO**

40887 *asctime()*, *clock()*, *ctime()*, *difftime()*, *getdate()*, *gmtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*,  
 40888 *tzset()*, *utime()*

40889 XBD Section 4.15 (on page 113), [time.h](#)

40890 **CHANGE HISTORY**

40891 First released in Issue 1. Derived from Issue 1 of the SVID.

40892 **Issue 5**

40893 A note indicating that the *localtime()* function need not be reentrant is added to the  
 40894 DESCRIPTION.

40895 The *localtime\_r()* function is included for alignment with the POSIX Threads Extension.

40896 **Issue 6**

40897 The *localtime\_r()* function is marked as part of the Thread-Safe Functions option.

40898 Extensions beyond the ISO C standard are marked.

40899 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
 40900 its avoidance of possibly using a static data area.

40901 The **restrict** keyword is added to the *localtime\_r()* prototype for alignment with the  
 40902 ISO/IEC 9899:1999 standard.

40903 Examples are added.

40904 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/32 is applied, adding the  
 40905 [EOverflow] error.

- 40906 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/55 is applied, updating the error handling  
40907 for *localtime\_r()*.
- 40908 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/56 is applied, adding a requirement that if  
40909 *localtime\_r()* does not set the *tzname* variable, it shall not set the *daylight* or *timezone* variables. On  
40910 systems supporting XSI, the *daylight*, *timezone*, and *tzname* variables should all be set to provide  
40911 information for the same timezone. This updates the description of *localtime\_r()* to mention  
40912 *daylight* and *timezone* as well as *tzname*. The SEE ALSO section is updated.
- 40913 **Issue 7**
- 40914 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 40915 The *localtime\_r()* function is moved from the Thread-Safe Functions option to the Base.
- 40916 Changes are made to the EXAMPLES section related to support for finegrained timestamps.

**lockf()**40917 **NAME**

40918 lockf — record locking on files

40919 **SYNOPSIS**

```
40920 XSI #include <unistd.h>
40921 int lockf(int fildev, int function, off_t size);
```

40922 **DESCRIPTION**

40923 The *lockf()* function shall lock sections of a file with advisory-mode locks. Calls to *lockf()* from  
 40924 threads in other processes which attempt to lock the locked file section shall either return an  
 40925 error value or block until the section becomes unlocked. All the locks for a process are removed  
 40926 when the process terminates. Record locking with *lockf()* shall be supported for regular files and  
 40927 may be supported for other files.

40928 The *fildev* argument is an open file descriptor. To establish a lock with this function, the file  
 40929 descriptor shall be opened with write-only permission (O\_WRONLY) or with read/write  
 40930 permission (O\_RDWR).

40931 The *function* argument is a control value which specifies the action to be taken. The permissible  
 40932 values for *function* are defined in <unistd.h> as follows:

Function	Description
F_ULOCK	Unlock locked sections.
F_LOCK	Lock a section for exclusive use.
F_TLOCK	Test and lock a section for exclusive use.
F_TEST	Test a section for locks by other processes.

40933 F\_TEST shall detect if a lock by another process is present on the specified section.

40934 F\_LOCK and F\_TLOCK shall both lock a section of a file if the section is available.

40935 F\_ULOCK shall remove locks from a section of the file.

40936 The *size* argument is the number of contiguous bytes to be locked or unlocked. The section to be  
 40937 locked or unlocked starts at the current offset in the file and extends forward for a positive size  
 40938 or backward for a negative size (the preceding bytes up to but not including the current offset).  
 40939 If *size* is 0, the section from the current offset through the largest possible file offset shall be  
 40940 locked (that is, from the current offset through the present or any future end-of-file). An area  
 40941 need not be allocated to the file to be locked because locks may exist past the end-of-file.

40942 The sections locked with F\_LOCK or F\_TLOCK may, in whole or in part, contain or be contained  
 40943 by a previously locked section for the same process. When this occurs, or if adjacent locked  
 40944 sections would occur, the sections shall be combined into a single locked section. If the request  
 40945 would cause the number of locks to exceed a system-imposed limit, the request shall fail.

40946 F\_LOCK and F\_TLOCK requests differ only by the action taken if the section is not available.  
 40947 F\_LOCK shall block the calling thread until the section is available. F\_TLOCK shall cause the  
 40948 function to fail if the section is already locked by another process.

40949 File locks shall be released on first close by the locking process of any file descriptor for the file.

40950 F\_ULOCK requests may release (wholly or in part) one or more locked sections controlled by the  
 40951 process. Locked sections shall be unlocked starting at the current file offset through *size* bytes or  
 40952 to the end-of-file if *size* is (off\_t)0. When all of a locked section is not released (that is, when the  
 40953 beginning or end of the area to be unlocked falls within a locked section), the remaining portions  
 40954 of that section shall remain locked by the process. Releasing the center portion of a locked  
 40955 section shall cause the remaining locked beginning and end portions to become two separate

- 40961 locked sections. If the request would cause the number of locks in the system to exceed a system-  
40962 imposed limit, the request shall fail.
- 40963 A potential for deadlock occurs if the threads of a process controlling a locked section are  
40964 blocked by accessing a locked section of another process. If the system detects that deadlock  
40965 would occur, *lockf()* shall fail with an [EDEADLK] error.
- 40966 The interaction between *fcntl()* and *lockf()* locks is unspecified.
- 40967 Blocking on a section shall be interrupted by any signal.
- 40968 An F\_ULOCK request in which *size* is non-zero and the offset of the last byte of the requested  
40969 section is the maximum value for an object of type `off_t`, when the process has an existing lock  
40970 in which *size* is 0 and which includes the last byte of the requested section, shall be treated as a  
40971 request to unlock from the start of the requested section with a size equal to 0. Otherwise, an  
40972 F\_ULOCK request shall attempt to unlock only the requested section.
- 40973 Attempting to lock a section of a file that is associated with a buffered stream produces  
40974 unspecified results.
- 40975 **RETURN VALUE**
- 40976 Upon successful completion, *lockf()* shall return 0. Otherwise, it shall return -1, set *errno* to  
40977 indicate an error, and existing locks shall not be changed.
- 40978 **ERRORS**
- 40979 The *lockf()* function shall fail if:
- 40980 [EBADF] The *fildev* argument is not a valid open file descriptor; or *function* is F\_LOCK  
40981 or F\_TLOCK and *fildev* is not a valid file descriptor open for writing.
- 40982 [EACCES] or [EAGAIN]  
40983 The *function* argument is F\_TLOCK or F\_TEST and the section is already  
40984 locked by another process.
- 40985 [EDEADLK] The *function* argument is F\_LOCK and a deadlock is detected.
- 40986 [EINTR] A signal was caught during execution of the function.
- 40987 [EINVAL] The *function* argument is not one of F\_LOCK, F\_TLOCK, F\_TEST, or  
40988 F\_ULOCK; or *size* plus the current file offset is less than 0.
- 40989 [EOVERFLOW] The offset of the first, or if *size* is not 0 then the last, byte in the requested  
40990 section cannot be represented correctly in an object of type `off_t`.
- 40991 The *lockf()* function may fail if:
- 40992 [EAGAIN] The *function* argument is F\_LOCK or F\_TLOCK and the file is mapped with  
40993 *mmap()*.
- 40994 [EDEADLK] or [ENOLCK]  
40995 The *function* argument is F\_LOCK, F\_TLOCK, or F\_ULOCK, and the request  
40996 would cause the number of locks to exceed a system-imposed limit.
- 40997 [EOPNOTSUPP] or [EINVAL]  
40998 The implementation does not support the locking of files of the type indicated  
40999 by the *fildev* argument.

**lockf()**41000 **EXAMPLES**41001 **Locking a Portion of a File**

41002 In the following example, a file named `/home/cnd/mod1` is being modified. Other processes that  
 41003 use locking are prevented from changing it during this process. Only the first 10 000 bytes are  
 41004 locked, and the lock call fails if another process has any part of this area locked already.

```
41005 #include <fcntl.h>
41006 #include <unistd.h>
41007
41008 int fildes;
41009 int status;
41009 ...
41010 fildes = open("/home/cnd/mod1", O_RDWR);
41011 status = lockf(fildes, F_TLOCK, (off_t)10000);
```

41012 **APPLICATION USAGE**

41013 Record-locking should not be used in combination with the `fopen()`, `fread()`, `fwrite()`, and other  
 41014 `stdio` functions. Instead, the more primitive, non-buffered functions (such as `open()`) should be  
 41015 used. Unexpected results may occur in processes that do buffering in the user address space. The  
 41016 process may later read/write data which is/was locked. The `stdio` functions are the most  
 41017 common source of unexpected buffering.

41018 The `alarm()` function may be used to provide a timeout facility in applications requiring it.

41019 **RATIONALE**

41020 None.

41021 **FUTURE DIRECTIONS**

41022 None.

41023 **SEE ALSO**

41026 **CHANGE HISTORY**

41027 First released in Issue 4, Version 2.

41028 **Issue 5**

41029 Moved from X/OPEN UNIX extension to BASE.

41030 Large File Summit extensions are added. In particular, the description of [EINVAL] is clarified  
 41031 and moved from optional to mandatory status.

41032 A note is added to the DESCRIPTION indicating the effects of attempting to lock a section of a  
 41033 file that is associated with a buffered stream.

41034 **Issue 6**

41035 The normative text is updated to avoid use of the term “must” for application requirements.

41036 **Issue 7**

41037 Austin Group Interpretation 1003.1-2001 #054 is applied, updating the DESCRIPTION.

41038 **NAME**

41039 log, logf, logl — natural logarithm function

41040 **SYNOPSIS**

```
41041 #include <math.h>
41042 double log(double x);
41043 float logf(float x);
41044 long double logl(long double x);
```

41045 **DESCRIPTION**

41046 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 41047 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41048 volume of POSIX.1-2008 defers to the ISO C standard.

41049 These functions shall compute the natural logarithm of their argument  $x$ ,  $\log_e(x)$ .

41050 An application wishing to check for error situations should set *errno* to zero and call  
 41051 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 41052 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 41053 zero, an error has occurred.

41054 **RETURN VALUE**

41055 Upon successful completion, these functions shall return the natural logarithm of  $x$ .

41056 If  $x$  is  $\pm 0$ , a pole error shall occur and *log()*, *logf()*, and *logl()* shall return `-HUGE_VAL`,  
 41057 `-HUGE_VALF`, and `-HUGE_VALL`, respectively.

41058 **MX** For finite values of  $x$  that are less than 0, or if  $x$  is `-Inf`, a domain error shall occur, and either a  
 41059 NaN (if supported), or an implementation-defined value shall be returned.

41060 **MX** If  $x$  is NaN, a NaN shall be returned.

41061 If  $x$  is 1, `+0` shall be returned.

41062 If  $x$  is `+Inf`,  $x$  shall be returned.

41063 **ERRORS**

41064 These functions shall fail if:

41065 **MX** Domain Error The finite value of  $x$  is negative, or  $x$  is `-Inf`.

41066 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41067 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 41068 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 41069 shall be raised.

41070 Pole Error The value of  $x$  is zero.

41071 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41072 then *errno* shall be set to [ERANGE]. If the integer expression  
 41073 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 41074 floating-point exception shall be raised.

**log()**41075 **EXAMPLES**

41076 None.

41077 **APPLICATION USAGE**41078 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
41079 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.41080 **RATIONALE**

41081 None.

41082 **FUTURE DIRECTIONS**

41083 None.

41084 **SEE ALSO**41085 *exp()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *log10()*, *log1p()*

41086 XBD Section 4.19 (on page 116), &lt;math.h&gt;

41087 **CHANGE HISTORY**

41088 First released in Issue 1. Derived from Issue 1 of the SVID.

41089 **Issue 5**41090 The DESCRIPTION is updated to indicate how an application should check for an error. This  
41091 text was previously published in the APPLICATION USAGE section.41092 **Issue 6**

41093 The normative text is updated to avoid use of the term “must” for application requirements.

41094 The *logf()* and *logl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.41095 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
41096 revised to align with the ISO/IEC 9899:1999 standard.41097 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
41098 marked.

41099 **NAME**

41100 log10, log10f, log10l — base 10 logarithm function

41101 **SYNOPSIS**

```
41102 #include <math.h>
41103 double log10(double x);
41104 float log10f(float x);
41105 long double log10l(long double x);
```

41106 **DESCRIPTION**

41107 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 41108 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41109 volume of POSIX.1-2008 defers to the ISO C standard.

41110 These functions shall compute the base 10 logarithm of their argument  $x$ ,  $\log_{10}(x)$ .

41111 An application wishing to check for error situations should set *errno* to zero and call  
 41112 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 41113 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 41114 zero, an error has occurred.

41115 **RETURN VALUE**

41116 Upon successful completion, these functions shall return the base 10 logarithm of  $x$ .

41117 If  $x$  is  $\pm 0$ , a pole error shall occur and *log10()*, *log10f()*, and *log10l()* shall return  $-\text{HUGE\_VAL}$ ,  
 41118  $-\text{HUGE\_VALF}$ , and  $-\text{HUGE\_VALL}$ , respectively.

41119 **MX** For finite values of  $x$  that are less than 0, or if  $x$  is  $-\text{Inf}$ , a domain error shall occur, and either a  
 41120 NaN (if supported), or an implementation-defined value shall be returned.

41121 **MX** If  $x$  is NaN, a NaN shall be returned.

41122 If  $x$  is 1,  $+0$  shall be returned.

41123 If  $x$  is  $+\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

41124 **ERRORS**

41125 These functions shall fail if:

41126 **MX** Domain Error The finite value of  $x$  is negative, or  $x$  is  $-\text{Inf}$ .

41127 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41128 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 41129 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 41130 shall be raised.

41131 Pole Error The value of  $x$  is zero.

41132 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41133 then *errno* shall be set to [ERANGE]. If the integer expression  
 41134 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 41135 floating-point exception shall be raised.

**log10()**41136 **EXAMPLES**

41137 None.

41138 **APPLICATION USAGE**41139 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
41140 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.41141 **RATIONALE**

41142 None.

41143 **FUTURE DIRECTIONS**

41144 None.

41145 **SEE ALSO**41146 *feclearexcept()*, *fetestexcept()*, *isnan()*, *log()*, *pow()*

41148 **CHANGE HISTORY**

41149 First released in Issue 1. Derived from Issue 1 of the SVID.

41150 **Issue 5**41151 The DESCRIPTION is updated to indicate how an application should check for an error. This  
41152 text was previously published in the APPLICATION USAGE section.41153 **Issue 6**

41154 The normative text is updated to avoid use of the term “must” for application requirements.

41155 The *log10f()* and *log10l()* functions are added for alignment with the ISO/IEC 9899:1999  
41156 standard.41157 The DESCRIPTION, RETURN VALUE ERRORS, and APPLICATION USAGE sections are  
41158 revised to align with the ISO/IEC 9899:1999 standard.41159 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
41160 marked.

## 41161 NAME

41162 log1p, log1pf, log1pl — compute a natural logarithm

## 41163 SYNOPSIS

```
41164 #include <math.h>
41165 double log1p(double x);
41166 float log1pf(float x);
41167 long double log1pl(long double x);
```

## 41168 DESCRIPTION

41169 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 41170 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41171 volume of POSIX.1-2008 defers to the ISO C standard.

41172 These functions shall compute  $\log_e(1.0 + x)$ .

41173 An application wishing to check for error situations should set *errno* to zero and call  
 41174 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 41175 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 41176 zero, an error has occurred.

## 41177 RETURN VALUE

41178 Upon successful completion, these functions shall return the natural logarithm of  $1.0 + x$ .

41179 If  $x$  is  $-1$ , a pole error shall occur and *log1p()*, *log1pf()*, and *log1pl()* shall return  $-\text{HUGE\_VAL}$ ,  
 41180  $-\text{HUGE\_VALF}$ , and  $-\text{HUGE\_VALL}$ , respectively.

41181 MX For finite values of  $x$  that are less than  $-1$ , or if  $x$  is  $-\text{Inf}$ , a domain error shall occur, and either a  
 41182 NaN (if supported), or an implementation-defined value shall be returned.

41183 MX If  $x$  is NaN, a NaN shall be returned.

41184 If  $x$  is  $\pm 0$ , or  $+\text{Inf}$ ,  $x$  shall be returned.

41185 If  $x$  is subnormal, a range error may occur and  $x$  should be returned.

## 41186 ERRORS

41187 These functions shall fail if:

41188 MX Domain Error The finite value of  $x$  is less than  $-1$ , or  $x$  is  $-\text{Inf}$ .

41189 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41190 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 41191 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 41192 shall be raised.

41193 Pole Error The value of  $x$  is  $-1$ .

41194 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41195 then *errno* shall be set to [ERANGE]. If the integer expression  
 41196 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 41197 floating-point exception shall be raised.

41198 These functions may fail if:

41199 MX Range Error The value of  $x$  is subnormal.

41200 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41201 then *errno* shall be set to [ERANGE]. If the integer expression  
 41202 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 41203 floating-point exception shall be raised.

**log1p()**41204 **EXAMPLES**

41205 None.

41206 **APPLICATION USAGE**41207 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
41208 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.41209 **RATIONALE**

41210 None.

41211 **FUTURE DIRECTIONS**

41212 None.

41213 **SEE ALSO**41214 *feclearexcept()*, *fetestexcept()*, *log()*

41215 XBD Section 4.19 (on page 116), &lt;math.h&gt;

41216 **CHANGE HISTORY**

41217 First released in Issue 4, Version 2.

41218 **Issue 5**

41219 Moved from X/OPEN UNIX extension to BASE.

41220 **Issue 6**

41221 The normative text is updated to avoid use of the term "must" for application requirements.

41222 The *log1p()* function is no longer marked as an extension.41223 The *log1pf()* and *log1pl()* functions are added for alignment with the ISO/IEC 9899:1999  
41224 standard.41225 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
41226 revised to align with the ISO/IEC 9899:1999 standard.41227 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
41228 marked.

41229 **NAME**

41230 log2, log2f, log2l — compute base 2 logarithm functions

41231 **SYNOPSIS**

```
41232 #include <math.h>
41233 double log2(double x);
41234 float log2f(float x);
41235 long double log2l(long double x);
```

41236 **DESCRIPTION**

41237 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 41238 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41239 volume of POSIX.1-2008 defers to the ISO C standard.

41240 These functions shall compute the base 2 logarithm of their argument  $x$ ,  $\log_2(x)$ .

41241 An application wishing to check for error situations should set *errno* to zero and call  
 41242 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 41243 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 41244 zero, an error has occurred.

41245 **RETURN VALUE**

41246 Upon successful completion, these functions shall return the base 2 logarithm of  $x$ .

41247 If  $x$  is  $\pm 0$ , a pole error shall occur and *log2()*, *log2f()*, and *log2l()* shall return  $-\text{HUGE\_VAL}$ ,  
 41248  $-\text{HUGE\_VALF}$ , and  $-\text{HUGE\_VALL}$ , respectively.

41249 MX For finite values of  $x$  that are less than 0, or if  $x$  is  $-\text{Inf}$ , a domain error shall occur, and either a  
 41250 NaN (if supported), or an implementation-defined value shall be returned.

41251 MX If  $x$  is NaN, a NaN shall be returned.

41252 If  $x$  is 1, +0 shall be returned.

41253 If  $x$  is  $+\text{Inf}$ ,  $x$  shall be returned.

41254 **ERRORS**

41255 These functions shall fail if:

41256 MX Domain Error The finite value of  $x$  is less than zero, or  $x$  is  $-\text{Inf}$ .

41257 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41258 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 41259 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 41260 shall be raised.

41261 Pole Error The value of  $x$  is zero.

41262 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41263 then *errno* shall be set to [ERANGE]. If the integer expression  
 41264 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 41265 floating-point exception shall be raised.

**log2()**41266 **EXAMPLES**

41267 None.

41268 **APPLICATION USAGE**41269 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
41270 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.41271 **RATIONALE**

41272 None.

41273 **FUTURE DIRECTIONS**

41274 None.

41275 **SEE ALSO**41276 *feclearexcept()*, *fetestexcept()*, *log()*41277 XBD Section 4.19 (on page 116), <[math.h](#)>41278 **CHANGE HISTORY**

41280 **NAME**

41281 logb, logbf, logbl — radix-independent exponent

41282 **SYNOPSIS**

```
41283 #include <math.h>
41284 double logb(double x);
41285 float logbf(float x);
41286 long double logbl(long double x);
```

41287 **DESCRIPTION**

41288 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 41289 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41290 volume of POSIX.1-2008 defers to the ISO C standard.

41291 These functions shall compute the exponent of  $x$ , which is the integral part of  $\log_r |x|$ , as a  
 41292 signed floating-point value, for non-zero  $x$ , where  $r$  is the radix of the machine's floating-point  
 41293 arithmetic, which is the value of FLT\_RADIX defined in the <float.h> header.

41294 If  $x$  is subnormal it is treated as though it were normalized; thus for finite positive  $x$ :

41295  $1 \leq x * \text{FLT\_RADIX}^{-\text{logb}(x)} < \text{FLT\_RADIX}$

41296 An application wishing to check for error situations should set *errno* to zero and call  
 41297 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 41298 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 41299 zero, an error has occurred.

41300 **RETURN VALUE**

41301 Upon successful completion, these functions shall return the exponent of  $x$ .

41302 If  $x$  is  $\pm 0$ , *logb()*, *logbf()*, and *logbl()* shall return `-HUGE_VAL`, `-HUGE_VALF`, and  
 41303 MX `-HUGE_VALL`, respectively. On systems that support the IEC 60559 Floating-Point option, a  
 41304 pole error shall occur;

41305 CX otherwise, a pole error may occur.

41306 MX If  $x$  is NaN, a NaN shall be returned.

41307 MX If  $x$  is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

41308 **ERRORS**

41309 These functions shall fail if:

41310 MX **Pole Error** The value of  $x$  is  $\pm 0$ .

41311 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41312 then *errno* shall be set to [ERANGE]. If the integer expression  
 41313 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 41314 floating-point exception shall be raised.

41315 These functions may fail if:

41316 Pole Error The value of  $x$  is 0.

41317 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41318 then *errno* shall be set to [ERANGE]. If the integer expression  
 41319 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 41320 floating-point exception shall be raised.

**logb()**41321 **EXAMPLES**

41322           None.

41323 **APPLICATION USAGE**41324           On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
41325           MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.41326 **RATIONALE**

41327           None.

41328 **FUTURE DIRECTIONS**

41329           None.

# longjmp()

**41354 NAME**

41355           longjmp — non-local goto

**41356 SYNOPSIS**

41357           #include &lt;setjmp.h&gt;

41358           void longjmp(jmp\_buf env, int val);

**41359 DESCRIPTION**

41360 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 41361       conflict between the requirements described here and the ISO C standard is unintentional. This  
 41362       volume of POSIX.1-2008 defers to the ISO C standard.

41363       The *longjmp()* function shall restore the environment saved by the most recent invocation of  
 41364       *setjmp()* in the same thread, with the corresponding **jmp\_buf** argument. If there is no such  
 41365       invocation, or if the function containing the invocation of *setjmp()* has terminated execution in  
 41366       the interim, or if the invocation of *setjmp()* was within the scope of an identifier with variably  
 41367 CX       modified type and execution has left that scope in the interim, the behavior is undefined. It is  
 41368       unspecified whether *longjmp()* restores the signal mask, leaves the signal mask unchanged, or  
 41369       restores it to its value at the time *setjmp()* was called.

41370       All accessible objects have values, and all other components of the abstract machine have state  
 41371       (for example, floating-point status flags and open files), as of the time *longjmp()* was called,  
 41372       except that the values of objects of automatic storage duration are unspecified if they meet all  
 41373       the following conditions:

- 41374           • They are local to the function containing the corresponding *setjmp()* invocation.
- 41375           • They do not have volatile-qualified type.
- 41376           • They are changed between the *setjmp()* invocation and *longjmp()* call.

41377 CX       As it bypasses the usual function call and return mechanisms, *longjmp()* shall execute correctly  
 41378       in contexts of interrupts, signals, and any of their associated functions. However, if *longjmp()* is  
 41379       invoked from a nested signal handler (that is, from a function invoked as a result of a signal  
 41380       raised during the handling of another signal), the behavior is undefined.

41381       The effect of a call to *longjmp()* where initialization of the **jmp\_buf** structure was not performed  
 41382       in the calling thread is undefined.

**41383 RETURN VALUE**

41384       After *longjmp()* is completed, program execution continues as if the corresponding invocation of  
 41385       *setjmp()* had just returned the value specified by *val*. The *longjmp()* function shall not cause  
 41386       *setjmp()* to return 0; if *val* is 0, *setjmp()* shall return 1.

**41387 ERRORS**

41388       No errors are defined.

**41389 EXAMPLES**

41390       None.

**41391 APPLICATION USAGE**

41392       Applications whose behavior depends on the value of the signal mask should not use *longjmp()*  
 41393       and *setjmp()*, since their effect on the signal mask is unspecified, but should instead use the  
 41394       *siglongjmp()* and *sigsetjmp()* functions (which can save and restore the signal mask under  
 41395       application control).

41396 **RATIONALE**

41397 None.

41398 **FUTURE DIRECTIONS**

41399 None.

41400 **SEE ALSO**41401 *setjmp()*, *sigaction()*, *siglongjmp()*, *sigsetjmp()*

41402 XBD &lt;setjmp.h&gt;

41403 **CHANGE HISTORY**

41404 First released in Issue 1. Derived from Issue 1 of the SVID.

41405 **Issue 5**

41406 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

41407 **Issue 6**

41408 Extensions beyond the ISO C standard are marked.

41409 The following new requirements on POSIX implementations derive from alignment with the  
41410 Single UNIX Specification:

- 41411
- The DESCRIPTION now explicitly makes *longjmp()*'s effect on the signal mask  
41412 unspecified.

41413 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

**lrand48()**

System Interfaces

41414 **NAME**

41415 lrand48 — generate uniformly distributed pseudo-random non-negative long integers

41416 **SYNOPSIS**

```
41417 XSI #include <stdlib.h>  
41418 long lrand48(void);
```

41419 **DESCRIPTION**41420 Refer to *drand48()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

41421 **NAME**

41422 lrint, lrintf, lrintl — round to nearest integer value using current rounding direction

41423 **SYNOPSIS**

```
41424 #include <math.h>
41425 long lrint(double x);
41426 long lrintf(float x);
41427 long lrintl(long double x);
```

41428 **DESCRIPTION**

41429 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 41430 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41431 volume of POSIX.1-2008 defers to the ISO C standard.

41432 These functions shall round their argument to the nearest integer value, rounding according to  
 41433 the current rounding direction.

41434 An application wishing to check for error situations should set *errno* to zero and call  
 41435 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 41436 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 41437 zero, an error has occurred.

41438 **RETURN VALUE**

41439 Upon successful completion, these functions shall return the rounded integer value.

41440 MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.41441 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.41442 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

41443 If the correct value is positive and too large to represent as a **long**, an unspecified value shall be  
 41444 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall  
 41445 occur;

41446 CX otherwise, a domain error may occur.

41447 If the correct value is negative and too large to represent as a **long**, an unspecified value shall be  
 41448 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall  
 41449 occur;

41450 CX otherwise, a domain error may occur.

41451 **ERRORS**

41452 These functions shall fail if:

41453 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
 41454 integer.

41455 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41456 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 41457 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 41458 shall be raised.

41459 These functions may fail if:

41460 **Domain Error** The correct value is not representable as an integer.

41461 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41462 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 41463 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 41464 shall be raised.

**lrint()**41465 **EXAMPLES**

41466 None.

41467 **APPLICATION USAGE**41468 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
41469 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.41470 **RATIONALE**41471 These functions provide floating-to-integer conversions. They round according to the current  
41472 rounding direction. If the rounded value is outside the range of the return type, the numeric  
41473 result is unspecified and the invalid floating-point exception is raised. When they raise no other  
41474 floating-point exception and the result differs from the argument, they raise the inexact floating-  
41475 point exception.41476 **FUTURE DIRECTIONS**

41477 None.

41478 **SEE ALSO**41479 *feclearexcept()*, *fetestexcept()*, *llrint()*41480 XBD Section 4.19 (on page 116), [<math.h>](#)41481 **CHANGE HISTORY**

41482 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

41483 **Issue 7**

41484 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #53 (SD5-XSH-ERN-77) is applied.

41485 **NAME**

41486 lround, lroundf, lroundl — round to nearest integer value

41487 **SYNOPSIS**

```
41488 #include <math.h>
41489 long lround(double x);
41490 long lroundf(float x);
41491 long lroundl(long double x);
```

41492 **DESCRIPTION**

41493 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 41494 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41495 volume of POSIX.1-2008 defers to the ISO C standard.

41496 These functions shall round their argument to the nearest integer value, rounding halfway cases  
 41497 away from zero, regardless of the current rounding direction.

41498 An application wishing to check for error situations should set *errno* to zero and call  
 41499 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 41500 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 41501 zero, an error has occurred.

41502 **RETURN VALUE**

41503 Upon successful completion, these functions shall return the rounded integer value.

41504 **MX** If *x* is NaN, a domain error shall occur and an unspecified value is returned.

41505 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

41506 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

41507 If the correct value is positive and too large to represent as a **long**, an unspecified value shall be  
 41508 **MX** returned. On systems that support the IEC 60559 Floating-Point option, a domain shall occur;  
 41509 **CX** otherwise, a domain error may occur.

41510 If the correct value is negative and too large to represent as a **long**, an unspecified value shall be  
 41511 **MX** returned. On systems that support the IEC 60559 Floating-Point option, a domain shall occur;  
 41512 **CX** otherwise, a domain error may occur.

41513 **ERRORS**

41514 These functions shall fail if:

41515 **MX** **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an  
 41516 integer.

41517 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41518 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 41519 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 41520 shall be raised.

41521 These functions may fail if:

41522 **Domain Error** The correct value is not representable as an integer.

41523 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 41524 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 41525 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 41526 shall be raised.

**lround()**41527 **EXAMPLES**

41528       None.

41529 **APPLICATION USAGE**41530       On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
41531       MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.41532 **RATIONALE**41533       These functions differ from the *lrint()* functions in the default rounding direction, with the  
41534       *lround()* functions rounding halfway cases away from zero and needing not to raise the inexact  
41535       floating-point exception for non-integer arguments that round to within the range of the return  
41536       type.41537 **FUTURE DIRECTIONS**

41538       None.

41539 **SEE ALSO**41540       *feclearexcept()*, *fetestexcept()*, *llround()*

41541       XBD Section 4.19 (on page 116), &lt;math.h&gt;

41542 **CHANGE HISTORY**

41543       First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

41544 **Issue 7**

41545       ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #54 (SD5-XSH-ERN-78) is applied.

41546 **NAME**

41547 lsearch, lfind — linear search and update

41548 **SYNOPSIS**

```

41549 XSI #include <search.h>
41550 void *lsearch(const void *key, void *base, size_t *nel, size_t width,
41551             int (*compar)(const void *, const void *));
41552 void *lfind(const void *key, const void *base, size_t *nel,
41553            size_t width, int (*compar)(const void *, const void *));

```

41554 **DESCRIPTION**

41555 The *lsearch()* function shall linearly search the table and return a pointer into the table for the  
 41556 matching entry. If the entry does not occur, it shall be added at the end of the table. The *key*  
 41557 argument points to the entry to be sought in the table. The *base* argument points to the first  
 41558 element in the table. The *width* argument is the size of an element in bytes. The *nel* argument  
 41559 points to an integer containing the current number of elements in the table. The integer to which  
 41560 *nel* points shall be incremented if the entry is added to the table. The *compar* argument points to  
 41561 a comparison function which the application shall supply (for example, *strcmp()*). It is called  
 41562 with two arguments that point to the elements being compared. The application shall ensure  
 41563 that the function returns 0 if the elements are equal, and non-zero otherwise.

41564 The *lfind()* function shall be equivalent to *lsearch()*, except that if the entry is not found, it is not  
 41565 added to the table. Instead, a null pointer is returned.

41566 **RETURN VALUE**

41567 If the searched for entry is found, both *lsearch()* and *lfind()* shall return a pointer to it.  
 41568 Otherwise, *lfind()* shall return a null pointer and *lsearch()* shall return a pointer to the newly  
 41569 added element.

41570 Both functions shall return a null pointer in case of error.

41571 **ERRORS**

41572 No errors are defined.

41573 **EXAMPLES**41574 **Storing Strings in a Table**

41575 This fragment reads in less than or equal to TABSIZE strings of length less than or equal to  
 41576 ELSIZE and stores them in a table, eliminating duplicates.

```

41577 #include <stdio.h>
41578 #include <string.h>
41579 #include <search.h>
41580 #define TABSIZE 50
41581 #define ELSIZE 120
41582 ...
41583     char line[ELSIZE], tab[TABSIZE][ELSIZE];
41584     size_t nel = 0;
41585     ...
41586     while (fgets(line, ELSIZE, stdin) != NULL && nel < TABSIZE)
41587         (void) lsearch(line, tab, &nel,
41588                      ELSIZE, (int (*)(const void *, const void *)) strcmp);
41589     ...

```

**lsearch()**41590 **Finding a Matching Entry**

41591 The following example finds any line that reads "This is a test."

```
41592 #include <search.h>
41593 #include <string.h>
41594 ...
41595 char line[ELSIZE], tab[TABSIZE][ELSIZE];
41596 size_t nel = 0;
41597 char *findline;
41598 void *entry;

41599 findline = "This is a test.\n";

41600 entry = lfind(findline, tab, &nel, ELSIZE, (
41601     int (*)(const void *, const void *)) strcmp);
```

41602 **APPLICATION USAGE**

41603 The comparison function need not compare every byte, so arbitrary data may be contained in  
41604 the elements in addition to the values being compared.

41605 Undefined results can occur if there is not enough room in the table to add a new item.

41606 **RATIONALE**

41607 None.

41608 **FUTURE DIRECTIONS**

41609 None.

41610 **SEE ALSO**

41611 *hcreate()*, *tdelete()*

41612 XBD [<search.h>](#)

41613 **CHANGE HISTORY**

41614 First released in Issue 1. Derived from Issue 1 of the SVID.

41615 **Issue 6**

41616 The normative text is updated to avoid use of the term "must" for application requirements.

41617 **NAME**

41618 lseek — move the read/write file offset

41619 **SYNOPSIS**

41620 #include &lt;unistd.h&gt;

41621 off\_t lseek(int *fildes*, off\_t *offset*, int *whence*);41622 **DESCRIPTION**41623 The *lseek()* function shall set the file offset for the open file description associated with the file  
41624 descriptor *fildes*, as follows:

- 41625 • If *whence* is SEEK\_SET, the file offset shall be set to *offset* bytes.
- 41626 • If *whence* is SEEK\_CUR, the file offset shall be set to its current location plus *offset*.
- 41627 • If *whence* is SEEK\_END, the file offset shall be set to the size of the file plus *offset*.

41628 The symbolic constants SEEK\_SET, SEEK\_CUR, and SEEK\_END are defined in &lt;unistd.h&gt;.

41629 The behavior of *lseek()* on devices which are incapable of seeking is implementation-defined.  
41630 The value of the file offset associated with such a device is undefined.41631 The *lseek()* function shall allow the file offset to be set beyond the end of the existing data in the  
41632 file. If data is later written at this point, subsequent reads of data in the gap shall return bytes  
41633 with the value 0 until data is actually written into the gap.41634 The *lseek()* function shall not, by itself, extend the size of a file.41635 SHM If *fildes* refers to a shared memory object, the result of the *lseek()* function is unspecified.41636 TYP If *fildes* refers to a typed memory object, the result of the *lseek()* function is unspecified.41637 **RETURN VALUE**41638 Upon successful completion, the resulting offset, as measured in bytes from the beginning of the  
41639 file, shall be returned. Otherwise, (off\_t)-1 shall be returned, *errno* shall be set to indicate the  
41640 error, and the file offset shall remain unchanged.41641 **ERRORS**41642 The *lseek()* function shall fail if:

- |       |             |  |
|-------|-------------|--|
| 41643 | [EBADF]     | The <i>fildes</i> argument is not an open file descriptor.   |
| 41644 | [EINVAL]    | The <i>whence</i> argument is not a proper value, or the resulting file offset would be negative for a regular file, block special file, or directory. |
| 41646 | [EOVERFLOW] | The resulting file offset would be a value which cannot be represented correctly in an object of type <b>off_t</b> .                                   |
| 41648 | [ESPIPE]    | The <i>fildes</i> argument is associated with a pipe, FIFO, or socket.   |

41649 **EXAMPLES**

41650 None.

41651 **APPLICATION USAGE**

41652 None.

41653 **RATIONALE**41654 The ISO C standard includes the functions *fgetpos()* and *fsetpos()*, which work on very large files  
41655 by use of a special positioning type.41656 Although *lseek()* may position the file offset beyond the end of the file, this function does not  
41657 itself extend the size of the file. While the only function in POSIX.1-2008 that may directly extend

**lseek()**

41658 the size of the file is *write()*, *truncate()*, and *ftruncate()*, several functions originally derived from  
 41659 the ISO C standard, such as *fwrite()*, *fprintf()*, and so on, may do so (by causing calls on *write()*).

41660 An invalid file offset that would cause [EINVAL] to be returned may be both implementation-  
 41661 defined and device-dependent (for example, memory may have few invalid values). A negative  
 41662 file offset may be valid for some devices in some implementations.

41663 The POSIX.1-1990 standard did not specifically prohibit *lseek()* from returning a negative offset.  
 41664 Therefore, an application was required to clear *errno* prior to the call and check *errno* upon return  
 41665 to determine whether a return value of (**off\_t**)-1 is a negative offset or an indication of an error  
 41666 condition. The standard developers did not wish to require this action on the part of a  
 41667 conforming application, and chose to require that *errno* be set to [EINVAL] when the resulting  
 41668 file offset would be negative for a regular file, block special file, or directory.

**FUTURE DIRECTIONS**

41669 None.

**CHANGE HISTORY**

41674 First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

41677 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

41678 Large File Summit extensions are added.

**Issue 6**

41680 In the SYNOPSIS, the optional include of the <**sys/types.h**> header is removed.

41681 The following new requirements on POSIX implementations derive from alignment with the  
 41682 Single UNIX Specification:

- 41683 • The requirement to include <**sys/types.h**> has been removed. Although <**sys/types.h**> was  
 41684 required for conforming implementations of previous POSIX specifications, it was not  
 41685 required for UNIX applications.
- 41686 • The [EOVERFLOW] error condition is added. This change is to support large files.

41687 An additional [ESPIPE] error condition is added for sockets.

41688 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
 41689 *lseek()* results are unspecified for typed memory objects.

*System Interfaces***lstat()**41690 **NAME**

41691        lstat — get file status

41692 **SYNOPSIS**

41693        #include &lt;sys/stat.h&gt;

41694        int lstat(const char \*restrict *path*, struct stat \*restrict *buf*);41695 **DESCRIPTION**41696        Refer to *fstatat()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**malloc()**41697 **NAME**41698 `malloc` — a memory allocator41699 **SYNOPSIS**41700 `#include <stdlib.h>`41701 `void *malloc(size_t size);`41702 **DESCRIPTION**

41703 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 41704 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41705 volume of POSIX.1-2008 defers to the ISO C standard.

41706 The `malloc()` function shall allocate unused space for an object whose size in bytes is specified by  
 41707 `size` and whose value is unspecified.

41708 The order and contiguity of storage allocated by successive calls to `malloc()` is unspecified. The  
 41709 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to  
 41710 a pointer to any type of object and then used to access such an object in the space allocated (until  
 41711 the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object  
 41712 disjoint from any other object. The pointer returned points to the start (lowest byte address) of  
 41713 the allocated space. If the space cannot be allocated, a null pointer shall be returned. If the size of  
 41714 the space requested is 0, the behavior is implementation-defined: the value returned shall be  
 41715 either a null pointer or a unique pointer.

41716 **RETURN VALUE**

41717 Upon successful completion with `size` not equal to 0, `malloc()` shall return a pointer to the  
 41718 allocated space. If `size` is 0, either a null pointer or a unique pointer that can be successfully  
 41719 CX passed to `free()` shall be returned. Otherwise, it shall return a null pointer and set `errno` to  
 41720 indicate the error.

41721 **ERRORS**41722 The `malloc()` function shall fail if:

41723 CX [ENOMEM] Insufficient storage space is available.

41724 **EXAMPLES**

41725 None.

41726 **APPLICATION USAGE**

41727 None.

41728 **RATIONALE**

41729 None.

41730 **FUTURE DIRECTIONS**

41731 None.

41732 **SEE ALSO**41733 `calloc()`, `free()`, `getrlimit()`, `posix_memalign()`, `realloc()`41734 XBD `<stdlib.h>`41735 **CHANGE HISTORY**

41736 First released in Issue 1. Derived from Issue 1 of the SVID.

41737 **Issue 6**

41738 Extensions beyond the ISO C standard are marked.

- 41739 The following new requirements on POSIX implementations derive from alignment with the  
41740 Single UNIX Specification:
- 41741 • In the RETURN VALUE section, the requirement to set *errno* to indicate an error is added.
  - 41742 • The [ENOMEM] error condition is added.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**mblen()**41743 **NAME**41744 `mblen` — get number of bytes in a character41745 **SYNOPSIS**41746 `#include <stdlib.h>`41747 `int mblen(const char *s, size_t n);`41748 **DESCRIPTION**41749 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
41750 conflict between the requirements described here and the ISO C standard is unintentional. This  
41751 volume of POSIX.1-2008 defers to the ISO C standard.41752 If *s* is not a null pointer, *mblen()* shall determine the number of bytes constituting the character  
41753 pointed to by *s*. Except that the shift state of *mbtowc()* is not affected, it shall be equivalent to:41754 `mbtowc((wchar_t *)0, s, n);`41755 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
41756 *mblen()*.41757 The behavior of this function is affected by the *LC\_CTYPE* category of the current locale. For a  
41758 state-dependent encoding, this function shall be placed into its initial state by a call for which its  
41759 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null  
41760 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a  
41761 null pointer shall cause this function to return a non-zero value if encodings have state  
41762 dependency, and 0 otherwise. If the implementation employs special bytes to change the shift  
41763 state, these bytes shall not produce separate wide-character codes, but shall be grouped with an  
41764 adjacent character. Changing the *LC\_CTYPE* category causes the shift state of this function to be  
41765 unspecified.41766 **RETURN VALUE**41767 If *s* is a null pointer, *mblen()* shall return a non-zero or 0 value, if character encodings,  
41768 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mblen()* shall  
41769 either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the  
41770 character (if the next *n* or fewer bytes form a valid character), or return -1 (if they do not form a  
41771 valid character) and may set *errno* to indicate the error. In no case shall the value returned be  
41772 greater than *n* or the value of the {MB\_CUR\_MAX} macro.41773 **ERRORS**41774 The *mblen()* function may fail if:

41775 XSI [EILSEQ] An invalid character sequence is detected.

41776 **EXAMPLES**

41777 None.

41778 **APPLICATION USAGE**

**mbrlen()**41789 **NAME**41790 `mbrlen` — get number of bytes in a character (restartable)41791 **SYNOPSIS**41792 `#include <wchar.h>`41793 `size_t mbrlen(const char *restrict s, size_t n,`  
41794 `mbstate_t *restrict ps);`41795 **DESCRIPTION**41796 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
41797 conflict between the requirements described here and the ISO C standard is unintentional. This  
41798 volume of POSIX.1-2008 defers to the ISO C standard.41799 If *s* is not a null pointer, *mbrlen()* shall determine the number of bytes constituting the character  
41800 pointed to by *s*. It shall be equivalent to:41801 `mbstate_t internal;`  
41802 `mbrtowc(NULL, s, n, ps != NULL ? ps : &internal);`41803 If *ps* is a null pointer, the *mbrlen()* function shall use its own internal **mbstate\_t** object, which is  
41804 initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t** object  
41805 pointed to by *ps* shall be used to completely describe the current conversion state of the  
41806 associated character sequence. The implementation shall behave as if no function defined in this  
41807 volume of POSIX.1-2008 calls *mbrlen()*.41808 The behavior of this function is affected by the *LC\_CTYPE* category of the current locale.41809 **RETURN VALUE**41810 The *mbrlen()* function shall return the first of the following that applies:41811 `0` If the next *n* or fewer bytes complete the character that corresponds to the null  
41812 wide character.41813 *positive* If the next *n* or fewer bytes complete a valid character; the value returned shall  
41814 be the number of bytes that complete the character.41815 `(size_t)-2` If the next *n* bytes contribute to an incomplete but potentially valid character,  
41816 and all *n* bytes have been processed. When *n* has at least the value of the  
41817 `{MB_CUR_MAX}` macro, this case can only occur if *s* points at a sequence of  
41818 redundant shift sequences (for implementations with state-dependent  
41819 encodings).41820 `(size_t)-1` If an encoding error occurs, in which case the next *n* or fewer bytes do not  
41821 contribute to a complete and valid character. In this case, `[EILSEQ]` shall be  
41822 stored in *errno* and the conversion state is undefined.41823 **ERRORS**41824 The *mbrlen()* function shall fail if:41825 `[EILSEQ]` An invalid character sequence is detected.41826 The *mbrlen()* function may fail if:41827 `[EINVAL]` *ps* points to an object that contains an invalid conversion state.

**mbrtowc()**41846 **NAME**41847 `mbrtowc` — convert a character to a wide-character code (restartable)41848 **SYNOPSIS**41849 `#include <wchar.h>`41850 `size_t mbrtowc(wchar_t *restrict pwc, const char *restrict s,`  
41851 `size_t n, mbstate_t *restrict ps);`41852 **DESCRIPTION**41853 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
41854 conflict between the requirements described here and the ISO C standard is unintentional. This  
41855 volume of POSIX.1-2008 defers to the ISO C standard.41856 If *s* is a null pointer, the `mbrtowc()` function shall be equivalent to the call:41857 `mbrtowc(NULL, "", 1, ps)`41858 In this case, the values of the arguments *pwc* and *n* are ignored.41859 If *s* is not a null pointer, the `mbrtowc()` function shall inspect at most *n* bytes beginning at the  
41860 byte pointed to by *s* to determine the number of bytes needed to complete the next character  
41861 (including any shift sequences). If the function determines that the next character is completed,  
41862 it shall determine the value of the corresponding wide character and then, if *pwc* is not a null  
41863 pointer, shall store that value in the object pointed to by *pwc*. If the corresponding wide  
41864 character is the null wide character, the resulting state described shall be the initial conversion  
41865 state.41866 If *ps* is a null pointer, the `mbrtowc()` function shall use its own internal **mbstate\_t** object, which  
41867 shall be initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t**  
41868 object pointed to by *ps* shall be used to completely describe the current conversion state of the  
41869 associated character sequence. The implementation shall behave as if no function defined in this  
41870 volume of POSIX.1-2008 calls `mbrtowc()`.41871 The behavior of this function is affected by the `LC_CTYPE` category of the current locale.41872 **RETURN VALUE**41873 The `mbrtowc()` function shall return the first of the following that applies:41874 **0** If the next *n* or fewer bytes complete the character that corresponds to the null  
41875 wide character (which is the value stored).41876 between 1 and *n* inclusive41877 If the next *n* or fewer bytes complete a valid character (which is the value  
41878 stored); the value returned shall be the number of bytes that complete the  
41879 character.41880 **(size\_t)-2** If the next *n* bytes contribute to an incomplete but potentially valid character,  
41881 and all *n* bytes have been processed (no value is stored). When *n* has at least  
41882 the value of the `{MB_CUR_MAX}` macro, this case can only occur if *s* points at  
41883 a sequence of redundant shift sequences (for implementations with state-  
41884 dependent encodings).41885 **(size\_t)-1** If an encoding error occurs, in which case the next *n* or fewer bytes do not  
41886 contribute to a complete and valid character (no value is stored). In this case,  
41887 `[EILSEQ]` shall be stored in `errno` and the conversion state is undefined.

41888 **ERRORS**41889 The *mbrtowc()* function shall fail if:

41890 [EILSEQ] An invalid character sequence is detected.

41891 The *mbrtowc()* function may fail if:41892 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.41893 **EXAMPLES**

41894 None.

41895 **APPLICATION USAGE**

41896 None.

41897 **RATIONALE**

41898 None.

41899 **FUTURE DIRECTIONS**

**mbsinit()**41915 **NAME**41916 `mbsinit` — determine conversion object status41917 **SYNOPSIS**

```
41918 #include <wchar.h>
41919 int mbsinit(const mbstate_t *ps);
```

41920 **DESCRIPTION**

41921 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 41922 conflict between the requirements described here and the ISO C standard is unintentional. This  
 41923 volume of POSIX.1-2008 defers to the ISO C standard.

41924 If *ps* is not a null pointer, the `mbsinit()` function shall determine whether the object pointed to by  
 41925 *ps* describes an initial conversion state.

41926 **RETURN VALUE**

41927 The `mbsinit()` function shall return non-zero if *ps* is a null pointer, or if the pointed-to object  
 41928 describes an initial conversion state; otherwise, it shall return zero.

41929 If an `mbstate_t` object is altered by any of the functions described as “restartable”, and is then  
 41930 used with a different character sequence, or in the other conversion direction, or with a different  
 41931 `LC_CTYPE` category setting than on earlier function calls, the behavior is undefined.

41932 **ERRORS**

41933 No errors are defined.

41934 **EXAMPLES**

41935 None.

41936 **APPLICATION USAGE**

41937 The `mbstate_t` object is used to describe the current conversion state from a particular character  
 41938 sequence to a wide-character sequence (or *vice versa*) under the rules of a particular setting of the  
 41939 `LC_CTYPE` category of the current locale.

41940 The initial conversion state corresponds, for a conversion in either direction, to the beginning of  
 41941 a new character sequence in the initial shift state. A zero valued `mbstate_t` object is at least one  
 41942 way to describe an initial conversion state. A zero valued `mbstate_t` object can be used to initiate  
 41943 conversion involving any character sequence, in any `LC_CTYPE` category setting.

41944 **RATIONALE**

41945 None.

 41953 (E).

41954 **NAME**41955 `mbsnrto wcs, mbsrtowcs` — convert a character string to a wide-character string (restartable)41956 **SYNOPSIS**41957 `#include <wchar.h>`

```
41958 CX size_t mbsnrto wcs(wchar_t *restrict dst, const char **restrict src,
41959 size_t nmc, size_t len, mbstate_t *restrict ps);
41960 size_t mbsrtowcs(wchar_t *restrict dst, const char **restrict src,
41961 size_t len, mbstate_t *restrict ps);
```

41962 **DESCRIPTION**

41963 CX For `mbsrtowcs()`: The functionality described on this reference page is aligned with the ISO C  
 41964 standard. Any conflict between the requirements described here and the ISO C standard is  
 41965 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

41966 The `mbsrtowcs()` function shall convert a sequence of characters, beginning in the conversion  
 41967 state described by the object pointed to by `ps`, from the array indirectly pointed to by `src` into a  
 41968 sequence of corresponding wide characters. If `dst` is not a null pointer, the converted characters  
 41969 shall be stored into the array pointed to by `dst`. Conversion continues up to and including a  
 41970 terminating null character, which shall also be stored. Conversion shall stop early in either of the  
 41971 following cases:

- 41972 • A sequence of bytes is encountered that does not form a valid character.
- 41973 • `len` codes have been stored into the array pointed to by `dst` (and `dst` is not a null pointer).

41974 Each conversion shall take place as if by a call to the `mbrtowc()` function.

41975 If `dst` is not a null pointer, the pointer object pointed to by `src` shall be assigned either a null  
 41976 pointer (if conversion stopped due to reaching a terminating null character) or the address just  
 41977 past the last character converted (if any). If conversion stopped due to reaching a terminating  
 41978 null character, and if `dst` is not a null pointer, the resulting state described shall be the initial  
 41979 conversion state.

41980 If `ps` is a null pointer, the `mbsrtowcs()` function shall use its own internal `mbstate_t` object, which  
 41981 is initialized at program start-up to the initial conversion state. Otherwise, the `mbstate_t` object  
 41982 pointed to by `ps` shall be used to completely describe the current conversion state of the  
 41983 associated character sequence.

41984 CX The `mbsnrto wcs()` function shall be equivalent to the `mbsrtowcs()` function, except that the  
 41985 conversion of characters pointed to by `src` is limited to at most `nmc` bytes (the size of the input  
 41986 buffer).

41987 The behavior of these functions shall be affected by the `LC_CTYPE` category of the current locale.

41988 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
 41989 these functions.

41990 **RETURN VALUE**

41991 If the input conversion encounters a sequence of bytes that do not form a valid character, an  
 41992 encoding error occurs. In this case, these functions shall store the value of the macro `[EILSEQ]` in  
 41993 `errno` and shall return `(size_t)-1`; the conversion state is undefined. Otherwise, these functions  
 41994 shall return the number of characters successfully converted, not including the terminating null  
 41995 (if any).

**mbsrtowcs()**41996 **ERRORS**

41997 These functions shall fail if:

41998 [EILSEQ] An invalid character sequence is detected.

41999 These functions may fail if:

42000 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.42001 **EXAMPLES**

42002 None.

42003 **APPLICATION USAGE**

42004 None.

42005 **RATIONALE**

42006 None.

42009 **SEE ALSO**42010 *iconv()*, *mbrtowc()*, *mbstowcs()*42011 XBD <*wchar.h*>42012 **CHANGE HISTORY**42013 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
42014 (E).42015 **Issue 6**42016 The *mbsrtowcs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

42017 The [EINVAL] error condition is marked CX.

42018 **Issue 7**

42019 Austin Group Interpretation 1003.1-2001 #170 is applied.

42020 The *mbsnr towcs()* function is added from The Open Group Technical Standard, 2006, Extended  
42021 API Set Part 1.

42022 **NAME**

42023 mbstowcs — convert a character string to a wide-character string

42024 **SYNOPSIS**

42025 #include &lt;stdlib.h&gt;

42026 size\_t mbstowcs(wchar\_t \*restrict pwcs, const char \*restrict s,  
42027 size\_t n);42028 **DESCRIPTION**42029 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
42030 conflict between the requirements described here and the ISO C standard is unintentional. This  
42031 volume of POSIX.1-2008 defers to the ISO C standard.42032 The *mbstowcs()* function shall convert a sequence of characters that begins in the initial shift  
42033 state from the array pointed to by *s* into a sequence of corresponding wide-character codes and  
42034 shall store not more than *n* wide-character codes into the array pointed to by *pwcs*. No  
42035 characters that follow a null byte (which is converted into a wide-character code with value 0)  
42036 shall be examined or converted. Each character shall be converted as if by a call to *mbtowlc()*,  
42037 except that the shift state of *mbtowlc()* is not affected.42038 No more than *n* elements shall be modified in the array pointed to by *pwcs*. If copying takes  
42039 place between objects that overlap, the behavior is undefined.42040 XSI The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.  
42041 If *pwcs* is a null pointer, *mbstowcs()* shall return the length required to convert the entire array  
42042 regardless of the value of *n*, but no values are stored.42043 **RETURN VALUE**42044 CX If an invalid character is encountered, *mbstowcs()* shall return **(size\_t)-1** and may set *errno* to  
42045 indicate the error.42046 XSI Otherwise, *mbstowcs()* shall return the number of the array elements modified (or required if  
42047 *pwcs* is null), not including a terminating 0 code, if any. The array shall not be zero-terminated if  
42048 the value returned is *n*.42049 **ERRORS**42050 The *mbstowcs()* function shall fail if:

42051 XSI [EILSEQ] An invalid byte sequence is detected.

42052 **EXAMPLES**

42053 None.

42054 **APPLICATION USAGE**

42055 None.

42070 **NAME**

42071 mbtowc — convert a character to a wide-character code

42072 **SYNOPSIS**

42073 #include &lt;stdlib.h&gt;

42074 int mbtowc(wchar\_t \*restrict *pwc*, const char \*restrict *s*, size\_t *n*);42075 **DESCRIPTION**

42076 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 42077 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42078 volume of POSIX.1-2008 defers to the ISO C standard.

42079 If *s* is not a null pointer, *mbtowc()* shall determine the number of bytes that constitute the  
 42080 character pointed to by *s*. It shall then determine the wide-character code for the value of type  
 42081 **wchar\_t** that corresponds to that character. (The value of the wide-character code corresponding  
 42082 to the null byte is 0.) If the character is valid and *pwc* is not a null pointer, *mbtowc()* shall store  
 42083 the wide-character code in the object pointed to by *pwc*.

42084 The behavior of this function is affected by the *LC\_CTYPE* category of the current locale. For a  
 42085 state-dependent encoding, this function is placed into its initial state by a call for which its  
 42086 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null  
 42087 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a  
 42088 null pointer shall cause this function to return a non-zero value if encodings have state  
 42089 dependency, and 0 otherwise. If the implementation employs special bytes to change the shift  
 42090 state, these bytes shall not produce separate wide-character codes, but shall be grouped with an  
 42091 adjacent character. Changing the *LC\_CTYPE* category causes the shift state of this function to be  
 42092 unspecified. At most *n* bytes of the array pointed to by *s* shall be examined.

42093 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
 42094 *mbtowc()*.

42095 **RETURN VALUE**

42096 If *s* is a null pointer, *mbtowc()* shall return a non-zero or 0 value, if character encodings,  
 42097 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mbtowc()*  
 42098 shall either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the  
 42099 converted character (if the next *n* or fewer bytes form a valid character), or return -1 and may  
 42100 set *errno* to indicate the error (if they do not form a valid character).

42101 In no case shall the value returned be greater than *n* or the value of the {MB\_CUR\_MAX} macro.

42102 **ERRORS**

42103 The *mbtowc()* function shall fail if:

42104 XSI [EILSEQ] An invalid character sequence is detected.

42105 **EXAMPLES**

42106 None.

42107 **APPLICATION USAGE**

42108 None.

42123 **NAME**

42124           memcpy — copy bytes in memory

42125 **SYNOPSIS**

```
42126 XSI      #include <string.h>
42127
42127 void *memcpy(void *restrict s1, const void *restrict s2,
42128             int c, size_t n);
```

42129 **DESCRIPTION**

42130       The *memcpy()* function shall copy bytes from memory area *s2* into *s1*, stopping after the first  
42131       occurrence of byte *c* (converted to an **unsigned char**) is copied, or after *n* bytes are copied,  
42132       whichever comes first. If copying takes place between objects that overlap, the behavior is  
42133       undefined.

42134 **RETURN VALUE**

42135       The *memcpy()* function shall return a pointer to the byte after the copy of *c* in *s1*, or a null  
42136       pointer if *c* was not found in the first *n* bytes of *s2*.

42137 **ERRORS**

42138       No errors are defined.

42139 **EXAMPLES**

42140       None.

42141 **APPLICATION USAGE**

42142       The *memcpy()* function does not check for the overflow of the receiving memory area.

42143 **RATIONALE**

42144       None.

42145 **FUTURE DIRECTIONS**

42146       None.

42147 **SEE ALSO**

42148       XBD [<string.h>](#)

42149 **CHANGE HISTORY**

42150       First released in Issue 1. Derived from Issue 1 of the SVID.

42151 **Issue 6**

42152       The **restrict** keyword is added to the *memcpy()* prototype for alignment with the  
42153       ISO/IEC 9899:1999 standard.

**memchr()**42154 **NAME**

42155 memchr — find byte in memory

42156 **SYNOPSIS**

42157 #include &lt;string.h&gt;

42158 void \*memchr(const void \*s, int c, size\_t n);

42159 **DESCRIPTION**

42160 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 42161 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42162 volume of POSIX.1-2008 defers to the ISO C standard.

42163 The *memchr()* function shall locate the first occurrence of *c* (converted to an **unsigned char**) in  
 42164 the initial *n* bytes (each interpreted as **unsigned char**) of the object pointed to by *s*.

42165 **RETURN VALUE**

42166 The *memchr()* function shall return a pointer to the located byte, or a null pointer if the byte does  
 42167 not occur in the object.

42168 **ERRORS**

42169 No errors are defined.

42170 **EXAMPLES**

42171 None.

42172 **APPLICATION USAGE**

42173 None.

42174 **RATIONALE**

42175 None.

42180 **CHANGE HISTORY**

42181 First released in Issue 1. Derived from Issue 1 of the SVID.

42182 **NAME**

42183       memcmp — compare bytes in memory

42184 **SYNOPSIS**

42185       #include &lt;string.h&gt;

42186       int memcmp(const void \*s1, const void \*s2, size\_t n);

42187 **DESCRIPTION**42188 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
42189 conflict between the requirements described here and the ISO C standard is unintentional. This  
42190 volume of POSIX.1-2008 defers to the ISO C standard.42191       The *memcmp()* function shall compare the first *n* bytes (each interpreted as **unsigned char**) of the  
42192 object pointed to by *s1* to the first *n* bytes of the object pointed to by *s2*.42193       The sign of a non-zero return value shall be determined by the sign of the difference between the  
42194 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the objects  
42195 being compared.42196 **RETURN VALUE**42197       The *memcmp()* function shall return an integer greater than, equal to, or less than 0, if the object  
42198 pointed to by *s1* is greater than, equal to, or less than the object pointed to by *s2*, respectively.42199 **ERRORS**

42200       No errors are defined.

42201 **EXAMPLES**

42202       None.

42203 **APPLICATION USAGE**

42204       None.

42295           XBD &lt;string.h&gt;

42296 **CHANGE HISTORY**

42297           First released in Issue 1. Derived from Issue 1 of the SVID.

42298 **NAME**

42299        mkdir, mkdirat — make a directory relative to directory file descriptor

42300 **SYNOPSIS**

42301        #include &lt;sys/stat.h&gt;

42302        int mkdir(const char \*path, mode\_t mode);

42303        int mkdirat(int fd, const char \*path, mode\_t mode);

42304 **DESCRIPTION**

42305        The *mkdir()* function shall create a new directory with name *path*. The file permission bits of the  
 42306        new directory shall be initialized from *mode*. These file permission bits of the *mode* argument  
 42307        shall be modified by the process' file creation mask.

42308        When bits in *mode* other than the file permission bits are set, the meaning of these additional bits  
 42309        is implementation-defined.

42310        The directory's user ID shall be set to the process' effective user ID. The directory's group ID  
 42311        shall be set to the group ID of the parent directory or to the effective group ID of the process.  
 42312        Implementations shall provide a way to initialize the directory's group ID to the group ID of the  
 42313        parent directory. Implementations may, but need not, provide an implementation-defined way  
 42314        to initialize the directory's group ID to the effective group ID of the calling process.

42315        The newly created directory shall be an empty directory.

42316        If *path* names a symbolic link, *mkdir()* shall fail and set *errno* to [EEXIST].

42317        Upon successful completion, *mkdir()* shall mark for update the last data access, last data  
 42318        modification, and last file status change timestamps of the directory. Also, the last data  
 42319        modification and last file status change timestamps of the directory that contains the new entry  
 42320        shall be marked for update.

42321        The *mkdirat()* function shall be equivalent to the *mkdir()* function except in the case where *path*  
 42322        specifies a relative path. In this case the newly created directory is created relative to the  
 42323        directory associated with the file descriptor *fd* instead of the current working directory. If the file  
 42324        descriptor was opened without O\_SEARCH, the function shall check whether directory searches  
 42325        are permitted using the current permissions of the directory underlying the file descriptor. If the  
 42326        file descriptor was opened with O\_SEARCH, the function shall not perform the check.

42327        If *mkdirat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 42328        directory is used and the behavior shall be identical to a call to *mkdir()*.

42329 **RETURN VALUE**

42330        Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 42331        return -1 and set *errno* to indicate the error. If -1 is returned, no directory shall be created.

42332 **ERRORS**

42333        These functions shall fail if:

- |       |          |  |
|-------|----------|--|
| 42334 | [EACCES] | Search permission is denied on a component of the path prefix, or write permission is denied on the parent directory of the directory to be created. |
| 42335 |          |  |
| 42336 | [EEXIST] | The named file exists.   |
| 42337 | [ELOOP]  | A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.   |
| 42338 |          |  |
| 42339 | [EMLINK] | The link count of the parent directory would exceed {LINK_MAX}.  |

**mkdir()**

- 42340 [ENAMETOOLONG]  
 42341 The length of a component of a pathname is longer than {NAME\_MAX}.
- 42342 [ENOENT] A component of the path prefix specified by *path* does not name an existing  
 42343 directory or *path* is an empty string.
- 42344 [ENOSPC] The file system does not contain enough space to hold the contents of the new  
 42345 directory or to extend the parent directory of the new directory.
- 42346 [ENOTDIR] A component of the path prefix is not a directory.
- 42347 [EROFS] The parent directory resides on a read-only file system.
- 42348 In addition, the *mkdirat()* function shall fail if:
- 42349 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
 42350 neither AT\_FDCWD nor a valid file descriptor open for reading.
- 42351 These functions may fail if:
- 42352 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 42353 resolution of the *path* argument.
- 42354 [ENAMETOOLONG]  
 42355 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 42356 symbolic link produced an intermediate result with a length that exceeds  
 42357 {PATH\_MAX}.
- 42358 The *mkdirat()* function may fail if:
- 42359 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT\_FDCWD nor a  
 42360 file descriptor associated with a directory.

42361 **EXAMPLES**42362 **Creating a Directory**

42363 The following example shows how to create a directory named **/home/cnd/mod1**, with  
 42364 read/write/search permissions for owner and group, and with read/search permissions for  
 42365 others.

```
42366 #include <sys/types.h>
42367 #include <sys/stat.h>
42368 int status;
42369 ...
42370 status = mkdir("/home/cnd/mod1", S_IRWXU | S_IRWXG | S_IROTH | S_IXOTH);
```

42371 **APPLICATION USAGE**

42372 None.

42373 **RATIONALE**

42374 The *mkdir()* function originated in 4.2 BSD and was added to System V in Release 3.0.

42375 4.3 BSD detects [ENAMETOOLONG].

42376 The POSIX.1-1990 standard required that the group ID of a newly created directory be set to the  
 42377 group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2  
 42378 required that implementations provide a way to have the group ID be set to the group ID of the  
 42379 containing directory, but did not prohibit implementations also supporting a way to set the  
 42380 group ID to the effective group ID of the creating process. Conforming applications should not

42381 assume which group ID will be used. If it matters, an application can use *chown()* to set the  
 42382 group ID after the directory is created, or determine under what conditions the implementation  
 42383 will set the desired group ID.

42384 The purpose of the *mkdirat()* function is to create a directory in directories other than the current  
 42385 working directory without exposure to race conditions. Any part of the path of a file could be  
 42386 changed in parallel to the call to *mkdir()*, resulting in unspecified behavior. By opening a file  
 42387 descriptor for the target directory and using the *mkdirat()* function it can be guaranteed that the  
 42388 newly created directory is located relative to the desired directory.

#### 42389 FUTURE DIRECTIONS

42390 None.

#### 42391 SEE ALSO

42392 *chmod()*, *mkdtemp()*, *mknod()*, *umask()*

42393 XBD [<sys/stat.h>](#), [<sys/types.h>](#)

#### 42394 CHANGE HISTORY

42395 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 42396 Issue 6

42397 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

42398 The following new requirements on POSIX implementations derive from alignment with the  
 42399 Single UNIX Specification:

- 42400 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
 42401 required for conforming implementations of previous POSIX specifications, it was not  
 42402 required for UNIX applications.
- 42403 • The [ELOOP] mandatory error condition is added.
- 42404 • A second [ENAMETOOLONG] is added as an optional error condition.

42405 The following changes were made to align with the IEEE P1003.1a draft standard:

- 42406 • The [ELOOP] optional error condition is added.

#### 42407 Issue 7

42408 Austin Group Interpretation 1003.1-2001 #143 is applied.

42409 The *mkdirat()* function is added from The Open Group Technical Standard, 2006, Extended API  
 42410 Set Part 2.

42411 Changes are made related to support for finegrained timestamps.

**mkdtemp()**42412 **NAME**

42413 mkdtemp, mkstemp — create a unique directory or file

42414 **SYNOPSIS**

```
42415 CX #include <stdlib.h>
42416 char *mkdtemp(char *template);
42417 int mkstemp(char *template);
```

42418 **DESCRIPTION**

42419 The *mkdtemp()* function uses the contents of *template* to construct a unique directory name. The  
 42420 string provided in *template* shall be a filename ending with six trailing 'X's. The *mkdtemp()*  
 42421 function shall replace each 'X' with a character from the portable filename character set. The  
 42422 characters are chosen such that the resulting name does not duplicate the name of an existing file  
 42423 at the time of a call to *mkdtemp()*. The unique directory name is used to attempt to create the  
 42424 directory using mode 0700 as modified by the file creation mask.

42425 The *mkstemp()* function shall replace the contents of the string pointed to by *template* by a unique  
 42426 filename, and return a file descriptor for the file open for reading and writing. The *mkstemp()*  
 42427 function shall create the file, and obtain a file descriptor for it, as if by a call to:

```
42428 open(filename, O_RDWR|O_CREAT|O_EXCL, S_IRUSR|S_IWUSR)
```

42429 The function thus prevents any possible race condition between testing whether the file exists  
 42430 and opening it for use. The string in *template* should look like a filename with six trailing 'X's;  
 42431 *mkstemp()* replaces each 'X' with a character from the portable filename character set. The  
 42432 characters are chosen such that the resulting name does not duplicate the name of an existing file  
 42433 at the time of a call to *mkstemp()*.

42434 **RETURN VALUE**

42435 Upon successful completion, the *mkdtemp()* function shall return a pointer to the string  
 42436 containing the directory name if it was created. Otherwise, it shall return a null pointer and shall  
 42437 set *errno* to indicate the error.

42438 Upon successful completion, the *mkstemp()* function shall return an open file descriptor.  
 42439 Otherwise, it shall return `-1` if no suitable file could be created.

42440 **ERRORS**

42441 The *mkdtemp()* function shall fail if:

42442 [EACCES] Search permission is denied on a component of the path prefix, or write  
 42443 permission is denied on the parent directory of the directory to be created.

42444 [EINVAL] The string pointed to by *template* does not end in "XXXXXX".

42445 [ELOOP] A loop exists in symbolic links encountered during resolution of the path of  
 42446 the directory to be created.

42447 [EMLINK] The link count of the parent directory would exceed {LINK\_MAX}.

42448 [ENAMETOOLONG]

42449 The length of a component of a pathname is longer than {NAME\_MAX}.

42450 [ENOENT] A component of the path prefix specified by the *template* argument does not  
 42451 name an existing directory.

42452 [ENOSPC] The file system does not contain enough space to hold the contents of the new  
 42453 directory or to extend the parent directory of the new directory.

- 42454 [ENOTDIR] A component of the path prefix is not a directory.
- 42455 [EROFS] The parent directory resides on a read-only file system.
- 42456 The *mkdtemp()* function may fail if:
- 42457 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
42458 resolution of the path of the directory to be created.
- 42459 [ENAMETOOLONG]  
42460 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
42461 symbolic link produced an intermediate result with a length that exceeds  
42462 {PATH\_MAX}.
- 42463 The error conditions for the *mkstemp()* function are defined in *open()*.

**42464 EXAMPLES****42465 Generating a Filename**

42466 The following example creates a file with a 10-character name beginning with the characters  
42467 "file" and opens the file for reading and writing. The value returned as the value of *fd* is a file  
42468 descriptor that identifies the file.

```
42469 #include <stdlib.h>
42470 ...
42471 char template[] = "/tmp/fileXXXXXX";
42472 int fd;
42473
42474 fd = mkstemp(template);
```

**42474 APPLICATION USAGE**

42475 It is possible to run out of letters.

42476 The *mkdtemp()* and *mkstemp()* functions need not check to determine whether the filename part  
42477 of *template* exceeds the maximum allowable filename length.

**42478 RATIONALE**

42479 None.

**42480 FUTURE DIRECTIONS**

42481 None.

**42482 SEE ALSO**

42495 **NAME**

42496 mkfifo, mkfifoat — make a FIFO special file relative to directory file descriptor

42497 **SYNOPSIS**

42498 #include &lt;sys/stat.h&gt;

42499 int mkfifo(const char \*path, mode\_t mode);

42500 int mkfifoat(int fd, const char \*path, mode\_t mode);

42501 **DESCRIPTION**

42502 The *mkfifo()* function shall create a new FIFO special file named by the pathname pointed to by  
 42503 *path*. The file permission bits of the new FIFO shall be initialized from *mode*. The file permission  
 42504 bits of the *mode* argument shall be modified by the process' file creation mask.

42505 When bits in *mode* other than the file permission bits are set, the effect is implementation-  
 42506 defined.

42507 If *path* names a symbolic link, *mkfifo()* shall fail and set *errno* to [EEXIST].

42508 The FIFO's user ID shall be set to the process' effective user ID. The FIFO's group ID shall be set  
 42509 to the group ID of the parent directory or to the effective group ID of the process.  
 42510 Implementations shall provide a way to initialize the FIFO's group ID to the group ID of the  
 42511 parent directory. Implementations may, but need not, provide an implementation-defined way  
 42512 to initialize the FIFO's group ID to the effective group ID of the calling process.

42513 Upon successful completion, *mkfifo()* shall mark for update the last data access, last data  
 42514 modification, and last file status change timestamps of the file. Also, the last data modification  
 42515 and last file status change timestamps of the directory that contains the new entry shall be  
 42516 marked for update.

42517 The *mkfifoat()* function shall be equivalent to the *mkfifo()* function except in the case where *path*  
 42518 specifies a relative path. In this case the newly created FIFO is created relative to the directory  
 42519 associated with the file descriptor *fd* instead of the current working directory. If the file  
 42520 descriptor was opened without O\_SEARCH, the function shall check whether directory searches  
 42521 are permitted using the current permissions of the directory underlying the file descriptor. If the  
 42522 file descriptor was opened with O\_SEARCH, the function shall not perform the check.

42523 If *mkfifoat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 42524 directory is used and the behavior shall be identical to a call to *mkfifo()*.

42525 **RETURN VALUE**

42526 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 42527 return -1 and set *errno* to indicate the error. If -1 is returned, no FIFO shall be created.

42528 **ERRORS**

42529 These functions shall fail if:

42530 [EACCES] A component of the path prefix denies search permission, or write permission  
 42531 is denied on the parent directory of the FIFO to be created.

42532 [EEXIST] The named file already exists.

42533 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 42534 argument.

42535 [ENAMETOOLONG]

42536 The length of a component of a pathname is longer than {NAME\_MAX}.

**mkfifo()**

42537	[ENOENT]	A component of the path prefix specified by <i>path</i> does not name an existing directory or <i>path</i> is an empty string.
42538		
42539	[ENOSPC]	The directory that would contain the new file cannot be extended or the file system is out of file-allocation resources.
42540		
42541	[ENOTDIR]	A component of the path prefix is not a directory.
42542	[EROFS]	The named file resides on a read-only file system.
42543		The <i>mkfifoat()</i> function shall fail if:
42544	[EACCES]	<i>fd</i> was not opened with O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.
42545		
42546	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.
42547		
42548		These functions may fail if:
42549	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
42550		
42551	[ENAMETOOLONG]	
42552		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
42553		
42554		
42555		The <i>mkfifoat()</i> function may fail if:
42556	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is neither AT_FDCWD nor a file descriptor associated with a directory.
42557		

42558 **EXAMPLES**42559 **Creating a FIFO File**

42560 The following example shows how to create a FIFO file named `/home/cnd/mod_done`, with  
 42561 read/write permissions for owner, and with read permissions for group and others.

```
42562 #include <sys/types.h>
42563 #include <sys/stat.h>
42564
42565 int status;
42566 ...
42567 status = mkfifo("/home/cnd/mod_done", S_IWUSR | S_IRUSR |
42568 S_IRGRP | S_IROTH);
```

42568 **APPLICATION USAGE**

42569 None.

42570 **RATIONALE**

42571 The syntax of this function is intended to maintain compatibility with historical  
 42572 implementations of *mknod()*. The latter function was included in the 1984 /usr/group standard  
 42573 but only for use in creating FIFO special files. The *mknod()* function was originally excluded  
 42574 from the POSIX.1-1988 standard as implementation-defined and replaced by *mkdir()* and  
 42575 *mkfifo()*. The *mknod()* function is now included for alignment with the Single UNIX  
 42576 Specification.

42577 The POSIX.1-1990 standard required that the group ID of a newly created FIFO be set to the  
 42578 group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2

42579 required that implementations provide a way to have the group ID be set to the group ID of the  
 42580 containing directory, but did not prohibit implementations also supporting a way to set the  
 42581 group ID to the effective group ID of the creating process. Conforming applications should not  
 42582 assume which group ID will be used. If it matters, an application can use *chown()* to set the  
 42583 group ID after the FIFO is created, or determine under what conditions the implementation will  
 42584 set the desired group ID.

42585 The purpose of the *mkfifoat()* function is to create a FIFO special file in directories other than the  
 42586 current working directory without exposure to race conditions. Any part of the path of a file  
 42587 could be changed in parallel to a call to *mkfifo()*, resulting in unspecified behavior. By opening a  
 42588 file descriptor for the target directory and using the *mkfifoat()* function it can be guaranteed that  
 42589 the newly created FIFO is located relative to the desired directory.

#### 42590 FUTURE DIRECTIONS

42591 None.

#### 42592 SEE ALSO

42593 *chmod()*, *mknod()*, *umask()*

42594 XBD [<sys/stat.h>](#), [<sys/types.h>](#)

#### 42595 CHANGE HISTORY

42596 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 42597 Issue 6

42598 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

42599 The following new requirements on POSIX implementations derive from alignment with the  
 42600 Single UNIX Specification:

- 42601 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was
- 42602 required for conforming implementations of previous POSIX specifications, it was not
- 42603 required for UNIX applications.
- 42604 • The [ELOOP] mandatory error condition is added.
- 42605 • A second [ENAMETOOLONG] is added as an optional error condition.

42606 The following changes were made to align with the IEEE P1003.1a draft standard:

- 42607 • The [ELOOP] optional error condition is added.

#### 42608 Issue 7

42609 Austin Group Interpretation 1003.1-2001 #143 is applied.

42610 The *mkfifoat()* function is added from The Open Group Technical Standard, 2006, Extended API  
 42611 Set Part 2.

42612 Changes are made related to support for finegrained timestamps.

42613 Changes are made to allow a directory to be opened for searching.

# mknod()

42614 **NAME**

42615 mknod, mknodat — make directory, special file, or regular file

42616 **SYNOPSIS**

```
42617 xSI #include <sys/stat.h>
42618
42618 int mknod(const char *path, mode_t mode, dev_t dev);
42619 int mknodat(int fd, const char *path, mode_t mode, dev_t dev);
```

42620 **DESCRIPTION**

42621 The *mknod()* function shall create a new file named by the pathname to which the argument *path*  
42622 points.

42623 The file type for *path* is OR'ed into the *mode* argument, and the application shall select one of the  
42624 following symbolic constants:

Name	Description
S_IFIFO	FIFO-special
S_IFCHR	Character-special (non-portable)
S_IFDIR	Directory (non-portable)
S_IFBLK	Block-special (non-portable)
S_IFREG	Regular (non-portable)

42631 The only portable use of *mknod()* is to create a FIFO-special file. If *mode* is not S\_IFIFO or *dev* is  
42632 not 0, the behavior of *mknod()* is unspecified.

42633 The permissions for the new file are OR'ed into the *mode* argument, and may be selected from  
42634 any combination of the following symbolic constants:

Name	Description
S_ISUID	Set user ID on execution.
S_ISGID	Set group ID on execution.
S_IRWXU	Read, write, or execute (search) by owner.
S_IRUSR	Read by owner.
S_IWUSR	Write by owner.
S_IXUSR	Execute (search) by owner.
S_IRWXG	Read, write, or execute (search) by group.
S_IRGRP	Read by group.
S_IWGRP	Write by group.
S_IXGRP	Execute (search) by group.
S_IRWXO	Read, write, or execute (search) by others.
S_IROTH	Read by others.
S_IWOTH	Write by others.
S_IXOTH	Execute (search) by others.
S_ISVTX	On directories, restricted deletion flag.

42651 The user ID of the file shall be initialized to the effective user ID of the process. The group ID of  
42652 the file shall be initialized to either the effective group ID of the process or the group ID of the  
42653 parent directory. Implementations shall provide a way to initialize the file's group ID to the  
42654 group ID of the parent directory. Implementations may, but need not, provide an  
42655 implementation-defined way to initialize the file's group ID to the effective group ID of the  
42656 calling process. The owner, group, and other permission bits of *mode* shall be modified by the file  
42657 mode creation mask of the process. The *mknod()* function shall clear each bit whose  
42658 corresponding bit in the file mode creation mask of the process is set.

- 42659 If *path* names a symbolic link, *mknod()* shall fail and set *errno* to [EEXIST].
- 42660 Upon successful completion, *mknod()* shall mark for update the last data access, last data  
42661 modification, and last file status change timestamps of the file. Also, the last data modification  
42662 and last file status change timestamps of the directory that contains the new entry shall be  
42663 marked for update.
- 42664 Only a process with appropriate privileges may invoke *mknod()* for file types other than FIFO  
42665 special.
- 42666 The *mknodat()* function shall be equivalent to the *mknod()* function except in the case where *path*  
42667 specifies a relative path. In this case the newly created directory, special file, or regular file is  
42668 located relative to the directory associated with the file descriptor *fd* instead of the current  
42669 working directory. If the file descriptor was opened without O\_SEARCH, the function shall  
42670 check whether directory searches are permitted using the current permissions of the directory  
42671 underlying the file descriptor. If the file descriptor was opened with O\_SEARCH, the function  
42672 shall not perform the check.
- 42673 If *mknodat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
42674 directory is used and the behavior shall be identical to a call to *mknod()*.
- 42675 **RETURN VALUE**
- 42676 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
42677 return -1 and set *errno* to indicate the error. If -1 is returned, the new file shall not be created.
- 42678 **ERRORS**
- 42679 These functions shall fail if:
- |       |                |  |
|-------|----------------|--|
| 42680 | [EACCES]       | A component of the path prefix denies search permission, or write permission is denied on the parent directory.                |
| 42681 |                |  |
| 42682 | [EEXIST]       | The named file exists.   |
| 42683 | [EINVAL]       | An invalid argument exists.  |
| 42684 | [EIO]          | An I/O error occurred while accessing the file system.   |
| 42685 | [ELOOP]        | A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.                                     |
| 42686 |                |  |
| 42687 | [ENAMETOOLONG] |  |
| 42688 |                | The length of a component of a pathname is longer than {NAME_MAX}.   |
| 42689 | [ENOENT]       | A component of the path prefix specified by <i>path</i> does not name an existing directory or <i>path</i> is an empty string. |
| 42690 |                |  |
| 42691 | [ENOSPC]       | The directory that would contain the new file cannot be extended or the file system is out of file allocation resources.       |
| 42692 |                |  |
| 42693 | [ENOTDIR]      | A component of the path prefix is not a directory.   |
| 42694 | [EPERM]        | The invoking process does not have appropriate privileges and the file type is not FIFO-special.                               |
| 42695 |                |  |
| 42696 | [EROFS]        | The directory in which the file is to be created is located on a read-only file system.  |
| 42697 |                |  |

**mknod()**

- 42698 The *mknodat()* function shall fail if:
- 42699 [EACCES] *fd* was not opened with O\_SEARCH and the permissions of the directory  
42700 underlying *fd* do not permit directory searches.
- 42701 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
42702 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.
- 42703 These functions may fail if:
- 42704 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
42705 resolution of the *path* argument.
- 42706 [ENAMETOOLONG]  
42707 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
42708 symbolic link produced an intermediate result with a length that exceeds  
42709 {PATH\_MAX}.
- 42710 The *mknodat()* function may fail if:
- 42711 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT\_FDCWD nor a  
42712 file descriptor associated with a directory.

42713 **EXAMPLES**42714 **Creating a FIFO Special File**

42715 The following example shows how to create a FIFO special file named */home/cnd/mod\_done*,  
42716 with read/write permissions for owner, and with read permissions for group and others.

```
42717 #include <sys/types.h>
42718 #include <sys/stat.h>
42719 dev_t dev;
42720 int status;
42721 ...
42722 status = mknod("/home/cnd/mod_done", S_IFIFO | S_IWUSR |
42723 S_IRUSR | S_IRGRP | S_IROTH, dev);
```

42724 **APPLICATION USAGE**

42725 The *mkfifo()* function is preferred over this function for making FIFO special files.

42726 **RATIONALE**

42727 The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group  
42728 ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required  
42729 that implementations provide a way to have the group ID be set to the group ID of the  
42730 containing directory, but did not prohibit implementations also supporting a way to set the  
42731 group ID to the effective group ID of the creating process. Conforming applications should not  
42732 assume which group ID will be used. If it matters, an application can use *chown()* to set the  
42733 group ID after the file is created, or determine under what conditions the implementation will  
42734 set the desired group ID.

42735 The purpose of the *mknodat()* function is to create directories, special files, or regular files in  
42736 directories other than the current working directory without exposure to race conditions. Any  
42737 part of the path of a file could be changed in parallel to a call to *mknod()*, resulting in unspecified  
42738 behavior. By opening a file descriptor for the target directory and using the *mknodat()* function it  
42739 can be guaranteed that the newly created directory, special file, or regular file is located relative  
42740 to the desired directory.

42746 **CHANGE HISTORY**

42747 First released in Issue 4, Version 2.

42748 **Issue 5**

42749 Moved from X/OPEN UNIX extension to BASE.

42750 **Issue 6**

42751 The normative text is updated to avoid use of the term “must” for application requirements.

42752 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
42753 [ELOOP] error condition is added.42754 **Issue 7**

42755 Austin Group Interpretation 1003.1-2001 #143 is applied.

42756 The *mknodat()* function is added from The Open Group Technical Standard, 2006, Extended API  
42757 Set Part 2.

42758 Changes are made related to support for finegrained timestamps.

42759 Changes are made to allow a directory to be opened for searching.

**mkstemp()***System Interfaces*42760 **NAME**

42761 mkstemp — create a unique directory

42762 **SYNOPSIS**

```
42763 CX #include <stdlib.h>  
42764 int mkstemp(char *template);
```

42765 **DESCRIPTION**42766 Refer to *mkdtemp()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

42767 **NAME**

42768 mktime — convert broken-down time into time since the Epoch

42769 **SYNOPSIS**

42770 #include &lt;time.h&gt;

42771 time\_t mktime(struct tm \*timeptr);

42772 **DESCRIPTION**

42773 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 42774 conflict between the requirements described here and the ISO C standard is unintentional. This  
 42775 volume of POSIX.1-2008 defers to the ISO C standard.

42776 The *mktime()* function shall convert the broken-down time, expressed as local time, in the  
 42777 structure pointed to by *timeptr*, into a time since the Epoch value with the same encoding as that  
 42778 of the values returned by *time()*. The original values of the *tm\_wday* and *tm\_yday* components of  
 42779 the structure are ignored, and the original values of the other components are not restricted to  
 42780 the ranges described in <time.h>.

42781 CX A positive or 0 value for *tm\_isdst* shall cause *mktime()* to presume initially that Daylight Savings  
 42782 Time, respectively, is or is not in effect for the specified time. A negative value for *tm\_isdst* shall  
 42783 cause *mktime()* to attempt to determine whether Daylight Savings Time is in effect for the  
 42784 specified time.

42785 Local timezone information shall be set as though *mktime()* called *tzset()*.

42786 The relationship between the **tm** structure (defined in the <time.h> header) and the time in  
 42787 seconds since the Epoch is that the result shall be as specified in the expression given in the  
 42788 definition of seconds since the Epoch (see XBD Section 4.15, on page 113) corrected for timezone  
 42789 and any seasonal time adjustments, where the names in the structure and in the expression  
 42790 correspond.

42791 Upon successful completion, the values of the *tm\_wday* and *tm\_yday* components of the structure  
 42792 shall be set appropriately, and the other components are set to represent the specified time since  
 42793 the Epoch, but with their values forced to the ranges indicated in the <time.h> entry; the final  
 42794 value of *tm\_mday* shall not be set until *tm\_mon* and *tm\_year* are determined.

42795 **RETURN VALUE**

42796 The *mktime()* function shall return the specified time since the Epoch encoded as a value of type  
 42797 **time\_t**. If the time since the Epoch cannot be represented, the function shall return the value  
 42798 CX (**time\_t**)-1 and may set *errno* to indicate the error.

42799 **ERRORS**42800 The *mktime()* function may fail if:

42801 CX [EOVERFLOW] The result cannot be represented.

42802 **EXAMPLES**

42803 What day of the week is July 4, 2001?

42804 #include &lt;stdio.h&gt;

42805 #include &lt;time.h&gt;

42806 struct tm time\_str;

42807 char daybuf[20];

42808 int main(void)

42809 {

42810 time\_str.tm\_year = 2001 - 1900;

**mktime()**

```

42811         time_str.tm_mon = 7 - 1;
42812         time_str.tm_mday = 4;
42813         time_str.tm_hour = 0;
42814         time_str.tm_min = 0;
42815         time_str.tm_sec = 1;
42816         time_str.tm_isdst = -1;
42817         if (mktime(&time_str) == -1)
42818             (void)puts("-unknown-");
42819         else {
42820             (void)strftime(daybuf, sizeof(daybuf), "%A", &time_str);
42821             (void)puts(daybuf);
42822         }
42823         return 0;
42824     }

```

42834 XBD Section 4.15 (on page 113), **<time.h>**

42835 **CHANGE HISTORY**

42836 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ANSI C  
42837 standard.

42838 **Issue 6**

42839 Extensions beyond the ISO C standard are marked.

42840 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/58 is applied, updating the RETURN  
42841 VALUE and ERRORS sections to add the optional [Eoverflow] error as a CX extension.

42842 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/59 is applied, adding the *tzset()* function  
42843 to the SEE ALSO section.

42844 **NAME**42845 **mlock, munlock** — lock or unlock a range of process address space (**REALTIME**)42846 **SYNOPSIS**

```
42847 MLR #include <sys/mman.h>
42848 int mlock(const void *addr, size_t len);
42849 int munlock(const void *addr, size_t len);
```

42850 **DESCRIPTION**

42851 The *mlock()* function shall cause those whole pages containing any part of the address space of  
 42852 the process starting at address *addr* and continuing for *len* bytes to be memory resident until  
 42853 unlocked or until the process exits or *execs* another process image. The implementation may  
 42854 require that *addr* be a multiple of {PAGESIZE}.

42855 The *munlock()* function shall unlock those whole pages containing any part of the address space  
 42856 of the process starting at address *addr* and continuing for *len* bytes, regardless of how many  
 42857 times *mlock()* has been called by the process for any of the pages in the specified range. The  
 42858 implementation may require that *addr* be a multiple of {PAGESIZE}.

42859 If any of the pages in the range specified to a call to *munlock()* are also mapped into the address  
 42860 spaces of other processes, any locks established on those pages by another process are  
 42861 unaffected by the call of this process to *munlock()*. If any of the pages in the range specified by a  
 42862 call to *munlock()* are also mapped into other portions of the address space of the calling process  
 42863 outside the range specified, any locks established on those pages via the other mappings are also  
 42864 unaffected by this call.

42865 Upon successful return from *mlock()*, pages in the specified range shall be locked and memory-  
 42866 resident. Upon successful return from *munlock()*, pages in the specified range shall be unlocked  
 42867 with respect to the address space of the process. Memory residency of unlocked pages is  
 42868 unspecified.

42869 Appropriate privileges are required to lock process memory with *mlock()*.

42870 **RETURN VALUE**

42871 Upon successful completion, the *mlock()* and *munlock()* functions shall return a value of zero.  
 42872 Otherwise, no change is made to any locks in the address space of the process, and the function  
 42873 shall return a value of -1 and set *errno* to indicate the error.

42874 **ERRORS**

42875 The *mlock()* and *munlock()* functions shall fail if:

42876 [ENOMEM] Some or all of the address range specified by the *addr* and *len* arguments does  
 42877 not correspond to valid mapped pages in the address space of the process.

42878 The *mlock()* function shall fail if:

42879 [EAGAIN] Some or all of the memory identified by the operation could not be locked  
 42880 when the call was made.

42881 The *mlock()* and *munlock()* functions may fail if:

42882 [EINVAL] The *addr* argument is not a multiple of {PAGESIZE}.

42883 The *mlock()* function may fail if:

42884 [ENOMEM] Locking the pages mapped by the specified range would exceed an  
 42885 implementation-defined limit on the amount of memory that the process may  
 42886 lock.

**mlock()**

System Interfaces

42887 [EPERM] The calling process does not have appropriate privileges to perform the  
42888 requested operation.

42889 **EXAMPLES**

42890 None.

42891 **APPLICATION USAGE**

42892 None.

42899 XBD &lt;sys/mman.h&gt;

42900 **CHANGE HISTORY**

42901 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

42902 **Issue 6**42903 The *mlock()* and *munlock()* functions are marked as part of the Range Memory Locking option.42904 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
42905 implementation does not support the Range Memory Locking option.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

42906 **NAME**42907 mlockall, munlockall — lock/unlock the address space of a process (**REALTIME**)42908 **SYNOPSIS**

```
42909 ML #include <sys/mman.h>
42910 int mlockall(int flags);
42911 int munlockall(void);
```

42912 **DESCRIPTION**

42913 The *mlockall()* function shall cause all of the pages mapped by the address space of a process to  
 42914 be memory-resident until unlocked or until the process exits or *execs* another process image. The  
 42915 *flags* argument determines whether the pages to be locked are those currently mapped by the  
 42916 address space of the process, those that are mapped in the future, or both. The *flags* argument is  
 42917 constructed from the bitwise-inclusive OR of one or more of the following symbolic constants,  
 42918 defined in **<sys/mman.h>**:

42919 **MCL\_CURRENT** Lock all of the pages currently mapped into the address space of the process.

42920 **MCL\_FUTURE** Lock all of the pages that become mapped into the address space of the  
 42921 process in the future, when those mappings are established.

42922 If **MCL\_FUTURE** is specified, and the automatic locking of future mappings eventually causes  
 42923 the amount of locked memory to exceed the amount of available physical memory or any other  
 42924 implementation-defined limit, the behavior is implementation-defined. The manner in which the  
 42925 implementation informs the application of these situations is also implementation-defined.

42926 The *munlockall()* function shall unlock all currently mapped pages of the address space of the  
 42927 process. Any pages that become mapped into the address space of the process after a call to  
 42928 *munlockall()* shall not be locked, unless there is an intervening call to *mlockall()* specifying  
 42929 **MCL\_FUTURE** or a subsequent call to *mlockall()* specifying **MCL\_CURRENT**. If pages mapped  
 42930 into the address space of the process are also mapped into the address spaces of other processes  
 42931 and are locked by those processes, the locks established by the other processes shall be  
 42932 unaffected by a call by this process to *munlockall()*.

42933 Upon successful return from the *mlockall()* function that specifies **MCL\_CURRENT**, all currently  
 42934 mapped pages of the address space of the process shall be memory-resident and locked. Upon  
 42935 return from the *munlockall()* function, all currently mapped pages of the address space of the  
 42936 process shall be unlocked with respect to the address space of the process. The memory  
 42937 residency of unlocked pages is unspecified.

42938 Appropriate privileges are required to lock process memory with *mlockall()*.

42939 **RETURN VALUE**

42940 Upon successful completion, the *mlockall()* function shall return a value of zero. Otherwise, no  
 42941 additional memory shall be locked, and the function shall return a value of  $-1$  and set *errno* to  
 42942 indicate the error. The effect of failure of *mlockall()* on previously existing locks in the address  
 42943 space is unspecified.

42944 If it is supported by the implementation, the *munlockall()* function shall always return a value of  
 42945 zero. Otherwise, the function shall return a value of  $-1$  and set *errno* to indicate the error.

42946 **ERRORS**

42947 The *mlockall()* function shall fail if:

42948 **[EAGAIN]** Some or all of the memory identified by the operation could not be locked  
 42949 when the call was made.

**mlockall()**

System Interfaces

- 42950 [EINVAL] The *flags* argument is zero, or includes unimplemented flags.
- 42951 The *mlockall()* function may fail if:
- 42952 [ENOMEM] Locking all of the pages currently mapped into the address space of the  
42953 process would exceed an implementation-defined limit on the amount of  
42954 memory that the process may lock.
- 42955 [EPERM] The calling process does not have appropriate privileges to perform the  
42956 requested operation.
- 42957 **EXAMPLES**
- 42958 None.
- 42959 **APPLICATION USAGE**
- 42960 None.
- 42961 **RATIONALE**
- 42962 None.
- 42963 **FUTURE DIRECTIONS**
- 42964 None.
- 42965 **SEE ALSO**
- 42966 *exec*, *exit()*, *fork()*, *mlock()*, *munmap()*
- 42967 XBD <sys/mman.h>
- 42968 **CHANGE HISTORY**
- 42969 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
- 42970 **Issue 6**
- 42971 The *mlockall()* and *munlockall()* functions are marked as part of the Process Memory Locking  
42972 option.
- 42973 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
42974 implementation does not support the Process Memory Locking option.

42975 **NAME**42976 `mmap` — map pages of memory42977 **SYNOPSIS**42978 `#include <sys/mman.h>`42979 `void *mmap(void *addr, size_t len, int prot, int flags,`  
42980 `int fildes, off_t off);`42981 **DESCRIPTION**42982 The `mmap()` function shall establish a mapping between an address space of a process and a  
42983 memory object.42984 The `mmap()` function shall be supported for the following memory objects:

- 42985 • Regular files
- 42986 SHM • Shared memory objects
- 42987 TYM • Typed memory objects

42988 Support for any other type of file is unspecified.

42989 The format of the call is as follows:

42990 `pa=mmap(addr, len, prot, flags, fildes, off);`

42991 The `mmap()` function shall establish a mapping between the address space of the process at an  
42992 address `pa` for `len` bytes to the memory object represented by the file descriptor `fildes` at offset `off`  
42993 for `len` bytes. The value of `pa` is an implementation-defined function of the parameter `addr` and  
42994 the values of `flags`, further described below. A successful `mmap()` call shall return `pa` as its result.  
42995 The address range starting at `pa` and continuing for `len` bytes shall be legitimate for the possible  
42996 (not necessarily current) address space of the process. The range of bytes starting at `off` and  
42997 continuing for `len` bytes shall be legitimate for the possible (not necessarily current) offsets in the  
42998 memory object represented by `fildes`.

42999 TYM If `fildes` represents a typed memory object opened with either the  
43000 POSIX\_TYPED\_MEM\_ALLOCATE flag or the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG  
43001 flag, the memory object to be mapped shall be that portion of the typed memory object allocated  
43002 by the implementation as specified below. In this case, if `off` is non-zero, the behavior of `mmap()`  
43003 is undefined. If `fildes` refers to a valid typed memory object that is not accessible from the calling  
43004 process, `mmap()` shall fail.

43005 The mapping established by `mmap()` shall replace any previous mappings for those whole pages  
43006 containing any part of the address space of the process starting at `pa` and continuing for `len`  
43007 bytes.

43008 If the size of the mapped file changes after the call to `mmap()` as a result of some other operation  
43009 on the mapped file, the effect of references to portions of the mapped region that correspond to  
43010 added or removed portions of the file is unspecified.

43011 If `len` is zero, `mmap()` shall fail and no mapping shall be established.

43012 The parameter `prot` determines whether read, write, execute, or some combination of accesses  
43013 are permitted to the data being mapped. The `prot` shall be either PROT\_NONE or the bitwise-  
43014 inclusive OR of one or more of the other flags in the following table, defined in the  
43015 `<sys/mman.h>` header.

**mmap()**

43016  
43017  
43018  
43019  
43020

Symbolic Constant	Description
PROT_READ	Data can be read.
PROT_WRITE	Data can be written.
PROT_EXEC	Data can be executed.
PROT_NONE	Data cannot be accessed.

43021  
43022

If an implementation cannot support the combination of access types specified by *prot*, the call to *mmap()* shall fail.

43023  
43024  
43025  
43026  
43027  
43028  
43029  
43030  
43031

An implementation may permit accesses other than those specified by *prot*; however, the implementation shall not permit a write to succeed where PROT\_WRITE has not been set and shall not permit any access where PROT\_NONE alone has been set. The implementation shall support at least the following values of *prot*: PROT\_NONE, PROT\_READ, PROT\_WRITE, and the bitwise-inclusive OR of PROT\_READ and PROT\_WRITE. The file descriptor *filde*s shall have been opened with read permission, regardless of the protection options specified. If PROT\_WRITE is specified, the application shall ensure that it has opened the file descriptor *filde*s with write permission unless MAP\_PRIVATE is specified in the *flags* parameter as described below.

43032  
43033

The parameter *flags* provides other information about the handling of the mapped data. The value of *flags* is the bitwise-inclusive OR of these options, defined in `<sys/mman.h>`:

43034  
43035  
43036  
43037

Symbolic Constant	Description
MAP_SHARED	Changes are shared.
MAP_PRIVATE	Changes are private.
MAP_FIXED	Interpret <i>addr</i> exactly.

43038 XSI  
43039

It is implementation-defined whether MAP\_FIXED shall be supported. MAP\_FIXED shall be supported on XSI-conformant systems.

43040  
43041  
43042  
43043  
43044  
43045  
43046

MAP\_SHARED and MAP\_PRIVATE describe the disposition of write references to the memory object. If MAP\_SHARED is specified, write references shall change the underlying object. If MAP\_PRIVATE is specified, modifications to the mapped data by the calling process shall be visible only to the calling process and shall not change the underlying object. It is unspecified whether modifications to the underlying object done after the MAP\_PRIVATE mapping is established are visible through the MAP\_PRIVATE mapping. Either MAP\_SHARED or MAP\_PRIVATE can be specified, but not both. The mapping type is retained across *fork()*.

43047  
43048  
43049

The state of synchronization objects such as mutexes, semaphores, barriers, and conditional variables placed in shared memory mapped with MAP\_SHARED becomes undefined when the last region in any process containing the synchronization object is unmapped.

43050 TYM  
43051  
43052  
43053  
43054  
43055  
43056  
43057  
43058  
43059  
43060  
43061  
43062

When *filde*s represents a typed memory object opened with either the POSIX\_TYPED\_MEM\_ALLOCATE flag or the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag, *mmap()* shall, if there are enough resources available, map *len* bytes allocated from the corresponding typed memory object which were not previously allocated to any process in any processor that may access that typed memory object. If there are not enough resources available, the function shall fail. If *filde*s represents a typed memory object opened with the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag, these allocated bytes shall be contiguous within the typed memory object. If *filde*s represents a typed memory object opened with the POSIX\_TYPED\_MEM\_ALLOCATE flag, these allocated bytes may be composed of non-contiguous fragments within the typed memory object. If *filde*s represents a typed memory object opened with neither the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag nor the POSIX\_TYPED\_MEM\_ALLOCATE flag, *len* bytes starting at offset *off* within the typed memory object are mapped, exactly as when mapping a file or shared memory object. In this case, if two

- 43063 processes map an area of typed memory using the same *off* and *len* values and using file  
 43064 descriptors that refer to the same memory pool (either from the same port or from a different  
 43065 port), both processes shall map the same region of storage.
- 43066 When MAP\_FIXED is set in the *flags* argument, the implementation is informed that the value of  
 43067 *pa* shall be *addr*, exactly. If MAP\_FIXED is set, *mmap()* may return MAP\_FAILED and set *errno* to  
 43068 [EINVAL]. If a MAP\_FIXED request is successful, the mapping established by *mmap()* replaces  
 43069 any previous mappings for the pages in the range [*pa*,*pa+len*) of the process.
- 43070 When MAP\_FIXED is not set, the implementation uses *addr* in an implementation-defined  
 43071 manner to arrive at *pa*. The *pa* so chosen shall be an area of the address space that the  
 43072 implementation deems suitable for a mapping of *len* bytes to the file. All implementations  
 43073 interpret an *addr* value of 0 as granting the implementation complete freedom in selecting *pa*,  
 43074 subject to constraints described below. A non-zero value of *addr* is taken to be a suggestion of a  
 43075 process address near which the mapping should be placed. When the implementation selects a  
 43076 value for *pa*, it never places a mapping at address 0, nor does it replace any extant mapping.
- 43077 If MAP\_FIXED is specified and *addr* is non-zero, it shall have the same remainder as the *off*  
 43078 parameter, modulo the page size as returned by *sysconf()* when passed \_SC\_PAGESIZE or  
 43079 \_SC\_PAGE\_SIZE. The implementation may require that *off* is a multiple of the page size. If  
 43080 MAP\_FIXED is specified, the implementation may require that *addr* is a multiple of the page  
 43081 size. The system performs mapping operations over whole pages. Thus, while the parameter *len*  
 43082 need not meet a size or alignment constraint, the system shall include, in any mapping  
 43083 operation, any partial page specified by the address range starting at *pa* and continuing for *len*  
 43084 bytes.
- 43085 The system shall always zero-fill any partial page at the end of an object. Further, the system  
 43086 shall never write out any modified portions of the last page of an object which are beyond its  
 43087 end. References within the address range starting at *pa* and continuing for *len* bytes to whole  
 43088 pages following the end of an object shall result in delivery of a SIGBUS signal.
- 43089 An implementation may generate SIGBUS signals when a reference would cause an error in the  
 43090 mapped object, such as out-of-space condition.
- 43091 The *mmap()* function shall add an extra reference to the file associated with the file descriptor  
 43092 *fd* which is not removed by a subsequent *close()* on that file descriptor. This reference shall be  
 43093 removed when there are no more mappings to the file.
- 43094 The last data access timestamp of the mapped file may be marked for update at any time  
 43095 between the *mmap()* call and the corresponding *munmap()* call. The initial read or write  
 43096 reference to a mapped region shall cause the file's last data access timestamp to be marked for  
 43097 update if it has not already been marked for update.
- 43098 The last data modification and last file status change timestamps of a file that is mapped with  
 43099 MAP\_SHARED and PROT\_WRITE shall be marked for update at some point in the interval  
 43100 between a write reference to the mapped region and the next call to *msync()* with MS\_ASYNC or  
 43101 MS\_SYNC for that portion of the file by any process. If there is no such call and if the  
 43102 underlying file is modified as a result of a write reference, then these timestamps shall be  
 43103 marked for update at some time after the write reference.
- 43104 There may be implementation-defined limits on the number of memory regions that can be  
 43105 mapped (per process or per system).
- 43106 XSI If such a limit is imposed, whether the number of memory regions that can be mapped by a  
 43107 process is decreased by the use of *shmat()* is implementation-defined.
- 43108 If *mmap()* fails for reasons other than [EBADF], [EINVAL], or [ENOTSUP], some of the

**mmap()**

43109 mappings in the address range starting at *addr* and continuing for *len* bytes may have been  
43110 unmapped.

**RETURN VALUE**

43112 Upon successful completion, the *mmap()* function shall return the address at which the mapping  
43113 was placed (*pa*); otherwise, it shall return a value of MAP\_FAILED and set *errno* to indicate the  
43114 error. The symbol MAP\_FAILED is defined in the `<sys/mman.h>` header. No successful return  
43115 from *mmap()* shall return the value MAP\_FAILED.

**ERRORS**

43116 The *mmap()* function shall fail if:

43118 [EACCES] The *fildev* argument is not open for read, regardless of the protection specified,  
43119 or *fildev* is not open for write and PROT\_WRITE was specified for a  
43120 MAP\_SHARED type mapping.

43121 ML [EAGAIN] The mapping could not be locked in memory, if required by *mlockall()*, due to  
43122 a lack of resources.

43123 [EBADF] The *fildev* argument is not a valid open file descriptor.

43124 [EINVAL] The value of *len* is zero.

43125 [EINVAL] The value of *flags* is invalid (neither MAP\_PRIVATE nor MAP\_SHARED is  
43126 set).

43127 [EMFILE] The number of mapped regions would exceed an implementation-defined  
43128 limit (per process or per system).

43129 [ENODEV] The *fildev* argument refers to a file whose type is not supported by *mmap()*.

43130 [ENOMEM] MAP\_FIXED was specified, and the range [*addr*,*addr+len*) exceeds that allowed  
43131 for the address space of a process; or, if MAP\_FIXED was not specified and  
43132 there is insufficient room in the address space to effect the mapping.

43133 ML [ENOMEM] The mapping could not be locked in memory, if required by *mlockall()*,  
43134 because it would require more space than the system is able to supply.

43135 TYM [ENOMEM] Not enough unallocated memory resources remain in the typed memory  
43136 object designated by *fildev* to allocate *len* bytes.

43137 [ENOTSUP] MAP\_FIXED or MAP\_PRIVATE was specified in the *flags* argument and the  
43138 implementation does not support this functionality.

43139 The implementation does not support the combination of accesses requested  
43140 in the *prot* argument.

43141 [ENXIO] Addresses in the range [*off*,*off+len*) are invalid for the object specified by *fildev*.

43142 [ENXIO] MAP\_FIXED was specified in *flags* and the combination of *addr*, *len*, and *off* is  
43143 invalid for the object specified by *fildev*.

43144 TYM [ENXIO] The *fildev* argument refers to a typed memory object that is not accessible from  
43145 the calling process.

43146 [EOVERFLOW] The file is a regular file and the value of *off* plus *len* exceeds the offset  
43147 maximum established in the open file description associated with *fildev*.

43148 The *mmap()* function may fail if:

43149 [EINVAL] The *addr* argument (if MAP\_FIXED was specified) or *off* is not a multiple of the  
43150 page size as returned by *sysconf()*, or is considered invalid by the  
43151 implementation.

#### 43152 EXAMPLES

43153 None.

#### 43154 APPLICATION USAGE

43155 Use of *mmap()* may reduce the amount of memory available to other memory allocation  
43156 functions.

43157 Use of MAP\_FIXED may result in unspecified behavior in further use of *malloc()* and *shmat()*.  
43158 The use of MAP\_FIXED is discouraged, as it may prevent an implementation from making the  
43159 most effective use of resources. Most implementations require that *off* and *addr* are multiples of  
43160 the page size as returned by *sysconf()*.

43161 The application must ensure correct synchronization when using *mmap()* in conjunction with  
43162 any other file access method, such as *read()* and *write()*, standard input/output, and *shmat()*.

43163 The *mmap()* function allows access to resources via address space manipulations, instead of  
43164 *read()/write()*. Once a file is mapped, all a process has to do to access it is use the data at the  
43165 address to which the file was mapped. So, using pseudo-code to illustrate the way in which an  
43166 existing program might be changed to use *mmap()*, the following:

```
43167 fildes = open(...)
43168 lseek(fildes, some_offset)
43169 read(fildes, buf, len)
43170 /* Use data in buf. */
```

43171 becomes:

```
43172 fildes = open(...)
43173 address = mmap(0, len, PROT_READ, MAP_PRIVATE, fildes, some_offset)
43174 /* Use data at address. */
```

#### 43175 RATIONALE

43176 After considering several other alternatives, it was decided to adopt the *mmap()* definition  
43177 found in SVR4 for mapping memory objects into process address spaces. The SVR4 definition is  
43178 minimal, in that it describes only what has been built, and what appears to be necessary for a  
43179 general and portable mapping facility.

43180 Note that while *mmap()* was first designed for mapping files, it is actually a general-purpose  
43181 mapping facility. It can be used to map any appropriate object, such as memory, files, devices,  
43182 and so on, into the address space of a process.

43183 When a mapping is established, it is possible that the implementation may need to map more  
43184 than is requested into the address space of the process because of hardware requirements. An  
43185 application, however, cannot count on this behavior. Implementations that do not use a paged  
43186 architecture may simply allocate a common memory region and return the address of it; such  
43187 implementations probably do not allocate any more than is necessary. References past the end of  
43188 the requested area are unspecified.

43189 If an application requests a mapping that would overlay existing mappings in the process, it  
43190 might be desirable that an implementation detect this and inform the application. However, the  
43191 default, portable (not MAP\_FIXED) operation does not overlay existing mappings. On the other  
43192 hand, if the program specifies a fixed address mapping (which requires some implementation

**mmap()**

43193 knowledge to determine a suitable address, if the function is supported at all), then the program  
43194 is presumed to be successfully managing its own address space and should be trusted when it  
43195 asks to map over existing data structures. Furthermore, it is also desirable to make as few system  
43196 calls as possible, and it might be considered onerous to require an *munmap()* before an *mmap()*  
43197 to the same address range. This volume of POSIX.1-2008 specifies that the new mappings  
43198 replace any existing mappings, following existing practice in this regard.

43199 It is not expected that all hardware implementations are able to support all combinations of  
43200 permissions at all addresses. Implementations are required to disallow write access to mappings  
43201 without write permission and to disallow access to mappings without any access permission.  
43202 Other than these restrictions, implementations may allow access types other than those  
43203 requested by the application. For example, if the application requests only `PROT_WRITE`, the  
43204 implementation may also allow read access. A call to *mmap()* fails if the implementation cannot  
43205 support allowing all the access requested by the application. For example, some  
43206 implementations cannot support a request for both write access and execute access  
43207 simultaneously. All implementations must support requests for no access, read access, write  
43208 access, and both read and write access. Strictly conforming code must only rely on the required  
43209 checks. These restrictions allow for portability across a wide range of hardware.

43210 The `MAP_FIXED` address treatment is likely to fail for non-page-aligned values and for certain  
43211 architecture-dependent address ranges. Conforming implementations cannot count on being  
43212 able to choose address values for `MAP_FIXED` without utilizing non-portable, implementation-  
43213 defined knowledge. Nonetheless, `MAP_FIXED` is provided as a standard interface conforming  
43214 to existing practice for utilizing such knowledge when it is available.

43215 Similarly, in order to allow implementations that do not support virtual addresses, support for  
43216 directly specifying any mapping addresses via `MAP_FIXED` is not required and thus a  
43217 conforming application may not count on it.

43218 The `MAP_PRIVATE` function can be implemented efficiently when memory protection hardware  
43219 is available. When such hardware is not available, implementations can implement such  
43220 “mappings” by simply making a real copy of the relevant data into process private memory,  
43221 though this tends to behave similarly to *read()*.

43222 The function has been defined to allow for many different models of using shared memory.  
43223 However, all uses are not equally portable across all machine architectures. In particular, the  
43224 *mmap()* function allows the system as well as the application to specify the address at which to  
43225 map a specific region of a memory object. The most portable way to use the function is always to  
43226 let the system choose the address, specifying `NULL` as the value for the argument *addr* and not  
43227 to specify `MAP_FIXED`.

43228 If it is intended that a particular region of a memory object be mapped at the same address in a  
43229 group of processes (on machines where this is even possible), then `MAP_FIXED` can be used to  
43230 pass in the desired mapping address. The system can still be used to choose the desired address  
43231 if the first such mapping is made without specifying `MAP_FIXED`, and then the resulting  
43232 mapping address can be passed to subsequent processes for them to pass in via `MAP_FIXED`.  
43233 The availability of a specific address range cannot be guaranteed, in general.

43234 The *mmap()* function can be used to map a region of memory that is larger than the current size  
43235 of the object. Memory access within the mapping but beyond the current end of the underlying  
43236 objects may result in `SIGBUS` signals being sent to the process. The reason for this is that the size  
43237 of the object can be manipulated by other processes and can change at any moment. The  
43238 implementation should tell the application that a memory reference is outside the object where  
43239 this can be detected; otherwise, written data may be lost and read data may not reflect actual  
43240 data in the object.

43241 Note that references beyond the end of the object do not extend the object as the new end cannot  
 43242 be determined precisely by most virtual memory hardware. Instead, the size can be directly  
 43243 manipulated by *ftruncate()*.

43244 Process memory locking does apply to shared memory regions, and the MEMLOCK\_FUTURE  
 43245 argument to *mlockall()* can be relied upon to cause new shared memory regions to be  
 43246 automatically locked.

43247 Existing implementations of *mmap()* return the value  $-1$  when unsuccessful. Since the casting of  
 43248 this value to type **void \*** cannot be guaranteed by the ISO C standard to be distinct from a  
 43249 successful value, this volume of POSIX.1-2008 defines the symbol MAP\_FAILED, which a  
 43250 conforming implementation does not return as the result of a successful call.

#### 43251 FUTURE DIRECTIONS

43252 None.

43256 XBD <sys/mman.h>

#### 43257 CHANGE HISTORY

43258 First released in Issue 4, Version 2.

#### 43259 Issue 5

43260 Moved from X/OPEN UNIX extension to BASE.

43261 Aligned with *mmap()* in the POSIX Realtime Extension as follows:

- 43262 • The DESCRIPTION is extensively reworded.
- 43263 • The [EAGAIN] and [ENOTSUP] mandatory error conditions are added.
- 43264 • New cases of [ENOMEM] and [ENXIO] are added as mandatory error conditions.
- 43265 • The value returned on failure is the value of the constant MAP\_FAILED; this was  
 43266 previously defined as  $-1$ .

43267 Large File Summit extensions are added.

#### 43268 Issue 6

43269 The *mmap()* function is marked as part of the Memory Mapped Files option.

43270 The Open Group Corrigendum U028/6 is applied, changing (**void \***) $-1$  to MAP\_FAILED.

43271 The following new requirements on POSIX implementations derive from alignment with the  
 43272 Single UNIX Specification:

- 43273 • The DESCRIPTION is updated to describe the use of MAP\_FIXED.
- 43274 • The DESCRIPTION is updated to describe the addition of an extra reference to the file  
 43275 associated with the file descriptor passed to *mmap()*.
- 43276 • The DESCRIPTION is updated to state that there may be implementation-defined limits on  
 43277 the number of memory regions that can be mapped.
- 43278 • The DESCRIPTION is updated to describe constraints on the alignment and size of the *off*  
 43279 argument.

**mmap()**

- 43280           • The [EINVAL] and [EMFILE] error conditions are added.
- 43281           • The [EOVERFLOW] error condition is added. This change is to support large files.
- 43282       The following changes are made for alignment with the ISO POSIX-1: 1996 standard:
- 43283           • The DESCRIPTION is updated to describe the cases when MAP\_PRIVATE and  
43284           MAP\_FIXED need not be supported.
- 43285       The following changes are made for alignment with IEEE Std 1003.1j-2000:
- 43286           • Semantics for typed memory objects are added to the DESCRIPTION.
- 43287           • New [ENOMEM] and [ENXIO] errors are added to the ERRORS section.
- 43288           • The *posix\_typed\_mem\_open()* function is added to the SEE ALSO section.
- 43289       The normative text is updated to avoid use of the term “must” for application requirements.
- 43290       IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code  
43291       in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).
- 43292       IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/60 is applied, updating the  
43293       DESCRIPTION and ERRORS sections to add the [EINVAL] error when *len* is zero.
- 43294       **Issue 7**
- 43295       Austin Group Interpretations 1003.1-2001 #078 and #079 are applied, clarifying page alignment  
43296       requirements and adding a note about the state of synchronization objects becoming undefined  
43297       when a shared region is unmapped.
- 43298       Functionality relating to the Memory Protection and Memory Mapped Files options is moved to  
43299       the Base.
- 43300       Changes are made related to support for finegrained timestamps.

43301 **NAME**

43302 modf, modff, modfl — decompose a floating-point number

43303 **SYNOPSIS**

43304 #include &lt;math.h&gt;

43305 double modf(double *x*, double \**iptr*);43306 float modff(float *value*, float \**iptr*);43307 long double modfl(long double *value*, long double \**iptr*);43308 **DESCRIPTION**

43309 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 43310 conflict between the requirements described here and the ISO C standard is unintentional. This  
 43311 volume of POSIX.1-2008 defers to the ISO C standard.

43312 These functions shall break the argument *x* into integral and fractional parts, each of which has  
 43313 the same sign as the argument. It stores the integral part as a **double** (for the *modf()* function), a  
 43314 **float** (for the *modff()* function), or a **long double** (for the *modfl()* function), in the object pointed  
 43315 to by *iptr*.

43316 **RETURN VALUE**43317 Upon successful completion, these functions shall return the signed fractional part of *x*.43318 **MX** If *x* is NaN, a NaN shall be returned, and \**iptr* shall be set to a NaN.43319 If *x* is ±Inf, ±0 shall be returned, and \**iptr* shall be set to ±Inf.43320 **ERRORS**

43321 No errors are defined.

43322 **EXAMPLES**

43323 None.

43324 **APPLICATION USAGE**43325 The *modf()* function computes the function result and \**iptr* such that:43326 *a* = modf(*x*, *iptr*) ;43327 *x* == *a*+\**iptr* ;

43328 allowing for the usual floating-point inaccuracies.

43329 **RATIONALE**

43330 None.

43331 **FUTURE DIRECTIONS**

43332 None.

43333 **SEE ALSO**43334 *frexp()*, *isnan()*, *ldexp()*

43335 XBD &lt;math.h&gt;

43336 **CHANGE HISTORY**

43337 First released in Issue 1. Derived from Issue 1 of the SVID.

43338 **Issue 5**

43339 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 43340 text was previously published in the APPLICATION USAGE section.

**modf()**43341 **Issue 6**

43342 The *modff()* and *modfl()* functions are added for alignment with the ISO/IEC 9899:1999  
43343 standard.

43344 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
43345 revised to align with the ISO/IEC 9899:1999 standard.

43346 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
43347 marked.

43348 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/35 is applied, correcting the code example  
43349 in the APPLICATION USAGE section.

43350 **NAME**43351 `mprotect` — set protection of memory mapping43352 **SYNOPSIS**43353 `#include <sys/mman.h>`43354 `int mprotect(void *addr, size_t len, int prot);`43355 **DESCRIPTION**

43356 The `mprotect()` function shall change the access protections to be that specified by `prot` for those  
 43357 whole pages containing any part of the address space of the process starting at address `addr` and  
 43358 continuing for `len` bytes. The parameter `prot` determines whether read, write, execute or some  
 43359 combination of accesses are permitted to the data being mapped. The `prot` argument should be  
 43360 either `PROT_NONE` or the bitwise-inclusive OR of one or more of `PROT_READ`, `PROT_WRITE`,  
 43361 and `PROT_EXEC`.

43362 If an implementation cannot support the combination of access types specified by `prot`, the call to  
 43363 `mprotect()` shall fail.

43364 An implementation may permit accesses other than those specified by `prot`; however, no  
 43365 implementation shall permit a write to succeed where `PROT_WRITE` has not been set or shall  
 43366 permit any access where `PROT_NONE` alone has been set. Implementations shall support at  
 43367 least the following values of `prot`: `PROT_NONE`, `PROT_READ`, `PROT_WRITE`, and the bitwise-  
 43368 inclusive OR of `PROT_READ` and `PROT_WRITE`. If `PROT_WRITE` is specified, the application  
 43369 shall ensure that it has opened the mapped objects in the specified address range with write  
 43370 permission, unless `MAP_PRIVATE` was specified in the original mapping, regardless of whether  
 43371 the file descriptors used to map the objects have since been closed.

43372 The implementation may require that `addr` be a multiple of the page size as returned by  
 43373 `sysconf()`.

43374 The behavior of this function is unspecified if the mapping was not established by a call to  
 43375 `mmap()`.

43376 When `mprotect()` fails for reasons other than `[EINVAL]`, the protections on some of the pages in  
 43377 the range `[addr,addr+len)` may have been changed.

43378 **RETURN VALUE**

43379 Upon successful completion, `mprotect()` shall return 0; otherwise, it shall return `-1` and set `errno`  
 43380 to indicate the error.

43381 **ERRORS**

43382 The `mprotect()` function shall fail if:

43383 `[EACCESS]` The `prot` argument specifies a protection that violates the access permission the  
 43384 process has to the underlying memory object.

43385 `[EAGAIN]` The `prot` argument specifies `PROT_WRITE` over a `MAP_PRIVATE` mapping  
 43386 and there are insufficient memory resources to reserve for locking the private  
 43387 page.

43388 `[ENOMEM]` Addresses in the range `[addr,addr+len)` are invalid for the address space of a  
 43389 process, or specify one or more pages which are not mapped.

43390 `[ENOMEM]` The `prot` argument specifies `PROT_WRITE` on a `MAP_PRIVATE` mapping, and  
 43391 it would require more space than the system is able to supply for locking the  
 43392 private pages, if required.

**mprotect()**

43393	[ENOTSUP]	The implementation does not support the combination of accesses requested in the <i>prot</i> argument.
43394		
43395		The <i>mprotect()</i> function may fail if:
43396	[EINVAL]	The <i>addr</i> argument is not a multiple of the page size as returned by <i>sysconf()</i> .
43397	<b>EXAMPLES</b>	
43398		None.
43399	<b>APPLICATION USAGE</b>	
43400		Most implementations require that <i>addr</i> is a multiple of the page size as returned by <i>sysconf()</i> .
43401	<b>RATIONALE</b>	
43402		None.

43406		<i>mmap()</i> , <i>sysconf()</i>
43407		XBD <sys/mman.h>
43408	<b>CHANGE HISTORY</b>	
43409		First released in Issue 4, Version 2.
43410	<b>Issue 5</b>	
43411		Moved from X/OPEN UNIX extension to BASE.
43412		Aligned with <i>mprotect()</i> in the POSIX Realtime Extension as follows:
43413		• The DESCRIPTION is largely reworded.
43414		• [ENOTSUP] and a second form of [ENOMEM] are added as mandatory error conditions.
43415		• [EAGAIN] is moved from the optional to the mandatory error conditions.
43416	<b>Issue 6</b>	
43417		The <i>mprotect()</i> function is marked as part of the Memory Protection option.
43418		The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
43419		
43420		• The DESCRIPTION is updated to state that implementations require <i>addr</i> to be a multiple of the page size as returned by <i>sysconf()</i> .
43421		
43422		• The [EINVAL] error condition is added.
43423		The normative text is updated to avoid use of the term “must” for application requirements.
43424	<b>Issue 7</b>	
43425		SD5-XSH-ERN-22 is applied, deleting erroneous APPLICATION USAGE.
43426		Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment requirements.
43427		
43428		The <i>mprotect()</i> function is moved from the Memory Protection option to the Base.

43429 **NAME**43430 mq\_close — close a message queue (**REALTIME**)43431 **SYNOPSIS**

```
43432 MSG #include <mqueue.h>
43433 int mq_close(mqd_t mqdes);
```

43434 **DESCRIPTION**

43435 The *mq\_close()* function shall remove the association between the message queue descriptor,  
 43436 *mqdes*, and its message queue. The results of using this message queue descriptor after successful  
 43437 return from this *mq\_close()*, and until the return of this message queue descriptor from a  
 43438 subsequent *mq\_open()*, are undefined.

43439 If the process has successfully attached a notification request to the message queue via this  
 43440 *mqdes*, this attachment shall be removed, and the message queue is available for another process  
 43441 to attach for notification.

43442 **RETURN VALUE**

43443 Upon successful completion, the *mq\_close()* function shall return a value of zero; otherwise, the  
 43444 function shall return a value of -1 and set *errno* to indicate the error.

43445 **ERRORS**

43446 The *mq\_close()* function shall fail if:

43447 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

43448 **EXAMPLES**

43449 None.

43450 **APPLICATION USAGE**

43451 None.

43452 **RATIONALE**

43453 None.

43454 **FUTURE DIRECTIONS**

43455 None.

43456 **SEE ALSO**

43457 *mq\_open()*, *mq\_unlink()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*

43458 XBD <mqueue.h>

43459 **CHANGE HISTORY**

43460 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

43461 **Issue 6**

43462 The *mq\_close()* function is marked as part of the Message Passing option.

43463 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 43464 implementation does not support the Message Passing option.

**mq\_getattr()**43465 **NAME**43466 `mq_getattr` — get message queue attributes (**REALTIME**)43467 **SYNOPSIS**

```
43468 MSG #include <mqqueue.h>
43469 int mq_getattr(mqd_t mqdes, struct mq_attr *mqstat);
```

43470 **DESCRIPTION**

43471 The `mq_getattr()` function shall obtain status information and attributes of the message queue  
 43472 and the open message queue description associated with the message queue descriptor.

43473 The `mqdes` argument specifies a message queue descriptor.

43474 The results shall be returned in the `mq_attr` structure referenced by the `mqstat` argument.

43475 Upon return, the following members shall have the values associated with the open message  
 43476 queue description as set when the message queue was opened and as modified by subsequent  
 43477 `mq_setattr()` calls: `mq_flags`.

43478 The following attributes of the message queue shall be returned as set at message queue  
 43479 creation: `mq_maxmsg`, `mq_msgsize`.

43480 Upon return, the following members within the `mq_attr` structure referenced by the `mqstat`  
 43481 argument shall be set to the current state of the message queue:

43482 `mq_curmsgs` The number of messages currently on the queue.

43483 **RETURN VALUE**

43484 Upon successful completion, the `mq_getattr()` function shall return zero. Otherwise, the function  
 43485 shall return `-1` and set `errno` to indicate the error.

43486 **ERRORS**

43487 The `mq_getattr()` function may fail if:

43488 [EBADF] The `mqdes` argument is not a valid message queue descriptor.

43489 **EXAMPLES**

43490 See `mq_notify()`.

43491 **APPLICATION USAGE**

43492 None.

43493 **RATIONALE**

43494 None.

43495 **FUTURE DIRECTIONS**

43496 None.

**mq\_notify()**43510 **NAME**43511 mq\_notify — notify process that a message is available (**REALTIME**)43512 **SYNOPSIS**

```
43513 MSG #include <mqueue.h>
43514 int mq_notify(mqd_t mqdes, const struct sigevent *notification);
```

43515 **DESCRIPTION**

43516 If the argument *notification* is not NULL, this function shall register the calling process to be  
 43517 notified of message arrival at an empty message queue associated with the specified message  
 43518 queue descriptor, *mqdes*. The notification specified by the *notification* argument shall be sent to  
 43519 the process when the message queue transitions from empty to non-empty. At any time, only  
 43520 one process may be registered for notification by a message queue. If the calling process or any  
 43521 other process has already registered for notification of message arrival at the specified message  
 43522 queue, subsequent attempts to register for that message queue shall fail.

43523 If *notification* is NULL and the process is currently registered for notification by the specified  
 43524 message queue, the existing registration shall be removed.

43525 When the notification is sent to the registered process, its registration shall be removed. The  
 43526 message queue shall then be available for registration.

43527 If a process has registered for notification of message arrival at a message queue and some  
 43528 thread is blocked in *mq\_receive()* or *mq\_timedreceive()* waiting to receive a message when a  
 43529 message arrives at the queue, the arriving message shall satisfy the appropriate *mq\_receive()* or  
 43530 *mq\_timedreceive()*, respectively. The resulting behavior is as if the message queue remains empty,  
 43531 and no notification shall be sent.

43532 **RETURN VALUE**

43533 Upon successful completion, the *mq\_notify()* function shall return a value of zero; otherwise, the  
 43534 function shall return a value of -1 and set *errno* to indicate the error.

43535 **ERRORS**

43536 The *mq\_notify()* function shall fail if:

43537 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

43538 [EBUSY] A process is already registered for notification by the message queue.

43539 The *mq\_notify()* function may fail if:

43540 [EINVAL] The *notification* argument is NULL and the process is currently not registered.

43541 **EXAMPLES**

43542 The following program registers a notification request for the message queue named in its  
 43543 command-line argument. Notification is performed by creating a thread. The thread executes a  
 43544 function which reads one message from the queue and then terminates the process.

```
43545 #include <pthread.h>
43546 #include <mqueue.h>
43547 #include <assert.h>
43548 #include <stdio.h>
43549 #include <stdlib.h>
43550 #include <unistd.h>

43551 static void /* Thread start function */
43552 tfunc(union sigval sv)
43553 {
```

```

43554     struct mq_attr attr;
43555     ssize_t nr;
43556     void *buf;
43557     mqd_t mqdes = *((mqd_t *) sv.sival_ptr);
43558
43558     /* Determine maximum msg size; allocate buffer to receive msg */
43559     if (mq_getattr(mqdes, &attr) == -1) {
43560         perror("mq_getattr");
43561         exit(EXIT_FAILURE);
43562     }
43563     buf = malloc(attr.mq_msgsize);
43564
43564     if (buf == NULL) {
43565         perror("malloc");
43566         exit(EXIT_FAILURE);
43567     }
43568
43568     nr = mq_receive(mqdes, buf, attr.mq_msgsize, NULL);
43569     if (nr == -1) {
43570         perror("mq_receive");
43571         exit(EXIT_FAILURE);
43572     }
43573
43573     printf("Read %ld bytes from message queue\n", (long) nr);
43574     free(buf);
43575     exit(EXIT_SUCCESS);          /* Terminate the process */
43576 }
43577
43577 int
43578 main(int argc, char *argv[])
43579 {
43580     mqd_t mqdes;
43581     struct sigevent not;
43582
43582     assert(argc == 2);
43583
43583     mqdes = mq_open(argv[1], O_RDONLY);
43584     if (mqdes == (mqd_t) -1) {
43585         perror("mq_open");
43586         exit(EXIT_FAILURE);
43587     }
43588
43588     not.sigev_notify = SIGEV_THREAD;
43589     not.sigev_notify_function = tfunc;
43590     not.sigev_notify_attributes = NULL;
43591     not.sigev_value.sival_ptr = &mqdes;    /* Arg. to thread func. */
43592     if (mq_notify(mqdes, &not) == -1) {
43593         perror("mq_notify");
43594         exit(EXIT_FAILURE);
43595     }
43596
43596     pause();    /* Process will be terminated by thread function */
43597 }

43607 **CHANGE HISTORY**

43608 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

43609 **Issue 6**43610 The *mq\_notify()* function is marked as part of the Message Passing option.43611 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
43612 implementation does not support the Message Passing option.43613 The *mq\_timedsend()* function is added to the SEE ALSO section for alignment with IEEE Std  
43614 1003.1d-1999.43615 **Issue 7**43616 SD5-XSH-ERN-38 is applied, adding the *mq\_timedreceive()* function to the DESCRIPTION.

43617 Austin Group Interpretation 1003.1-2001 #032 is applied, adding the [EINVAL] error.

43618 An example is added.

43619 **NAME**43620 mq\_open — open a message queue (**REALTIME**)43621 **SYNOPSIS**

```
43622 MSG #include <mqueue.h>
43623 mqd_t mq_open(const char *name, int oflag, ...);
```

43624 **DESCRIPTION**

43625 The *mq\_open()* function shall establish the connection between a process and a message queue  
 43626 with a message queue descriptor. It shall create an open message queue description that refers to  
 43627 the message queue, and a message queue descriptor that refers to that open message queue  
 43628 description. The message queue descriptor is used by other functions to refer to that message  
 43629 queue. The *name* argument points to a string naming a message queue. It is unspecified whether  
 43630 the name appears in the file system and is visible to other functions that take pathnames as  
 43631 arguments. The *name* argument conforms to the construction rules for a pathname, except that  
 43632 the interpretation of <slash> characters other than the leading <slash> character in *name* is  
 43633 implementation-defined, and that the length limits for the *name* argument are implementation-  
 43634 defined and need not be the same as the pathname limits {PATH\_MAX} and {NAME\_MAX}. If  
 43635 *name* begins with the <slash> character, then processes calling *mq\_open()* with the same value of  
 43636 *name* shall refer to the same message queue object, as long as that name has not been removed. If  
 43637 *name* does not begin with the <slash> character, the effect is implementation-defined. If the *name*  
 43638 argument is not the name of an existing message queue and creation is not requested, *mq\_open()*  
 43639 shall fail and return an error.

43640 A message queue descriptor may be implemented using a file descriptor, in which case  
 43641 applications can open up to at least {OPEN\_MAX} file and message queues.

43642 The *oflag* argument requests the desired receive and/or send access to the message queue. The  
 43643 requested access permission to receive messages or send messages shall be granted if the calling  
 43644 process would be granted read or write access, respectively, to an equivalently protected file.

43645 The value of *oflag* is the bitwise-inclusive OR of values from the following list. Applications  
 43646 shall specify exactly one of the first three values (access modes) below in the value of *oflag*:

43647 **O\_RDONLY** Open the message queue for receiving messages. The process can use the  
 43648 returned message queue descriptor with *mq\_receive()*, but not *mq\_send()*. A  
 43649 message queue may be open multiple times in the same or different processes  
 43650 for receiving messages.

43651 **O\_WRONLY** Open the queue for sending messages. The process can use the returned  
 43652 message queue descriptor with *mq\_send()* but not *mq\_receive()*. A message  
 43653 queue may be open multiple times in the same or different processes for  
 43654 sending messages.

43655 **O\_RDWR** Open the queue for both receiving and sending messages. The process can use  
 43656 any of the functions allowed for **O\_RDONLY** and **O\_WRONLY**. A message  
 43657 queue may be open multiple times in the same or different processes for  
 43658 sending messages.

43659 Any combination of the remaining flags may be specified in the value of *oflag*:

43660 **O\_CREAT** Create a message queue. It requires two additional arguments: *mode*, which  
 43661 shall be of type **mode\_t**, and *attr*, which shall be a pointer to an **mq\_attr**  
 43662 structure. If the pathname *name* has already been used to create a message  
 43663 queue that still exists, then this flag shall have no effect, except as noted under  
 43664 **O\_EXCL**. Otherwise, a message queue shall be created without any messages

**mq\_open()**

43665		in it. The user ID of the message queue shall be set to the effective user ID of the process. The group ID of the message queue shall be set to the effective group ID of the process; however, if the <i>name</i> argument is visible in the file system, the group ID may be set to the group ID of the containing directory. When bits in <i>mode</i> other than the file permission bits are specified, the effect is unspecified. If <i>attr</i> is NULL, the message queue shall be created with implementation-defined default message queue attributes. If <i>attr</i> is non-NULL and the calling process has appropriate privileges on <i>name</i> , the message queue <i>mq_maxmsg</i> and <i>mq_msgsize</i> attributes shall be set to the values of the corresponding members in the <b>mq_attr</b> structure referred to by <i>attr</i> . If <i>attr</i> is non-NULL, but the calling process does not have appropriate privileges on <i>name</i> , the <i>mq_open()</i> function shall fail and return an error without creating the message queue.
43666		
43667		
43668		
43669		
43670		
43671		
43672		
43673		
43674		
43675		
43676		
43677		
43678	O_EXCL	If O_EXCL and O_CREAT are set, <i>mq_open()</i> shall fail if the message queue <i>name</i> exists. The check for the existence of the message queue and the creation of the message queue if it does not exist shall be atomic with respect to other threads executing <i>mq_open()</i> naming the same <i>name</i> with O_EXCL and O_CREAT set. If O_EXCL is set and O_CREAT is not set, the result is undefined.
43679		
43680		
43681		
43682		
43683		
43684	O_NONBLOCK	Determines whether an <i>mq_send()</i> or <i>mq_receive()</i> waits for resources or messages that are not currently available, or fails with <i>errno</i> set to [EAGAIN]; see <i>mq_send()</i> and <i>mq_receive()</i> for details.
43685		
43686		
43687		The <i>mq_open()</i> function does not add or remove messages from the queue.
43688	<b>RETURN VALUE</b>	
43689		Upon successful completion, the function shall return a message queue descriptor; otherwise, the function shall return ( <b>mqd_t</b> )-1 and set <i>errno</i> to indicate the error.
43690		
43691	<b>ERRORS</b>	
43692		The <i>mq_open()</i> function shall fail if:
43693	[EACCES]	The message queue exists and the permissions specified by <i>oflag</i> are denied, or the message queue does not exist and permission to create the message queue is denied.
43694		
43695		
43696	[EEXIST]	O_CREAT and O_EXCL are set and the named message queue already exists.
43697	[EINTR]	The <i>mq_open()</i> function was interrupted by a signal.
43698	[EINVAL]	The <i>mq_open()</i> function is not supported for the given name.
43699	[EINVAL]	O_CREAT was specified in <i>oflag</i> , the value of <i>attr</i> is not NULL, and either <i>mq_maxmsg</i> or <i>mq_msgsize</i> was less than or equal to zero.
43700		
43701	[EMFILE]	Too many message queue descriptors or file descriptors are currently in use by this process.
43702		
43703	[ENFILE]	Too many message queues are currently open in the system.
43704	[ENOENT]	O_CREAT is not set and the named message queue does not exist.
43705	[ENOSPC]	There is insufficient space for the creation of the new message queue.

43706 If any of the following conditions occur, the *mq\_open()* function may return (**mqd\_t**)-1 and set  
43707 *errno* to the corresponding value.

43708 [ENAMETOOLONG]

43709 The length of the *name* argument exceeds {\_POSIX\_PATH\_MAX} on systems  
43710 XSI that do not support the XSI option or exceeds {\_XOPEN\_PATH\_MAX} on XSI  
43711 systems, or has a pathname component that is longer than  
43712 XSI {\_POSIX\_NAME\_MAX} on systems that do not support the XSI option or  
43713 longer than {\_XOPEN\_NAME\_MAX} on XSI systems.

#### 43714 EXAMPLES

43715 None.

#### 43716 APPLICATION USAGE

43717 None.

#### 43718 RATIONALE

43719 None.

#### 43720 FUTURE DIRECTIONS

43721 A future version might require the *mq\_open()* and *mq\_unlink()* functions to have semantics  
43722 similar to normal file system operations.

#### 43723 SEE ALSO

43724 *mq\_close()*, *mq\_getattr()*, *mq\_receive()*, *mq\_send()*, *mq\_setattr()*, *mq\_unlink()*, *msgctl()*, *msgget()*,  
43725 *msgrcv()*, *msgsnd()*

43726 XBD <mqqueue.h>

#### 43727 CHANGE HISTORY

43728 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### 43729 Issue 6

43730 The *mq\_open()* function is marked as part of the Message Passing option.

43731 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
43732 implementation does not support the Message Passing option.

43733 The *mq\_timedreceive()* and *mq\_timedsend()* functions are added to the SEE ALSO section for  
43734 alignment with IEEE Std 1003.1d-1999.

43735 The DESCRIPTION of O\_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

43736 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/62 is applied, updating the description of  
43737 the permission bits in the DESCRIPTION. The change is made for consistency with the  
43738 *shm\_open()* and *sem\_open()* functions.

#### 43739 Issue 7

43740 Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and  
43741 changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error.

43742 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

43743 SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the  
43744 user ID and group ID of the message queue.

**mq\_receive()**43745 **NAME**43746 `mq_receive`, `mq_timedreceive` — receive a message from a message queue (**REALTIME**)43747 **SYNOPSIS**

```

43748 MSG #include <mqqueue.h>
43749
43749 ssize_t mq_receive(mqd_t mqdes, char *msg_ptr, size_t msg_len,
43750                 unsigned *msg_prio);
43751
43751 #include <mqqueue.h>
43752 #include <time.h>
43753
43753 ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
43754                       size_t msg_len, unsigned *restrict msg_prio,
43755                       const struct timespec *restrict abstime);

```

43756 **DESCRIPTION**

43757 The `mq_receive()` function shall receive the oldest of the highest priority message(s) from the  
 43758 message queue specified by `mqdes`. If the size of the buffer in bytes, specified by the `msg_len`  
 43759 argument, is less than the `mq_msgsize` attribute of the message queue, the function shall fail and  
 43760 return an error. Otherwise, the selected message shall be removed from the queue and copied to  
 43761 the buffer pointed to by the `msg_ptr` argument.

43762 If the value of `msg_len` is greater than {SSIZE\_MAX}, the result is implementation-defined.

43763 If the argument `msg_prio` is not NULL, the priority of the selected message shall be stored in the  
 43764 location referenced by `msg_prio`.

43765 If the specified message queue is empty and O\_NONBLOCK is not set in the message queue  
 43766 description associated with `mqdes`, `mq_receive()` shall block until a message is enqueued on the  
 43767 message queue or until `mq_receive()` is interrupted by a signal. If more than one thread is waiting  
 43768 to receive a message when a message arrives at an empty queue and the Priority Scheduling  
 43769 option is supported, then the thread of highest priority that has been waiting the longest shall be  
 43770 selected to receive the message. Otherwise, it is unspecified which waiting thread receives the  
 43771 message. If the specified message queue is empty and O\_NONBLOCK is set in the message  
 43772 queue description associated with `mqdes`, no message shall be removed from the queue, and  
 43773 `mq_receive()` shall return an error.

43774 The `mq_timedreceive()` function shall receive the oldest of the highest priority messages from the  
 43775 message queue specified by `mqdes` as described for the `mq_receive()` function. However, if  
 43776 O\_NONBLOCK was not specified when the message queue was opened via the `mq_open()`  
 43777 function, and no message exists on the queue to satisfy the receive, the wait for such a message  
 43778 shall be terminated when the specified timeout expires. If O\_NONBLOCK is set, this function is  
 43779 equivalent to `mq_receive()`.

43780 The timeout expires when the absolute time specified by `abstime` passes, as measured by the  
 43781 clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
 43782 `abstime`), or if the absolute time specified by `abstime` has already been passed at the time of the  
 43783 call.

43784 The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall  
 43785 be the resolution of the clock on which it is based. The `timespec` argument is defined in the  
 43786 `<time.h>` header.

43787 Under no circumstance shall the operation fail with a timeout if a message can be removed from  
 43788 the message queue immediately. The validity of the `abstime` parameter need not be checked if a  
 43789 message can be removed from the message queue immediately.

43790 **RETURN VALUE**

43791 Upon successful completion, the *mq\_receive()* and *mq\_timedreceive()* functions shall return the  
 43792 length of the selected message in bytes and the message shall be removed from the queue.  
 43793 Otherwise, no message shall be removed from the queue, the functions shall return a value of -1,  
 43794 and set *errno* to indicate the error.

43795 **ERRORS**

43796 These functions shall fail if:

- 43797 [EAGAIN] O\_NONBLOCK was set in the message description associated with *mqdes*, and  
 43798 the specified message queue is empty.
- 43799 [EBADF] The *mqdes* argument is not a valid message queue descriptor open for reading.
- 43800 [EMSGSIZE] The specified message buffer size, *msg\_len*, is less than the message size  
 43801 attribute of the message queue.
- 43802 [EINTR] The *mq\_receive()* or *mq\_timedreceive()* operation was interrupted by a signal.
- 43803 [EINVAL] The process or thread would have blocked, and the *abstime* parameter  
 43804 specified a nanoseconds field value less than zero or greater than or equal to  
 43805 1 000 million.
- 43806 [ETIMEDOUT] The O\_NONBLOCK flag was not set when the message queue was opened,  
 43807 but no message arrived on the queue before the specified timeout expired.

43808 These functions may fail if:

- 43809 [EBADMSG] The implementation has detected a data corruption problem with the  
 43810 message.

43811 **EXAMPLES**

43812 None.

43813 **APPLICATION USAGE**

43814 None.

43815 **RATIONALE**

43816 None.

43817 **FUTURE DIRECTIONS**

43818 None.

43819 **SEE ALSO**

43820 *mq\_open()*, *mq\_send()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*, *time()*

43821 XBD [<mqqueue.h>](#), [<time.h>](#)

43822 **CHANGE HISTORY**

43823 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

43824 **Issue 6**

43825 The *mq\_receive()* function is marked as part of the Message Passing option.

43826 The Open Group Corrigendum U021/4 is applied. The DESCRIPTION is changed to refer to  
 43827 *msg\_len* rather than *maxsize*.

43828 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 43829 implementation does not support the Message Passing option.

43830 The following new requirements on POSIX implementations derive from alignment with the  
 43831 Single UNIX Specification:

**mq\_receive()**

- 43832                   • In this function it is possible for the return value to exceed the range of the type **ssize\_t**  
43833                   (since **size\_t** has a larger range of positive values than **ssize\_t**). A sentence restricting the  
43834                   size of the **size\_t** object is added to the description to resolve this conflict.
- 43835                   The *mq\_timedreceive()* function is added for alignment with IEEE Std 1003.1d-1999.
- 43836                   The **restrict** keyword is added to the *mq\_timedreceive()* prototype for alignment with the  
43837                   ISO/IEC 9899: 1999 standard.
- 43838                   IEEE PASC Interpretation 1003.1 #109 is applied, correcting the return type for *mq\_timedreceive()*  
43839                   from **int** to **ssize\_t**.
- 43840   **Issue 7**
- 43841                   The *mq\_timedreceive()* function is moved from the Timeouts option to the Base.
- 43842                   Functionality relating to the Timers option is moved to the Base.

## 43843 NAME

43844 mq\_send, mq\_timedsend — send a message to a message queue (REALTIME)

## 43845 SYNOPSIS

```

43846 MSG #include <mqueue.h>
43847 int mq_send(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
43848             unsigned msg_prio);
43849 #include <mqueue.h>
43850 #include <time.h>
43851 int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
43852                 unsigned msg_prio, const struct timespec *abstime);

```

## 43853 DESCRIPTION

43854 The *mq\_send()* function shall add the message pointed to by the argument *msg\_ptr* to the  
 43855 message queue specified by *mqdes*. The *msg\_len* argument specifies the length of the message, in  
 43856 bytes, pointed to by *msg\_ptr*. The value of *msg\_len* shall be less than or equal to the *mq\_msgsize*  
 43857 attribute of the message queue, or *mq\_send()* shall fail.

43858 If the specified message queue is not full, *mq\_send()* shall behave as if the message is inserted  
 43859 into the message queue at the position indicated by the *msg\_prio* argument. A message with a  
 43860 larger numeric value of *msg\_prio* shall be inserted before messages with lower values of  
 43861 *msg\_prio*. A message shall be inserted after other messages in the queue, if any, with equal  
 43862 *msg\_prio*. The value of *msg\_prio* shall be less than {MQ\_PRIO\_MAX}.

43863 If the specified message queue is full and O\_NONBLOCK is not set in the message queue  
 43864 description associated with *mqdes*, *mq\_send()* shall block until space becomes available to  
 43865 enqueue the message, or until *mq\_send()* is interrupted by a signal. If more than one thread is  
 43866 waiting to send when space becomes available in the message queue and the Priority Scheduling  
 43867 option is supported, then the thread of the highest priority that has been waiting the longest  
 43868 shall be unblocked to send its message. Otherwise, it is unspecified which waiting thread is  
 43869 unblocked. If the specified message queue is full and O\_NONBLOCK is set in the message  
 43870 queue description associated with *mqdes*, the message shall not be queued and *mq\_send()* shall  
 43871 return an error.

43872 The *mq\_timedsend()* function shall add a message to the message queue specified by *mqdes* in the  
 43873 manner defined for the *mq\_send()* function. However, if the specified message queue is full and  
 43874 O\_NONBLOCK is not set in the message queue description associated with *mqdes*, the wait for  
 43875 sufficient room in the queue shall be terminated when the specified timeout expires. If  
 43876 O\_NONBLOCK is set in the message queue description, this function shall be equivalent to  
 43877 *mq\_send()*.

43878 The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the  
 43879 clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
 43880 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the  
 43881 call.

43882 The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall  
 43883 be the resolution of the clock on which it is based. The *timespec* argument is defined in the  
 43884 **<time.h>** header.

43885 Under no circumstance shall the operation fail with a timeout if there is sufficient room in the  
 43886 queue to add the message immediately. The validity of the *abstime* parameter need not be  
 43887 checked when there is sufficient room in the queue.

**mq\_send()**43888 **RETURN VALUE**

43889 Upon successful completion, the *mq\_send()* and *mq\_timedsend()* functions shall return a value of  
 43890 zero. Otherwise, no message shall be enqueued, the functions shall return *-1*, and *errno* shall be  
 43891 set to indicate the error.

43892 **ERRORS**

43893 The *mq\_send()* and *mq\_timedsend()* functions shall fail if:

- 43894 [EAGAIN] The O\_NONBLOCK flag is set in the message queue description associated  
 43895 with *mqdes*, and the specified message queue is full.
- 43896 [EBADF] The *mqdes* argument is not a valid message queue descriptor open for writing.
- 43897 [EINTR] A signal interrupted the call to *mq\_send()* or *mq\_timedsend()*.
- 43898 [EINVAL] The value of *msg\_prio* was outside the valid range.
- 43899 [EINVAL] The process or thread would have blocked, and the *abstime* parameter  
 43900 specified a nanoseconds field value less than zero or greater than or equal to  
 43901 1 000 million.
- 43902 [EMSGSIZE] The specified message length, *msg\_len*, exceeds the message size attribute of  
 43903 the message queue.
- 43904 [ETIMEDOUT] The O\_NONBLOCK flag was not set when the message queue was opened,  
 43905 but the timeout expired before the message could be added to the queue.

43906 **EXAMPLES**

43907 None.

43908 **APPLICATION USAGE**

43909 The value of the symbol {MQ\_PRIO\_MAX} limits the number of priority levels supported by the  
 43910 application. Message priorities range from 0 to {MQ\_PRIO\_MAX}-1.

43911 **RATIONALE**

43912 None.

43913 **FUTURE DIRECTIONS**

43914 None.

43915 **SEE ALSO**

43916 *mq\_open()*, *mq\_receive()*, *mq\_setattr()*, *time()*

43917 XBD <mqqueue.h>, <time.h>

43918 **CHANGE HISTORY**

43919 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

43920 **Issue 6**

43921 The *mq\_send()* function is marked as part of the Message Passing option.

43922 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 43923 implementation does not support the Message Passing option.

43924 The *mq\_timedsend()* function is added for alignment with IEEE Std 1003.1d-1999.

43925 **Issue 7**

43926 The *mq\_timedsend()* function is moved from the Timeouts option to the Base.

43927 Functionality relating to the Timers option is moved to the Base.

43928 **NAME**43929 mq\_setattr — set message queue attributes (**REALTIME**)43930 **SYNOPSIS**

```
43931 MSG #include <mqqueue.h>
43932 int mq_setattr(mqd_t mqdes, const struct mq_attr *restrict mqstat,
43933 struct mq_attr *restrict omqstat);
```

43934 **DESCRIPTION**

43935 The *mq\_setattr()* function shall set attributes associated with the open message queue  
 43936 description referenced by the message queue descriptor specified by *mqdes*.

43937 The message queue attributes corresponding to the following members defined in the **mq\_attr**  
 43938 structure shall be set to the specified values upon successful completion of *mq\_setattr()*:

43939 *mq\_flags* The value of this member is the bitwise-logical OR of zero or more of  
 43940 O\_NONBLOCK and any implementation-defined flags.

43941 The values of the *mq\_maxmsg*, *mq\_msgsize*, and *mq\_curmsgs* members of the **mq\_attr** structure  
 43942 shall be ignored by *mq\_setattr()*.

43943 If *omqstat* is non-NULL, the *mq\_setattr()* function shall store, in the location referenced by  
 43944 *omqstat*, the previous message queue attributes and the current queue status. These values shall  
 43945 be the same as would be returned by a call to *mq\_getattr()* at that point.

43946 **RETURN VALUE**

43947 Upon successful completion, the function shall return a value of zero and the attributes of the  
 43948 message queue shall have been changed as specified.

43949 Otherwise, the message queue attributes shall be unchanged, and the function shall return a  
 43950 value of -1 and set *errno* to indicate the error.

43951 **ERRORS**

43952 The *mq\_setattr()* function shall fail if:

43953 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

43954 **EXAMPLES**

43955 None.

43956 **APPLICATION USAGE**

43957 None.

43958 **RATIONALE**

43959 None.

43960 **FUTURE DIRECTIONS**

43961 None.

43975 **NAME**43976 `mq_timedreceive` — receive a message from a message queue (**ADVANCED REALTIME**)43977 **SYNOPSIS**

```
43978 MSG #include <mqueue.h>
43979 #include <time.h>
43980
43980 ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
43981 size_t msg_len, unsigned *restrict msg_prio,
43982 const struct timespec *restrict abstime);
```

43983 **DESCRIPTION**43984 Refer to [mq\\_receive\(\)](#).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**mq\_timedsend()**43985 **NAME**43986 `mq_timedsend` — send a message to a message queue (**ADVANCED REALTIME**)43987 **SYNOPSIS**

```
43988 MSG #include <mqueue.h>
43989 #include <time.h>
43990 int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
43991 unsigned msg_prio, const struct timespec *abstime);
```

43992 **DESCRIPTION**43993 Refer to [mq\\_send\(\)](#).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

43994 **NAME**43995 mq\_unlink — remove a message queue (**REALTIME**)43996 **SYNOPSIS**

```
43997 MSG #include <mqueue.h>
43998 int mq_unlink(const char *name);
```

43999 **DESCRIPTION**

44000 The *mq\_unlink()* function shall remove the message queue named by the string name. If one or  
 44001 more processes have the message queue open when *mq\_unlink()* is called, destruction of the  
 44002 message queue shall be postponed until all references to the message queue have been closed.  
 44003 However, the *mq\_unlink()* call need not block until all references have been closed; it may return  
 44004 immediately.

44005 After a successful call to *mq\_unlink()*, reuse of the name shall subsequently cause *mq\_open()* to  
 44006 behave as if no message queue of this name exists (that is, *mq\_open()* will fail if **O\_CREAT** is not  
 44007 set, or will create a new message queue if **O\_CREAT** is set).

44008 **RETURN VALUE**

44009 Upon successful completion, the function shall return a value of zero. Otherwise, the named  
 44010 message queue shall be unchanged by this function call, and the function shall return a value of  
 44011  $-1$  and set *errno* to indicate the error.

44012 **ERRORS**44013 The *mq\_unlink()* function shall fail if:

44014 [EACCES] Permission is denied to unlink the named message queue.

44015 [ENOENT] The named message queue does not exist.

44016 The *mq\_unlink()* function may fail if:

44017 [ENAMETOOLONG]

44018 The length of the *name* argument exceeds  $\{\_POSIX\_PATH\_MAX\}$  on systems  
 44019 XSI that do not support the XSI option or exceeds  $\{\_XOPEN\_PATH\_MAX\}$  on XSI  
 44020 systems, or has a pathname component that is longer than  
 44021 XSI  $\{\_POSIX\_NAME\_MAX\}$  on systems that do not support the XSI option or  
 44022 longer than  $\{\_XOPEN\_NAME\_MAX\}$  on XSI systems. A call to *mq\_unlink()*  
 44023 with a *name* argument that contains the same message queue name as was  
 44024 previously used in a successful *mq\_open()* call shall not give an  
 44025 [ENAMETOOLONG] error.

44026 **EXAMPLES**

44027 None.

44028 **APPLICATION USAGE**

44029 None.

44030 **RATIONALE**

44031 None.

44032 **FUTURE DIRECTIONS**

44033 A future version might require the *mq\_open()* and *mq\_unlink()* functions to have semantics  
 44034 similar to normal file system operations.

**mq\_unlink()**44035 **SEE ALSO**44036 *mq\_close()*, *mq\_open()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*44037 XBD <[mqqueue.h](#)>44038 **CHANGE HISTORY**

44039 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

44040 **Issue 6**44041 The *mq\_unlink()* function is marked as part of the Message Passing option.

44042 The Open Group Corrigendum U021/5 is applied, clarifying that upon unsuccessful completion, the named message queue is unchanged by this function.

44044 The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

44046 **Issue 7**

44047 Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error .

44049 Austin Group Interpretation 1003.1-2001 #141 is applied.

*System Interfaces***rand48()**44050 **NAME**

44051           rand48 — generate uniformly distributed pseudo-random signed long integers

44052 **SYNOPSIS**44053 XSI       #include <stdlib.h>  
44054           long rand48(void);44055 **DESCRIPTION**44056           Refer to *drand48()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**msgctl()**44057 **NAME**

44058 msgctl — XSI message control operations

44059 **SYNOPSIS**

```
44060 XSI #include <sys/msg.h>
44061 int msgctl(int msqid, int cmd, struct msqid_ds *buf);
```

44062 **DESCRIPTION**

44063 The *msgctl()* function operates on XSI message queues (see XBD Section 3.224, on page 69). It is  
 44064 unspecified whether this function interoperates with the realtime interprocess communication  
 44065 facilities defined in Section 2.8 (on page 497).

44066 The *msgctl()* function shall provide message control operations as specified by *cmd*. The  
 44067 following values for *cmd*, and the message control operations they specify, are:

44068 **IPC\_STAT** Place the current value of each member of the **msqid\_ds** data structure  
 44069 associated with *msqid* into the structure pointed to by *buf*. The contents of this  
 44070 structure are defined in **<sys/msg.h>**.

44071 **IPC\_SET** Set the value of the following members of the **msqid\_ds** data structure  
 44072 associated with *msqid* to the corresponding value found in the structure  
 44073 pointed to by *buf*:

```
44074 msg_perm.uid
44075 msg_perm.gid
44076 msg_perm.mode
44077 msg_qbytes
```

44078 **IPC\_SET** can only be executed by a process with appropriate privileges or that  
 44079 has an effective user ID equal to the value of **msg\_perm.cuid** or  
 44080 **msg\_perm.uid** in the **msqid\_ds** data structure associated with *msqid*. Only a  
 44081 process with appropriate privileges can raise the value of **msg\_qbytes**.

44082 **IPC\_RMID** Remove the message queue identifier specified by *msqid* from the system and  
 44083 destroy the message queue and **msqid\_ds** data structure associated with it.  
 44084 **IPC\_RMID** can only be executed by a process with appropriate privileges or  
 44085 one that has an effective user ID equal to the value of **msg\_perm.cuid** or  
 44086 **msg\_perm.uid** in the **msqid\_ds** data structure associated with *msqid*.

44087 **RETURN VALUE**

44088 Upon successful completion, *msgctl()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 44089 indicate the error.

44090 **ERRORS**

44091 The *msgctl()* function shall fail if:

44092 **[EACCES]** The argument *cmd* is **IPC\_STAT** and the calling process does not have read  
 44093 permission; see Section 2.7 (on page 496).

44094 **[EINVAL]** The value of *msqid* is not a valid message queue identifier; or the value of *cmd*  
 44095 is not a valid command.

44096 **[EPERM]** The argument *cmd* is **IPC\_RMID** or **IPC\_SET** and the effective user ID of the  
 44097 calling process is not equal to that of a process with appropriate privileges and  
 44098 it is not equal to the value of **msg\_perm.cuid** or **msg\_perm.uid** in the data  
 44099 structure associated with *msqid*.

44100 [EPERM] The argument *cmd* is IPC\_SET, an attempt is being made to increase to the  
 44101 value of **msg\_qbytes**, and the effective user ID of the calling process does not  
 44102 have appropriate privileges.

#### 44103 EXAMPLES

44104 None.

#### 44105 APPLICATION USAGE

44106 The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
 44107 (IPC). Application developers who need to use IPC should design their applications so that  
 44108 modules using the IPC routines described in [Section 2.7](#) (on page 496) can be easily modified to  
 44109 use the alternative interfaces.

#### 44110 RATIONALE

44111 None.

#### 44112 FUTURE DIRECTIONS

44113 None.

#### 44114 SEE ALSO

44115 [Section 2.7](#) (on page 496), [Section 2.8](#) (on page 497), [mq\\_close\(\)](#), [mq\\_getattr\(\)](#), [mq\\_notify\(\)](#),

#### 44118 CHANGE HISTORY

44119 First released in Issue 2. Derived from Issue 2 of the SVID.

#### 44120 Issue 5

44121 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
 44122 DIRECTIONS to a new APPLICATION USAGE section.

**msgget()**44123 **NAME**44124 `msgget` — get the XSI message queue identifier44125 **SYNOPSIS**

```
44126 XSI #include <sys/msg.h>
44127 int msgget(key_t key, int msgflg);
```

44128 **DESCRIPTION**

44129 The `msgget()` function operates on XSI message queues (see XBD Section 3.224, on page 69). It is  
 44130 unspecified whether this function interoperates with the realtime interprocess communication  
 44131 facilities defined in Section 2.8 (on page 497).

44132 The `msgget()` function shall return the message queue identifier associated with the argument  
 44133 `key`.

44134 A message queue identifier, associated message queue, and data structure (see `<sys/msg.h>`),  
 44135 shall be created for the argument `key` if one of the following is true:

- 44136 • The argument `key` is equal to `IPC_PRIVATE`.
- 44137 • The argument `key` does not already have a message queue identifier associated with it, and  
 44138 (`msgflg & IPC_CREAT`) is non-zero.

44139 Upon creation, the data structure associated with the new message queue identifier shall be  
 44140 initialized as follows:

- 44141 • `msg_perm.cuid`, `msg_perm.uid`, `msg_perm.cgid`, and `msg_perm.gid` shall be set equal to  
 44142 the effective user ID and effective group ID, respectively, of the calling process.
- 44143 • The low-order 9 bits of `msg_perm.mode` shall be set equal to the low-order 9 bits of `msgflg`.
- 44144 • `msg_qnum`, `msg_lspid`, `msg_lrpid`, `msg_stime`, and `msg_rtime` shall be set equal to 0.
- 44145 • `msg_ctime` shall be set equal to the current time.
- 44146 • `msg_qbytes` shall be set equal to the system limit.

44147 **RETURN VALUE**

44148 Upon successful completion, `msgget()` shall return a non-negative integer, namely a message  
 44149 queue identifier. Otherwise, it shall return `-1` and set `errno` to indicate the error.

44150 **ERRORS**

44151 The `msgget()` function shall fail if:

- |       |          |   |
|-------|----------|---|
| 44152 | [EACCES] | A message queue identifier exists for the argument <code>key</code> , but operation permission as specified by the low-order 9 bits of <code>msgflg</code> would not be granted; see Section 2.7 (on page 496). |
| 44153 |          |   |
| 44154 |          |   |
| 44155 | [EEXIST] | A message queue identifier exists for the argument <code>key</code> but $((msgflg \& IPC\_CREAT) \&\& (msgflg \& IPC\_EXCL))$ is non-zero.  |
| 44156 |          |   |
| 44157 | [ENOENT] | A message queue identifier does not exist for the argument <code>key</code> and $(msgflg \& IPC\_CREAT)$ is 0.  |
| 44158 |          |   |
| 44159 | [ENOSPC] | A message queue identifier is to be created but the system-imposed limit on the maximum number of allowed message queue identifiers system-wide would be exceeded.  |
| 44160 |          |   |
| 44161 |          |   |

44162 **EXAMPLES**

44163 None.

44164 **APPLICATION USAGE**

44165 The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
 44166 (IPC). Application developers who need to use IPC should design their applications so that  
 44167 modules using the IPC routines described in [Section 2.7](#) (on page 496) can be easily modified to  
 44168 use the alternative interfaces.

44169 **RATIONALE**

44170 None.

44171 **FUTURE DIRECTIONS**

44172 None.

44176 XBD [Section 3.224](#) (on page 69), [<sys/msg.h>](#)44177 **CHANGE HISTORY**

44178 First released in Issue 2. Derived from Issue 2 of the SVID.

44179 **Issue 5**

44180 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
 44181 DIRECTIONS to a new APPLICATION USAGE section.

**msgrcv()**44182 **NAME**44183 `msgrcv` — XSI message receive operation44184 **SYNOPSIS**

```
44185 XSI #include <sys/msg.h>
44186
44186 ssize_t msgrcv(int msqid, void *msgp, size_t msgsz, long msgtyp,
44187               int msgflg);
```

44188 **DESCRIPTION**

44189 The `msgrcv()` function operates on XSI message queues (see XBD Section 3.224, on page 69). It is  
 44190 unspecified whether this function interoperates with the realtime interprocess communication  
 44191 facilities defined in Section 2.8 (on page 497).

44192 The `msgrcv()` function shall read a message from the queue associated with the message queue  
 44193 identifier specified by `msqid` and place it in the user-defined buffer pointed to by `msgp`.

44194 The application shall ensure that the argument `msgp` points to a user-defined buffer that contains  
 44195 first a field of type **long** specifying the type of the message, and then a data portion that holds  
 44196 the data bytes of the message. The structure below is an example of what this user-defined  
 44197 buffer might look like:

```
44198 struct mymsg {
44199     long    mtype;    /* Message type. */
44200     char    mtext[1]; /* Message text. */
44201 }
```

44202 The structure member `mtype` is the received message's type as specified by the sending process.

44203 The structure member `mtext` is the text of the message.

44204 The argument `msgsz` specifies the size in bytes of `mtext`. The received message shall be truncated  
 44205 to `msgsz` bytes if it is larger than `msgsz` and (`msgflg & MSG_NOERROR`) is non-zero. The  
 44206 truncated part of the message shall be lost and no indication of the truncation shall be given to  
 44207 the calling process.

44208 If the value of `msgsz` is greater than `{SSIZE_MAX}`, the result is implementation-defined.

44209 The argument `msgtyp` specifies the type of message requested as follows:

- 44210 • If `msgtyp` is 0, the first message on the queue shall be received.
- 44211 • If `msgtyp` is greater than 0, the first message of type `msgtyp` shall be received.
- 44212 • If `msgtyp` is less than 0, the first message of the lowest type that is less than or equal to the  
 44213 absolute value of `msgtyp` shall be received.

44214 The argument `msgflg` specifies the action to be taken if a message of the desired type is not on the  
 44215 queue. These are as follows:

- 44216 • If (`msgflg & IPC_NOWAIT`) is non-zero, the calling thread shall return immediately with a  
 44217 return value of `-1` and `errno` set to `[ENOMSG]`.
- 44218 • If (`msgflg & IPC_NOWAIT`) is 0, the calling thread shall suspend execution until one of the  
 44219 following occurs:
  - 44220 — A message of the desired type is placed on the queue.
  - 44221 — The message queue identifier `msqid` is removed from the system; when this occurs,  
 44222 `errno` shall be set equal to `[EIDRM]` and `-1` shall be returned.

44223 — The calling thread receives a signal that is to be caught; in this case a message is not  
 44224 received and the calling thread resumes execution in the manner prescribed in  
 44225 *sigaction()*.

44226 Upon successful completion, the following actions are taken with respect to the data structure  
 44227 associated with *msqid*:

- 44228 • **msg\_qnum** shall be decremented by 1.
- 44229 • **msg\_lrpid** shall be set equal to the process ID of the calling process.
- 44230 • **msg\_rtime** shall be set equal to the current time.

#### 44231 RETURN VALUE

44232 Upon successful completion, *msgrcv()* shall return a value equal to the number of bytes actually  
 44233 placed into the buffer *mtext*. Otherwise, no message shall be received, *msgrcv()* shall return  
 44234 (**ssize\_t**)-1, and *errno* shall be set to indicate the error.

#### 44235 ERRORS

44236 The *msgrcv()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 44237 | [E2BIG]  | The value of <i>mtext</i> is greater than <i>msgsz</i> and ( <i>msgflg</i> & MSG_NOERROR) is 0.         |
| 44238 | [EACCES] | Operation permission is denied to the calling process; see <a href="#">Section 2.7</a> (on page 496).   |
| 44239 |          |   |
| 44240 | [EIDRM]  | The message queue identifier <i>msqid</i> is removed from the system.                                   |
| 44241 | [EINTR]  | The <i>msgrcv()</i> function was interrupted by a signal.   |
| 44242 | [EINVAL] | <i>msqid</i> is not a valid message queue identifier.   |
| 44243 | [ENOMSG] | The queue does not contain a message of the desired type and ( <i>msgflg</i> & IPC_NOWAIT) is non-zero. |
| 44244 |          |   |

#### 44245 EXAMPLES

##### 44246 Receiving a Message

44247 The following example receives the first message on the queue (based on the value of the *msgtyp*  
 44248 argument, 0). The queue is identified by the *msqid* argument (assuming that the value has  
 44249 previously been set). This call specifies that an error should be reported if no message is  
 44250 available, but not if the message is too large. The message size is calculated directly using the  
 44251 *sizeof* operator.

```

44252 #include <sys/msg.h>
44253 ...
44254 int result;
44255 int msqid;
44256 struct message {
44257     long type;
44258     char text[20];
44259 } msg;
44260 long msgtyp = 0;
44261 ...
44262 result = msgrcv(msqid, (void *) &msg, sizeof(msg.text),
44263               msgtyp, MSG_NOERROR | IPC_NOWAIT);
  
```

**msgrcv()**44264 **APPLICATION USAGE**

44265 The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
 44266 (IPC). Application developers who need to use IPC should design their applications so that  
 44267 modules using the IPC routines described in [Section 2.7](#) (on page 496) can be easily modified to  
 44268 use the alternative interfaces.

44269 **RATIONALE**

44270 None.

44271 **FUTURE DIRECTIONS**

44272 None.

44273 **SEE ALSO**

44274 [Section 2.7](#) (on page 496), [Section 2.8](#) (on page 497), [mq\\_close\(\)](#), [mq\\_getattr\(\)](#), [mq\\_notify\(\)](#),

 44276 [sigaction\(\)](#)

44277 XBD [Section 3.224](#) (on page 69), [<sys/msg.h>](#)

44278 **CHANGE HISTORY**

44279 First released in Issue 2. Derived from Issue 2 of the SVID.

44280 **Issue 5**

44281 The type of the return value is changed from **int** to **ssize\_t**, and a warning is added to the  
 44282 DESCRIPTION about values of *msgsz* larger the {SSIZE\_MAX}.

44283 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
 44284 DIRECTIONS to the APPLICATION USAGE section.

44285 **Issue 6**

44286 The normative text is updated to avoid use of the term “must” for application requirements.

44287 **NAME**

44288 msgsnd — XSI message send operation

44289 **SYNOPSIS**

```
44290 XSI #include <sys/msg.h>
44291 int msgsnd(int msqid, const void *msgp, size_t msgsz, int msgflg);
```

44292 **DESCRIPTION**

44293 The *msgsnd()* function operates on XSI message queues (see XBD Section 3.224, on page 69). It is  
 44294 unspecified whether this function interoperates with the realtime interprocess communication  
 44295 facilities defined in Section 2.8 (on page 497).

44296 The *msgsnd()* function shall send a message to the queue associated with the message queue  
 44297 identifier specified by *msqid*.

44298 The application shall ensure that the argument *msgp* points to a user-defined buffer that contains  
 44299 first a field of type **long** specifying the type of the message, and then a data portion that holds  
 44300 the data bytes of the message. The structure below is an example of what this user-defined  
 44301 buffer might look like:

```
44302 struct mymsg {
44303     long    mtype;           /* Message type. */
44304     char    mtext[1];      /* Message text. */
44305 }
```

44306 The structure member *mtype* is a non-zero positive type **long** that can be used by the receiving  
 44307 process for message selection.

44308 The structure member *mtext* is any text of length *msgsz* bytes. The argument *msgsz* can range  
 44309 from 0 to a system-imposed maximum.

44310 The argument *msgflg* specifies the action to be taken if one or more of the following is true:

- 44311 • The number of bytes already on the queue is equal to **msg\_qbytes**; see `<sys/msg.h>`.
- 44312 • The total number of messages on all queues system-wide is equal to the system-imposed  
 44313 limit.

44314 These actions are as follows:

- 44315 • If (*msgflg* & `IPC_NOWAIT`) is non-zero, the message shall not be sent and the calling  
 44316 thread shall return immediately.
- 44317 • If (*msgflg* & `IPC_NOWAIT`) is 0, the calling thread shall suspend execution until one of the  
 44318 following occurs:
  - 44319 — The condition responsible for the suspension no longer exists, in which case the  
 44320 message is sent.
  - 44321 — The message queue identifier *msqid* is removed from the system; when this occurs,  
 44322 *errno* shall be set equal to `[EIDRM]` and `-1` shall be returned.
  - 44323 — The calling thread receives a signal that is to be caught; in this case the message is not  
 44324 sent and the calling thread resumes execution in the manner prescribed in *sigaction()*.

**msgsnd()**

44325 Upon successful completion, the following actions are taken with respect to the data structure  
44326 associated with *msqid*; see `<sys/msg.h>`:

- 44327 • **msg\_qnum** shall be incremented by 1.
- 44328 • **msg\_lspid** shall be set equal to the process ID of the calling process.
- 44329 • **msg\_stime** shall be set equal to the current time.

**RETURN VALUE**

44331 Upon successful completion, *msgsnd()* shall return 0; otherwise, no message shall be sent,  
44332 *msgsnd()* shall return -1, and *errno* shall be set to indicate the error.

**ERRORS**

44334 The *msgsnd()* function shall fail if:

- 44335 [EACCES] Operation permission is denied to the calling process; see [Section 2.7](#) (on page  
44336 496).
- 44337 [EAGAIN] The message cannot be sent for one of the reasons cited above and (*msgflg* &  
44338 IPC\_NOWAIT) is non-zero.
- 44339 [EIDRM] The message queue identifier *msqid* is removed from the system.
- 44340 [EINTR] The *msgsnd()* function was interrupted by a signal.
- 44341 [EINVAL] The value of *msqid* is not a valid message queue identifier, or the value of  
44342 *mtype* is less than 1; or the value of *msgsz* is less than 0 or greater than the  
44343 system-imposed limit.

**EXAMPLES****Sending a Message**

44345 The following example sends a message to the queue identified by the *msqid* argument  
44346 (assuming that value has previously been set). This call specifies that an error should be  
44347 reported if no message is available. The message size is calculated directly using the *sizeof*  
44348 operator.  
44349

```
44350 #include <sys/msg.h>
44351 ...
44352 int result;
44353 int msqid;
44354 struct message {
44355     long type;
44356     char text[20];
44357 } msg;
44358 msg.type = 1;
44359 strcpy(msg.text, "This is message 1");
44360 ...
44361 result = msgsnd(msqid, (void *) &msg, sizeof(msg.text), IPC_NOWAIT);
```

**APPLICATION USAGE**

44362 The POSIX Realtime Extension defines alternative interfaces for interprocess communication  
44363 (IPC). Application developers who need to use IPC should design their applications so that  
44364 modules using the IPC routines described in [Section 2.7](#) (on page 496) can be easily modified to  
44365 use the alternative interfaces.  
44366

# msync()

44383 **NAME**

44384 `msync` — synchronize memory with physical storage

44385 **SYNOPSIS**

```
44386 XSI|SIO #include <sys/mman.h>
44387 int msync(void *addr, size_t len, int flags);
```

44388 **DESCRIPTION**

44389 The `msync()` function shall write all modified data to permanent storage locations, if any, in  
 44390 those whole pages containing any part of the address space of the process starting at address  
 44391 `addr` and continuing for `len` bytes. If no such storage exists, `msync()` need not have any effect. If  
 44392 requested, the `msync()` function shall then invalidate cached copies of data.

44393 The implementation may require that `addr` be a multiple of the page size as returned by  
 44394 `sysconf()`.

44395 For mappings to files, the `msync()` function shall ensure that all write operations are completed  
 44396 as defined for synchronized I/O data integrity completion. It is unspecified whether the  
 44397 implementation also writes out other file attributes. When the `msync()` function is called on  
 44398 MAP\_PRIVATE mappings, any modified data shall not be written to the underlying object and  
 44399 shall not cause such data to be made visible to other processes. It is unspecified whether data in  
 44400 SHM|TYM MAP\_PRIVATE mappings has any permanent storage locations. The effect of `msync()` on a  
 44401 shared memory object or a typed memory object is unspecified. The behavior of this function is  
 44402 unspecified if the mapping was not established by a call to `mmap()`.

44403 The `flags` argument is constructed from the bitwise-inclusive OR of one or more of the following  
 44404 flags defined in the `<sys/mman.h>` header:

Symbolic Constant	Description
MS_ASYNC	Perform asynchronous writes.
MS_SYNC	Perform synchronous writes.
MS_INVALIDATE	Invalidate cached data.

44409 When MS\_ASYNC is specified, `msync()` shall return immediately once all the write operations  
 44410 are initiated or queued for servicing; when MS\_SYNC is specified, `msync()` shall not return until  
 44411 all write operations are completed as defined for synchronized I/O data integrity completion.  
 44412 Either MS\_ASYNC or MS\_SYNC shall be specified, but not both.

44413 When MS\_INVALIDATE is specified, `msync()` shall invalidate all cached copies of mapped data  
 44414 that are inconsistent with the permanent storage locations such that subsequent references shall  
 44415 obtain data that was consistent with the permanent storage locations sometime between the call  
 44416 to `msync()` and the first subsequent memory reference to the data.

44417 If `msync()` causes any write to a file, the file's last data modification and last file status change  
 44418 timestamps shall be marked for update.

44419 **RETURN VALUE**

44420 Upon successful completion, `msync()` shall return 0; otherwise, it shall return -1 and set `errno` to  
 44421 indicate the error.

44422 **ERRORS**

44423 The `msync()` function shall fail if:

44424 [EBUSY] Some or all of the addresses in the range starting at `addr` and continuing for `len`  
 44425 bytes are locked, and MS\_INVALIDATE is specified.

- 44426 [EINVAL] The value of *flags* is invalid.
- 44427 [ENOMEM] The addresses in the range starting at *addr* and continuing for *len* bytes are  
44428 outside the range allowed for the address space of a process or specify one or  
44429 more pages that are not mapped.

44430 The *msync()* function may fail if:

- 44431 [EINVAL] The value of *addr* is not a multiple of the page size as returned by *sysconf()*.

#### 44432 EXAMPLES

44433 None.

#### 44434 APPLICATION USAGE

44435 The *msync()* function is only supported if the Synchronized Input and Output option is  
44436 supported, and thus need not be available on all implementations.

44437 The *msync()* function should be used by programs that require a memory object to be in a  
44438 known state; for example, in building transaction facilities.

44439 Normal system activity can cause pages to be written to disk. Therefore, there are no guarantees  
44440 that *msync()* is the only control over when pages are or are not written to disk.

#### 44441 RATIONALE

44442 The *msync()* function writes out data in a mapped region to the permanent storage for the  
44443 underlying object. The call to *msync()* ensures data integrity of the file.

44444 After the data is written out, any cached data may be invalidated if the MS\_INVALIDATE flag  
44445 was specified. This is useful on systems that do not support read/write consistency.

#### 44446 FUTURE DIRECTIONS

44447 None.

#### 44448 SEE ALSO

44449 *mmap()*, *sysconf()*

44450 XBD <[sys/mman.h](#)>

#### 44451 CHANGE HISTORY

44452 First released in Issue 4, Version 2.

#### 44453 Issue 5

44454 Moved from X/OPEN UNIX extension to BASE.

44455 Aligned with *msync()* in the POSIX Realtime Extension as follows:

- 44456 • The DESCRIPTION is extensively reworded.
- 44457 • [EBUSY] and a new form of [EINVAL] are added as mandatory error conditions.

#### 44458 Issue 6

44459 The *msync()* function is marked as part of the Memory Mapped Files and Synchronized Input  
44460 and Output options.

44461 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 44462 • The [EBUSY] mandatory error condition is added.

44463 The following new requirements on POSIX implementations derive from alignment with the  
44464 Single UNIX Specification:

**msync()**

- 44465           • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple  
44466           of the page size.
- 44467           • The second [EINVAL] error condition is made mandatory.
- 44468           The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding reference to  
44469           typed memory objects.
- 44470   **Issue 7**
- 44471           Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment  
44472           requirements.
- 44473           SD5-XSH-ERN-110 is applied.
- 44474           The *msync()* function is marked as part of the Synchronized Input and Output option or XSI  
44475           option as the Memory Mapped Files is moved to the Base.
- 44476           Changes are made related to support for finegrained timestamps.

44477 **NAME**

44478           munlock — unlock a range of process address space

44479 **SYNOPSIS**

44480 MLR       #include &lt;sys/mman.h&gt;

44481           int munlock(const void \*addr, size\_t len);

44482 **DESCRIPTION**44483           Refer to *mlock()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**munlockall()***System Interfaces*44484 **NAME**

44485           munlockall — unlock the address space of a process

44486 **SYNOPSIS**44487 ML       #include <sys/mman.h>  
44488           int munlockall(void);44489 **DESCRIPTION**44490           Refer to *mlockall()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

44491 **NAME**44492 `munmap` — unmap pages of memory44493 **SYNOPSIS**44494 `#include <sys/mman.h>`44495 `int munmap(void *addr, size_t len);`44496 **DESCRIPTION**

44497 The `munmap()` function shall remove any mappings for those entire pages containing any part of  
 44498 the address space of the process starting at `addr` and continuing for `len` bytes. Further references  
 44499 to these pages shall result in the generation of a SIGSEGV signal to the process. If there are no  
 44500 mappings in the specified address range, then `munmap()` has no effect.

44501 The implementation may require that `addr` be a multiple of the page size as returned by  
 44502 `sysconf()`.

44503 If a mapping to be removed was private, any modifications made in this address range shall be  
 44504 discarded.

44505 ML|MLR Any memory locks (see `mlock()` and `mlockall()`) associated with this address range shall be  
 44506 removed, as if by an appropriate call to `munlock()`.

44507 TYM If a mapping removed from a typed memory object causes the corresponding address range of  
 44508 the memory pool to be inaccessible by any process in the system except through allocatable  
 44509 mappings (that is, mappings of typed memory objects opened with the  
 44510 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flag), then that range of the memory pool shall  
 44511 become deallocated and may become available to satisfy future typed memory allocation  
 44512 requests.

44513 A mapping removed from a typed memory object opened with the  
 44514 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flag shall not affect in any way the availability of  
 44515 that typed memory for allocation.

44516 The behavior of this function is unspecified if the mapping was not established by a call to  
 44517 `mmap()`.

44518 **RETURN VALUE**

44519 Upon successful completion, `munmap()` shall return 0; otherwise, it shall return -1 and set `errno`  
 44520 to indicate the error.

44521 **ERRORS**

44522 The `munmap()` function shall fail if:

44523 [EINVAL] Addresses in the range `[addr,addr+len)` are outside the valid range for the  
 44524 address space of a process.

44525 [EINVAL] The `len` argument is 0.

44526 The `munmap()` function may fail if:

44527 [EINVAL] The `addr` argument is not a multiple of the page size as returned by `sysconf()`.

**munmap()**44528 **EXAMPLES**

44529 None.

44530 **APPLICATION USAGE**

44531 None.

44532 **RATIONALE**44533 The *munmap()* function corresponds to SVR4, just as the *mmap()* function does.

44534 It is possible that an application has applied process memory locking to a region that contains  
 44535 shared memory. If this has occurred, the *munmap()* call ignores those locks and, if necessary,  
 44536 causes those locks to be removed.

44537 Most implementations require that *addr* is a multiple of the page size as returned by *sysconf()*.44538 **FUTURE DIRECTIONS**

44539 None.

44540 **SEE ALSO**44541 *mlock()*, *mlockall()*, *mmap()*, *posix\_typed\_mem\_open()*, *sysconf()*

44542 XBD &lt;sys/mman.h&gt;

44543 **CHANGE HISTORY**

44544 First released in Issue 4, Version 2.

44545 **Issue 5**

44546 Moved from X/OPEN UNIX extension to BASE.

44547 Aligned with *munmap()* in the POSIX Realtime Extension as follows:

- 44548 • The DESCRIPTION is extensively reworded.
- 44549 • The SIGBUS error is no longer permitted to be generated.

44550 **Issue 6**44551 The *munmap()* function is marked as part of the Memory Mapped Files and Shared Memory  
44552 Objects option.44553 The following new requirements on POSIX implementations derive from alignment with the  
44554 Single UNIX Specification:

- 44555 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple  
44556 of the page size.
- 44557 • The [EINVAL] error conditions are added.

44558 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 44559 • Semantics for typed memory objects are added to the DESCRIPTION.
- 44560 • The *posix\_typed\_mem\_open()* function is added to the SEE ALSO section.

44561 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code  
44562 in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).44563 **Issue 7**44564 Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment  
44565 requirements.44566 The *munmap()* function is moved from the Memory Mapped Files option to the Base.

44567 **NAME**

44568 nan, nanf, nanl — return quiet NaN

44569 **SYNOPSIS**

```
44570 #include <math.h>
44571 double nan(const char *tagp);
44572 float nanf(const char *tagp);
44573 long double nanl(const char *tagp);
```

44574 **DESCRIPTION**

44575 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 44576 conflict between the requirements described here and the ISO C standard is unintentional. This  
 44577 volume of POSIX.1-2008 defers to the ISO C standard.

44578 The function call *nan*("*n-char-sequence*") shall be equivalent to:

```
44579 strtod("NAN(n-char-sequence)", (char **) NULL);
```

44580 The function call *nan*("") shall be equivalent to:

```
44581 strtod("NAN()", (char **) NULL)
```

44582 If *tagp* does not point to an *n-char* sequence or an empty string, the function call shall be  
 44583 equivalent to:

```
44584 strtod("NAN", (char **) NULL)
```

44585 Function calls to *nanf*() and *nanl*() are equivalent to the corresponding function calls to *strtof*()  
 44586 and *strtold*().

44587 **RETURN VALUE**

44588 These functions shall return a quiet NaN, if available, with content indicated through *tagp*.

44589 If the implementation does not support quiet NaNs, these functions shall return zero.

44590 **ERRORS**

44591 No errors are defined.

44592 **EXAMPLES**

44593 None.

44594 **APPLICATION USAGE**

44595 None.

44596 **RATIONALE**

44597 None.

44598 **FUTURE DIRECTIONS**

44599 None.

44601 [strtod\(\)](#)

44602 XBD [<math.h>](#)

44603 **CHANGE HISTORY**

44604 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**nanosleep()**44605 **NAME**

44606 nanosleep — high resolution sleep

44607 **SYNOPSIS**

```
44608 CX #include <time.h>
44609 int nanosleep(const struct timespec *rqtp, struct timespec *rmtp);
```

44610 **DESCRIPTION**

44611 The *nanosleep()* function shall cause the current thread to be suspended from execution until  
 44612 either the time interval specified by the *rqtp* argument has elapsed or a signal is delivered to the  
 44613 calling thread, and its action is to invoke a signal-catching function or to terminate the process.  
 44614 The suspension time may be longer than requested because the argument value is rounded up to  
 44615 an integer multiple of the sleep resolution or because of the scheduling of other activity by the  
 44616 system. But, except for the case of being interrupted by a signal, the suspension time shall not be  
 44617 less than the time specified by *rqtp*, as measured by the system clock `CLOCK_REALTIME`.

44618 The use of the *nanosleep()* function has no effect on the action or blockage of any signal.

44619 **RETURN VALUE**

44620 If the *nanosleep()* function returns because the requested time has elapsed, its return value shall  
 44621 be zero.

44622 If the *nanosleep()* function returns because it has been interrupted by a signal, it shall return a  
 44623 value of `-1` and set *errno* to indicate the interruption. If the *rmtp* argument is non-NULL, the  
 44624 **timespec** structure referenced by it is updated to contain the amount of time remaining in the  
 44625 interval (the requested time minus the time actually slept). The *rqtp* and *rmtp* arguments may  
 44626 point to the same object. If the *rmtp* argument is NULL, the remaining time is not returned.

44627 If *nanosleep()* fails, it shall return a value of `-1` and set *errno* to indicate the error.

44628 **ERRORS**

44629 The *nanosleep()* function shall fail if:

44630 [EINTR] The *nanosleep()* function was interrupted by a signal.

44631 [EINVAL] The *rqtp* argument specified a nanosecond value less than zero or greater than  
 44632 or equal to 1 000 million.

44633 **EXAMPLES**

44634 None.

44635 **APPLICATION USAGE**

44636 None.

44637 **RATIONALE**

44638 It is common to suspend execution of a thread for an interval in order to poll the status of a non-  
 44639 interrupting function. A large number of actual needs can be met with a simple extension to  
 44640 *sleep()* that provides finer resolution.

44641 In the POSIX.1-1990 standard and SVR4, it is possible to implement such a routine, but the  
 44642 frequency of wakeup is limited by the resolution of the *alarm()* and *sleep()* functions. In 4.3 BSD,  
 44643 it is possible to write such a routine using no static storage and reserving no system facilities.  
 44644 Although it is possible to write a function with similar functionality to *sleep()* using the  
 44645 remainder of the *timer\_\**() functions, such a function requires the use of signals and the  
 44646 reservation of some signal number. This volume of POSIX.1-2008 requires that *nanosleep()* be  
 44647 non-intrusive of the signals function.

44648 The *nanosleep()* function shall return a value of 0 on success and `-1` on failure or if interrupted.

44649 This latter case is different from *sleep()*. This was done because the remaining time is returned  
44650 via an argument structure pointer, *rmtp*, instead of as the return value.

#### 44651 FUTURE DIRECTIONS

44652 None.

#### 44653 SEE ALSO

44654 *clock\_nanosleep()*, *sleep()*

44655 XBD <[time.h](#)>

#### 44656 CHANGE HISTORY

44657 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### 44658 Issue 6

44659 The *nanosleep()* function is marked as part of the Timers option.

44660 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
44661 implementation does not support the Timers option.

44662 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/37 is applied, updating the SEE ALSO  
44663 section to include the *clock\_nanosleep()* function.

44664 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/63 is applied, correcting text in the  
44665 RATIONALE section.

#### 44666 Issue 7

44667 SD5-XBD-ERN-33 is applied.

44668 The *nanosleep()* function is moved from the Timers option to the Base.

**nearbyint()**44669 **NAME**

44670 nearbyint, nearbyintf, nearbyintl — floating-point rounding functions

44671 **SYNOPSIS**

```
44672 #include <math.h>
44673 double nearbyint(double x);
44674 float nearbyintf(float x);
44675 long double nearbyintl(long double x);
```

44676 **DESCRIPTION**

44677 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 44678 conflict between the requirements described here and the ISO C standard is unintentional. This  
 44679 volume of POSIX.1-2008 defers to the ISO C standard.

44680 These functions shall round their argument to an integer value in floating-point format, using  
 44681 the current rounding direction and without raising the inexact floating-point exception.

44682 An application wishing to check for error situations should set *errno* to zero and call  
 44683 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 44684 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 44685 zero, an error has occurred.

44686 **RETURN VALUE**

44687 Upon successful completion, these functions shall return the rounded integer value.

44688 MX If *x* is NaN, a NaN shall be returned.44689 If *x* is  $\pm 0$ ,  $\pm 0$  shall be returned.44690 If *x* is  $\pm\text{Inf}$ , *x* shall be returned.

44691 XSI If the correct value would cause overflow, a range error shall occur and *nearbyint()*, *nearbyintf()*,  
 44692 and *nearbyintl()* shall return the value of the macro  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  
 44693  $\pm\text{HUGE\_VALL}$  (with the same sign as *x*), respectively.

44694 **ERRORS**

44695 These functions shall fail if:

44696 XSI Range Error The result would cause an overflow.

44697 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 44698 then *errno* shall be set to [ERANGE]. If the integer expression  
 44699 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 44700 floating-point exception shall be raised.

44701 **EXAMPLES**

44702 None.

44703 **APPLICATION USAGE**

44704 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 44705 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

44706 **RATIONALE**

44707 None.

44708 **FUTURE DIRECTIONS**

44709 None.

44710 **SEE ALSO**44711 [fclearexcept\(\)](#), [fetestexcept\(\)](#)44712 XBD [Section 4.19](#) (on page 116), [<math.h>](#)44713 **CHANGE HISTORY**

**newlocale()**44715 **NAME**

44716 newlocale — create or modify a locale object

44717 **SYNOPSIS**

```
44718 CX #include <locale.h>
44719 locale_t newlocale(int category_mask, const char *locale,
44720 locale_t base);
```

44721 **DESCRIPTION**

44722 The *newlocale()* function shall create a new locale object or modify an existing one. If the *base*  
 44723 argument is **(locale\_t)0**, a new locale object shall be created. It is unspecified whether the locale  
 44724 object pointed to by *base* shall be modified or freed and a new locale object created.

44725 The *category\_mask* argument specifies the locale categories to be set or modified. Values for  
 44726 *category\_mask* shall be constructed by a bitwise-inclusive OR of the symbolic constants  
 44727 *LC\_CTYPE\_MASK*, *LC\_NUMERIC\_MASK*, *LC\_TIME\_MASK*, *LC\_COLLATE\_MASK*,  
 44728 *LC\_MONETARY\_MASK*, and *LC\_MESSAGES\_MASK*, or any of the other implementation-  
 44729 defined *LC\_\*\_MASK* values defined in **<locale.h>**.

44730 For each category with the corresponding bit set in *category\_mask* the data from the locale named  
 44731 by *locale* shall be used. In the case of modifying an existing locale object, the data from the locale  
 44732 named by *locale* shall replace the existing data within the locale object. If a completely new locale  
 44733 object is created, the data for all sections not requested by *category\_mask* shall be taken from the  
 44734 default locale.

44735 The following preset values of *locale* are defined for all settings of *category\_mask*:

44736	"POSIX"	Specifies the minimal environment for C-language translation called the 44737 POSIX locale.
44738	"C"	Equivalent to "POSIX".
44739	""	Specifies an implementation-defined native environment. This corresponds to 44740 the value of the associated environment variables, <i>LC_*</i> and <i>LANG</i> ; see XBD 44741 <a href="#">Chapter 7</a> (on page 135) and <a href="#">Chapter 8</a> (on page 173).

44742 If the *base* argument is not **(locale\_t)0** and the *newlocale()* function call succeeds, the contents of  
 44743 *base* are unspecified. Applications shall ensure that they stop using *base* as a locale object before  
 44744 calling *newlocale()*. If the function call fails and the *base* argument is not **(locale\_t)0**, the contents  
 44745 of *base* shall remain valid and unchanged.

44746 The results are undefined if the *base* argument is the special locale object *LC\_GLOBAL\_LOCALE*.

44747 **RETURN VALUE**

44748 Upon successful completion, the *newlocale()* function shall return a handle which the caller may  
 44749 use on subsequent calls to *duplocale()*, *freelocale()*, and other functions taking a **locale\_t**  
 44750 argument.

44751 Upon failure, the *newlocale()* function shall return **(locale\_t)0** and set *errno* to indicate the error.

44752 **ERRORS**

44753 The *newlocale()* function shall fail if:

44754	[ENOMEM]	There is not enough memory available to create the locale object or load the 44755 locale data.
-------	----------	--

- 44756 [EINVAL] The *category\_mask* contains a bit that does not correspond to a valid category.
- 44757 [ENOENT] For any of the categories in *category\_mask*, the locale data is not available.
- 44758 The *newlocale()* function may fail if:
- 44759 [EINVAL] The *locale* argument is not a valid string pointer.

44760 **EXAMPLES**44761 **Constructing a Locale Object from Different Locales**

44762 The following example shows the construction of a locale where the *LC\_CTYPE* category data  
44763 comes from a locale *loc1* and the *LC\_TIME* category data from a locale *tok2*:

```
44764 #include <locale.h>
44765 ...
44766 locale_t loc, new_loc;
44767 /* Get the "loc1" data. */
44768 loc = newlocale (LC_CTYPE_MASK, "loc1", NULL);
44769 if (loc == (locale_t) 0)
44770     abort ();
44771 /* Get the "loc2" data. */
44772 new_loc = newlocale (LC_TIME_MASK, "loc2", loc);
44773 if (new_loc != (locale_t) 0)
44774     /* We don't abort if this fails. In this case this
44775     simply used to unchanged locale object. */
44776     loc = new_loc;
44777 ...
```

44778 **Freeing up a Locale Object**

44779 The following example shows a code fragment to free a locale object created by *newlocale()*:

```
44780 #include <locale.h>
44781 ...
44782 /* Every locale object allocated with newlocale() should be
44783 * freed using freelocale():
44784 */
44785 locale_t loc;
44786 /* Get the locale. */
44787 loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", NULL);
44788 /* ... Use the locale object ... */
44789 ...
44790 /* Free the locale object resources. */
44791 freelocale (loc);
```

**newlocale()**

System Interfaces

44792 **APPLICATION USAGE**

44793 Handles for locale objects created by the *newlocale()* function should be released by a  
44794 corresponding call to *freelocale()*.

44795 The special locale object *LC\_GLOBAL\_LOCALE* must not be passed for the *base* argument, even  
44796 when returned by the *uselocale()* function.

44797 **RATIONALE**

44798 None.

44799 **FUTURE DIRECTIONS**

44800 None.

44801 **SEE ALSO**

44802 *duplocale()*, *freelocale()*, *uselocale()*

44806 **NAME**

44807 nextafter, nextafterf, nextafterl, nexttoward, nexttowardf, nexttowardl — next representable  
44808 floating-point number

44809 **SYNOPSIS**

```
44810 #include <math.h>
44811 double nextafter(double x, double y);
44812 float nextafterf(float x, float y);
44813 long double nextafterl(long double x, long double y);
44814 double nexttoward(double x, long double y);
44815 float nexttowardf(float x, long double y);
44816 long double nexttowardl(long double x, long double y);
```

44817 **DESCRIPTION**

44818 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
44819 conflict between the requirements described here and the ISO C standard is unintentional. This  
44820 volume of POSIX.1-2008 defers to the ISO C standard.

44821 The *nextafter()*, *nextafterf()*, and *nextafterl()* functions shall compute the next representable  
44822 floating-point value following *x* in the direction of *y*. Thus, if *y* is less than *x*, *nextafter()* shall  
44823 return the largest representable floating-point number less than *x*. The *nextafter()*, *nextafterf()*,  
44824 and *nextafterl()* functions shall return *y* if *x* equals *y*.

44825 The *nexttoward()*, *nexttowardf()*, and *nexttowardl()* functions shall be equivalent to the  
44826 corresponding *nextafter()* functions, except that the second parameter shall have type **long**  
44827 **double** and the functions shall return *y* converted to the type of the function if *x* equals *y*.

44828 An application wishing to check for error situations should set *errno* to zero and call  
44829 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
44830 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
44831 zero, an error has occurred.

44832 **RETURN VALUE**

44833 Upon successful completion, these functions shall return the next representable floating-point  
44834 value following *x* in the direction of *y*.

44835 If  $x==y$ , *y* (of the type *x*) shall be returned.

44836 If *x* is finite and the correct function value would overflow, a range error shall occur and  
44837  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL (with the same sign as *x*) shall be returned as  
44838 appropriate for the return type of the function.

44839 **MX** If *x* or *y* is NaN, a NaN shall be returned.

44840 If  $x!=y$  and the correct function value is subnormal, zero, or underflows, a range error shall  
44841 occur, and either the correct function value (if representable) or 0.0 shall be returned.

44842 **ERRORS**

44843 These functions shall fail if:

44844 **Range Error** The correct value overflows.

44845 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
44846 then *errno* shall be set to [ERANGE]. If the integer expression  
44847 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
44848 floating-point exception shall be raised.

**nextafter()**

44849	MX	<b>Range Error</b>	The correct value is subnormal or underflows.
44850			If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
44851			then <i>errno</i> shall be set to [ERANGE]. If the integer expression
44852			( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the underflow
44853			floating-point exception shall be raised.
44854		<b>EXAMPLES</b>	
44855		None.	
44856		<b>APPLICATION USAGE</b>	
44857		On error, the expressions ( <i>math_errhandling</i> & MATH_ERRNO) and ( <i>math_errhandling</i> &	
44858		MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.	
44859		<b>RATIONALE</b>	
44860		None.

44870		<b>Issue 6</b>	
44871		The <i>nextafter()</i> function is no longer marked as an extension.	
44872		The <i>nextafterf()</i> , <i>nextafterl()</i> , <i>nexttoward()</i> , <i>nexttowardf()</i> , and <i>nexttowardl()</i> functions are added	
44873		for alignment with the ISO/IEC 9899:1999 standard.	
44874		The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are	
44875		revised to align with the ISO/IEC 9899:1999 standard.	
44876		IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are	
44877		marked.	

44878 **NAME**

44879 nftw — walk a file tree

44880 **SYNOPSIS**

```
44881 XSI #include <ftw.h>
44882 int nftw(const char *path, int (*fn)(const char *,
44883     const struct stat *, int, struct FTW *), int fd_limit, int flags);
```

44884 **DESCRIPTION**

44885 The *nftw()* function shall recursively descend the directory hierarchy rooted in *path*. The *nftw()*  
 44886 function has a similar effect to *ftw()* except that it takes an additional argument *flags*, which is a  
 44887 bitwise-inclusive OR of zero or more of the following flags:

- 44888 **FTW\_CHDIR** If set, *nftw()* shall change the current working directory to each directory as it  
 44889 reports files in that directory. If clear, *nftw()* shall not change the current  
 44890 working directory.
- 44891 **FTW\_DEPTH** If set, *nftw()* shall report all files in a directory before reporting the directory  
 44892 itself. If clear, *nftw()* shall report any directory before reporting the files in that  
 44893 directory.
- 44894 **FTW\_MOUNT** If set, *nftw()* shall only report files in the same file system as *path*. If clear,  
 44895 *nftw()* shall report all files encountered during the walk.
- 44896 **FTW\_PHYS** If set, *nftw()* shall perform a physical walk and shall not follow symbolic links.

44897 If **FTW\_PHYS** is clear and **FTW\_DEPTH** is set, *nftw()* shall follow links instead of reporting  
 44898 them, but shall not report any directory that would be a descendant of itself. If **FTW\_PHYS** is  
 44899 clear and **FTW\_DEPTH** is clear, *nftw()* shall follow links instead of reporting them, but shall not  
 44900 report the contents of any directory that would be a descendant of itself.

44901 At each file it encounters, *nftw()* shall call the user-supplied function *fn* with four arguments:

- 44902 • The first argument is the pathname of the object.
- 44903 • The second argument is a pointer to the **stat** buffer containing information on the object,  
 44904 filled in as if *fstatat()*, *stat()*, or *lstat()* had been called to retrieve the information.
- 44905 • The third argument is an integer giving additional information. Its value is one of the  
 44906 following:
- 44907 **FTW\_D** The object is a directory.
- 44908 **FTW\_DNR** The object is a directory that cannot be read. The *fn* function shall not be  
 44909 called for any of its descendants.
- 44910 **FTW\_DP** The object is a directory and subdirectories have been visited. (This condition  
 44911 shall only occur if the **FTW\_DEPTH** flag is included in *flags*.)
- 44912 **FTW\_F** The object is a file.
- 44913 **FTW\_NS** The *stat()* function failed on the object because of lack of appropriate  
 44914 permission. The **stat** buffer passed to *fn* is undefined. Failure of *stat()* for any  
 44915 other reason is considered an error and *nftw()* shall return  $-1$ .
- 44916 **FTW\_SL** The object is a symbolic link. (This condition shall only occur if the  
 44917 **FTW\_PHYS** flag is included in *flags*.)

**nftw()**

44918 FTW\_SLN The object is a symbolic link that does not name an existing file. (This  
44919 condition shall only occur if the FTW\_PHYS flag is not included in *flags*.)

44920 • The fourth argument is a pointer to an FTW structure. The value of **base** is the offset of the  
44921 object's filename in the pathname passed as the first argument to *fn*. The value of **level**  
44922 indicates depth relative to the root of the walk, where the root level is 0.

44923 The results are unspecified if the application-supplied *fn* function does not preserve the current  
44924 working directory.

44925 The argument *fd\_limit* sets the maximum number of file descriptors that shall be used by *nftw()*  
44926 while traversing the file tree. At most one file descriptor shall be used for each directory level.

44927 The *nftw()* function need not be thread-safe.

**RETURN VALUE**

44928 The *nftw()* function shall continue until the first of the following conditions occurs:

- 44930 • An invocation of *fn* shall return a non-zero value, in which case *nftw()* shall return that  
44931 value.
- 44932 • The *nftw()* function detects an error other than [EACCES] (see FTW\_DNR and FTW\_NS  
44933 above), in which case *nftw()* shall return -1 and set *errno* to indicate the error.
- 44934 • The tree is exhausted, in which case *nftw()* shall return 0.

**ERRORS**

44935 The *nftw()* function shall fail if:

- 44937 [EACCES] Search permission is denied for any component of *path* or read permission is  
44938 denied for *path*, or *fn* returns -1 and does not reset *errno*.
- 44939 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
44940 argument.
- 44941 [ENAMETOOLONG] The length of a component of a pathname is longer than {NAME\_MAX}.
- 44942 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 44943 [ENOTDIR] A component of *path* is not a directory.
- 44944 [EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current  
44945 programming environment for one or more files found in the file hierarchy.

44947 The *nftw()* function may fail if:

- 44948 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
44949 resolution of the *path* argument.
- 44950 [EMFILE] All file descriptors available to the process are currently open.
- 44951 [ENAMETOOLONG] The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
44952 symbolic link produced an intermediate result with a length that exceeds  
44953 {PATH\_MAX}.
- 44954 [ENFILE] Too many files are currently open in the system.

44956 In addition, *errno* may be set if the function pointed to by *fn* causes *errno* to be set.

44957 **EXAMPLES**

44958 The following program traverses the directory tree under the path named in its first command-  
 44959 line argument, or under the current directory if no argument is supplied. It displays various  
 44960 information about each file. The second command-line argument can be used to specify  
 44961 characters that control the value assigned to the *flags* argument when calling *nftw()*.

```

44962 #include <ftw.h>
44963 #include <stdio.h>
44964 #include <stdlib.h>
44965 #include <string.h>
44966 #include <stdint.h>

44967 static int
44968 display_info(const char *fpath, const struct stat *sb,
44969             int tflag, struct FTW *ftwbuf)
44970 {
44971     printf("%-3s %2d %7jd   %-40s %d %s\n",
44972          (tflag == FTW_D) ? "d" : (tflag == FTW_DNR) ? "dnr" :
44973          (tflag == FTW_DP) ? "dp" : (tflag == FTW_F) ? "f" :
44974          (tflag == FTW_NS) ? "ns" : (tflag == FTW_SL) ? "sl" :
44975          (tflag == FTW_SLN) ? "sln" : "???",
44976          ftwbuf->level, (intmax_t) sb->st_size,
44977          fpath, ftwbuf->base, fpath + ftwbuf->base);
44978     return 0; /* To tell nftw() to continue */
44979 }

44980 int
44981 main(int argc, char *argv[])
44982 {
44983     int flags = 0;

44984     if (argc > 2 && strchr(argv[2], 'd') != NULL)
44985         flags |= FTW_DEPTH;
44986     if (argc > 2 && strchr(argv[2], 'p') != NULL)
44987         flags |= FTW_PHYS;

44988     if (nftw((argc < 2) ? "." : argv[1], display_info, 20, flags) == -1)
44989     {
44990         perror("nftw");
44991         exit(EXIT_FAILURE);
44992     }

44993     exit(EXIT_SUCCESS);
44994 }

```

44995 **APPLICATION USAGE**

44996 The *nftw()* function may allocate dynamic storage during its operation. If *nftw()* is forcibly  
 44997 terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *fn*  
 44998 or an interrupt routine, *nftw()* does not have a chance to free that storage, so it remains  
 44999 permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has  
 45000 occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next  
 45001 invocation.

**nftw()**45002 **RATIONALE**

45003 None.

45004 **FUTURE DIRECTIONS**

45005 None.

45006 **SEE ALSO**45007 *fdopendir()*, *fstatat()*, *readdir()*

45008 XBD &lt;ftw.h&gt;

45009 **CHANGE HISTORY**

45010 First released in Issue 4, Version 2.

45011 **Issue 5**

45012 Moved from X/OPEN UNIX extension to BASE.

45013 In the DESCRIPTION, the definition of the *depth* argument is clarified.45014 **Issue 6**

45015 The Open Group Base Resolution bwg97-003 is applied.

45016 The ERRORS section is updated as follows:

- 45017 • The wording of the mandatory [ELOOP] error condition is updated.
- 45018 • A second optional [ELOOP] error condition is added.
- 45019 • The [EOVERFLOW] mandatory error condition is added.

45020 Text is added to the DESCRIPTION to say that the *nftw()* function need not be reentrant and that  
 45021 the results are unspecified if the application-supplied *fn* function does not preserve the current  
 45022 working directory.

45023 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/64 is applied, changing the argument  
 45024 *depth* to *fd\_limit* throughout and changing “to a maximum of 5 levels deep” to “using a  
 45025 maximum of 5 file descriptors” in the EXAMPLES section.

45026 **Issue 7**

45027 Austin Group Interpretations 1003.1-2001 #143 and #156 are applied.

45028 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

45029 SD5-XBD-ERN-61 is applied.

45030 APPLICATION USAGE is added and the EXAMPLES section is replaced with a new example.

45031 **NAME**

45032 nice — change the nice value of a process

45033 **SYNOPSIS**

```
45034 XSI #include <unistd.h>
45035 int nice(int incr);
```

45036 **DESCRIPTION**

45037 The *nice()* function shall add the value of *incr* to the nice value of the calling process. A nice  
 45038 value of a process is a non-negative number for which a more positive value shall result in less  
 45039 favorable scheduling.

45040 A maximum nice value of  $2 * \{NZERO\} - 1$  and a minimum nice value of 0 shall be imposed by the  
 45041 system. Requests for values above or below these limits shall result in the nice value being set to  
 45042 the corresponding limit. Only a process with appropriate privileges can lower the nice value.

45043 PS | TPS Calling the *nice()* function has no effect on the priority of processes or threads with policy  
 45044 SCHED\_FIFO or SCHED\_RR. The effect on processes or threads with other scheduling policies  
 45045 is implementation-defined.

45046 The nice value set with *nice()* shall be applied to the process. If the process is multi-threaded, the  
 45047 nice value shall affect all system scope threads in the process.

45048 As  $-1$  is a permissible return value in a successful situation, an application wishing to check for  
 45049 error situations should set *errno* to 0, then call *nice()*, and if it returns  $-1$ , check to see whether  
 45050 *errno* is non-zero.

45051 **RETURN VALUE**

45052 Upon successful completion, *nice()* shall return the new nice value  $-\{NZERO\}$ . Otherwise,  $-1$   
 45053 shall be returned, the nice value of the process shall not be changed, and *errno* shall be set to  
 45054 indicate the error.

45055 **ERRORS**

45056 The *nice()* function shall fail if:

45057 [EPERM] The *incr* argument is negative and the calling process does not have  
 45058 appropriate privileges.

45059 **EXAMPLES**45060 **Changing the Nice Value**

45061 The following example adds the value of the *incr* argument,  $-20$ , to the nice value of the calling  
 45062 process.

```
45063 #include <unistd.h>
45064 ...
45065 int incr = -20;
45066 int ret;
45067 ret = nice(incr);
```

45068 **APPLICATION USAGE**

45069 None.

**nice()**45070 **RATIONALE**

45071 None.

45072 **FUTURE DIRECTIONS**

45073 None.

45074 **SEE ALSO**45075 *exec*, *getpriority()*45076 XBD [<limits.h>](#), [<unistd.h>](#)45077 **CHANGE HISTORY**

45078 First released in Issue 1. Derived from Issue 1 of the SVID.

45079 **Issue 5**45080 A statement is added to the description indicating the effects of this function on the different  
45081 scheduling policies and multi-threaded processes.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

45082 **NAME**

45083 nl\_langinfo, nl\_langinfo\_l — language information

45084 **SYNOPSIS**

```
45085 #include <langinfo.h>
45086 char *nl_langinfo(nl_item item);
45087 char *nl_langinfo_l(nl_item item, locale_t locale);
```

45088 **DESCRIPTION**

45089 The *nl\_langinfo()* and *nl\_langinfo\_l()* functions shall return a pointer to a string containing  
 45090 information relevant to the particular language or cultural area defined in the locale of the  
 45091 process, or in the locale represented by *locale*, respectively (see <langinfo.h>). The manifest  
 45092 constant names and values of *item* are defined in <langinfo.h>. For example:

```
45093 nl_langinfo(ABDAY_1)
```

45094 would return a pointer to the string "Dom" if the identified language was Portuguese, and  
 45095 "Sun" if the identified language was English.

```
45096 nl_langinfo_l(ABDAY_1, loc)
```

45097 would return a pointer to the string "Dom" if the identified language of the locale represented by  
 45098 *loc* was Portuguese, and "Sun" if the identified language of the locale represented by *loc* was  
 45099 English.

45100 Calls to *setlocale()* with a category corresponding to the category of *item* (see <langinfo.h>), or to  
 45101 the category *LC\_ALL*, may overwrite the array pointed to by the return value. Calls to *uselocale()*  
 45102 which change the category corresponding to the category of *item* may overwrite the array  
 45103 pointed to by the return value.

45104 The *nl\_langinfo()* function need not be thread-safe.

45105 **RETURN VALUE**

45106 In a locale where *langinfo* data is not defined, these functions shall return a pointer to the  
 45107 corresponding string in the POSIX locale. In all locales, these functions shall return a pointer to  
 45108 an empty string if *item* contains an invalid setting.

45109 This pointer may point to static data that may be overwritten on the next call to either function.

45110 **ERRORS**

45111 The *nl\_langinfo\_l()* function may fail if:

45112 [EINVAL] *locale* is not a valid locale object handle.

45113 **EXAMPLES**45114 **Getting Date and Time Formatting Information**

45115 The following example returns a pointer to a string containing date and time formatting  
 45116 information, as defined in the *LC\_TIME* category of the current locale.

```
45117 #include <time.h>
45118 #include <langinfo.h>
45119 ...
45120 strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);
45121 ...
```

**nl\_langinfo()**

System Interfaces

45122 **APPLICATION USAGE**

45123 The array pointed to by the return value should not be modified by the program, but may be  
45124 modified by further calls to these functions.

45125 **RATIONALE**

45126 None.

45127 **FUTURE DIRECTIONS**

45128 None.

45129 **SEE ALSO**

45130 [setlocale\(\)](#), [uselocale\(\)](#)

45131 XBD [Chapter 7](#) (on page 135), [<langinfo.h>](#), [<locale.h>](#), [<nl\\_types.h>](#)

45132 **CHANGE HISTORY**

45133 First released in Issue 2.

45134 **Issue 5**

45135 The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

45136 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

45137 **Issue 7**

45138 Austin Group Interpretation 1003.1-2001 #156 is applied.

45139 The `nl_langinfo()` function is moved from the XSI option to the Base.

45140 The `nl_langinfo_l()` function is added from The Open Group Technical Standard, 2006, Extended  
45141 API Set Part 4.

45142 **NAME**

45143 nrnd48 — generate uniformly distributed pseudo-random non-negative long integers

45144 **SYNOPSIS**45145 XSI 

```
#include <stdlib.h>
```

  
45146 

```
long nrnd48(unsigned short xsubi[3]);
```

45147 **DESCRIPTION**45148 Refer to *drand48()*.

**ntohl()**45149 **NAME**

45150           ntohl, ntohs — convert values between host and network byte order

45151 **SYNOPSIS**

```
45152       #include <arpa/inet.h>
45153       uint32_t ntohl(uint32_t netlong);
45154       uint16_t ntohs(uint16_t netshort);
```

45155 **DESCRIPTION**45156       Refer to *htonl()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

45157 **NAME**

45158 open, openat — open file relative to directory file descriptor

45159 **SYNOPSIS**45160 OH `#include <sys/stat.h>`45161 `#include <fcntl.h>`45162 `int open(const char *path, int oflag, ...);`45163 `int openat(int fd, const char *path, int oflag, ...);`45164 **DESCRIPTION**

45165 The `open()` function shall establish the connection between a file and a file descriptor. It shall  
 45166 create an open file description that refers to a file and a file descriptor that refers to that open file  
 45167 description. The file descriptor is used by other I/O functions to refer to that file. The `path`  
 45168 argument points to a pathname naming the file.

45169 The `open()` function shall return a file descriptor for the named file that is the lowest file  
 45170 descriptor not currently open for that process. The open file description is new, and therefore the  
 45171 file descriptor shall not share it with any other process in the system. The `FD_CLOEXEC` file  
 45172 descriptor flag associated with the new file descriptor shall be cleared unless the `O_CLOEXEC`  
 45173 flag is set in `oflag`.

45174 The file offset used to mark the current position within the file shall be set to the beginning of  
 45175 the file.

45176 The file status flags and file access modes of the open file description shall be set according to  
 45177 the value of `oflag`.

45178 Values for `oflag` are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 45179 in `<fcntl.h>`. Applications shall specify exactly one of the first five values (file access modes)  
 45180 below in the value of `oflag`:

45181 `O_EXEC` Open for execute only (non-directory files). The result is unspecified if  
 45182 this flag is applied to a directory.

45183 `O_RDONLY` Open for reading only.

45184 `O_RDWR` Open for reading and writing. The result is undefined if this flag is  
 45185 applied to a FIFO.

45186 `O_SEARCH` Open directory for search only. The result is unspecified if this flag is  
 45187 applied to a non-directory file.

45188 `O_WRONLY` Open for writing only.

45189 Any combination of the following may be used:

45190 `O_APPEND` If set, the file offset shall be set to the end of the file prior to each write.

45191 `O_CLOEXEC` If set, the `FD_CLOEXEC` flag for the new file descriptor shall be set.

45192 `O_CREAT` If the file exists, this flag has no effect except as noted under `O_EXCL`  
 45193 below. Otherwise, the file shall be created; the user ID of the file shall be  
 45194 set to the effective user ID of the process; the group ID of the file shall be  
 45195 set to the group ID of the file's parent directory or to the effective group  
 45196 ID of the process; and the access permission bits (see `<sys/stat.h>`) of the  
 45197 file mode shall be set to the value of the argument following the `oflag`  
 45198 argument taken as type `mode_t` modified as follows: a bitwise AND is  
 45199 performed on the file-mode bits and the corresponding bits in the  
 45200 complement of the process' file mode creation mask. Thus, all bits in the

## open()

45201		file mode whose corresponding bit in the file mode creation mask is set
45202		are cleared. When bits other than the file permission bits are set, the effect
45203		is unspecified. The argument following the <i>oflag</i> argument does not affect
45204		whether the file is open for reading, writing, or for both. Implementations
45205		shall provide a way to initialize the file's group ID to the group ID of the
45206		parent directory. Implementations may, but need not, provide an
45207		implementation-defined way to initialize the file's group ID to the
45208		effective group ID of the calling process.
45209	O_DIRECTORY	If <i>path</i> does not name a directory, fail and set <i>errno</i> to [ENOTDIR].
45210	SIO O_DSYNC	Write I/O operations on the file descriptor shall complete as defined by
45211		synchronized I/O data integrity completion.
45212	O_EXCL	If O_CREAT and O_EXCL are set, <i>open()</i> shall fail if the file exists. The
45213		check for the existence of the file and the creation of the file if it does not
45214		exist shall be atomic with respect to other threads executing <i>open()</i>
45215		naming the same filename in the same directory with O_EXCL and
45216		O_CREAT set. If O_EXCL and O_CREAT are set, and <i>path</i> names a
45217		symbolic link, <i>open()</i> shall fail and set <i>errno</i> to [EEXIST], regardless of the
45218		contents of the symbolic link. If O_EXCL is set and O_CREAT is not set,
45219		the result is undefined.
45220	O_NOCTTY	If set and <i>path</i> identifies a terminal device, <i>open()</i> shall not cause the
45221		terminal device to become the controlling terminal for the process. If <i>path</i>
45222		does not identify a terminal device, O_NOCTTY shall be ignored.
45223	O_NOFOLLOW	If <i>path</i> names a symbolic link, fail and set <i>errno</i> to [ELOOP].
45224	O_NONBLOCK	When opening a FIFO with O_RDONLY or O_WRONLY set:
45225		• If O_NONBLOCK is set, an <i>open()</i> for reading-only shall return
45226		without delay. An <i>open()</i> for writing-only shall return an error if no
45227		process currently has the file open for reading.
45228		• If O_NONBLOCK is clear, an <i>open()</i> for reading-only shall block the
45229		calling thread until a thread opens the file for writing. An <i>open()</i> for
45230		writing-only shall block the calling thread until a thread opens the
45231		file for reading.
45232		When opening a block special or character special file that supports non-
45233		blocking opens:
45234		• If O_NONBLOCK is set, the <i>open()</i> function shall return without
45235		blocking for the device to be ready or available. Subsequent
45236		behavior of the device is device-specific.
45237		• If O_NONBLOCK is clear, the <i>open()</i> function shall block the calling
45238		thread until the device is ready or available before returning.
45239		Otherwise, the behavior of O_NONBLOCK is unspecified.
45240	SIO O_RSYNC	Read I/O operations on the file descriptor shall complete at the same
45241		level of integrity as specified by the O_DSYNC and O_SYNC flags. If both
45242		O_DSYNC and O_RSYNC are set in <i>oflag</i> , all I/O operations on the file
45243		descriptor shall complete as defined by synchronized I/O data integrity
45244		completion. If both O_SYNC and O_RSYNC are set in flags, all I/O
45245		operations on the file descriptor shall complete as defined by

45246			synchronized I/O file integrity completion.
45247	XSI   SIO	O_SYNC	Write I/O operations on the file descriptor shall complete as defined by
45248			synchronized I/O file integrity completion.
45249	XSI		The O_SYNC flag shall be supported for regular files, even if the
45250			Synchronized Input and Output option is not supported.
45251		O_TRUNC	If the file exists and is a regular file, and the file is successfully opened
45252			O_RDWR or O_WRONLY, its length shall be truncated to 0, and the mode
45253			and owner shall be unchanged. It shall have no effect on FIFO special files
45254			or terminal device files. Its effect on other file types is implementation-
45255			defined. The result of using O_TRUNC without either O_RDWR or
45256			O_WRONLY is undefined.
45257		O_TTY_INIT	If <i>path</i> identifies a terminal device other than a pseudo-terminal, the
45258			device is not already open in any process, and either O_TTY_INIT is set in
45259			<i>oflag</i> or O_TTY_INIT has the value zero, <i>open()</i> shall set any non-standard
45260			<b>termios</b> structure terminal parameters to a state that provides conforming
45261			behavior; see XBD Section 11.2 (on page 205). It is unspecified whether
45262			O_TTY_INIT has any effect if the device is already open in any process. If
45263			<i>path</i> identifies the slave side of a pseudo-terminal that is not already open
45264			in any process, <i>open()</i> shall set any non-standard <b>termios</b> structure
45265			terminal parameters to a state that provides conforming behavior,
45266			regardless of whether O_TTY_INIT is set. If <i>path</i> does not identify a
45267			terminal device, O_TTY_INIT shall be ignored.
45268			If O_CREAT is set and the file did not previously exist, upon successful completion, <i>open()</i> shall
45269			mark for update the last data access, last data modification, and last file status change
45270			timestamps of the file and the last data modification and last file status change timestamps of
45271			the parent directory.
45272			If O_TRUNC is set and the file did previously exist, upon successful completion, <i>open()</i> shall
45273			mark for update the last data modification and last file status change timestamps of the file.
45274	SIO		If both the O_SYNC and O_DSYNC flags are set, the effect is as if only the O_SYNC flag was set.
45275	OB   XSR		If <i>path</i> refers to a STREAMS file, <i>oflag</i> may be constructed from O_NONBLOCK OR'ed with
45276			either O_RDONLY, O_WRONLY, or O_RDWR. Other flag values are not applicable to STREAMS
45277			devices and shall have no effect on them. The value O_NONBLOCK affects the operation of
45278			STREAMS drivers and certain functions applied to file descriptors associated with STREAMS
45279			files. For STREAMS drivers, the implementation of O_NONBLOCK is device-specific.
45280			The application shall ensure that it specifies the O_TTY_INIT flag on the first open of a terminal
45281			device since system boot or since the device was closed by the process that last had it open. The
45282	XSI		application need not specify the O_TTY_INIT flag when opening pseudo-terminals. If <i>path</i>
45283			names the master side of a pseudo-terminal device, then it is unspecified whether <i>open()</i> locks
45284			the slave side so that it cannot be opened. Conforming applications shall call <i>unlockpt()</i> before
45285			opening the slave side.
45286			The largest value that can be represented correctly in an object of type <b>off_t</b> shall be established
45287			as the offset maximum in the open file description.
45288			The <i>openat()</i> function shall be equivalent to the <i>open()</i> function except in the case where <i>path</i>
45289			specifies a relative path. In this case the file to be opened is determined relative to the directory
45290			associated with the file descriptor <i>fd</i> instead of the current working directory. If the file

**open()**

45291 descriptor was opened without `O_SEARCH`, the function shall check whether directory searches  
 45292 are permitted using the current permissions of the directory underlying the file descriptor. If the  
 45293 file descriptor was opened with `O_SEARCH`, the function shall not perform the check.

45294 The *oflag* parameter and the optional fourth parameter correspond exactly to the parameters of  
 45295 *open()*.

45296 If *openat()* is passed the special value `AT_FDCWD` in the *fd* parameter, the current working  
 45297 directory is used and the behavior shall be identical to a call to *open()*.

**RETURN VALUE**

45298 Upon successful completion, these functions shall open the file and return a non-negative  
 45299 integer representing the lowest numbered unused file descriptor. Otherwise, these functions  
 45300 shall return `-1` and set *errno* to indicate the error. If `-` is returned, no files shall be created or  
 45301 modified.  
 45302

**ERRORS**

45303 These functions shall fail if:

45304 [EACCES] Search permission is denied on a component of the path prefix, or the file  
 45305 exists and the permissions specified by *oflag* are denied, or the file does not  
 45306 exist and write permission is denied for the parent directory of the file to be  
 45307 created, or `O_TRUNC` is specified and write permission is denied.  
 45308

45309 [EEXIST] `O_CREAT` and `O_EXCL` are set, and the named file exists.

45310 [EINTR] A signal was caught during *open()*.

45311 SIO [EINVAL] The implementation does not support synchronized I/O for this file.

45312 OB XSR [EIO] The *path* argument names a STREAMS file and a hangup or error occurred  
 45313 during the *open()*.

45314 [EISDIR] The named file is a directory and *oflag* includes `O_WRONLY` or `O_RDWR`.

45315 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 45316 argument, or `O_NOFOLLOW` was specified and the *path* argument names a  
 45317 symbolic link.

45318 [EMFILE] All file descriptors available to the process are currently open.

45319 [ENAMETOOLONG]

45320 The length of a component of a pathname is longer than `{NAME_MAX}`.

45321 [ENFILE] The maximum allowable number of files is currently open in the system.

45322 [ENOENT] `O_CREAT` is not set and the named file does not exist; or `O_CREAT` is set and  
 45323 either the path prefix does not exist or the *path* argument points to an empty  
 45324 string.

45325 OB XSR [ENOSR] The *path* argument names a STREAMS-based file and the system is unable to  
 45326 allocate a STREAM.

45327 [ENOSPC] The directory or file system that would contain the new file cannot be  
 45328 expanded, the file does not exist, and `O_CREAT` is specified.

45329 [ENOTDIR] A component of the path prefix is not a directory; or `O_CREAT` and `O_EXCL`  
 45330 are not specified, the *path* argument contains at least one non-`<slash>`  
 45331 character and ends with one or more trailing `<slash>` characters, and the last  
 45332 pathname component names an existing file that is neither a directory nor a  
 45333 symbolic link to a directory; or `O_DIRECTORY` was specified and the *path*

45334		argument does not name a directory.
45335	[ENXIO]	O_NONBLOCK is set, the named file is a FIFO, O_WRONLY is set, and no process has the file open for reading.
45336		
45337	[ENXIO]	The named file is a character special or block special file, and the device associated with this special file does not exist.
45338		
45339	[EOVERFLOW]	The named file is a regular file and the size of the file cannot be represented correctly in an object of type <code>off_t</code> .
45340		
45341	[EROFS]	The named file resides on a read-only file system and either O_WRONLY, O_RDWR, O_CREAT (if the file does not exist), or O_TRUNC is set in the <i>oflag</i> argument.
45342		
45343		
45344		The <i>openat()</i> function shall fail if:
45345	[EACCES]	<i>fd</i> was not opened with O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.
45346		
45347	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.
45348		
45349		These functions may fail if:
45350	XSI [EAGAIN]	The <i>path</i> argument names the slave side of a pseudo-terminal device that is locked.
45351		
45352	[EINVAL]	The value of the <i>oflag</i> argument is not valid.
45353	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
45354		
45355	[ENAMETOOLONG]	
45356		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
45357		
45358		
45359	OB XSR [ENOMEM]	The <i>path</i> argument names a STREAMS file and the system is unable to allocate resources.
45360		
45361	[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and <i>oflag</i> is O_WRONLY or O_RDWR.
45362		
45363		The <i>openat()</i> function may fail if:
45364	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is neither AT_FDCWD nor a file descriptor associated with a directory.
45365		

45366 **EXAMPLES**45367 **Opening a File for Writing by the Owner**

45368 The following example opens the file `/tmp/file`, either by creating it (if it does not already exist),  
 45369 or by truncating its length to 0 (if it does exist). In the former case, if the call creates a new file,  
 45370 the access permission bits in the file mode of the file are set to permit reading and writing by the  
 45371 owner, and to permit reading only by group members and others.

45372 If the call to *open()* is successful, the file is opened for writing.

```
45373 #include <fcntl.h>
45374 ...
```

**open()**

```

45375     int fd;
45376     mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
45377     char *filename = "/tmp/file";
45378     ...
45379     fd = open(filename, O_WRONLY | O_CREAT | O_TRUNC, mode);
45380     ...

```

**Opening a File Using an Existence Check**

The following example uses the *open()* function to try to create the **LOCKFILE** file and open it for writing. Since the *open()* function specifies the **O\_EXCL** flag, the call fails if the file already exists. In that case, the program assumes that someone else is updating the password file and exits.

```

45386     #include <fcntl.h>
45387     #include <stdio.h>
45388     #include <stdlib.h>
45389
45390     #define LOCKFILE "/etc/ptmp"
45391     ...
45392     int pfd; /* Integer for file descriptor returned by open() call. */
45393     ...
45394     if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
45395                   S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
45396     {
45397         fprintf(stderr, "Cannot open %etc/ptmp. Try again later.\n");
45398         exit(1);
45399     }
45400     ...

```

**Opening a File for Writing**

The following example opens a file for writing, creating the file if it does not already exist. If the file does exist, the system truncates the file to zero bytes.

```

45403     #include <fcntl.h>
45404     #include <stdio.h>
45405     #include <stdlib.h>
45406
45407     #define LOCKFILE "/etc/ptmp"
45408     ...
45409     int pfd;
45410     char filename[PATH_MAX+1];
45411     ...
45412     if ((pfd = open(filename, O_WRONLY | O_CREAT | O_TRUNC,
45413                   S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
45414     {
45415         perror("Cannot open output file\n"); exit(1);
45416     }
45417     ...

```

## 45417 APPLICATION USAGE

45418 POSIX.1-2008 does not require that terminal parameters be automatically set to any state on first  
 45419 open, nor that they be reset after the last close. It is possible for a non-conforming application to  
 45420 leave a terminal device in a state where the next process to use that device finds it in a non-  
 45421 conforming state, but has no way of determining this. To ensure that the device is set to a  
 45422 conforming initial state, applications which perform a first open of a terminal (other than a  
 45423 pseudo-terminal) should do so using the O\_TTY\_INIT flag to set the parameters associated with  
 45424 the terminal to a conforming state.

## 45425 RATIONALE

45426 Except as specified in this volume of POSIX.1-2008, the flags allowed in *oflag* are not mutually-  
 45427 exclusive and any number of them may be used simultaneously.

45428 Some implementations permit opening FIFOs with O\_RDWR. Since FIFOs could be  
 45429 implemented in other ways, and since two file descriptors can be used to the same effect, this  
 45430 possibility is left as undefined.

45431 See *getgroups()* about the group of a newly created file.

45432 The use of *open()* to create a regular file is preferable to the use of *creat()*, because the latter is  
 45433 redundant and included only for historical reasons.

45434 The use of the O\_TRUNC flag on FIFOs and directories (pipes cannot be *open()*-ed) must be  
 45435 permissible without unexpected side-effects (for example, *creat()* on a FIFO must not remove  
 45436 data). Since terminal special files might have type-ahead data stored in the buffer, O\_TRUNC  
 45437 should not affect their content, particularly if a program that normally opens a regular file  
 45438 should open the current controlling terminal instead. Other file types, particularly  
 45439 implementation-defined ones, are left implementation-defined.

45440 POSIX.1-2008 permits [EACCES] to be returned for conditions other than those explicitly listed.

45441 The O\_NOCTTY flag was added to allow applications to avoid unintentionally acquiring a  
 45442 controlling terminal as a side-effect of opening a terminal file. This volume of POSIX.1-2008 does  
 45443 not specify how a controlling terminal is acquired, but it allows an implementation to provide  
 45444 this on *open()* if the O\_NOCTTY flag is not set and other conditions specified in XBD Chapter 11  
 45445 (on page 199) are met.

45446 In historical implementations the value of O\_RDONLY is zero. Because of that, it is not possible  
 45447 to detect the presence of O\_RDONLY and another option. Future implementations should  
 45448 encode O\_RDONLY and O\_WRONLY as bit flags so that:

45449 `O_RDONLY | O_WRONLY == O_RDWR`

45450 O\_EXEC and O\_SEARCH are specified as two of the five file access modes. Since O\_EXEC does  
 45451 not apply to directories, and O\_SEARCH only applies to directories, their values need not be  
 45452 distinct. Since O\_RDONLY has historically had the value zero, implementations are not able to  
 45453 distinguish between O\_SEARCH and O\_SEARCH | O\_RDONLY, and similarly for O\_EXEC.

45454 In general, the *open()* function follows the symbolic link if *path* names a symbolic link. However,  
 45455 the *open()* function, when called with O\_CREAT and O\_EXCL, is required to fail with [EEXIST]  
 45456 if *path* names an existing symbolic link, even if the symbolic link refers to a nonexistent file. This  
 45457 behavior is required so that privileged applications can create a new file in a known location  
 45458 without the possibility that a symbolic link might cause the file to be created in a different  
 45459 location.

45460 For example, a privileged application that must create a file with a predictable name in a user-  
 45461 writable directory, such as the user's home directory, could be compromised if the user creates a  
 45462 symbolic link with that name that refers to a nonexistent file in a system directory. If the user can

**open()**

45463 influence the contents of a file, the user could compromise the system by creating a new system  
 45464 configuration or spool file that would then be interpreted by the system. The test for a symbolic  
 45465 link which refers to a nonexisting file must be atomic with the creation of a new file.

45466 In addition, the *open()* function refuses to open non-directories if the `O_DIRECTORY` flag is set.  
 45467 This avoids race conditions whereby a user might compromise the system by substituting a hard  
 45468 link to a sensitive file (e.g., a device or a FIFO) while a privileged application is running, where  
 45469 opening a file even for read access might have undesirable side-effects.

45470 In addition, the *open()* function does not follow symbolic links if the `O_NOFOLLOW` flag is set.  
 45471 This avoids race conditions whereby a user might compromise the system by substituting a  
 45472 symbolic link to a sensitive file (e.g., a device) while a privileged application is running, where  
 45473 opening a file even for read access might have undesirable side-effects.

45474 The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group  
 45475 ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required  
 45476 that implementations provide a way to have the group ID be set to the group ID of the  
 45477 containing directory, but did not prohibit implementations also supporting a way to set the  
 45478 group ID to the effective group ID of the creating process. Conforming applications should not  
 45479 assume which group ID will be used. If it matters, an application can use *chown()* to set the  
 45480 group ID after the file is created, or determine under what conditions the implementation will  
 45481 set the desired group ID.

45482 The purpose of the *openat()* function is to enable opening files in directories other than the  
 45483 current working directory without exposure to race conditions. Any part of the path of a file  
 45484 could be changed in parallel to a call to *open()*, resulting in unspecified behavior. By opening a  
 45485 file descriptor for the target directory and using the *openat()* function it can be guaranteed that  
 45486 the opened file is located relative to the desired directory. Some implementations use the  
 45487 *openat()* function for other purposes as well. In some cases, if the *oflag* parameter has the  
 45488 `O_XATTR` bit set, the returned file descriptor provides access to extended attributes. This  
 45489 functionality is not standardized here.

**FUTURE DIRECTIONS**

45490 None.

**CHANGE HISTORY**

45497 First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

45499 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 45500 Threads Extension.

45501 Large File Summit extensions are added.

**Issue 6**

45503 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

45504 The following new requirements on POSIX implementations derive from alignment with the  
 45505 Single UNIX Specification:

- 45506 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
 45507 required for conforming implementations of previous POSIX specifications, it was not  
 45508 required for UNIX applications.
- 45509 • In the DESCRIPTION, `O_CREAT` is amended to state that the group ID of the file is set to  
 45510 the group ID of the file's parent directory or to the effective group ID of the process. This is  
 45511 a FIPS requirement.
- 45512 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open  
 45513 file description. This change is to support large files.
- 45514 • In the ERRORS section, the `[Eoverflow]` condition is added. This change is to support  
 45515 large files.
- 45516 • The `[ENXIO]` mandatory error condition is added.
- 45517 • The `[EINVAL]`, `[ENAMETOOLONG]`, and `[ETXTBSY]` optional error conditions are added.
- 45518 The DESCRIPTION and ERRORS sections are updated so that items related to the optional XSI  
 45519 STREAMS Option Group are marked.
- 45520 The following changes were made to align with the IEEE P1003.1a draft standard:
- 45521 • An explanation is added of the effect of the `O_CREAT` and `O_EXCL` flags when the path  
 45522 refers to a symbolic link.
- 45523 • The `[ELOOP]` optional error condition is added.
- 45524 The normative text is updated to avoid use of the term "must" for application requirements.
- 45525 The DESCRIPTION of `O_EXCL` is updated in response to IEEE PASC Interpretation 1003.1c #48.
- 45526 **Issue 7**
- 45527 Austin Group Interpretations 1003.1-2001 #113 and #143 are applied.
- 45528 Austin Group Interpretation 1003.1-2001 #144 is applied, adding the `O_TTY_INIT` flag.
- 45529 Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the  
 45530 `FD_CLOEXEC` flag atomically at `open()`, and adding the `F_DUPFD_CLOEXEC` flag.
- 45531 SD5-XBD-ERN-4 is applied, changing the definition of the `[EMFILE]` error.
- 45532 This page is revised and the `openat()` function is added from The Open Group Technical  
 45533 Standard, 2006, Extended API Set Part 2.
- 45534 Functionality relating to the XSI STREAMS option is marked obsolescent.
- 45535 Changes are made related to support for finegrained timestamps.
- 45536 Changes are made to allow a directory to be opened for searching.

**open\_memstream()**45537 **NAME**45538 `open_memstream, open_wmemstream` — open a dynamic memory buffer stream45539 **SYNOPSIS**

```

45540 CX #include <stdio.h>
45541 FILE *open_memstream(char **bufp, size_t *sizep);
45542 #include <wchar.h>
45543 FILE *open_wmemstream(wchar_t **bufp, size_t *sizep);

```

45544 **DESCRIPTION**

45545 The `open_memstream()` and `open_wmemstream()` functions shall create an I/O stream associated  
 45546 with a dynamically allocated memory buffer. The stream shall be opened for writing and shall  
 45547 be seekable.

45548 The stream associated with a call to `open_memstream()` shall be byte-oriented.

45549 The stream associated with a call to `open_wmemstream()` shall be wide-oriented.

45550 The stream shall maintain a current position in the allocated buffer and a current buffer length.  
 45551 The position shall be initially set to zero (the start of the buffer). Each write to the stream shall  
 45552 start at the current position and move this position by the number of successfully written bytes  
 45553 for `open_memstream()` or the number of successfully written wide characters for  
 45554 `open_wmemstream()`. The length shall be initially set to zero. If a write moves the position to a  
 45555 value larger than the current length, the current length shall be set to this position. In this case a  
 45556 null character for `open_memstream()` or a null wide character for `open_wmemstream()` shall be  
 45557 appended to the current buffer. For both functions the terminating null is not included in the  
 45558 calculation of the buffer length.

45559 After a successful `fflush()` or `fclose()`, the pointer referenced by `bufp` shall contain the address of  
 45560 the buffer, and the variable pointed to by `sizep` shall contain the smaller of the current buffer  
 45561 length and the number of bytes for `open_memstream()`, or the number of wide characters for  
 45562 `open_wmemstream()`, between the beginning of the buffer and the current file position indicator.

45563 After a successful `fflush()` the pointer referenced by `bufp` and the variable referenced by `sizep`  
 45564 remain valid only until the next write operation on the stream or a call to `fclose()`.

45565 **RETURN VALUE**

45566 Upon successful completion, these functions shall return a pointer to the object controlling the  
 45567 stream. Otherwise, a null pointer shall be returned, and `errno` shall be set to indicate the error.

45568 **ERRORS**

45569 These functions may fail if:

- |       |          |  |
|-------|----------|--|
| 45570 | [EINVAL] | <code>bufp</code> or <code>sizep</code> are NULL.              |
| 45571 | [EMFILE] | {FOPEN_MAX} streams are currently open in the calling process. |
| 45572 | [ENOMEM] | Memory for the stream or the buffer could not be allocated.    |

45573 **EXAMPLES**

```

45574     #include <stdio.h>
45575     #include <stdlib.h>

45576     int
45577     main (void)
45578     {
45579         FILE *stream;
45580         char *buf;
45581         size_t len;
45582         off_t eob;

45583         stream = open_memstream (&buf, &len);
45584         if (stream == NULL)
45585             /* handle error */ ;
45586         fprintf (stream, "hello my world");
45587         fflush (stream);
45588         printf ("buf=%s, len=%zu\n", buf, len);
45589         eob = ftello(stream);
45590         fseeko (stream, 0, SEEK_SET);
45591         fprintf (stream, "good-bye");
45592         fseeko (stream, eob, SEEK_SET);
45593         fclose (stream);
45594         printf ("buf=%s, len=%zu\n", buf, len);
45595         free (buf);
45596         return 0;
45597     }

```

45598 This program produces the following output:

```

45599     buf=hello my world, len=14
45600     buf=good-bye world, len=14

```

45601 **APPLICATION USAGE**

45602 The buffer created by these functions should be freed by the application after closing the stream,  
45603 by means of a call to *free()*.

45604 **RATIONALE**

45605 These functions are similar to *fmemopen()* except that the memory is always allocated  
45606 dynamically by the function, and the stream is opened only for output.

45607 **FUTURE DIRECTIONS**

45608 None.

45650 **NAME**

45651 pause — suspend the thread until a signal is received

45652 **SYNOPSIS**

45653 #include &lt;unistd.h&gt;

45654 int pause(void);

45655 **DESCRIPTION**45656 The *pause()* function shall suspend the calling thread until delivery of a signal whose action is  
45657 either to execute a signal-catching function or to terminate the process.45658 If the action is to terminate the process, *pause()* shall not return.45659 If the action is to execute a signal-catching function, *pause()* shall return after the signal-catching  
45660 function returns.45661 **RETURN VALUE**45662 Since *pause()* suspends thread execution indefinitely unless interrupted by a signal, there is no  
45663 successful completion return value. A value of  $-1$  shall be returned and *errno* set to indicate the  
45664 error.45665 **ERRORS**45666 The *pause()* function shall fail if:45667 [EINTR] A signal is caught by the calling process and control is returned from the  
45668 signal-catching function.45669 **EXAMPLES**

45670 None.

45671 **APPLICATION USAGE**45672 Many common uses of *pause()* have timing windows. The scenario involves checking a  
45673 condition related to a signal and, if the signal has not occurred, calling *pause()*. When the signal  
45674 occurs between the check and the call to *pause()*, the process often blocks indefinitely. The  
45675 *sigprocmask()* and *sigsuspend()* functions can be used to avoid this type of problem.45676 **RATIONALE**

45677 None.

45678 **FUTURE DIRECTIONS**

45679 None.

45680 **SEE ALSO**45681 *sigsuspend()*

45682 XBD &lt;unistd.h&gt;

45683 **CHANGE HISTORY**

45684 First released in Issue 1. Derived from Issue 1 of the SVID.

45685 **Issue 5**

45686 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

45687 **Issue 6**

45688 The APPLICATION USAGE section is added.

**pclose()**45689 **NAME**45690 `pclose` — close a pipe stream to or from a process45691 **SYNOPSIS**

```
45692 CX #include <stdio.h>
45693 int pclose(FILE *stream);
```

45694 **DESCRIPTION**

45695 The `pclose()` function shall close a stream that was opened by `popen()`, wait for the command to  
 45696 terminate, and return the termination status of the process that was running the command  
 45697 language interpreter. However, if a call caused the termination status to be unavailable to  
 45698 `pclose()`, then `pclose()` shall return `-1` with `errno` set to `[ECHILD]` to report this situation. This can  
 45699 happen if the application calls one of the following functions:

- 45700 • `wait()`
- 45701 • `waitpid()` with a `pid` argument less than or equal to 0 or equal to the process ID of the  
 45702 command line interpreter
- 45703 • Any other function not defined in this volume of POSIX.1-2008 that could do one of the  
 45704 above

45705 In any case, `pclose()` shall not return before the child process created by `popen()` has terminated.

45706 If the command language interpreter cannot be executed, the child termination status returned  
 45707 by `pclose()` shall be as if the command language interpreter terminated using `exit(127)` or  
 45708 `_exit(127)`.

45709 The `pclose()` function shall not affect the termination status of any child of the calling process  
 45710 other than the one created by `popen()` for the associated stream.

45711 If the argument `stream` to `pclose()` is not a pointer to a stream created by `popen()`, the result of  
 45712 `pclose()` is undefined.

45713 **RETURN VALUE**

45714 Upon successful return, `pclose()` shall return the termination status of the command language  
 45715 interpreter. Otherwise, `pclose()` shall return `-1` and set `errno` to indicate the error.

45716 **ERRORS**

45717 The `pclose()` function shall fail if:

- 45718 `[ECHILD]` The status of the child process could not be obtained, as described above.

45719 **EXAMPLES**

45720 None.

45721 **APPLICATION USAGE**

45722 None.

45723 **RATIONALE**

45724 There is a requirement that `pclose()` not return before the child process terminates. This is  
 45725 intended to disallow implementations that return `[EINTR]` if a signal is received while waiting.  
 45726 If `pclose()` returned before the child terminated, there would be no way for the application to  
 45727 discover which child used to be associated with the stream, and it could not do the cleanup  
 45728 itself.

45729 If the stream pointed to by `stream` was not created by `popen()`, historical implementations of  
 45730 `pclose()` return `-1` without setting `errno`. To avoid requiring `pclose()` to set `errno` in this case,  
 45731 POSIX.1-2008 makes the behavior unspecified. An application should not use `pclose()` to close

45732 any stream that was not created by *popen()*.

45733 Some historical implementations of *pclose()* either block or ignore the signals SIGINT, SIGQUIT,  
45734 and SIGHUP while waiting for the child process to terminate. Since this behavior is not  
45735 described for the *pclose()* function in POSIX.1-2008, such implementations are not conforming.  
45736 Also, some historical implementations return [EINTR] if a signal is received, even though the  
45737 child process has not terminated. Such implementations are also considered non-conforming.

45738 Consider, for example, an application that uses:

```
45739 popen("command", "r")
```

45740 to start *command*, which is part of the same application. The parent writes a prompt to its  
45741 standard output (presumably the terminal) and then reads from the *popen()*ed stream. The child  
45742 reads the response from the user, does some transformation on the response (pathname  
45743 expansion, perhaps) and writes the result to its standard output. The parent process reads the  
45744 result from the pipe, does something with it, and prints another prompt. The cycle repeats.  
45745 Assuming that both processes do appropriate buffer flushing, this would be expected to work.

45746 To conform to POSIX.1-2008, *pclose()* must use *waitpid()*, or some similar function, instead of  
45747 *wait()*.

45748 The code sample below illustrates how the *pclose()* function might be implemented on a system  
45749 conforming to POSIX.1-2008.

```
45750 int pclose(FILE *stream)
45751 {
45752     int stat;
45753     pid_t pid;
45754
45755     pid = <pid for process created for stream by popen()>
45756     (void) fclose(stream);
45757     while (waitpid(pid, &stat, 0) == -1) {
45758         if (errno != EINTR) {
45759             stat = -1;
45760             break;
45761         }
45762     }
45763     return(stat);
45764 }
```

#### 45764 FUTURE DIRECTIONS

45770 First released in Issue 1. Derived from Issue 1 of the SVID.

**perror()**45771 **NAME**45772            **perror** — write error messages to standard error45773 **SYNOPSIS**

45774            #include &lt;stdio.h&gt;

45775            void perror(const char \*s);

45776 **DESCRIPTION**45777 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
45778 conflict between the requirements described here and the ISO C standard is unintentional. This  
45779 volume of POSIX.1-2008 defers to the ISO C standard.45780        The *perror()* function shall map the error number accessed through the symbol *errno* to a  
45781 language-dependent error message, which shall be written to the standard error stream as  
45782 follows:

- 45783
- First (if *s* is not a null pointer and the character pointed to by *s* is not the null byte), the  
45784 string pointed to by *s* followed by a <colon> and a <space>.
  - Then an error message string followed by a <newline>.

45786        The contents of the error message strings shall be the same as those returned by *strerror()* with  
45787 argument *errno*.45788 **CX**        The *perror()* function shall mark for update the last data modification and last file status change  
45789 timestamps of the file associated with the standard error stream at some time between its  
45790 successful completion and *exit()*, *abort()*, or the completion of *fflush()* or *fclose()* on *stderr*.45791        The *perror()* function shall not change the orientation of the standard error stream.45792 **RETURN VALUE**45793        The *perror()* function shall not return a value.45794 **ERRORS**

45795        No errors are defined.

45796 **EXAMPLES**45797            **Printing an Error Message for a Function**45798        The following example replaces *bufptr* with a buffer that is the necessary size. If an error occurs,  
45799 the *perror()* function prints a message and the program exits.45800        #include <stdio.h>  
45801        #include <stdlib.h>  
45802        ...  
45803        char \*bufptr;  
45804        size\_t szbuf;  
45805        ...  
45806        if ((bufptr = malloc(szbuf)) == NULL) {  
45807            perror("malloc"); exit(2);  
45808        }  
45809        ...45810 **APPLICATION USAGE**

45811        None.

45812 **RATIONALE**

45813 None.

45814 **FUTURE DIRECTIONS**

45815 None.

45816 **SEE ALSO**45817 *psiginfo()*, *strerror()*

45818 XBD &lt;stdio.h&gt;

45819 **CHANGE HISTORY**

45820 First released in Issue 1. Derived from Issue 1 of the SVID.

45821 **Issue 5**45822 A paragraph is added to the DESCRIPTION indicating that *perror()* does not change the  
45823 orientation of the standard error stream.45824 **Issue 6**

45825 Extensions beyond the ISO C standard are marked.

45826 **Issue 7**

45827 SD5-XSH-ERN-95 is applied.

45828 Changes are made related to support for finegrained timestamps.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**pipe()**45829 **NAME**

45830 pipe — create an interprocess channel

45831 **SYNOPSIS**

```
45832 #include <unistd.h>
45833 int pipe(int fildes[2]);
```

45834 **DESCRIPTION**

45835 The *pipe()* function shall create a pipe and place two file descriptors, one each into the  
 45836 arguments *fildes*[0] and *fildes*[1], that refer to the open file descriptions for the read and write  
 45837 ends of the pipe. Their integer values shall be the two lowest available at the time of the *pipe()*  
 45838 call. The *O\_NONBLOCK* and *FD\_CLOEXEC* flags shall be clear on both file descriptors. (The  
 45839 *fcntl()* function can be used to set both these flags.)

45840 Data can be written to the file descriptor *fildes*[1] and read from the file descriptor *fildes*[0]. A  
 45841 read on the file descriptor *fildes*[0] shall access data written to the file descriptor *fildes*[1] on a  
 45842 first-in-first-out basis. It is unspecified whether *fildes*[0] is also open for writing and whether  
 45843 *fildes*[1] is also open for reading.

45844 A process has the pipe open for reading (correspondingly writing) if it has a file descriptor open  
 45845 that refers to the read end, *fildes*[0] (write end, *fildes*[1]).

45846 The pipe's user ID shall be set to the effective user ID of the calling process.

45847 The pipe's group ID shall be set to the effective group ID of the calling process.

45848 Upon successful completion, *pipe()* shall mark for update the last data access, last data  
 45849 modification, and last file status change timestamps of the pipe.

45850 **RETURN VALUE**

45851 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
 45852 indicate the error.

45853 **ERRORS**

45854 The *pipe()* function shall fail if:

- |       |          |  |
|-------|----------|--|
| 45855 | [EMFILE] | All, or all but one, of the file descriptors available to the process are currently open.  |
| 45857 | [ENFILE] | The number of simultaneously open files in the system would exceed a system-imposed limit. |

45859 **EXAMPLES**45860 **Using a Pipe to Pass Data Between a Parent Process and a Child Process**

45861 The following example demonstrates the use of a pipe to transfer data between a parent process  
 45862 and a child process. Error handling is excluded, but otherwise this code demonstrates good  
 45863 practice when using pipes: after the *fork()* the two processes close the unused ends of the pipe  
 45864 before they commence transferring data.

```
45865 #include <stdlib.h>
45866 #include <unistd.h>
45867 ...
45868 int fildes[2];
45869 const int BSIZE = 100;
45870 char buf[BSIZE];
45871 ssize_t nbytes;
```

```

45872     int status;
45873     status = pipe(fildes);
45874     if (status == -1 ) {
45875         /* an error occurred */
45876         ...
45877     }
45878     switch (fork()) {
45879     case -1: /* Handle error */
45880         break;
45881     case 0: /* Child - reads from pipe */
45882         close(fildes[1]); /* Write end is unused */
45883         nbytes = read(fildes[0], buf, BSIZE); /* Get data from pipe */
45884         /* At this point, a further read would see end of file ... */
45885         close(fildes[0]); /* Finished with pipe */
45886         exit(EXIT_SUCCESS);
45887     default: /* Parent - writes to pipe */
45888         close(fildes[0]); /* Read end is unused */
45889         write(fildes[1], "Hello world\n", 12); /* Write data on pipe */
45890         close(fildes[1]); /* Child will see EOF */
45891         exit(EXIT_SUCCESS);
45892     }

```

**45893 APPLICATION USAGE**

45894 None.

**45895 RATIONALE**

45896 The wording carefully avoids using the verb "to open" in order to avoid any implication of use  
45897 of *open()*; see also *write()*.

**45898 FUTURE DIRECTIONS**

45899 None.

**45900 SEE ALSO**

45901 *fcntl()*, *read()*, *write()*  
45902 XBD <*fcntl.h*>, <*unistd.h*>

45904 First released in Issue 1. Derived from Issue 1 of the SVID.

**45905 Issue 6**

45906 The following new requirements on POSIX implementations derive from alignment with the  
45907 Single UNIX Specification:

- 45908 • The DESCRIPTION is updated to indicate that certain dispositions of *fildes[0]* and *fildes[1]*  
45909 are unspecified.

45910 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/65 is applied, adding the example to the  
45911 EXAMPLES section.

## pipe()

45912 **Issue 7**

45913 SD5-XSH-ERN-156 is applied, updating the DESCRIPTION to state the setting of the pipe's user  
45914 ID and group ID.

45915 Changes are made related to support for finegrained timestamps.

## 45916 NAME

45917 poll — input/output multiplexing

## 45918 SYNOPSIS

45919 #include &lt;poll.h&gt;

45920 int poll(struct pollfd *fds*[], nfd\_t *nfds*, int *timeout*);

## 45921 DESCRIPTION

45922 The *poll()* function provides applications with a mechanism for multiplexing input/output over  
 45923 a set of file descriptors. For each member of the array pointed to by *fds*, *poll()* shall examine the  
 45924 given file descriptor for the event(s) specified in *events*. The number of **pollfd** structures in the  
 45925 *fds* array is specified by *nfds*. The *poll()* function shall identify those file descriptors on which an  
 45926 application can read or write data, or on which certain events have occurred.

45927 The *fds* argument specifies the file descriptors to be examined and the events of interest for each  
 45928 file descriptor. It is a pointer to an array with one member for each open file descriptor of  
 45929 interest. The array's members are **pollfd** structures within which *fd* specifies an open file  
 45930 descriptor and *events* and *revents* are bitmasks constructed by OR'ing a combination of the  
 45931 following event flags:

45932	POLLIN	Data other than high-priority data may be read without blocking.
45933	OB XSR	For STREAMS, this flag is set in <i>revents</i> even if the message is of zero length.
45934		This flag shall be equivalent to <code>POLLRDNORM   POLLRDBAND</code> .
45935	POLLRDNORM	Normal data may be read without blocking.
45936	OB XSR	For STREAMS, data on priority band 0 may be read without blocking. This
45937		flag is set in <i>revents</i> even if the message is of zero length.
45938	POLLRDBAND	Priority data may be read without blocking.
45939	OB XSR	For STREAMS, data on priority bands greater than 0 may be read without
45940		blocking. This flag is set in <i>revents</i> even if the message is of zero length.
45941	POLLPRI	High-priority data may be read without blocking.
45942	OB XSR	For STREAMS, this flag is set in <i>revents</i> even if the message is of zero length.
45943	POLLOUT	Normal data may be written without blocking.
45944	OB XSR	For STREAMS, data on priority band 0 may be written without blocking.
45945	POLLWRNORM	Equivalent to POLLOUT.
45946	POLLWRBAND	Priority data may be written.
45947	OB XSR	For STREAMS, data on priority bands greater than 0 may be written without
45948		blocking. If any priority band has been written to on this STREAM, this event
45949		only examines bands that have been written to at least once.
45950	POLLERR	An error has occurred on the device or stream. This flag is only valid in the
45951		<i>revents</i> bitmask; it shall be ignored in the <i>events</i> member.
45952	POLLHUP	A device has been disconnected, or a pipe or FIFO has been closed by the last
45953		process that had it open for writing. Once set, the hangup state of a FIFO shall
45954		persist until some process opens the FIFO for writing or until all read-only file
45955		descriptors for the FIFO are closed. This event and POLLOUT are mutually-
45956		exclusive; a stream can never be writable if a hangup has occurred. However,
45957		this event and POLLIN, POLLRDNORM, POLLRDBAND, or POLLPRI are
45958		not mutually-exclusive. This flag is only valid in the <i>revents</i> bitmask; it shall be

**poll()**

45959		ignored in the <i>events</i> member.
45960	POLLNVAL	The specified <i>fd</i> value is invalid. This flag is only valid in the <i>revents</i> member; it shall ignored in the <i>events</i> member.
45961		
45962		The significance and semantics of normal, priority, and high-priority data are file and device-specific.
45963		
45964		If the value of <i>fd</i> is less than 0, <i>events</i> shall be ignored, and <i>revents</i> shall be set to 0 in that entry on return from <i>poll()</i> .
45965		
45966		In each <b>pollfd</b> structure, <i>poll()</i> shall clear the <i>revents</i> member, except that where the application requested a report on a condition by setting one of the bits of <i>events</i> listed above, <i>poll()</i> shall set the corresponding bit in <i>revents</i> if the requested condition is true. In addition, <i>poll()</i> shall set the POLLHUP, POLLERR, and POLLNVAL flag in <i>revents</i> if the condition is true, even if the application did not set the corresponding bit in <i>events</i> .
45967		
45968		
45969		
45970		
45971		If none of the defined events have occurred on any selected file descriptor, <i>poll()</i> shall wait at least <i>timeout</i> milliseconds for an event to occur on any of the selected file descriptors. If the value of <i>timeout</i> is 0, <i>poll()</i> shall return immediately. If the value of <i>timeout</i> is -1, <i>poll()</i> shall block until a requested event occurs or until the call is interrupted.
45972		
45973		
45974		
45975		Implementations may place limitations on the granularity of timeout intervals. If the requested timeout interval requires a finer granularity than the implementation supports, the actual timeout interval shall be rounded up to the next supported value.
45976		
45977		
45978		The <i>poll()</i> function shall not be affected by the O_NONBLOCK flag.
45979		The <i>poll()</i> function shall support regular files, terminal and pseudo-terminal devices, FIFOs,
45980	OB XSR	pipes, sockets and <b>STREAMS-based files</b> . The behavior of <i>poll()</i> on elements of <i>fds</i> that refer to other types of file is unspecified.
45981		
45982		Regular files shall always poll TRUE for reading and writing.
45983		A file descriptor for a socket that is listening for connections shall indicate that it is ready for reading, once connections are available. A file descriptor for a socket that is connecting asynchronously shall indicate that it is ready for writing, once a connection has been established.
45984		
45985		
45986		<b>RETURN VALUE</b>
45987		Upon successful completion, <i>poll()</i> shall return a non-negative value. A positive value indicates the total number of file descriptors that have been selected (that is, file descriptors for which the <i>revents</i> member is non-zero). A value of 0 indicates that the call timed out and no file descriptors have been selected. Upon failure, <i>poll()</i> shall return -1 and set <i>errno</i> to indicate the error.
45988		
45989		
45990		
45991		<b>ERRORS</b>
45992		The <i>poll()</i> function shall fail if:
45993	[EAGAIN]	The allocation of internal data structures failed but a subsequent request may succeed.
45994		
45995	[EINTR]	A signal was caught during <i>poll()</i> .
45996	OB XSR [EINVAL]	The <i>nfds</i> argument is greater than {OPEN_MAX}, or one of the <i>fd</i> members refers to a <b>STREAM</b> or multiplexer that is linked (directly or indirectly) downstream from a multiplexer.
45997		
45998		

## 45999 EXAMPLES

46000 **Checking for Events on a Stream**

46001 The following example opens a pair of STREAMS devices and then waits for either one to  
 46002 become writable. This example proceeds as follows:

- 46003 1. Sets the *timeout* parameter to 500 milliseconds.
- 46004 2. Opens the STREAMS devices */dev/dev0* and */dev/dev1*, and then polls them, specifying  
 46005 POLLOUT and POLLWRBAND as the events of interest.

46006 The STREAMS device names */dev/dev0* and */dev/dev1* are only examples of how  
 46007 STREAMS devices can be named; STREAMS naming conventions may vary among  
 46008 systems conforming to the POSIX.1-2008.

- 46009 3. Uses the *ret* variable to determine whether an event has occurred on either of the two  
 46010 STREAMS. The *poll()* function is given 500 milliseconds to wait for an event to occur (if it  
 46011 has not occurred prior to the *poll()* call).
- 46012 4. Checks the returned value of *ret*. If a positive value is returned, one of the following can  
 46013 be done:
  - 46014 a. Priority data can be written to the open STREAM on priority bands greater than 0,  
 46015 because the POLLWRBAND event occurred on the open STREAM (*fds[0]* or *fds[1]*).
  - 46016 b. Data can be written to the open STREAM on priority-band 0, because the  
 46017 POLLOUT event occurred on the open STREAM (*fds[0]* or *fds[1]*).
- 46018 5. If the returned value is not a positive value, permission to write data to the open  
 46019 STREAM (on any priority band) is denied.
- 46020 6. If the POLLHUP event occurs on the open STREAM (*fds[0]* or *fds[1]*), the device on the  
 46021 open STREAM has disconnected.

```

46022 #include <stropts.h>
46023 #include <poll.h>
46024 ...
46025 struct pollfd fds[2];
46026 int timeout_msecs = 500;
46027 int ret;
46028     int i;

46029 /* Open STREAMS device. */
46030 fds[0].fd = open("/dev/dev0", ...);
46031 fds[1].fd = open("/dev/dev1", ...);
46032 fds[0].events = POLLOUT | POLLWRBAND;
46033 fds[1].events = POLLOUT | POLLWRBAND;

46034 ret = poll(fds, 2, timeout_msecs);

46035 if (ret > 0) {
46036     /* An event on one of the fds has occurred. */
46037     for (i=0; i<2; i++) {
46038         if (fds[i].revents & POLLWRBAND) {
46039             /* Priority data may be written on device number i. */
46040             ...
46041         }
46042         if (fds[i].revents & POLLOUT) {

```

**poll()**

```

46043             /* Data may be written on device number i. */
46044     ...
46045     }
46046     if (fds[i].revents & POLLHUP) {
46047         /* A hangup has occurred on device number i. */
46048     ...
46049     }
46050     }
46051 }

```

**46052 APPLICATION USAGE**

46053 None.

**46054 RATIONALE**

46055 The POLLHUP event does not occur for FIFOs just because the FIFO is not open for writing. It  
46056 only occurs when the FIFO is closed by the last writer and persists until some process opens the  
46057 FIFO for writing or until all read-only file descriptors for the FIFO are closed.

**46058 FUTURE DIRECTIONS**

46059 None.

**46060 SEE ALSO**

**46063 CHANGE HISTORY**

46064 First released in Issue 4, Version 2.

**46065 Issue 5**

46066 Moved from X/OPEN UNIX extension to BASE.

46067 The description of POLLWRBAND is updated.

**46068 Issue 6**

46069 Text referring to sockets is added to the DESCRIPTION.

46070 Functionality relating to the XSI STREAMS Option Group is marked.

46071 The Open Group Corrigendum U055/3 is applied, updating the DESCRIPTION of  
46072 POLLWRBAND.

46073 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/66 is applied, correcting the spacing in  
46074 the EXAMPLES section.

**46075 Issue 7**

46076 Austin Group Interpretation 1003.1-2001 #209 is applied, clarifying the POLLHUP event.

46077 The *poll()* function is moved from the XSI option to the Base.

46078 Functionality relating to the XSI STREAMS option is marked obsolescent.

46079 **NAME**

46080 popen — initiate pipe streams to or from a process

46081 **SYNOPSIS**

```
46082 CX #include <stdio.h>
46083 FILE *popen(const char *command, const char *mode);
```

46084 **DESCRIPTION**

46085 The *popen()* function shall execute the command specified by the string *command*. It shall create  
 46086 a pipe between the calling program and the executed command, and shall return a pointer to a  
 46087 stream that can be used to either read from or write to the pipe.

46088 The environment of the executed command shall be as if a child process were created within the  
 46089 *popen()* call using the *fork()* function, and the child invoked the *sh* utility using the call:

```
46090 execl(shell_path, "sh", "-c", command, (char *)0);
```

46091 where *shell\_path* is an unspecified pathname for the *sh* utility.

46092 The *popen()* function shall ensure that any streams from previous *popen()* calls that remain open  
 46093 in the parent process are closed in the new child process.

46094 The *mode* argument to *popen()* is a string that specifies I/O mode:

- 46095 1. If *mode* is *r*, when the child process is started, its file descriptor `STDOUT_FILENO` shall be  
 46096 the writable end of the pipe, and the file descriptor *fileno(stream)* in the calling process,  
 46097 where *stream* is the stream pointer returned by *popen()*, shall be the readable end of the  
 46098 pipe.
- 46099 2. If *mode* is *w*, when the child process is started its file descriptor `STDIN_FILENO` shall be  
 46100 the readable end of the pipe, and the file descriptor *fileno(stream)* in the calling process,  
 46101 where *stream* is the stream pointer returned by *popen()*, shall be the writable end of the  
 46102 pipe.
- 46103 3. If *mode* is any other value, the result is unspecified.

46104 After *popen()*, both the parent and the child process shall be capable of executing independently  
 46105 before either terminates.

46106 Pipe streams are byte-oriented.

46107 **RETURN VALUE**

46108 Upon successful completion, *popen()* shall return a pointer to an open stream that can be used to  
 46109 read or write to the pipe. Otherwise, it shall return a null pointer and may set *errno* to indicate  
 46110 the error.

46111 **ERRORS**

46112 The *popen()* function shall fail if:

46113 [EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

46114 The *popen()* function may fail if:

46115 [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

46116 [EINVAL] The *mode* argument is invalid.

46117 The *popen()* function may also set *errno* values as described by *fork()* or *pipe()*.

**popen()**46118 **EXAMPLES**46119 **Using popen() to Obtain a List of Files from the ls Utility**

46120 The following example demonstrates the use of *popen()* and *pclose()* to execute the command *ls\**  
 46121 in order to obtain a list of files in the current directory:

```

46122 #include <stdio.h>
46123 ...
46124 FILE *fp;
46125 int status;
46126 char path[PATH_MAX];
46127 fp = popen("ls *", "r");
46128 if (fp == NULL)
46129     /* Handle error */;
46130 while (fgets(path, PATH_MAX, fp) != NULL)
46131     printf("%s", path);
46132 status = pclose(fp);
46133 if (status == -1) {
46134     /* Error reported by pclose() */
46135     ...
46136 } else {
46137     /* Use macros described under wait() to inspect 'status' in order
46138     to determine success/failure of command executed by popen() */
46139     ...
46140 }

```

46141 **APPLICATION USAGE**

46142 Since open files are shared, a mode *r* command can be used as an input filter and a mode *w*  
 46143 command as an output filter.

46144 Buffered reading before opening an input filter may leave the standard input of that filter  
 46145 mispositioned. Similar problems with an output filter may be prevented by careful buffer  
 46146 flushing; for example, with *fflush()*.

46147 A stream opened by *popen()* should be closed by *pclose()*.

46148 The behavior of *popen()* is specified for values of *mode* of *r* and *w*. Other modes such as *rb* and  
 46149 *wb* might be supported by specific implementations, but these would not be portable features.  
 46150 Note that historical implementations of *popen()* only check to see if the first character of *mode* is  
 46151 *r*. Thus, a mode of *robert the robot* would be treated as mode *r*, and a mode of *anything else* would be  
 46152 treated as mode *w*.

46153 If the application calls *waitpid()* or *waitid()* with a *pid* argument greater than 0, and it still has a  
 46154 stream that was called with *popen()* open, it must ensure that *pid* does not refer to the process  
 46155 started by *popen()*.

46156 To determine whether or not the environment specified in the Shell and Utilities volume of  
 46157 POSIX.1-2008 is present, use the function call:

```
46158 sysconf (_SC_2_VERSION)
```

46159 (See *sysconf()*).

46160 **RATIONALE**

46161 The *popen()* function should not be used by programs that have set user (or group) ID privileges.  
 46162 The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used instead.  
 46163 This prevents any unforeseen manipulation of the environment of the user that could cause  
 46164 execution of commands not anticipated by the calling program.

46165 If the original and *popen()*ed processes both intend to read or write or read and write a common  
 46166 file, and either will be using FILE-type C functions (*fread()*, *fwrite()*, and so on), the rules for  
 46167 sharing file handles must be observed (see Section 2.5.1, on page 491).

46168 **FUTURE DIRECTIONS**

46169 None.

46170 **SEE ALSO**

46173 XCU *sh*

46174 **CHANGE HISTORY**

46175 First released in Issue 1. Derived from Issue 1 of the SVID.

46176 **Issue 5**

46177 A statement is added to the DESCRIPTION indicating that pipe streams are byte-oriented.

46178 **Issue 6**

46179 The following new requirements on POSIX implementations derive from alignment with the  
 46180 Single UNIX Specification:

- 46181 • The optional [EMFILE] error condition is added.

46182 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/67 is applied, adding the example to the  
 46183 EXAMPLES section.

46184 **Issue 7**

46185 Austin Group Interpretation 1003.1-2001 #029 is applied, clarifying the values for *mode* in the  
 46186 DESCRIPTION.

46187 SD5-XSH-ERN-149 is applied, changing the {STREAM\_MAX} [EMFILE] error condition from a  
 46188 "may fail" to a "shall fail".

**posix\_fadvise()**46189 **NAME**46190 `posix_fadvise` — file advisory information (**ADVANCED REALTIME**)46191 **SYNOPSIS**

```
46192 ADV #include <fcntl.h>
46193 int posix_fadvise(int fd, off_t offset, off_t len, int advice);
```

46194 **DESCRIPTION**

46195 The `posix_fadvise()` function shall advise the implementation on the expected behavior of the  
 46196 application with respect to the data in the file associated with the open file descriptor `fd`, starting  
 46197 at `offset` and continuing for `len` bytes. The specified range need not currently exist in the file. If `len`  
 46198 is zero, all data following `offset` is specified. The implementation may use this information to  
 46199 optimize handling of the specified data. The `posix_fadvise()` function shall have no effect on the  
 46200 semantics of other operations on the specified data, although it may affect the performance of  
 46201 other operations.

46202 The advice to be applied to the data is specified by the `advice` parameter and may be one of the  
 46203 following values:

46204 **POSIX\_FADV\_NORMAL**

46205 Specifies that the application has no advice to give on its behavior with respect to the  
 46206 specified data. It is the default characteristic if no advice is given for an open file.

46207 **POSIX\_FADV\_SEQUENTIAL**

46208 Specifies that the application expects to access the specified data sequentially from lower  
 46209 offsets to higher offsets.

46210 **POSIX\_FADV\_RANDOM**

46211 Specifies that the application expects to access the specified data in a random order.

46212 **POSIX\_FADV\_WILLNEED**

46213 Specifies that the application expects to access the specified data in the near future.

46214 **POSIX\_FADV\_DONTNEED**

46215 Specifies that the application expects that it will not access the specified data in the near  
 46216 future.

46217 **POSIX\_FADV\_NOREUSE**

46218 Specifies that the application expects to access the specified data once and then not reuse it  
 46219 thereafter.

46220 These values are defined in `<fcntl.h>`.

46221 **RETURN VALUE**

46222 Upon successful completion, `posix_fadvise()` shall return zero; otherwise, an error number shall  
 46223 be returned to indicate the error.

46224 **ERRORS**

46225 The `posix_fadvise()` function shall fail if:

- |       |          |  |
|-------|----------|--|
| 46226 | [EBADF]  | The <code>fd</code> argument is not a valid file descriptor.                                     |
| 46227 | [EINVAL] | The value of <code>advice</code> is invalid, or the value of <code>len</code> is less than zero. |
| 46228 | [ESPIPE] | The <code>fd</code> argument is associated with a pipe or FIFO.                                  |

**46229 EXAMPLES**

46230 None.

**46231 APPLICATION USAGE**

46232 The *posix\_fadvise()* function is part of the Advisory Information option and need not be  
46233 provided on all implementations.

**46234 RATIONALE**

46235 None.

**46236 FUTURE DIRECTIONS**

46237 None.

**46238 SEE ALSO**

46239 *posix\_madvise()*

46240 XBD `<fcntl.h>`

**46241 CHANGE HISTORY**

46242 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

46243 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

46244 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/68 is applied, changing the function  
46245 prototype in the SYNOPSIS section. The previous prototype was not large file-aware, and the  
46246 standard developers felt it acceptable to make this change before implementations of this  
46247 function become widespread.

**46248 Issue 7**

46249 Austin Group Interpretation 1003.1-2001 #024 is applied, changing the definition of the  
46250 [EINVAL] error.

**posix\_fallocate()**46251 **NAME**46252 `posix_fallocate` — file space control (**ADVANCED REALTIME**)46253 **SYNOPSIS**

```
46254 ADV #include <fcntl.h>
46255 int posix_fallocate(int fd, off_t offset, off_t len);
```

46256 **DESCRIPTION**

46257 The `posix_fallocate()` function shall ensure that any required storage for regular file data starting  
 46258 at `offset` and continuing for `len` bytes is allocated on the file system storage media. If  
 46259 `posix_fallocate()` returns successfully, subsequent writes to the specified file data shall not fail due  
 46260 to the lack of free space on the file system storage media.

46261 If the `offset+len` is beyond the current file size, then `posix_fallocate()` shall adjust the file size to  
 46262 `offset+len`. Otherwise, the file size shall not be changed.

46263 It is implementation-defined whether a previous `posix_fadvise()` call influences allocation  
 46264 strategy.

46265 Space allocated via `posix_fallocate()` shall be freed by a successful call to `creat()` or `open()` that  
 46266 truncates the size of the file. Space allocated via `posix_fallocate()` may be freed by a successful call  
 46267 to `ftruncate()` that reduces the file size to a size smaller than `offset+len`.

46268 **RETURN VALUE**

46269 Upon successful completion, `posix_fallocate()` shall return zero; otherwise, an error number shall  
 46270 be returned to indicate the error.

46271 **ERRORS**46272 The `posix_fallocate()` function shall fail if:46273 [EBADF] The `fd` argument is not a valid file descriptor.46274 [EBADF] The `fd` argument references a file that was opened without write permission.46275 [EFBIG] The value of `offset+len` is greater than the maximum file size.

46276 [EINTR] A signal was caught during execution.

46277 [EINVAL] The `len` argument is less than zero, or the `offset` argument is less than zero, or  
 46278 the underlying file system does not support this operation.

46279 [EIO] An I/O error occurred while reading from or writing to a file system.

46280 [ENODEV] The `fd` argument does not refer to a regular file.

46281 [ENOSPC] There is insufficient free space remaining on the file system storage media.

46282 [ESPIPE] The `fd` argument is associated with a pipe or FIFO.46283 The `posix_fallocate()` function may fail if:46284 [EINVAL] The `len` argument is zero.

46285 **EXAMPLES**

46286 None.

46287 **APPLICATION USAGE**46288 The *posix\_fallocate()* function is part of the Advisory Information option and need not be  
46289 provided on all implementations.46290 **RATIONALE**

46291 None.

46292 **FUTURE DIRECTIONS**

46294 **SEE ALSO**46295 *creat()*, *ftruncate()*, *open()*, *unlink()*46296 XBD `<fcntl.h>`46297 **CHANGE HISTORY**

46298 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

46299 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.46300 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/69 is applied, changing the function  
46301 prototype in the SYNOPSIS section. The previous prototype was not large file-aware, and the  
46302 standard developers felt it acceptable to make this change before implementations of this  
46303 function become widespread.46304 **Issue 7**46305 Austin Group Interpretations 1003.1-2001 #022, #024, and #162 are applied, changing the  
46306 definition of the [EINVAL] error.

**posix\_madvise()**

System Interfaces

46307 **NAME**

46308 **posix\_madvise** — memory advisory information and alignment control (**ADVANCED**  
 46309 **REALTIME**)

46310 **SYNOPSIS**

```
46311 ADV #include <sys/mman.h>
46312 int posix_madvise(void *addr, size_t len, int advice);
```

46313 **DESCRIPTION**

46314 The *posix\_madvise()* function shall advise the implementation on the expected behavior of the  
 46315 application with respect to the data in the memory starting at address *addr*, and continuing for  
 46316 *len* bytes. The implementation may use this information to optimize handling of the specified  
 46317 data. The *posix\_madvise()* function shall have no effect on the semantics of access to memory in  
 46318 the specified range, although it may affect the performance of access.

46319 The implementation may require that *addr* be a multiple of the page size, which is the value  
 46320 returned by *sysconf()* when the name value *\_SC\_PAGESIZE* is used.

46321 The advice to be applied to the memory range is specified by the *advice* parameter and may be  
 46322 one of the following values:

46323 **POSIX\_MADV\_NORMAL**

46324 Specifies that the application has no advice to give on its behavior with respect to the  
 46325 specified range. It is the default characteristic if no advice is given for a range of memory.

46326 **POSIX\_MADV\_SEQUENTIAL**

46327 Specifies that the application expects to access the specified range sequentially from lower  
 46328 addresses to higher addresses.

46329 **POSIX\_MADV\_RANDOM**

46330 Specifies that the application expects to access the specified range in a random order.

46331 **POSIX\_MADV\_WILLNEED**

46332 Specifies that the application expects to access the specified range in the near future.

46333 **POSIX\_MADV\_DONTNEED**

46334 Specifies that the application expects that it will not access the specified range in the near  
 46335 future.

46336 These values are defined in the `<sys/mman.h>` header.

46337 **RETURN VALUE**

46338 Upon successful completion, *posix\_madvise()* shall return zero; otherwise, an error number shall  
 46339 be returned to indicate the error.

46340 **ERRORS**

46341 The *posix\_madvise()* function shall fail if:

46342 [EINVAL] The value of *advice* is invalid.

46343 [ENOMEM] Addresses in the range starting at *addr* and continuing for *len* bytes are partly  
 46344 or completely outside the range allowed for the address space of the calling  
 46345 process.

- 46346 The *posix\_madvise()* function may fail if:
- 46347 [EINVAL] The value of *addr* is not a multiple of the value returned by *sysconf()* when the  
46348 name value *\_SC\_PAGESIZE* is used.
- 46349 [EINVAL] The value of *len* is zero.
- 46350 **EXAMPLES**
- 46351 None.
- 46352 **APPLICATION USAGE**
- 46353 The *posix\_madvise()* function is part of the Advisory Information option and need not be  
46354 provided on all implementations.

**posix\_mem\_offset()**

System Interfaces

46365 **NAME**

46366 **posix\_mem\_offset** — find offset and length of a mapped typed memory block (**ADVANCED**  
 46367 **REALTIME**)

46368 **SYNOPSIS**

```
46369 TYM #include <sys/mman.h>
46370 int posix_mem_offset(const void *restrict addr, size_t len,
46371 off_t *restrict off, size_t *restrict contig_len,
46372 int *restrict fildes);
```

46373 **DESCRIPTION**

46374 The *posix\_mem\_offset()* function shall return in the variable pointed to by *off* a value that  
 46375 identifies the offset (or location), within a memory object, of the memory block currently  
 46376 mapped at *addr*. The function shall return in the variable pointed to by *fildes*, the descriptor used  
 46377 (via *mmap()*) to establish the mapping which contains *addr*. If that descriptor was closed since  
 46378 the mapping was established, the returned value of *fildes* shall be  $-1$ . The *len* argument specifies  
 46379 the length of the block of the memory object the user wishes the offset for; upon return, the  
 46380 value pointed to by *contig\_len* shall equal either *len*, or the length of the largest contiguous block  
 46381 of the memory object that is currently mapped to the calling process starting at *addr*, whichever  
 46382 is smaller.

46383 If the memory object mapped at *addr* is a typed memory object, then if the *off* and *contig\_len*  
 46384 values obtained by calling *posix\_mem\_offset()* are used in a call to *mmap()* with a file descriptor  
 46385 that refers to the same memory pool as *fildes* (either through the same port or through a different  
 46386 port), and that was opened with neither the **POSIX\_TYPED\_MEM\_ALLOCATE** nor the  
 46387 **POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG** flag, the typed memory area that is mapped shall  
 46388 be exactly the same area that was mapped at *addr* in the address space of the process that called  
 46389 *posix\_mem\_offset()*.

46390 If the memory object specified by *fildes* is not a typed memory object, then the behavior of this  
 46391 function is implementation-defined.

46392 **RETURN VALUE**

46393 Upon successful completion, the *posix\_mem\_offset()* function shall return zero; otherwise, the  
 46394 corresponding error status value shall be returned.

46395 **ERRORS**

46396 The *posix\_mem\_offset()* function shall fail if:

46397 [EACCES] The process has not mapped a memory object supported by this function at  
 46398 the given address *addr*.

46399 This function shall not return an error code of [EINTR].

46400 **EXAMPLES**

46401 None.

46402 **APPLICATION USAGE**

46403 None.

46404 **RATIONALE**

**posix\_memalign()**46413 **NAME**46414 posix\_memalign — aligned memory allocation (**ADVANCED REALTIME**)46415 **SYNOPSIS**

```
46416 ADV #include <stdlib.h>
46417 int posix_memalign(void **memptr, size_t alignment, size_t size);
```

46418 **DESCRIPTION**

46419 The *posix\_memalign()* function shall allocate *size* bytes aligned on a boundary specified by  
 46420 *alignment*, and shall return a pointer to the allocated memory in *memptr*. The value of *alignment*  
 46421 shall be a power of two multiple of *sizeof(void \*)*.

46422 Upon successful completion, the value pointed to by *memptr* shall be a multiple of *alignment*.

46423 If the size of the space requested is 0, the behavior is implementation-defined; the value returned  
 46424 in *memptr* shall be either a null pointer or a unique pointer.

46425 CX The *free()* function shall deallocate memory that has previously been allocated by  
 46426 *posix\_memalign()*.

46427 **RETURN VALUE**

46428 Upon successful completion, *posix\_memalign()* shall return zero; otherwise, an error number  
 46429 shall be returned to indicate the error.

46430 **ERRORS**

46431 The *posix\_memalign()* function shall fail if:

- |       |          |  |
|-------|----------|--|
| 46432 | [EINVAL] | The value of the alignment parameter is not a power of two multiple of <i>sizeof(void *)</i> . |
| 46433 |          |  |
| 46434 | [ENOMEM] | There is insufficient memory available with the requested alignment.                           |

46435 **EXAMPLES**

46436 None.

46437 **APPLICATION USAGE**

46438 The *posix\_memalign()* function is part of the Advisory Information option and need not be  
 46439 provided on all implementations.

**posix\_openpt()**46455 **NAME**46456 `posix_openpt` — open a pseudo-terminal device46457 **SYNOPSIS**

```
46458 XSI #include <stdlib.h>
46459 #include <fcntl.h>
46460 int posix_openpt(int oflag);
```

46461 **DESCRIPTION**

46462 The `posix_openpt()` function shall establish a connection between a master device for a pseudo-terminal and a file descriptor. The file descriptor is used by other I/O functions that refer to that pseudo-terminal.

46465 The file status flags and file access modes of the open file description shall be set according to the value of `oflag`.

46467 Values for `oflag` are constructed by a bitwise-inclusive OR of flags from the following list, defined in `<fcntl.h>`:

46469 `O_RDWR` Open for reading and writing.

46470 `O_NOCTTY` If set `posix_openpt()` shall not cause the terminal device to become the controlling terminal for the process.

46472 The behavior of other values for the `oflag` argument is unspecified.

46473 **RETURN VALUE**

46474 Upon successful completion, the `posix_openpt()` function shall open a master pseudo-terminal device and return a non-negative integer representing the lowest numbered unused file descriptor. Otherwise, `-1` shall be returned and `errno` set to indicate the error.

46477 **ERRORS**

46478 The `posix_openpt()` function shall fail if:

46479 [EMFILE] All file descriptors available to the process are currently open.

46480 [ENFILE] The maximum allowable number of files is currently open in the system.

46481 The `posix_openpt()` function may fail if:

46482 [EINVAL] The value of `oflag` is not valid.

46483 [EAGAIN] Out of pseudo-terminal resources.

46484 OB XSR [ENOSR] Out of STREAMS resources.

46485 **EXAMPLES**

46486 **Opening a Pseudo-Terminal and Returning the Name of the Slave Device and a File Descriptor**

```
46488 #include <fcntl.h>
46489 #include <stdio.h>
46490 int masterfd, slavefd;
46491 char *slavedevice;
46492 masterfd = posix_openpt(O_RDWR|O_NOCTTY);
46493 if (masterfd == -1
46494     || grantpt(masterfd) == -1
```

```

46495         || unlockpt (masterfd) == -1
46496         || (slavedevice = ptsname (masterfd)) == NULL)
46497         return -1;

46498     printf("slave device is: %s\n", slavedevice);

46499     slavefd = open(slavedevice, O_RDWR|O_NOCTTY);
46500     if (slavefd < 0)
46501         return -1;

```

#### 46502 APPLICATION USAGE

46503 This function is a method for portably obtaining a file descriptor of a master terminal device for  
 46504 a pseudo-terminal. The *grantpt()* and *ptsname()* functions can be used to manipulate mode and  
 46505 ownership permissions, and to obtain the name of the slave device, respectively.

#### 46506 RATIONALE

46507 The standard developers considered the matter of adding a special device for cloning master  
 46508 pseudo-terminals: the */dev/ptmx* device. However, consensus could not be reached, and it was  
 46509 felt that adding a new function would permit other implementations. The *posix\_openpt()*  
 46510 function is designed to complement the *grantpt()*, *ptsname()*, and *unlockpt()* functions.

46511 On implementations supporting the */dev/ptmx* clone device opening the master device of a  
 46512 pseudo-terminal is simply:

```

46513 mfdp = open("/dev/ptmx", oflag );
46514 if (mfdp < 0)
46515     return -1;

```

#### 46516 FUTURE DIRECTIONS

46517 None.

#### 46518 SEE ALSO

46519 *grantpt()*, *open()*, *ptsname()*, *unlockpt()*

46520 XBD <*fcntl.h*>, <*stdlib.h*>

#### 46521 CHANGE HISTORY

46522 First released in Issue 6

#### 46523 Issue 7

46524 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

46525 SD5-XSH-ERN-51 is applied, correcting an error in the EXAMPLES section.

**posix\_spawn()**46526 **NAME**46527 `posix_spawn`, `posix_spawnp` — spawn a process (**ADVANCED REALTIME**)46528 **SYNOPSIS**

```

46529 SPN #include <spawn.h>
46530 int posix_spawn(pid_t *restrict pid, const char *restrict path,
46531               const posix_spawn_file_actions_t *file_actions,
46532               const posix_spawnattr_t *restrict attrp,
46533               char *const argv[restrict], char *const envp[restrict]);
46534 int posix_spawnp(pid_t *restrict pid, const char *restrict file,
46535                const posix_spawn_file_actions_t *file_actions,
46536                const posix_spawnattr_t *restrict attrp,
46537                char *const argv[restrict], char *const envp[restrict]);

```

46538 **DESCRIPTION**

46539 The `posix_spawn()` and `posix_spawnp()` functions shall create a new process (child process) from  
 46540 the specified process image. The new process image shall be constructed from a regular  
 46541 executable file called the new process image file.

46542 When a C program is executed as the result of this call, it shall be entered as a C-language  
 46543 function call as follows:

```
46544 int main(int argc, char *argv[]);
```

46545 where `argc` is the argument count and `argv` is an array of character pointers to the arguments  
 46546 themselves. In addition, the following variable:

```
46547 extern char **environ;
```

46548 shall be initialized as a pointer to an array of character pointers to the environment strings.

46549 The argument `argv` is an array of character pointers to null-terminated strings. The last member  
 46550 of this array shall be a null pointer and is not counted in `argc`. These strings constitute the  
 46551 argument list available to the new process image. The value in `argv[0]` should point to a filename  
 46552 that is associated with the process image being started by the `posix_spawn()` or `posix_spawnp()`  
 46553 function.

46554 The argument `envp` is an array of character pointers to null-terminated strings. These strings  
 46555 constitute the environment for the new process image. The environment array is terminated by a  
 46556 null pointer.

46557 The number of bytes available for the combined argument and environment lists of the child  
 46558 process is {ARG\_MAX}. The implementation shall specify in the system documentation (see  
 46559 XBD Chapter 2, on page 15) whether any list overhead, such as length words, null terminators,  
 46560 pointers, or alignment bytes, is included in this total.

46561 The `path` argument to `posix_spawn()` is a pathname that identifies the new process image file to  
 46562 execute.

46563 The `file` parameter to `posix_spawnp()` shall be used to construct a pathname that identifies the  
 46564 new process image file. If the `file` parameter contains a <slash> character, the `file` parameter shall  
 46565 be used as the pathname for the new process image file. Otherwise, the path prefix for this file  
 46566 shall be obtained by a search of the directories passed as the environment variable `PATH` (see  
 46567 XBD Chapter 8, on page 173). If this environment variable is not defined, the results of the  
 46568 search are implementation-defined.

46569 If `file_actions` is a null pointer, then file descriptors open in the calling process shall remain open

46570 in the child process, except for those whose close-on-exec flag FD\_CLOEXEC is set (see *fcntl()*).  
 46571 For those file descriptors that remain open, all attributes of the corresponding open file  
 46572 descriptions, including file locks (see *fcntl()*), shall remain unchanged.

46573 If *file\_actions* is not NULL, then the file descriptors open in the child process shall be those open  
 46574 in the calling process as modified by the spawn file actions object pointed to by *file\_actions* and  
 46575 the FD\_CLOEXEC flag of each remaining open file descriptor after the spawn file actions have  
 46576 been processed. The effective order of processing the spawn file actions shall be:

- 46577 1. The set of open file descriptors for the child process shall initially be the same set as is  
 46578 open for the calling process. All attributes of the corresponding open file descriptions,  
 46579 including file locks (see *fcntl()*), shall remain unchanged.
- 46580 2. The signal mask, signal default actions, and the effective user and group IDs for the child  
 46581 process shall be changed as specified in the attributes object referenced by *attrp*.
- 46582 3. The file actions specified by the spawn file actions object shall be performed in the order  
 46583 in which they were added to the spawn file actions object.
- 46584 4. Any file descriptor that has its FD\_CLOEXEC flag set (see *fcntl()*) shall be closed.

46585 The **posix\_spawnattr\_t** spawn attributes object type is defined in **<spawn.h>**. It shall contain at  
 46586 least the attributes defined below.

46587 If the POSIX\_SPAWN\_SETPGROUP flag is set in the *spawn\_flags* attribute of the object referenced  
 46588 by *attrp*, and the *spawn-pgroup* attribute of the same object is non-zero, then the child's process  
 46589 group shall be as specified in the *spawn-pgroup* attribute of the object referenced by *attrp*.

46590 As a special case, if the POSIX\_SPAWN\_SETPGROUP flag is set in the *spawn\_flags* attribute of  
 46591 the object referenced by *attrp*, and the *spawn-pgroup* attribute of the same object is set to zero,  
 46592 then the child shall be in a new process group with a process group ID equal to its process ID.

46593 If the POSIX\_SPAWN\_SETPGROUP flag is not set in the *spawn\_flags* attribute of the object  
 46594 referenced by *attrp*, the new child process shall inherit the parent's process group.

46595 PS If the POSIX\_SPAWN\_SETSCHEDPARAM flag is set in the *spawn\_flags* attribute of the object  
 46596 referenced by *attrp*, but POSIX\_SPAWN\_SETSCHEDULER is not set, the new process image  
 46597 shall initially have the scheduling policy of the calling process with the scheduling parameters  
 46598 specified in the *spawn-schedparam* attribute of the object referenced by *attrp*.

46599 If the POSIX\_SPAWN\_SETSCHEDULER flag is set in the *spawn\_flags* attribute of the object  
 46600 referenced by *attrp* (regardless of the setting of the POSIX\_SPAWN\_SETSCHEDPARAM flag),  
 46601 the new process image shall initially have the scheduling policy specified in the *spawn-*  
 46602 *schedpolicy* attribute of the object referenced by *attrp* and the scheduling parameters specified in  
 46603 the *spawn-schedparam* attribute of the same object.

46604 The POSIX\_SPAWN\_RESETPIDS flag in the *spawn\_flags* attribute of the object referenced by *attrp*  
 46605 governs the effective user ID of the child process. If this flag is not set, the child process shall  
 46606 inherit the effective user ID of the parent process. If this flag is set, the effective user ID of the  
 46607 child process shall be reset to the parent's real user ID. In either case, if the set-user-ID mode bit  
 46608 of the new process image file is set, the effective user ID of the child process shall become that  
 46609 file's owner ID before the new process image begins execution.

46610 The POSIX\_SPAWN\_RESETPIDS flag in the *spawn\_flags* attribute of the object referenced by *attrp*  
 46611 also governs the effective group ID of the child process. If this flag is not set, the child process  
 46612 shall inherit the effective group ID of the parent process. If this flag is set, the effective group ID  
 46613 of the child process shall be reset to the parent's real group ID. In either case, if the set-group-ID  
 46614 mode bit of the new process image file is set, the effective group ID of the child process shall

**posix\_spawn()**

- 46615 become that file's group ID before the new process image begins execution.
- 46616 If the POSIX\_SPAWN\_SETSIGMASK flag is set in the *spawn\_flags* attribute of the object  
46617 referenced by *attrp*, the child process shall initially have the signal mask specified in the *spawn-*  
46618 *sigmask* attribute of the object referenced by *attrp*.
- 46619 If the POSIX\_SPAWN\_SETSIGDEF flag is set in the *spawn\_flags* attribute of the object referenced  
46620 by *attrp*, the signals specified in the *spawn\_sigdefault* attribute of the same object shall be set to  
46621 their default actions in the child process. Signals set to the default action in the parent process  
46622 shall be set to the default action in the child process.
- 46623 Signals set to be caught by the calling process shall be set to the default action in the child  
46624 process.
- 46625 Except for SIGCHLD, signals set to be ignored by the calling process image shall be set to be  
46626 ignored by the child process, unless otherwise specified by the POSIX\_SPAWN\_SETSIGDEF flag  
46627 being set in the *spawn\_flags* attribute of the object referenced by *attrp* and the signals being  
46628 indicated in the *spawn\_sigdefault* attribute of the object referenced by *attrp*.
- 46629 If the SIGCHLD signal is set to be ignored by the calling process, it is unspecified whether the  
46630 SIGCHLD signal is set to be ignored or to the default action in the child process, unless  
46631 otherwise specified by the POSIX\_SPAWN\_SETSIGDEF flag being set in the *spawn\_flags*  
46632 attribute of the object referenced by *attrp* and the SIGCHLD signal being indicated in the  
46633 *spawn\_sigdefault* attribute of the object referenced by *attrp*.
- 46634 If the value of the *attrp* pointer is NULL, then the default values are used.
- 46635 All process attributes, other than those influenced by the attributes set in the object referenced  
46636 by *attrp* as specified above or by the file descriptor manipulations specified in *file\_actions*, shall  
46637 appear in the new process image as though *fork()* had been called to create a child process and  
46638 then a member of the *exec* family of functions had been called by the child process to execute the  
46639 new process image.
- 46640 It is implementation-defined whether the fork handlers are run when *posix\_spawn()* or  
46641 *posix\_spawnp()* is called.
- 46642 **RETURN VALUE**
- 46643 Upon successful completion, *posix\_spawn()* and *posix\_spawnp()* shall return the process ID of the  
46644 child process to the parent process, in the variable pointed to by a non-NULL *pid* argument, and  
46645 shall return zero as the function return value. Otherwise, no child process shall be created, the  
46646 value stored into the variable pointed to by a non-NULL *pid* is unspecified, and an error number  
46647 shall be returned as the function return value to indicate the error. If the *pid* argument is a null  
46648 pointer, the process ID of the child is not returned to the caller.
- 46649 **ERRORS**
- 46650 These functions may fail if:
- 46651 [EINVAL] The value specified by *file\_actions* or *attrp* is invalid.
- 46652 If this error occurs after the calling process successfully returns from the *posix\_spawn()* or  
46653 *posix\_spawnp()* function, the child process may exit with exit status 127.
- 46654 If *posix\_spawn()* or *posix\_spawnp()* fail for any of the reasons that would cause *fork()* or one of  
46655 the *exec* family of functions to fail, an error value shall be returned as described by *fork()* and  
46656 *exec*, respectively (or, if the error occurs after the calling process successfully returns, the child  
46657 process shall exit with exit status 127).
- 46658 If POSIX\_SPAWN\_SETPGROUP is set in the *spawn\_flags* attribute of the object referenced by  
46659 *attrp*, and *posix\_spawn()* or *posix\_spawnp()* fails while changing the child's process group, an

46660 error value shall be returned as described by *setpgid()* (or, if the error occurs after the calling  
46661 process successfully returns, the child process shall exit with exit status 127).

46662 PS If POSIX\_SPAWN\_SETSCHEDPARAM is set and POSIX\_SPAWN\_SETSCHEDULER is not set in  
46663 the *spawn-flags* attribute of the object referenced by *attrp*, then if *posix\_spawn()* or *posix\_spawnp()*  
46664 fails for any of the reasons that would cause *sched\_setparam()* to fail, an error value shall be  
46665 returned as described by *sched\_setparam()* (or, if the error occurs after the calling process  
46666 successfully returns, the child process shall exit with exit status 127).

46667 If POSIX\_SPAWN\_SETSCHEDULER is set in the *spawn-flags* attribute of the object referenced by  
46668 *attrp*, and if *posix\_spawn()* or *posix\_spawnp()* fails for any of the reasons that would cause  
46669 *sched\_setscheduler()* to fail, an error value shall be returned as described by *sched\_setscheduler()*  
46670 (or, if the error occurs after the calling process successfully returns, the child process shall exit  
46671 with exit status 127).

46672 If the *file\_actions* argument is not NULL, and specifies any *close*, *dup2*, or *open* actions to be  
46673 performed, and if *posix\_spawn()* or *posix\_spawnp()* fails for any of the reasons that would cause  
46674 *close()*, *dup2()*, or *open()* to fail, an error value shall be returned as described by *close()*, *dup2()*,  
46675 and *open()*, respectively (or, if the error occurs after the calling process successfully returns, the  
46676 child process shall exit with exit status 127). An open file action may, by itself, result in any of  
46677 the errors described by *close()* or *dup2()*, in addition to those described by *open()*.

#### 46678 EXAMPLES

46679 None.

#### 46680 APPLICATION USAGE

46681 These functions are part of the Spawn option and need not be provided on all implementations.

#### 46682 RATIONALE

46683 The *posix\_spawn()* function and its close relation *posix\_spawnp()* have been introduced to  
46684 overcome the following perceived difficulties with *fork()*: the *fork()* function is difficult or  
46685 impossible to implement without swapping or dynamic address translation.

- 46686 • Swapping is generally too slow for a realtime environment.
- 46687 • Dynamic address translation is not available everywhere that POSIX might be useful.
- 46688 • Processes are too useful to simply option out of POSIX whenever it must run without  
46689 address translation or other MMU services.

46690 Thus, POSIX needs process creation and file execution primitives that can be efficiently  
46691 implemented without address translation or other MMU services.

46692 The *posix\_spawn()* function is implementable as a library routine, but both *posix\_spawn()* and  
46693 *posix\_spawnp()* are designed as kernel operations. Also, although they may be an efficient  
46694 replacement for many *fork()/exec* pairs, their goal is to provide useful process creation  
46695 primitives for systems that have difficulty with *fork()*, not to provide drop-in replacements for  
46696 *fork()/exec*.

46697 This view of the role of *posix\_spawn()* and *posix\_spawnp()* influenced the design of their API. It  
46698 does not attempt to provide the full functionality of *fork()/exec* in which arbitrary user-specified  
46699 operations of any sort are permitted between the creation of the child process and the execution  
46700 of the new process image; any attempt to reach that level would need to provide a programming  
46701 language as parameters. Instead, *posix\_spawn()* and *posix\_spawnp()* are process creation  
46702 primitives like the *Start\_Process* and *Start\_Process\_Search* Ada language bindings package  
46703 *POSIX\_Process\_Primitives* and also like those in many operating systems that are not UNIX  
46704 systems, but with some POSIX-specific additions.

**posix\_spawn()**

46705 To achieve its coverage goals, *posix\_spawn()* and *posix\_spawnp()* have control of six types of  
 46706 inheritance: file descriptors, process group ID, user and group ID, signal mask, scheduling, and  
 46707 whether each signal ignored in the parent will remain ignored in the child, or be reset to its  
 46708 default action in the child.

46709 Control of file descriptors is required to allow an independently written child process image to  
 46710 access data streams opened by and even generated or read by the parent process without being  
 46711 specifically coded to know which parent files and file descriptors are to be used. Control of the  
 46712 process group ID is required to control how the job control of the child process relates to that of  
 46713 the parent.

46714 Control of the signal mask and signal defaulting is sufficient to support the implementation of  
 46715 *system()*. Although support for *system()* is not explicitly one of the goals for *posix\_spawn()* and  
 46716 *posix\_spawnp()*, it is covered under the “at least 50%” coverage goal.

46717 The intention is that the normal file descriptor inheritance across *fork()*, the subsequent effect of  
 46718 the specified spawn file actions, and the normal file descriptor inheritance across one of the *exec*  
 46719 family of functions should fully specify open file inheritance. The implementation need make no  
 46720 decisions regarding the set of open file descriptors when the child process image begins  
 46721 execution, those decisions having already been made by the caller and expressed as the set of  
 46722 open file descriptors and their FD\_CLOEXEC flags at the time of the call and the spawn file  
 46723 actions object specified in the call. We have been assured that in cases where the POSIX  
 46724 *Start\_Process* Ada primitives have been implemented in a library, this method of controlling file  
 46725 descriptor inheritance may be implemented very easily.

46726 We can identify several problems with *posix\_spawn()* and *posix\_spawnp()*, but there does not  
 46727 appear to be a solution that introduces fewer problems. Environment modification for child  
 46728 process attributes not specifiable via the *attrp* or *file\_actions* arguments must be done in the  
 46729 parent process, and since the parent generally wants to save its context, it is more costly than  
 46730 similar functionality with *fork()/exec*. It is also complicated to modify the environment of a  
 46731 multi-threaded process temporarily, since all threads must agree when it is safe for the  
 46732 environment to be changed. However, this cost is only borne by those invocations of  
 46733 *posix\_spawn()* and *posix\_spawnp()* that use the additional functionality. Since extensive  
 46734 modifications are not the usual case, and are particularly unlikely in time-critical code, keeping  
 46735 much of the environment control out of *posix\_spawn()* and *posix\_spawnp()* is appropriate design.

46736 The *posix\_spawn()* and *posix\_spawnp()* functions do not have all the power of *fork()/exec*. This is  
 46737 to be expected. The *fork()* function is a wonderfully powerful operation. We do not expect to  
 46738 duplicate its functionality in a simple, fast function with no special hardware requirements. It is  
 46739 worth noting that *posix\_spawn()* and *posix\_spawnp()* are very similar to the process creation  
 46740 operations on many operating systems that are not UNIX systems.

**Requirements**

46741 The requirements for *posix\_spawn()* and *posix\_spawnp()* are:

- 46743 • They must be implementable without an MMU or unusual hardware.
- 46744 • They must be compatible with existing POSIX standards.

46745 Additional goals are:

- 46746 • They should be efficiently implementable.
- 46747 • They should be able to replace at least 50% of typical executions of *fork()*.

- 46748
- 46749
- A system with *posix\_spawn()* and *posix\_spawnp()* and without *fork()* should be useful, at least for realtime applications.
- 46750
- 46751
- A system with *fork()* and the *exec* family should be able to implement *posix\_spawn()* and *posix\_spawnp()* as library routines.

46752

### Two-Syntax

46753

46754

46755

46756

POSIX *exec* has several calling sequences with approximately the same functionality. These appear to be required for compatibility with existing practice. Since the existing practice for the *posix\_spawn\*()* functions is otherwise substantially unlike POSIX, we feel that simplicity outweighs compatibility. There are, therefore, only two names for the *posix\_spawn\*()* functions.

46757

46758

The parameter list does not differ between *posix\_spawn()* and *posix\_spawnp()*; *posix\_spawnp()* interprets the second parameter more elaborately than *posix\_spawn()*.

46759

### Compatibility with POSIX.5 (Ada)

46760

46761

46762

46763

46764

46765

46766

46767

46768

46769

46770

46771

46772

46773

46774

The *Start\_Process* and *Start\_Process\_Search* procedures from the *POSIX\_Process\_Primitives* package from the Ada language binding to POSIX.1 encapsulate *fork()* and *exec* functionality in a manner similar to that of *posix\_spawn()* and *posix\_spawnp()*. Originally, in keeping with our simplicity goal, the standard developers had limited the capabilities of *posix\_spawn()* and *posix\_spawnp()* to a subset of the capabilities of *Start\_Process* and *Start\_Process\_Search*; certain non-default capabilities were not supported. However, based on suggestions by the ballot group to improve file descriptor mapping or drop it, and on the advice of an Ada Language Bindings working group member, the standard developers decided that *posix\_spawn()* and *posix\_spawnp()* should be sufficiently powerful to implement *Start\_Process* and *Start\_Process\_Search*. The rationale is that if the Ada language binding to such a primitive had already been approved as an IEEE standard, there can be little justification for not approving the functionally-equivalent parts of a C binding. The only three capabilities provided by *posix\_spawn()* and *posix\_spawnp()* that are not provided by *Start\_Process* and *Start\_Process\_Search* are optionally specifying the child's process group ID, the set of signals to be reset to default signal handling in the child process, and the child's scheduling policy and parameters.

46775

46776

46777

46778

46779

46780

For the Ada language binding for *Start\_Process* to be implemented with *posix\_spawn()*, that binding would need to explicitly pass an empty signal mask and the parent's environment to *posix\_spawn()* whenever the caller of *Start\_Process* allowed these arguments to default, since *posix\_spawn()* does not provide such defaults. The ability of *Start\_Process* to mask user-specified signals during its execution is functionally unique to the Ada language binding and must be dealt with in the binding separately from the call to *posix\_spawn()*.

46781

### Process Group

46782

46783

46784

The process group inheritance field can be used to join the child process with an existing process group. By assigning a value of zero to the *spawn-pgroup* attribute of the object referenced by *attrp*, the *setpgid()* mechanism will place the child process in a new process group.

**posix\_spawn()**46785 **Threads**

46786 Without the *posix\_spawn()* and *posix\_spawnnp()* functions, systems without address translation  
 46787 can still use threads to give an abstraction of concurrency. In many cases, thread creation  
 46788 suffices, but it is not always a good substitute. The *posix\_spawn()* and *posix\_spawnnp()* functions  
 46789 are considerably “heavier” than thread creation. Processes have several important attributes that  
 46790 threads do not. Even without address translation, a process may have base-and-bound memory  
 46791 protection. Each process has a process environment including security attributes and file  
 46792 capabilities, and powerful scheduling attributes. Processes abstract the behavior of non-  
 46793 uniform-memory-architecture multi-processors better than threads, and they are more  
 46794 convenient to use for activities that are not closely linked.

46795 The *posix\_spawn()* and *posix\_spawnnp()* functions may not bring support for multiple processes to  
 46796 every configuration. Process creation is not the only piece of operating system support required  
 46797 to support multiple processes. The total cost of support for multiple processes may be quite high  
 46798 in some circumstances. Existing practice shows that support for multiple processes is  
 46799 uncommon and threads are common among “tiny kernels”. There should, therefore, probably  
 46800 continue to be AEPs for operating systems with only one process.

46801 **Asynchronous Error Notification**

46802 A library implementation of *posix\_spawn()* or *posix\_spawnnp()* may not be able to detect all  
 46803 possible errors before it forks the child process. POSIX.1-2008 provides for an error indication  
 46804 returned from a child process which could not successfully complete the spawn operation via a  
 46805 special exit status which may be detected using the status value returned by *wait()*, *waitid()*, and  
 46806 *waitpid()*.

46807 The *stat\_val* interface and the macros used to interpret it are not well suited to the purpose of  
 46808 returning API errors, but they are the only path available to a library implementation. Thus, an  
 46809 implementation may cause the child process to exit with exit status 127 for any error detected  
 46810 during the spawn process after the *posix\_spawn()* or *posix\_spawnnp()* function has successfully  
 46811 returned.

46812 The standard developers had proposed using two additional macros to interpret *stat\_val*. The  
 46813 first, WIFSPAWNFAIL, would have detected a status that indicated that the child exited because  
 46814 of an error detected during the *posix\_spawn()* or *posix\_spawnnp()* operations rather than during  
 46815 actual execution of the child process image; the second, WSPAWNERRNO, would have  
 46816 extracted the error value if WIFSPAWNFAIL indicated a failure. Unfortunately, the ballot group  
 46817 strongly opposed this because it would make a library implementation of *posix\_spawn()* or  
 46818 *posix\_spawnnp()* dependent on kernel modifications to *waitpid()* to be able to embed special  
 46819 information in *stat\_val* to indicate a spawn failure.

46820 The 8 bits of child process exit status that are guaranteed by POSIX.1-2008 to be accessible to the  
 46821 waiting parent process are insufficient to disambiguate a spawn error from any other kind of  
 46822 error that may be returned by an arbitrary process image. No other bits of the exit status are  
 46823 required to be visible in *stat\_val*, so these macros could not be strictly implemented at the library  
 46824 level. Reserving an exit status of 127 for such spawn errors is consistent with the use of this  
 46825 value by *system()* and *popen()* to signal failures in these operations that occur after the function  
 46826 has returned but before a shell is able to execute. The exit status of 127 does not uniquely  
 46827 identify this class of error, nor does it provide any detailed information on the nature of the  
 46828 failure. Note that a kernel implementation of *posix\_spawn()* or *posix\_spawnnp()* is permitted (and  
 46829 encouraged) to return any possible error as the function value, thus providing more detailed  
 46830 failure information to the parent process.

46831 Thus, no special macros are available to isolate asynchronous *posix\_spawn()* or *posix\_spawnnp()*

46832 errors. Instead, errors detected by the *posix\_spawn()* or *posix\_spawnnp()* operations in the context  
 46833 of the child process before the new process image executes are reported by setting the child's exit  
 46834 status to 127. The calling process may use the WIFEXITED and WEXITSTATUS macros on the  
 46835 *stat\_val* stored by the *wait()* or *waitpid()* functions to detect spawn failures to the extent that  
 46836 other status values with which the child process image may exit (before the parent can  
 46837 conclusively determine that the child process image has begun execution) are distinct from exit  
 46838 status 127.

#### 46849 CHANGE HISTORY

46850 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

46851 IEEE PASC Interpretation 1003.1 #103 is applied, noting that the signal default actions are  
 46852 changed as well as the signal mask in step 2.

46853 IEEE PASC Interpretation 1003.1 #132 is applied.

#### 46854 Issue 7

46855 Functionality relating to the Threads option is moved to the Base.

**posix\_spawn\_file\_actions\_addclose()**

System Interfaces

46856 **NAME**

46857 **posix\_spawn\_file\_actions\_addclose**, **posix\_spawn\_file\_actions\_addopen** — add close or open  
 46858 action to spawn file actions object (**ADVANCED REALTIME**)

46859 **SYNOPSIS**

```
46860 SPN #include <spawn.h>
46861
46862 int posix_spawn_file_actions_addclose(posix_spawn_file_actions_t
46863 *file_actions, int fildes);
46864 int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t
46865 *restrict file_actions, int fildes,
46866 const char *restrict path, int oflag, mode_t mode);
```

46866 **DESCRIPTION**

46867 These functions shall add or delete a close or open action to a spawn file actions object.

46868 A spawn file actions object is of type **posix\_spawn\_file\_actions\_t** (defined in **<spawn.h>**) and is  
 46869 used to specify a series of actions to be performed by a *posix\_spawn()* or *posix\_spawnp()*  
 46870 operation in order to arrive at the set of open file descriptors for the child process given the set  
 46871 of open file descriptors of the parent. POSIX.1-2008 does not define comparison or assignment  
 46872 operators for the type **posix\_spawn\_file\_actions\_t**.

46873 A spawn file actions object, when passed to *posix\_spawn()* or *posix\_spawnp()*, shall specify how  
 46874 the set of open file descriptors in the calling process is transformed into a set of potentially open  
 46875 file descriptors for the spawned process. This transformation shall be as if the specified sequence  
 46876 of actions was performed exactly once, in the context of the spawned process (prior to execution  
 46877 of the new process image), in the order in which the actions were added to the object;  
 46878 additionally, when the new process image is executed, any file descriptor (from this new set)  
 46879 which has its FD\_CLOEXEC flag set shall be closed (see *posix\_spawn()*).

46880 The *posix\_spawn\_file\_actions\_addclose()* function shall add a *close* action to the object referenced  
 46881 by *file\_actions* that shall cause the file descriptor *fildes* to be closed (as if *close(fildes)* had been  
 46882 called) when a new process is spawned using this file actions object.

46883 The *posix\_spawn\_file\_actions\_addopen()* function shall add an *open* action to the object referenced  
 46884 by *file\_actions* that shall cause the file named by *path* to be opened (as if *open(path, oflag, mode)*  
 46885 had been called, and the returned file descriptor, if not *fildes*, had been changed to *fildes*) when a  
 46886 new process is spawned using this file actions object. If *fildes* was already an open file descriptor,  
 46887 it shall be closed before the new file is opened.

46888 The string described by *path* shall be copied by the *posix\_spawn\_file\_actions\_addopen()* function.

46889 **RETURN VALUE**

46890 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
 46891 be returned to indicate the error.

46892 **ERRORS**

46893 These functions shall fail if:

46894 [EBADF] The value specified by *fildes* is negative or greater than or equal to  
 46895 {OPEN\_MAX}.

46896 These functions may fail if:

46897 [EINVAL] The value specified by *file\_actions* is invalid.

46898 [ENOMEM] Insufficient memory exists to add to the spawn file actions object.

46899 It shall not be considered an error for the *fildev* argument passed to these functions to specify a  
 46900 file descriptor for which the specified operation could not be performed at the time of the call.  
 46901 Any such error will be detected when the associated file actions object is later used during a  
 46902 *posix\_spawn()* or *posix\_spawnp()* operation.

#### 46903 EXAMPLES

46904 None.

#### 46905 APPLICATION USAGE

46906 These functions are part of the Spawn option and need not be provided on all implementations.

#### 46907 RATIONALE

46908 A spawn file actions object may be initialized to contain an ordered sequence of *close()*, *dup2()*,  
 46909 and *open()* operations to be used by *posix\_spawn()* or *posix\_spawnp()* to arrive at the set of open  
 46910 file descriptors inherited by the spawned process from the set of open file descriptors in the  
 46911 parent at the time of the *posix\_spawn()* or *posix\_spawnp()* call. It had been suggested that the  
 46912 *close()* and *dup2()* operations alone are sufficient to rearrange file descriptors, and that files  
 46913 which need to be opened for use by the spawned process can be handled either by having the  
 46914 calling process open them before the *posix\_spawn()* or *posix\_spawnp()* call (and close them after),  
 46915 or by passing filenames to the spawned process (in *argv*) so that it may open them itself. The  
 46916 standard developers recommend that applications use one of these two methods when practical,  
 46917 since detailed error status on a failed open operation is always available to the application this  
 46918 way. However, the standard developers feel that allowing a spawn file actions object to specify  
 46919 open operations is still appropriate because:

- 46920 1. It is consistent with equivalent POSIX.5 (Ada) functionality.
- 46921 2. It supports the I/O redirection paradigm commonly employed by POSIX programs  
 46922 designed to be invoked from a shell. When such a program is the child process, it may not  
 46923 be designed to open files on its own.
- 46924 3. It allows file opens that might otherwise fail or violate file ownership/access rights if  
 46925 executed by the parent process.

46926 Regarding 2. above, note that the spawn open file action provides to *posix\_spawn()* and  
 46927 *posix\_spawnp()* the same capability that the shell redirection operators provide to *system()*, only  
 46928 without the intervening execution of a shell; for example:

```
46929 system ("myprog <file1 3<file2");
```

46930 Regarding 3. above, note that if the calling process needs to open one or more files for access by  
 46931 the spawned process, but has insufficient spare file descriptors, then the open action is necessary  
 46932 to allow the *open()* to occur in the context of the child process after other file descriptors have  
 46933 been closed (that must remain open in the parent).

46934 Additionally, if a parent is executed from a file having a "set-user-id" mode bit set and the  
 46935 POSIX\_SPAWN\_RESETIDS flag is set in the spawn attributes, a file created within the parent  
 46936 process will (possibly incorrectly) have the parent's effective user ID as its owner, whereas a file  
 46937 created via an *open()* action during *posix\_spawn()* or *posix\_spawnp()* will have the parent's real  
 46938 ID as its owner; and an open by the parent process may successfully open a file to which the real  
 46939 user should not have access or fail to open a file to which the real user should have access.

**posix\_spawn\_file\_actions\_addclose()**

System Interfaces

46940 **File Descriptor Mapping**

46941 The standard developers had originally proposed using an array which specified the mapping of  
46942 child file descriptors back to those of the parent. It was pointed out by the ballot group that it is  
46943 not possible to reshuffle file descriptors arbitrarily in a library implementation of *posix\_spawn()*  
46944 or *posix\_spawnp()* without provision for one or more spare file descriptor entries (which simply  
46945 may not be available). Such an array requires that an implementation develop a complex  
46946 strategy to achieve the desired mapping without inadvertently closing the wrong file descriptor  
46947 at the wrong time.

46948 It was noted by a member of the Ada Language Bindings working group that the approved Ada  
46949 Language *Start\_Process* family of POSIX process primitives use a caller-specified set of file  
46950 actions to alter the normal *fork()/exec* semantics for inheritance of file descriptors in a very  
46951 flexible way, yet no such problems exist because the burden of determining how to achieve the  
46952 final file descriptor mapping is completely on the application. Furthermore, although the file  
46953 actions interface appears frightening at first glance, it is actually quite simple to implement in  
46954 either a library or the kernel.

46955 **FUTURE DIRECTIONS**

46956 None.

46959 *posix\_spawn\_file\_actions\_destroy()*

46960 XBD <[spawn.h](#)>46961 **CHANGE HISTORY**

46962 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

46963 IEEE PASC Interpretation 1003.1 #105 is applied, adding a note to the DESCRIPTION that the  
46964 string pointed to by *path* is copied by the *posix\_spawn\_file\_actions\_addopen()* function.

46965 **NAME**

46966 `posix_spawn_file_actions_adddup2` — add `dup2` action to spawn file actions object  
 46967 (**ADVANCED REALTIME**)

46968 **SYNOPSIS**

```
46969 SPN #include <spawn.h>
46970 int posix_spawn_file_actions_adddup2 (posix_spawn_file_actions_t
46971 *file_actions, int fildes, int newfildes);
```

46972 **DESCRIPTION**

46973 The `posix_spawn_file_actions_adddup2()` function shall add a `dup2()` action to the object  
 46974 referenced by `file_actions` that shall cause the file descriptor `fildes` to be duplicated as `newfildes` (as  
 46975 if `dup2(fildes, newfildes)` had been called) when a new process is spawned using this file actions  
 46976 object.

46977 A spawn file actions object is as defined in `posix_spawn_file_actions_addclose()`.

46978 **RETURN VALUE**

46979 Upon successful completion, the `posix_spawn_file_actions_adddup2()` function shall return zero;  
 46980 otherwise, an error number shall be returned to indicate the error.

46981 **ERRORS**

46982 The `posix_spawn_file_actions_adddup2()` function shall fail if:

- 46983 [EBADF] The value specified by `fildes` or `newfildes` is negative or greater than or equal to  
 46984 {OPEN\_MAX}.
- 46985 [ENOMEM] Insufficient memory exists to add to the spawn file actions object.

46986 The `posix_spawn_file_actions_adddup2()` function may fail if:

- 46987 [EINVAL] The value specified by `file_actions` is invalid.

46988 It shall not be considered an error for the `fildes` argument passed to the  
 46989 `posix_spawn_file_actions_adddup2()` function to specify a file descriptor for which the specified  
 46990 operation could not be performed at the time of the call. Any such error will be detected when  
 46991 the associated file actions object is later used during a `posix_spawn()` or `posix_spawnnp()`  
 46992 operation.

46993 **EXAMPLES**

46994 None.

46995 **APPLICATION USAGE**

46996 The `posix_spawn_file_actions_adddup2()` function is part of the Spawn option and need not be  
 46997 provided on all implementations.

46998 **RATIONALE**

46999 Refer to the RATIONALE in `posix_spawn_file_actions_addclose()`.

47000 **FUTURE DIRECTIONS**

47001 None.

**posix\_spawn\_file\_actions\_destroy()**

System Interfaces

47019 **NAME**

47020 `posix_spawn_file_actions_destroy`, `posix_spawn_file_actions_init` — destroy and initialize  
 47021 spawn file actions object (**ADVANCED REALTIME**)

47022 **SYNOPSIS**

```
47023 SPN      #include <spawn.h>
47024
47024      int posix_spawn_file_actions_destroy(posix_spawn_file_actions_t
47025          *file_actions);
47026
47026      int posix_spawn_file_actions_init(posix_spawn_file_actions_t
47027          *file_actions);
```

47028 **DESCRIPTION**

47029 The `posix_spawn_file_actions_destroy()` function shall destroy the object referenced by `file_actions`;  
 47030 the object becomes, in effect, uninitialized. An implementation may cause  
 47031 `posix_spawn_file_actions_destroy()` to set the object referenced by `file_actions` to an invalid value. A  
 47032 destroyed spawn file actions object can be reinitialized using `posix_spawn_file_actions_init()`; the  
 47033 results of otherwise referencing the object after it has been destroyed are undefined.

47034 The `posix_spawn_file_actions_init()` function shall initialize the object referenced by `file_actions` to  
 47035 contain no file actions for `posix_spawn()` or `posix_spawnnp()` to perform.

47036 A spawn file actions object is as defined in `posix_spawn_file_actions_addclose()`.

47037 The effect of initializing an already initialized spawn file actions object is undefined.

47038 **RETURN VALUE**

47039 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
 47040 be returned to indicate the error.

47041 **ERRORS**

47042 The `posix_spawn_file_actions_init()` function shall fail if:

47043 [ENOMEM] Insufficient memory exists to initialize the spawn file actions object.

47044 The `posix_spawn_file_actions_destroy()` function may fail if:

47045 [EINVAL] The value specified by `file_actions` is invalid.

47046 **EXAMPLES**

47047 None.

47048 **APPLICATION USAGE**

47049 These functions are part of the Spawn option and need not be provided on all implementations.

47050 **RATIONALE**

47051 Refer to the RATIONALE in `posix_spawn_file_actions_addclose()`.

47052 **FUTURE DIRECTIONS**

47053 None.

47054 **SEE ALSO**

47055 `posix_spawn()`

47056 XBD `<spawn.h>`

**CHANGE HISTORY**

- 47057 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.
- 47058
- 47059 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

**posix\_spawnattr\_destroy()**47060 **NAME**

47061 `posix_spawnattr_destroy`, `posix_spawnattr_init` — destroy and initialize spawn attributes object  
 47062 (ADVANCED REALTIME)

47063 **SYNOPSIS**

```
47064 SPN #include <spawn.h>
47065
47065 int posix_spawnattr_destroy(posix_spawnattr_t *attr);
47066 int posix_spawnattr_init(posix_spawnattr_t *attr);
```

47067 **DESCRIPTION**

47068 The `posix_spawnattr_destroy()` function shall destroy a spawn attributes object. A destroyed `attr`  
 47069 attributes object can be reinitialized using `posix_spawnattr_init()`; the results of otherwise  
 47070 referencing the object after it has been destroyed are undefined. An implementation may cause  
 47071 `posix_spawnattr_destroy()` to set the object referenced by `attr` to an invalid value.

47072 The `posix_spawnattr_init()` function shall initialize a spawn attributes object `attr` with the default  
 47073 value for all of the individual attributes used by the implementation. Results are undefined if  
 47074 `posix_spawnattr_init()` is called specifying an already initialized `attr` attributes object.

47075 A spawn attributes object is of type `posix_spawnattr_t` (defined in `<spawn.h>`) and is used to  
 47076 specify the inheritance of process attributes across a spawn operation. POSIX.1-2008 does not  
 47077 define comparison or assignment operators for the type `posix_spawnattr_t`.

47078 Each implementation shall document the individual attributes it uses and their default values  
 47079 unless these values are defined by POSIX.1-2008. Attributes not defined by POSIX.1-2008, their  
 47080 default values, and the names of the associated functions to get and set those attribute values are  
 47081 implementation-defined.

47082 The resulting spawn attributes object (possibly modified by setting individual attribute values),  
 47083 is used to modify the behavior of `posix_spawn()` or `posix_spawnnp()`. After a spawn attributes  
 47084 object has been used to spawn a process by a call to a `posix_spawn()` or `posix_spawnnp()`, any  
 47085 function affecting the attributes object (including destruction) shall not affect any process that  
 47086 has been spawned in this way.

47087 **RETURN VALUE**

47088 Upon successful completion, `posix_spawnattr_destroy()` and `posix_spawnattr_init()` shall return  
 47089 zero; otherwise, an error number shall be returned to indicate the error.

47090 **ERRORS**

47091 The `posix_spawnattr_init()` function shall fail if:

47092 [ENOMEM] Insufficient memory exists to initialize the spawn attributes object.

47093 The `posix_spawnattr_destroy()` function may fail if:

47094 [EINVAL] The value specified by `attr` is invalid.

47095 **EXAMPLES**

47096 None.

47097 **APPLICATION USAGE**

47098 These functions are part of the Spawn option and need not be provided on all implementations.

47099 **RATIONALE**

47100 The original spawn interface proposed in POSIX.1-2008 defined the attributes that specify the  
 47101 inheritance of process attributes across a spawn operation as a structure. In order to be able to  
 47102 separate optional individual attributes under their appropriate options (that is, the `spawn-`  
 47103 `schedparam` and `spawn-schedpolicy` attributes depending upon the Process Scheduling option), and

47104 also for extensibility and consistency with the newer POSIX interfaces, the attributes interface  
47105 has been changed to an opaque data type. This interface now consists of the type  
47106 **posix\_spawnattr\_t**, representing a spawn attributes object, together with associated functions to  
47107 initialize or destroy the attributes object, and to set or get each individual attribute. Although the  
47108 new object-oriented interface is more verbose than the original structure, it is simple to use,  
47109 more extensible, and easy to implement.

**47110 FUTURE DIRECTIONS**

47111 None.

**47112 SEE ALSO**

47113 *posix\_spawn()*, *posix\_spawnattr\_getsigdefault()*, *posix\_spawnattr\_getflags()*,  
47114 *posix\_spawnattr\_getpgroup()*, *posix\_spawnattr\_getschedparam()*, *posix\_spawnattr\_getschedpolicy()*,  
47115 *posix\_spawnattr\_getsigmask()*

47116 XBD <spawn.h>

**47117 CHANGE HISTORY**

47118 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

47119 IEEE PASC Interpretation 1003.1 #106 is applied, noting that the effect of initializing an already  
47120 initialized spawn attributes option is undefined.

**posix\_spawnattr\_getflags()**

System Interfaces

47121 **NAME**

47122 `posix_spawnattr_getflags`, `posix_spawnattr_setflags` — get and set the spawn-flags attribute of a  
 47123 spawn attributes object (**ADVANCED REALTIME**)

47124 **SYNOPSIS**

```
47125 SPN #include <spawn.h>
47126
47126 int posix_spawnattr_getflags(const posix_spawnattr_t *restrict attr,
47127 short *restrict flags);
47128 int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

47129 **DESCRIPTION**

47130 The `posix_spawnattr_getflags()` function shall obtain the value of the *spawn-flags* attribute from the  
 47131 attributes object referenced by *attr*.

47132 The `posix_spawnattr_setflags()` function shall set the *spawn-flags* attribute in an initialized  
 47133 attributes object referenced by *attr*.

47134 The *spawn-flags* attribute is used to indicate which process attributes are to be changed in the  
 47135 new process image when invoking `posix_spawn()` or `posix_spawnwp()`. It is the bitwise-inclusive  
 47136 OR of zero or more of the following flags:

```
47137 POSIX_SPAWN_RESETIDS
47138 POSIX_SPAWN_SETPGROUP
47139 POSIX_SPAWN_SETSIGDEF
47140 POSIX_SPAWN_SETSIGMASK
47141 PS POSIX_SPAWN_SETSCHEDPARAM
47142 POSIX_SPAWN_SETSCHEDULER
```

47143 These flags are defined in `<spawn.h>`. The default value of this attribute shall be as if no flags  
 47144 were set.

47145 **RETURN VALUE**

47146 Upon successful completion, `posix_spawnattr_getflags()` shall return zero and store the value of  
 47147 the *spawn-flags* attribute of *attr* into the object referenced by the *flags* parameter; otherwise, an  
 47148 error number shall be returned to indicate the error.

47149 Upon successful completion, `posix_spawnattr_setflags()` shall return zero; otherwise, an error  
 47150 number shall be returned to indicate the error.

47151 **ERRORS**

47152 These functions may fail if:

47153 [EINVAL] The value specified by *attr* is invalid.

47154 The `posix_spawnattr_setflags()` function may fail if:

47155 [EINVAL] The value of the attribute being set is not valid.

**47156 EXAMPLES**

47157 None.

**47158 APPLICATION USAGE**

47159 These functions are part of the Spawn option and need not be provided on all implementations.

**47160 RATIONALE**

47161 None.

**posix\_spawnattr\_getpgroup()**

System Interfaces

47171 **NAME**

47172 `posix_spawnattr_getpgroup`, `posix_spawnattr_setpgroup` — get and set the spawn-pgroup  
 47173 attribute of a spawn attributes object (**ADVANCED REALTIME**)

47174 **SYNOPSIS**

```
47175 SPN #include <spawn.h>
47176
47176 int posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict attr,
47177 pid_t *restrict pgroup);
47178 int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
```

47179 **DESCRIPTION**

47180 The `posix_spawnattr_getpgroup()` function shall obtain the value of the `spawn-pgroup` attribute  
 47181 from the attributes object referenced by `attr`.

47182 The `posix_spawnattr_setpgroup()` function shall set the `spawn-pgroup` attribute in an initialized  
 47183 attributes object referenced by `attr`.

47184 The `spawn-pgroup` attribute represents the process group to be joined by the new process image  
 47185 in a spawn operation (if `POSIX_SPAWN_SETPGROUP` is set in the `spawn-flags` attribute). The  
 47186 default value of this attribute shall be zero.

47187 **RETURN VALUE**

47188 Upon successful completion, `posix_spawnattr_getpgroup()` shall return zero and store the value of  
 47189 the `spawn-pgroup` attribute of `attr` into the object referenced by the `pgroup` parameter; otherwise,  
 47190 an error number shall be returned to indicate the error.

47191 Upon successful completion, `posix_spawnattr_setpgroup()` shall return zero; otherwise, an error  
 47192 number shall be returned to indicate the error.

47193 **ERRORS**

47194 These functions may fail if:

47195 [EINVAL] The value specified by `attr` is invalid.

47196 The `posix_spawnattr_setpgroup()` function may fail if:

47197 [EINVAL] The value of the attribute being set is not valid.

47198 **EXAMPLES**

47199 None.

47200 **APPLICATION USAGE**

47201 These functions are part of the Spawn option and need not be provided on all implementations.

**posix\_spawnattr\_getschedparam()**

System Interfaces

47213 **NAME**

47214 `posix_spawnattr_getschedparam`, `posix_spawnattr_setschedparam` — get and set the `spawn-schedparam`  
 47215 attribute of a spawn attributes object (**ADVANCED REALTIME**)

47216 **SYNOPSIS**

```
47217 SPN PS #include <spawn.h>
47218 #include <sched.h>

47219 int posix_spawnattr_getschedparam(const posix_spawnattr_t
47220     *restrict attr, struct sched_param *restrict schedparam);
47221 int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,
47222     const struct sched_param *restrict schedparam);
```

47223 **DESCRIPTION**

47224 The `posix_spawnattr_getschedparam()` function shall obtain the value of the `spawn-schedparam`  
 47225 attribute from the attributes object referenced by `attr`.

47226 The `posix_spawnattr_setschedparam()` function shall set the `spawn-schedparam` attribute in an  
 47227 initialized attributes object referenced by `attr`.

47228 The `spawn-schedparam` attribute represents the scheduling parameters to be assigned to the new  
 47229 process image in a spawn operation (if `POSIX_SPAWN_SETSCHEDULER` or  
 47230 `POSIX_SPAWN_SETSCHEDPARAM` is set in the `spawn-flags` attribute). The default value of this  
 47231 attribute is unspecified.

47232 **RETURN VALUE**

47233 Upon successful completion, `posix_spawnattr_getschedparam()` shall return zero and store the  
 47234 value of the `spawn-schedparam` attribute of `attr` into the object referenced by the `schedparam`  
 47235 parameter; otherwise, an error number shall be returned to indicate the error.

47236 Upon successful completion, `posix_spawnattr_setschedparam()` shall return zero; otherwise, an  
 47237 error number shall be returned to indicate the error.

47238 **ERRORS**

47239 These functions may fail if:

47240 [EINVAL] The value specified by `attr` is invalid.

47241 The `posix_spawnattr_setschedparam()` function may fail if:

47242 [EINVAL] The value of the attribute being set is not valid.

47243 **EXAMPLES**

47244 None.

System Interfaces

47259 **NAME**

47260 `posix_spawnattr_getschedpolicy`, `posix_spawnattr_setschedpolicy` — get and set the spawn-  
 47261 `schedpolicy` attribute of a spawn attributes object (**ADVANCED REALTIME**)

47262 **SYNOPSIS**

```
47263 SPN PS #include <spawn.h>
47264 #include <sched.h>

47265 int posix_spawnattr_getschedpolicy(const posix_spawnattr_t
47266     *restrict attr, int *restrict schedpolicy);
47267 int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,
47268     int schedpolicy);
```

47269 **DESCRIPTION**

47270 The `posix_spawnattr_getschedpolicy()` function shall obtain the value of the `spawn-schedpolicy`  
 47271 attribute from the attributes object referenced by `attr`.

47272 The `posix_spawnattr_setschedpolicy()` function shall set the `spawn-schedpolicy` attribute in an  
 47273 initialized attributes object referenced by `attr`.

47274 The `spawn-schedpolicy` attribute represents the scheduling policy to be assigned to the new  
 47275 process image in a spawn operation (if `POSIX_SPAWN_SETSCHEDULER` is set in the `spawn-`  
 47276 `flags` attribute). The default value of this attribute is unspecified.

47277 **RETURN VALUE**

47278 Upon successful completion, `posix_spawnattr_getschedpolicy()` shall return zero and store the  
 47279 value of the `spawn-schedpolicy` attribute of `attr` into the object referenced by the `schedpolicy`  
 47280 parameter; otherwise, an error number shall be returned to indicate the error.

47281 Upon successful completion, `posix_spawnattr_setschedpolicy()` shall return zero; otherwise, an  
 47282 error number shall be returned to indicate the error.

47283 **ERRORS**

47284 These functions may fail if:

47285 [EINVAL] The value specified by `attr` is invalid.

47286 The `posix_spawnattr_setschedpolicy()` function may fail if:

47287 [EINVAL] The value of the attribute being set is not valid.

47288 **EXAMPLES**

47289 None.

47290 **APPLICATION USAGE**

47291 These functions are part of the Spawn and Process Scheduling options and need not be provided  
 47292 on all implementations.

47293 **RATIONALE**

47294 None.

47295 **FUTURE DIRECTIONS**

47296 None.

**posix\_spawnattr\_getsigdefault()**47304 **NAME**

47305 `posix_spawnattr_getsigdefault`, `posix_spawnattr_setsigdefault` — get and set the `spawn-sigdefault`  
 47306 attribute of a spawn attributes object (**ADVANCED REALTIME**)

47307 **SYNOPSIS**

```
47308 #include <signal.h>
47309 #include <spawn.h>

47310 int posix_spawnattr_getsigdefault(const posix_spawnattr_t
47311     *restrict attr, sigset_t *restrict sigdefault);
47312 int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,
47313     const sigset_t *restrict sigdefault);
```

47314 **DESCRIPTION**

47315 The `posix_spawnattr_getsigdefault()` function shall obtain the value of the `spawn-sigdefault`  
 47316 attribute from the attributes object referenced by `attr`.

47317 The `posix_spawnattr_setsigdefault()` function shall set the `spawn-sigdefault` attribute in an  
 47318 initialized attributes object referenced by `attr`.

47319 The `spawn-sigdefault` attribute represents the set of signals to be forced to default signal handling  
 47320 in the new process image (if `POSIX_SPAWN_SETSIGDEF` is set in the `spawn-flags` attribute) by a  
 47321 spawn operation. The default value of this attribute shall be an empty signal set.

47322 **RETURN VALUE**

47323 Upon successful completion, `posix_spawnattr_getsigdefault()` shall return zero and store the value  
 47324 of the `spawn-sigdefault` attribute of `attr` into the object referenced by the `sigdefault` parameter;  
 47325 otherwise, an error number shall be returned to indicate the error.

47326 Upon successful completion, `posix_spawnattr_setsigdefault()` shall return zero; otherwise, an error  
 47327 number shall be returned to indicate the error.

47328 **ERRORS**

47329 These functions may fail if:

47330 [EINVAL] The value specified by `attr` is invalid.

47331 The `posix_spawnattr_setsigdefault()` function may fail if:

47332 [EINVAL] The value of the attribute being set is not valid.

47333 **EXAMPLES**

47334 None.

47335 **APPLICATION USAGE**

47336 These functions are part of the Spawn option and need not be provided on all implementations.

47337 **RATIONALE**

47338 None.

**posix\_spawnattr\_getsigmask()**47347 **NAME**

47348 `posix_spawnattr_getsigmask`, `posix_spawnattr_setsigmask` — get and set the `spawn-sigmask`  
 47349 attribute of a `spawn` attributes object (**ADVANCED REALTIME**)

47350 **SYNOPSIS**

```
47351 #include <signal.h>
47352 #include <spawn.h>

47353 int posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict attr,
47354                               sigset_t *restrict sigmask);
47355 int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,
47356                               const sigset_t *restrict sigmask);
```

47357 **DESCRIPTION**

47358 The `posix_spawnattr_getsigmask()` function shall obtain the value of the `spawn-sigmask` attribute  
 47359 from the attributes object referenced by `attr`.

47360 The `posix_spawnattr_setsigmask()` function shall set the `spawn-sigmask` attribute in an initialized  
 47361 attributes object referenced by `attr`.

47362 The `spawn-sigmask` attribute represents the signal mask in effect in the new process image of a  
 47363 `spawn` operation (if `POSIX_SPAWN_SETSIGMASK` is set in the `spawn-flags` attribute). The  
 47364 default value of this attribute is unspecified.

47365 **RETURN VALUE**

47366 Upon successful completion, `posix_spawnattr_getsigmask()` shall return zero and store the value  
 47367 of the `spawn-sigmask` attribute of `attr` into the object referenced by the `sigmask` parameter;  
 47368 otherwise, an error number shall be returned to indicate the error.

47369 Upon successful completion, `posix_spawnattr_setsigmask()` shall return zero; otherwise, an error  
 47370 number shall be returned to indicate the error.

47371 **ERRORS**

47372 These functions may fail if:

47373 [EINVAL] The value specified by `attr` is invalid.

47374 The `posix_spawnattr_setsigmask()` function may fail if:

47375 [EINVAL] The value of the attribute being set is not valid.

47376 **EXAMPLES**

47377 None.

47378 **APPLICATION USAGE**

47379 These functions are part of the `Spawn` option and need not be provided on all implementations.

47380 **RATIONALE**

47381 None.

47382 **FUTURE DIRECTIONS**

47383 None.

**posix\_trace\_attr\_destroy()**

System Interfaces

47464 **NAME**

47465 `posix_trace_attr_destroy`, `posix_trace_attr_init` — destroy and initialize the trace stream  
 47466 attributes object (**TRACING**)

47467 **SYNOPSIS**

```
47468 OB TRC #include <trace.h>
47469
47469 int posix_trace_attr_destroy(trace_attr_t *attr);
47470 int posix_trace_attr_init(trace_attr_t *attr);
```

47471 **DESCRIPTION**

47472 The `posix_trace_attr_destroy()` function shall destroy an initialized trace attributes object. A  
 47473 destroyed `attr` attributes object can be reinitialized using `posix_trace_attr_init()`; the results of  
 47474 otherwise referencing the object after it has been destroyed are undefined.

47475 The `posix_trace_attr_init()` function shall initialize a trace attributes object `attr` with the default  
 47476 value for all of the individual attributes used by a given implementation. The read-only  
 47477 `generation-version` and `clock-resolution` attributes of the newly initialized trace attributes object  
 47478 shall be set to their appropriate values (see [Section 2.11.1.2](#), on page 535).

47479 Results are undefined if `posix_trace_attr_init()` is called specifying an already initialized `attr`  
 47480 attributes object.

47481 Implementations may add extensions to the trace attributes object structure as permitted in XBD  
 47482 [Chapter 2](#) (on page 15).

47483 The resulting attributes object (possibly modified by setting individual attributes values), when  
 47484 used by `posix_trace_create()`, defines the attributes of the trace stream created. A single attributes  
 47485 object can be used in multiple calls to `posix_trace_create()`. After one or more trace streams have  
 47486 been created using an attributes object, any function affecting that attributes object, including  
 47487 destruction, shall not affect any trace stream previously created. An initialized attributes object  
 47488 also serves to receive the attributes of an existing trace stream or trace log when calling the  
 47489 `posix_trace_get_attr()` function.

47490 **RETURN VALUE**

47491 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 47492 return the corresponding error number.

47493 **ERRORS**

47494 The `posix_trace_attr_destroy()` function may fail if:

47495 [EINVAL] The value of `attr` is invalid.

47496 The `posix_trace_attr_init()` function shall fail if:

47497 [ENOMEM] Insufficient memory exists to initialize the trace attributes object.

47498 **EXAMPLES**

47499 None.

47500 **APPLICATION USAGE**

47501 None.

47502 **RATIONALE**

47503 None.

**47504 FUTURE DIRECTIONS**

47505       The *posix\_trace\_attr\_destroy()* and *posix\_trace\_attr\_init()* functions may be removed in a future  
47506       version.

**47507 SEE ALSO**

47508       *posix\_trace\_create()*, *posix\_trace\_get\_attr()*, *uname()*

47509       XBD <trace.h>

**47510 CHANGE HISTORY**

47511       First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

47512       IEEE PASC Interpretation 1003.1 #123 is applied.

**47513 Issue 7**

47514       The *posix\_trace\_attr\_destroy()* and *posix\_trace\_attr\_init()* functions are marked obsolescent.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**posix\_trace\_attr\_getclockres()**

System Interfaces

47515 **NAME**

47516 `posix_trace_attr_getclockres`, `posix_trace_attr_getcreatetime`, `posix_trace_attr_getgenversion`,  
 47517 `posix_trace_attr_getname`, `posix_trace_attr_setname` — retrieve and set information about a  
 47518 trace stream (**TRACING**)

47519 **SYNOPSIS**

```
47520 OB TRC #include <time.h>
47521 #include <trace.h>

47522 int posix_trace_attr_getclockres(const trace_attr_t *attr,
47523     struct timespec *resolution);
47524 int posix_trace_attr_getcreatetime(const trace_attr_t *attr,
47525     struct timespec *createtime);

47526 #include <trace.h>

47527 int posix_trace_attr_getgenversion(const trace_attr_t *attr,
47528     char *genversion);
47529 int posix_trace_attr_getname(const trace_attr_t *attr,
47530     char *tracename);
47531 int posix_trace_attr_setname(trace_attr_t *attr,
47532     const char *tracename);
```

47533 **DESCRIPTION**

47534 The `posix_trace_attr_getclockres()` function shall copy the clock resolution of the clock used to  
 47535 generate timestamps from the *clock-resolution* attribute of the attributes object pointed to by the  
 47536 *attr* argument into the structure pointed to by the *resolution* argument.

47537 The `posix_trace_attr_getcreatetime()` function shall copy the trace stream creation time from the  
 47538 *creation-time* attribute of the attributes object pointed to by the *attr* argument into the structure  
 47539 pointed to by the *createtime* argument. The *creation-time* attribute shall represent the time of  
 47540 creation of the trace stream.

47541 The `posix_trace_attr_getgenversion()` function shall copy the string containing version information  
 47542 from the *generation-version* attribute of the attributes object pointed to by the *attr* argument into  
 47543 the string pointed to by the *genversion* argument. The *genversion* argument shall be the address of  
 47544 a character array which can store at least {TRACE\_NAME\_MAX} characters.

47545 The `posix_trace_attr_getname()` function shall copy the string containing the trace name from the  
 47546 *trace-name* attribute of the attributes object pointed to by the *attr* argument into the string  
 47547 pointed to by the *tracename* argument. The *tracename* argument shall be the address of a character  
 47548 array which can store at least {TRACE\_NAME\_MAX} characters.

47549 The `posix_trace_attr_setname()` function shall set the name in the *trace-name* attribute of the  
 47550 attributes object pointed to by the *attr* argument, using the trace name string supplied by the  
 47551 *tracename* argument. If the supplied string contains more than {TRACE\_NAME\_MAX}  
 47552 characters, the name copied into the *trace-name* attribute may be truncated to one less than the  
 47553 length of {TRACE\_NAME\_MAX} characters. The default value is a null string.

47554 **RETURN VALUE**

47555 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 47556 return the corresponding error number.

47557 If successful, the `posix_trace_attr_getclockres()` function stores the *clock-resolution* attribute value in  
 47558 the object pointed to by *resolution*. Otherwise, the content of this object is unspecified.

47559 If successful, the `posix_trace_attr_getcreatetime()` function stores the trace stream creation time in

47560 the object pointed to by *createtime*. Otherwise, the content of this object is unspecified.

47561 If successful, the *posix\_trace\_attr\_getgenversion()* function stores the trace version information in  
47562 the string pointed to by *genversion*. Otherwise, the content of this string is unspecified.

47563 If successful, the *posix\_trace\_attr\_getname()* function stores the trace name in the string pointed  
47564 to by *tracename*. Otherwise, the content of this string is unspecified.

#### 47565 **ERRORS**

47566 The *posix\_trace\_attr\_getclockres()*, *posix\_trace\_attr\_getcreatetime()*, *posix\_trace\_attr\_getgenversion()*,  
47567 and *posix\_trace\_attr\_getname()* functions may fail if:

47568 [EINVAL] The value specified by one of the arguments is invalid.

#### 47569 **EXAMPLES**

47570 None.

#### 47571 **APPLICATION USAGE**

47572 None.

#### 47573 **RATIONALE**

47574 None.

#### 47575 **FUTURE DIRECTIONS**

47576 The *posix\_trace\_attr\_getclockres()*, *posix\_trace\_attr\_getcreatetime()*, *posix\_trace\_attr\_getgenversion()*,  
47577 *posix\_trace\_attr\_getname()*, and *posix\_trace\_attr\_setname()* functions may be removed in a future  
47578 version.

#### 47579 **SEE ALSO**

47601 int inheritancepolicy);
47602 TRL int posix_trace_attr_setlogfullpolicy(trace_attr_t *attr,
47603 int logpolicy);
47604 int posix_trace_attr_setstreamfullpolicy(trace_attr_t *attr,
47605 int streampolicy);
```

47606 **DESCRIPTION**

47607 TRI The `posix_trace_attr_getinherited()` and `posix_trace_attr_setinherited()` functions, respectively, shall  
 47608 get and set the inheritance policy stored in the *inheritance* attribute for traced processes across the  
 47609 `fork()` and `spawn()` operations. The *inheritance* attribute of the attributes object pointed to by the  
 47610 *attr* argument shall be set to one of the following values defined by manifest constants in the  
 47611 **<trace.h>** header:

47612 **POSIX\_TRACE\_CLOSE\_FOR\_CHILD**

47613 After a `fork()` or `spawn()` operation, the child shall not be traced, and tracing of the parent  
 47614 shall continue.

47615 **POSIX\_TRACE\_INHERITED**

47616 After a `fork()` or `spawn()` operation, if the parent is being traced, its child shall be  
 47617 concurrently traced using the same trace stream.

47618 The default value for the *inheritance* attribute is **POSIX\_TRACE\_CLOSE\_FOR\_CHILD**.

47619 TRL The `posix_trace_attr_getlogfullpolicy()` and `posix_trace_attr_setlogfullpolicy()` functions,  
 47620 respectively, shall get and set the trace log full policy stored in the *log-full-policy* attribute of the  
 47621 attributes object pointed to by the *attr* argument.

47622 The *log-full-policy* attribute shall be set to one of the following values defined by manifest  
 47623 constants in the **<trace.h>** header:

47624 **POSIX\_TRACE\_LOOP**

47625 The trace log shall loop until the associated trace stream is stopped. This policy means that  
 47626 when the trace log gets full, the file system shall reuse the resources allocated to the oldest  
 47627 trace events that were recorded. In this way, the trace log will always contain the most  
 47628 recent trace events flushed.

47629 **POSIX\_TRACE\_UNTIL\_FULL**

47630 The trace stream shall be flushed to the trace log until the trace log is full. This condition can  
 47631 be deduced from the *posix\_log\_full\_status* member status (see the **posix\_trace\_status\_info**  
 47632 structure defined in **<trace.h>**). The last recorded trace event shall be the  
 47633 **POSIX\_TRACE\_STOP** trace event.

- 47634 **POSIX\_TRACE\_APPEND**  
 47635 The associated trace stream shall be flushed to the trace log without log size limitation. If  
 47636 the application specifies **POSIX\_TRACE\_APPEND**, the implementation shall ignore the *log-*  
 47637 *max-size* attribute.
- 47638 The default value for the *log-full-policy* attribute is **POSIX\_TRACE\_LOOP**.
- 47639 The *posix\_trace\_attr\_getstreamfullpolicy()* and *posix\_trace\_attr\_setstreamfullpolicy()* functions  
 47640 respectively, shall get and set the trace stream full policy stored in the *stream-full-policy* attribute  
 47641 of the attributes object pointed to by the *attr* argument.
- 47642 The *stream-full-policy* attribute shall be set to one of the following values defined by manifest  
 47643 constants in the **<trace.h>** header:
- 47644 **POSIX\_TRACE\_LOOP**  
 47645 The trace stream shall loop until explicitly stopped by the *posix\_trace\_stop()* function. This  
 47646 policy means that when the trace stream is full, the trace system shall reuse the resources  
 47647 allocated to the oldest trace events recorded. In this way, the trace stream will always  
 47648 contain the most recent trace events recorded.
- 47649 **POSIX\_TRACE\_UNTIL\_FULL**  
 47650 The trace stream will run until the trace stream resources are exhausted. Then the trace  
 47651 stream will stop. This condition can be deduced from *posix\_stream\_status* and  
 47652 *posix\_stream\_full\_status* (see the **posix\_trace\_status\_info** structure defined in **<trace.h>**).  
 47653 When this trace stream is read, a **POSIX\_TRACE\_STOP** trace event shall be reported after  
 47654 reporting the last recorded trace event. The trace system shall reuse the resources allocated  
 47655 to any trace events already reported—see the *posix\_trace\_getnext\_event()*,  
 47656 *posix\_trace\_trygetnext\_event()*, and *posix\_trace\_timedgetnext\_event()* functions—or already  
 47657 flushed for an active trace stream with log if the Trace Log option is supported; see the  
 47658 *posix\_trace\_flush()* function. The trace system shall restart the trace stream when it is empty  
 47659 and may restart it sooner. A **POSIX\_TRACE\_START** trace event shall be reported before  
 47660 reporting the next recorded trace event.
- 47661 **POSIX\_TRACE\_FLUSH**  
 47662 If the Trace Log option is supported, this policy is identical to the  
 47663 **POSIX\_TRACE\_UNTIL\_FULL** trace stream full policy except that the trace stream shall be  
 47664 flushed regularly as if *posix\_trace\_flush()* had been explicitly called. Defining this policy for  
 47665 an active trace stream without log shall be invalid.
- 47666 The default value for the *stream-full-policy* attribute shall be **POSIX\_TRACE\_LOOP** for an active  
 47667 trace stream without log.
- 47668 **POSIX\_TRACE\_FLUSH**  
 47669 If the Trace Log option is supported, the default value for the *stream-full-policy* attribute shall be  
**POSIX\_TRACE\_FLUSH** for an active trace stream with log.
- 47670 **RETURN VALUE**  
 47671 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 47672 return the corresponding error number.
- 47673 **inheritance**  
 47674 If successful, the *posix\_trace\_attr\_getinherited()* function shall store the *inheritance* attribute value  
 in the object pointed to by *inheritancepolicy*. Otherwise, the content of this object is undefined.
- 47675 **log-policy**  
 47676 If successful, the *posix\_trace\_attr\_getlogfullpolicy()* function shall store the *log-full-policy* attribute  
 value in the object pointed to by *logpolicy*. Otherwise, the content of this object is undefined.
- 47677 **stream-policy**  
 47678 If successful, the *posix\_trace\_attr\_getstreamfullpolicy()* function shall store the *stream-full-policy*  
 attribute value in the object pointed to by *streampolicy*. Otherwise, the content of this object is  
 47679 undefined.

**posix\_trace\_attr\_getinherited()**47680 **ERRORS**

47681 These functions may fail if:

47682 [EINVAL] The value specified by at least one of the arguments is invalid.

47683 **EXAMPLES**

47684 None.

47685 **APPLICATION USAGE**

47686 None.

47687 **RATIONALE**

47688 None.

47689 **FUTURE DIRECTIONS**

47690 The following functions:

47691 *posix\_trace\_attr\_getinherited()*  
 47692 *posix\_trace\_attr\_getlogfullpolicy()*  
 47693 *posix\_trace\_attr\_getstreamfullpolicy()*  
 47694 *posix\_trace\_attr\_setinherited()*  
 47695 *posix\_trace\_attr\_setlogfullpolicy()*  
 47696 *posix\_trace\_attr\_setstreamfullpolicy()*

47697 may be removed in a future version.

47698 **SEE ALSO**

47699 *fork()*, *posix\_trace\_attr\_destroy()*, *posix\_trace\_create()*, *posix\_trace\_get\_attr()*,  
 47700 *posix\_trace\_getnext\_event()*, *posix\_trace\_start()*

47701 XBD &lt;trace.h&gt;

47702 **CHANGE HISTORY**

47703 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

47704 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/39 is applied, adding the TRL and TRC  
 47705 margin codes to the *posix\_trace\_attr\_setlogfullpolicy()* function.

47706 **Issue 7**

47707 SD5-XSH-ERN-116 is applied, adding the missing **restrict** keyword to the  
 47708 *posix\_trace\_attr\_getstreamfullpolicy()* function declaration.

47709 These functions are marked obsolescent.

## 47710 NAME

47711 posix\_trace\_attr\_getlogsize, posix\_trace\_attr\_getmaxdatasize,  
 47712 posix\_trace\_attr\_getmaxsystemeventsizesize, posix\_trace\_attr\_getmaxusereventsizesize,  
 47713 posix\_trace\_attr\_getstreamsize, posix\_trace\_attr\_setlogsize, posix\_trace\_attr\_setmaxdatasize,  
 47714 posix\_trace\_attr\_setstreamsize — retrieve and set trace stream size attributes (TRACING)

## 47715 SYNOPSIS

```
47716 OB TRC #include <sys/types.h>
47717 #include <trace.h>

47718 TRL int posix_trace_attr_getlogsize(const trace_attr_t *restrict attr,
47719 size_t *restrict logsize);
47720 int posix_trace_attr_getmaxdatasize(const trace_attr_t *restrict attr,
47721 size_t *restrict maxdatasize);
47722 int posix_trace_attr_getmaxsystemeventsizesize(
47723 const trace_attr_t *restrict attr,
47724 size_t *restrict eventsizesize);
47725 int posix_trace_attr_getmaxusereventsizesize(

47727 size_t data_len, size_t *restrict eventsizesize);
47728 int posix_trace_attr_getstreamsize(const trace_attr_t *restrict attr,
47729 size_t *restrict streamsize);
47730 TRL int posix_trace_attr_setlogsize(trace_attr_t *attr,
47731 size_t logsize);
47732 int posix_trace_attr_setmaxdatasize(trace_attr_t *attr,
47733 size_t maxdatasize);
47734 int posix_trace_attr_setstreamsize(trace_attr_t *attr,
47735 size_t streamsize);
```

## 47736 DESCRIPTION

47737 TRL The *posix\_trace\_attr\_getlogsize()* function shall copy the log size, in bytes, from the *log-max-size*  
 47738 attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by  
 47739 the *logsize* argument. This log size is the maximum total of bytes that shall be allocated for  
 47740 system and user trace events in the trace log. The default value for the *log-max-size* attribute is  
 47741 implementation-defined.

47742 The *posix\_trace\_attr\_setlogsize()* function shall set the maximum allowed size, in bytes, in the *log-*  
 47743 *max-size* attribute of the attributes object pointed to by the *attr* argument, using the size value  
 47744 supplied by the *logsize* argument.

47745 The trace log size shall be used if the *log-full-policy* attribute is set to `POSIX_TRACE_LOOP` or  
 47746 `POSIX_TRACE_UNTIL_FULL`. If the *log-full-policy* attribute is set to `POSIX_TRACE_APPEND`,  
 47747 the implementation shall ignore the *log-max-size* attribute.

47748 The *posix\_trace\_attr\_getmaxdatasize()* function shall copy the maximum user trace event data  
 47749 size, in bytes, from the *max-data-size* attribute of the attributes object pointed to by the *attr*  
 47750 argument into the variable pointed to by the *maxdatasize* argument. The default value for the  
 47751 *max-data-size* attribute is implementation-defined.

47752 The *posix\_trace\_attr\_getmaxsystemeventsizesize()* function shall calculate the maximum memory size,  
 47753 in bytes, required to store a single system trace event. This value is calculated for the trace  
 47754 stream attributes object pointed to by the *attr* argument and is returned in the variable pointed  
 47755 to by the *eventsizesize* argument.

47756 The values returned as the maximum memory sizes of the user and system trace events shall be  
 47757 such that if the sum of the maximum memory sizes of a set of the trace events that may be

**posix\_trace\_attr\_getlogsize()**

47758 recorded in a trace stream is less than or equal to the *stream-min-size* attribute of that trace  
 47759 stream, the system provides the necessary resources for recording all those trace events, without  
 47760 loss.

47761 The *posix\_trace\_attr\_getmaxusereventsize()* function shall calculate the maximum memory size, in  
 47762 bytes, required to store a single user trace event generated by a call to *posix\_trace\_event()* with a  
 47763 *data\_len* parameter equal to the *data\_len* value specified in this call. This value is calculated for  
 47764 the trace stream attributes object pointed to by the *attr* argument and is returned in the variable  
 47765 pointed to by the *eventsize* argument.

47766 The *posix\_trace\_attr\_getstreamsize()* function shall copy the stream size, in bytes, from the *stream-*  
 47767 *min-size* attribute of the attributes object pointed to by the *attr* argument into the variable  
 47768 pointed to by the *streamsize* argument.

47769 This stream size is the current total memory size reserved for system and user trace events in the  
 47770 trace stream. The default value for the *stream-min-size* attribute is implementation-defined. The  
 47771 stream size refers to memory used to store trace event records. Other stream data (for example,  
 47772 trace attribute values) shall not be included in this size.

47773 The *posix\_trace\_attr\_setmaxdatasize()* function shall set the maximum allowed size, in bytes, in  
 47774 the *max-data-size* attribute of the attributes object pointed to by the *attr* argument, using the size  
 47775 value supplied by the *maxdatasize* argument. This maximum size is the maximum allowed size  
 47776 for the user data argument which may be passed to *posix\_trace\_event()*. The implementation  
 47777 shall be allowed to truncate data passed to *trace\_user\_event* which is longer than *maxdatasize*.

47778 The *posix\_trace\_attr\_setstreamsize()* function shall set the minimum allowed size, in bytes, in the  
 47779 *stream-min-size* attribute of the attributes object pointed to by the *attr* argument, using the size  
 47780 value supplied by the *streamsize* argument.

**RETURN VALUE**

47781 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 47782 return the corresponding error number.  
 47783

47784 TRL The *posix\_trace\_attr\_getlogsize()* function stores the maximum trace log allowed size in the object  
 47785 pointed to by *logsize*, if successful.

47786 The *posix\_trace\_attr\_getmaxdatasize()* function stores the maximum trace event record memory  
 47787 size in the object pointed to by *maxdatasize*, if successful.

47788 The *posix\_trace\_attr\_getmaxsystemeventsize()* function stores the maximum memory size to store a  
 47789 single system trace event in the object pointed to by *eventsize*, if successful.

47790 The *posix\_trace\_attr\_getmaxusereventsize()* function stores the maximum memory size to store a  
 47791 single user trace event in the object pointed to by *eventsize*, if successful.

47792 The *posix\_trace\_attr\_getstreamsize()* function stores the maximum trace stream allowed size in the  
 47793 object pointed to by *streamsize*, if successful.

**ERRORS**

47794 These functions may fail if:

47795 [EINVAL] The value specified by one of the arguments is invalid.  
 47796

47797 **EXAMPLES**

47798 None.

47799 **APPLICATION USAGE**

47800 None.

47801 **RATIONALE**

47802 None.

47803 **FUTURE DIRECTIONS**

47804 The following functions:

47805 *posix\_trace\_attr\_getlogsize()*  
 47806 *posix\_trace\_attr\_getmaxdatasize()*  
 47807 *posix\_trace\_attr\_getmaxsystemeventszize()*  
 47808 *posix\_trace\_attr\_getmaxusereventszize()*  
 47809 *posix\_trace\_attr\_getstreamsize()*  
 47810 *posix\_trace\_attr\_setlogsize()*  
 47811 *posix\_trace\_attr\_setmaxdatasize()*  
 47812 *posix\_trace\_attr\_setstreamsize()*

47813 may be removed in a future version.

47814 **SEE ALSO**47815 *posix\_trace\_attr\_destroy()*, *posix\_trace\_create()*, *posix\_trace\_event()*, *posix\_trace\_get\_attr()*

47900         size_t streamsize);
```

47901 **DESCRIPTION**47902        Refer to *posix\_trace\_attr\_getlogsize()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

47903 **NAME**47904 `posix_trace_clear` — clear trace stream and trace log (TRACING)47905 **SYNOPSIS**

```
47906 OB TRC #include <sys/types.h>
47907 #include <trace.h>
47908 int posix_trace_clear(trace_id_t trid);
```

47909 **DESCRIPTION**

47910 The `posix_trace_clear()` function shall reinitialize the trace stream identified by the argument `trid`  
 47911 as if it were returning from the `posix_trace_create()` function, except that the same allocated  
 47912 resources shall be reused, the mapping of trace event type identifiers to trace event names shall  
 47913 be unchanged, and the trace stream status shall remain unchanged (that is, if it was running, it  
 47914 remains running and if it was suspended, it remains suspended).

47915 All trace events in the trace stream recorded before the call to `posix_trace_clear()` shall be lost. The  
 47916 `posix_stream_full_status` status shall be set to `POSIX_TRACE_NOT_FULL`. There is no guarantee  
 47917 that all trace events that occurred during the `posix_trace_clear()` call are recorded; the behavior  
 47918 with respect to trace points that may occur during this call is unspecified.

47919 OB TRL If the Trace Log option is supported and the trace stream has been created with a log, the  
 47920 `posix_trace_clear()` function shall reinitialize the trace stream with the same behavior as if the  
 47921 trace stream was created without the log, plus it shall reinitialize the trace log associated with  
 47922 the trace stream identified by the argument `trid` as if it were returning from the  
 47923 `posix_trace_create_withlog()` function, except that the same allocated resources, for the trace log,  
 47924 may be reused and the associated trace stream status remains unchanged. The first trace event  
 47925 recorded in the trace log after the call to `posix_trace_clear()` shall be the same as the first trace  
 47926 event recorded in the active trace stream after the call to `posix_trace_clear()`. The  
 47927 `posix_log_full_status` status shall be set to `POSIX_TRACE_NOT_FULL`. There is no guarantee that  
 47928 all trace events that occurred during the `posix_trace_clear()` call are recorded in the trace log; the  
 47929 behavior with respect to trace points that may occur during this call is unspecified. If the log full  
 47930 policy is `POSIX_TRACE_APPEND`, the effect of a call to this function is unspecified for the trace  
 47931 log associated with the trace stream identified by the `trid` argument.

47932 **RETURN VALUE**

47933 Upon successful completion, the `posix_trace_clear()` function shall return a value of zero.  
 47934 Otherwise, it shall return the corresponding error number.

47935 **ERRORS**

47936 The `posix_trace_clear()` function shall fail if:

47937 [EINVAL] The value of the `trid` argument does not correspond to an active trace stream.

47938 **EXAMPLES**

47939 None.

47940 **APPLICATION USAGE**

47941 None.

47942 **RATIONALE**

47943 None.

47944 **FUTURE DIRECTIONS**

47945 The `posix_trace_clear()` function may be removed in a future version.

47954 **NAME**47955 `posix_trace_close`, `posix_trace_open`, `posix_trace_rewind` — trace log management (TRACING)47956 **SYNOPSIS**

```

47957 OB TRC #include <trace.h>
47958 TRL     int posix_trace_close(trace_id_t trid);
47959         int posix_trace_open(int file_desc, trace_id_t *trid);
47960         int posix_trace_rewind(trace_id_t trid);

```

47961 **DESCRIPTION**

47962 The `posix_trace_close()` function shall deallocate the trace log identifier indicated by *trid*, and all  
 47963 of its associated resources. If there is no valid trace log pointed to by the *trid*, this function shall  
 47964 fail.

47965 The `posix_trace_open()` function shall allocate the necessary resources and establish the  
 47966 connection between a trace log identified by the *file\_desc* argument and a trace stream identifier  
 47967 identified by the object pointed to by the *trid* argument. The *file\_desc* argument should be a valid  
 47968 open file descriptor that corresponds to a trace log. The *file\_desc* argument shall be open for  
 47969 reading. The current trace event timestamp, which specifies the timestamp of the trace event that  
 47970 will be read by the next call to `posix_trace_getnext_event()`, shall be set to the timestamp of the  
 47971 oldest trace event recorded in the trace log identified by *trid*.

47972 The `posix_trace_open()` function shall return a trace stream identifier in the variable pointed to by  
 47973 the *trid* argument, that may only be used by the following functions:

47974	<code>posix_trace_close()</code>	<code>posix_trace_get_attr()</code>
47975	<code>posix_trace_eventid_equal()</code>	<code>posix_trace_get_status()</code>
47976	<code>posix_trace_eventid_get_name()</code>	<code>posix_trace_getnext_event()</code>
47977	<code>posix_trace_eventtypelist_getnext_id()</code>	<code>posix_trace_rewind()</code>
47978	<code>posix_trace_eventtypelist_rewind()</code>	

47979 In particular, notice that the operations normally used by a trace controller process, such as  
 47980 `posix_trace_start()`, `posix_trace_stop()`, or `posix_trace_shutdown()`, cannot be invoked using the  
 47981 trace stream identifier returned by the `posix_trace_open()` function.

47982 The `posix_trace_rewind()` function shall reset the current trace event timestamp, which specifies  
 47983 the timestamp of the trace event that will be read by the next call to `posix_trace_getnext_event()`,  
 47984 to the timestamp of the oldest trace event recorded in the trace log identified by *trid*.

47985 **RETURN VALUE**

47986 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 47987 return the corresponding error number.

47988 If successful, the `posix_trace_open()` function stores the trace stream identifier value in the object  
 47989 pointed to by *trid*.

47990 **ERRORS**

47991 The `posix_trace_open()` function shall fail if:

47992	[EINTR]	The operation was interrupted by a signal and thus no trace log was opened.
47993	[EINVAL]	The object pointed to by <i>file_desc</i> does not correspond to a valid trace log.

**posix\_trace\_close()**

System Interfaces

47994 The *posix\_trace\_close()* and *posix\_trace\_rewind()* functions may fail if:  
47995 [EINVAL] The object pointed to by *trid* does not correspond to a valid trace log.

**EXAMPLES**

47996 None.  
47997

**APPLICATION USAGE**

47998 None.  
47999

**RATIONALE**

48000 None.  
48001

**FUTURE DIRECTIONS**

48002 The *posix\_trace\_close()*, *posix\_trace\_open()*, and *posix\_trace\_rewind()* functions may be removed in  
48003 a future version.

**CHANGE HISTORY**

48008 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.  
48009

48010 IEEE PASC Interpretation 1003.1 #123 is applied.

**Issue 7**

48011 The *posix\_trace\_close()*, *posix\_trace\_open()*, and *posix\_trace\_rewind()* functions are marked  
48012  
48013 obsolescent.

48014 **NAME**

48015 **posix\_trace\_create**, **posix\_trace\_create\_withlog**, **posix\_trace\_flush**, **posix\_trace\_shutdown** —  
 48016 trace stream initialization, flush, and shutdown from a process (TRACING)

48017 **SYNOPSIS**

```
48018 OB TRC #include <sys/types.h>
48019 #include <trace.h>

48020 int posix_trace_create(pid_t pid,
48021     const trace_attr_t *restrict attr,
48022     trace_id_t *restrict trid);
48023 TRL int posix_trace_create_withlog(pid_t pid,
48024     const trace_attr_t *restrict attr, int file_desc,
48025     trace_id_t *restrict trid);
48026 int posix_trace_flush(trace_id_t trid);
48027 int posix_trace_shutdown(trace_id_t trid);
```

48028 **DESCRIPTION**

48029 The *posix\_trace\_create()* function shall create an active trace stream. It allocates all the resources  
 48030 needed by the trace stream being created for tracing the process specified by *pid* in accordance  
 48031 with the *attr* argument. The *attr* argument represents the initial attributes of the trace stream and  
 48032 shall have been initialized by the function *posix\_trace\_attr\_init()* prior to the *posix\_trace\_create()*  
 48033 call. If the argument *attr* is NULL, the default attributes shall be used. The *attr* attributes object  
 48034 shall be manipulated through a set of functions described in the *posix\_trace\_attr* family of  
 48035 functions. If the attributes of the object pointed to by *attr* are modified later, the attributes of the  
 48036 trace stream shall not be affected. The *creation-time* attribute of the newly created trace stream  
 48037 shall be set to the value of the system clock, if the Timers option is not supported, or to the value  
 48038 of the CLOCK\_REALTIME clock, if the Timers option is supported.

48039 The *pid* argument represents the target process to be traced. If the process executing this function  
 48040 does not have appropriate privileges to trace the process identified by *pid*, an error shall be  
 48041 returned. If the *pid* argument is zero, the calling process shall be traced.

48042 The *posix\_trace\_create()* function shall store the trace stream identifier of the new trace stream in  
 48043 the object pointed to by the *trid* argument. This trace stream identifier shall be used in  
 48044 subsequent calls to control tracing. The *trid* argument may only be used by the following  
 48045 functions:

48046	<i>posix_trace_clear()</i>	<i>posix_trace_getnext_event()</i>
48047	<i>posix_trace_eventid_equal()</i>	<i>posix_trace_shutdown()</i>
48048	<i>posix_trace_eventid_get_name()</i>	<i>posix_trace_start()</i>
48049	<i>posix_trace_eventtypelist_getnext_id()</i>	<i>posix_trace_stop()</i>
48050	<i>posix_trace_eventtypelist_rewind()</i>	<i>posix_trace_timedgetnext_event()</i>
48051	<i>posix_trace_get_attr()</i>	<i>posix_trace_trid_eventid_open()</i>
48052	<i>posix_trace_get_status()</i>	<i>posix_trace_trygetnext_event()</i>

48053 TEF If the Trace Event Filter option is supported, the following additional functions may use the *trid*  
 48054 argument:

```
48055 posix_trace_get_filter()   posix_trace_set_filter()
```

48056 In particular, notice that the operations normally used by a trace analyzer process, such as  
 48057 *posix\_trace\_rewind()* or *posix\_trace\_close()*, cannot be invoked using the trace stream identifier  
 48058 returned by the *posix\_trace\_create()* function.

**posix\_trace\_create()**

- 48059 TEF A trace stream shall be created in a suspended state. If the Trace Event Filter option is  
48060 supported, its trace event type filter shall be empty.
- 48061 The *posix\_trace\_create()* function may be called multiple times from the same or different  
48062 processes, with the system-wide limit indicated by the runtime invariant value  
48063 {TRACE\_SYS\_MAX}, which has the minimum value {\_POSIX\_TRACE\_SYS\_MAX}.
- 48064 The trace stream identifier returned by the *posix\_trace\_create()* function in the argument pointed  
48065 to by *trid* is valid only in the process that made the function call. If it is used from another  
48066 process, that is a child process, in functions defined in POSIX.1-2008, these functions shall return  
48067 with the error [EINVAL].
- 48068 TRL The *posix\_trace\_create\_withlog()* function shall be equivalent to *posix\_trace\_create()*, except that it  
48069 associates a trace log with this stream. The *file\_desc* argument shall be the file descriptor  
48070 designating the trace log destination. The function shall fail if this file descriptor refers to a file  
48071 with a file type that is not compatible with the log policy associated with the trace log. The list of  
48072 the appropriate file types that are compatible with each log policy is implementation-defined.
- 48073 The *posix\_trace\_create\_withlog()* function shall return in the parameter pointed to by *trid* the trace  
48074 stream identifier, which uniquely identifies the newly created trace stream, and shall be used in  
48075 subsequent calls to control tracing. The *trid* argument may only be used by the following  
48076 functions:
- |       |   |   |
|-------|---|---|
| 48077 | <i>posix_trace_clear()</i>                    | <i>posix_trace_get_status()</i>         |
| 48078 | <i>posix_trace_eventid_equal()</i>            | <i>posix_trace_getnext_event()</i>      |
| 48079 | <i>posix_trace_eventid_get_name()</i>         | <i>posix_trace_shutdown()</i>           |
| 48080 | <i>posix_trace_eventtypelist_getnext_id()</i> | <i>posix_trace_start()</i>              |
| 48081 | <i>posix_trace_eventtypelist_rewind()</i>     | <i>posix_trace_stop()</i>               |
| 48082 | <i>posix_trace_flush()</i>                    | <i>posix_trace_timedgetnext_event()</i> |
| 48083 | <i>posix_trace_get_attr()</i>                 | <i>posix_trace_trid_eventid_open()</i>  |
- 48084 TEF TRL If the Trace Event Filter option is supported, the following additional functions may use the *trid*  
48085 argument:
- 48086 *posix\_trace\_get\_filter()* *posix\_trace\_set\_filter()*
- 48087 TRL In particular, notice that the operations normally used by a trace analyzer process, such as  
48088 *posix\_trace\_rewind()* or *posix\_trace\_close()*, cannot be invoked using the trace stream identifier  
48089 returned by the *posix\_trace\_create\_withlog()* function.
- 48090 The *posix\_trace\_flush()* function shall initiate a flush operation which copies the contents of the  
48091 trace stream identified by the argument *trid* into the trace log associated with the trace stream at  
48092 the creation time. If no trace log has been associated with the trace stream pointed to by *trid*, this  
48093 function shall return an error. The termination of the flush operation can be polled by the  
48094 *posix\_trace\_get\_status()* function. During the flush operation, it shall be possible to trace new  
48095 trace events up to the point when the trace stream becomes full. After flushing is completed, the  
48096 space used by the flushed trace events shall be available for tracing new trace events.
- 48097 If flushing the trace stream causes the resulting trace log to become full, the trace log full policy  
48098 shall be applied. If the trace *log-full-policy* attribute is set, the following occurs:
- 48099 POSIX\_TRACE\_UNTIL\_FULL  
48100 The trace events that have not yet been flushed shall be discarded.

48101		<b>POSIX_TRACE_LOOP</b>
48102		The trace events that have not yet been flushed shall be written to the beginning of the trace log, overwriting previous trace events stored there.
48103		
48104		<b>POSIX_TRACE_APPEND</b>
48105		The trace events that have not yet been flushed shall be appended to the trace log.
48106		The <i>posix_trace_shutdown()</i> function shall stop the tracing of trace events in the trace stream identified by <i>trid</i> , as if <i>posix_trace_stop()</i> had been invoked. The <i>posix_trace_shutdown()</i> function shall free all the resources associated with the trace stream.
48107		
48108		
48109		The <i>posix_trace_shutdown()</i> function shall not return until all the resources associated with the trace stream have been freed. When the <i>posix_trace_shutdown()</i> function returns, the <i>trid</i> argument becomes an invalid trace stream identifier. A call to this function shall unconditionally deallocate the resources regardless of whether all trace events have been retrieved by the analyzer process. Any thread blocked on one of the <i>trace_getnext_event()</i> functions (which specified this <i>trid</i> ) before this call is unblocked with the error [EINVAL].
48110		
48111		
48112		
48113		
48114		
48115		If the process exits, invokes a member of the <i>exec</i> family of functions, or is terminated, the trace streams that the process had created and that have not yet been shut down, shall be automatically shut down as if an explicit call were made to the <i>posix_trace_shutdown()</i> function.
48116		
48117		
48118	TRL	For an active trace stream with log, when the <i>posix_trace_shutdown()</i> function is called, all trace events that have not yet been flushed to the trace log shall be flushed, as in the <i>posix_trace_flush()</i> function, and the trace log shall be closed.
48119		
48120		
48121		When a trace log is closed, all the information that may be retrieved later from the trace log through the trace interface shall have been written to the trace log. This information includes the trace attributes, the list of trace event types (with the mapping between trace event names and trace event type identifiers), and the trace status.
48122		
48123		
48124		
48125		In addition, unspecified information shall be written to the trace log to allow detection of a valid trace log during the <i>posix_trace_open()</i> operation.
48126		
48127		The <i>posix_trace_shutdown()</i> function shall not return until all trace events have been flushed.
48128		<b>RETURN VALUE</b>
48129		Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.
48130		
48131	TRL	The <i>posix_trace_create()</i> and <i>posix_trace_create_withlog()</i> functions store the trace stream identifier value in the object pointed to by <i>trid</i> , if successful.
48132		
48133		<b>ERRORS</b>
48134	TRL	The <i>posix_trace_create()</i> and <i>posix_trace_create_withlog()</i> functions shall fail if:
48135		[EAGAIN] No more trace streams can be started now. {TRACE_SYS_MAX} has been exceeded.
48136		
48137		[EINTR] The operation was interrupted by a signal. No trace stream was created.
48138		[EINVAL] One or more of the trace parameters specified by the <i>attr</i> parameter is invalid.
48139		[ENOMEM] The implementation does not currently have sufficient memory to create the trace stream with the specified parameters.
48140		
48141		[EPERM] The caller does not have appropriate privileges to trace the process specified by <i>pid</i> .
48142		

**posix\_trace\_create()**

48143	[ESRCH]	The <i>pid</i> argument does not refer to an existing process.
48144	TRL	The <i>posix_trace_create_withlog()</i> function shall fail if:
48145	[EBADF]	The <i>file_desc</i> argument is not a valid file descriptor open for writing.
48146	[EINVAL]	The <i>file_desc</i> argument refers to a file with a file type that does not support the log policy associated with the trace log.
48147		
48148	[ENOSPC]	No space left on device. The device corresponding to the argument <i>file_desc</i> does not contain the space required to create this trace log.
48149		
48150	TRL	The <i>posix_trace_flush()</i> and <i>posix_trace_shutdown()</i> functions shall fail if:
48151	[EINVAL]	The value of the <i>trid</i> argument does not correspond to an active trace stream with log.
48152		
48153	[EFBIG]	The trace log file has attempted to exceed an implementation-defined maximum file size.
48154		
48155	[ENOSPC]	No space left on device.
48156		<b>EXAMPLES</b>
48157		None.
48158		<b>APPLICATION USAGE</b>
48159		None.
48160		<b>RATIONALE</b>
48161		None.
48162		<b>FUTURE DIRECTIONS</b>
48163		The <i>posix_trace_create()</i> , <i>posix_trace_create_withlog()</i> , <i>posix_trace_flush()</i> , and
48164		<i>posix_trace_shutdown()</i> functions may be removed in a future version.

48170		<b>CHANGE HISTORY</b>
48171		First released in Issue 6. Derived from IEEE Std 1003.1q-2000.
48172		<b>Issue 7</b>
48173		These functions are marked obsolescent.
48174		SD5-XSH-ERN-154 is applied, updating the DESCRIPTION to remove the
48175		<i>posix_trace_trygetnext_event()</i> function from the list of functions that use the <i>trid</i> argument.

48176 **NAME**

48177 posix\_trace\_event, posix\_trace\_eventid\_open — trace functions for instrumenting application  
48178 code (**TRACING**)

48179 **SYNOPSIS**

```
48180 OB TRC #include <sys/types.h>
48181 #include <trace.h>

48182 void posix_trace_event(trace_event_id_t event_id,
48183     const void *restrict data_ptr, size_t data_len);
48184 int posix_trace_eventid_open(const char *restrict event_name,
48185     trace_event_id_t *restrict event_id);
```

48186 **DESCRIPTION**

48187 The *posix\_trace\_event()* function shall record the *event\_id* and the user data pointed to by *data\_ptr*  
48188 in the trace stream into which the calling process is being traced and in which *event\_id* is not  
48189 filtered out. If the total size of the user trace event data represented by *data\_len* is not greater  
48190 than the declared maximum size for user trace event data, then the *truncation-status* attribute of  
48191 the trace event recorded is POSIX\_TRACE\_NOT\_TRUNCATED. Otherwise, the user trace event  
48192 data is truncated to this declared maximum size and the *truncation-status* attribute of the trace  
48193 event recorded is POSIX\_TRACE\_TRUNCATED\_RECORD.

48194 If there is no trace stream created for the process or if the created trace stream is not running, or  
48195 if the trace event specified by *event\_id* is filtered out in the trace stream, the *posix\_trace\_event()*  
48196 function shall have no effect.

48197 The *posix\_trace\_eventid\_open()* function shall associate a user trace event name with a trace event  
48198 type identifier for the calling process. The trace event name is the string pointed to by the  
48199 argument *event\_name*. It shall have a maximum of {TRACE\_EVENT\_NAME\_MAX} characters  
48200 (which has the minimum value {\_POSIX\_TRACE\_EVENT\_NAME\_MAX}). The number of user  
48201 trace event type identifiers that can be defined for any given process is limited by the maximum  
48202 value {TRACE\_USER\_EVENT\_MAX}, which has the minimum value  
48203 {POSIX\_TRACE\_USER\_EVENT\_MAX}.

48204 If the Trace Inherit option is not supported, the *posix\_trace\_eventid\_open()* function shall associate  
48205 the user trace event name pointed to by the *event\_name* argument with a trace event type  
48206 identifier that is unique for the traced process, and is returned in the variable pointed to by the  
48207 *event\_id* argument. If the user trace event name has already been mapped for the traced process,  
48208 then the previously assigned trace event type identifier shall be returned. If the per-process user  
48209 trace event name limit represented by {TRACE\_USER\_EVENT\_MAX} has been reached, the pre-  
48210 defined POSIX\_TRACE\_UNNAMED\_USEREVENT (see Table 2-7, on page 539) user trace event  
48211 shall be returned.

48212 TRI If the Trace Inherit option is supported, the *posix\_trace\_eventid\_open()* function shall associate the  
48213 user trace event name pointed to by the *event\_name* argument with a trace event type identifier  
48214 that is unique for all the processes being traced in this same trace stream, and is returned in the  
48215 variable pointed to by the *event\_id* argument. If the user trace event name has already been  
48216 mapped for the traced processes, then the previously assigned trace event type identifier shall be  
48217 returned. If the per-process user trace event name limit represented by  
48218 {TRACE\_USER\_EVENT\_MAX} has been reached, the pre-defined  
48219 POSIX\_TRACE\_UNNAMED\_USEREVENT (Table 2-7, on page 539) user trace event shall be  
48220 returned.

48221 **Note:** The above procedure, together with the fact that multiple processes can only be traced into the  
48222 same trace stream by inheritance, ensure that all the processes that are traced into a trace stream  
48223 have the same mapping of trace event names to trace event type identifiers.

**posix\_trace\_event()**

48224 If there is no trace stream created, the *posix\_trace\_eventid\_open()* function shall store this  
48225 information for future trace streams created for this process.

**RETURN VALUE**

48227 No return value is defined for the *posix\_trace\_event()* function.

48228 Upon successful completion, the *posix\_trace\_eventid\_open()* function shall return a value of zero.  
48229 Otherwise, it shall return the corresponding error number. The *posix\_trace\_eventid\_open()*  
48230 function stores the trace event type identifier value in the object pointed to by *event\_id*, if  
48231 successful.

**ERRORS**

48232 The *posix\_trace\_eventid\_open()* function shall fail if:

48234 [ENAMETOOLONG]

48235 The size of the name pointed to by the *event\_name* argument was longer than  
48236 the implementation-defined value {TRACE\_EVENT\_NAME\_MAX}.

**EXAMPLES**

48238 None.

**APPLICATION USAGE**

48240 None.

**RATIONALE**

48242 None.

**FUTURE DIRECTIONS**

48244 The *posix\_trace\_event()* and *posix\_trace\_eventid\_open()* functions may be removed in a future  
48245 version.

**SEE ALSO**

**CHANGE HISTORY**

48250 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

48251 IEEE PASC Interpretation 1003.1 #123 is applied.

48252 IEEE PASC Interpretation 1003.1 #127 is applied, correcting some editorial errors in the names of  
48253 the *posix\_trace\_eventid\_open()* function and the *event\_id* argument.

**Issue 7**

48254 The *posix\_trace\_event()* and *posix\_trace\_eventid\_open()* functions are marked obsolescent.  
48255

48256 **NAME**

48257 `posix_trace_eventid_equal`, `posix_trace_eventid_get_name`, `posix_trace_trid_eventid_open` —  
 48258 manipulate the trace event type identifier (**TRACING**)

48259 **SYNOPSIS**

```
48260 OB TRC #include <trace.h>
48261
48261 int posix_trace_eventid_equal(trace_id_t trid, trace_event_id_t event1,
48262 trace_event_id_t event2);
48263
48263 int posix_trace_eventid_get_name(trace_id_t trid,
48264 trace_event_id_t event, char *event_name);
48265 TEF int posix_trace_trid_eventid_open(trace_id_t trid,
48266 const char *restrict event_name,
48267 trace_event_id_t *restrict event);
```

48268 **DESCRIPTION**

48269 The `posix_trace_eventid_equal()` function shall compare the trace event type identifiers `event1` and  
 48270 `event2` from the same trace stream or the same trace log identified by the `trid` argument. If the  
 48271 trace event type identifiers `event1` and `event2` are from different trace streams, the return value  
 48272 shall be unspecified.

48273 The `posix_trace_eventid_get_name()` function shall return, in the argument pointed to by  
 48274 `event_name`, the trace event name associated with the trace event type identifier identified by the  
 48275 argument `event`, for the trace stream or for the trace log identified by the `trid` argument. The  
 48276 name of the trace event shall have a maximum of `{TRACE_EVENT_NAME_MAX}` characters  
 48277 (which has the minimum value `{_POSIX_TRACE_EVENT_NAME_MAX}`). Successive calls to  
 48278 this function with the same trace event type identifier and the same trace stream identifier shall  
 48279 return the same event name.

48280 TEF The `posix_trace_trid_eventid_open()` function shall associate a user trace event name with a trace  
 48281 event type identifier for a given trace stream. The trace stream is identified by the `trid` argument,  
 48282 and it shall be an active trace stream. The trace event name is the string pointed to by the  
 48283 argument `event_name`. It shall have a maximum of `{TRACE_EVENT_NAME_MAX}` characters  
 48284 (which has the minimum value `{_POSIX_TRACE_EVENT_NAME_MAX}`). The number of user  
 48285 trace event type identifiers that can be defined for any given process is limited by the maximum  
 48286 value `{TRACE_USER_EVENT_MAX}`, which has the minimum value  
 48287 `{_POSIX_TRACE_USER_EVENT_MAX}`.

48288 If the Trace Inherit option is not supported, the `posix_trace_trid_eventid_open()` function shall  
 48289 associate the user trace event name pointed to by the `event_name` argument with a trace event  
 48290 type identifier that is unique for the process being traced in the trace stream identified by the `trid`  
 48291 argument, and is returned in the variable pointed to by the `event` argument. If the user trace  
 48292 event name has already been mapped for the traced process, then the previously assigned trace  
 48293 event type identifier shall be returned. If the per-process user trace event name limit represented  
 48294 by `{TRACE_USER_EVENT_MAX}` has been reached, the pre-defined  
 48295 `POSIX_TRACE_UNNAMED_USEREVENT` (see Table 2-7, on page 539) user trace event shall be  
 48296 returned.

48297 TEF TRI If the Trace Inherit option is supported, the `posix_trace_trid_eventid_open()` function shall  
 48298 associate the user trace event name pointed to by the `event_name` argument with a trace event  
 48299 type identifier that is unique for all the processes being traced in the trace stream identified by  
 48300 the `trid` argument, and is returned in the variable pointed to by the `event` argument. If the user  
 48301 trace event name has already been mapped for the traced processes, then the previously  
 48302 assigned trace event type identifier shall be returned. If the per-process user trace event name  
 48303 limit represented by `{TRACE_USER_EVENT_MAX}` has been reached, the pre-defined

**posix\_trace\_eventid\_equal()**

System Interfaces

48304 POSIX\_TRACE\_UNNAMED\_USEREVENT (see Table 2-7, on page 539) user trace event shall be  
48305 returned.

**RETURN VALUE**

48307 TEF Upon successful completion, the `posix_trace_eventid_get_name()` and  
48308 `posix_trace_trid_eventid_open()` functions shall return a value of zero. Otherwise, they shall return  
48309 the corresponding error number.

48310 The `posix_trace_eventid_equal()` function shall return a non-zero value if `event1` and `event2` are  
48311 equal; otherwise, a value of zero shall be returned. No errors are defined. If either `event1` or  
48312 `event2` are not valid trace event type identifiers for the trace stream specified by `trid` or if the `trid`  
48313 is invalid, the behavior shall be unspecified.

48314 The `posix_trace_eventid_get_name()` function stores the trace event name value in the object  
48315 pointed to by `event_name`, if successful.

48316 TEF The `posix_trace_trid_eventid_open()` function stores the trace event type identifier value in the  
48317 object pointed to by `event`, if successful.

**ERRORS**

48319 TEF The `posix_trace_eventid_get_name()` and `posix_trace_trid_eventid_open()` functions shall fail if:

48320 [EINVAL] The `trid` argument was not a valid trace stream identifier.

48321 TEF The `posix_trace_trid_eventid_open()` function shall fail if:

48322 TEF [ENAMETOOLONG]

48323 The size of the name pointed to by the `event_name` argument was longer than  
48324 the implementation-defined value {TRACE\_EVENT\_NAME\_MAX}.

48325 The `posix_trace_eventid_get_name()` function shall fail if:

48326 [EINVAL] The trace event type identifier `event` was not associated with any name.

**EXAMPLES**

48328 None.

**APPLICATION USAGE**

48330 None.

**RATIONALE**

48332 None.

**FUTURE DIRECTIONS**

48334 The `posix_trace_eventid_equal()`, `posix_trace_eventid_get_name()`, and  
48335 `posix_trace_trid_eventid_open()` functions may be removed in a future version.

**posix\_trace\_eventset\_add()**

System Interfaces

48353 **NAME**

48354 `posix_trace_eventset_add`, `posix_trace_eventset_del`, `posix_trace_eventset_empty`,  
 48355 `posix_trace_eventset_fill`, `posix_trace_eventset_ismember` — manipulate trace event type sets  
 48356 (TRACING)

48357 **SYNOPSIS**

```
48358 OB TRC #include <trace.h>
48359 TEF int posix_trace_eventset_add(trace_event_id_t event_id,
48360 trace_event_set_t *set);
48361 int posix_trace_eventset_del(trace_event_id_t event_id,
48362 trace_event_set_t *set);
48363 int posix_trace_eventset_empty(trace_event_set_t *set);
48364 int posix_trace_eventset_fill(trace_event_set_t *set, int what);
48365 int posix_trace_eventset_ismember(trace_event_id_t event_id,
48366 const trace_event_set_t *restrict set, int *restrict ismember);
```

48367 **DESCRIPTION**

48368 These primitives manipulate sets of trace event types. They operate on data objects addressable  
 48369 by the application, not on the current trace event filter of any trace stream.

48370 The `posix_trace_eventset_add()` and `posix_trace_eventset_del()` functions, respectively, shall add or  
 48371 delete the individual trace event type specified by the value of the argument `event_id` to or from  
 48372 the trace event type set pointed to by the argument `set`. Adding a trace event type already in the  
 48373 set or deleting a trace event type not in the set shall not be considered an error.

48374 The `posix_trace_eventset_empty()` function shall initialize the trace event type set pointed to by  
 48375 the `set` argument such that all trace event types defined, both system and user, shall be excluded  
 48376 from the set.

48377 The `posix_trace_eventset_fill()` function shall initialize the trace event type set pointed to by the  
 48378 argument `set`, such that the set of trace event types defined by the argument `what` shall be  
 48379 included in the set. The value of the argument `what` shall consist of one of the following values,  
 48380 as defined in the `<trace.h>` header:

48381 **POSIX\_TRACE\_WOPID\_EVENTS**

48382 All the process-independent implementation-defined system trace event types are included  
 48383 in the set.

48384 **POSIX\_TRACE\_SYSTEM\_EVENTS**

48385 All the implementation-defined system trace event types are included in the set, as are those  
 48386 defined in POSIX.1-2008.

48387 **POSIX\_TRACE\_ALL\_EVENTS**

48388 All trace event types defined, both system and user, are included in the set.

48389 Applications shall call either `posix_trace_eventset_empty()` or `posix_trace_eventset_fill()` at least  
 48390 once for each object of type `trace_event_set_t` prior to any other use of that object. If such an  
 48391 object is not initialized in this way, but is nonetheless supplied as an argument to any of the  
 48392 `posix_trace_eventset_add()`, `posix_trace_eventset_del()`, or `posix_trace_eventset_ismember()` functions,  
 48393 the results are undefined.

48394 The `posix_trace_eventset_ismember()` function shall test whether the trace event type specified by  
 48395 the value of the argument `event_id` is a member of the set pointed to by the argument `set`. The  
 48396 value returned in the object pointed to by `ismember` argument is zero if the trace event type  
 48397 identifier is not a member of the set and a value different from zero if it is a member of the set.

**48398 RETURN VALUE**

48399       Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
48400       return the corresponding error number.

**48401 ERRORS**

48402       These functions may fail if:

48403       [EINVAL]       The value of one of the arguments is invalid.

**48404 EXAMPLES**

48405       None.

**48406 APPLICATION USAGE**

48407       None.

**48408 RATIONALE**

48409       None.

**48410 FUTURE DIRECTIONS**

48411       The `posix_trace_eventset_add()`, `posix_trace_eventset_del()`, `posix_trace_eventset_empty()`,  
48412       `posix_trace_eventset_fill()`, and `posix_trace_eventset_ismember()` functions may be removed in a  
48413       future version.

**48414 SEE ALSO**

48416       XBD <[trace.h](#)>

**48417 CHANGE HISTORY**

48418       First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

**48419 Issue 7**

48420       The `posix_trace_eventset_add()`, `posix_trace_eventset_del()`, `posix_trace_eventset_empty()`,  
48421       `posix_trace_eventset_fill()`, and `posix_trace_eventset_ismember()` functions are marked obsolescent.

**posix\_trace\_eventtypelist\_getnext\_id()**

System Interfaces

48422 **NAME**

48423 `posix_trace_eventtypelist_getnext_id`, `posix_trace_eventtypelist_rewind` — iterate over a  
 48424 mapping of trace event types (**TRACING**)

48425 **SYNOPSIS**

```
48426 OB TRC #include <trace.h>
48427
48427 int posix_trace_eventtypelist_getnext_id(trace_id_t trid,
48428     trace_event_id_t *restrict event, int *restrict unavailable);
48429 int posix_trace_eventtypelist_rewind(trace_id_t trid);
```

48430 **DESCRIPTION**

48431 The first time `posix_trace_eventtypelist_getnext_id()` is called, the function shall return in the  
 48432 variable pointed to by `event` the first trace event type identifier of the list of trace events of the  
 48433 trace stream identified by the `trid` argument. Successive calls to  
 48434 `posix_trace_eventtypelist_getnext_id()` return in the variable pointed to by `event` the next trace  
 48435 event type identifier in that same list. Each time a trace event type identifier is successfully  
 48436 written into the variable pointed to by the `event` argument, the variable pointed to by the  
 48437 `unavailable` argument shall be set to zero. When no more trace event type identifiers are available,  
 48438 and so none is returned, the variable pointed to by the `unavailable` argument shall be set to a  
 48439 value different from zero.

48440 The `posix_trace_eventtypelist_rewind()` function shall reset the next trace event type identifier to  
 48441 be read to the first trace event type identifier from the list of trace events used in the trace stream  
 48442 identified by `trid`.

48443 **RETURN VALUE**

48444 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 48445 return the corresponding error number.

48446 The `posix_trace_eventtypelist_getnext_id()` function stores the trace event type identifier value in  
 48447 the object pointed to by `event`, if successful.

48448 **ERRORS**

48449 These functions shall fail if:

48450 [EINVAL] The `trid` argument was not a valid trace stream identifier.

48451 **EXAMPLES**

48452 None.

48453 **APPLICATION USAGE**

48454 None.

48455 **RATIONALE**

48456 None.

48457 **FUTURE DIRECTIONS**

48458 The `posix_trace_eventtypelist_getnext_id()` and `posix_trace_eventtypelist_rewind()` functions may be  
 48459 removed in a future version.

**posix\_trace\_flush()**

System Interfaces

48469 **NAME**48470 `posix_trace_flush` — trace stream flush from a process (**TRACING**)48471 **SYNOPSIS**

```
48472 OB TRC #include <sys/types.h>  
48473 #include <trace.h>  
48474 TRL int posix_trace_flush(trace_id_t trid);
```

48475 **DESCRIPTION**48476 Refer to [posix\\_trace\\_create\(\)](#).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

48477 **NAME**

48478 `posix_trace_get_attr`, `posix_trace_get_status` — retrieve the trace attributes or trace status  
 48479 (TRACING)

48480 **SYNOPSIS**

```
48481 OB TRC #include <trace.h>
48482
48482 int posix_trace_get_attr(trace_id_t trid, trace_attr_t *attr);
48483 int posix_trace_get_status(trace_id_t trid,
48484 struct posix_trace_status_info *statusinfo);
```

48485 **DESCRIPTION**

48486 The `posix_trace_get_attr()` function shall copy the attributes of the active trace stream identified  
 48487 TRL by `trid` into the object pointed to by the `attr` argument. If the Trace Log option is supported, `trid`  
 48488 may represent a pre-recorded trace log.

48489 The `posix_trace_get_status()` function shall return, in the structure pointed to by the `statusinfo`  
 48490 argument, the current trace status for the trace stream identified by the `trid` argument. These  
 48491 status values returned in the structure pointed to by `statusinfo` shall have been appropriately  
 48492 TRL read to ensure that the returned values are consistent. If the Trace Log option is supported and  
 48493 the `trid` argument refers to a pre-recorded trace stream, the status shall be the status of the  
 48494 completed trace stream.

48495 Each time the `posix_trace_get_status()` function is used, the overrun status of the trace stream  
 48496 TRL shall be reset to `POSIX_TRACE_NO_OVERRUN` immediately after the call completes. If the  
 48497 Trace Log option is supported, the `posix_trace_get_status()` function shall behave the same as  
 48498 when the option is not supported except for the following differences:

- 48499 • If the `trid` argument refers to a trace stream with log, each time the `posix_trace_get_status()`  
 48500 function is used, the log overrun status of the trace stream shall be reset to  
 48501 `POSIX_TRACE_NO_OVERRUN` and the `flush_error` status shall be reset to zero  
 48502 immediately after the call completes.
- 48503 • If the `trid` argument refers to a pre-recorded trace stream, the status returned shall be the  
 48504 status of the completed trace stream and the status values of the trace stream shall not be  
 48505 reset.

48506 **RETURN VALUE**

48507 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 48508 return the corresponding error number.

48509 The `posix_trace_get_attr()` function stores the trace attributes in the object pointed to by `attr`, if  
 48510 successful.

48511 The `posix_trace_get_status()` function stores the trace status in the object pointed to by `statusinfo`,  
 48512 if successful.

48513 **ERRORS**

48514 These functions shall fail if:

- 48515 [EINVAL] The trace stream argument `trid` does not correspond to a valid active trace  
 48516 stream or a valid trace log.

**posix\_trace\_get\_attr()**48517 **EXAMPLES**

48518 None.

48519 **APPLICATION USAGE**

48520 None.

48521 **RATIONALE**

48522 None.

48523 **FUTURE DIRECTIONS**48524 The *posix\_trace\_get\_attr()* and *posix\_trace\_get\_status()* functions may be removed in a future  
48525 version.48526 **SEE ALSO**48527 [posix\\_trace\\_attr\\_destroy\(\)](#), [posix\\_trace\\_close\(\)](#), [posix\\_trace\\_create\(\)](#)48528 XBD [<trace.h>](#)48529 **CHANGE HISTORY**

48530 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

48531 IEEE PASC Interpretation 1003.1 #123 is applied.

48532 **Issue 7**48533 The *posix\_trace\_get\_attr()* and *posix\_trace\_get\_status()* functions are marked obsolescent.

48534 **NAME**

48535 `posix_trace_get_filter`, `posix_trace_set_filter` — retrieve and set the filter of an initialized trace  
 48536 stream (**TRACING**)

48537 **SYNOPSIS**

```
48538 OB TRC #include <trace.h>
48539 TEF int posix_trace_get_filter(trace_id_t trid, trace_event_set_t *set);
48540 int posix_trace_set_filter(trace_id_t trid,
48541 const trace_event_set_t *set, int how);
```

48542 **DESCRIPTION**

48543 The `posix_trace_get_filter()` function shall retrieve, into the argument pointed to by `set`, the actual  
 48544 trace event filter from the trace stream specified by `trid`.

48545 The `posix_trace_set_filter()` function shall change the set of filtered trace event types after a trace  
 48546 stream identified by the `trid` argument is created. This function may be called prior to starting  
 48547 the trace stream, or while the trace stream is active. By default, if no call is made to  
 48548 `posix_trace_set_filter()`, all trace events shall be recorded (that is, none of the trace event types are  
 48549 filtered out).

48550 If this function is called while the trace is in progress, a special system trace event,  
 48551 `POSIX_TRACE_FILTER`, shall be recorded in the trace indicating both the old and the new sets  
 48552 of filtered trace event types (see [Table 2-4](#) (on page 537) and [Table 2-6](#), on page 538).

48553 If the `posix_trace_set_filter()` function is interrupted by a signal, an error shall be returned and the  
 48554 filter shall not be changed. In this case, the state of the trace stream shall not be changed.

48555 The value of the argument `how` indicates the manner in which the set is to be changed and shall  
 48556 have one of the following values, as defined in the `<trace.h>` header:

48557 `POSIX_TRACE_SET_EVENTSET`

48558 The resulting set of trace event types to be filtered shall be the trace event type set pointed  
 48559 to by the argument `set`.

48560 `POSIX_TRACE_ADD_EVENTSET`

48561 The resulting set of trace event types to be filtered shall be the union of the current set and  
 48562 the trace event type set pointed to by the argument `set`.

48563 `POSIX_TRACE_SUB_EVENTSET`

48564 The resulting set of trace event types to be filtered shall be all trace event types in the  
 48565 current set that are not in the set pointed to by the argument `set`; that is, remove each  
 48566 element of the specified set from the current filter.

48567 **RETURN VALUE**

48568 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 48569 return the corresponding error number.

48570 The `posix_trace_get_filter()` function stores the set of filtered trace event types in `set`, if successful.

48571 **ERRORS**

48572 These functions shall fail if:

48573 `[EINVAL]` The value of the `trid` argument does not correspond to an active trace stream  
 48574 or the value of the argument pointed to by `set` is invalid.

48575 `[EINTR]` The operation was interrupted by a signal.

**posix\_trace\_getnext\_event()**

System Interfaces

48601 **NAME**

48602 `posix_trace_getnext_event`, `posix_trace_timedgetnext_event`, `posix_trace_trygetnext_event` —  
 48603 retrieve a trace event (**TRACING**)

48604 **SYNOPSIS**

```
48605 OB TRC #include <sys/types.h>
48606 #include <trace.h>

48607 int posix_trace_getnext_event(trace_id_t trid,
48608     struct posix_trace_event_info *restrict event,
48609     void *restrict data, size_t num_bytes,
48610     size_t *restrict data_len, int *restrict unavailable);
48611 int posix_trace_timedgetnext_event(trace_id_t trid,
48612     struct posix_trace_event_info *restrict event,
48613     void *restrict data, size_t num_bytes,
48614     size_t *restrict data_len, int *restrict unavailable,
48615     const struct timespec *restrict abstime);
48616 int posix_trace_trygetnext_event(trace_id_t trid,
48617     struct posix_trace_event_info *restrict event,
48618     void *restrict data, size_t num_bytes,
48619     size_t *restrict data_len, int *restrict unavailable);
```

48620 **DESCRIPTION**

48621 The `posix_trace_getnext_event()` function shall report a recorded trace event either from an active  
 48622 TRL trace stream without log or a pre-recorded trace stream identified by the `trid` argument. The  
 48623 `posix_trace_trygetnext_event()` function shall report a recorded trace event from an active trace  
 48624 stream without log identified by the `trid` argument.

48625 The trace event information associated with the recorded trace event shall be copied by the  
 48626 function into the structure pointed to by the argument `event` and the data associated with the  
 48627 trace event shall be copied into the buffer pointed to by the `data` argument.

48628 The `posix_trace_getnext_event()` function shall block if the `trid` argument identifies an active trace  
 48629 stream and there is currently no trace event ready to be retrieved. When returning, if a recorded  
 48630 trace event was reported, the variable pointed to by the `unavailable` argument shall be set to zero.  
 48631 Otherwise, the variable pointed to by the `unavailable` argument shall be set to a value different  
 48632 from zero.

48633 The `posix_trace_timedgetnext_event()` function shall attempt to get another trace event from an  
 48634 active trace stream without log, as in the `posix_trace_getnext_event()` function. However, if no  
 48635 trace event is available from the trace stream, the implied wait shall be terminated when the  
 48636 timeout specified by the argument `abstime` expires, and the function shall return the error  
 48637 [ETIMEDOUT].

48638 The timeout shall expire when the absolute time specified by `abstime` passes, as measured by the  
 48639 clock upon which timeouts are based (that is, when the value of that clock equals or exceeds  
 48640 `abstime`), or if the absolute time specified by `abstime` has already passed at the time of the call.

48641 The timeout shall be based on the `CLOCK_REALTIME` clock. The resolution of the timeout shall  
 48642 be the resolution of the clock on which it is based. The `timespec` data type is defined in the  
 48643 `<time.h>` header.

48644 Under no circumstance shall the function fail with a timeout if a trace event is immediately  
 48645 available from the trace stream. The validity of the `abstime` argument need not be checked if a  
 48646 trace event is immediately available from the trace stream.

- 48647 The behavior of this function for a pre-recorded trace stream is unspecified.
- 48648 TRL The *posix\_trace\_trygetnext\_event()* function shall not block. This function shall return an error if  
 48649 the *trid* argument identifies a pre-recorded trace stream. If a recorded trace event was reported,  
 48650 the variable pointed to by the *unavailable* argument shall be set to zero. Otherwise, if no trace  
 48651 event was reported, the variable pointed to by the *unavailable* argument shall be set to a value  
 48652 different from zero.
- 48653 The argument *num\_bytes* shall be the size of the buffer pointed to by the *data* argument. The  
 48654 argument *data\_len* reports to the application the length in bytes of the data record just  
 48655 transferred. If *num\_bytes* is greater than or equal to the size of the data associated with the trace  
 48656 event pointed to by the *event* argument, all the recorded data shall be transferred. In this case,  
 48657 the *truncation-status* member of the trace event structure shall be either  
 48658 POSIX\_TRACE\_NOT\_TRUNCATED, if the trace event data was recorded without truncation  
 48659 while tracing, or POSIX\_TRACE\_TRUNCATED\_RECORD, if the trace event data was truncated  
 48660 when it was recorded. If the *num\_bytes* argument is less than the length of recorded trace event  
 48661 data, the data transferred shall be truncated to a length of *num\_bytes*, the value stored in the  
 48662 variable pointed to by *data\_len* shall be equal to *num\_bytes*, and the *truncation-status* member of  
 48663 the *event* structure argument shall be set to POSIX\_TRACE\_TRUNCATED\_READ (see the  
 48664 **posix\_trace\_event\_info** structure defined in <trace.h>).
- 48665 The report of a trace event shall be sequential starting from the oldest recorded trace event. Trace  
 48666 events shall be reported in the order in which they were generated, up to an implementation-  
 48667 defined time resolution that causes the ordering of trace events occurring very close to each  
 48668 other to be unknown. Once reported, a trace event cannot be reported again from an active trace  
 48669 stream. Once a trace event is reported from an active trace stream without log, the trace stream  
 48670 shall make the resources associated with that trace event available to record future generated  
 48671 trace events.
- 48672 **RETURN VALUE**
- 48673 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
 48674 return the corresponding error number.
- 48675 If successful, these functions store:
- 48676 • The recorded trace event in the object pointed to by *event*
  - 48677 • The trace event information associated with the recorded trace event in the object pointed  
 48678 to by *data*
  - 48679 • The length of this trace event information in the object pointed to by *data\_len*
  - 48680 • The value of zero in the object pointed to by *unavailable*
- 48681 **ERRORS**
- 48682 These functions shall fail if:
- 48683 [EINVAL] The trace stream identifier argument *trid* is invalid.
- 48684 The *posix\_trace\_getnext\_event()* and *posix\_trace\_timedgetnext\_event()* functions shall fail if:
- 48685 [EINTR] The operation was interrupted by a signal, and so the call had no effect.
- 48686 The *posix\_trace\_trygetnext\_event()* function shall fail if:
- 48687 [EINVAL] The trace stream identifier argument *trid* does not correspond to an active  
 48688 trace stream.

**posix\_trace\_getnext\_event()**

System Interfaces

48689 The *posix\_trace\_timedgetnext\_event()* function shall fail if:

48690 [EINVAL] There is no trace event immediately available from the trace stream, and the  
48691 *timeout* argument is invalid.

48692 [ETIMEDOUT] No trace event was available from the trace stream before the specified  
48693 *timeout* expired.

48728 **NAME**48729 `posix_trace_shutdown` — trace stream shutdown from a process (TRACING)48730 **SYNOPSIS**

```
48731 OB TRC #include <sys/types.h>  
48732 #include <trace.h>  
48733 int posix_trace_shutdown(trace_id_t trid);
```

48734 **DESCRIPTION**48735 Refer to [posix\\_trace\\_create\(\)](#).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**posix\_trace\_start()**48736 **NAME**48737            **posix\_trace\_start, posix\_trace\_stop** — trace start and stop (**TRACING**)48738 **SYNOPSIS**

```
48739 OB TRC #include <trace.h>
48740
48740 int posix_trace_start(trace_id_t trid);
48741 int posix_trace_stop (trace_id_t trid);
```

48742 **DESCRIPTION**

48743        The *posix\_trace\_start()* and *posix\_trace\_stop()* functions, respectively, shall start and stop the trace  
48744 stream identified by the argument *trid*.

48745        The effect of calling the *posix\_trace\_start()* function shall be recorded in the trace stream as the  
48746 POSIX\_TRACE\_START system trace event and the status of the trace stream shall become  
48747 POSIX\_TRACE\_RUNNING. If the trace stream is in progress when this function is called, the  
48748 POSIX\_TRACE\_START system trace event shall not be recorded and the trace stream shall  
48749 continue to run. If the trace stream is full, the POSIX\_TRACE\_START system trace event shall  
48750 not be recorded and the status of the trace stream shall not be changed.

48751        The effect of calling the *posix\_trace\_stop()* function shall be recorded in the trace stream as the  
48752 POSIX\_TRACE\_STOP system trace event and the status of the trace stream shall become  
48753 POSIX\_TRACE\_SUSPENDED. If the trace stream is suspended when this function is called, the  
48754 POSIX\_TRACE\_STOP system trace event shall not be recorded and the trace stream shall remain  
48755 suspended. If the trace stream is full, the POSIX\_TRACE\_STOP system trace event shall not be  
48756 recorded and the status of the trace stream shall not be changed.

48757 **RETURN VALUE**

48758        Upon successful completion, these functions shall return a value of zero. Otherwise, they shall  
48759 return the corresponding error number.

48760 **ERRORS**

48761        These functions shall fail if:

48762        [EINVAL]        The value of the argument *trid* does not correspond to an active trace stream  
48763 and thus no trace stream was started or stopped.

48764        [EINTR]        The operation was interrupted by a signal and thus the trace stream was not  
48765 necessarily started or stopped.

48766 **EXAMPLES**

48767        None.

48768 **APPLICATION USAGE**

48769        None.

48770 **RATIONALE**

**posix\_trace\_trygetnext\_event()**

System Interfaces

48803 **NAME**48804 `posix_trace_trygetnext_event` — retrieve a trace event (**TRACING**)48805 **SYNOPSIS**

```
48806 OB TRC #include <sys/types.h>
48807 #include <trace.h>

48808 int posix_trace_trygetnext_event(trace_id_t trid,
48809 struct posix_trace_event_info *restrict event,
48810 void *restrict data, size_t num_bytes,
48811 size_t *restrict data_len, int *restrict unavailable);
```

48812 **DESCRIPTION**48813 Refer to [posix\\_trace\\_getnext\\_event\(\)](#).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

48814 **NAME**48815 `posix_typed_mem_get_info` — query typed memory information (**ADVANCED REALTIME**)48816 **SYNOPSIS**

```
48817 TYM      #include <sys/mman.h>
48818
48818      int posix_typed_mem_get_info(int fildes,
48819      struct posix_typed_mem_info *info);
```

48820 **DESCRIPTION**

48821 The `posix_typed_mem_get_info()` function shall return, in the `posix_tmi_length` field of the  
 48822 **posix\_typed\_mem\_info** structure pointed to by `info`, the maximum length which may be  
 48823 successfully allocated by the typed memory object designated by `fildes`. This maximum length  
 48824 shall take into account the flag `POSIX_TYPED_MEM_ALLOCATE` or  
 48825 `POSIX_TYPED_MEM_ALLOCATE_CONTIG` specified when the typed memory object  
 48826 represented by `fildes` was opened. The maximum length is dynamic; therefore, the value  
 48827 returned is valid only while the current mapping of the corresponding typed memory pool  
 48828 remains unchanged.

48829 If `fildes` represents a typed memory object opened with neither the  
 48830 `POSIX_TYPED_MEM_ALLOCATE` flag nor the `POSIX_TYPED_MEM_ALLOCATE_CONTIG`  
 48831 flag specified, the returned value of `info->posix_tmi_length` is unspecified.

48832 The `posix_typed_mem_get_info()` function may return additional implementation-defined  
 48833 information in other fields of the **posix\_typed\_mem\_info** structure pointed to by `info`.

48834 If the memory object specified by `fildes` is not a typed memory object, then the behavior of this  
 48835 function is undefined.

48836 **RETURN VALUE**

48837 Upon successful completion, the `posix_typed_mem_get_info()` function shall return zero;  
 48838 otherwise, the corresponding error status value shall be returned.

48839 **ERRORS**

48840 The `posix_typed_mem_get_info()` function shall fail if:

48841 [EBADF] The `fildes` argument is not a valid open file descriptor.

48842 [ENODEV] The `fildes` argument is not connected to a memory object supported by this  
 48843 function.

48844 This function shall not return an error code of [EINTR].

48845 **EXAMPLES**

48846 None.

48847 **APPLICATION USAGE**

48848 None.

48849 **RATIONALE**

48850 An application that needs to allocate a block of typed memory with length dependent upon the  
 48851 amount of memory currently available must either query the typed memory object to obtain the  
 48852 amount available, or repeatedly invoke `mmap()` attempting to guess an appropriate length.  
 48853 While the latter method is existing practice with `malloc()`, it is awkward and imprecise. The  
 48854 `posix_typed_mem_get_info()` function allows an application to immediately determine available  
 48855 memory. This is particularly important for typed memory objects that may in some cases be  
 48856 scarce resources. Note that when a typed memory pool is a shared resource, some form of  
 48857 mutual-exclusion or synchronization may be required while typed memory is being queried and

**posix\_typed\_mem\_get\_info()**

System Interfaces

48858 allocated to prevent race conditions.

48859 The existing *fstat()* function is not suitable for this purpose. We realize that implementations  
48860 may wish to provide other attributes of typed memory objects (for example, alignment  
48861 requirements, page size, and so on). The *fstat()* function returns a structure which is not  
48862 extensible and, furthermore, contains substantial information that is inappropriate for typed  
48863 memory objects.

**48864 FUTURE DIRECTIONS**

48865 None.

**48866 SEE ALSO**

48867 *fstat()*, *mmap()*, *posix\_typed\_mem\_open()*

48868 XBD <sys/mman.h>

**48869 CHANGE HISTORY**

48870 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

48871 **NAME**

48872 posix\_typed\_mem\_open — open a typed memory object (ADVANCED REALTIME)

48873 **SYNOPSIS**

```
48874 TYM #include <sys/mman.h>
48875 int posix_typed_mem_open(const char *name, int oflag, int tflag);
```

48876 **DESCRIPTION**

48877 The *posix\_typed\_mem\_open()* function shall establish a connection between the typed memory  
 48878 object specified by the string pointed to by *name* and a file descriptor. It shall create an open file  
 48879 description that refers to the typed memory object and a file descriptor that refers to that open  
 48880 file description. The file descriptor is used by other functions to refer to that typed memory  
 48881 object. It is unspecified whether the name appears in the file system and is visible to other  
 48882 functions that take pathnames as arguments. The *name* argument conforms to the construction  
 48883 rules for a pathname, except that the interpretation of <slash> characters other than the leading  
 48884 <slash> character in *name* is implementation-defined, and that the length limits for the *name*  
 48885 argument are implementation-defined and need not be the same as the pathname limits  
 48886 {PATH\_MAX} and {NAME\_MAX}. If *name* begins with the <slash> character, then processes  
 48887 calling *posix\_typed\_mem\_open()* with the same value of *name* shall refer to the same typed  
 48888 memory object. If *name* does not begin with the <slash> character, the effect is implementation-  
 48889 defined.

48890 Each typed memory object supported in a system shall be identified by a name which specifies  
 48891 not only its associated typed memory pool, but also the path or port by which it is accessed. That  
 48892 is, the same typed memory pool accessed via several different ports shall have several different  
 48893 corresponding names. The binding between names and typed memory objects is established in  
 48894 an implementation-defined manner. Unlike shared memory objects, there is no way within  
 48895 POSIX.1-2008 for a program to create a typed memory object.

48896 The value of *tflag* shall determine how the typed memory object behaves when subsequently  
 48897 mapped by calls to *mmap()*. At most, one of the following flags defined in <sys/mman.h> may  
 48898 be specified:

48899 POSIX\_TYPED\_MEM\_ALLOCATE

48900 Allocate on *mmap()*.

48901 POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG

48902 Allocate contiguously on *mmap()*.

48903 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE

48904 Map on *mmap()*, without affecting allocatability.

48905 If *tflag* has the flag POSIX\_TYPED\_MEM\_ALLOCATE specified, any subsequent call to *mmap()*  
 48906 using the returned file descriptor shall result in allocation and mapping of typed memory from  
 48907 the specified typed memory pool. The allocated memory may be a contiguous previously  
 48908 unallocated area of the typed memory pool or several non-contiguous previously unallocated  
 48909 areas (mapped to a contiguous portion of the process address space). If *tflag* has the flag  
 48910 POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG specified, any subsequent call to *mmap()* using the  
 48911 returned file descriptor shall result in allocation and mapping of a single contiguous previously  
 48912 unallocated area of the typed memory pool (also mapped to a contiguous portion of the process  
 48913 address space). If *tflag* has none of the flags POSIX\_TYPED\_MEM\_ALLOCATE or  
 48914 POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG specified, any subsequent call to *mmap()* using the  
 48915 returned file descriptor shall map an application-chosen area from the specified typed memory  
 48916 pool such that this mapped area becomes unavailable for allocation until unmapped by all  
 48917 processes. If *tflag* has the flag POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE specified, any

**posix\_typed\_mem\_open()**

48918 subsequent call to *mmap()* using the returned file descriptor shall map an application-chosen  
 48919 area from the specified typed memory pool without an effect on the availability of that area for  
 48920 allocation; that is, mapping such an object leaves each byte of the mapped area unallocated if it  
 48921 was unallocated prior to the mapping or allocated if it was allocated prior to the mapping.  
 48922 Appropriate privileges to specify the POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flag are  
 48923 implementation-defined.

48924 If successful, *posix\_typed\_mem\_open()* shall return a file descriptor for the typed memory object  
 48925 that is the lowest numbered file descriptor not currently open for that process. The open file  
 48926 description is new, and therefore the file descriptor shall not share it with any other processes. It  
 48927 is unspecified whether the file offset is set. The FD\_CLOEXEC file descriptor flag associated  
 48928 with the new file descriptor shall be cleared.

48929 The behavior of *msync()*, *ftruncate()*, and all file operations other than *mmap()*,  
 48930 *posix\_mem\_offset()*, *posix\_typed\_mem\_get\_info()*, *fstat()*, *dup()*, *dup2()*, and *close()*, is unspecified  
 48931 when passed a file descriptor connected to a typed memory object by this function.

48932 The file status flags of the open file description shall be set according to the value of *oflag*.  
 48933 Applications shall specify exactly one of the three access mode values described below and  
 48934 defined in the `<fcntl.h>` header, as the value of *oflag*.

48935 O\_RDONLY Open for read access only.

48936 O\_WRONLY Open for write access only.

48937 O\_RDWR Open for read or write access.

**RETURN VALUE**

48938 Upon successful completion, the *posix\_typed\_mem\_open()* function shall return a non-negative  
 48939 integer representing the lowest numbered unused file descriptor. Otherwise, it shall return `-1`  
 48940 and set *errno* to indicate the error.  
 48941

**ERRORS**

48942 The *posix\_typed\_mem\_open()* function shall fail if:

48943 [EACCES] The typed memory object exists and the permissions specified by *oflag* are  
 48944 denied.

48945 [EINTR] The *posix\_typed\_mem\_open()* operation was interrupted by a signal.

48946 [EINVAL] The flags specified in *tflag* are invalid (more than one of  
 48947 POSIX\_TYPED\_MEM\_ALLOCATE,  
 48948 POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG, or  
 48949 POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE is specified).  
 48950

48951 [EMFILE] All file descriptors available to the process are currently open.

48952 [ENAMETOOLONG]

48953 The length of the *name* argument exceeds `{_POSIX_PATH_MAX}` on systems  
 48954 XSI that do not support the XSI option or exceeds `{_XOPEN_PATH_MAX}` on XSI  
 48955 systems, or has a pathname component that is longer than  
 48956 XSI `{_POSIX_NAME_MAX}` on systems that do not support the XSI option or  
 48957 longer than `{_XOPEN_NAME_MAX}` on XSI systems.

48958 [ENFILE] Too many file descriptors are currently open in the system.

48959 [ENOENT] The named typed memory object does not exist.

48960 [E`PERM`] The caller lacks appropriate privileges to specify the  
 48961 `POSIX_TYPED_MEM_MAP_ALLOCATABLE` flag in the *tflag* argument.

**pow()**48978 **NAME**48979 `pow, powf, powl` — power function48980 **SYNOPSIS**48981 `#include <math.h>`48982 `double pow(double x, double y);`48983 `float powf(float x, float y);`48984 `long double powl(long double x, long double y);`48985 **DESCRIPTION**48986 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
48987 conflict between the requirements described here and the ISO C standard is unintentional. This  
48988 volume of POSIX.1-2008 defers to the ISO C standard.48989 These functions shall compute the value of  $x$  raised to the power  $y$ ,  $x^y$ . If  $x$  is negative, the  
48990 application shall ensure that  $y$  is an integer value.48991 An application wishing to check for error situations should set *errno* to zero and call  
48992 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
48993 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
48994 zero, an error has occurred.48995 **RETURN VALUE**48996 Upon successful completion, these functions shall return the value of  $x$  raised to the power  $y$ .48997 **MX** For finite values of  $x < 0$ , and finite non-integer values of  $y$ , a domain error shall occur and  
48998 either a NaN (if representable), or an implementation-defined value shall be returned.48999 If the correct value would cause overflow, a range error shall occur and *pow()*, *powf()*, and  
49000 *powl()* shall return  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL, respectively, with the  
49001 same sign as the correct value of the function.49002 If the correct value would cause underflow, and is not representable, a range error may occur,  
49003 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.49004 **CX** For  $y < 0$ , if  $x$  is zero, a pole error may occur and *pow()*, *powf()*, and *powl()* shall return  
49005 **MX**  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL, respectively. On systems that support the  
49006 IEC 60559 Floating-Point option, a pole error shall occur and *pow()*, *powf()*, and *powl()* shall  
49007 return  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL, respectively if  $y$  is an odd integer, or  
49008 HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively if  $y$  is not an odd integer.49009 **MX** If  $x$  or  $y$  is a NaN, a NaN shall be returned (unless specified elsewhere in this description).49010 For any value of  $y$  (including NaN), if  $x$  is +1, 1.0 shall be returned.49011 For any value of  $x$  (including NaN), if  $y$  is  $\pm 0$ , 1.0 shall be returned.49012 For any odd integer value of  $y > 0$ , if  $x$  is  $\pm 0$ ,  $\pm 0$  shall be returned.49013 For  $y > 0$  and not an odd integer, if  $x$  is  $\pm 0$ , +0 shall be returned.49014 If  $x$  is  $-1$ , and  $y$  is  $\pm$ Inf, 1.0 shall be returned.49015 For  $|x| < 1$ , if  $y$  is  $-$ Inf, +Inf shall be returned.49016 For  $|x| > 1$ , if  $y$  is  $-$ Inf, +0 shall be returned.49017 For  $|x| < 1$ , if  $y$  is +Inf, +0 shall be returned.49018 For  $|x| > 1$ , if  $y$  is +Inf, +Inf shall be returned.49019 For  $y$  an odd integer  $< 0$ , if  $x$  is  $-$ Inf,  $-0$  shall be returned.

49020		For $y < 0$ and not an odd integer, if $x$ is $-\text{Inf}$ , $+0$ shall be returned.
49021		For $y$ an odd integer $> 0$ , if $x$ is $-\text{Inf}$ , $-\text{Inf}$ shall be returned.
49022		For $y > 0$ and not an odd integer, if $x$ is $-\text{Inf}$ , $+\text{Inf}$ shall be returned.
49023		For $y < 0$ , if $x$ is $+\text{Inf}$ , $+0$ shall be returned.
49024		For $y > 0$ , if $x$ is $+\text{Inf}$ , $+\text{Inf}$ shall be returned.
49025		If the correct value would cause underflow, and is representable, a range error may occur and
49026		the correct value shall be returned.
49027	<b>ERRORS</b>	
49028		These functions shall fail if:
49029	Domain Error	The value of $x$ is negative and $y$ is a finite non-integer.
49030		If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
49031		then <i>errno</i> shall be set to [EDOM]. If the integer expression ( <i>math_errhandling</i>
49032		& MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
49033		shall be raised.
49034	MX Pole Error	The value of $x$ is zero and $y$ is negative.
49035		If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
49036		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
49037		( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
49038		floating-point exception shall be raised.
49039	Range Error	The result overflows.
49040		If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
49041		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
49042		( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the overflow
49043		floating-point exception shall be raised.
49044		These functions may fail if:
49045	Pole Error	The value of $x$ is zero and $y$ is negative.
49046		If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
49047		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
49048		( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
49049		floating-point exception shall be raised.
49050	Range Error	The result underflows.
49051		If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
49052		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
49053		( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the underflow
49054		floating-point exception shall be raised.

**pow()**49055 **EXAMPLES**

49056 None.

49057 **APPLICATION USAGE**49058 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
49059 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.49060 **RATIONALE**

49061 None.

49062 **FUTURE DIRECTIONS**

49110 void FD_SET(int fd, fd_set *fdset);
49111 void FD_ZERO(fd_set *fdset);

```

49112 **DESCRIPTION**

49113 The *pselect()* function shall examine the file descriptor sets whose addresses are passed in the  
 49114 *readfds*, *writefds*, and *errorfds* parameters to see whether some of their descriptors are ready for  
 49115 reading, are ready for writing, or have an exceptional condition pending, respectively.

49116 The *select()* function shall be equivalent to the *pselect()* function, except as follows:

- 49117 • For the *select()* function, the timeout period is given in seconds and microseconds in an  
 49118 argument of type **struct timeval**, whereas for the *pselect()* function the timeout period is  
 49119 given in seconds and nanoseconds in an argument of type **struct timespec**.
- 49120 • The *select()* function has no *sigmask* argument; it shall behave as *pselect()* does when  
 49121 *sigmask* is a null pointer.
- 49122 • Upon successful completion, the *select()* function may modify the object pointed to by the  
 49123 *timeout* argument.

49124 The *pselect()* and *select()* functions shall support regular files, terminal and pseudo-terminal  
 49125 OB XSR devices, **STREAMS-based files**, FIFOs, pipes, and sockets. The behavior of *pselect()* and *select()*  
 49126 on file descriptors that refer to other types of file is unspecified.

49127 The *nfd* argument specifies the range of descriptors to be tested. The first *nfd* descriptors shall  
 49128 be checked in each set; that is, the descriptors from zero through *nfd*–1 in the descriptor sets  
 49129 shall be examined.

49130 If the *readfds* argument is not a null pointer, it points to an object of type **fd\_set** that on input  
 49131 specifies the file descriptors to be checked for being ready to read, and on output indicates  
 49132 which file descriptors are ready to read.

49133 If the *writefds* argument is not a null pointer, it points to an object of type **fd\_set** that on input  
 49134 specifies the file descriptors to be checked for being ready to write, and on output indicates  
 49135 which file descriptors are ready to write.

49136 If the *errorfds* argument is not a null pointer, it points to an object of type **fd\_set** that on input  
 49137 specifies the file descriptors to be checked for error conditions pending, and on output indicates  
 49138 which file descriptors have error conditions pending.

49139 Upon successful completion, the *pselect()* or *select()* function shall modify the objects pointed to  
 49140 by the *readfds*, *writefds*, and *errorfds* arguments to indicate which file descriptors are ready for  
 49141 reading, ready for writing, or have an error condition pending, respectively, and shall return the  
 49142 total number of ready descriptors in all the output sets. For each file descriptor less than *nfd*, the

**pselect()**

49143 corresponding bit shall be set upon successful completion if it was set on input and the  
49144 associated condition is true for that file descriptor.

49145 If none of the selected descriptors are ready for the requested operation, the *pselect()* or *select()*  
49146 function shall block until at least one of the requested operations becomes ready, until the  
49147 *timeout* occurs, or until interrupted by a signal. The *timeout* parameter controls how long the  
49148 *pselect()* or *select()* function shall take before timing out. If the *timeout* parameter is not a null  
49149 pointer, it specifies a maximum interval to wait for the selection to complete. If the specified  
49150 time interval expires without any requested operation becoming ready, the function shall return.  
49151 If the *timeout* parameter is a null pointer, then the call to *pselect()* or *select()* shall block  
49152 indefinitely until at least one descriptor meets the specified criteria. To effect a poll, the *timeout*  
49153 parameter should not be a null pointer, and should point to a zero-valued **timespec** structure.

49154 The use of a timeout does not affect any pending timers set up by *alarm()* or *settimer()*.

49155 Implementations may place limitations on the maximum timeout interval supported. All  
49156 implementations shall support a maximum timeout interval of at least 31 days. If the *timeout*  
49157 argument specifies a timeout interval greater than the implementation-defined maximum value,  
49158 the maximum value shall be used as the actual timeout value. Implementations may also place  
49159 limitations on the granularity of timeout intervals. If the requested timeout interval requires a  
49160 finer granularity than the implementation supports, the actual timeout interval shall be rounded  
49161 up to the next supported value.

49162 If *sigmask* is not a null pointer, then the *pselect()* function shall replace the signal mask of the  
49163 caller by the set of signals pointed to by *sigmask* before examining the descriptors, and shall  
49164 restore the signal mask of the calling thread before returning.

49165 A descriptor shall be considered ready for reading when a call to an input function with  
49166 O\_NONBLOCK clear would not block, whether or not the function would transfer data  
49167 successfully. (The function might return data, an end-of-file indication, or an error other than  
49168 one indicating that it is blocked, and in each of these cases the descriptor shall be considered  
49169 ready for reading.)

49170 A descriptor shall be considered ready for writing when a call to an output function with  
49171 O\_NONBLOCK clear would not block, whether or not the function would transfer data  
49172 successfully.

49173 If a socket has a pending error, it shall be considered to have an exceptional condition pending.  
49174 Otherwise, what constitutes an exceptional condition is file type-specific. For a file descriptor for  
49175 use with a socket, it is protocol-specific except as noted below. For other file types it is  
49176 implementation-defined. If the operation is meaningless for a particular file type, *pselect()* or  
49177 *select()* shall indicate that the descriptor is ready for read or write operations, and shall indicate  
49178 that the descriptor has no exceptional condition pending.

49179 If a descriptor refers to a socket, the implied input function is the *recvmsg()* function with  
49180 parameters requesting normal and ancillary data, such that the presence of either type shall  
49181 cause the socket to be marked as readable. The presence of out-of-band data shall be checked if  
49182 the socket option SO\_OOBINLINE has been enabled, as out-of-band data is enqueued with  
49183 normal data. If the socket is currently listening, then it shall be marked as readable if an  
49184 incoming connection request has been received, and a call to the *accept()* function shall complete  
49185 without blocking.

49186 If a descriptor refers to a socket, the implied output function is the *sendmsg()* function supplying  
49187 an amount of normal data equal to the current value of the SO\_SNDLOWAT option for the  
49188 socket. If a non-blocking call to the *connect()* function has been made for a socket, and the  
49189 connection attempt has either succeeded or failed leaving a pending error, the socket shall be

49190 marked as writable.

49191 A socket shall be considered to have an exceptional condition pending if a receive operation  
49192 with `O_NONBLOCK` clear for the open file description and with the `MSG_OOB` flag set would  
49193 return out-of-band data without blocking. (It is protocol-specific whether the `MSG_OOB` flag  
49194 would be used to read out-of-band data.) A socket shall also be considered to have an  
49195 exceptional condition pending if an out-of-band data mark is present in the receive queue. Other  
49196 circumstances under which a socket may be considered to have an exceptional condition  
49197 pending are protocol-specific and implementation-defined.

49198 If the `readfds`, `writefds`, and `errorfds` arguments are all null pointers and the `timeout` argument is  
49199 not a null pointer, the `pselect()` or `select()` function shall block for the time specified, or until  
49200 interrupted by a signal. If the `readfds`, `writefds`, and `errorfds` arguments are all null pointers and  
49201 the `timeout` argument is a null pointer, the `pselect()` or `select()` function shall block until  
49202 interrupted by a signal.

49203 File descriptors associated with regular files shall always select true for ready to read, ready to  
49204 write, and error conditions.

49205 On failure, the objects pointed to by the `readfds`, `writefds`, and `errorfds` arguments shall not be  
49206 modified. If the timeout interval expires without the specified condition being true for any of the  
49207 specified file descriptors, the objects pointed to by the `readfds`, `writefds`, and `errorfds` arguments  
49208 shall have all bits set to 0.

49209 File descriptor masks of type `fd_set` can be initialized and tested with `FD_CLR()`, `FD_ISSET()`,  
49210 `FD_SET()`, and `FD_ZERO()`. It is unspecified whether each of these is a macro or a function. If a  
49211 macro definition is suppressed in order to access an actual function, or a program defines an  
49212 external identifier with any of these names, the behavior is undefined.

49213 `FD_CLR(fd, fdsetp)` shall remove the file descriptor `fd` from the set pointed to by `fdsetp`. If `fd` is not  
49214 a member of this set, there shall be no effect on the set, nor will an error be returned.

49215 `FD_ISSET(fd, fdsetp)` shall evaluate to non-zero if the file descriptor `fd` is a member of the set  
49216 pointed to by `fdsetp`, and shall evaluate to zero otherwise.

49217 `FD_SET(fd, fdsetp)` shall add the file descriptor `fd` to the set pointed to by `fdsetp`. If the file  
49218 descriptor `fd` is already in this set, there shall be no effect on the set, nor will an error be  
49219 returned.

49220 `FD_ZERO(fdsetp)` shall initialize the descriptor set pointed to by `fdsetp` to the null set. No error is  
49221 returned if the set is not empty at the time `FD_ZERO()` is invoked.

49222 The behavior of these macros is undefined if the `fd` argument is less than 0 or greater than or  
49223 equal to `FD_SETSIZE`, or if `fd` is not a valid file descriptor, or if any of the arguments are  
49224 expressions with side-effects.

49225 If a thread gets canceled during a `pselect()` call, the signal mask in effect when executing the  
49226 registered cleanup functions is either the original signal mask or the signal mask installed as part  
49227 of the `pselect()` call.

#### 49228 RETURN VALUE

49229 Upon successful completion, the `pselect()` and `select()` functions shall return the total number of  
49230 bits set in the bit masks. Otherwise, `-1` shall be returned, and `errno` shall be set to indicate the  
49231 error.

49232 `FD_CLR()`, `FD_SET()`, and `FD_ZERO()` do not return a value. `FD_ISSET()` shall return a non-  
49233 zero value if the bit for the file descriptor `fd` is set in the file descriptor set pointed to by `fdset`, and  
49234 0 otherwise.

**pselect()**49235 **ERRORS**

49236 Under the following conditions, *pselect()* and *select()* shall fail and set *errno* to:

- 49237 [EBADF] One or more of the file descriptor sets specified a file descriptor that is not a  
49238 valid open file descriptor.
- 49239 [EINTR] The function was interrupted before any of the selected events occurred and  
49240 before the timeout interval expired.
- 49241 XSI If SA\_RESTART has been set for the interrupting signal, it is implementation-  
49242 defined whether the function restarts or returns with [EINTR].
- 49243 [EINVAL] An invalid timeout interval was specified.
- 49244 [EINVAL] The *nfds* argument is less than 0 or greater than FD\_SETSIZE.
- 49245 OB XSR [EINVAL] One of the specified file descriptors refers to a STREAM or multiplexer that is  
49246 linked (directly or indirectly) downstream from a multiplexer.

49247 **EXAMPLES**

49248 None.

49249 **APPLICATION USAGE**

49250 None.

49251 **RATIONALE**

49252 In earlier versions of the Single UNIX Specification, the *select()* function was defined in the  
49253 `<sys/time.h>` header. This is now changed to `<sys/select.h>`. The rationale for this change was  
49254 as follows: the introduction of the *pselect()* function included the `<sys/select.h>` header and the  
49255 `<sys/select.h>` header defines all the related definitions for the *pselect()* and *select()* functions.  
49256 Backwards-compatibility to existing XSI implementations is handled by allowing `<sys/time.h>`  
49257 to include `<sys/select.h>`.

49258 Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers  
49259 can install an additional cancellation handler which resets the signal mask to the expected value.

```

49260 void cleanup(void *arg)
49261 {
49262     sigset_t *ss = (sigset_t *) arg;
49263     pthread_sigmask(SIG_SETMASK, ss, NULL);
49264 }
49265 int call_pselect(int nfds, fd_set *readfds, fd_set *writefds,
49266                fd_set errorfds, const struct timespec *timeout,
49267                const sigset_t *sigmask)
49268 {
49269     sigset_t oldmask;
49270     int result;
49271     pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
49272     pthread_cleanup_push(cleanup, &oldmask);
49273     result = pselect(nfds, readfds, writefds, errorfds, timeout, sigmask);
49274     pthread_cleanup_pop(0);
49275     return result;
49276 }

```

49277 **FUTURE DIRECTIONS**

49278 None.

49279 **SEE ALSO**49280 *accept()*, *alarm()*, *connect()*, *fcntl()*, *getitimer()*, *poll()*, *read()*, *recvmsg()*, *sendmsg()*, *write()*49281 XBD [<sys/select.h>](#), [<sys/time.h>](#)49282 **CHANGE HISTORY**

49283 First released in Issue 4, Version 2.

49284 **Issue 5**

49285 Moved from X/OPEN UNIX extension to BASE.

49286 In the ERRORS section, the text has been changed to indicate that [EINVAL] is returned when  
 49287 *nfds* is less than 0 or greater than FD\_SETSIZE. It previously stated less than 0, or greater than or  
 49288 equal to FD\_SETSIZE.

49289 Text about *timeout* is moved from the APPLICATION USAGE section to the DESCRIPTION.49290 **Issue 6**49291 The Open Group Corrigendum U026/6 is applied, changing the occurrences of *readfs* and *writefs*  
 49292 in the *select()* DESCRIPTION to be *readfds* and *writefds*.

49293 Text referring to sockets is added to the DESCRIPTION.

49294 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are  
 49295 marked as part of the XSI STREAMS Option Group.49296 The following new requirements on POSIX implementations derive from alignment with the  
 49297 Single UNIX Specification:

- 49298
- These functions are now mandatory.

49299 The *pselect()* function is added for alignment with IEEE Std 1003.1g-2000 and additional detail  
 49300 related to sockets semantics is added to the DESCRIPTION.49301 The *select()* function now requires inclusion of [<sys/select.h>](#).49302 The **restrict** keyword is added to the *select()* prototype for alignment with the  
 49303 ISO/IEC 9899:1999 standard.49304 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/70 is applied, updating the  
 49305 DESCRIPTION to reference the signal mask in terms of the calling thread rather than the  
 49306 process.49307 **Issue 7**49308 SD5-XSH-ERN-122 is applied, adding text to the DESCRIPTION for when a thread is canceled  
 49309 during a call to *pselect()*, and adding example code to the RATIONALE.

49310 Functionality relating to the XSI STREAMS option is marked obsolescent.

49311 Functionality relating to the Threads option is moved to the Base.

**psiginfo()**49312 **NAME**

49313           psiginfo, psignal — print signal information to standard error

49314 **SYNOPSIS**

```
49315 CX       #include <signal.h>
49316       void psiginfo(const siginfo_t *pinfo, const char *message);
49317       void psignal(int signum, const char *message);
```

49318 **DESCRIPTION**

49319       The *psiginfo()* and *psignal()* functions shall print a message out on *stderr* associated with a signal  
49320       number. If *message* is not null and is not the empty string, then the string pointed to by the  
49321       *message* argument shall be printed first, followed by a <colon>, a <space>, and the signal  
49322       description string indicated by *signum*, or by the signal associated with *pinfo*. If the *message*  
49323       argument is null or points to an empty string, then only the signal description shall be printed.  
49324       For *psiginfo()*, the argument *pinfo* references a valid **siginfo\_t** structure. For *psignal()*, if *signum* is  
49325       not a valid signal number, the behavior is implementation-defined.

49326       The *psiginfo()* and *psignal()* functions shall not change the orientation of the standard error  
49327       stream.

49328       The *psiginfo()* and *psignal()* functions shall mark for update the last data modification and last  
49329       file status change timestamps of the file associated with the standard error stream at some time  
49330       between their successful completion and *exit()*, *abort()*, or the completion of *fflush()* or *fclose()*  
49331       on *stderr*.

49332 **RETURN VALUE**

49333       These functions shall not return a value.

49334 **ERRORS**

49335       No errors are defined.

49336 **EXAMPLES**

49337       None.

49338 **APPLICATION USAGE**

49339       None.

49340 **RATIONALE**

49341       System V historically has *psignal()* and *psiginfo()* in <**siginfo.h**>. However, the <**siginfo.h**>  
49342       header is not specified in the Base Definitions volume of POSIX.1-2008, and the type **siginfo\_t** is  
49343       defined in <**signal.h**>.

49344 **FUTURE DIRECTIONS**

49345       None.

49346 **SEE ALSO**49347       *perorr()*, *strsignal()*49348       XBD <**signal.h**>49349 **CHANGE HISTORY**

49350       First released in Issue 7.

49351 **NAME**

49352 pthread\_atfork — register fork handlers

49353 **SYNOPSIS**

49354 #include &lt;pthread.h&gt;

49355 int pthread\_atfork(void (\*prepare)(void), void (\*parent)(void),  
49356 void (\*child)(void));49357 **DESCRIPTION**

49358 The *pthread\_atfork()* function shall declare fork handlers to be called before and after *fork()*, in  
 49359 the context of the thread that called *fork()*. The *prepare* fork handler shall be called before *fork()*  
 49360 processing commences. The *parent* fork handle shall be called after *fork()* processing completes  
 49361 in the parent process. The *child* fork handler shall be called after *fork()* processing completes in  
 49362 the child process. If no handling is desired at one or more of these three points, the  
 49363 corresponding fork handler address(es) may be set to NULL.

49364 The order of calls to *pthread\_atfork()* is significant. The *parent* and *child* fork handlers shall be  
 49365 called in the order in which they were established by calls to *pthread\_atfork()*. The *prepare* fork  
 49366 handlers shall be called in the opposite order.

49367 **RETURN VALUE**

49368 Upon successful completion, *pthread\_atfork()* shall return a value of zero; otherwise, an error  
 49369 number shall be returned to indicate the error.

49370 **ERRORS**49371 The *pthread\_atfork()* function shall fail if:

49372 [ENOMEM] Insufficient table space exists to record the fork handler addresses.

49373 The *pthread\_atfork()* function shall not return an error code of [EINTR].49374 **EXAMPLES**

49375 None.

49376 **APPLICATION USAGE**

49377 None.

49378 **RATIONALE**

49379 There are at least two serious problems with the semantics of *fork()* in a multi-threaded  
 49380 program. One problem has to do with state (for example, memory) covered by mutexes.  
 49381 Consider the case where one thread has a mutex locked and the state covered by that mutex is  
 49382 inconsistent while another thread calls *fork()*. In the child, the mutex is in the locked state  
 49383 (locked by a nonexistent thread and thus can never be unlocked). Having the child simply  
 49384 reinitialize the mutex is unsatisfactory since this approach does not resolve the question about  
 49385 how to correct or otherwise deal with the inconsistent state in the child.

49386 It is suggested that programs that use *fork()* call an *exec* function very soon afterwards in the  
 49387 child process, thus resetting all states. In the meantime, only a short list of async-signal-safe  
 49388 library routines are promised to be available.

49389 Unfortunately, this solution does not address the needs of multi-threaded libraries. Application  
 49390 programs may not be aware that a multi-threaded library is in use, and they feel free to call any  
 49391 number of library routines between the *fork()* and *exec* calls, just as they always have. Indeed,  
 49392 they may be extant single-threaded programs and cannot, therefore, be expected to obey new  
 49393 restrictions imposed by the threads library.

49394 On the other hand, the multi-threaded library needs a way to protect its internal state during  
 49395 *fork()* in case it is re-entered later in the child process. The problem arises especially in multi-

**pthread\_atfork()**

49396 threaded I/O libraries, which are almost sure to be invoked between the *fork()* and *exec* calls to  
49397 effect I/O redirection. The solution may require locking mutex variables during *fork()*, or it may  
49398 entail simply resetting the state in the child after the *fork()* processing completes.

49399 The *pthread\_atfork()* function was intended to provide multi-threaded libraries with a means to  
49400 protect themselves from innocent application programs that call *fork()*, and to provide multi-  
49401 threaded application programs with a standard mechanism for protecting themselves from  
49402 *fork()* calls in a library routine or the application itself.

49403 The expected usage was that the prepare handler would acquire all mutex locks and the other  
49404 two fork handlers would release them.

49405 For example, an application could have supplied a prepare routine that acquires the necessary  
49406 mutexes the library maintains and supplied child and parent routines that release those  
49407 mutexes, thus ensuring that the child would have got a consistent snapshot of the state of the  
49408 library (and that no mutexes would have been left stranded). This is good in theory, but in  
49409 reality not practical. Each and every mutex and lock in the process must be located and locked.  
49410 Every component of a program including third-party components must participate and they  
49411 must agree who is responsible for which mutex or lock. This is especially problematic for  
49412 mutexes and locks in dynamically allocated memory. All mutexes and locks internal to the  
49413 implementation must be locked, too. This possibly delays the thread calling *fork()* for a long  
49414 time or even indefinitely since uses of these synchronization objects may not be under control of  
49415 the application. A final problem to mention here is the problem of locking streams. At least the  
49416 streams under control of the system (like *stdin*, *stdout*, *stderr*) must be protected by locking the  
49417 stream with *flockfile()*. But the application itself could have done that, possibly in the same  
49418 thread calling *fork()*. In this case, the process will deadlock.

49419 Alternatively, some libraries might have been able to supply just a *child* routine that reinitializes  
49420 the mutexes in the library and all associated states to some known value (for example, what it  
49421 was when the image was originally executed). This approach is not possible, though, because  
49422 implementations are allowed to fail *\*\_init()* and *\*\_destroy()* calls for mutexes and locks if the  
49423 mutex or lock is still locked. In this case, the *child* routine is not able to reinitialize the mutexes  
49424 and locks.

49425 When *fork()* is called, only the calling thread is duplicated in the child process. Synchronization  
49426 variables remain in the same state in the child as they were in the parent at the time *fork()* was  
49427 called. Thus, for example, mutex locks may be held by threads that no longer exist in the child  
49428 process, and any associated states may be inconsistent. The intention was that the parent process  
49429 could have avoided this by explicit code that acquires and releases locks critical to the child via  
49430 *pthread\_atfork()*. In addition, any critical threads would have needed to be recreated and  
49431 reinitialized to the proper state in the child (also via *pthread\_atfork()*).

49432 A higher-level package may acquire locks on its own data structures before invoking lower-level  
49433 packages. Under this scenario, the order specified for fork handler calls allows a simple rule of  
49434 initialization for avoiding package deadlock: a package initializes all packages on which it  
49435 depends before it calls the *pthread\_atfork()* function for itself.

49436 As explained, there is no suitable solution for functionality which requires non-atomic  
49437 operations to be protected through mutexes and locks. This is why the POSIX.1 standard since  
49438 the 1996 release requires that the child process after *fork()* in a multi-threaded process only calls  
49439 *async-signal-safe* interfaces.

49440 **FUTURE DIRECTIONS**

49441 None.

**pthread\_attr\_destroy()**

System Interfaces

49454 **NAME**

49455 pthread\_attr\_destroy, pthread\_attr\_init — destroy and initialize the thread attributes object

49456 **SYNOPSIS**

```
49457 #include <pthread.h>
49458 int pthread_attr_destroy(pthread_attr_t *attr);
49459 int pthread_attr_init(pthread_attr_t *attr);
```

49460 **DESCRIPTION**

49461 The *pthread\_attr\_destroy()* function shall destroy a thread attributes object. An implementation  
 49462 may cause *pthread\_attr\_destroy()* to set *attr* to an implementation-defined invalid value. A  
 49463 destroyed *attr* attributes object can be reinitialized using *pthread\_attr\_init()*; the results of  
 49464 otherwise referencing the object after it has been destroyed are undefined.

49465 The *pthread\_attr\_init()* function shall initialize a thread attributes object *attr* with the default  
 49466 value for all of the individual attributes used by a given implementation.

49467 The resulting attributes object (possibly modified by setting individual attribute values) when  
 49468 used by *pthread\_create()* defines the attributes of the thread created. A single attributes object can  
 49469 be used in multiple simultaneous calls to *pthread\_create()*. Results are undefined if  
 49470 *pthread\_attr\_init()* is called specifying an already initialized *attr* attributes object.

49471 The behavior is undefined if the value specified by the *attr* argument to *pthread\_attr\_destroy()*  
 49472 does not refer to an initialized thread attributes object.

49473 **RETURN VALUE**

49474 Upon successful completion, *pthread\_attr\_destroy()* and *pthread\_attr\_init()* shall return a value of  
 49475 0; otherwise, an error number shall be returned to indicate the error.

49476 **ERRORS**

49477 The *pthread\_attr\_init()* function shall fail if:

49478 [ENOMEM] Insufficient memory exists to initialize the thread attributes object.

49479 These functions shall not return an error code of [EINTR].

49480 **EXAMPLES**

49481 None.

49482 **APPLICATION USAGE**

49483 None.

49484 **RATIONALE**

49485 Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to  
 49486 support probable future standardization in these areas without requiring that the function itself  
 49487 be changed.

49488 Attributes objects provide clean isolation of the configurable aspects of threads. For example,  
 49489 “stack size” is an important attribute of a thread, but it cannot be expressed portably. When  
 49490 porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects  
 49491 can help by allowing the changes to be isolated in a single place, rather than being spread across  
 49492 every instance of thread creation.

49493 Attributes objects can be used to set up “classes” of threads with similar attributes; for example,  
 49494 “threads with large stacks and high priority” or “threads with minimal stacks”. These classes  
 49495 can be defined in a single place and then referenced wherever threads need to be created.  
 49496 Changes to “class” decisions become straightforward, and detailed analysis of each  
 49497 *pthread\_create()* call is not required.

49498 The attributes objects are defined as opaque types as an aid to extensibility. If these objects had  
 49499 been specified as structures, adding new attributes would force recompilation of all multi-  
 49500 threaded programs when the attributes objects are extended; this might not be possible if  
 49501 different program components were supplied by different vendors.

49502 Additionally, opaque attributes objects present opportunities for improving performance.  
 49503 Argument validity can be checked once when attributes are set, rather than each time a thread is  
 49504 created. Implementations often need to cache kernel objects that are expensive to create.  
 49505 Opaque attributes objects provide an efficient mechanism to detect when cached objects become  
 49506 invalid due to attribute changes.

49507 Since assignment is not necessarily defined on a given opaque type, implementation-defined  
 49508 default values cannot be defined in a portable way. The solution to this problem is to allow  
 49509 attributes objects to be initialized dynamically by attributes object initialization functions, so that  
 49510 default values can be supplied automatically by the implementation.

49511 The following proposal was provided as a suggested alternative to the supplied attributes:

- 49512 1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to  
 49513 the initialization routines (*pthread\_create()*, *pthread\_mutex\_init()*, *pthread\_cond\_init()*). The  
 49514 parameter containing the flags should be an opaque type for extensibility. If no flags are  
 49515 set in the parameter, then the objects are created with default characteristics. An  
 49516 implementation may specify implementation-defined flag values and associated  
 49517 behavior.
- 49518 2. If further specialization of mutexes and condition variables is necessary, implementations  
 49519 may specify additional procedures that operate on the **pthread\_mutex\_t** and  
 49520 **pthread\_cond\_t** objects (instead of on attributes objects).

49521 The difficulties with this solution are:

- 49522 1. A bitmask is not opaque if bits have to be set into bitvector attributes objects using  
 49523 explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an **int**,  
 49524 application programmers need to know the location of each bit. If bits are set or read by  
 49525 encapsulation (that is, get and set functions), then the bitmask is merely an  
 49526 implementation of attributes objects as currently defined and should not be exposed to  
 49527 the programmer.
- 49528 2. Many attributes are not Boolean or very small integral values. For example, scheduling  
 49529 policy may be placed in 3-bit or 4-bit, but priority requires 5-bit or more, thereby taking  
 49530 up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this,  
 49531 the bitmask can only reasonably control whether particular attributes are set or not, and it  
 49532 cannot serve as the repository of the value itself. The value needs to be specified as a  
 49533 function parameter (which is non-extensible), or by setting a structure field (which is non-  
 49534 opaque), or by get and set functions (making the bitmask a redundant addition to the  
 49535 attributes objects).

49536 Stack size is defined as an optional attribute because the very notion of a stack is inherently  
 49537 machine-dependent. Some implementations may not be able to change the size of the stack, for  
 49538 example, and others may not need to because stack pages may be discontinuous and can be  
 49539 allocated and released on demand.

49540 The attribute mechanism has been designed in large measure for extensibility. Future extensions  
 49541 to the attribute mechanism or to any attributes object defined in this volume of POSIX.1-2008 has  
 49542 to be done with care so as not to affect binary-compatibility.

49543 Attributes objects, even if allocated by means of dynamic allocation functions such as *malloc()*,

**pthread\_attr\_destroy()**

49544 may have their size fixed at compile time. This means, for example, a *pthread\_create()* in an  
49545 implementation with extensions to **pthread\_attr\_t** cannot look beyond the area that the binary  
49546 application assumes is valid. This suggests that implementations should maintain a size field in  
49547 the attributes object, as well as possibly version information, if extensions in different directions  
49548 (possibly by different vendors) are to be accommodated.

49549 If an implementation detects that the value specified by the *attr* argument to  
49550 *pthread\_attr\_destroy()* does not refer to an initialized thread attributes object, it is recommended  
49551 that the function should fail and report an [EINVAL] error.

49552 If an implementation detects that the value specified by the *attr* argument to *pthread\_attr\_init()*  
49553 refers to an already initialized thread attributes object, it is recommended that the function  
49554 should fail and report an [EBUSY] error.

**FUTURE DIRECTIONS**

49555 None.

**CHANGE HISTORY**

49560 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

49563 The *pthread\_attr\_destroy()* and *pthread\_attr\_init()* functions are marked as part of the Threads  
49564 option.

49565 IEEE PASC Interpretation 1003.1 #107 is applied, noting that the effect of initializing an already  
49566 initialized thread attributes object is undefined.

49567 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/71 is applied, updating the ERRORS  
49568 section to add the optional [EINVAL] error for the *pthread\_attr\_destroy()* function, and the  
49569 optional [EBUSY] error for the *pthread\_attr\_init()* function.

**Issue 7**

49570 The *pthread\_attr\_destroy()* and *pthread\_attr\_init()* functions are moved from the Threads option  
49571 to the Base.

49573 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
49574 results in undefined behavior.

49575 The [EBUSY] error for an already initialized thread attributes object is removed; this condition  
49576 results in undefined behavior.

49577 **NAME**

49578 pthread\_attr\_getdetachstate, pthread\_attr\_setdetachstate — get and set the detachstate attribute

49579 **SYNOPSIS**

49580 #include &lt;pthread.h&gt;

49581 int pthread\_attr\_getdetachstate(const pthread\_attr\_t \*attr,  
49582 int \*detachstate);

49583 int pthread\_attr\_setdetachstate(pthread\_attr\_t \*attr, int detachstate);

49584 **DESCRIPTION**49585 The *detachstate* attribute controls whether the thread is created in a detached state. If the thread  
49586 is created detached, then use of the ID of the newly created thread by the *pthread\_detach()* or  
49587 *pthread\_join()* function is an error.49588 The *pthread\_attr\_getdetachstate()* and *pthread\_attr\_setdetachstate()* functions, respectively, shall get  
49589 and set the *detachstate* attribute in the *attr* object.49590 For *pthread\_attr\_getdetachstate()*, *detachstate* shall be set to either  
49591 PTHREAD\_CREATE\_DETACHED or PTHREAD\_CREATE\_JOINABLE.49592 For *pthread\_attr\_setdetachstate()*, the application shall set *detachstate* to either  
49593 PTHREAD\_CREATE\_DETACHED or PTHREAD\_CREATE\_JOINABLE.49594 A value of PTHREAD\_CREATE\_DETACHED shall cause all threads created with *attr* to be in  
49595 the detached state, whereas using a value of PTHREAD\_CREATE\_JOINABLE shall cause all  
49596 threads created with *attr* to be in the joinable state. The default value of the *detachstate* attribute  
49597 shall be PTHREAD\_CREATE\_JOINABLE.49598 The behavior is undefined if the value specified by the *attr* argument to  
49599 *pthread\_attr\_getdetachstate()* or *pthread\_attr\_setdetachstate()* does not refer to an initialized thread  
49600 attributes object.49601 **RETURN VALUE**49602 Upon successful completion, *pthread\_attr\_getdetachstate()* and *pthread\_attr\_setdetachstate()* shall  
49603 return a value of 0; otherwise, an error number shall be returned to indicate the error.49604 The *pthread\_attr\_getdetachstate()* function stores the value of the *detachstate* attribute in *detachstate*  
49605 if successful.49606 **ERRORS**49607 The *pthread\_attr\_setdetachstate()* function shall fail if:49608 [EINVAL] The value of *detachstate* was not valid

49609 These functions shall not return an error code of [EINTR].

49610 **EXAMPLES**49611 **Retrieving the detachstate Attribute**49612 This example shows how to obtain the *detachstate* attribute of a thread attribute object.

49613 #include &lt;pthread.h&gt;

49614 pthread\_attr\_t thread\_attr;

49615 int detachstate;

49616 int rc;

49617 /\* code initializing thread\_attr \*/

49618 ...

**pthread\_attr\_getdetachstate()**

```

49619     rc = pthread_attr_getdetachstate (&thread_attr, &detachstate);
49620     if (rc!=0) {
49621         /* handle error */
49622         ...
49623     }
49624     else {
49625         /* legal values for detachstate are:
49626          * PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE
49627          */
49628         ...
49629     }

```

**49630 APPLICATION USAGE**

49631 None.

**49632 RATIONALE**

49633 If an implementation detects that the value specified by the *attr* argument to  
49634 *pthread\_attr\_getdetachstate()* or *pthread\_attr\_setdetachstate()* does not refer to an initialized thread  
49635 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

**49636 FUTURE DIRECTIONS**

49637 None.

**49638 SEE ALSO**

49639 [pthread\\_attr\\_destroy\(\)](#), [pthread\\_attr\\_getstacksize\(\)](#), [pthread\\_create\(\)](#)

49640 XBD <[pthread.h](#)>

**49641 CHANGE HISTORY**

49642 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**49643 Issue 6**

49644 The *pthread\_attr\_setdetachstate()* and *pthread\_attr\_getdetachstate()* functions are marked as part of  
49645 the Threads option.

49646 The normative text is updated to avoid use of the term “must” for application requirements.

49647 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/72 is applied, adding the example to the  
49648 EXAMPLES section.

49649 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/73 is applied, updating the ERRORS  
49650 section to include the optional [EINVAL] error.

**49651 Issue 7**

49652 The *pthread\_attr\_setdetachstate()* and *pthread\_attr\_getdetachstate()* functions are moved from the  
49653 Threads option to the Base.

49654 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
49655 results in undefined behavior.

49656 **NAME**

49657 pthread\_attr\_getguardsize, pthread\_attr\_setguardsize — get and set the thread guardsize  
 49658 attribute

49659 **SYNOPSIS**

```
49660 #include <pthread.h>
49661 int pthread_attr_getguardsize(const pthread_attr_t *restrict attr,
49662 size_t *restrict guardsize);
49663 int pthread_attr_setguardsize(pthread_attr_t *attr,
49664 size_t guardsize);
```

49665 **DESCRIPTION**

49666 The *pthread\_attr\_getguardsize()* function shall get the *guardsize* attribute in the *attr* object. This  
 49667 attribute shall be returned in the *guardsize* parameter.

49668 The *pthread\_attr\_setguardsize()* function shall set the *guardsize* attribute in the *attr* object. The new  
 49669 value of this attribute shall be obtained from the *guardsize* parameter. If *guardsize* is zero, a guard  
 49670 area shall not be provided for threads created with *attr*. If *guardsize* is greater than zero, a guard  
 49671 area of at least size *guardsize* bytes shall be provided for each thread created with *attr*.

49672 The *guardsize* attribute controls the size of the guard area for the created thread's stack. The  
 49673 *guardsize* attribute provides protection against overflow of the stack pointer. If a thread's stack is  
 49674 created with guard protection, the implementation allocates extra memory at the overflow end  
 49675 of the stack as a buffer against stack overflow of the stack pointer. If an application overflows  
 49676 into this buffer an error shall result (possibly in a SIGSEGV signal being delivered to the thread).

49677 A conforming implementation may round up the value contained in *guardsize* to a multiple of  
 49678 the configurable system variable {PAGESIZE} (see <sys/mman.h>). If an implementation  
 49679 rounds up the value of *guardsize* to a multiple of {PAGESIZE}, a call to *pthread\_attr\_getguardsize()*  
 49680 specifying *attr* shall store in the *guardsize* parameter the guard size specified by the previous  
 49681 *pthread\_attr\_setguardsize()* function call.

49682 The default value of the *guardsize* attribute is implementation-defined.

49683 If the *stackaddr* attribute has been set (that is, the caller is allocating and managing its own thread  
 49684 stacks), the *guardsize* attribute shall be ignored and no protection shall be provided by the  
 49685 implementation. It is the responsibility of the application to manage stack overflow along with  
 49686 stack allocation and management in this case.

49687 The behavior is undefined if the value specified by the *attr* argument to  
 49688 *pthread\_attr\_getguardsize()* or *pthread\_attr\_setguardsize()* does not refer to an initialized thread  
 49689 attributes object.

49690 **RETURN VALUE**

49691 If successful, the *pthread\_attr\_getguardsize()* and *pthread\_attr\_setguardsize()* functions shall return  
 49692 zero; otherwise, an error number shall be returned to indicate the error.

49693 **ERRORS**

49694 These functions shall fail if:

49695 [EINVAL] The parameter *guardsize* is invalid.

49696 These functions shall not return an error code of [EINTR].

**pthread\_attr\_getguardsize()**49697 **EXAMPLES**49698 **Retrieving the guardsize Attribute**

49699 This example shows how to obtain the *guardsize* attribute of a thread attribute object.

```

49700 #include <pthread.h>
49701 pthread_attr_t thread_attr;
49702 size_t guardsize;
49703 int rc;
49704 /* code initializing thread_attr */
49705 ...
49706 rc = pthread_attr_getguardsize (&thread_attr, &guardsize);
49707 if (rc != 0) {
49708     /* handle error */
49709     ...
49710 }
49711 else {
49712     if (guardsize > 0) {
49713         /* a guard area of at least guardsize bytes is provided */
49714         ...
49715     }
49716     else {
49717         /* no guard area provided */
49718         ...
49719     }
49720 }

```

49721 **APPLICATION USAGE**

49722 None.

49723 **RATIONALE**

49724 The *guardsize* attribute is provided to the application for two reasons:

- 49725 1. Overflow protection can potentially result in wasted system resources. An application  
49726 that creates a large number of threads, and which knows its threads never overflow their  
49727 stack, can save system resources by turning off guard areas.
- 49728 2. When threads allocate large data structures on the stack, large guard areas may be needed  
49729 to detect stack overflow.

49730 The default size of the guard area is left implementation-defined since on systems supporting  
49731 very large page sizes, the overhead might be substantial if at least one guard page is required by  
49732 default.

49733 If an implementation detects that the value specified by the *attr* argument to  
49734 *pthread\_attr\_getguardsize()* or *pthread\_attr\_setguardsize()* does not refer to an initialized thread  
49735 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

49736 **FUTURE DIRECTIONS**

49737 None.

49738 **SEE ALSO**49739 XBD [<pthread.h>](#), [<sys/mman.h>](#)49740 **CHANGE HISTORY**

49741 First released in Issue 5.

49742 **Issue 6**49743 In the ERRORS section, a third [EINVAL] error condition is removed as it is covered by the  
49744 second error condition.49745 The **restrict** keyword is added to the *pthread\_attr\_getguardsize()* prototype for alignment with the  
49746 ISO/IEC 9899:1999 standard.49747 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/74 is applied, updating the ERRORS  
49748 section to remove the [EINVAL] error (“The attribute *attr* is invalid.”), and replacing it with the  
49749 optional [EINVAL] error.49750 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/76 is applied, adding the example to the  
49751 EXAMPLES section.49752 **Issue 7**49753 SD5-XSH-ERN-111 is applied, removing the reference to the *stack* attribute in the DESCRIPTION.49754 SD5-XSH-ERN-175 is applied, updating the DESCRIPTION to note that the default size of the  
49755 guard area is implementation-defined.49756 The *pthread\_attr\_getguardsize()* and *pthread\_attr\_setguardsize()* functions are moved from the XSI  
49757 option to the Base.49758 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
49759 results in undefined behavior.

**pthread\_attr\_getinheritsched()**49760 **NAME**

49761 pthread\_attr\_getinheritsched, pthread\_attr\_setinheritsched — get and set the inheritsched  
 49762 attribute (**REALTIME THREADS**)

49763 **SYNOPSIS**

```
49764 TPS #include <pthread.h>
49765 int pthread_attr_getinheritsched(const pthread_attr_t *restrict attr,
49766 int *restrict inheritsched);
49767 int pthread_attr_setinheritsched(pthread_attr_t *attr,
49768 int inheritsched);
```

49769 **DESCRIPTION**

49770 The *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions, respectively, shall  
 49771 get and set the *inheritsched* attribute in the *attr* argument.

49772 When the attributes objects are used by *pthread\_create()*, the *inheritsched* attribute determines  
 49773 how the other scheduling attributes of the created thread shall be set.

49774 The supported values of *inheritsched* shall be:

49775 **PTHREAD\_INHERIT\_SCHED**

49776 Specifies that the thread scheduling attributes shall be inherited from the creating thread,  
 49777 and the scheduling attributes in this *attr* argument shall be ignored.

49778 **PTHREAD\_EXPLICIT\_SCHED**

49779 Specifies that the thread scheduling attributes shall be set to the corresponding values from  
 49780 this attributes object.

49781 The symbols **PTHREAD\_INHERIT\_SCHED** and **PTHREAD\_EXPLICIT\_SCHED** are defined in  
 49782 the **<pthread.h>** header.

49783 The following thread scheduling attributes defined by POSIX.1-2008 are affected by the  
 49784 *inheritsched* attribute: scheduling policy (*schedpolicy*), scheduling parameters (*schedparam*), and  
 49785 scheduling contention scope (*contentionscope*).

49786 The behavior is undefined if the value specified by the *attr* argument to  
 49787 *pthread\_attr\_getinheritsched()* or *pthread\_attr\_setinheritsched()* does not refer to an initialized  
 49788 thread attributes object.

49789 **RETURN VALUE**

49790 If successful, the *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions shall  
 49791 return zero; otherwise, an error number shall be returned to indicate the error.

49792 **ERRORS**

49793 The *pthread\_attr\_setinheritsched()* function may fail if:

49794 [EINVAL] The value of *inheritsched* is not valid.

49795 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

49796 These functions shall not return an error code of [EINTR].

49797 **EXAMPLES**

49798 None.

49799 **APPLICATION USAGE**49800 After these attributes have been set, a thread can be created with the specified attributes using  
49801 *pthread\_create()*. Using these routines does not affect the current running thread.49802 See [Section 2.9.4](#) (on page 509) for further details on thread scheduling attributes and their  
49803 default settings.49804 **RATIONALE**49805 If an implementation detects that the value specified by the *attr* argument to  
49806 *pthread\_attr\_getinheritsched()* or *pthread\_attr\_setinheritsched()* does not refer to an initialized  
49807 thread attributes object, it is recommended that the function should fail and report an [EINVAL]  
49808 error.49809 **FUTURE DIRECTIONS**

49810 None.

49811 **SEE ALSO**49812 *pthread\_attr\_destroy()*, *pthread\_attr\_getscope()*, *pthread\_attr\_getschedpolicy()*,  
49813 *pthread\_attr\_getschedparam()*, *pthread\_create()*49814 XBD [<pthread.h>](#), [<sched.h>](#)49815 **CHANGE HISTORY**

49816 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

49817 Marked as part of the Realtime Threads Feature Group.

49818 **Issue 6**49819 The *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions are marked as part  
49820 of the Threads and Thread Execution Scheduling options.49821 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
49822 implementation does not support the Thread Execution Scheduling option.49823 The **restrict** keyword is added to the *pthread\_attr\_getinheritsched()* prototype for alignment with  
49824 the ISO/IEC 9899:1999 standard.49825 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/75 is applied, clarifying the values of  
49826 *inheritsched* in the DESCRIPTION and adding two optional [EINVAL] errors to the ERRORS  
49827 section for checking when *attr* refers to an uninitialized thread attribute object.49828 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/77 is applied, adding a reference to  
49829 [Section 2.9.4](#) (on page 509) in the APPLICATION USAGE section.49830 **Issue 7**49831 The *pthread\_attr\_getinheritsched()* and *pthread\_attr\_setinheritsched()* functions are moved from the  
49832 Threads option.49833 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
49834 results in undefined behavior.

**pthread\_attr\_getschedparam()**

System Interfaces

49835 **NAME**

49836 pthread\_attr\_getschedparam, pthread\_attr\_setschedparam — get and set the schedparam  
49837 attribute

49838 **SYNOPSIS**

```
49839 #include <pthread.h>
49840 int pthread_attr_getschedparam(const pthread_attr_t *restrict attr,
49841 struct sched_param *restrict param);
49842 int pthread_attr_setschedparam(pthread_attr_t *restrict attr,
49843 const struct sched_param *restrict param);
```

49844 **DESCRIPTION**

49845 The *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions, respectively, shall  
49846 get and set the scheduling parameter attributes in the *attr* argument. The contents of the *param*  
49847 structure are defined in the **<sched.h>** header. For the SCHED\_FIFO and SCHED\_RR policies,  
49848 the only required member of *param* is *sched\_priority*.

49849 TSP For the SCHED\_SPORADIC policy, the required members of the *param* structure are  
49850 *sched\_priority*, *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, *sched\_ss\_init\_budget*, and  
49851 *sched\_ss\_max\_repl*. The specified *sched\_ss\_repl\_period* must be greater than or equal to the  
49852 specified *sched\_ss\_init\_budget* for the function to succeed; if it is not, then the function shall fail.  
49853 The value of *sched\_ss\_max\_repl* shall be within the inclusive range [1,{SS\_REPL\_MAX}] for the  
49854 function to succeed; if not, the function shall fail. It is unspecified whether the  
49855 *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values are stored as provided by this function or are  
49856 rounded to align with the resolution of the clock being used.

49857 The behavior is undefined if the value specified by the *attr* argument to  
49858 *pthread\_attr\_getschedparam()* or *pthread\_attr\_setschedparam()* does not refer to an initialized thread  
49859 attributes object.

49860 **RETURN VALUE**

49861 If successful, the *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions shall  
49862 return zero; otherwise, an error number shall be returned to indicate the error.

49863 **ERRORS**

49864 The *pthread\_attr\_setschedparam()* function may fail if:

- 49865 [EINVAL] The value of *param* is not valid.
- 49866 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.
- 49867 These functions shall not return an error code of [EINTR].

49868 **EXAMPLES**

49869 None.

49870 **APPLICATION USAGE**

49871 After these attributes have been set, a thread can be created with the specified attributes using  
49872 *pthread\_create()*. Using these routines does not affect the current running thread.

49873 **RATIONALE**

49874 If an implementation detects that the value specified by the *attr* argument to  
49875 *pthread\_attr\_getschedparam()* or *pthread\_attr\_setschedparam()* does not refer to an initialized thread  
49876 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

**49877 FUTURE DIRECTIONS**

49878 None.

**49879 SEE ALSO**

49880 *pthread\_attr\_destroy()*, *pthread\_attr\_getscope()*, *pthread\_attr\_getinheritsched()*,  
49881 *pthread\_attr\_getschedpolicy()*, *pthread\_create()*

49882 XBD **<pthread.h>**, **<sched.h>**

**49883 CHANGE HISTORY**

49884 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**49885 Issue 6**

49886 The *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions are marked as part  
49887 of the Threads option.

49888 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

49889 The **restrict** keyword is added to the *pthread\_attr\_getschedparam()* and  
49890 *pthread\_attr\_setschedparam()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

49891 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/78 is applied, updating the ERRORS  
49892 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute  
49893 object.

**49894 Issue 7**

49895 The *pthread\_attr\_getschedparam()* and *pthread\_attr\_setschedparam()* functions are moved from the  
49896 Threads option to the Base.

49897 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements  
49898 for the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values.

49899 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
49900 results in undefined behavior.

**pthread\_attr\_getschedpolicy()**

System Interfaces

49901 **NAME**

49902 pthread\_attr\_getschedpolicy, pthread\_attr\_setschedpolicy — get and set the schedpolicy  
 49903 attribute (**REALTIME THREADS**)

49904 **SYNOPSIS**

```
49905 TPS #include <pthread.h>
49906
49907 int pthread_attr_getschedpolicy(const pthread_attr_t *restrict attr,
49908                               int *restrict policy);
49908 int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);
```

49909 **DESCRIPTION**

49910 The *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions, respectively, shall  
 49911 get and set the *schedpolicy* attribute in the *attr* argument.

49912 The supported values of *policy* shall include SCHED\_FIFO, SCHED\_RR, and SCHED\_OTHER,  
 49913 which are defined in the **<sched.h>** header. When threads executing with the scheduling policy  
 49914 TSP SCHED\_FIFO, SCHED\_RR, or SCHED\_SPORADIC are waiting on a mutex, they shall acquire  
 49915 the mutex in priority order when the mutex is unlocked.

49916 The behavior is undefined if the value specified by the *attr* argument to  
 49917 *pthread\_attr\_getschedpolicy()* or *pthread\_attr\_setschedpolicy()* does not refer to an initialized thread  
 49918 attributes object.

49919 **RETURN VALUE**

49920 If successful, the *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions shall  
 49921 return zero; otherwise, an error number shall be returned to indicate the error.

49922 **ERRORS**

49923 The *pthread\_attr\_setschedpolicy()* function may fail if:

49924 [EINVAL] The value of *policy* is not valid.

49925 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

49926 These functions shall not return an error code of [EINTR].

49927 **EXAMPLES**

49928 None.

49929 **APPLICATION USAGE**

49930 After these attributes have been set, a thread can be created with the specified attributes using  
 49931 *pthread\_create()*. Using these routines does not affect the current running thread.

49932 See Section 2.9.4 (on page 509) for further details on thread scheduling attributes and their  
 49933 default settings.

49934 **RATIONALE**

49935 If an implementation detects that the value specified by the *attr* argument to  
 49936 *pthread\_attr\_getschedpolicy()* or *pthread\_attr\_setschedpolicy()* does not refer to an initialized thread  
 49937 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

49938 **FUTURE DIRECTIONS**

49939 None.

49940 **SEE ALSO**

49941 *pthread\_attr\_destroy()*, *pthread\_attr\_getscope()*, *pthread\_attr\_getinheritsched()*,  
 49942 *pthread\_attr\_getschedparam()*, *pthread\_create()*

49943 XBD **<pthread.h>**, **<sched.h>**

**49944 CHANGE HISTORY**

49945 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

49946 Marked as part of the Realtime Threads Feature Group.

**49947 Issue 6**

49948 The *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions are marked as part of  
49949 the Threads and Thread Execution Scheduling options.

49950 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
49951 implementation does not support the Thread Execution Scheduling option.

49952 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

49953 The **restrict** keyword is added to the *pthread\_attr\_getschedpolicy()* prototype for alignment with  
49954 the ISO/IEC 9899:1999 standard.

49955 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/79 is applied, adding a reference to  
49956 [Section 2.9.4](#) (on page 509) in the APPLICATION USAGE section.

49957 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/80 is applied, updating the ERRORS  
49958 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute  
49959 object.

**49960 Issue 7**

49961 The *pthread\_attr\_getschedpolicy()* and *pthread\_attr\_setschedpolicy()* functions are moved from the  
49962 Threads option.

49963 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
49964 results in undefined behavior.

**pthread\_attr\_getscope()**

System Interfaces

49965 **NAME**

49966 pthread\_attr\_getscope, pthread\_attr\_setscope — get and set the contentionscope attribute  
 49967 (REALTIME THREADS)

49968 **SYNOPSIS**

```
49969 TPS #include <pthread.h>
49970 int pthread_attr_getscope(const pthread_attr_t *restrict attr,
49971 int *restrict contentionscope);
49972 int pthread_attr_setscope(pthread_attr_t *attr, int contentionscope);
```

49973 **DESCRIPTION**

49974 The *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions, respectively, shall get and set  
 49975 the *contentionscope* attribute in the *attr* object.

49976 The *contentionscope* attribute may have the values PTHREAD\_SCOPE\_SYSTEM, signifying  
 49977 system scheduling contention scope, or PTHREAD\_SCOPE\_PROCESS, signifying process  
 49978 scheduling contention scope. The symbols PTHREAD\_SCOPE\_SYSTEM and  
 49979 PTHREAD\_SCOPE\_PROCESS are defined in the **<pthread.h>** header.

49980 The behavior is undefined if the value specified by the *attr* argument to *pthread\_attr\_getscope()* or  
 49981 *pthread\_attr\_setscope()* does not refer to an initialized thread attributes object.

49982 **RETURN VALUE**

49983 If successful, the *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions shall return zero;  
 49984 otherwise, an error number shall be returned to indicate the error.

49985 **ERRORS**

49986 The *pthread\_attr\_setscope()* function may fail if:

49987 [EINVAL] The value of *contentionscope* is not valid.

49988 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

49989 These functions shall not return an error code of [EINTR].

49990 **EXAMPLES**

49991 None.

49992 **APPLICATION USAGE**

49993 After these attributes have been set, a thread can be created with the specified attributes using  
 49994 *pthread\_create()*. Using these routines does not affect the current running thread.

49995 See Section 2.9.4 (on page 509) for further details on thread scheduling attributes and their  
 49996 default settings.

49997 **RATIONALE**

49998 If an implementation detects that the value specified by the *attr* argument to  
 49999 *pthread\_attr\_getscope()* or *pthread\_attr\_setscope()* does not refer to an initialized thread attributes  
 50000 object, it is recommended that the function should fail and report an [EINVAL] error.

50001 **FUTURE DIRECTIONS**

50002 None.

50003 **SEE ALSO**

50004 *pthread\_attr\_destroy()*, *pthread\_attr\_getinheritsched()*, *pthread\_attr\_getschedpolicy()*,  
 50005 *pthread\_attr\_getschedparam()*, *pthread\_create()*

50006 XBD **<pthread.h>**, **<sched.h>**

50007 **CHANGE HISTORY**

50008 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

50009 Marked as part of the Realtime Threads Feature Group.

50010 **Issue 6**

50011 The *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions are marked as part of the  
50012 Threads and Thread Execution Scheduling options.

50013 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
50014 implementation does not support the Thread Execution Scheduling option.

50015 The **restrict** keyword is added to the *pthread\_attr\_getscope()* prototype for alignment with the  
50016 ISO/IEC 9899: 1999 standard.

50017 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/81 is applied, adding a reference to  
50018 [Section 2.9.4](#) (on page 509) in the APPLICATION USAGE section.

50019 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/82 is applied, updating the ERRORS  
50020 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute  
50021 object.

50022 **Issue 7**

50023 The *pthread\_attr\_getscope()* and *pthread\_attr\_setscope()* functions are moved from the Threads  
50024 option.

50025 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
50026 results in undefined behavior.

**pthread\_attr\_getstack()**50027 **NAME**

50028 pthread\_attr\_getstack, pthread\_attr\_setstack — get and set stack attributes

50029 **SYNOPSIS**

```
50030 TSA TSS #include <pthread.h>
50031 int pthread_attr_getstack(const pthread_attr_t *restrict attr,
50032 void **restrict stackaddr, size_t *restrict stacksize);
50033 int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,
50034 size_t stacksize);
```

50035 **DESCRIPTION**

50036 The *pthread\_attr\_getstack()* and *pthread\_attr\_setstack()* functions, respectively, shall get and set the  
 50037 thread creation stack attributes *stackaddr* and *stacksize* in the *attr* object.

50038 The stack attributes specify the area of storage to be used for the created thread's stack. The base  
 50039 (lowest addressable byte) of the storage shall be *stackaddr*, and the size of the storage shall be  
 50040 *stacksize* bytes. The *stacksize* shall be at least {PTHREAD\_STACK\_MIN}. The  
 50041 *pthread\_attr\_setstack()* function may fail with [EINVAL] if *stackaddr* does not meet  
 50042 implementation-defined alignment requirements. All pages within the stack described by  
 50043 *stackaddr* and *stacksize* shall be both readable and writable by the thread.

50044 If the *pthread\_attr\_getstack()* function is called before the *stackaddr* attribute has been set, the  
 50045 behavior is unspecified.

50046 The behavior is undefined if the value specified by the *attr* argument to *pthread\_attr\_getstack()* or  
 50047 *pthread\_attr\_setstack()* does not refer to an initialized thread attributes object.

50048 **RETURN VALUE**

50049 Upon successful completion, these functions shall return a value of 0; otherwise, an error  
 50050 number shall be returned to indicate the error.

50051 The *pthread\_attr\_getstack()* function shall store the stack attribute values in *stackaddr* and *stacksize*  
 50052 if successful.

50053 **ERRORS**

50054 The *pthread\_attr\_setstack()* function shall fail if:

50055 [EINVAL] The value of *stacksize* is less than {PTHREAD\_STACK\_MIN} or exceeds an  
 50056 implementation-defined limit.

50057 The *pthread\_attr\_setstack()* function may fail if:

50058 [EINVAL] The value of *stackaddr* does not have proper alignment to be used as a stack, or  
 50059 ((**char** \*)*stackaddr* + *stacksize*) lacks proper alignment.

50060 [EACCES] The stack page(s) described by *stackaddr* and *stacksize* are not both readable  
 50061 and writable by the thread.

50062 These functions shall not return an error code of [EINTR].

50063 **EXAMPLES**

50064 None.

50065 **APPLICATION USAGE**50066 These functions are appropriate for use by applications in an environment where the stack for a  
50067 thread must be placed in some particular region of memory.50068 While it might seem that an application could detect stack overflow by providing a protected  
50069 page outside the specified stack region, this cannot be done portably. Implementations are free  
50070 to place the thread's initial stack pointer anywhere within the specified region to accommodate  
50071 the machine's stack pointer behavior and allocation requirements. Furthermore, on some  
50072 architectures, such as the IA-64, "overflow" might mean that two separate stack pointers  
50073 allocated within the region will overlap somewhere in the middle of the region.50074 After a successful call to `pthread_attr_setstack()`, the storage area specified by the `stackaddr`  
50075 parameter is under the control of the implementation, as described in Section 2.9.8 (on page 516).50076 The specification of the `stackaddr` attribute presents several ambiguities that make portable use of  
50077 these functions impossible. For example, the standard allows implementations to impose  
50078 arbitrary alignment requirements on `stackaddr`. Applications cannot assume that a buffer  
50079 obtained from `malloc()` is suitably aligned. Note that although the `stacksize` value passed to  
50080 `pthread_attr_setstack()` must satisfy alignment requirements, the same is not true for  
50081 `pthread_attr_setstacksize()` where the implementation must increase the specified size if necessary  
50082 to achieve the proper alignment.50083 **RATIONALE**50084 If an implementation detects that the value specified by the `attr` argument to  
50085 `pthread_attr_getstack()` or `pthread_attr_setstack()` does not refer to an initialized thread attributes  
50086 object, it is recommended that the function should fail and report an [EINVAL] error.50087 **FUTURE DIRECTIONS**

50088 None.

50089 **SEE ALSO**50090 `pthread_attr_destroy()`, `pthread_attr_getdetachstate()`, `pthread_attr_getstacksize()`, `pthread_create()`50091 XBD `<limits.h>`, `<pthread.h>`50092 **CHANGE HISTORY**50093 First released in Issue 6. Developed as part of the XSI option and brought into the BASE by IEEE  
50094 PASC Interpretation 1003.1 #101.50095 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/83 is applied, updating the  
50096 APPLICATION USAGE section to refer to Section 2.9.8 (on page 516).50097 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC/D6/84 is applied, updating the ERRORS  
50098 section to include optional errors for the case when `attr` refers to an uninitialized thread attribute  
50099 object.50100 **Issue 7**50101 SD5-XSH-ERN-66 is applied, correcting the use of `attr` in the [EINVAL] error condition.50102 Austin Group Interpretation 1003.1-2001 #057 is applied, clarifying the behavior if the function is  
50103 called before the `stackaddr` attribute is set.

50104 SD5-XSH-ERN-157 is applied, updating the APPLICATION USAGE section.

50105 The description of the `stackaddr` attribute is updated in the DESCRIPTION and APPLICATION  
50106 USAGE sections.

## **pthread\_attr\_getstack()**

*System Interfaces*

50107  
50108

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

50109 **NAME**

50110 pthread\_attr\_getstacksize, pthread\_attr\_setstacksize — get and set the stacksize attribute

50111 **SYNOPSIS**

```
50112 TSS #include <pthread.h>
50113 int pthread_attr_getstacksize(const pthread_attr_t *restrict attr,
50114 size_t *restrict stacksize);
50115 int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);
```

50116 **DESCRIPTION**50117 The *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* functions, respectively, shall get and  
50118 set the thread creation *stacksize* attribute in the *attr* object.50119 The *stacksize* attribute shall define the minimum stack size (in bytes) allocated for the created  
50120 threads stack.50121 The behavior is undefined if the value specified by the *attr* argument to  
50122 *pthread\_attr\_getstacksize()* or *pthread\_attr\_setstacksize()* does not refer to an initialized thread  
50123 attributes object.50124 **RETURN VALUE**50125 Upon successful completion, *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* shall  
50126 return a value of 0; otherwise, an error number shall be returned to indicate the error.50127 The *pthread\_attr\_getstacksize()* function stores the *stacksize* attribute value in *stacksize* if  
50128 successful.50129 **ERRORS**50130 The *pthread\_attr\_setstacksize()* function shall fail if:50131 [EINVAL] The value of *stacksize* is less than {PTHREAD\_STACK\_MIN} or exceeds a  
50132 system-imposed limit.

50133 These functions shall not return an error code of [EINTR].

50134 **EXAMPLES**

50135 None.

50136 **APPLICATION USAGE**

50137 None.

50138 **RATIONALE**50139 If an implementation detects that the value specified by the *attr* argument to  
50140 *pthread\_attr\_getstacksize()* or *pthread\_attr\_setstacksize()* does not refer to an initialized thread  
50141 attributes object, it is recommended that the function should fail and report an [EINVAL] error.50142 **FUTURE DIRECTIONS**

50147 **CHANGE HISTORY**

50148 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**pthread\_attr\_getstacksize()**

System Interfaces

50149 **Issue 6**

50150 The *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* functions are marked as part of the  
50151 Threads and Thread Stack Size Attribute options.

50152 The **restrict** keyword is added to the *pthread\_attr\_getstacksize()* prototype for alignment with the  
50153 ISO/IEC 9899:1999 standard.

50154 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/43 is applied, correcting the margin code  
50155 in the SYNOPSIS from TSA to TSS and updating the CHANGE HISTORY from “Thread Stack  
50156 Address Attribute” option to “Thread Stack Size Attribute” option.

50157 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/87 is applied, updating the ERRORS  
50158 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute  
50159 object.

50160 **Issue 7**

50161 The *pthread\_attr\_getstacksize()* and *pthread\_attr\_setstacksize()* functions are moved from the  
50162 Threads option.

50163 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition  
50164 results in undefined behavior.

**pthread\_barrier\_destroy()**

System Interfaces

50232 **NAME**

50233 pthread\_barrier\_destroy, pthread\_barrier\_init — destroy and initialize a barrier object

50234 **SYNOPSIS**

```
50235 #include <pthread.h>
50236
50236 int pthread_barrier_destroy(pthread_barrier_t *barrier);
50237 int pthread_barrier_init(pthread_barrier_t *restrict barrier,
50238 const pthread_barrierattr_t *restrict attr, unsigned count);
```

50239 **DESCRIPTION**

50240 The *pthread\_barrier\_destroy()* function shall destroy the barrier referenced by *barrier* and release  
 50241 any resources used by the barrier. The effect of subsequent use of the barrier is undefined until  
 50242 the barrier is reinitialized by another call to *pthread\_barrier\_init()*. An implementation may use  
 50243 this function to set *barrier* to an invalid value. The results are undefined if  
 50244 *pthread\_barrier\_destroy()* is called when any thread is blocked on the barrier, or if this function is  
 50245 called with an uninitialized barrier.

50246 The *pthread\_barrier\_init()* function shall allocate any resources required to use the barrier  
 50247 referenced by *barrier* and shall initialize the barrier with attributes referenced by *attr*. If *attr* is  
 50248 NULL, the default barrier attributes shall be used; the effect is the same as passing the address of  
 50249 a default barrier attributes object. The results are undefined if *pthread\_barrier\_init()* is called  
 50250 when any thread is blocked on the barrier (that is, has not returned from the  
 50251 *pthread\_barrier\_wait()* call). The results are undefined if a barrier is used without first being  
 50252 initialized. The results are undefined if *pthread\_barrier\_init()* is called specifying an already  
 50253 initialized barrier.

50254 The *count* argument specifies the number of threads that must call *pthread\_barrier\_wait()* before  
 50255 any of them successfully return from the call. The value specified by *count* must be greater than  
 50256 zero.

50257 If the *pthread\_barrier\_init()* function fails, the barrier shall not be initialized and the contents of  
 50258 *barrier* are undefined.

50259 Only the object referenced by *barrier* may be used for performing synchronization. The result of  
 50260 referring to copies of that object in calls to *pthread\_barrier\_destroy()* or *pthread\_barrier\_wait()* is  
 50261 undefined.

50262 **RETURN VALUE**

50263 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
 50264 be returned to indicate the error.

50265 **ERRORS**

50266 The *pthread\_barrier\_init()* function shall fail if:

50267 [EAGAIN] The system lacks the necessary resources to initialize another barrier.

50268 [EINVAL] The value specified by *count* is equal to zero.

50269 [ENOMEM] Insufficient memory exists to initialize the barrier.

50270 These functions shall not return an error code of [EINTR].

**50271 EXAMPLES**

50272       None.

**50273 APPLICATION USAGE**

50274       None.

**50275 RATIONALE**

50276       If an implementation detects that the value specified by the *barrier* argument to *pthread\_barrier\_destroy()* does not refer to an initialized barrier object, it is recommended that the function should fail and report an [EINVAL] error.

50279       If an implementation detects that the value specified by the *attr* argument to *pthread\_barrier\_init()* does not refer to an initialized barrier attributes object, it is recommended that the function should fail and report an [EINVAL] error.

50282       If an implementation detects that the value specified by the *barrier* argument to *pthread\_barrier\_destroy()* or *pthread\_barrier\_init()* refers to a barrier that is in use (for example, in a *pthread\_barrier\_wait()* call) by another thread, or detects that the value specified by the *barrier* argument to *pthread\_barrier\_init()* refers to an already initialized barrier object, it is recommended that the function should fail and report an [EBUSY] error.

**50287 FUTURE DIRECTIONS**

50288       None.

**50289 SEE ALSO**

50290       *pthread\_barrier\_wait()*

50291       XBD <pthread.h>

**50292 CHANGE HISTORY**

50293       First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

**50294 Issue 7**

50295       The *pthread\_barrier\_destroy()* and *pthread\_barrier\_init()* functions are moved from the Barriers option to the Base.

50297       The [EINVAL] error for an uninitialized barrier object and an uninitialized barrier attributes object is removed; this condition results in undefined behavior.

50299       The [EBUSY] error for a barrier that is in use or an already initialized barrier object is removed; this condition results in undefined behavior.

**pthread\_barrier\_wait()**

System Interfaces

50301 **NAME**

50302 pthread\_barrier\_wait — synchronize at a barrier

50303 **SYNOPSIS**

50304 #include &lt;pthread.h&gt;

50305 int pthread\_barrier\_wait(pthread\_barrier\_t \*barrier);

50306 **DESCRIPTION**

50307 The *pthread\_barrier\_wait()* function shall synchronize participating threads at the barrier  
 50308 referenced by *barrier*. The calling thread shall block until the required number of threads have  
 50309 called *pthread\_barrier\_wait()* specifying the barrier.

50310 When the required number of threads have called *pthread\_barrier\_wait()* specifying the barrier,  
 50311 the constant PTHREAD\_BARRIER\_SERIAL\_THREAD shall be returned to one unspecified  
 50312 thread and zero shall be returned to each of the remaining threads. At this point, the barrier shall  
 50313 be reset to the state it had as a result of the most recent *pthread\_barrier\_init()* function that  
 50314 referenced it.

50315 The constant PTHREAD\_BARRIER\_SERIAL\_THREAD is defined in <pthread.h> and its value  
 50316 shall be distinct from any other value returned by *pthread\_barrier\_wait()*.

50317 The results are undefined if this function is called with an uninitialized barrier.

50318 If a signal is delivered to a thread blocked on a barrier, upon return from the signal handler the  
 50319 thread shall resume waiting at the barrier if the barrier wait has not completed (that is, if the  
 50320 required number of threads have not arrived at the barrier during the execution of the signal  
 50321 handler); otherwise, the thread shall continue as normal from the completed barrier wait. Until  
 50322 the thread in the signal handler returns from it, it is unspecified whether other threads may  
 50323 proceed past the barrier once they have all reached it.

50324 A thread that has blocked on a barrier shall not prevent any unblocked thread that is eligible to  
 50325 use the same processing resources from eventually making forward progress in its execution.  
 50326 Eligibility for processing resources shall be determined by the scheduling policy.

50327 **RETURN VALUE**

50328 Upon successful completion, the *pthread\_barrier\_wait()* function shall return  
 50329 PTHREAD\_BARRIER\_SERIAL\_THREAD for a single (arbitrary) thread synchronized at the  
 50330 barrier and zero for each of the other threads. Otherwise, an error number shall be returned to  
 50331 indicate the error.

50332 **ERRORS**

50333 This function shall not return an error code of [EINTR].

50334 **EXAMPLES**

50335 None.

50336 **APPLICATION USAGE**

50337 Applications using this function may be subject to priority inversion, as discussed in XBD  
 50338 Section 3.285 (on page 79).

50339 **RATIONALE**

50340 If an implementation detects that the value specified by the *barrier* argument to  
 50341 *pthread\_barrier\_wait()* does not refer to an initialized barrier object, it is recommended that the  
 50342 function should fail and report an [EINVAL] error.

50343 **FUTURE DIRECTIONS**

50344 None.

50345 **SEE ALSO**50346 [pthread\\_barrier\\_destroy\(\)](#)50347 XBD [Section 3.285](#) (on page 79), [Section 4.11](#) (on page 110), [<pthread.h>](#)50348 **CHANGE HISTORY**

**pthread\_barrierattr\_destroy()**

System Interfaces

50355 **NAME**

50356 `pthread_barrierattr_destroy`, `pthread_barrierattr_init` — destroy and initialize the barrier  
 50357 attributes object

50358 **SYNOPSIS**

```
50359 #include <pthread.h>
50360 int pthread_barrierattr_destroy(pthread_barrierattr_t *attr);
50361 int pthread_barrierattr_init(pthread_barrierattr_t *attr);
```

50362 **DESCRIPTION**

50363 The `pthread_barrierattr_destroy()` function shall destroy a barrier attributes object. A destroyed  
 50364 `attr` attributes object can be reinitialized using `pthread_barrierattr_init()`; the results of otherwise  
 50365 referencing the object after it has been destroyed are undefined. An implementation may cause  
 50366 `pthread_barrierattr_destroy()` to set the object referenced by `attr` to an invalid value.

50367 The `pthread_barrierattr_init()` function shall initialize a barrier attributes object `attr` with the  
 50368 default value for all of the attributes defined by the implementation.

50369 If `pthread_barrierattr_init()` is called specifying an already initialized `attr` attributes object, the  
 50370 results are undefined.

50371 After a barrier attributes object has been used to initialize one or more barriers, any function  
 50372 affecting the attributes object (including destruction) shall not affect any previously initialized  
 50373 barrier.

50374 The behavior is undefined if the value specified by the `attr` argument to  
 50375 `pthread_barrierattr_destroy()` does not refer to an initialized barrier attributes object.

50376 **RETURN VALUE**

50377 If successful, the `pthread_barrierattr_destroy()` and `pthread_barrierattr_init()` functions shall return  
 50378 zero; otherwise, an error number shall be returned to indicate the error.

50379 **ERRORS**

50380 The `pthread_barrierattr_init()` function shall fail if:

50381 [ENOMEM] Insufficient memory exists to initialize the barrier attributes object.

50382 These functions shall not return an error code of [EINTR].

50383 **EXAMPLES**

50384 None.

50385 **APPLICATION USAGE**

50386 None.

50387 **RATIONALE**

50388 If an implementation detects that the value specified by the `attr` argument to  
 50389 `pthread_barrierattr_destroy()` does not refer to an initialized barrier attributes object, it is  
 50390 recommended that the function should fail and report an [EINVAL] error.

50391 **FUTURE DIRECTIONS**

50392 None.

50393 **SEE ALSO**

50394 [\*pthread\\_barrierattr\\_getpshared\(\)\*](#)

50395 XBD [\*<pthread.h>\*](#)

50396 **CHANGE HISTORY**

50397 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

50398 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.50399 **Issue 7**50400 The `pthread_barrierattr_destroy()` and `pthread_barrierattr_init()` functions are moved from the Barriers option to the Base.

50402 The [EINVAL] error for an uninitialized barrier attributes object is removed; this condition results in undefined behavior.

**pthread\_barrierattr\_getpshared()**

System Interfaces

50404 **NAME**

50405 pthread\_barrierattr\_getpshared, pthread\_barrierattr\_setpshared — get and set the process-  
 50406 shared attribute of the barrier attributes object

50407 **SYNOPSIS**

```
50408 TSH #include <pthread.h>
50409
50409 int pthread_barrierattr_getpshared(const pthread_barrierattr_t
50410     *restrict attr, int *restrict pshared);
50411 int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
50412     int pshared);
```

50413 **DESCRIPTION**

50414 The *pthread\_barrierattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
 50415 from the attributes object referenced by *attr*. The *pthread\_barrierattr\_setpshared()* function shall  
 50416 set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

50417 The *process-shared* attribute is set to `PTHREAD_PROCESS_SHARED` to permit a barrier to be  
 50418 operated upon by any thread that has access to the memory where the barrier is allocated. If the  
 50419 *process-shared* attribute is `PTHREAD_PROCESS_PRIVATE`, the barrier shall only be operated  
 50420 upon by threads created within the same process as the thread that initialized the barrier; if  
 50421 threads of different processes attempt to operate on such a barrier, the behavior is undefined.  
 50422 The default value of the attribute shall be `PTHREAD_PROCESS_PRIVATE`. Both constants  
 50423 `PTHREAD_PROCESS_SHARED` and `PTHREAD_PROCESS_PRIVATE` are defined in  
 50424 `<pthread.h>`.

50425 Additional attributes, their default values, and the names of the associated functions to get and  
 50426 set those attribute values are implementation-defined.

50427 The behavior is undefined if the value specified by the *attr* argument to  
 50428 *pthread\_barrierattr\_getpshared()* or *pthread\_barrierattr\_setpshared()* does not refer to an initialized  
 50429 barrier attributes object.

50430 **RETURN VALUE**

50431 If successful, the *pthread\_barrierattr\_getpshared()* function shall return zero and store the value of  
 50432 the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise,  
 50433 an error number shall be returned to indicate the error.

50434 If successful, the *pthread\_barrierattr\_setpshared()* function shall return zero; otherwise, an error  
 50435 number shall be returned to indicate the error.

50436 **ERRORS**

50437 The *pthread\_barrierattr\_setpshared()* function may fail if:

50438 [EINVAL] The new value specified for the *process-shared* attribute is not one of the legal  
 50439 values `PTHREAD_PROCESS_SHARED` or `PTHREAD_PROCESS_PRIVATE`.

50440 These functions shall not return an error code of [EINTR].

**50441 EXAMPLES**

50442       None.

**50443 APPLICATION USAGE**

50444       The *pthread\_barrierattr\_getpshared()* and *pthread\_barrierattr\_setpshared()* functions are part of the  
50445       Thread Process-Shared Synchronization option and need not be provided on all  
50446       implementations.

**50447 RATIONALE**

50448       If an implementation detects that the value specified by the *attr* argument to  
50449       *pthread\_barrierattr\_getpshared()* or *pthread\_barrierattr\_setpshared()* does not refer to an initialized  
50450       barrier attributes object, it is recommended that the function should fail and report an [EINVAL]  
50451       error.

**50452 FUTURE DIRECTIONS**

50453       None.

**50454 SEE ALSO**

50455       *pthread\_barrier\_destroy()*, *pthread\_barrierattr\_destroy()*

50456       XBD <pthread.h>

**50457 CHANGE HISTORY**

50458       First released in Issue 6. Derived from IEEE Std 1003.1j-2000

**50459 Issue 7**

50460       The *pthread\_barrierattr\_getpshared()* and *pthread\_barrierattr\_setpshared()* functions are moved from  
50461       the Barriers option.

50462       The [EINVAL] error for an uninitialized barrier attributes object is removed; this condition  
50463       results in undefined behavior.

**pthread\_barrierattr\_init()***System Interfaces*50464 **NAME**

50465 pthread\_barrierattr\_init — initialize the barrier attributes object

50466 **SYNOPSIS**

50467 #include &lt;pthread.h&gt;

50468 int pthread\_barrierattr\_init(pthread\_barrierattr\_t \*attr);

50469 **DESCRIPTION**50470 Refer to *pthread\_barrierattr\_destroy()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

50471 **NAME**

50472 pthread\_barrierattr\_setpshared — set the process-shared attribute of the barrier attributes object

50473 **SYNOPSIS**

```
50474 TSH #include <pthread.h>
50475      int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
50476      int pshared);
```

50477 **DESCRIPTION**50478 Refer to [pthread\\_barrierattr\\_getpshared\(\)](#).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**pthread\_cancel()**50479 **NAME**

50480 pthread\_cancel — cancel execution of a thread

50481 **SYNOPSIS**

50482 #include &lt;pthread.h&gt;

50483 int pthread\_cancel(pthread\_t thread);

50484 **DESCRIPTION**

50485 The *pthread\_cancel()* function shall request that *thread* be canceled. The target thread's  
 50486 cancelability state and type determines when the cancellation takes effect. When the cancellation  
 50487 is acted on, the cancellation cleanup handlers for *thread* shall be called. When the last  
 50488 cancellation cleanup handler returns, the thread-specific data destructor functions shall be called  
 50489 for *thread*. When the last destructor function returns, *thread* shall be terminated.

50490 The cancellation processing in the target thread shall run asynchronously with respect to the  
 50491 calling thread returning from *pthread\_cancel()*.

50492 **RETURN VALUE**

50493 If successful, the *pthread\_cancel()* function shall return zero; otherwise, an error number shall be  
 50494 returned to indicate the error.

50495 **ERRORS**

50496 The *pthread\_cancel()* function shall not return an error code of [EINTR].

50497 **EXAMPLES**

50498 None.

50499 **APPLICATION USAGE**

50500 None.

50501 **RATIONALE**

50502 Two alternative functions were considered for sending the cancellation notification to a thread.  
 50503 One would be to define a new SIGCANCEL signal that had the cancellation semantics when  
 50504 delivered; the other was to define the new *pthread\_cancel()* function, which would trigger the  
 50505 cancellation semantics.

50506 The advantage of a new signal was that so much of the delivery criteria were identical to that  
 50507 used when trying to deliver a signal that making cancellation notification a signal was seen as  
 50508 consistent. Indeed, many implementations implement cancellation using a special signal. On the  
 50509 other hand, there would be no signal functions that could be used with this signal except  
 50510 *pthread\_kill()*, and the behavior of the delivered cancellation signal would be unlike any  
 50511 previously existing defined signal.

50512 The benefits of a special function include the recognition that this signal would be defined  
 50513 because of the similar delivery criteria and that this is the only common behavior between a  
 50514 cancellation request and a signal. In addition, the cancellation delivery mechanism does not  
 50515 have to be implemented as a signal. There are also strong, if not stronger, parallels with  
 50516 language exception mechanisms than with signals that are potentially obscured if the delivery  
 50517 mechanism is visibly closer to signals.

50518 In the end, it was considered that as there were so many exceptions to the use of the new signal  
 50519 with existing signals functions it would be misleading. A special function has resolved this  
 50520 problem. This function was carefully defined so that an implementation wishing to provide the  
 50521 cancellation functions on top of signals could do so. The special function also means that  
 50522 implementations are not obliged to implement cancellation with signals.

50523 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
 50524 that the function should fail and report an [ESRCH] error.

50525 **FUTURE DIRECTIONS**

50526 None.

50527 **SEE ALSO**50528 *pthread\_exit()*, *pthread\_cond\_timedwait()*, *pthread\_join()*, *pthread\_setcancelstate()*

50529 XBD &lt;pthread.h&gt;

50530 **CHANGE HISTORY**

50531 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

50532 **Issue 6**50533 The *pthread\_cancel()* function is marked as part of the Threads option.50534 **Issue 7**50535 The *pthread\_cancel()* function is moved from the Threads option to the Base.

50536 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**pthread\_cleanup\_pop()**50537 **NAME**

50538 pthread\_cleanup\_pop, pthread\_cleanup\_push — establish cancellation handlers

50539 **SYNOPSIS**

50540 #include &lt;pthread.h&gt;

50541 void pthread\_cleanup\_pop(int *execute*);50542 void pthread\_cleanup\_push(void (\**routine*)(void\*), void \**arg*);50543 **DESCRIPTION**50544 The *pthread\_cleanup\_pop()* function shall remove the routine at the top of the calling thread's  
50545 cancellation cleanup stack and optionally invoke it (if *execute* is non-zero).50546 The *pthread\_cleanup\_push()* function shall push the specified cancellation cleanup handler *routine*  
50547 onto the calling thread's cancellation cleanup stack. The cancellation cleanup handler shall be  
50548 popped from the cancellation cleanup stack and invoked with the argument *arg* when:

- 50549
- The thread exits (that is, calls *pthread\_exit()*).
50550   - The thread acts upon a cancellation request.
50551   - The thread calls *pthread\_cleanup\_pop()* with a non-zero *execute* argument.

50552 These functions may be implemented as macros. The application shall ensure that they appear  
50553 as statements, and in pairs within the same lexical scope (that is, the *pthread\_cleanup\_push()*  
50554 macro may be thought to expand to a token list whose first token is '{' with  
50555 *pthread\_cleanup\_pop()* expanding to a token list whose last token is the corresponding '}').50556 The effect of calling *longjmp()* or *siglongjmp()* is undefined if there have been any calls to  
50557 *pthread\_cleanup\_push()* or *pthread\_cleanup\_pop()* made without the matching call since the jump  
50558 buffer was filled. The effect of calling *longjmp()* or *siglongjmp()* from inside a cancellation  
50559 cleanup handler is also undefined unless the jump buffer was also filled in the cancellation  
50560 cleanup handler.50561 The effect of the use of **return**, **break**, **continue**, and **goto** to prematurely leave a code block  
50562 described by a pair of *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* functions calls is  
50563 undefined.50564 **RETURN VALUE**50565 The *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* functions shall not return a value.50566 **ERRORS**

50567 No errors are defined.

50568 These functions shall not return an error code of [EINTR].

50569 **EXAMPLES**50570 The following is an example using thread primitives to implement a cancelable, writers-priority  
50571 read-write lock:50572 typedef struct {  
50573 pthread\_mutex\_t lock;  
50574 pthread\_cond\_t rcond,  
50575 wcond;  
50576 int lock\_count; /\* < 0 .. Held by writer. \*/  
50577 /\* > 0 .. Held by lock\_count readers. \*/  
50578 /\* = 0 .. Held by nobody. \*/  
50579 int waiting\_writers; /\* Count of waiting writers. \*/  
50580 } rwlock;

```

50581     void
50582     waiting_reader_cleanup(void *arg)
50583     {
50584         rwlock *l;
50585
50586         l = (rwlock *) arg;
50587         pthread_mutex_unlock(&l->lock);
50588     }
50589
50590     void
50591     lock_for_read(rwlock *l)
50592     {
50593         pthread_mutex_lock(&l->lock);
50594         pthread_cleanup_push(waiting_reader_cleanup, l);
50595         while ((l->lock_count < 0) && (l->waiting_writers != 0))
50596             pthread_cond_wait(&l->rcond, &l->lock);
50597         l->lock_count++;
50598         /*
50599          * Note the pthread_cleanup_pop executes
50600          * waiting_reader_cleanup.
50601          */
50602         pthread_cleanup_pop(1);
50603     }
50604
50605     void
50606     release_read_lock(rwlock *l)
50607     {
50608         pthread_mutex_lock(&l->lock);
50609         if (--l->lock_count == 0)
50610             pthread_cond_signal(&l->wcond);
50611         pthread_mutex_unlock(l);
50612     }
50613
50614     void
50615     waiting_writer_cleanup(void *arg)
50616     {
50617         rwlock *l;
50618
50619         l = (rwlock *) arg;
50620         if ((l->waiting_writers == 0) && (l->lock_count >= 0)) {
50621             /*
50622              * This only happens if we have been canceled.
50623              */
50624             pthread_cond_broadcast(&l->wcond);
50625         }
50626         pthread_mutex_unlock(&l->lock);
50627     }
50628
50629     void
50630     lock_for_write(rwlock *l)
50631     {
50632         pthread_mutex_lock(&l->lock);
50633         l->waiting_writers++;
50634         pthread_cleanup_push(waiting_writer_cleanup, l);
50635         while (l->lock_count != 0)

```

**pthread\_cleanup\_pop()**

```

50630         pthread_cond_wait(&l->wcond, &l->lock);
50631         l->lock_count = -1;
50632         /*
50633          * Note the pthread_cleanup_pop executes
50634          * waiting_writer_cleanup.
50635          */
50636         pthread_cleanup_pop(1);
50637     }

50638 void
50639 release_write_lock(rwlock *l)
50640 {
50641     pthread_mutex_lock(&l->lock);
50642     l->lock_count = 0;
50643     if (l->waiting_writers == 0)
50644         pthread_cond_broadcast(&l->rcond)
50645     else
50646         pthread_cond_signal(&l->wcond);
50647     pthread_mutex_unlock(&l->lock);
50648 }

50649 /*
50650  * This function is called to initialize the read/write lock.
50651  */
50652 void
50653 initialize_rwlock(rwlock *l)
50654 {
50655     pthread_mutex_init(&l->lock, pthread_mutexattr_default);
50656     pthread_cond_init(&l->wcond, pthread_condattr_default);
50657     pthread_cond_init(&l->rcond, pthread_condattr_default);
50658     l->lock_count = 0;
50659     l->waiting_writers = 0;

50673     pthread_cleanup_push(release_write_lock, &lock);
50674     /*
50675      * Thread has write lock.
50676      */
50677     pthread_cleanup_pop(1);
50678 }

```

**50679 APPLICATION USAGE**

50680 The two routines that push and pop cancellation cleanup handlers, *pthread\_cleanup\_push()* and  
 50681 *pthread\_cleanup\_pop()*, can be thought of as left and right-parentheses. They always need to be  
 50682 matched.

**50683 RATIONALE**

50684 The restriction that the two routines that push and pop cancellation cleanup handlers,  
 50685 *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()*, have to appear in the same lexical scope  
 50686 allows for efficient macro or compiler implementations and efficient storage management. A  
 50687 sample implementation of these routines as macros might look like this:

```
50688 #define pthread_cleanup_push(rtn, arg) { \
50689     struct _pthread_handler_rec __cleanup_handler, *__head; \
50690     __cleanup_handler.rtn = rtn; \
50691     __cleanup_handler.arg = arg; \
50692     (void) pthread_getspecific(_pthread_handler_key, &__head); \
50693     __cleanup_handler.next = *__head; \
50694     *__head = &__cleanup_handler;
50695
50696 #define pthread_cleanup_pop(ex) \
50697     *__head = __cleanup_handler.next; \
50698     if (ex) (*__cleanup_handler.rtn)(__cleanup_handler.arg); \
50699 }
```

50699 A more ambitious implementation of these routines might do even better by allowing the  
 50700 compiler to note that the cancellation cleanup handler is a constant and can be expanded inline.

50701 This volume of POSIX.1-2008 currently leaves unspecified the effect of calling *longjmp()* from a  
 50702 signal handler executing in a POSIX System Interfaces function. If an implementation wants to  
 50703 allow this and give the programmer reasonable behavior, the *longjmp()* function has to call all  
 50704 cancellation cleanup handlers that have been pushed but not popped since the time *setjmp()* was  
 50705 called.

50706 Consider a multi-threaded function called by a thread that uses signals. If a signal were  
 50707 delivered to a signal handler during the operation of *qsort()* and that handler were to call  
 50708 *longjmp()* (which, in turn, did *not* call the cancellation cleanup handlers) the helper threads  
 50709 created by the *qsort()* function would not be canceled. Instead, they would continue to execute  
 50710 and write into the argument array even though the array might have been popped off the stack.

50711 Note that the specified cleanup handling mechanism is especially tied to the C language and,  
 50712 while the requirement for a uniform mechanism for expressing cleanup is language-  
 50713 independent, the mechanism used in other languages may be quite different. In addition, this  
 50714 mechanism is really only necessary due to the lack of a real exception mechanism in the C  
 50715 language, which would be the ideal solution.

50716 There is no notion of a cancellation cleanup-safe function. If an application has no cancellation  
 50717 points in its signal handlers, blocks any signal whose handler may have cancellation points  
 50718 while calling async-unsafe functions, or disables cancellation while calling async-unsafe  
 50719 functions, all functions may be safely called from cancellation cleanup routines.

50725 **CHANGE HISTORY**

50726 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

50727 **Issue 6**50728 The *pthread\_cleanup\_pop()* and *pthread\_cleanup\_push()* functions are marked as part of the  
50729 Threads option.

50730 The APPLICATION USAGE section is added.

50731 The normative text is updated to avoid use of the term “must” for application requirements.

50732 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/88 is applied, updating the  
50733 DESCRIPTION to describe the consequences of prematurely leaving a code block defined by the  
50734 *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* functions.50735 **Issue 7**50736 The *pthread\_cleanup\_pop()* and *pthread\_cleanup\_push()* functions are moved from the Threads  
50737 option to the Base.

50738 **NAME**

50739 pthread\_cond\_broadcast, pthread\_cond\_signal — broadcast or signal a condition

50740 **SYNOPSIS**

50741 #include &lt;pthread.h&gt;

50742 int pthread\_cond\_broadcast(pthread\_cond\_t \*cond);

50743 int pthread\_cond\_signal(pthread\_cond\_t \*cond);

50744 **DESCRIPTION**

50745 These functions shall unblock threads blocked on a condition variable.

50746 The *pthread\_cond\_broadcast()* function shall unblock all threads currently blocked on the  
50747 specified condition variable *cond*.50748 The *pthread\_cond\_signal()* function shall unblock at least one of the threads that are blocked on  
50749 the specified condition variable *cond* (if any threads are blocked on *cond*).50750 If more than one thread is blocked on a condition variable, the scheduling policy shall determine  
50751 the order in which threads are unblocked. When each thread unblocked as a result of a  
50752 *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* returns from its call to *pthread\_cond\_wait()* or  
50753 *pthread\_cond\_timedwait()*, the thread shall own the mutex with which it called  
50754 *pthread\_cond\_wait()* or *pthread\_cond\_timedwait()*. The thread(s) that are unblocked shall contend  
50755 for the mutex according to the scheduling policy (if applicable), and as if each had called  
50756 *pthread\_mutex\_lock()*.50757 The *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* functions may be called by a thread  
50758 whether or not it currently owns the mutex that threads calling *pthread\_cond\_wait()* or  
50759 *pthread\_cond\_timedwait()* have associated with the condition variable during their waits;  
50760 however, if predictable scheduling behavior is required, then that mutex shall be locked by the  
50761 thread calling *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()*.50762 The *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()* functions shall have no effect if there are  
50763 no threads currently blocked on *cond*.50764 The behavior is undefined if the value specified by the *cond* argument to *pthread\_cond\_broadcast()*  
50765 or *pthread\_cond\_signal()* does not refer to an initialized condition variable.50766 **RETURN VALUE**50767 If successful, the *pthread\_cond\_broadcast()* and *pthread\_cond\_signal()* functions shall return zero;  
50768 otherwise, an error number shall be returned to indicate the error.50769 **ERRORS**

50770 These functions shall not return an error code of [EINTR].

50771 **EXAMPLES**

50772 None.

50773 **APPLICATION USAGE**50774 The *pthread\_cond\_broadcast()* function is used whenever the shared-variable state has been  
50775 changed in a way that more than one thread can proceed with its task. Consider a single  
50776 producer/multiple consumer problem, where the producer can insert multiple items on a list  
50777 that is accessed one item at a time by the consumers. By calling the *pthread\_cond\_broadcast()*  
50778 function, the producer would notify all consumers that might be waiting, and thereby the  
50779 application would receive more throughput on a multi-processor. In addition,  
50780 *pthread\_cond\_broadcast()* makes it easier to implement a read-write lock. The  
50781 *pthread\_cond\_broadcast()* function is needed in order to wake up all waiting readers when a  
50782 writer releases its lock. Finally, the two-phase commit algorithm can use this broadcast function  
50783 to notify all clients of an impending transaction commit.

**pthread\_cond\_broadcast()**

50784 It is not safe to use the *pthread\_cond\_signal()* function in a signal handler that is invoked  
 50785 asynchronously. Even if it were safe, there would still be a race between the test of the Boolean  
 50786 *pthread\_cond\_wait()* that could not be efficiently eliminated.

50787 Mutexes and condition variables are thus not suitable for releasing a waiting thread by signaling  
 50788 from code running in a signal handler.

**RATIONALE**

50789 If an implementation detects that the value specified by the *cond* argument to  
 50790 *pthread\_cond\_broadcast()* or *pthread\_cond\_signal()* does not refer to an initialized condition  
 50791 variable, it is recommended that the function should fail and report an [EINVAL] error.  
 50792

**Multiple Awakenings by Condition Signal**

50793  
 50794 On a multi-processor, it may be impossible for an implementation of *pthread\_cond\_signal()* to  
 50795 avoid the unblocking of more than one thread blocked on a condition variable. For example,  
 50796 consider the following partial implementation of *pthread\_cond\_wait()* and *pthread\_cond\_signal()*,  
 50797 executed by two threads in the order given. One thread is trying to wait on the condition  
 50798 variable, another is concurrently executing *pthread\_cond\_signal()*, while a third thread is already  
 50799 waiting.

```

50800 pthread_cond_wait(mutex, cond):
50801     value = cond->value; /* 1 */
50802     pthread_mutex_unlock(mutex); /* 2 */
50803     pthread_mutex_lock(cond->mutex); /* 10 */
50804     if (value == cond->value) { /* 11 */
50805         me->next_cond = cond->waiter;
50806         cond->waiter = me;
50807         pthread_mutex_unlock(cond->mutex);
50808         unable_to_run(me);
50809     } else
50810         pthread_mutex_unlock(cond->mutex); /* 12 */
50811     pthread_mutex_lock(mutex); /* 13 */

50812 pthread_cond_signal(cond):
50813     pthread_mutex_lock(cond->mutex); /* 3 */
50814     cond->value++; /* 4 */
50815     if (cond->waiter) { /* 5 */
50816         sleeper = cond->waiter; /* 6 */
50817         cond->waiter = sleeper->next_cond; /* 7 */
50818         able_to_run(sleeper); /* 8 */
50819     }
50820     pthread_mutex_unlock(cond->mutex); /* 9 */
  
```

50821 The effect is that more than one thread can return from its call to *pthread\_cond\_wait()* or  
 50822 *pthread\_cond\_timedwait()* as a result of one call to *pthread\_cond\_signal()*. This effect is called  
 50823 “spurious wakeup”. Note that the situation is self-correcting in that the number of threads that  
 50824 are so awakened is finite; for example, the next thread to call *pthread\_cond\_wait()* after the  
 50825 sequence of events above blocks.

50826 While this problem could be resolved, the loss of efficiency for a fringe condition that occurs  
 50827 only rarely is unacceptable, especially given that one has to check the predicate associated with a  
 50828 condition variable anyway. Correcting this problem would unnecessarily reduce the degree of  
 50829 concurrency in this basic building block for all higher-level synchronization operations.

50830 An added benefit of allowing spurious wakeups is that applications are forced to code a

50831 predicate-testing-loop around the condition wait. This also makes the application tolerate  
50832 superfluous condition broadcasts or signals on the same condition variable that may be coded in  
50833 some other part of the application. The resulting applications are thus more robust. Therefore,  
50834 POSIX.1-2008 explicitly documents that spurious wakeups may occur.

50849 The [EINVAL] error for an uninitialized condition variable is removed; this condition results in  
50850 undefined behavior.

**pthread\_cond\_destroy()**

System Interfaces

50851 **NAME**

50852 pthread\_cond\_destroy, pthread\_cond\_init — destroy and initialize condition variables

50853 **SYNOPSIS**

```
50854 #include <pthread.h>
50855 int pthread_cond_destroy(pthread_cond_t *cond);
50856 int pthread_cond_init(pthread_cond_t *restrict cond,
50857     const pthread_condattr_t *restrict attr);
50858 pthread_cond_t cond = PTHREAD_COND_INITIALIZER;
```

50859 **DESCRIPTION**

50860 The *pthread\_cond\_destroy()* function shall destroy the given condition variable specified by *cond*;  
 50861 the object becomes, in effect, uninitialized. An implementation may cause *pthread\_cond\_destroy()*  
 50862 to set the object referenced by *cond* to an invalid value. A destroyed condition variable object can  
 50863 be reinitialized using *pthread\_cond\_init()*; the results of otherwise referencing the object after it  
 50864 has been destroyed are undefined.

50865 It shall be safe to destroy an initialized condition variable upon which no threads are currently  
 50866 blocked. Attempting to destroy a condition variable upon which other threads are currently  
 50867 blocked results in undefined behavior.

50868 The *pthread\_cond\_init()* function shall initialize the condition variable referenced by *cond* with  
 50869 attributes referenced by *attr*. If *attr* is NULL, the default condition variable attributes shall be  
 50870 used; the effect is the same as passing the address of a default condition variable attributes  
 50871 object. Upon successful initialization, the state of the condition variable shall become initialized.

50872 Only *cond* itself may be used for performing synchronization. The result of referring to copies of  
 50873 *cond* in calls to *pthread\_cond\_wait()*, *pthread\_cond\_timedwait()*, *pthread\_cond\_signal()*,  
 50874 *pthread\_cond\_broadcast()*, and *pthread\_cond\_destroy()* is undefined.

50875 Attempting to initialize an already initialized condition variable results in undefined behavior.

50876 In cases where default condition variable attributes are appropriate, the macro  
 50877 PTHREAD\_COND\_INITIALIZER can be used to initialize condition variables that are statically  
 50878 allocated. The effect shall be equivalent to dynamic initialization by a call to *pthread\_cond\_init()*  
 50879 with parameter *attr* specified as NULL, except that no error checks are performed.

50880 The behavior is undefined if the value specified by the *cond* argument to *pthread\_cond\_destroy()*  
 50881 does not refer to an initialized condition variable.

50882 The behavior is undefined if the value specified by the *attr* argument to *pthread\_cond\_init()* does  
 50883 not refer to an initialized condition variable attributes object.

50884 **RETURN VALUE**

50885 If successful, the *pthread\_cond\_destroy()* and *pthread\_cond\_init()* functions shall return zero;  
 50886 otherwise, an error number shall be returned to indicate the error.

50887 **ERRORS**

50888 The *pthread\_cond\_init()* function shall fail if:

50889 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize  
 50890 another condition variable.

50891 [ENOMEM] Insufficient memory exists to initialize the condition variable.

50892 These functions shall not return an error code of [EINTR].

**EXAMPLES**

50894 A condition variable can be destroyed immediately after all the threads that are blocked on it are  
50895 awakened. For example, consider the following code:

```
50896 struct list {
50897     pthread_mutex_t lm;
50898     ...
50899 }

50900 struct elt {
50901     key k;
50902     int busy;
50903     pthread_cond_t notbusy;
50904     ...
50905 }

50906 /* Find a list element and reserve it. */
50907 struct elt *
50908 list_find(struct list *lp, key k)
50909 {
50910     struct elt *ep;

50911     pthread_mutex_lock(&lp->lm);
50912     while ((ep = find_elt(l, k) != NULL) && ep->busy)
50913         pthread_cond_wait(&ep->notbusy, &lp->lm);
50914     if (ep != NULL)
50915         ep->busy = 1;
50916     pthread_mutex_unlock(&lp->lm);
50917     return(ep);
50918 }

50919 delete_elt(struct list *lp, struct elt *ep)
50920 {
50921     pthread_mutex_lock(&lp->lm);
50922     assert(ep->busy);
50923     ... remove ep from list ...
50924     ep->busy = 0; /* Paranoid. */
50925     (A) pthread_cond_broadcast(&ep->notbusy);
50926     pthread_mutex_unlock(&lp->lm);
50927     (B) pthread_cond_destroy(&rp->notbusy);
50928     free(ep);
50929 }
```

50930 In this example, the condition variable and its list element may be freed (line B) immediately  
50931 after all threads waiting for it are awakened (line A), since the mutex and the code ensure that  
50932 no other thread can touch the element to be deleted.

**APPLICATION USAGE**

50934 None.

**RATIONALE**

50936 If an implementation detects that the value specified by the *cond* argument to  
50937 *pthread\_cond\_destroy()* does not refer to an initialized condition variable, it is recommended that  
50938 the function should fail and report an [EINVAL] error.

50939 If an implementation detects that the value specified by the *cond* argument to

**pthread\_cond\_destroy()**

System Interfaces

50940 *pthread\_cond\_destroy()* or *pthread\_cond\_init()* refers to a condition variable that is in use (for  
 50941 example, in a *pthread\_cond\_wait()* call) by another thread, or detects that the value specified by  
 50942 the *cond* argument to *pthread\_cond\_init()* refers to an already initialized condition variable, it is  
 50943 recommended that the function should fail and report an [EBUSY] error.

50944 If an implementation detects that the value specified by the *attr* argument to *pthread\_cond\_init()*  
 50945 does not refer to an initialized condition variable attributes object, it is recommended that the  
 50946 function should fail and report an [EINVAL] error.

50947 See also *pthread\_mutex\_destroy()*.

**FUTURE DIRECTIONS**

50948 None.

**SEE ALSO**

**pthread\_cond\_timedwait()**50975 **NAME**

50976 pthread\_cond\_timedwait, pthread\_cond\_wait — wait on a condition

50977 **SYNOPSIS**

```
50978 #include <pthread.h>
50979
50979 int pthread_cond_timedwait(pthread_cond_t *restrict cond,
50980 pthread_mutex_t *restrict mutex,
50981 const struct timespec *restrict abstime);
50982
50982 int pthread_cond_wait(pthread_cond_t *restrict cond,
50983 pthread_mutex_t *restrict mutex);
```

50984 **DESCRIPTION**

50985 The *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()* functions shall block on a condition  
 50986 variable. The application shall ensure that these functions are called with *mutex* locked by the  
 50987 calling thread; otherwise, an error (for PTHREAD\_MUTEX\_ERRORCHECK and robust  
 50988 mutexes) or undefined behavior (for other mutexes) results.

50989 These functions atomically release *mutex* and cause the calling thread to block on the condition  
 50990 variable *cond*; atomically here means “atomically with respect to access by another thread to the  
 50991 mutex and then the condition variable”. That is, if another thread is able to acquire the mutex  
 50992 after the about-to-block thread has released it, then a subsequent call to *pthread\_cond\_broadcast()*  
 50993 or *pthread\_cond\_signal()* in that thread shall behave as if it were issued after the about-to-block  
 50994 thread has blocked.

50995 Upon successful return, the mutex shall have been locked and shall be owned by the calling  
 50996 thread. If *mutex* is a robust mutex where an owner terminated while holding the lock and the  
 50997 state is recoverable, the mutex shall be acquired even though the function returns an error code.

50998 When using condition variables there is always a Boolean predicate involving shared variables  
 50999 associated with each condition wait that is true if the thread should proceed. Spurious wakeups  
 51000 from the *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* functions may occur. Since the return  
 51001 from *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* does not imply anything about the value of  
 51002 this predicate, the predicate should be re-evaluated upon such return.

51003 When a thread waits on a condition variable, having specified a particular mutex to either the  
 51004 *pthread\_cond\_timedwait()* or the *pthread\_cond\_wait()* operation, a dynamic binding is formed  
 51005 between that mutex and condition variable that remains in effect as long as at least one thread is  
 51006 blocked on the condition variable. During this time, the effect of an attempt by any thread to  
 51007 wait on that condition variable using a different mutex is undefined. Once all waiting threads  
 51008 have been unblocked (as by the *pthread\_cond\_broadcast()* operation), the next wait operation on  
 51009 that condition variable shall form a new dynamic binding with the mutex specified by that wait  
 51010 operation. Even though the dynamic binding between condition variable and mutex may be  
 51011 removed or replaced between the time a thread is unblocked from a wait on the condition  
 51012 variable and the time that it returns to the caller or begins cancellation cleanup, the unblocked  
 51013 thread shall always re-acquire the mutex specified in the condition wait operation call from  
 51014 which it is returning.

51015 A condition wait (whether timed or not) is a cancellation point. When the cancelability type of a  
 51016 thread is set to PTHREAD\_CANCEL\_DEFERRED, a side-effect of acting upon a cancellation  
 51017 request while in a condition wait is that the mutex is (in effect) re-acquired before calling the first  
 51018 cancellation cleanup handler. The effect is as if the thread were unblocked, allowed to execute up  
 51019 to the point of returning from the call to *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()*, but at  
 51020 that point notices the cancellation request and instead of returning to the caller of  
 51021 *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()*, starts the thread cancellation activities, which  
 51022 includes calling cancellation cleanup handlers.

51023 A thread that has been unblocked because it has been canceled while blocked in a call to  
 51024 *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* shall not consume any condition signal that may  
 51025 be directed concurrently at the condition variable if there are other threads blocked on the  
 51026 condition variable.

51027 The *pthread\_cond\_timedwait()* function shall be equivalent to *pthread\_cond\_wait()*, except that an  
 51028 error is returned if the absolute time specified by *abstime* passes (that is, system time equals or  
 51029 exceeds *abstime*) before the condition *cond* is signaled or broadcasted, or if the absolute time  
 51030 specified by *abstime* has already been passed at the time of the call.

51031 The condition variable shall have a clock attribute which specifies the clock that shall be used to  
 51032 measure the time specified by the *abstime* argument. When such timeouts occur,  
 51033 *pthread\_cond\_timedwait()* shall nonetheless release and re-acquire the mutex referenced by *mutex*.  
 51034 The *pthread\_cond\_timedwait()* function is also a cancellation point.

51035 If a signal is delivered to a thread waiting for a condition variable, upon return from the signal  
 51036 handler the thread resumes waiting for the condition variable as if it was not interrupted, or it  
 51037 shall return zero due to spurious wakeup.

51038 The behavior is undefined if the value specified by the *cond* or *mutex* argument to these  
 51039 functions does not refer to an initialized condition variable or an initialized mutex object,  
 51040 respectively.

#### 51041 RETURN VALUE

51042 Except in the case of [ETIMEDOUT], all these error checks shall act as if they were performed  
 51043 immediately at the beginning of processing for the function and shall cause an error return, in  
 51044 effect, prior to modifying the state of the mutex specified by *mutex* or the condition variable  
 51045 specified by *cond*.

51046 Upon successful completion, a value of zero shall be returned; otherwise, an error number shall  
 51047 be returned to indicate the error.

#### 51048 ERRORS

51049 These functions shall fail if:

51050 [ENOTRECOVERABLE]

51051 The state protected by the mutex is not recoverable.

51052 [EOWNERDEAD]

51053 The mutex is a robust mutex and the process containing the previous owning  
 51054 thread terminated while holding the mutex lock. The mutex lock shall be  
 51055 acquired by the calling thread and it is up to the new owner to make the state  
 51056 consistent.

51057 [EPERM]

51058 The mutex type is PTHREAD\_MUTEX\_ERRORCHECK or the mutex is a  
 robust mutex, and the current thread does not own the mutex.

51059 The *pthread\_cond\_timedwait()* function shall fail if:

51060 [ETIMEDOUT] The time specified by *abstime* to *pthread\_cond\_timedwait()* has passed.

51061 [EINVAL]

51062 The *abstime* argument specified a nanosecond value less than zero or greater  
 than or equal to 1000 million.

51063 These functions may fail if:

51064 [EOWNERDEAD]

51065 The mutex is a robust mutex and the previous owning thread terminated  
 51066 while holding the mutex lock. The mutex lock shall be acquired by the calling

**pthread\_cond\_timedwait()**

51067 thread and it is up to the new owner to make the state consistent.

51068 These functions shall not return an error code of [EINTR].

**EXAMPLES**

51070 None.

**APPLICATION USAGE**

51072 Applications that have assumed that non-zero return values are errors will need updating for  
51073 use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting  
51074 a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error  
51075 returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If  
51076 an application is supposed to work with normal and robust mutexes, it should check all return  
51077 values for error conditions and if necessary take appropriate action.

**RATIONALE**

51078 If an implementation detects that the value specified by the *cond* argument to  
51079 *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()* does not refer to an initialized condition  
51080 variable, or detects that the value specified by the *mutex* argument to *pthread\_cond\_timedwait()* or  
51081 *pthread\_cond\_wait()* does not refer to an initialized mutex object, it is recommended that the  
51082 function should fail and report an [EINVAL] error.  
51083

**Condition Wait Semantics**

51084  
51085 It is important to note that when *pthread\_cond\_wait()* and *pthread\_cond\_timedwait()* return  
51086 without error, the associated predicate may still be false. Similarly, when  
51087 *pthread\_cond\_timedwait()* returns with the timeout error, the associated predicate may be true  
51088 due to an unavoidable race between the expiration of the timeout and the predicate state change.

51089 The application needs to recheck the predicate on any return because it cannot be sure there is  
51090 another thread waiting on the thread to handle the signal, and if there is not then the signal is  
51091 lost. The burden is on the application to check the predicate.

51092 Some implementations, particularly on a multi-processor, may sometimes cause multiple  
51093 threads to wake up when the condition variable is signaled simultaneously on different  
51094 processors.

51095 In general, whenever a condition wait returns, the thread has to re-evaluate the predicate  
51096 associated with the condition wait to determine whether it can safely proceed, should wait  
51097 again, or should declare a timeout. A return from the wait does not imply that the associated  
51098 predicate is either true or false.

51099 It is thus recommended that a condition wait be enclosed in the equivalent of a “while loop”  
51100 that checks the predicate.

**Timed Wait Semantics**

51101  
51102 An absolute time measure was chosen for specifying the timeout parameter for two reasons.  
51103 First, a relative time measure can be easily implemented on top of a function that specifies  
51104 absolute time, but there is a race condition associated with specifying an absolute timeout on top  
51105 of a function that specifies relative timeouts. For example, assume that *clock\_gettime()* returns  
51106 the current time and *cond\_relative\_timed\_wait()* uses relative timeouts:

```
51107 clock_gettime(CLOCK_REALTIME, &now)
51108 reltime = sleep_til_this_absolute_time -now;
51109 cond_relative_timed_wait(c, m, &reltime);
```

51110 If the thread is preempted between the first statement and the last statement, the thread blocks

51111 for too long. Blocking, however, is irrelevant if an absolute timeout is used. An absolute timeout  
 51112 also need not be recomputed if it is used multiple times in a loop, such as that enclosing a  
 51113 condition wait.

51114 For cases when the system clock is advanced discontinuously by an operator, it is expected that  
 51115 implementations process any timed wait expiring at an intervening time as if that time had  
 51116 actually occurred.

#### 51117 **Cancellation and Condition Wait**

51118 A condition wait, whether timed or not, is a cancellation point. That is, the functions  
 51119 `pthread_cond_wait()` or `pthread_cond_timedwait()` are points where a pending (or concurrent)  
 51120 cancellation request is noticed. The reason for this is that an indefinite wait is possible at these  
 51121 points—whatever event is being waited for, even if the program is totally correct, might never  
 51122 occur; for example, some input data being awaited might never be sent. By making condition  
 51123 wait a cancellation point, the thread can be canceled and perform its cancellation cleanup  
 51124 handler even though it may be stuck in some indefinite wait.

51125 A side-effect of acting on a cancellation request while a thread is blocked on a condition variable  
 51126 is to re-acquire the mutex before calling any of the cancellation cleanup handlers. This is done in  
 51127 order to ensure that the cancellation cleanup handler is executed in the same state as the critical  
 51128 code that lies both before and after the call to the condition wait function. This rule is also  
 51129 required when interfacing to POSIX threads from languages, such as Ada or C++, which may  
 51130 choose to map cancellation onto a language exception; this rule ensures that each exception  
 51131 handler guarding a critical section can always safely depend upon the fact that the associated  
 51132 mutex has already been locked regardless of exactly where within the critical section the  
 51133 exception was raised. Without this rule, there would not be a uniform rule that exception  
 51134 handlers could follow regarding the lock, and so coding would become very cumbersome.

51135 Therefore, since *some* statement has to be made regarding the state of the lock when a  
 51136 cancellation is delivered during a wait, a definition has been chosen that makes application  
 51137 coding most convenient and error free.

51138 When acting on a cancellation request while a thread is blocked on a condition variable, the  
 51139 implementation is required to ensure that the thread does not consume any condition signals  
 51140 directed at that condition variable if there are any other threads waiting on that condition  
 51141 variable. This rule is specified in order to avoid deadlock conditions that could occur if these  
 51142 two independent requests (one acting on a thread and the other acting on the condition variable)  
 51143 were not processed independently.

#### 51144 **Performance of Mutexes and Condition Variables**

51145 Mutexes are expected to be locked only for a few instructions. This practice is almost  
 51146 automatically enforced by the desire of programmers to avoid long serial regions of execution  
 51147 (which would reduce total effective parallelism).

51148 When using mutexes and condition variables, one tries to ensure that the usual case is to lock the  
 51149 mutex, access shared data, and unlock the mutex. Waiting on a condition variable should be a  
 51150 relatively rare situation. For example, when implementing a read-write lock, code that acquires a  
 51151 read-lock typically needs only to increment the count of readers (under mutual-exclusion) and  
 51152 return. The calling thread would actually wait on the condition variable only when there is  
 51153 already an active writer. So the efficiency of a synchronization operation is bounded by the cost  
 51154 of mutex lock/unlock and not by condition wait. Note that in the usual case there is no context  
 51155 switch.

51156 This is not to say that the efficiency of condition waiting is unimportant. Since there needs to be

**pthread\_cond\_timedwait()**

51157 at least one context switch per Ada rendezvous, the efficiency of waiting on a condition variable  
 51158 is important. The cost of waiting on a condition variable should be little more than the minimal  
 51159 cost for a context switch plus the time to unlock and lock the mutex.

**51160 Features of Mutexes and Condition Variables**

51161 It had been suggested that the mutex acquisition and release be decoupled from condition wait.  
 51162 This was rejected because it is the combined nature of the operation that, in fact, facilitates  
 51163 realtime implementations. Those implementations can atomically move a high-priority thread  
 51164 between the condition variable and the mutex in a manner that is transparent to the caller. This  
 51165 can prevent extra context switches and provide more deterministic acquisition of a mutex when  
 51166 the waiting thread is signaled. Thus, fairness and priority issues can be dealt with directly by the  
 51167 scheduling discipline. Furthermore, the current condition wait operation matches existing  
 51168 practice.

**51169 Scheduling Behavior of Mutexes and Condition Variables**

51170 Synchronization primitives that attempt to interfere with scheduling policy by specifying an  
 51171 ordering rule are considered undesirable. Threads waiting on mutexes and condition variables  
 51172 are selected to proceed in an order dependent upon the scheduling policy rather than in some  
 51173 fixed order (for example, FIFO or priority). Thus, the scheduling policy determines which  
 51174 thread(s) are awakened and allowed to proceed.

**51175 Timed Condition Wait**

51176 The *pthread\_cond\_timedwait()* function allows an application to give up waiting for a particular  
 51177 condition after a given amount of time. An example of its use follows:

```
51178 (void) pthread_mutex_lock(&t.mn);
51179     t.waiters++;
51180     clock_gettime(CLOCK_REALTIME, &ts);
51181     ts.tv_sec += 5;
51182     rc = 0;
51183     while (! mypredicate(&t) && rc == 0)
51184         rc = pthread_cond_timedwait(&t.cond, &t.mn, &ts);
51185     t.waiters--;
51186     if (rc == 0) setmystate(&t);
51187 (void) pthread_mutex_unlock(&t.mn);
```

51188 By making the timeout parameter absolute, it does not need to be recomputed each time the  
 51189 program checks its blocking predicate. If the timeout was relative, it would have to be  
 51190 recomputed before each call. This would be especially difficult since such code would need to  
 51191 take into account the possibility of extra wakeups that result from extra broadcasts or signals on  
 51192 the condition variable that occur before either the predicate is true or the timeout is due.

**51193 FUTURE DIRECTIONS**

51194 None.

**CHANGE HISTORY**

51198 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

51201 The *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()* functions are marked as part of the  
51202 Threads option.

51203 The Open Group Corrigendum U021/9 is applied, correcting the prototype for the  
51204 *pthread\_cond\_wait()* function.

51205 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics  
51206 for the Clock Selection option.

51207 The ERRORS section has an additional case for [EPERM] in response to IEEE PASC  
51208 Interpretation 1003.1c #28.

51209 The **restrict** keyword is added to the *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()*  
51210 prototypes for alignment with the ISO/IEC 9899:1999 standard.

51211 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/89 is applied, updating the  
51212 DESCRIPTION for consistency with the *pthread\_cond\_destroy()* function that states it is safe to  
51213 destroy an initialized condition variable upon which no threads are currently blocked.

51214 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/90 is applied, updating words in the  
51215 DESCRIPTION from “the cancelability enable state” to “the cancelability type”.

51216 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/91 is applied, updating the ERRORS  
51217 section to remove the error case related to *abstime* from the *pthread\_cond\_wait()* function, and to  
51218 make the error case related to *abstime* mandatory for *pthread\_cond\_timedwait()* for consistency  
51219 with other functions.

51220 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/92 is applied, adding a new paragraph to  
51221 the RATIONALE section stating that an application should check the predicate on any return  
51222 from this function.

**Issue 7**

51223 SD5-XSH-ERN-44 is applied, changing the definition of the “shall fail” case of the [EINVAL]  
51224 error.

51226 Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

51227 The *pthread\_cond\_timedwait()* and *pthread\_cond\_wait()* functions are moved from the Threads  
51228 option to the Base.

51229 The [EINVAL] error for an uninitialized condition variable or uninitialized mutex object is  
51230 removed; this condition results in undefined behavior”

51231 The [EPERM] error is revised and moved to the “shall fail” list of error conditions for the  
51232 *pthread\_cond\_timedwait()* function.

51233 The DESCRIPTION is updated to clarify the behavior when *mutex* is a robust mutex.

51234 The ERRORS section is updated to include “shall fail” cases for  
51235 PTHREAD\_MUTEX\_ERRORCHECK mutexes.

51236 The DESCRIPTION is rewritten to clarify that undefined behavior occurs only for mutexes  
51237 where the [EPERM] error is not mandated.

**pthread\_condattr\_destroy()**51238 **NAME**

51239 pthread\_condattr\_destroy, pthread\_condattr\_init — destroy and initialize the condition variable  
51240 attributes object

51241 **SYNOPSIS**

```
51242 #include <pthread.h>
51243 int pthread_condattr_destroy(pthread_condattr_t *attr);
51244 int pthread_condattr_init(pthread_condattr_t *attr);
```

51245 **DESCRIPTION**

51246 The *pthread\_condattr\_destroy()* function shall destroy a condition variable attributes object; the  
51247 object becomes, in effect, uninitialized. An implementation may cause *pthread\_condattr\_destroy()*  
51248 to set the object referenced by *attr* to an invalid value. A destroyed *attr* attributes object can be  
51249 reinitialized using *pthread\_condattr\_init()*; the results of otherwise referencing the object after it  
51250 has been destroyed are undefined.

51251 The *pthread\_condattr\_init()* function shall initialize a condition variable attributes object *attr* with  
51252 the default value for all of the attributes defined by the implementation.

51253 Results are undefined if *pthread\_condattr\_init()* is called specifying an already initialized *attr*  
51254 attributes object.

51255 After a condition variable attributes object has been used to initialize one or more condition  
51256 variables, any function affecting the attributes object (including destruction) shall not affect any  
51257 previously initialized condition variables.

51258 This volume of POSIX.1-2008 requires two attributes, the *clock* attribute and the *process-shared*  
51259 attribute.

51260 Additional attributes, their default values, and the names of the associated functions to get and  
51261 set those attribute values are implementation-defined.

51262 The behavior is undefined if the value specified by the *attr* argument to  
51263 *pthread\_condattr\_destroy()* does not refer to an initialized condition variable attributes object.

51264 **RETURN VALUE**

51265 If successful, the *pthread\_condattr\_destroy()* and *pthread\_condattr\_init()* functions shall return  
51266 zero; otherwise, an error number shall be returned to indicate the error.

51267 **ERRORS**

51268 The *pthread\_condattr\_init()* function shall fail if:

51269 [ENOMEM] Insufficient memory exists to initialize the condition variable attributes object.

51270 These functions shall not return an error code of [EINTR].

51271 **EXAMPLES**

51272 None.

51273 **APPLICATION USAGE**

51274 None.

51275 **RATIONALE**

51276 A *process-shared* attribute has been defined for condition variables for the same reason it has been  
51277 defined for mutexes.

51278 If an implementation detects that the value specified by the *attr* argument to  
51279 *pthread\_condattr\_destroy()* does not refer to an initialized condition variable attributes object, it is  
51280 recommended that the function should fail and report an [EINVAL] error.

51281 See also *pthread\_attr\_destroy()* and *pthread\_mutex\_destroy()*.

51282 **FUTURE DIRECTIONS**

51283 None.

51284 **SEE ALSO**

51285 *pthread\_attr\_destroy()*, *pthread\_cond\_destroy()*, *pthread\_condattr\_getpshared()*, *pthread\_create()*,  
51286 *pthread\_mutex\_destroy()*

51287 XBD <pthread.h>

51288 **CHANGE HISTORY**

51289 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

51290 **Issue 6**

51291 The *pthread\_condattr\_destroy()* and *pthread\_condattr\_init()* functions are marked as part of the  
51292 Threads option.

51293 **Issue 7**

51294 The *pthread\_condattr\_destroy()* and *pthread\_condattr\_init()* functions are moved from the Threads  
51295 option to the Base.

51296 The [EINVAL] error for an uninitialized condition variable attributes object is removed; this  
51297 condition results in undefined behavior.

**pthread\_condattr\_getclock()**

System Interfaces

51298 **NAME**

51299 pthread\_condattr\_getclock, pthread\_condattr\_setclock — get and set the clock selection  
 51300 condition variable attribute

51301 **SYNOPSIS**

```
51302 #include <pthread.h>
51303 int pthread_condattr_getclock(const pthread_condattr_t *restrict attr,
51304 clockid_t *restrict clock_id);
51305 int pthread_condattr_setclock(pthread_condattr_t *attr,
51306 clockid_t clock_id);
```

51307 **DESCRIPTION**

51308 The *pthread\_condattr\_getclock()* function shall obtain the value of the *clock* attribute from the  
 51309 attributes object referenced by *attr*.

51310 The *pthread\_condattr\_setclock()* function shall set the *clock* attribute in an initialized attributes  
 51311 object referenced by *attr*. If *pthread\_condattr\_setclock()* is called with a *clock\_id* argument that  
 51312 refers to a CPU-time clock, the call shall fail.

51313 The *clock* attribute is the clock ID of the clock that shall be used to measure the timeout service of  
 51314 *pthread\_cond\_timedwait()*. The default value of the *clock* attribute shall refer to the system clock.

51315 The behavior is undefined if the value specified by the *attr* argument to  
 51316 *pthread\_condattr\_getclock()* or *pthread\_condattr\_setclock()* does not refer to an initialized condition  
 51317 variable attributes object.

51318 **RETURN VALUE**

51319 If successful, the *pthread\_condattr\_getclock()* function shall return zero and store the value of the  
 51320 clock attribute of *attr* into the object referenced by the *clock\_id* argument. Otherwise, an error  
 51321 number shall be returned to indicate the error.

51322 If successful, the *pthread\_condattr\_setclock()* function shall return zero; otherwise, an error  
 51323 number shall be returned to indicate the error.

51324 **ERRORS**

51325 The *pthread\_condattr\_setclock()* function may fail if:

51326 [EINVAL] The value specified by *clock\_id* does not refer to a known clock, or is a CPU-  
 51327 time clock.

51328 These functions shall not return an error code of [EINTR].

51329 **EXAMPLES**

51330 None.

51331 **APPLICATION USAGE**

51332 None.

51333 **RATIONALE**

51334 If an implementation detects that the value specified by the *attr* argument to  
 51335 *pthread\_condattr\_getclock()* or *pthread\_condattr\_setclock()* does not refer to an initialized condition  
 51336 variable attributes object, it is recommended that the function should fail and report an  
 51337 [EINVAL] error.

51338 **FUTURE DIRECTIONS**

51339 None.

51340 **SEE ALSO**

51341 *pthread\_cond\_destroy()*, *pthread\_cond\_timedwait()*, *pthread\_condattr\_destroy()*,  
51342 *pthread\_condattr\_getpshared()*, *pthread\_create()*, *pthread\_mutex\_destroy()*

51343 XBD <pthread.h>

51344 **CHANGE HISTORY**

51345 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

51346 **Issue 7**

51347 The *pthread\_condattr\_getclock()* and *pthread\_condattr\_setclock()* functions are moved from the  
51348 Clock Selection option to the Base.

51349 The [EINVAL] error for an uninitialized condition variable attributes object is removed; this  
51350 condition results in undefined behavior.

**pthread\_condattr\_getpshared()**51351 **NAME**

51352 pthread\_condattr\_getpshared, pthread\_condattr\_setpshared — get and set the process-shared  
 51353 condition variable attributes

51354 **SYNOPSIS**

```
51355 TSH #include <pthread.h>
51356
51356 int pthread_condattr_getpshared(const pthread_condattr_t *restrict attr,
51357 int *restrict pshared);
51358
51358 int pthread_condattr_setpshared(pthread_condattr_t *attr,
51359 int pshared);
```

51360 **DESCRIPTION**

51361 The *pthread\_condattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
 51362 from the attributes object referenced by *attr*.

51363 The *pthread\_condattr\_setpshared()* function shall set the *process-shared* attribute in an initialized  
 51364 attributes object referenced by *attr*.

51365 The *process-shared* attribute is set to PTHREAD\_PROCESS\_SHARED to permit a condition  
 51366 variable to be operated upon by any thread that has access to the memory where the condition  
 51367 variable is allocated, even if the condition variable is allocated in memory that is shared by  
 51368 multiple processes. If the *process-shared* attribute is PTHREAD\_PROCESS\_PRIVATE, the  
 51369 condition variable shall only be operated upon by threads created within the same process as the  
 51370 thread that initialized the condition variable; if threads of differing processes attempt to operate  
 51371 on such a condition variable, the behavior is undefined. The default value of the attribute is  
 51372 PTHREAD\_PROCESS\_PRIVATE.

51373 The behavior is undefined if the value specified by the *attr* argument to  
 51374 *pthread\_condattr\_getpshared()* or *pthread\_condattr\_setpshared()* does not refer to an initialized  
 51375 condition variable attributes object.

51376 **RETURN VALUE**

51377 If successful, the *pthread\_condattr\_setpshared()* function shall return zero; otherwise, an error  
 51378 number shall be returned to indicate the error.

51379 If successful, the *pthread\_condattr\_getpshared()* function shall return zero and store the value of  
 51380 the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise,  
 51381 an error number shall be returned to indicate the error.

51382 **ERRORS**

51383 The *pthread\_condattr\_setpshared()* function may fail if:

51384 [EINVAL] The new value specified for the attribute is outside the range of legal values  
 51385 for that attribute.

51386 These functions shall not return an error code of [EINTR].

51387 **EXAMPLES**

51388 None.

51389 **APPLICATION USAGE**

51390 None.

51391 **RATIONALE**

51392 If an implementation detects that the value specified by the *attr* argument to  
 51393 *pthread\_condattr\_getpshared()* or *pthread\_condattr\_setpshared()* does not refer to an initialized  
 51394 condition variable attributes object, it is recommended that the function should fail and report  
 51395 an [EINVAL] error.

51396 **FUTURE DIRECTIONS**

51397 None.

51398 **SEE ALSO**51399 *pthread\_create()*, *pthread\_cond\_destroy()*, *pthread\_condattr\_destroy()*, *pthread\_mutex\_destroy()*

51400 XBD &lt;pthread.h&gt;

51401 **CHANGE HISTORY**

51402 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

51403 **Issue 6**

51404 The *pthread\_condattr\_getpshared()* and *pthread\_condattr\_setpshared()* functions are marked as part  
 51405 of the Threads and Thread Process-Shared Synchronization options.

51406 The **restrict** keyword is added to the *pthread\_condattr\_getpshared()* prototype for alignment with  
 51407 the ISO/IEC 9899:1999 standard.

51408 **Issue 7**

51409 The *pthread\_condattr\_getpshared()* and *pthread\_condattr\_setpshared()* functions are moved from the  
 51410 Threads option.

51411 The [EINVAL] error for an uninitialized condition variable attributes object is removed; this  
 51412 condition results in undefined behavior.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

51436 **NAME**

51437 pthread\_create — thread creation

51438 **SYNOPSIS**

```
51439 #include <pthread.h>
51440 int pthread_create(pthread_t *restrict thread,
51441                  const pthread_attr_t *restrict attr,
51442                  void *(*start_routine)(void*), void *restrict arg);
```

51443 **DESCRIPTION**

51444 The *pthread\_create()* function shall create a new thread, with attributes specified by *attr*, within a  
 51445 process. If *attr* is NULL, the default attributes shall be used. If the attributes specified by *attr* are  
 51446 modified later, the thread's attributes shall not be affected. Upon successful completion,  
 51447 *pthread\_create()* shall store the ID of the created thread in the location referenced by *thread*.

51448 The thread is created executing *start\_routine* with *arg* as its sole argument. If the *start\_routine*  
 51449 returns, the effect shall be as if there was an implicit call to *pthread\_exit()* using the return value  
 51450 of *start\_routine* as the exit status. Note that the thread in which *main()* was originally invoked  
 51451 differs from this. When it returns from *main()*, the effect shall be as if there was an implicit call to  
 51452 *exit()* using the return value of *main()* as the exit status.

51453 The signal state of the new thread shall be initialized as follows:

- 51454 • The signal mask shall be inherited from the creating thread.
- 51455 • The set of signals pending for the new thread shall be empty.

51456 XSI The alternate stack shall not be inherited.

51457 The floating-point environment shall be inherited from the creating thread.

51458 If *pthread\_create()* fails, no new thread is created and the contents of the location referenced by  
 51459 *thread* are undefined.

51460 TCT If `_POSIX_THREAD_CPUTIME` is defined, the new thread shall have a CPU-time clock  
 51461 accessible, and the initial value of this clock shall be set to zero.

51462 The behavior is undefined if the value specified by the *attr* argument to *pthread\_create()* does not  
 51463 refer to an initialized thread attributes object.

51464 **RETURN VALUE**

51465 If successful, the *pthread\_create()* function shall return zero; otherwise, an error number shall be  
 51466 returned to indicate the error.

51467 **ERRORS**

51468 The *pthread\_create()* function shall fail if:

51469 [EAGAIN] The system lacked the necessary resources to create another thread, or the  
 51470 system-imposed limit on the total number of threads in a process  
 51471 {PTHREAD\_THREADS\_MAX} would be exceeded.

51472 [EPERM] The caller does not have appropriate privileges to set the required scheduling  
 51473 parameters or scheduling policy.

51474 The *pthread\_create()* function shall not return an error code of [EINTR].

**pthread\_create()**51475 **EXAMPLES**

51476 None.

51477 **APPLICATION USAGE**

51478 There is no requirement on the implementation that the ID of the created thread be available  
 51479 before the newly created thread starts executing. The calling thread can obtain the ID of the  
 51480 created thread through the return value of the *pthread\_create()* function, and the newly created  
 51481 thread can obtain its ID by a call to *pthread\_self()*.

51482 **RATIONALE**

51483 A suggested alternative to *pthread\_create()* would be to define two separate operations: create  
 51484 and start. Some applications would find such behavior more natural. Ada, in particular,  
 51485 separates the “creation” of a task from its “activation”.

51486 Splitting the operation was rejected by the standard developers for many reasons:

- 51487 • The number of calls required to start a thread would increase from one to two and thus
- 51488 place an additional burden on applications that do not require the additional
- 51489 synchronization. The second call, however, could be avoided by the additional
- 51490 complication of a start-up state attribute.
- 51491 • An extra state would be introduced: “created but not started”. This would require the
- 51492 standard to specify the behavior of the thread operations when the target has not yet
- 51493 started executing.
- 51494 • For those applications that require such behavior, it is possible to simulate the two separate
- 51495 steps with the facilities that are currently provided. The *start\_routine()* can synchronize by
- 51496 waiting on a condition variable that is signaled by the start operation.

51497 An Ada implementor can choose to create the thread at either of two points in the Ada program:  
 51498 when the task object is created, or when the task is activated (generally at a “begin”). If the first  
 51499 approach is adopted, the *start\_routine()* needs to wait on a condition variable to receive the order  
 51500 to begin “activation”. The second approach requires no such condition variable or extra  
 51501 synchronization. In either approach, a separate Ada task control block would need to be created  
 51502 when the task object is created to hold rendezvous queues, and so on.

51503 An extension of the preceding model would be to allow the state of the thread to be modified  
 51504 between the create and start. This would allow the thread attributes object to be eliminated. This  
 51505 has been rejected because:

- 51506 • All state in the thread attributes object has to be able to be set for the thread. This would
- 51507 require the definition of functions to modify thread attributes. There would be no
- 51508 reduction in the number of function calls required to set up the thread. In fact, for an
- 51509 application that creates all threads using identical attributes, the number of function calls
- 51510 required to set up the threads would be dramatically increased. Use of a thread attributes
- 51511 object permits the application to make one set of attribute setting function calls.
- 51512 Otherwise, the set of attribute setting function calls needs to be made for each thread
- 51513 creation.
- 51514 • Depending on the implementation architecture, functions to set thread state would require
- 51515 kernel calls, or for other implementation reasons would not be able to be implemented as
- 51516 macros, thereby increasing the cost of thread creation.
- 51517 • The ability for applications to segregate threads by class would be lost.

51518 Another suggested alternative uses a model similar to that for process creation, such as “thread  
 51519 fork”. The fork semantics would provide more flexibility and the “create” function can be  
 51520 implemented simply by doing a thread fork followed immediately by a call to the desired “start

51521 routine” for the thread. This alternative has these problems:

- 51522 • For many implementations, the entire stack of the calling thread would need to be
- 51523 duplicated, since in many architectures there is no way to determine the size of the calling
- 51524 frame.
- 51525 • Efficiency is reduced since at least some part of the stack has to be copied, even though in
- 51526 most cases the thread never needs the copied context, since it merely calls the desired start
- 51527 routine.

51528 If an implementation detects that the value specified by the *attr* argument to *pthread\_create()*

51529 does not refer to an initialized thread attributes object, it is recommended that the function

51530 should fail and report an [EINVAL] error.

#### 51531 FUTURE DIRECTIONS

51532 None.

#### 51533 SEE ALSO

51534 *fork()*, *pthread\_exit()*, *pthread\_join()*

51535 XBD Section 4.11 (on page 110), <*pthread.h*>

#### 51536 CHANGE HISTORY

51537 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 51538 Issue 6

51539 The *pthread\_create()* function is marked as part of the Threads option.

51540 The following new requirements on POSIX implementations derive from alignment with the

51541 Single UNIX Specification:

- 51542 • The [EPERM] mandatory error condition is added.

51543 The thread CPU-time clock semantics are added for alignment with IEEE Std 1003.1d-1999.

51544 The **restrict** keyword is added to the *pthread\_create()* prototype for alignment with the

51545 ISO/IEC 9899: 1999 standard.

51546 The DESCRIPTION is updated to make it explicit that the floating-point environment is

51547 inherited from the creating thread.

51548 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/44 is applied, adding text that the

51549 alternate stack is not inherited.

51550 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/93 is applied, updating the ERRORS

51551 section to remove the mandatory [EINVAL] error (“The value specified by *attr* is invalid”), and

51552 adding the optional [EINVAL] error (“The attributes specified by *attr* are invalid”).

51553 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/94 is applied, adding the APPLICATION

51554 USAGE section.

#### 51555 Issue 7

51556 The *pthread\_create()* function is moved from the Threads option to the Base.

51557 The [EINVAL] error for an uninitialized thread attributes object is removed; this condition

51558 results in undefined behavior.

**pthread\_detach()**51559 **NAME**

51560 pthread\_detach — detach a thread

51561 **SYNOPSIS**

51562 #include &lt;pthread.h&gt;

51563 int pthread\_detach(pthread\_t thread);

51564 **DESCRIPTION**

51565 The *pthread\_detach()* function shall indicate to the implementation that storage for the thread  
 51566 *thread* can be reclaimed when that thread terminates. If *thread* has not terminated,  
 51567 *pthread\_detach()* shall not cause it to terminate.

51568 The behavior is undefined if the value specified by the *thread* argument to *pthread\_detach()* does  
 51569 not refer to a joinable thread.

51570 **RETURN VALUE**

51571 If the call succeeds, *pthread\_detach()* shall return 0; otherwise, an error number shall be returned  
 51572 to indicate the error.

51573 **ERRORS**51574 The *pthread\_detach()* function shall not return an error code of [EINTR].51575 **EXAMPLES**

51576 None.

51577 **APPLICATION USAGE**

51578 None.

51579 **RATIONALE**

51580 The *pthread\_join()* or *pthread\_detach()* functions should eventually be called for every thread that  
 51581 is created so that storage associated with the thread may be reclaimed.

51582 It has been suggested that a “detach” function is not necessary; the *detachstate* thread creation  
 51583 attribute is sufficient, since a thread need never be dynamically detached. However, need arises  
 51584 in at least two cases:

51585 1. In a cancellation handler for a *pthread\_join()* it is nearly essential to have a  
 51586 *pthread\_detach()* function in order to detach the thread on which *pthread\_join()* was  
 51587 waiting. Without it, it would be necessary to have the handler do another *pthread\_join()* to  
 51588 attempt to detach the thread, which would both delay the cancellation processing for an  
 51589 unbounded period and introduce a new call to *pthread\_join()*, which might itself need a  
 51590 cancellation handler. A dynamic detach is nearly essential in this case.

51591 2. In order to detach the “initial thread” (as may be desirable in processes that set up server  
 51592 threads).

51593 If an implementation detects that the value specified by the *thread* argument to *pthread\_detach()*  
 51594 does not refer to a joinable thread, it is recommended that the function should fail and report an  
 51595 [EINVAL] error.

51596 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
 51597 that the function should fail and report an [ESRCH] error.

51598 **FUTURE DIRECTIONS**

51599 None.

51600 **SEE ALSO**51601 [pthread\\_join\(\)](#)51602 XBD [<pthread.h>](#)51603 **CHANGE HISTORY**

51604 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

51605 **Issue 6**51606 The *pthread\_detach()* function is marked as part of the Threads option.51607 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/95 is applied, updating the ERRORS  
51608 section so that the [EINVAL] and [ESRCH] error cases become optional.51609 **Issue 7**51610 The *pthread\_detach()* function is moved from the Threads option to the Base.

51611 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

51612 The [EINVAL] error for a non-joinable thread is removed; this condition results in undefined  
51613 behavior.

## pthread\_equal()

**51614 NAME**

51615 pthread\_equal — compare thread IDs

**51616 SYNOPSIS**

51617 #include <pthread.h>

51618 int pthread\_equal(pthread\_t t1, pthread\_t t2);

**51619 DESCRIPTION**

51620 This function shall compare the thread IDs *t1* and *t2*.

**51621 RETURN VALUE**

51622 The *pthread\_equal()* function shall return a non-zero value if *t1* and *t2* are equal; otherwise, zero shall be returned.

51624 If either *t1* or *t2* are not valid thread IDs, the behavior is undefined.

**51625 ERRORS**

51626 No errors are defined.

51627 The *pthread\_equal()* function shall not return an error code of [EINTR].

**51628 EXAMPLES**

51629 None.

**51630 APPLICATION USAGE**

51631 None.

**51632 RATIONALE**

51633 Implementations may choose to define a thread ID as a structure. This allows additional flexibility and robustness over using an **int**. For example, a thread ID could include a sequence number that allows detection of “dangling IDs” (copies of a thread ID that has been detached). Since the C language does not support comparison on structure types, the *pthread\_equal()* function is provided to compare thread IDs.

**51638 FUTURE DIRECTIONS**

51639 None.

**51640 SEE ALSO**

51641 *pthread\_create()*, *pthread\_self()*

51642 XBD <pthread.h>

51644 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**51645 Issue 6**

51646 The *pthread\_equal()* function is marked as part of the Threads option.

**51647 Issue 7**

51648 The *pthread\_equal()* function is moved from the Threads option to the Base.

**51649 NAME**

51650 pthread\_exit — thread termination

**51651 SYNOPSIS**

51652 #include &lt;pthread.h&gt;

51653 void pthread\_exit(void \*value\_ptr);

**51654 DESCRIPTION**

51655 The *pthread\_exit()* function shall terminate the calling thread and make the value *value\_ptr*  
 51656 available to any successful join with the terminating thread. Any cancellation cleanup handlers  
 51657 that have been pushed and not yet popped shall be popped in the reverse order that they were  
 51658 pushed and then executed. After all cancellation cleanup handlers have been executed, if the  
 51659 thread has any thread-specific data, appropriate destructor functions shall be called in an  
 51660 unspecified order. Thread termination does not release any application visible process resources,  
 51661 including, but not limited to, mutexes and file descriptors, nor does it perform any process-level  
 51662 cleanup actions, including, but not limited to, calling any *atexit()* routines that may exist.

51663 An implicit call to *pthread\_exit()* is made when a thread other than the thread in which *main()*  
 51664 was first invoked returns from the start routine that was used to create it. The function's return  
 51665 value shall serve as the thread's exit status.

51666 The behavior of *pthread\_exit()* is undefined if called from a cancellation cleanup handler or  
 51667 destructor function that was invoked as a result of either an implicit or explicit call to  
 51668 *pthread\_exit()*.

51669 After a thread has terminated, the result of access to local (auto) variables of the thread is  
 51670 undefined. Thus, references to local variables of the exiting thread should not be used for the  
 51671 *pthread\_exit()* *value\_ptr* parameter value.

51672 The process shall exit with an exit status of 0 after the last thread has been terminated. The  
 51673 behavior shall be as if the implementation called *exit()* with a zero argument at thread  
 51674 termination time.

**51675 RETURN VALUE**51676 The *pthread\_exit()* function cannot return to its caller.**51677 ERRORS**

51678 No errors are defined.

**51679 EXAMPLES**

51680 None.

**51681 APPLICATION USAGE**

51682 None.

**51683 RATIONALE**

51684 The normal mechanism by which a thread terminates is to return from the routine that was  
 51685 specified in the *pthread\_create()* call that started it. The *pthread\_exit()* function provides the  
 51686 capability for a thread to terminate without requiring a return from the start routine of that  
 51687 thread, thereby providing a function analogous to *exit()*.

51688 Regardless of the method of thread termination, any cancellation cleanup handlers that have  
 51689 been pushed and not yet popped are executed, and the destructors for any existing thread-  
 51690 specific data are executed. This volume of POSIX.1-2008 requires that cancellation cleanup  
 51691 handlers be popped and called in order. After all cancellation cleanup handlers have been  
 51692 executed, thread-specific data destructors are called, in an unspecified order, for each item of  
 51693 thread-specific data that exists in the thread. This ordering is necessary because cancellation  
 51694 cleanup handlers may rely on thread-specific data.

**pthread\_exit()**

51695 As the meaning of the status is determined by the application (except when the thread has been  
51696 canceled, in which case it is PTHREAD\_CANCELED), the implementation has no idea what an  
51697 illegal status value is, which is why no address error checking is done.

**51698 FUTURE DIRECTIONS**

51699 None.

**51700 SEE ALSO**

51701 *exit()*, *pthread\_create()*, *pthread\_join()*

51702 XBD <pthread.h>

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

51709 **NAME**

51710 pthread\_getconcurrency, pthread\_setconcurrency — get and set the level of concurrency

51711 **SYNOPSIS**

```
51712 OB XSI #include <pthread.h>
51713 int pthread_getconcurrency(void);
51714 int pthread_setconcurrency(int new_level);
```

51715 **DESCRIPTION**

51716 Unbound threads in a process may or may not be required to be simultaneously active. By  
 51717 default, the threads implementation ensures that a sufficient number of threads are active so that  
 51718 the process can continue to make progress. While this conserves system resources, it may not  
 51719 produce the most effective level of concurrency.

51720 The *pthread\_setconcurrency()* function allows an application to inform the threads  
 51721 implementation of its desired concurrency level, *new\_level*. The actual level of concurrency  
 51722 provided by the implementation as a result of this function call is unspecified.

51723 If *new\_level* is zero, it causes the implementation to maintain the concurrency level at its  
 51724 discretion as if *pthread\_setconcurrency()* had never been called.

51725 The *pthread\_getconcurrency()* function shall return the value set by a previous call to the  
 51726 *pthread\_setconcurrency()* function. If the *pthread\_setconcurrency()* function was not previously  
 51727 called, this function shall return zero to indicate that the implementation is maintaining the  
 51728 concurrency level.

51729 A call to *pthread\_setconcurrency()* shall inform the implementation of its desired concurrency  
 51730 level. The implementation shall use this as a hint, not a requirement.

51731 If an implementation does not support multiplexing of user threads on top of several kernel-  
 51732 scheduled entities, the *pthread\_setconcurrency()* and *pthread\_getconcurrency()* functions are  
 51733 provided for source code compatibility but they shall have no effect when called. To maintain  
 51734 the function semantics, the *new\_level* parameter is saved when *pthread\_setconcurrency()* is called  
 51735 so that a subsequent call to *pthread\_getconcurrency()* shall return the same value.

51736 **RETURN VALUE**

51737 If successful, the *pthread\_setconcurrency()* function shall return zero; otherwise, an error number  
 51738 shall be returned to indicate the error.

51739 The *pthread\_getconcurrency()* function shall always return the concurrency level set by a previous  
 51740 call to *pthread\_setconcurrency()*. If the *pthread\_setconcurrency()* function has never been called,  
 51741 *pthread\_getconcurrency()* shall return zero.

51742 **ERRORS**

51743 The *pthread\_setconcurrency()* function shall fail if:

51744 [EINVAL] The value specified by *new\_level* is negative.

51745 [EAGAIN] The value specified by *new\_level* would cause a system resource to be  
 51746 exceeded.

51747 The *pthread\_setconcurrency()* function shall not return an error code of [EINTR].

**pthread\_getconcurrency()**51748 **EXAMPLES**

51749 None.

51750 **APPLICATION USAGE**

51751 Application developers should note that an implementation can always ignore any calls to  
51752 *pthread\_setconcurrency()* and return a constant for *pthread\_getconcurrency()*. For this reason, it is  
51753 not recommended that portable applications use this function.

51754 **RATIONALE**

51755 None.

51756 **FUTURE DIRECTIONS**

51757 These functions may be removed in a future version.

51758 **SEE ALSO**51759 XBD [<pthread.h>](#)51760 **CHANGE HISTORY**

51761 First released in Issue 5.

51762 **Issue 7**

51763 SD5-XSH-ERN-184 is applied.

51764 The *pthread\_getconcurrency()* and *pthread\_setconcurrency()* functions are marked obsolescent.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

51765 **NAME**

51766 pthread\_getcpuclockid — access a thread CPU-time clock (ADVANCED REALTIME  
51767 THREADS)

51768 **SYNOPSIS**

```
51769 TCT #include <pthread.h>
51770 #include <time.h>
51771 int pthread_getcpuclockid(pthread_t thread_id, clockid_t *clock_id);
```

51772 **DESCRIPTION**

51773 The *pthread\_getcpuclockid()* function shall return in *clock\_id* the clock ID of the CPU-time clock of  
51774 the thread specified by *thread\_id*, if the thread specified by *thread\_id* exists.

51775 **RETURN VALUE**

51776 Upon successful completion, *pthread\_getcpuclockid()* shall return zero; otherwise, an error  
51777 number shall be returned to indicate the error.

51778 **ERRORS**

51779 No errors are defined.

51780 **EXAMPLES**

51781 None.

51782 **APPLICATION USAGE**

51783 The *pthread\_getcpuclockid()* function is part of the Thread CPU-Time Clocks option and need not  
51784 be provided on all implementations.

51785 **RATIONALE**

51786 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
51787 that the function should fail and report an [ESRCH] error.

51788 **FUTURE DIRECTIONS**

51789 None.

51790 **SEE ALSO**

51791 *clock\_getcpuclockid()*, *clock\_getres()*, *timer\_create()*

51792 XBD [<pthread.h>](#), [<time.h>](#)

51793 **CHANGE HISTORY**

51794 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

51795 In the SYNOPSIS, the inclusion of [<sys/types.h>](#) is no longer required.

51796 **Issue 7**

51797 The *pthread\_getcpuclockid()* function is moved from the Threads option.

51798 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

**pthread\_getschedparam()**

System Interfaces

51799 **NAME**

51800 pthread\_getschedparam, pthread\_setschedparam — dynamic thread scheduling parameters  
 51801 access (**REALTIME THREADS**)

51802 **SYNOPSIS**

```
51803 TPS #include <pthread.h>
51804 int pthread_getschedparam(pthread_t thread, int *restrict policy,
51805 struct sched_param *restrict param);
51806 int pthread_setschedparam(pthread_t thread, int policy,
51807 const struct sched_param *param);
```

51808 **DESCRIPTION**

51809 The *pthread\_getschedparam()* and *pthread\_setschedparam()* functions shall, respectively, get and set  
 51810 the scheduling policy and parameters of individual threads within a multi-threaded process to  
 51811 be retrieved and set. For SCHED\_FIFO and SCHED\_RR, the only required member of the  
 51812 **sched\_param** structure is the priority *sched\_priority*. For SCHED\_OTHER, the affected  
 51813 scheduling parameters are implementation-defined.

51814 The *pthread\_getschedparam()* function shall retrieve the scheduling policy and scheduling  
 51815 parameters for the thread whose thread ID is given by *thread* and shall store those values in  
 51816 *policy* and *param*, respectively. The priority value returned from *pthread\_getschedparam()* shall be  
 51817 the value specified by the most recent *pthread\_setschedparam()*, *pthread\_setschedprio()*, or  
 51818 *pthread\_create()* call affecting the target thread. It shall not reflect any temporary adjustments to  
 51819 its priority as a result of any priority inheritance or ceiling functions. The *pthread\_setschedparam()*  
 51820 function shall set the scheduling policy and associated scheduling parameters for the thread  
 51821 whose thread ID is given by *thread* to the policy and associated parameters provided in *policy*  
 51822 and *param*, respectively.

51823 The *policy* parameter may have the value SCHED\_OTHER, SCHED\_FIFO, or SCHED\_RR. The  
 51824 scheduling parameters for the SCHED\_OTHER policy are implementation-defined. The  
 51825 SCHED\_FIFO and SCHED\_RR policies shall have a single scheduling parameter, *priority*.

51826 TSP If **\_POSIX\_THREAD\_SPORADIC\_SERVER** is defined, then the *policy* argument may have the  
 51827 value SCHED\_SPORADIC, with the exception for the *pthread\_setschedparam()* function that if the  
 51828 scheduling policy was not SCHED\_SPORADIC at the time of the call, it is implementation-  
 51829 defined whether the function is supported; in other words, the implementation need not allow  
 51830 the application to dynamically change the scheduling policy to SCHED\_SPORADIC. The  
 51831 sporadic server scheduling policy has the associated parameters *sched\_ss\_low\_priority*,  
 51832 *sched\_ss\_repl\_period*, *sched\_ss\_init\_budget*, *sched\_priority*, and *sched\_ss\_max\_repl*. The specified  
 51833 *sched\_ss\_repl\_period* shall be greater than or equal to the specified *sched\_ss\_init\_budget* for the  
 51834 function to succeed; if it is not, then the function shall fail. The value of *sched\_ss\_max\_repl* shall  
 51835 be within the inclusive range [1, {SS\_REPL\_MAX}] for the function to succeed; if not, the function  
 51836 shall fail. It is unspecified whether the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values are  
 51837 stored as provided by this function or are rounded to align with the resolution of the clock being  
 51838 used.

51839 If the *pthread\_setschedparam()* function fails, the scheduling parameters shall not be changed for  
 51840 the target thread.

51841 **RETURN VALUE**

51842 If successful, the *pthread\_getschedparam()* and *pthread\_setschedparam()* functions shall return zero;  
 51843 otherwise, an error number shall be returned to indicate the error.

**51844 ERRORS**

51845 The *pthread\_setschedparam()* function may fail if:

51846 [EINVAL] The value specified by *policy* or one of the scheduling parameters associated  
51847 with the scheduling policy *policy* is invalid.

51848 [ENOTSUP] An attempt was made to set the policy or scheduling parameters to an  
51849 unsupported value.

51850 TSP [ENOTSUP] An attempt was made to dynamically change the scheduling policy to  
51851 SCHED\_SPORADIC, and the implementation does not support this change.

51852 [EPERM] The caller does not have appropriate privileges to set either the scheduling  
51853 parameters or the scheduling policy of the specified thread.

51854 [EPERM] The implementation does not allow the application to modify one of the  
51855 parameters to the value specified.

51856 These functions shall not return an error code of [EINTR].

**51857 EXAMPLES**

51858 None.

**51859 APPLICATION USAGE**

51860 None.

**51861 RATIONALE**

51862 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
51863 that the function should fail and report an [ESRCH] error.

**51864 FUTURE DIRECTIONS**

51865 None.

**51866 SEE ALSO**

51867 *pthread\_setschedprio()*, *sched\_getparam()*, *sched\_getscheduler()*

51868 XBD <pthread.h>, <sched.h>

**51869 CHANGE HISTORY**

51870 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**51871 Issue 6**

51872 The *pthread\_getschedparam()* and *pthread\_setschedparam()* functions are marked as part of the  
51873 Threads and Thread Execution Scheduling options.

51874 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
51875 implementation does not support the Thread Execution Scheduling option.

51876 The Open Group Corrigendum U026/2 is applied, correcting the prototype for the  
51877 *pthread\_setschedparam()* function so that its second argument is of type **int**.

51878 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

51879 The **restrict** keyword is added to the *pthread\_getschedparam()* prototype for alignment with the  
51880 ISO/IEC 9899: 1999 standard.

51881 The Open Group Corrigendum U047/1 is applied.

51882 IEEE PASC Interpretation 1003.1 #96 is applied, noting that priority values can also be set by a  
51883 call to the *pthread\_setschedprio()* function.

**pthread\_getschedparam()***System Interfaces*51884 **Issue 7**

51885 The *pthread\_getschedparam()* and *pthread\_setschedparam()* functions are moved from the Threads  
51886 option.

51887 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements  
51888 for the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values.

51889 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**51890 NAME**

51891 pthread\_getspecific, pthread\_setspecific — thread-specific data management

**51892 SYNOPSIS**

51893 #include <pthread.h>

51894 void \*pthread\_getspecific(pthread\_key\_t key);

51895 int pthread\_setspecific(pthread\_key\_t key, const void \*value);

**51896 DESCRIPTION**

51897 The *pthread\_getspecific()* function shall return the value currently bound to the specified *key* on  
51898 behalf of the calling thread.

51899 The *pthread\_setspecific()* function shall associate a thread-specific *value* with a *key* obtained via a  
51900 previous call to *pthread\_key\_create()*. Different threads may bind different values to the same  
51901 key. These values are typically pointers to blocks of dynamically allocated memory that have  
51902 been reserved for use by the calling thread.

51903 The effect of calling *pthread\_getspecific()* or *pthread\_setspecific()* with a *key* value not obtained  
51904 from *pthread\_key\_create()* or after *key* has been deleted with *pthread\_key\_delete()* is undefined.

51905 Both *pthread\_getspecific()* and *pthread\_setspecific()* may be called from a thread-specific data  
51906 destructor function. A call to *pthread\_getspecific()* for the thread-specific data key being  
51907 destroyed shall return the value NULL, unless the value is changed (after the destructor starts)  
51908 by a call to *pthread\_setspecific()*. Calling *pthread\_setspecific()* from a thread-specific data  
51909 destructor routine may result either in lost storage (after at least  
51910 PTHREAD\_DESTRUCTOR\_ITERATIONS attempts at destruction) or in an infinite loop.

51911 Both functions may be implemented as macros.

**51912 RETURN VALUE**

51913 The *pthread\_getspecific()* function shall return the thread-specific data value associated with the  
51914 given *key*. If no thread-specific data value is associated with *key*, then the value NULL shall be  
51915 returned.

51916 If successful, the *pthread\_setspecific()* function shall return zero; otherwise, an error number shall  
51917 be returned to indicate the error.

**51918 ERRORS**

51919 No errors are returned from *pthread\_getspecific()*.

51920 The *pthread\_setspecific()* function shall fail if:

51921 [ENOMEM] Insufficient memory exists to associate the non-NULL value with the key.

51922 The *pthread\_setspecific()* function shall not return an error code of [EINTR].

**51923 EXAMPLES**

51924 None.

**51925 APPLICATION USAGE**

51926 None.

**51927 RATIONALE**

51928 Performance and ease-of-use of *pthread\_getspecific()* are critical for functions that rely on  
51929 maintaining state in thread-specific data. Since no errors are required to be detected by it, and  
51930 since the only error that could be detected is the use of an invalid key, the function to  
51931 *pthread\_getspecific()* has been designed to favor speed and simplicity over error reporting.

51932 If an implementation detects that the value specified by the *key* argument to *pthread\_setspecific()*  
51933 does not refer to a key value obtained from *pthread\_key\_create()* or refers to a key that has been

**pthread\_getspecific()**

System Interfaces

51934 deleted with *pthread\_key\_delete()*, it is recommended that the function should fail and report an  
51935 [EINVAL] error.

**FUTURE DIRECTIONS**

51937 None.

**SEE ALSO**

51939 *pthread\_key\_create()*

51940 XBD <pthread.h>

**CHANGE HISTORY**

51942 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

51944 The *pthread\_getspecific()* and *pthread\_setspecific()* functions are marked as part of the Threads  
51945 option.

51946 IEEE PASC Interpretation 1003.1c #3 (Part 6) is applied, updating the DESCRIPTION.

51947 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/96 is applied, updating the ERRORS  
51948 section so that the [ENOMEM] error case is changed from “to associate the value with the key”  
51949 to “to associate the non-NULL value with the key”.

**Issue 7**

51950 Austin Group Interpretation 1003.1-2001 #063 is applied, updating the ERRORS section.

51952 The *pthread\_getspecific()* and *pthread\_setspecific()* functions are moved from the Threads option to  
51953 the Base.

51954 The [EINVAL] error for a key value not obtained from *pthread\_key\_create()* or a key deleted with  
51955 *pthread\_key\_delete()* is removed; this condition results in undefined behavior.

51956 **NAME**

51957 pthread\_join — wait for thread termination

51958 **SYNOPSIS**

51959 #include &lt;pthread.h&gt;

51960 int pthread\_join(pthread\_t thread, void \*\*value\_ptr);

51961 **DESCRIPTION**

51962 The *pthread\_join()* function shall suspend execution of the calling thread until the target *thread*  
 51963 terminates, unless the target *thread* has already terminated. On return from a successful  
 51964 *pthread\_join()* call with a non-NULL *value\_ptr* argument, the value passed to *pthread\_exit()* by  
 51965 the terminating thread shall be made available in the location referenced by *value\_ptr*. When a  
 51966 *pthread\_join()* returns successfully, the target thread has been terminated. The results of multiple  
 51967 simultaneous calls to *pthread\_join()* specifying the same target thread are undefined. If the  
 51968 thread calling *pthread\_join()* is canceled, then the target thread shall not be detached.

51969 It is unspecified whether a thread that has exited but remains unjoined counts against  
 51970 {PTHREAD\_THREADS\_MAX}.

51971 The behavior is undefined if the value specified by the *thread* argument to *pthread\_join()* does not  
 51972 refer to a joinable thread.

51973 The behavior is undefined if the value specified by the *thread* argument to *pthread\_join()* refers to  
 51974 the calling thread.

51975 **RETURN VALUE**

51976 If successful, the *pthread\_join()* function shall return zero; otherwise, an error number shall be  
 51977 returned to indicate the error.

51978 **ERRORS**51979 The *pthread\_join()* function may fail if:

51980 [EDEADLK] A deadlock was detected.

51981 The *pthread\_join()* function shall not return an error code of [EINTR].51982 **EXAMPLES**

51983 An example of thread creation and deletion follows:

```

51984 typedef struct {
51985     int *ar;
51986     long n;
51987 } subarray;

51988 void *
51989 incesr(void *arg)
51990 {
51991     long i;

51992     for (i = 0; i < ((subarray *)arg)->n; i++)
51993         ((subarray *)arg)->ar[i]++;
51994 }

51995 int main(void)
51996 {
51997     int ar[1000000];
51998     pthread_t th1, th2;
51999     subarray sb1, sb2;

```

**pthread\_join()**

```

52000         sb1.ar = &ar[0];
52001         sb1.n = 500000;
52002         (void) pthread_create(&th1, NULL, incer, &sb1);

52003         sb2.ar = &ar[500000];
52004         sb2.n = 500000;
52005         (void) pthread_create(&th2, NULL, incer, &sb2);

52006         (void) pthread_join(th1, NULL);
52007         (void) pthread_join(th2, NULL);
52008         return 0;
52009     }

```

52010 **APPLICATION USAGE**

52011 None.

52012 **RATIONALE**

52013 The *pthread\_join()* function is a convenience that has proven useful in multi-threaded  
52014 applications. It is true that a programmer could simulate this function if it were not provided by  
52015 passing extra state as part of the argument to the *start\_routine()*. The terminating thread would  
52016 set a flag to indicate termination and broadcast a condition that is part of that state; a joining  
52017 thread would wait on that condition variable. While such a technique would allow a thread to  
52018 wait on more complex conditions (for example, waiting for multiple threads to terminate),  
52019 waiting on individual thread termination is considered widely useful. Also, including the  
52020 *pthread\_join()* function in no way precludes a programmer from coding such complex waits.  
52021 Thus, while not a primitive, including *pthread\_join()* in this volume of POSIX.1-2008 was  
52022 considered valuable.

52023 The *pthread\_join()* function provides a simple mechanism allowing an application to wait for a  
52024 thread to terminate. After the thread terminates, the application may then choose to clean up  
52025 resources that were used by the thread. For instance, after *pthread\_join()* returns, any  
52026 application-provided stack storage could be reclaimed.

52027 The *pthread\_join()* or *pthread\_detach()* function should eventually be called for every thread that  
52028 is created with the *detachstate* attribute set to `PTHREAD_CREATE_JOINABLE` so that storage  
52029 associated with the thread may be reclaimed.

52030 The interaction between *pthread\_join()* and cancellation is well-defined for the following reasons:

- 52031 • The *pthread\_join()* function, like all other non-async-cancel-safe functions, can only be  
52032 called with deferred cancelability type.
- 52033 • Cancellation cannot occur in the disabled cancelability state.

52034 Thus, only the default cancelability state need be considered. As specified, either the  
52035 *pthread\_join()* call is canceled, or it succeeds, but not both. The difference is obvious to the  
52036 application, since either a cancellation handler is run or *pthread\_join()* returns. There are no race  
52037 conditions since *pthread\_join()* was called in the deferred cancelability state.

52038 If an implementation detects that the value specified by the *thread* argument to *pthread\_join()*  
52039 does not refer to a joinable thread, it is recommended that the function should fail and report an  
52040 `[EINVAL]` error.

52041 If an implementation detects that the value specified by the *thread* argument to *pthread\_join()*  
52042 refers to the calling thread, it is recommended that the function should fail and report an  
52043 `[EDEADLK]` error.

52044 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended

52045 that the function should fail and report an [ESRCH] error.

52046 **FUTURE DIRECTIONS**

52047 None.

52048 **SEE ALSO**

52049 *pthread\_create()*, *wait()*

52050 XBD Section 4.11 (on page 110), <pthread.h>

52051 **CHANGE HISTORY**

52052 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52053 **Issue 6**

52054 The *pthread\_join()* function is marked as part of the Threads option.

52055 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/97 is applied, updating the ERRORS  
52056 section so that the [EINVAL] error is made optional and the words “the implementation has  
52057 detected” are removed from it.

52058 **Issue 7**

52059 The *pthread\_join()* function is moved from the Threads option to the Base.

52060 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

52061 The [EINVAL] error for a non-joinable thread is removed; this condition results in undefined  
52062 behavior.

52063 The [EDEADLK] error for the calling thread is removed; this condition results in undefined  
52064 behavior.

**pthread\_key\_create()**52065 **NAME**

52066 pthread\_key\_create — thread-specific data key creation

52067 **SYNOPSIS**

52068 #include &lt;pthread.h&gt;

52069 int pthread\_key\_create(pthread\_key\_t \*key, void (\*destructor)(void\*));

52070 **DESCRIPTION**

52071 The *pthread\_key\_create()* function shall create a thread-specific data key visible to all threads in  
 52072 the process. Key values provided by *pthread\_key\_create()* are opaque objects used to locate  
 52073 thread-specific data. Although the same key value may be used by different threads, the values  
 52074 bound to the key by *pthread\_setspecific()* are maintained on a per-thread basis and persist for the  
 52075 life of the calling thread.

52076 Upon key creation, the value NULL shall be associated with the new key in all active threads.  
 52077 Upon thread creation, the value NULL shall be associated with all defined keys in the new  
 52078 thread.

52079 An optional destructor function may be associated with each key value. At thread exit, if a key  
 52080 value has a non-NULL destructor pointer, and the thread has a non-NULL value associated with  
 52081 that key, the value of the key is set to NULL, and then the function pointed to is called with the  
 52082 previously associated value as its sole argument. The order of destructor calls is unspecified if  
 52083 more than one destructor exists for a thread when it exits.

52084 If, after all the destructors have been called for all non-NULL values with associated destructors,  
 52085 there are still some non-NULL values with associated destructors, then the process is repeated.  
 52086 If, after at least {PTHREAD\_DESTRUCTOR\_ITERATIONS} iterations of destructor calls for  
 52087 outstanding non-NULL values, there are still some non-NULL values with associated  
 52088 destructors, implementations may stop calling destructors, or they may continue calling  
 52089 destructors until no non-NULL values with associated destructors exist, even though this might  
 52090 result in an infinite loop.

52091 **RETURN VALUE**

52092 If successful, the *pthread\_key\_create()* function shall store the newly created key value at \*key and  
 52093 shall return zero. Otherwise, an error number shall be returned to indicate the error.

52094 **ERRORS**52095 The *pthread\_key\_create()* function shall fail if:

52096 [EAGAIN] The system lacked the necessary resources to create another thread-specific  
 52097 data key, or the system-imposed limit on the total number of keys per process  
 52098 {PTHREAD\_KEYS\_MAX} has been exceeded.

52099 [ENOMEM] Insufficient memory exists to create the key.

52100 The *pthread\_key\_create()* function shall not return an error code of [EINTR].52101 **EXAMPLES**

52102 The following example demonstrates a function that initializes a thread-specific data key when it  
 52103 is first called, and associates a thread-specific object with each calling thread, initializing this  
 52104 object when necessary.

```
52105 static pthread_key_t key;
52106 static pthread_once_t key_once = PTHREAD_ONCE_INIT;

52107 static void
52108 make_key()
52109 {
```

```

52110         (void) pthread_key_create(&key, NULL);
52111     }
52112     func()
52113     {
52114         void *ptr;
52115         (void) pthread_once(&key_once, make_key);
52116         if ((ptr = pthread_getspecific(key)) == NULL) {
52117             ptr = malloc(OBJECT_SIZE);
52118             ...
52119             (void) pthread_setspecific(key, ptr);
52120         }
52121         ...
52122     }

```

52123 Note that the key has to be initialized before *pthread\_getspecific()* or *pthread\_setspecific()* can be  
52124 used. The *pthread\_key\_create()* call could either be explicitly made in a module initialization  
52125 routine, or it can be done implicitly by the first call to a module as in this example. Any attempt  
52126 to use the key before it is initialized is a programming error, making the code below incorrect.

```

52127     static pthread_key_t key;
52128     func()
52129     {
52130         void *ptr;
52131         /* KEY NOT INITIALIZED!!! THIS WON'T WORK!!! */
52132         if ((ptr = pthread_getspecific(key)) == NULL &&
52133             pthread_setspecific(key, NULL) != 0) {
52134             pthread_key_create(&key, NULL);
52135             ...
52136         }
52137     }

```

#### 52138 APPLICATION USAGE

52139 None.

#### 52140 RATIONALE

##### 52141 Destructor Functions

52142 Normally, the value bound to a key on behalf of a particular thread is a pointer to storage  
52143 allocated dynamically on behalf of the calling thread. The destructor functions specified with  
52144 *pthread\_key\_create()* are intended to be used to free this storage when the thread exits. Thread  
52145 cancellation cleanup handlers cannot be used for this purpose because thread-specific data may  
52146 persist outside the lexical scope in which the cancellation cleanup handlers operate.

52147 If the value associated with a key needs to be updated during the lifetime of the thread, it may  
52148 be necessary to release the storage associated with the old value before the new value is bound.  
52149 Although the *pthread\_setspecific()* function could do this automatically, this feature is not needed  
52150 often enough to justify the added complexity. Instead, the programmer is responsible for freeing  
52151 the stale storage:

```

52152     pthread_getspecific(key, &old);
52153     new = allocate();
52154     destructor(old);

```

**pthread\_key\_create()**

52155 `pthread_setspecific(key, new);`

52156 **Note:** The above example could leak storage if run with asynchronous cancellation enabled. No such  
52157 problems occur in the default cancellation state if no cancellation points occur between the get  
52158 and set.

52159 There is no notion of a destructor-safe function. If an application does not call `pthread_exit()`  
52160 from a signal handler, or if it blocks any signal whose handler may call `pthread_exit()` while  
52161 calling async-unsafe functions, all functions may be safely called from destructors.

### 52162 **Non-Idempotent Data Key Creation**

52163 There were requests to make `pthread_key_create()` idempotent with respect to a given `key` address  
52164 parameter. This would allow applications to call `pthread_key_create()` multiple times for a given  
52165 `key` address and be guaranteed that only one key would be created. Doing so would require the  
52166 key value to be previously initialized (possibly at compile time) to a known null value and  
52167 would require that implicit mutual-exclusion be performed based on the address and contents of  
52168 the `key` parameter in order to guarantee that exactly one key would be created.

52169 Unfortunately, the implicit mutual-exclusion would not be limited to only `pthread_key_create()`.  
52170 On many implementations, implicit mutual-exclusion would also have to be performed by  
52171 `pthread_getspecific()` and `pthread_setspecific()` in order to guard against using incompletely stored  
52172 or not-yet-visible key values. This could significantly increase the cost of important operations,  
52173 particularly `pthread_getspecific()`.

52174 Thus, this proposal was rejected. The `pthread_key_create()` function performs no implicit  
52175 synchronization. It is the responsibility of the programmer to ensure that it is called exactly once  
52176 per key before use of the key. Several straightforward mechanisms can already be used to  
52177 accomplish this, including calling explicit module initialization functions, using mutexes, and  
52178 using `pthread_once()`. This places no significant burden on the programmer, introduces no  
52179 possibly confusing *ad hoc* implicit synchronization mechanism, and potentially allows  
52180 commonly used thread-specific data operations to be more efficient.

### 52186 **CHANGE HISTORY**

52187 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 52188 **Issue 6**

52189 The `pthread_key_create()` function is marked as part of the Threads option.

52190 IEEE PASC Interpretation 1003.1c #8 is applied, updating the DESCRIPTION.

#### 52191 **Issue 7**

52192 The `pthread_key_create()` function is moved from the Threads option to the Base.

52193 **NAME**

52194 pthread\_key\_delete — thread-specific data key deletion

52195 **SYNOPSIS**

52196 #include &lt;pthread.h&gt;

52197 int pthread\_key\_delete(pthread\_key\_t key);

52198 **DESCRIPTION**

52199 The *pthread\_key\_delete()* function shall delete a thread-specific data key previously returned by  
 52200 *pthread\_key\_create()*. The thread-specific data values associated with *key* need not be NULL at  
 52201 the time *pthread\_key\_delete()* is called. It is the responsibility of the application to free any  
 52202 application storage or perform any cleanup actions for data structures related to the deleted key  
 52203 or associated thread-specific data in any threads; this cleanup can be done either before or after  
 52204 *pthread\_key\_delete()* is called. Any attempt to use *key* following the call to *pthread\_key\_delete()*  
 52205 results in undefined behavior.

52206 The *pthread\_key\_delete()* function shall be callable from within destructor functions. No  
 52207 destructor functions shall be invoked by *pthread\_key\_delete()*. Any destructor function that may  
 52208 have been associated with *key* shall no longer be called upon thread exit.

52209 **RETURN VALUE**

52210 If successful, the *pthread\_key\_delete()* function shall return zero; otherwise, an error number shall  
 52211 be returned to indicate the error.

52212 **ERRORS**52213 The *pthread\_key\_delete()* function shall not return an error code of [EINTR].52214 **EXAMPLES**

52215 None.

52216 **APPLICATION USAGE**

52217 None.

52218 **RATIONALE**

52219 A thread-specific data key deletion function has been included in order to allow the resources  
 52220 associated with an unused thread-specific data key to be freed. Unused thread-specific data keys  
 52221 can arise, among other scenarios, when a dynamically loaded module that allocated a key is  
 52222 unloaded.

52223 Conforming applications are responsible for performing any cleanup actions needed for data  
 52224 structures associated with the key to be deleted, including data referenced by thread-specific  
 52225 data values. No such cleanup is done by *pthread\_key\_delete()*. In particular, destructor functions  
 52226 are not called. There are several reasons for this division of responsibility:

- 52227 1. The associated destructor functions used to free thread-specific data at thread exit time  
 52228 are only guaranteed to work correctly when called in the thread that allocated the thread-  
 52229 specific data. (Destructors themselves may utilize thread-specific data.) Thus, they cannot  
 52230 be used to free thread-specific data in other threads at key deletion time. Attempting to  
 52231 have them called by other threads at key deletion time would require other threads to be  
 52232 asynchronously interrupted. But since interrupted threads could be in an arbitrary state,  
 52233 including holding locks necessary for the destructor to run, this approach would fail. In  
 52234 general, there is no safe mechanism whereby an implementation could free thread-  
 52235 specific data at key deletion time.
- 52236 2. Even if there were a means of safely freeing thread-specific data associated with keys to  
 52237 be deleted, doing so would require that implementations be able to enumerate the  
 52238 threads with non-NULL data and potentially keep them from creating more thread-

**pthread\_key\_delete()**

System Interfaces

- 52239 specific data while the key deletion is occurring. This special case could cause extra  
52240 synchronization in the normal case, which would otherwise be unnecessary.
- 52241 For an application to know that it is safe to delete a key, it has to know that all the threads that  
52242 might potentially ever use the key do not attempt to use it again. For example, it could know  
52243 this if all the client threads have called a cleanup procedure declaring that they are through with  
52244 the module that is being shut down, perhaps by setting a reference count to zero.
- 52245 If an implementation detects that the value specified by the *key* argument to *pthread\_key\_delete()*  
52246 does not refer to a key value obtained from *pthread\_key\_create()* or refers to a key that has been  
52247 deleted with *pthread\_key\_delete()*, it is recommended that the function should fail and report an  
52248 [EINVAL] error.
- 52249 **FUTURE DIRECTIONS**
- 52250 None.
- 52251 **SEE ALSO**
- 52252 [pthread\\_key\\_create\(\)](#)
- 52253 XBD [<pthread.h>](#)
- 52254 **CHANGE HISTORY**
- 52255 First released in Issue 5. Included for alignment with the POSIX Threads Extension.
- 52256 **Issue 6**
- 52257 The *pthread\_key\_delete()* function is marked as part of the Threads option.
- 52258 **Issue 7**
- 52259 The *pthread\_key\_delete()* function is moved from the Threads option to the Base.
- 52260 The [EINVAL] error for a key value not obtained from *pthread\_key\_create()* or a key deleted with  
52261 *pthread\_key\_delete()* is removed; this condition results in undefined behavior.

52262 **NAME**

52263 pthread\_kill — send a signal to a thread

52264 **SYNOPSIS**

```
52265 CX #include <signal.h>
52266 int pthread_kill(pthread_t thread, int sig);
```

52267 **DESCRIPTION**52268 The *pthread\_kill()* function shall request that a signal be delivered to the specified thread.52269 As in *kill()*, if *sig* is zero, error checking shall be performed but no signal shall actually be sent.52270 **RETURN VALUE**52271 Upon successful completion, the function shall return a value of zero. Otherwise, the function  
52272 shall return an error number. If the *pthread\_kill()* function fails, no signal shall be sent.52273 **ERRORS**52274 The *pthread\_kill()* function shall fail if:52275 [EINVAL] The value of the *sig* argument is an invalid or unsupported signal number.52276 The *pthread\_kill()* function shall not return an error code of [EINTR].52277 **EXAMPLES**

52278 None.

52279 **APPLICATION USAGE**52280 The *pthread\_kill()* function provides a mechanism for asynchronously directing a signal at a  
52281 thread in the calling process. This could be used, for example, by one thread to affect broadcast  
52282 delivery of a signal to a set of threads.52283 Note that *pthread\_kill()* only causes the signal to be handled in the context of the given thread;  
52284 the signal action (termination or stopping) affects the process as a whole.52285 **RATIONALE**52286 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
52287 that the function should fail and report an [ESRCH] error.52288 **FUTURE DIRECTIONS**

52289 None.

52290 **SEE ALSO**52291 *kill()*, *pthread\_self()*, *raise()*

52292 XBD &lt;signal.h&gt;

52293 **CHANGE HISTORY**

52294 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52295 **Issue 6**52296 The *pthread\_kill()* function is marked as part of the Threads option.

52297 The APPLICATION USAGE section is added.

52298 **Issue 7**52299 The *pthread\_kill()* function is moved from the Threads option to the Base.

52300 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

**pthread\_mutex\_consistent()**52301 **NAME**

52302 pthread\_mutex\_consistent — mark state protected by robust mutex as consistent

52303 **SYNOPSIS**

52304 #include &lt;pthread.h&gt;

52305 int pthread\_mutex\_consistent(pthread\_mutex\_t \*mutex);

52306 **DESCRIPTION**52307 If *mutex* is a robust mutex in an inconsistent state, the *pthread\_mutex\_consistent()* function can be  
52308 used to mark the state protected by the mutex referenced by *mutex* as consistent again.52309 If an owner of a robust mutex terminates while holding the mutex, the mutex becomes  
52310 inconsistent and the next thread that acquires the mutex lock shall be notified of the state by the  
52311 return value [EOWNERDEAD]. In this case, the mutex does not become normally usable again  
52312 until the state is marked consistent.52313 If the thread which acquired the mutex lock with the return value [EOWNERDEAD] terminates  
52314 before calling either *pthread\_mutex\_consistent()* or *pthread\_mutex\_unlock()*, the next thread that  
52315 acquires the mutex lock shall be notified about the state of the mutex by the return value  
52316 [EOWNERDEAD].52317 The behavior is undefined if the value specified by the *mutex* argument to  
52318 *pthread\_mutex\_consistent()* does not refer to an initialized mutex.52319 **RETURN VALUE**52320 Upon successful completion, the *pthread\_mutex\_consistent()* function shall return zero.  
52321 Otherwise, an error value shall be returned to indicate the error.52322 **ERRORS**52323 The *pthread\_mutex\_consistent()* function shall fail if:52324 [EINVAL] The mutex object referenced by *mutex* is not robust or does not protect an  
52325 inconsistent state.

52326 These functions shall not return an error code of [EINTR].

52327 **EXAMPLES**

52328 None.

52329 **APPLICATION USAGE**52330 The *pthread\_mutex\_consistent()* function is only responsible for notifying the implementation that  
52331 the state protected by the mutex has been recovered and that normal operations with the mutex  
52332 can be resumed. It is the responsibility of the application to recover the state so it can be reused.  
52333 If the application is not able to perform the recovery, it can notify the implementation that the  
52334 situation is unrecoverable by a call to *pthread\_mutex\_unlock()* without a prior call to  
52335 *pthread\_mutex\_consistent()*, in which case subsequent threads that attempt to lock the mutex will  
52336 fail to acquire the lock and be returned [ENOTRECOVERABLE].52337 **RATIONALE**52338 If an implementation detects that the value specified by the *mutex* argument to  
52339 *pthread\_mutex\_consistent()* does not refer to an initialized mutex, it is recommended that the  
52340 function should fail and report an [EINVAL] error.52341 **FUTURE DIRECTIONS**

52342 None.

**pthread\_mutex\_destroy()**

System Interfaces

52348 **NAME**

52349 pthread\_mutex\_destroy, pthread\_mutex\_init — destroy and initialize a mutex

52350 **SYNOPSIS**

```
52351 #include <pthread.h>
52352
52352 int pthread_mutex_destroy(pthread_mutex_t *mutex);
52353 int pthread_mutex_init(pthread_mutex_t *restrict mutex,
52354     const pthread_mutexattr_t *restrict attr);
52355 pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
```

52356 **DESCRIPTION**

52357 The *pthread\_mutex\_destroy()* function shall destroy the mutex object referenced by *mutex*; the  
 52358 mutex object becomes, in effect, uninitialized. An implementation may cause  
 52359 *pthread\_mutex\_destroy()* to set the object referenced by *mutex* to an invalid value.

52360 A destroyed mutex object can be reinitialized using *pthread\_mutex\_init()*; the results of otherwise  
 52361 referencing the object after it has been destroyed are undefined.

52362 It shall be safe to destroy an initialized mutex that is unlocked. Attempting to destroy a locked  
 52363 mutex or a mutex that is referenced (for example, while being used in a *pthread\_cond\_timedwait()*  
 52364 or *pthread\_cond\_wait()*) by another thread results in undefined behavior.

52365 The *pthread\_mutex\_init()* function shall initialize the mutex referenced by *mutex* with attributes  
 52366 specified by *attr*. If *attr* is NULL, the default mutex attributes are used; the effect shall be the  
 52367 same as passing the address of a default mutex attributes object. Upon successful initialization,  
 52368 the state of the mutex becomes initialized and unlocked.

52369 Only *mutex* itself may be used for performing synchronization. The result of referring to copies  
 52370 of *mutex* in calls to *pthread\_mutex\_lock()*, *pthread\_mutex\_trylock()*, *pthread\_mutex\_unlock()*, and  
 52371 *pthread\_mutex\_destroy()* is undefined.

52372 Attempting to initialize an already initialized mutex results in undefined behavior.

52373 In cases where default mutex attributes are appropriate, the macro  
 52374 PTHREAD\_MUTEX\_INITIALIZER can be used to initialize mutexes that are statically allocated.  
 52375 The effect shall be equivalent to dynamic initialization by a call to *pthread\_mutex\_init()* with  
 52376 parameter *attr* specified as NULL, except that no error checks are performed.

52377 The behavior is undefined if the value specified by the *mutex* argument to  
 52378 *pthread\_mutex\_destroy()* does not refer to an initialized mutex.

52379 The behavior is undefined if the value specified by the *attr* argument to *pthread\_mutex\_init()*  
 52380 does not refer to an initialized mutex attributes object.

52381 **RETURN VALUE**

52382 If successful, the *pthread\_mutex\_destroy()* and *pthread\_mutex\_init()* functions shall return zero;  
 52383 otherwise, an error number shall be returned to indicate the error.

52384 **ERRORS**

52385 The *pthread\_mutex\_init()* function shall fail if:

- |       |          |  |
|-------|----------|--|
| 52386 | [EAGAIN] | The system lacked the necessary resources (other than memory) to initialize another mutex. |
| 52387 |          |  |
| 52388 | [ENOMEM] | Insufficient memory exists to initialize the mutex.  |
| 52389 | [EPERM]  | The caller does not have the privilege to perform the operation.                           |

52390 The *pthread\_mutex\_init()* function may fail if:

52391 [EINVAL] The attributes object referenced by *attr* has the robust mutex attribute set  
52392 without the process-shared attribute being set.

52393 These functions shall not return an error code of [EINTR].

#### 52394 EXAMPLES

52395 None.

#### 52396 APPLICATION USAGE

52397 None.

#### 52398 RATIONALE

52399 If an implementation detects that the value specified by the *mutex* argument to  
52400 *pthread\_mutex\_destroy()* does not refer to an initialized mutex, it is recommended that the  
52401 function should fail and report an [EINVAL] error.

52402 If an implementation detects that the value specified by the *mutex* argument to  
52403 *pthread\_mutex\_destroy()* or *pthread\_mutex\_init()* refers to a locked mutex or a mutex that is  
52404 referenced (for example, while being used in a *pthread\_cond\_timedwait()* or *pthread\_cond\_wait()*)  
52405 by another thread, or detects that the value specified by the *mutex* argument to  
52406 *pthread\_mutex\_init()* refers to an already initialized mutex, it is recommended that the function  
52407 should fail and report an [EBUSY] error.

52408 If an implementation detects that the value specified by the *attr* argument to  
52409 *pthread\_mutex\_init()* does not refer to an initialized mutex attributes object, it is recommended  
52410 that the function should fail and report an [EINVAL] error.

#### 52411 Alternate Implementations Possible

52412 This volume of POSIX.1-2008 supports several alternative implementations of mutexes. An  
52413 implementation may store the lock directly in the object of type **pthread\_mutex\_t**. Alternatively,  
52414 an implementation may store the lock in the heap and merely store a pointer, handle, or unique  
52415 ID in the mutex object. Either implementation has advantages or may be required on certain  
52416 hardware configurations. So that portable code can be written that is invariant to this choice, this  
52417 volume of POSIX.1-2008 does not define assignment or equality for this type, and it uses the  
52418 term “initialize” to reinforce the (more restrictive) notion that the lock may actually reside in the  
52419 mutex object itself.

52420 Note that this precludes an over-specification of the type of the mutex or condition variable and  
52421 motivates the opaqueness of the type.

52422 An implementation is permitted, but not required, to have *pthread\_mutex\_destroy()* store an  
52423 illegal value into the mutex. This may help detect erroneous programs that try to lock (or  
52424 otherwise reference) a mutex that has already been destroyed.

#### 52425 Tradeoff Between Error Checks and Performance Supported

52426 Many error conditions that can occur are not required to be detected by the implementation in  
52427 order to let implementations trade off performance *versus* degree of error checking according to  
52428 the needs of their specific applications and execution environment. As a general rule, conditions  
52429 caused by the system (such as insufficient memory) are required to be detected, but conditions  
52430 caused by an erroneously coded application (such as failing to provide adequate  
52431 synchronization to prevent a mutex from being deleted while in use) are specified to result in  
52432 undefined behavior.

52433 A wide range of implementations is thus made possible. For example, an implementation

**pthread\_mutex\_destroy()**

intended for application debugging may implement all of the error checks, but an implementation running a single, provably correct application under very tight performance constraints in an embedded computer might implement minimal checks. An implementation might even be provided in two versions, similar to the options that compilers provide: a full-checking, but slower version; and a limited-checking, but faster version. To forbid this optionality would be a disservice to users.

By carefully limiting the use of “undefined behavior” only to things that an erroneous (badly coded) application might do, and by defining that resource-not-available errors are mandatory, this volume of POSIX.1-2008 ensures that a fully-conforming application is portable across the full range of implementations, while not forcing all implementations to add overhead to check for numerous things that a correct program never does. When the behavior is undefined, no error number is specified to be returned on implementations that do detect the condition. This is because undefined behavior means *anything* can happen, which includes returning with any value (which might happen to be a valid, but different, error number). However, since the error number might be useful to application developers when diagnosing problems during application development, a recommendation is made in rationale that implementors should return a particular error number if their implementation does detect the condition.

**Why No Limits are Defined**

Defining symbols for the maximum number of mutexes and condition variables was considered but rejected because the number of these objects may change dynamically. Furthermore, many implementations place these objects into application memory; thus, there is no explicit maximum.

**Static Initializers for Mutexes and Condition Variables**

Providing for static initialization of statically allocated synchronization objects allows modules with private static synchronization variables to avoid runtime initialization tests and overhead. Furthermore, it simplifies the coding of self-initializing modules. Such modules are common in C libraries, where for various reasons the design calls for self-initialization instead of requiring an explicit module initialization function to be called. An example use of static initialization follows.

Without static initialization, a self-initializing routine *foo()* might look as follows:

```
static pthread_once_t foo_once = PTHREAD_ONCE_INIT;
static pthread_mutex_t foo_mutex;

void foo_init()
{
    pthread_mutex_init(&foo_mutex, NULL);
}

void foo()
{
    pthread_once(&foo_once, foo_init);
    pthread_mutex_lock(&foo_mutex);
    /* Do work. */
    pthread_mutex_unlock(&foo_mutex);
}
```

With static initialization, the same routine could be coded as follows:

```
static pthread_mutex_t foo_mutex = PTHREAD_MUTEX_INITIALIZER;
```

```

52479 void foo()
52480 {
52481     pthread_mutex_lock(&foo_mutex);
52482     /* Do work. */
52483     pthread_mutex_unlock(&foo_mutex);
52484 }

```

52485 Note that the static initialization both eliminates the need for the initialization test inside  
52486 *pthread\_once()* and the fetch of *&foo\_mutex* to learn the address to be passed to  
52487 *pthread\_mutex\_lock()* or *pthread\_mutex\_unlock()*.

52488 Thus, the C code written to initialize static objects is simpler on all systems and is also faster on a  
52489 large class of systems; those where the (entire) synchronization object can be stored in  
52490 application memory.

52491 Yet the locking performance question is likely to be raised for machines that require mutexes to  
52492 be allocated out of special memory. Such machines actually have to have mutexes and possibly  
52493 condition variables contain pointers to the actual hardware locks. For static initialization to work  
52494 on such machines, *pthread\_mutex\_lock()* also has to test whether or not the pointer to the actual  
52495 lock has been allocated. If it has not, *pthread\_mutex\_lock()* has to initialize it before use. The  
52496 reservation of such resources can be made when the program is loaded, and hence return codes  
52497 have not been added to mutex locking and condition-variable waiting to indicate failure to  
52498 complete initialization.

52499 This runtime test in *pthread\_mutex\_lock()* would at first seem to be extra work; an extra test is  
52500 required to see whether the pointer has been initialized. On most machines this would actually  
52501 be implemented as a fetch of the pointer, testing the pointer against zero, and then using the  
52502 pointer if it has already been initialized. While the test might seem to add extra work, the extra  
52503 effort of testing a register is usually negligible since no extra memory references are actually  
52504 done. As more and more machines provide caches, the real expenses are memory references, not  
52505 instructions executed.

52506 Alternatively, depending on the machine architecture, there are often ways to eliminate *all*  
52507 overhead in the most important case: on the lock operations that occur *after* the lock has been  
52508 initialized. This can be done by shifting more overhead to the less frequent operation:  
52509 initialization. Since out-of-line mutex allocation also means that an address has to be  
52510 dereferenced to find the actual lock, one technique that is widely applicable is to have static  
52511 initialization store a bogus value for that address; in particular, an address that causes a machine  
52512 fault to occur. When such a fault occurs upon the first attempt to lock such a mutex, validity  
52513 checks can be done, and then the correct address for the actual lock can be filled in. Subsequent  
52514 lock operations incur no extra overhead since they do not “fault”. This is merely one technique  
52515 that can be used to support static initialization, while not adversely affecting the performance of  
52516 lock acquisition. No doubt there are other techniques that are highly machine-dependent.

52517 The locking overhead for machines doing out-of-line mutex allocation is thus similar for  
52518 modules being implicitly initialized, where it is improved for those doing mutex allocation  
52519 entirely inline. The inline case is thus made much faster, and the out-of-line case is not  
52520 significantly worse.

52521 Besides the issue of locking performance for such machines, a concern is raised that it is possible  
52522 that threads would serialize contending for initialization locks when attempting to finish  
52523 initializing statically allocated mutexes. (Such finishing would typically involve taking an  
52524 internal lock, allocating a structure, storing a pointer to the structure in the mutex, and releasing  
52525 the internal lock.) First, many implementations would reduce such serialization by hashing on  
52526 the mutex address. Second, such serialization can only occur a bounded number of times. In

**pthread\_mutex\_destroy()**

52527 particular, it can happen at most as many times as there are statically allocated synchronization  
 52528 objects. Dynamically allocated objects would still be initialized via *pthread\_mutex\_init()* or  
 52529 *pthread\_cond\_init()*.

52530 Finally, if none of the above optimization techniques for out-of-line allocation yields sufficient  
 52531 performance for an application on some implementation, the application can avoid static  
 52532 initialization altogether by explicitly initializing all synchronization objects with the  
 52533 corresponding *pthread\_\*\_init()* functions, which are supported by all implementations. An  
 52534 implementation can also document the tradeoffs and advise which initialization technique is  
 52535 more efficient for that particular implementation.

**52536 Destroying Mutexes**

52537 A mutex can be destroyed immediately after it is unlocked. For example, consider the following  
 52538 code:

```
52539 struct obj {
52540 pthread_mutex_t om;
52541     int refcnt;
52542     ...
52543 };
52544 obj_done(struct obj *op)
52545 {
52546     pthread_mutex_lock(&op->om);
52547     if (--op->refcnt == 0) {
52548         pthread_mutex_unlock(&op->om);
52549 (A)     pthread_mutex_destroy(&op->om);
52550 (B)     free(op);
52551     } else
52552 (C)     pthread_mutex_unlock(&op->om);
52553 }
```

52554 In this case *obj* is reference counted and *obj\_done()* is called whenever a reference to the object is  
 52555 dropped. Implementations are required to allow an object to be destroyed and freed and  
 52556 potentially unmapped (for example, lines A and B) immediately after the object is unlocked (line  
 52557 C).

**52558 Robust Mutexes**

52559 Implementations are required to provide robust mutexes for mutexes with the process-shared  
 52560 attribute set to *PTHREAD\_PROCESS\_SHARED*. Implementations are allowed, but not required,  
 52561 to provide robust mutexes when the process-shared attribute is set to  
 52562 *PTHREAD\_PROCESS\_PRIVATE*.

**52563 FUTURE DIRECTIONS**

52564 None.

**52565 SEE ALSO**

52566 *pthread\_mutex\_getprioceiling()*, *pthread\_mutexattr\_getrobust()*, *pthread\_mutex\_lock()*,  
 52567 *pthread\_mutex\_timedlock()*, *pthread\_mutexattr\_getshared()*

52568 XBD <pthread.h>

**52569 CHANGE HISTORY**

52570 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**52571 Issue 6**

52572 The *pthread\_mutex\_destroy()* and *pthread\_mutex\_init()* functions are marked as part of the  
52573 Threads option.

52574 The *pthread\_mutex\_timedlock()* function is added to the SEE ALSO section for alignment with  
52575 IEEE Std 1003.1d-1999.

52576 IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

52577 The **restrict** keyword is added to the *pthread\_mutex\_init()* prototype for alignment with the  
52578 ISO/IEC 9899: 1999 standard.

**52579 Issue 7**

52580 Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

52581 The *pthread\_mutex\_destroy()* and *pthread\_mutex\_init()* functions are moved from the Threads  
52582 option to the Base.

52583 The [EINVAL] error for an uninitialized mutex or an uninitialized mutex attributes object is  
52584 removed; this condition results in undefined behavior.

52585 The [EBUSY] error for a locked mutex, a mutex that is referenced, or an already initialized mutex  
52586 is removed; this condition results in undefined behavior.

**pthread\_mutex\_getprioceiling()**

System Interfaces

52587 **NAME**

52588 pthread\_mutex\_getprioceiling, pthread\_mutex\_setprioceiling — get and set the priority ceiling  
 52589 of a mutex (**REALTIME THREADS**)

52590 **SYNOPSIS**

```
52591 RPP|TPP #include <pthread.h>
52592
52592 int pthread_mutex_getprioceiling(const pthread_mutex_t *restrict mutex,
52593 int *restrict prioceiling);
52594 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
52595 int prioceiling, int *restrict old_ceiling);
```

52596 **DESCRIPTION**

52597 The *pthread\_mutex\_getprioceiling()* function shall return the current priority ceiling of the mutex.

52598 The *pthread\_mutex\_setprioceiling()* function shall attempt to lock the mutex as if by a call to  
 52599 *pthread\_mutex\_lock()*, except that the process of locking the mutex need not adhere to the priority  
 52600 protect protocol. On acquiring the mutex it shall change the mutex's priority ceiling and then  
 52601 release the mutex as if by a call to *pthread\_mutex\_unlock()*. When the change is successful, the  
 52602 previous value of the priority ceiling shall be returned in *old\_ceiling*.

52603 If the *pthread\_mutex\_setprioceiling()* function fails, the mutex priority ceiling shall not be  
 52604 changed.

52605 **RETURN VALUE**

52606 If successful, the *pthread\_mutex\_getprioceiling()* and *pthread\_mutex\_setprioceiling()* functions shall  
 52607 return zero; otherwise, an error number shall be returned to indicate the error.

52608 **ERRORS**

52609 These functions shall fail if:

52610 [EINVAL] The protocol attribute of *mutex* is PTHREAD\_PRIO\_NONE.

52611 [EPERM] The implementation requires appropriate privileges to perform the operation  
 52612 and the caller does not have appropriate privileges.

52613 The *pthread\_mutex\_setprioceiling()* function shall fail if:

52614 [EAGAIN] The mutex could not be acquired because the maximum number of recursive  
 52615 locks for *mutex* has been exceeded.

52616 [EDEADLK] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK and the current  
 52617 thread already owns the mutex.

52618 [EINVAL] The mutex was created with the protocol attribute having the value  
 52619 PTHREAD\_PRIO\_PROTECT and the calling thread's priority is higher than  
 52620 the mutex's current priority ceiling, and the implementation adheres to the  
 52621 priority protect protocol in the process of locking the mutex.

52622 [ENOTRECOVERABLE]

52623 The mutex is a robust mutex and the state protected by the mutex is not  
 52624 recoverable.

52625 [EOWNERDEAD]

52626 The mutex is a robust mutex and the process containing the previous owning  
 52627 thread terminated while holding the mutex lock. The mutex lock shall be  
 52628 acquired by the calling thread and it is up to the new owner to make the state  
 52629 consistent (see *pthread\_mutex\_lock()*).

- 52630 The *pthread\_mutex\_setprioceiling()* function may fail if:
- 52631 [EDEADLK] A deadlock condition was detected.
- 52632 [EINVAL] The priority requested by *prioceiling* is out of range.
- 52633 [EOWNERDEAD]
- 52634 The mutex is a robust mutex and the previous owning thread terminated
- 52635 while holding the mutex lock. The mutex lock shall be acquired by the calling
- 52636 thread and it is up to the new owner to make the state consistent (see
- 52637 *pthread\_mutex\_lock()*).
- 52638 These functions shall not return an error code of [EINTR].
- 52639 **EXAMPLES**
- 52640 None.
- 52641 **APPLICATION USAGE**
- 52642 None.
- 52643 **RATIONALE**
- 52644 None.
- 52645 **FUTURE DIRECTIONS**
- 52646 None.
- 52647 **SEE ALSO**
- 52648 *pthread\_mutex\_destroy()*, *pthread\_mutex\_lock()*, *pthread\_mutex\_timedlock()*
- 52649 XBD <pthread.h>
- 52650 **CHANGE HISTORY**
- 52651 First released in Issue 5. Included for alignment with the POSIX Threads Extension.
- 52652 Marked as part of the Realtime Threads Feature Group.
- 52653 **Issue 6**
- 52654 The *pthread\_mutex\_getprioceiling()* and *pthread\_mutex\_setprioceiling()* functions are marked as
- 52655 part of the Threads and Thread Priority Protection options.
- 52656 The [ENOSYS] error conditions have been removed.
- 52657 The *pthread\_mutex\_timedlock()* function is added to the SEE ALSO section for alignment with
- 52658 IEEE Std 1003.1d-1999.
- 52659 The **restrict** keyword is added to the *pthread\_mutex\_getprioceiling()* and
- 52660 *pthread\_mutex\_setprioceiling()* prototypes for alignment with the ISO/IEC 9899:1999 standard.
- 52661 **Issue 7**
- 52662 SD5-XSH-ERN-39 is applied.
- 52663 Austin Group Interpretation 1003.1-2001 #052 is applied, adding [EDEADLK] as a “may fail”
- 52664 error.
- 52665 SD5-XSH-ERN-158 is applied, updating the ERRORS section to include a “shall fail” error case
- 52666 for when the protocol attribute of *mutex* is PTHREAD\_PRIO\_NONE.
- 52667 The *pthread\_mutex\_getprioceiling()* and *pthread\_mutex\_setprioceiling()* functions are moved from
- 52668 the Threads option to require support of either the Robust Mutex Priority Protection option or
- 52669 the Non-Robust Mutex Priority Protection option.

## **pthread\_mutex\_getprioceiling()**

*System Interfaces*

52670  
52671

The DESCRIPTION and ERRORS sections are updated to account properly for all of the various mutex types.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**pthread\_mutex\_lock()**

System Interfaces

52681 **NAME**

52682 pthread\_mutex\_lock, pthread\_mutex\_trylock, pthread\_mutex\_unlock — lock and unlock a  
52683 mutex

52684 **SYNOPSIS**

```
52685 #include <pthread.h>
52686
52686 int pthread_mutex_lock(pthread_mutex_t *mutex);
52687 int pthread_mutex_trylock(pthread_mutex_t *mutex);
52688 int pthread_mutex_unlock(pthread_mutex_t *mutex);
```

52689 **DESCRIPTION**

52690 The mutex object referenced by *mutex* shall be locked by calling *pthread\_mutex\_lock()*. If the  
52691 mutex is already locked, the calling thread shall block until the mutex becomes available. This  
52692 operation shall return with the mutex object referenced by *mutex* in the locked state with the  
52693 calling thread as its owner.

52694 If the mutex type is PTHREAD\_MUTEX\_NORMAL, deadlock detection shall not be provided.  
52695 Attempting to relock the mutex causes deadlock. If a thread attempts to unlock a mutex that it  
52696 has not locked or a mutex which is unlocked, undefined behavior results.

52697 If the mutex type is PTHREAD\_MUTEX\_ERRORCHECK, then error checking shall be provided.  
52698 If a thread attempts to relock a mutex that it has already locked, an error shall be returned. If a  
52699 thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, an error  
52700 shall be returned.

52701 If the mutex type is PTHREAD\_MUTEX\_RECURSIVE, then the mutex shall maintain the  
52702 concept of a lock count. When a thread successfully acquires a mutex for the first time, the lock  
52703 count shall be set to one. Every time a thread relocks this mutex, the lock count shall be  
52704 incremented by one. Each time the thread unlocks the mutex, the lock count shall be  
52705 decremented by one. When the lock count reaches zero, the mutex shall become available for  
52706 other threads to acquire. If a thread attempts to unlock a mutex that it has not locked or a mutex  
52707 which is unlocked, an error shall be returned.

52708 If the mutex type is PTHREAD\_MUTEX\_DEFAULT, attempting to recursively lock the mutex  
52709 results in undefined behavior. Attempting to unlock the mutex if it was not locked by the calling  
52710 thread results in undefined behavior. Attempting to unlock the mutex if it is not locked results in  
52711 undefined behavior.

52712 The *pthread\_mutex\_trylock()* function shall be equivalent to *pthread\_mutex\_lock()*, except that if  
52713 the mutex object referenced by *mutex* is currently locked (by any thread, including the current  
52714 thread), the call shall return immediately. If the mutex type is PTHREAD\_MUTEX\_RECURSIVE  
52715 and the mutex is currently owned by the calling thread, the mutex lock count shall be  
52716 incremented by one and the *pthread\_mutex\_trylock()* function shall immediately return success.

52717 The *pthread\_mutex\_unlock()* function shall release the mutex object referenced by *mutex*. The  
52718 manner in which a mutex is released is dependent upon the mutex's type attribute. If there are  
52719 threads blocked on the mutex object referenced by *mutex* when *pthread\_mutex\_unlock()* is called,  
52720 resulting in the mutex becoming available, the scheduling policy shall determine which thread  
52721 shall acquire the mutex.

52722 (In the case of PTHREAD\_MUTEX\_RECURSIVE mutexes, the mutex shall become available  
52723 when the count reaches zero and the calling thread no longer has any locks on this mutex.)

52724 If a signal is delivered to a thread waiting for a mutex, upon return from the signal handler the  
52725 thread shall resume waiting for the mutex as if it was not interrupted.

52726 If *mutex* is a robust mutex and the process containing the owning thread terminated while

52727 holding the mutex lock, a call to *pthread\_mutex\_lock()* shall return the error value  
 52728 [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding  
 52729 the mutex lock, a call to *pthread\_mutex\_lock()* may return the error value [EOWNERDEAD] even  
 52730 if the process in which the owning thread resides has not terminated. In these cases, the mutex is  
 52731 locked by the thread but the state it protects is marked as inconsistent. The application should  
 52732 ensure that the state is made consistent for reuse and when that is complete call  
 52733 *pthread\_mutex\_consistent()*. If the application is unable to recover the state, it should unlock the  
 52734 mutex without a prior call to *pthread\_mutex\_consistent()*, after which the mutex is marked  
 52735 permanently unusable.

52736 If *mutex* does not refer to an initialized mutex object, the behavior of *pthread\_mutex\_lock()*,  
 52737 *pthread\_mutex\_trylock()*, and *pthread\_mutex\_unlock()* is undefined.

#### 52738 RETURN VALUE

52739 If successful, the *pthread\_mutex\_lock()* and *pthread\_mutex\_unlock()* functions shall return zero;  
 52740 otherwise, an error number shall be returned to indicate the error.

52741 The *pthread\_mutex\_trylock()* function shall return zero if a lock on the mutex object referenced by  
 52742 *mutex* is acquired. Otherwise, an error number is returned to indicate the error.

#### 52743 ERRORS

52744 The *pthread\_mutex\_lock()* and *pthread\_mutex\_trylock()* functions shall fail if:

52745 [EAGAIN] The mutex could not be acquired because the maximum number of recursive  
 52746 locks for *mutex* has been exceeded.

52747 RPP|TPP [EINVAL] The *mutex* was created with the protocol attribute having the value  
 52748 PTHREAD\_PRIO\_PROTECT and the calling thread's priority is higher than  
 52749 the mutex's current priority ceiling.

52750 [ENOTRECOVERABLE]

52751 The state protected by the mutex is not recoverable.

52752 [EOWNERDEAD]

52753 The mutex is a robust mutex and the process containing the previous owning  
 52754 thread terminated while holding the mutex lock. The mutex lock shall be  
 52755 acquired by the calling thread and it is up to the new owner to make the state  
 52756 consistent.

52757 The *pthread\_mutex\_lock()* function shall fail if:

52758 [EDEADLK] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK and the current  
 52759 thread already owns the mutex.

52760 The *pthread\_mutex\_trylock()* function shall fail if:

52761 [EBUSY] The *mutex* could not be acquired because it was already locked.

52762 The *pthread\_mutex\_unlock()* function shall fail if:

52763 [EPERM] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK or the mutex is a  
 52764 robust mutex, and the current thread does not own the mutex.

52765 The *pthread\_mutex\_lock()* and *pthread\_mutex\_trylock()* functions may fail if:

52766 [EOWNERDEAD]

52767 The mutex is a robust mutex and the previous owning thread terminated  
 52768 while holding the mutex lock. The mutex lock shall be acquired by the calling  
 52769 thread and it is up to the new owner to make the state consistent.

**pthread\_mutex\_lock()**

- 52770 The *pthread\_mutex\_lock()* function may fail if:
- 52771 [EDEADLK] A deadlock condition was detected.
- 52772 These functions shall not return an error code of [EINTR].

**EXAMPLES**

52773 None.

**APPLICATION USAGE**

52776 Applications that have assumed that non-zero return values are errors will need updating for use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If an application is supposed to work with normal and robust mutexes it should check all return values for error conditions and if necessary take appropriate action.

**RATIONALE**

52782 Mutex objects are intended to serve as a low-level primitive from which other thread synchronization functions can be built. As such, the implementation of mutexes should be as efficient as possible, and this has ramifications on the features available at the interface.

52786 The mutex functions and the particular default settings of the mutex attributes have been motivated by the desire to not preclude fast, inlined implementations of mutex locking and unlocking.

52789 Since most attributes only need to be checked when a thread is going to be blocked, the use of attributes does not slow the (common) mutex-locking case.

52791 Likewise, while being able to extract the thread ID of the owner of a mutex might be desirable, it would require storing the current thread ID when each mutex is locked, and this could incur unacceptable levels of overhead. Similar arguments apply to a *mutex\_tryunlock* operation.

52794 For further rationale on the extended mutex types, see XRAT [Threads Extensions](#) (on page 3573).

52795 If an implementation detects that the value specified by the *mutex* argument does not refer to an initialized mutex object, it is recommended that the function should fail and report an [EINVAL] error.

**FUTURE DIRECTIONS**

52798 None.

**SEE ALSO**

52801 [pthread\\_mutex\\_consistent\(\)](#), [pthread\\_mutex\\_destroy\(\)](#), [pthread\\_mutex\\_timedlock\(\)](#),

52803 XBD Section 4.11 (on page 110), [<pthread.h>](#)

**CHANGE HISTORY**

52805 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

52807 The *pthread\_mutex\_lock()*, *pthread\_mutex\_trylock()*, and *pthread\_mutex\_unlock()* functions are  
52808 marked as part of the Threads option.

- 52809 The following new requirements on POSIX implementations derive from alignment with the  
52810 Single UNIX Specification:
- 52811 • The behavior when attempting to relock a mutex is defined.
- 52812 The *pthread\_mutex\_timedlock()* function is added to the SEE ALSO section for alignment with  
52813 IEEE Std 1003.1d-1999.
- 52814 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/98 is applied, updating the ERRORS  
52815 section so that the [EDEADLK] error includes detection of a deadlock condition. The  
52816 RATIONALE section is also reworded to take into account non-XSI-conformant systems.
- 52817 **Issue 7**
- 52818 SD5-XSH-ERN-43 is applied, marking the “shall fail” case of the [EINVAL] error as dependent  
52819 on the Thread Priority Protection option.
- 52820 Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.
- 52821 The *pthread\_mutex\_lock()*, *pthread\_mutex\_trylock()*, and *pthread\_mutex\_unlock()* functions are  
52822 moved from the Threads option to the Base.
- 52823 The following extended mutex types are moved from the XSI option to the Base:
- 52824 PTHREAD\_MUTEX\_NORMAL
  - 52825 PTHREAD\_MUTEX\_ERRORCHECK
  - 52826 PTHREAD\_MUTEX\_RECURSIVE
  - 52827 PTHREAD\_MUTEX\_DEFAULT
- 52828 The DESCRIPTION is updated to clarify the behavior when *mutex* does not refer to an initialized  
52829 mutex.
- 52830 The ERRORS section is updated to account properly for all of the various mutex types.

**pthread\_mutex\_setprioceiling()**

System Interfaces

52831 **NAME**

52832 pthread\_mutex\_setprioceiling — change the priority ceiling of a mutex (**REALTIME**  
52833 **THREADS**)

52834 **SYNOPSIS**

```
52835 RPP|TPP #include <pthread.h>  
52836 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,  
52837 int prioceiling, int *restrict old_ceiling);
```

52838 **DESCRIPTION**

52839 Refer to [pthread\\_mutex\\_getprioceiling\(\)](#).

52840 **NAME**

52841 pthread\_mutex\_timedlock — lock a mutex

52842 **SYNOPSIS**

52843 #include &lt;pthread.h&gt;

52844 #include &lt;time.h&gt;

52845 int pthread\_mutex\_timedlock(pthread\_mutex\_t \*restrict mutex,  
52846 const struct timespec \*restrict abstime);52847 **DESCRIPTION**

52848 The *pthread\_mutex\_timedlock()* function shall lock the mutex object referenced by *mutex*. If the  
52849 mutex is already locked, the calling thread shall block until the mutex becomes available as in  
52850 the *pthread\_mutex\_lock()* function. If the mutex cannot be locked without waiting for another  
52851 thread to unlock the mutex, this wait shall be terminated when the specified timeout expires.

52852 The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the  
52853 clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
52854 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the  
52855 call.

52856 The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall  
52857 be the resolution of the clock on which it is based. The **timespec** data type is defined in the  
52858 <time.h> header.

52859 Under no circumstance shall the function fail with a timeout if the mutex can be locked  
52860 immediately. The validity of the *abstime* parameter need not be checked if the mutex can be  
52861 locked immediately.

52862 RPI|TPI As a consequence of the priority inheritance rules (for mutexes initialized with the  
52863 PRIO\_INHERIT protocol), if a timed mutex wait is terminated because its timeout expires, the  
52864 priority of the owner of the mutex shall be adjusted as necessary to reflect the fact that this  
52865 thread is no longer among the threads waiting for the mutex.

52866 If *mutex* is a robust mutex and the process containing the owning thread terminated while  
52867 holding the mutex lock, a call to *pthread\_mutex\_timedlock()* shall return the error value  
52868 [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding  
52869 the mutex lock, a call to *pthread\_mutex\_timedlock()* may return the error value [EOWNERDEAD]  
52870 even if the process in which the owning thread resides has not terminated. In these cases, the  
52871 mutex is locked by the thread but the state it protects is marked as inconsistent. The application  
52872 should ensure that the state is made consistent for reuse and when that is complete call  
52873 *pthread\_mutex\_consistent()*. If the application is unable to recover the state, it should unlock the  
52874 mutex without a prior call to *pthread\_mutex\_consistent()*, after which the mutex is marked  
52875 permanently unusable.

52876 If *mutex* does not refer to an initialized mutex object, the behavior is undefined.

52877 **RETURN VALUE**

52878 If successful, the *pthread\_mutex\_timedlock()* function shall return zero; otherwise, an error  
52879 number shall be returned to indicate the error.

52880 **ERRORS**

52881 The *pthread\_mutex\_timedlock()* function shall fail if:

52882 [EAGAIN] The mutex could not be acquired because the maximum number of recursive  
52883 locks for *mutex* has been exceeded.

**pthread\_mutex\_timedlock()**

System Interfaces

- 52884 [EDEADLK] The mutex type is PTHREAD\_MUTEX\_ERRORCHECK and the current  
52885 thread already owns the mutex.
- 52886 [EINVAL] The mutex was created with the protocol attribute having the value  
52887 PTHREAD\_PRIO\_PROTECT and the calling thread's priority is higher than  
52888 the mutex' current priority ceiling.
- 52889 [EINVAL] The process or thread would have blocked, and the *abstime* parameter  
52890 specified a nanoseconds field value less than zero or greater than or equal to  
52891 1 000 million.
- 52892 [ENOTRECOVERABLE]  
52893 The state protected by the mutex is not recoverable.
- 52894 [EOWNERDEAD]  
52895 The mutex is a robust mutex and the process containing the previous owning  
52896 thread terminated while holding the mutex lock. The mutex lock shall be  
52897 acquired by the calling thread and it is up to the new owner to make the state  
52898 consistent.
- 52899 [ETIMEDOUT] The mutex could not be locked before the specified timeout expired.
- 52900 The *pthread\_mutex\_timedlock()* function may fail if:
- 52901 [EDEADLK] A deadlock condition was detected.
- 52902 [EOWNERDEAD]  
52903 The mutex is a robust mutex and the previous owning thread terminated  
52904 while holding the mutex lock. The mutex lock shall be acquired by the calling  
52905 thread and it is up to the new owner to make the state consistent.
- 52906 This function shall not return an error code of [EINTR].

**52907 EXAMPLES**

52908 None.

**52909 APPLICATION USAGE**

52910 Applications that have assumed that non-zero return values are errors will need updating for  
52911 use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting  
52912 a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error  
52913 returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If  
52914 an application is supposed to work with normal and robust mutexes, it should check all return  
52915 values for error conditions and if necessary take appropriate action.

**pthread\_mutex\_trylock()***System Interfaces*52936 **NAME**

52937 pthread\_mutex\_trylock, pthread\_mutex\_unlock — lock and unlock a mutex

52938 **SYNOPSIS**

52939 #include &lt;pthread.h&gt;

52940 int pthread\_mutex\_trylock(pthread\_mutex\_t \*mutex);

52941 int pthread\_mutex\_unlock(pthread\_mutex\_t \*mutex);

52942 **DESCRIPTION**52943 Refer to [pthread\\_mutex\\_lock\(\)](#).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

52944 **NAME**

52945 pthread\_mutexattr\_destroy, pthread\_mutexattr\_init — destroy and initialize the mutex  
52946 attributes object

52947 **SYNOPSIS**

```
52948 #include <pthread.h>
52949
52949 int pthread_mutexattr_destroy(pthread_mutexattr_t *attr);
52950 int pthread_mutexattr_init(pthread_mutexattr_t *attr);
```

52951 **DESCRIPTION**

52952 The *pthread\_mutexattr\_destroy()* function shall destroy a mutex attributes object; the object  
52953 becomes, in effect, uninitialized. An implementation may cause *pthread\_mutexattr\_destroy()* to  
52954 set the object referenced by *attr* to an invalid value.

52955 A destroyed *attr* attributes object can be reinitialized using *pthread\_mutexattr\_init()*; the results of  
52956 otherwise referencing the object after it has been destroyed are undefined.

52957 The *pthread\_mutexattr\_init()* function shall initialize a mutex attributes object *attr* with the  
52958 default value for all of the attributes defined by the implementation.

52959 Results are undefined if *pthread\_mutexattr\_init()* is called specifying an already initialized *attr*  
52960 attributes object.

52961 After a mutex attributes object has been used to initialize one or more mutexes, any function  
52962 affecting the attributes object (including destruction) shall not affect any previously initialized  
52963 mutexes.

52964 The behavior is undefined if the value specified by the *attr* argument to  
52965 *pthread\_mutexattr\_destroy()* does not refer to an initialized mutex attributes object.

52966 **RETURN VALUE**

52967 Upon successful completion, *pthread\_mutexattr\_destroy()* and *pthread\_mutexattr\_init()* shall  
52968 return zero; otherwise, an error number shall be returned to indicate the error.

52969 **ERRORS**

52970 The *pthread\_mutexattr\_init()* function shall fail if:

52971 [ENOMEM] Insufficient memory exists to initialize the mutex attributes object.

52972 These functions shall not return an error code of [EINTR].

52973 **EXAMPLES**

52974 None.

52975 **APPLICATION USAGE**

52976 None.

52977 **RATIONALE**

52978 If an implementation detects that the value specified by the *attr* argument to  
52979 *pthread\_mutexattr\_destroy()* does not refer to an initialized mutex attributes object, it is  
52980 recommended that the function should fail and report an [EINVAL] error.

52981 See *pthread\_attr\_destroy()* for a general explanation of attributes. Attributes objects allow  
52982 implementations to experiment with useful extensions and permit extension of this volume of  
52983 POSIX.1-2008 without changing the existing functions. Thus, they provide for future  
52984 extensibility of this volume of POSIX.1-2008 and reduce the temptation to standardize  
52985 prematurely on semantics that are not yet widely implemented or understood.

52986 Examples of possible additional mutex attributes that have been discussed are *spin\_only*,  
52987 *limited\_spin*, *no\_spin*, *recursive*, and *metered*. (To explain what the latter attributes might mean:

**pthread\_mutexattr\_destroy()**

52988 recursive mutexes would allow for multiple re-locking by the current owner; metered mutexes  
 52989 would transparently keep records of queue length, wait time, and so on.) Since there is not yet  
 52990 wide agreement on the usefulness of these resulting from shared implementation and usage  
 52991 experience, they are not yet specified in this volume of POSIX.1-2008. Mutex attributes objects,  
 52992 however, make it possible to test out these concepts for possible standardization at a later time.

**Mutex Attributes and Performance**

52993 Care has been taken to ensure that the default values of the mutex attributes have been defined  
 52994 such that mutexes initialized with the defaults have simple enough semantics so that the locking  
 52995 and unlocking can be done with the equivalent of a test-and-set instruction (plus possibly a few  
 52996 other basic instructions).  
 52997

52998 There is at least one implementation method that can be used to reduce the cost of testing at  
 52999 lock-time if a mutex has non-default attributes. One such method that an implementation can  
 53000 employ (and this can be made fully transparent to fully conforming POSIX applications) is to  
 53001 secretly pre-lock any mutexes that are initialized to non-default attributes. Any later attempt  
 53002 to lock such a mutex causes the implementation to branch to the “slow path” as if the mutex were  
 53003 unavailable; then, on the slow path, the implementation can do the “real work” to lock a non-  
 53004 default mutex. The underlying unlock operation is more complicated since the implementation  
 53005 never really wants to release the pre-lock on this kind of mutex. This illustrates that, depending  
 53006 on the hardware, there may be certain optimizations that can be used so that whatever mutex  
 53007 attributes are considered “most frequently used” can be processed most efficiently.

**Process Shared Memory and Synchronization**

53008 The existence of memory mapping functions in this volume of POSIX.1-2008 leads to the  
 53009 possibility that an application may allocate the synchronization objects from this section in  
 53010 memory that is accessed by multiple processes (and therefore, by threads of multiple processes).  
 53011

53012 In order to permit such usage, while at the same time keeping the usual case (that is, usage  
 53013 within a single process) efficient, a *process-shared* option has been defined.

53014 If an implementation supports the `_POSIX_THREAD_PROCESS_SHARED` option, then the  
 53015 *process-shared* attribute can be used to indicate that mutexes or condition variables may be  
 53016 accessed by threads of multiple processes.

53017 The default setting of `PTHREAD_PROCESS_PRIVATE` has been chosen for the *process-shared*  
 53018 attribute so that the most efficient forms of these synchronization objects are created by default.

53019 Synchronization variables that are initialized with the `PTHREAD_PROCESS_PRIVATE` *process-*  
 53020 *shared* attribute may only be operated on by threads in the process that initialized them.  
 53021 Synchronization variables that are initialized with the `PTHREAD_PROCESS_SHARED` *process-*  
 53022 *shared* attribute may be operated on by any thread in any process that has access to it. In  
 53023 particular, these processes may exist beyond the lifetime of the initializing process. For example,  
 53024 the following code implements a simple counting semaphore in a mapped file that may be used  
 53025 by many processes.

```
53026 /* sem.h */
53027 struct semaphore {
53028     pthread_mutex_t lock;
53029     pthread_cond_t nonzero;
53030     unsigned count;
53031 };
53032 typedef struct semaphore semaphore_t;
```

```

53033 semaphore_t *semaphore_create(char *semaphore_name);
53034 semaphore_t *semaphore_open(char *semaphore_name);
53035 void semaphore_post(semaphore_t *semap);
53036 void semaphore_wait(semaphore_t *semap);
53037 void semaphore_close(semaphore_t *semap);

53038 /* sem.c */
53039 #include <sys/types.h>
53040 #include <sys/stat.h>
53041 #include <sys/mman.h>
53042 #include <fcntl.h>
53043 #include <pthread.h>
53044 #include "sem.h"

53045 semaphore_t *
53046 semaphore_create(char *semaphore_name)
53047 {
53048     int fd;
53049     semaphore_t *semap;
53050     pthread_mutexattr_t psharedm;
53051     pthread_condattr_t psharedc;

53052     fd = open(semaphore_name, O_RDWR | O_CREAT | O_EXCL, 0666);
53053     if (fd < 0)
53054         return (NULL);
53055     (void) ftruncate(fd, sizeof(semaphore_t));
53056     (void) pthread_mutexattr_init(&psharedm);
53057     (void) pthread_mutexattr_setpshared(&psharedm,
53058         PTHREAD_PROCESS_SHARED);
53059     (void) pthread_condattr_init(&psharedc);
53060     (void) pthread_condattr_setpshared(&psharedc,
53061         PTHREAD_PROCESS_SHARED);
53062     semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
53063         PROT_READ | PROT_WRITE, MAP_SHARED,
53064         fd, 0);
53065     close (fd);
53066     (void) pthread_mutex_init(&semap->lock, &psharedm);
53067     (void) pthread_cond_init(&semap->nonzero, &psharedc);
53068     semap->count = 0;
53069     return (semap);
53070 }

53071 semaphore_t *
53072 semaphore_open(char *semaphore_name)
53073 {
53074     int fd;
53075     semaphore_t *semap;

53076     fd = open(semaphore_name, O_RDWR, 0666);
53077     if (fd < 0)
53078         return (NULL);
53079     semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
53080         PROT_READ | PROT_WRITE, MAP_SHARED,
53081         fd, 0);

```

**pthread\_mutexattr\_destroy()**

```

53082         close (fd);
53083         return (semap);
53084     }

53085     void
53086     semaphore_post (semaphore_t *semap)
53087     {
53088         pthread_mutex_lock (&semap->lock);
53089         if (semap->count == 0)
53090             pthread_cond_signal (&semap->nonzero);
53091         semap->count++;
53092         pthread_mutex_unlock (&semap->lock);
53093     }

53094     void
53095     semaphore_wait (semaphore_t *semap)
53096     {
53097         pthread_mutex_lock (&semap->lock);
53098         while (semap->count == 0)
53099             pthread_cond_wait (&semap->nonzero, &semap->lock);
53100         semap->count--;
53101         pthread_mutex_unlock (&semap->lock);
53102     }

53103     void
53104     semaphore_close (semaphore_t *semap)
53105     {
53106         munmap ((void *) semap, sizeof (semaphore_t));
53107     }

```

The following code is for three separate processes that create, post, and wait on a semaphore in the file **/tmp/semaphore**. Once the file is created, the post and wait programs increment and decrement the counting semaphore (waiting and waking as required) even though they did not initialize the semaphore.

```

53112     /* create.c */
53113     #include "pthread.h"
53114     #include "sem.h"

53115     int
53116     main ()
53117     {
53118         semaphore_t *semap;

53119         semap = semaphore_create ("/tmp/semaphore");
53120         if (semap == NULL)
53121             exit (1);
53122         semaphore_close (semap);
53123         return (0);
53124     }

53125     /* post */
53126     #include "pthread.h"
53127     #include "sem.h"

53128     int

```

```

53129     main()
53130     {
53131         semaphore_t *semap;
53132
53133         semap = semaphore_open("/tmp/semaphore");
53134         if (semap == NULL)
53135             exit(1);
53136         semaphore_post(semap);
53137         semaphore_close(semap);
53138         return (0);
53139     }
53140
53141     /* wait */
53142     #include "pthread.h"
53143     #include "sem.h"
53144
53145     int
53146     main()
53147     {
53148         semaphore_t *semap;
53149
53150         semap = semaphore_open("/tmp/semaphore");
53151         if (semap == NULL)
53152             exit(1);
53153         semaphore_wait(semap);
53154         semaphore_close(semap);
53155         return (0);
53156     }

```

XBD <pthread.h>

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

The [pthread\\_mutexattr\\_destroy\(\)](#) and [pthread\\_mutexattr\\_init\(\)](#) functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #27 is applied, updating the ERRORS section.

**Issue 7**

The [pthread\\_mutexattr\\_destroy\(\)](#) and [pthread\\_mutexattr\\_init\(\)](#) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

**pthread\_mutexattr\_getprioceiling()**

System Interfaces

53169 **NAME**

53170 pthread\_mutexattr\_getprioceiling, pthread\_mutexattr\_setprioceiling — get and set the  
 53171 prioceiling attribute of the mutex attributes object (**REALTIME THREADS**)

53172 **SYNOPSIS**

```
53173 RPP|TPP #include <pthread.h>
53174 int pthread_mutexattr_getprioceiling(const pthread_mutexattr_t
53175     *restrict attr, int *restrict prioceiling);
53176 int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,
53177     int prioceiling);
```

53178 **DESCRIPTION**

53179 The *pthread\_mutexattr\_getprioceiling()* and *pthread\_mutexattr\_setprioceiling()* functions,  
 53180 respectively, shall get and set the priority ceiling attribute of a mutex attributes object pointed to  
 53181 by *attr* which was previously created by the function *pthread\_mutexattr\_init()*.

53182 The *prioceiling* attribute contains the priority ceiling of initialized mutexes. The values of  
 53183 *prioceiling* are within the maximum range of priorities defined by **SCHED\_FIFO**.

53184 The *prioceiling* attribute defines the priority ceiling of initialized mutexes, which is the minimum  
 53185 priority level at which the critical section guarded by the mutex is executed. In order to avoid  
 53186 priority inversion, the priority ceiling of the mutex shall be set to a priority higher than or equal  
 53187 to the highest priority of all the threads that may lock that mutex. The values of *prioceiling* are  
 53188 within the maximum range of priorities defined under the **SCHED\_FIFO** scheduling policy.

53189 The behavior is undefined if the value specified by the *attr* argument to  
 53190 *pthread\_mutexattr\_getprioceiling()* or *pthread\_mutexattr\_setprioceiling()* does not refer to an  
 53191 initialized mutex attributes object.

53192 **RETURN VALUE**

53193 Upon successful completion, the *pthread\_mutexattr\_getprioceiling()* and  
 53194 *pthread\_mutexattr\_setprioceiling()* functions shall return zero; otherwise, an error number shall be  
 53195 returned to indicate the error.

53196 **ERRORS**

53197 These functions may fail if:

53198 [EINVAL] The value specified by *prioceiling* is invalid.

53199 [EPERM] The caller does not have the privilege to perform the operation.

53200 These functions shall not return an error code of [EINTR].

53201 **EXAMPLES**

53202 None.

53203 **APPLICATION USAGE**

53204 None.

53205 **RATIONALE**

53206 If an implementation detects that the value specified by the *attr* argument to  
 53207 *pthread\_mutexattr\_getprioceiling()* or *pthread\_mutexattr\_setprioceiling()* does not refer to an  
 53208 initialized mutex attributes object, it is recommended that the function should fail and report an  
 53209 [EINVAL] error.

**53210 FUTURE DIRECTIONS**

53211 None.

**53212 SEE ALSO**

53213 *pthread\_cond\_destroy()*, *pthread\_create()*, *pthread\_mutex\_destroy()*

53214 XBD <pthread.h>

**53215 CHANGE HISTORY**

53216 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

53217 Marked as part of the Realtime Threads Feature Group.

**53218 Issue 6**

53219 The *pthread\_mutexattr\_getprioceiling()* and *pthread\_mutexattr\_setprioceiling()* functions are marked  
53220 as part of the Threads and Thread Priority Protection options.

53221 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
53222 implementation does not support the Thread Priority Protection option.

53223 The [ENOTSUP] error condition has been removed since these functions do not have a *protocol*  
53224 argument.

53225 The **restrict** keyword is added to the *pthread\_mutexattr\_getprioceiling()* prototype for alignment  
53226 with the ISO/IEC 9899:1999 standard.

**53227 Issue 7**

53228 The *pthread\_mutexattr\_getprioceiling()* and *pthread\_mutexattr\_setprioceiling()* functions are moved  
53229 from the Threads option to require support of either the Robust Mutex Priority Protection option  
53230 or the Non-Robust Mutex Priority Protection option.

53231 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition  
53232 results in undefined behavior.

**pthread\_mutexattr\_getprotocol()**

System Interfaces

53233 **NAME**

53234 pthread\_mutexattr\_getprotocol, pthread\_mutexattr\_setprotocol — get and set the protocol  
 53235 attribute of the mutex attributes object (**REALTIME THREADS**)

53236 **SYNOPSIS**

```
53237 MC1 #include <pthread.h>
53238
53238 int pthread_mutexattr_getprotocol(const pthread_mutexattr_t
53239 *restrict attr, int *restrict protocol);
53240 int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,
53241 int protocol);
```

53242 **DESCRIPTION**

53243 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions, respectively,  
 53244 shall get and set the protocol attribute of a mutex attributes object pointed to by *attr* which was  
 53245 previously created by the function *pthread\_mutexattr\_init()*.

53246 The *protocol* attribute defines the protocol to be followed in utilizing mutexes. The value of  
 53247 *protocol* may be one of:

53248	RPI   TPI	PTHREAD_PRIO_INHERIT
53249	MC1	PTHREAD_PRIO_NONE
53250	RPP   TPP	PTHREAD_PRIO_PROTECT

53251 which are defined in the **<pthread.h>** header. The default value of the attribute shall be  
 53252 PTHREAD\_PRIO\_NONE.

53253 When a thread owns a mutex with the PTHREAD\_PRIO\_NONE *protocol* attribute, its priority  
 53254 and scheduling shall not be affected by its mutex ownership.

53255 RPI When a thread is blocking higher priority threads because of owning one or more robust  
 53256 mutexes with the PTHREAD\_PRIO\_INHERIT *protocol* attribute, it shall execute at the higher of  
 53257 its priority or the priority of the highest priority thread waiting on any of the robust mutexes  
 53258 owned by this thread and initialized with this protocol.

53259 TPI When a thread is blocking higher priority threads because of owning one or more non-robust  
 53260 mutexes with the PTHREAD\_PRIO\_INHERIT *protocol* attribute, it shall execute at the higher of  
 53261 its priority or the priority of the highest priority thread waiting on any of the non-robust  
 53262 mutexes owned by this thread and initialized with this protocol.

53263 RPP When a thread owns one or more robust mutexes initialized with the  
 53264 PTHREAD\_PRIO\_PROTECT protocol, it shall execute at the higher of its priority or the highest  
 53265 of the priority ceilings of all the robust mutexes owned by this thread and initialized with this  
 53266 attribute, regardless of whether other threads are blocked on any of these robust mutexes or not.

53267 TPP When a thread owns one or more non-robust mutexes initialized with the  
 53268 PTHREAD\_PRIO\_PROTECT protocol, it shall execute at the higher of its priority or the highest  
 53269 of the priority ceilings of all the non-robust mutexes owned by this thread and initialized with  
 53270 this attribute, regardless of whether other threads are blocked on any of these non-robust  
 53271 mutexes or not.

53272 While a thread is holding a mutex which has been initialized with the  
 53273 PTHREAD\_PRIO\_INHERIT or PTHREAD\_PRIO\_PROTECT protocol attributes, it shall not be  
 53274 subject to being moved to the tail of the scheduling queue at its priority in the event that its  
 53275 original priority is changed, such as by a call to *sched\_setparam()*. Likewise, when a thread

53276 unlocks a mutex that has been initialized with the PTHREAD\_PRIO\_INHERIT or  
 53277 PTHREAD\_PRIO\_PROTECT protocol attributes, it shall not be subject to being moved to the tail  
 53278 of the scheduling queue at its priority in the event that its original priority is changed.

53279 If a thread simultaneously owns several mutexes initialized with different protocols, it shall  
 53280 execute at the highest of the priorities that it would have obtained by each of these protocols.

53281 RPI | TPI When a thread makes a call to *pthread\_mutex\_lock()*, the mutex was initialized with the protocol  
 53282 attribute having the value PTHREAD\_PRIO\_INHERIT, when the calling thread is blocked  
 53283 because the mutex is owned by another thread, that owner thread shall inherit the priority level  
 53284 of the calling thread as long as it continues to own the mutex. The implementation shall update  
 53285 its execution priority to the maximum of its assigned priority and all its inherited priorities.  
 53286 Furthermore, if this owner thread itself becomes blocked on another mutex with the *protocol*  
 53287 attribute having the value PTHREAD\_PRIO\_INHERIT, the same priority inheritance effect shall  
 53288 be propagated to this other owner thread, in a recursive manner.

53289 The behavior is undefined if the value specified by the *attr* argument to  
 53290 *pthread\_mutexattr\_getprotocol()* or *pthread\_mutexattr\_setprotocol()* does not refer to an initialized  
 53291 mutex attributes object.

#### 53292 RETURN VALUE

53293 Upon successful completion, the *pthread\_mutexattr\_getprotocol()* and  
 53294 *pthread\_mutexattr\_setprotocol()* functions shall return zero; otherwise, an error number shall be  
 53295 returned to indicate the error.

#### 53296 ERRORS

53297 The *pthread\_mutexattr\_setprotocol()* function shall fail if:

53298 [ENOTSUP] The value specified by *protocol* is an unsupported value.

53299 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions may fail if:

53300 [EINVAL] The value specified by *protocol* is invalid.

53301 [EPERM] The caller does not have the privilege to perform the operation.

53302 These functions shall not return an error code of [EINTR].

#### 53303 EXAMPLES

53304 None.

#### 53305 APPLICATION USAGE

53306 None.

#### 53307 RATIONALE

53308 If an implementation detects that the value specified by the *attr* argument to  
 53309 *pthread\_mutexattr\_getprotocol()* or *pthread\_mutexattr\_setprotocol()* does not refer to an initialized  
 53310 mutex attributes object, it is recommended that the function should fail and report an [EINVAL]  
 53311 error.

#### 53312 FUTURE DIRECTIONS

53313 None.

#### 53314 SEE ALSO

**pthread\_mutexattr\_getprotocol()**

System Interfaces

53317 **CHANGE HISTORY**

53318 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

53319 Marked as part of the Realtime Threads Feature Group.

53320 **Issue 6**53321 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions are marked as  
53322 part of the Threads option and either the Thread Priority Protection or Thread Priority  
53323 Inheritance options.53324 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
53325 implementation does not support the Thread Priority Protection or Thread Priority Inheritance  
53326 options.53327 The **restrict** keyword is added to the *pthread\_mutexattr\_getprotocol()* prototype for alignment  
53328 with the ISO/IEC 9899:1999 standard.53329 **Issue 7**53330 SD5-XSH-ERN-135 is applied, updating the DESCRIPTION to define a default value for the  
53331 *protocol* attribute.

53332 SD5-XSH-ERN-188 is applied, updating the DESCRIPTION.

53333 The *pthread\_mutexattr\_getprotocol()* and *pthread\_mutexattr\_setprotocol()* functions are moved from  
53334 the Threads option to require support of either the Non-Robust Mutex Priority Protection option  
53335 or the Non-Robust Mutex Priority Inheritance option or the Robust Mutex Priority Protection  
53336 option or the Robust Mutex Priority Inheritance option.53337 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition  
53338 results in undefined behavior.

**53339 NAME**

53340 pthread\_mutexattr\_getpshared, pthread\_mutexattr\_setpshared — get and set the process-shared  
53341 attribute

**53342 SYNOPSIS**

```
53343 TSH #include <pthread.h>
53344 int pthread_mutexattr_getpshared(const pthread_mutexattr_t
53345 *restrict attr, int *restrict pshared);
53346 int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
53347 int pshared);
```

**53348 DESCRIPTION**

53349 The *pthread\_mutexattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
53350 from the attributes object referenced by *attr*.

53351 The *pthread\_mutexattr\_setpshared()* function shall set the *process-shared* attribute in an initialized  
53352 attributes object referenced by *attr*.

53353 The *process-shared* attribute is set to PTHREAD\_PROCESS\_SHARED to permit a mutex to be  
53354 operated upon by any thread that has access to the memory where the mutex is allocated, even if  
53355 the mutex is allocated in memory that is shared by multiple processes. If the *process-shared*  
53356 attribute is PTHREAD\_PROCESS\_PRIVATE, the mutex shall only be operated upon by threads  
53357 created within the same process as the thread that initialized the mutex; if threads of differing  
53358 processes attempt to operate on such a mutex, the behavior is undefined. The default value of  
53359 the attribute shall be PTHREAD\_PROCESS\_PRIVATE.

53360 The behavior is undefined if the value specified by the *attr* argument to  
53361 *pthread\_mutexattr\_getpshared()* or *pthread\_mutexattr\_setpshared()* does not refer to an initialized  
53362 mutex attributes object.

**53363 RETURN VALUE**

53364 Upon successful completion, *pthread\_mutexattr\_setpshared()* shall return zero; otherwise, an error  
53365 number shall be returned to indicate the error.

53366 Upon successful completion, *pthread\_mutexattr\_getpshared()* shall return zero and store the value  
53367 of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter.  
53368 Otherwise, an error number shall be returned to indicate the error.

**53369 ERRORS**

53370 The *pthread\_mutexattr\_setpshared()* function may fail if:

53371 [EINVAL] The new value specified for the attribute is outside the range of legal values  
53372 for that attribute.

53373 These functions shall not return an error code of [EINTR].

**53374 EXAMPLES**

53375 None.

**53376 APPLICATION USAGE**

53377 None.

**53378 RATIONALE**

53379 If an implementation detects that the value specified by the *attr* argument to  
53380 *pthread\_mutexattr\_getpshared()* or *pthread\_mutexattr\_setpshared()* does not refer to an initialized  
53381 mutex attributes object, it is recommended that the function should fail and report an [EINVAL]  
53382 error.

**pthread\_mutexattr\_getpshared()**53383 **FUTURE DIRECTIONS**

53384 None.

53385 **SEE ALSO**53386 *pthread\_cond\_destroy()*, *pthread\_create()*, *pthread\_mutex\_destroy()*, *pthread\_mutexattr\_destroy()*53387 XBD [<pthread.h>](#)53388 **CHANGE HISTORY**

53389 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

53390 **Issue 6**53391 The *pthread\_mutexattr\_getpshared()* and *pthread\_mutexattr\_setpshared()* functions are marked as  
53392 part of the Threads and Thread Process-Shared Synchronization options.53393 The **restrict** keyword is added to the *pthread\_mutexattr\_getpshared()* prototype for alignment  
53394 with the ISO/IEC 9899:1999 standard.53395 **Issue 7**53396 The *pthread\_mutexattr\_getpshared()* and *pthread\_mutexattr\_setpshared()* functions are moved from  
53397 the Threads option.53398 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition  
53399 results in undefined behavior.

53400 **NAME**

53401 pthread\_mutexattr\_getrobust, pthread\_mutexattr\_setrobust — get and set the mutex robust  
53402 attribute

53403 **SYNOPSIS**

```
53404 #include <pthread.h>
53405 int pthread_mutexattr_getrobust(const pthread_mutexattr_t *restrict
53406     attr, int *restrict robust);
53407 int pthread_mutexattr_setrobust(pthread_mutexattr_t *attr,
53408     int robust);
```

53409 **DESCRIPTION**

53410 The *pthread\_mutexattr\_getrobust()* and *pthread\_mutexattr\_setrobust()* functions, respectively, shall  
53411 get and set the mutex *robust* attribute. This attribute is set in the *robust* parameter. Valid values  
53412 for *robust* include:

53413 **PTHREAD\_MUTEX\_STALLED**

53414 No special actions are taken if the owner of the mutex is terminated while holding the  
53415 mutex lock. This can lead to deadlocks if no other thread can unlock the mutex.  
53416 This is the default value.

53417 **PTHREAD\_MUTEX\_ROBUST**

53418 If the process containing the owning thread of a robust mutex terminates while holding the  
53419 mutex lock, the next thread that acquires the mutex shall be notified about the termination  
53420 by the return value [EOWNERDEAD] from the locking function. If the owning thread of a  
53421 robust mutex terminates while holding the mutex lock, the next thread that acquires the  
53422 mutex may be notified about the termination by the return value [EOWNERDEAD]. The  
53423 notified thread can then attempt to mark the state protected by the mutex as consistent  
53424 again by a call to *pthread\_mutex\_consistent()*. After a subsequent successful call to  
53425 *pthread\_mutex\_unlock()*, the mutex lock shall be released and can be used normally by other  
53426 threads. If the mutex is unlocked without a call to *pthread\_mutex\_consistent()*, it shall be in a  
53427 permanently unusable state and all attempts to lock the mutex shall fail with the error  
53428 [ENOTRECOVERABLE]. The only permissible operation on such a mutex is  
53429 *pthread\_mutex\_destroy()*.

53430 The behavior is undefined if the value specified by the *attr* argument to  
53431 *pthread\_mutexattr\_getrobust()* or *pthread\_mutexattr\_setrobust()* does not refer to an initialized  
53432 mutex attributes object.

53433 **RETURN VALUE**

53434 Upon successful completion, the *pthread\_mutexattr\_getrobust()* function shall return zero and  
53435 store the value of the *robust* attribute of *attr* into the object referenced by the *robust* parameter.  
53436 Otherwise, an error value shall be returned to indicate the error. If successful, the  
53437 *pthread\_mutexattr\_setrobust()* function shall return zero; otherwise, an error number shall be  
53438 returned to indicate the error.

53439 **ERRORS**

53440 The *pthread\_mutexattr\_setrobust()* function shall fail if:

53441 [EINVAL] The value of *robust* is invalid.

53442 These functions shall not return an error code of [EINTR].

**pthread\_mutexattr\_getrobust()**

System Interfaces

53443 **EXAMPLES**

53444 None.

53445 **APPLICATION USAGE**

53446 The actions required to make the state protected by the mutex consistent again are solely  
53447 dependent on the application. If it is not possible to make the state of a mutex consistent, robust  
53448 mutexes can be used to notify this situation by calling *pthread\_mutex\_unlock()* without a prior  
53449 call to *pthread\_mutex\_consistent()*.

53450 If the state is declared inconsistent by calling *pthread\_mutex\_unlock()* without a prior call to  
53451 *pthread\_mutex\_consistent()*, a possible approach could be to destroy the mutex and then  
53452 reinitialize it. However, it should be noted that this is possible only in certain situations where  
53453 the state protected by the mutex has to be reinitialized and coordination achieved with other  
53454 threads blocked on the mutex, because otherwise a call to a locking function with a reference to a  
53455 mutex object invalidated by a call to *pthread\_mutex\_destroy()* results in undefined behavior.

53456 **RATIONALE**

53457 If an implementation detects that the value specified by the *attr* argument to  
53458 *pthread\_mutexattr\_getrobust()* or *pthread\_mutexattr\_setrobust()* does not refer to an initialized  
53459 mutex attributes object, it is recommended that the function should fail and report an [EINVAL]  
53460 error.

53461 **FUTURE DIRECTIONS**

53462 None.

53463 **SEE ALSO**53464 *pthread\_mutex\_consistent()*, *pthread\_mutex\_destroy()*, *pthread\_mutex\_lock()*

53465 XBD &lt;pthread.h&gt;

53466 **CHANGE HISTORY**

53467 First released in Issue 7.

53468 **NAME**

53469 pthread\_mutexattr\_gettype, pthread\_mutexattr\_settype — get and set the mutex type attribute

53470 **SYNOPSIS**

53471 #include &lt;pthread.h&gt;

53472 int pthread\_mutexattr\_gettype(const pthread\_mutexattr\_t \*restrict attr,  
53473 int \*restrict type);

53474 int pthread\_mutexattr\_settype(pthread\_mutexattr\_t \*attr, int type);

53475 **DESCRIPTION**53476 The *pthread\_mutexattr\_gettype()* and *pthread\_mutexattr\_settype()* functions, respectively, shall get  
53477 and set the mutex *type* attribute. This attribute is set in the *type* parameter to these functions. The  
53478 default value of the *type* attribute is PTHREAD\_MUTEX\_DEFAULT.53479 The type of mutex is contained in the *type* attribute of the mutex attributes. Valid mutex types  
53480 include:

## 53481 PTHREAD\_MUTEX\_NORMAL

53482 This type of mutex does not detect deadlock. A thread attempting to relock this mutex  
53483 without first unlocking it shall deadlock. Attempting to unlock a mutex locked by a  
53484 different thread results in undefined behavior. Attempting to unlock an unlocked mutex  
53485 results in undefined behavior.

## 53486 PTHREAD\_MUTEX\_ERRORCHECK

53487 This type of mutex provides error checking. A thread attempting to relock this mutex  
53488 without first unlocking it shall return with an error. A thread attempting to unlock a mutex  
53489 which another thread has locked shall return with an error. A thread attempting to unlock  
53490 an unlocked mutex shall return with an error.

## 53491 PTHREAD\_MUTEX\_RECURSIVE

53492 A thread attempting to relock this mutex without first unlocking it shall succeed in locking  
53493 the mutex. The relocking deadlock which can occur with mutexes of type  
53494 PTHREAD\_MUTEX\_NORMAL cannot occur with this type of mutex. Multiple locks of this  
53495 mutex shall require the same number of unlocks to release the mutex before another thread  
53496 can acquire the mutex. A thread attempting to unlock a mutex which another thread has  
53497 locked shall return with an error. A thread attempting to unlock an unlocked mutex shall  
53498 return with an error.

## 53499 PTHREAD\_MUTEX\_DEFAULT

53500 Attempting to recursively lock a mutex of this type results in undefined behavior.  
53501 Attempting to unlock a mutex of this type which was not locked by the calling thread  
53502 results in undefined behavior. Attempting to unlock a mutex of this type which is not  
53503 locked results in undefined behavior. An implementation may map this mutex to one of the  
53504 other mutex types.53505 The behavior is undefined if the value specified by the *attr* argument to  
53506 *pthread\_mutexattr\_gettype()* or *pthread\_mutexattr\_settype()* does not refer to an initialized mutex  
53507 attributes object.53508 **RETURN VALUE**53509 Upon successful completion, the *pthread\_mutexattr\_gettype()* function shall return zero and store  
53510 the value of the *type* attribute of *attr* into the object referenced by the *type* parameter. Otherwise,  
53511 an error shall be returned to indicate the error.53512 If successful, the *pthread\_mutexattr\_settype()* function shall return zero; otherwise, an error  
53513 number shall be returned to indicate the error.

**pthread\_mutexattr\_gettype()****53514 ERRORS**

53515 The *pthread\_mutexattr\_settype()* function shall fail if:

53516 [EINVAL] The value *type* is invalid.

53517 These functions shall not return an error code of [EINTR].

**53518 EXAMPLES**

53519 None.

**53520 APPLICATION USAGE**

53521 It is advised that an application should not use a PTHREAD\_MUTEX\_RECURSIVE mutex with  
 53522 condition variables because the implicit unlock performed for a *pthread\_cond\_timedwait()* or  
 53523 *pthread\_cond\_wait()* may not actually release the mutex (if it had been locked multiple times). If  
 53524 this happens, no other thread can satisfy the condition of the predicate.

**53525 RATIONALE**

53526 If an implementation detects that the value specified by the *attr* argument to  
 53527 *pthread\_mutexattr\_gettype()* or *pthread\_mutexattr\_settype()* does not refer to an initialized mutex  
 53528 attributes object, it is recommended that the function should fail and report an [EINVAL] error.

**53529 FUTURE DIRECTIONS**

53530 None.

**53531 SEE ALSO**

53532 [\*pthread\\_cond\\_timedwait\(\)\*](#)

53533 XBD <[pthread.h](#)>

**53534 CHANGE HISTORY**

53535 First released in Issue 5.

**53536 Issue 6**

53537 The Open Group Corrigendum U033/3 is applied. The SYNOPSIS for  
 53538 *pthread\_mutexattr\_gettype()* is updated so that the first argument is of type **const**  
 53539 **pthread\_mutexattr\_t\***.

53540 The **restrict** keyword is added to the *pthread\_mutexattr\_gettype()* prototype for alignment with  
 53541 the ISO/IEC 9899:1999 standard.

**53542 Issue 7**

53543 The *pthread\_mutexattr\_gettype()* and *pthread\_mutexattr\_settype()* functions are moved from the  
 53544 XSI option to the Base.

53545 The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition  
 53546 results in undefined behavior.

*System Interfaces***pthread\_mutexattr\_init()**53547 **NAME**

53595 **NAME**

53596 pthread\_once — dynamic package initialization

53597 **SYNOPSIS**

```
53598 #include <pthread.h>
53599 int pthread_once(pthread_once_t *once_control,
53600 void (*init_routine)(void));
53601 pthread_once_t once_control = PTHREAD_ONCE_INIT;
```

53602 **DESCRIPTION**

53603 The first call to *pthread\_once()* by any thread in a process, with a given *once\_control*, shall call the  
 53604 *init\_routine* with no arguments. Subsequent calls of *pthread\_once()* with the same *once\_control*  
 53605 shall not call the *init\_routine*. On return from *pthread\_once()*, *init\_routine* shall have completed.  
 53606 The *once\_control* parameter shall determine whether the associated initialization routine has been  
 53607 called.

53608 The *pthread\_once()* function is not a cancellation point. However, if *init\_routine* is a cancellation  
 53609 point and is canceled, the effect on *once\_control* shall be as if *pthread\_once()* was never called.

53610 The constant PTHREAD\_ONCE\_INIT is defined in the **<pthread.h>** header.

53611 The behavior of *pthread\_once()* is undefined if *once\_control* has automatic storage duration or is  
 53612 not initialized by PTHREAD\_ONCE\_INIT.

53613 **RETURN VALUE**

53614 Upon successful completion, *pthread\_once()* shall return zero; otherwise, an error number shall  
 53615 be returned to indicate the error.

53616 **ERRORS**

53617 The *pthread\_once()* function shall not return an error code of [EINTR].

53618 **EXAMPLES**

53619 None.

53620 **APPLICATION USAGE**

53621 None.

53622 **RATIONALE**

53623 Some C libraries are designed for dynamic initialization. That is, the global initialization for the  
 53624 library is performed when the first procedure in the library is called. In a single-threaded  
 53625 program, this is normally implemented using a static variable whose value is checked on entry  
 53626 to a routine, as follows:

```
53627 static int random_is_initialized = 0;
53628 extern int initialize_random();
53629 int random_function()
53630 {
53631     if (random_is_initialized == 0) {
53632         initialize_random();
53633         random_is_initialized = 1;
53634     }
53635     ... /* Operations performed after initialization. */
53636 }
```

53637 To keep the same structure in a multi-threaded program, a new primitive is needed. Otherwise,  
 53638 library initialization has to be accomplished by an explicit call to a library-exported initialization  
 53639 function prior to any use of the library.

**pthread\_once()**

53640 For dynamic library initialization in a multi-threaded process, a simple initialization flag is not  
 53641 sufficient; the flag needs to be protected against modification by multiple threads  
 53642 simultaneously calling into the library. Protecting the flag requires the use of a mutex; however,  
 53643 mutexes have to be initialized before they are used. Ensuring that the mutex is only initialized  
 53644 once requires a recursive solution to this problem.

53645 The use of *pthread\_once()* not only supplies an implementation-guaranteed means of dynamic  
 53646 initialization, it provides an aid to the reliable construction of multi-threaded and realtime  
 53647 systems. The preceding example then becomes:

```
53648 #include <pthread.h>
53649 static pthread_once_t random_is_initialized = PTHREAD_ONCE_INIT;
53650 extern int initialize_random();

53651 int random_function()
53652 {
53653     (void) pthread_once(&random_is_initialized, initialize_random);
53654     ... /* Operations performed after initialization. */
53655 }
```

53656 Note that a **pthread\_once\_t** cannot be an array because some compilers do not accept the  
 53657 construct **&<array\_name>**.

53658 If an implementation detects that the value specified by the *once\_control* argument to  
 53659 *pthread\_once()* does not refer to a **pthread\_once\_t** object initialized by PTHREAD\_ONCE\_INIT,  
 53660 it is recommended that the function should fail and report an [EINVAL] error.

**FUTURE DIRECTIONS**

53661 None.

**SEE ALSO**

53664 XBD [<pthread.h>](#)

**CHANGE HISTORY**

53665 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

53668 The *pthread\_once()* function is marked as part of the Threads option.

53669 The [EINVAL] error is added as a “may fail” case for if either argument is invalid.

**Issue 7**

53671 The *pthread\_once()* function is moved from the Threads option to the Base.

53672 The [EINVAL] error for an uninitialized **pthread\_once\_t** object is removed; this condition results  
 53673 in undefined behavior.

53674 **NAME**

53675 pthread\_rwlock\_destroy, pthread\_rwlock\_init — destroy and initialize a read-write lock object

53676 **SYNOPSIS**

```
53677 #include <pthread.h>
53678 int pthread_rwlock_destroy(pthread_rwlock_t *rwlock);
53679 int pthread_rwlock_init(pthread_rwlock_t *restrict rwlock,
53680 const pthread_rwlockattr_t *restrict attr);
53681 pthread_rwlock_t rwlock = PTHREAD_RWLOCK_INITIALIZER;
```

53682 **DESCRIPTION**

53683 The *pthread\_rwlock\_destroy()* function shall destroy the read-write lock object referenced by  
 53684 *rwlock* and release any resources used by the lock. The effect of subsequent use of the lock is  
 53685 undefined until the lock is reinitialized by another call to *pthread\_rwlock\_init()*. An  
 53686 implementation may cause *pthread\_rwlock\_destroy()* to set the object referenced by *rwlock* to an  
 53687 invalid value. Results are undefined if *pthread\_rwlock\_destroy()* is called when any thread holds  
 53688 *rwlock*. Attempting to destroy an uninitialized read-write lock results in undefined behavior.

53689 The *pthread\_rwlock\_init()* function shall allocate any resources required to use the read-write lock  
 53690 referenced by *rwlock* and initializes the lock to an unlocked state with attributes referenced by  
 53691 *attr*. If *attr* is NULL, the default read-write lock attributes shall be used; the effect is the same as  
 53692 passing the address of a default read-write lock attributes object. Once initialized, the lock can be  
 53693 used any number of times without being reinitialized. Results are undefined if  
 53694 *pthread\_rwlock\_init()* is called specifying an already initialized read-write lock. Results are  
 53695 undefined if a read-write lock is used without first being initialized.

53696 If the *pthread\_rwlock\_init()* function fails, *rwlock* shall not be initialized and the contents of *rwlock*  
 53697 are undefined.

53698 Only the object referenced by *rwlock* may be used for performing synchronization. The result of  
 53699 referring to copies of that object in calls to *pthread\_rwlock\_destroy()*, *pthread\_rwlock\_rdlock()*,  
 53700 *pthread\_rwlock\_timedrdlock()*, *pthread\_rwlock\_timedwrlock()*, *pthread\_rwlock\_tryrdlock()*,  
 53701 *pthread\_rwlock\_trywrlock()*, *pthread\_rwlock\_unlock()*, or *pthread\_rwlock\_wrlock()* is undefined.

53702 In cases where default read-write lock attributes are appropriate, the macro  
 53703 PTHREAD\_RWLOCK\_INITIALIZER can be used to initialize read-write locks that are statically  
 53704 allocated. The effect shall be equivalent to dynamic initialization by a call to *pthread\_rwlock\_init()*  
 53705 with the *attr* parameter specified as NULL, except that no error checks are performed.

53706 The behavior is undefined if the value specified by the *attr* argument to *pthread\_rwlock\_init()*  
 53707 does not refer to an initialized read-write lock attributes object.

53708 **RETURN VALUE**

53709 If successful, the *pthread\_rwlock\_destroy()* and *pthread\_rwlock\_init()* functions shall return zero;  
 53710 otherwise, an error number shall be returned to indicate the error.

53711 **ERRORS**

53712 The *pthread\_rwlock\_init()* function shall fail if:

53713 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize  
 53714 another read-write lock.

53715 [ENOMEM] Insufficient memory exists to initialize the read-write lock.

53716 [EPERM] The caller does not have the privilege to perform the operation.

53717 These functions shall not return an error code of [EINTR].

**pthread\_rwlock\_destroy()**53718 **EXAMPLES**

53719 None.

53720 **APPLICATION USAGE**53721 Applications using these and related read-write lock functions may be subject to priority  
53722 inversion, as discussed in XBD Section 3.285 (on page 79).53723 **RATIONALE**53724 If an implementation detects that the value specified by the *rwlock* argument to  
53725 *pthread\_rwlock\_destroy()* does not refer to an initialized read-write lock object, it is recommended  
53726 that the function should fail and report an [EINVAL] error.53727 If an implementation detects that the value specified by the *attr* argument to  
53728 *pthread\_rwlock\_init()* does not refer to an initialized read-write lock attributes object, it is  
53729 recommended that the function should fail and report an [EINVAL] error.53730 If an implementation detects that the value specified by the *rwlock* argument to  
53731 *pthread\_rwlock\_destroy()* or *pthread\_rwlock\_init()* refers to a locked read-write lock object, or  
53732 detects that the value specified by the *rwlock* argument to *pthread\_rwlock\_init()* refers to an  
53733 already initialized read-write lock object, it is recommended that the function should fail and  
53734 report an [EBUSY] error.53735 **FUTURE DIRECTIONS**

53736 None.

53737 **SEE ALSO**53738 *pthread\_rwlock\_rdlock()*, *pthread\_rwlock\_timedrdlock()*, *pthread\_rwlock\_timedwrlock()*,  
53739 *pthread\_rwlock\_trywrlock()*, *pthread\_rwlock\_unlock()*53740 XBD Section 3.285 (on page 79), `<pthread.h>`53741 **CHANGE HISTORY**

53742 First released in Issue 5.

53743 **Issue 6**

53744 The following changes are made for alignment with IEEE Std 1003.1j-2000:

53745 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
53746 now part of the Threads option (previously it was part of the Read-Write Locks option in  
53747 IEEE Std 1003.1j-2000 and also part of the XSI extension). The initializer macro is also  
53748 deleted from the SYNOPSIS.

53749 • The DESCRIPTION is updated as follows:

53750 It explicitly notes allocation of resources upon initialization of a read-write lock  
53751 object.53752 — A paragraph is added specifying that copies of read-write lock objects may not be  
53753 used.53754 • An [EINVAL] error is added to the ERRORS section for *pthread\_rwlock\_init()*, indicating  
53755 that the *rwlock* value is invalid.

53756 • The SEE ALSO section is updated.

53757 The **restrict** keyword is added to the *pthread\_rwlock\_init()* prototype for alignment with the  
53758 ISO/IEC 9899:1999 standard.53759 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/45 is applied, adding APPLICATION  
53760 USAGE relating to priority inversion.

53761 **Issue 7**

53762 Austin Group Interpretation 1003.1-2001 #048 is applied, adding the  
53763 PTHREAD\_RWLOCK\_INITIALIZER macro.

53764 The *pthread\_rwlock\_destroy()* and *pthread\_rwlock\_init()* functions are moved from the Threads  
53765 option to the Base.

53766 The [EINVAL] error for an uninitialized read-write lock object or read-write lock attributes  
53767 object is removed; this condition results in undefined behavior.

53768 The [EBUSY] error for a locked read-write lock object or an already initialized read-write lock  
53769 object is removed; this condition results in undefined behavior.

**pthread\_rwlock\_rdlock()**

System Interfaces

53770 **NAME**

53771 pthread\_rwlock\_rdlock, pthread\_rwlock\_tryrdlock — lock a read-write lock object for reading

53772 **SYNOPSIS**

53773 #include &lt;pthread.h&gt;

53774 int pthread\_rwlock\_rdlock(pthread\_rwlock\_t \*rwlock);

53775 int pthread\_rwlock\_tryrdlock(pthread\_rwlock\_t \*rwlock);

53776 **DESCRIPTION**53777 The *pthread\_rwlock\_rdlock()* function shall apply a read lock to the read-write lock referenced by  
53778 *rwlock*. The calling thread acquires the read lock if a writer does not hold the lock and there are  
53779 no writers blocked on the lock.53780 TPS If the Thread Execution Scheduling option is supported, and the threads involved in the lock are  
53781 executing with the scheduling policies SCHED\_FIFO or SCHED\_RR, the calling thread shall not  
53782 acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on  
53783 the lock; otherwise, the calling thread shall acquire the lock.53784 TPS TSP If the Thread Execution Scheduling option is supported, and the threads involved in the lock are  
53785 executing with the SCHED\_SPORADIC scheduling policy, the calling thread shall not acquire  
53786 the lock if a writer holds the lock or if writers of higher or equal priority are blocked on the lock;  
53787 otherwise, the calling thread shall acquire the lock.53788 If the Thread Execution Scheduling option is not supported, it is implementation-defined  
53789 whether the calling thread acquires the lock when a writer does not hold the lock and there are  
53790 writers blocked on the lock. If a writer holds the lock, the calling thread shall not acquire the  
53791 read lock. If the read lock is not acquired, the calling thread shall block until it can acquire the  
53792 lock. The calling thread may deadlock if at the time the call is made it holds a write lock.53793 A thread may hold multiple concurrent read locks on *rwlock* (that is, successfully call the  
53794 *pthread\_rwlock\_rdlock()* function *n* times). If so, the application shall ensure that the thread  
53795 performs matching unlocks (that is, it calls the *pthread\_rwlock\_unlock()* function *n* times).53796 The maximum number of simultaneous read locks that an implementation guarantees can be  
53797 applied to a read-write lock shall be implementation-defined. The *pthread\_rwlock\_rdlock()*  
53798 function may fail if this maximum would be exceeded.53799 The *pthread\_rwlock\_tryrdlock()* function shall apply a read lock as in the *pthread\_rwlock\_rdlock()*  
53800 function, with the exception that the function shall fail if the equivalent *pthread\_rwlock\_rdlock()*  
53801 call would have blocked the calling thread. In no case shall the *pthread\_rwlock\_tryrdlock()*  
53802 function ever block; it always either acquires the lock or fails and returns immediately.

53803 Results are undefined if any of these functions are called with an uninitialized read-write lock.

53804 If a signal is delivered to a thread waiting for a read-write lock for reading, upon return from the  
53805 signal handler the thread resumes waiting for the read-write lock for reading as if it was not  
53806 interrupted.53807 **RETURN VALUE**53808 If successful, the *pthread\_rwlock\_rdlock()* function shall return zero; otherwise, an error number  
53809 shall be returned to indicate the error.53810 The *pthread\_rwlock\_tryrdlock()* function shall return zero if the lock for reading on the read-write  
53811 lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to  
53812 indicate the error.

**53813 ERRORS**

53814 The *pthread\_rwlock\_tryrdlock()* function shall fail if:

53815 [EBUSY] The read-write lock could not be acquired for reading because a writer holds  
53816 the lock or a writer with the appropriate priority was blocked on it.

53817 The *pthread\_rwlock\_rdlock()* and *pthread\_rwlock\_tryrdlock()* functions may fail if:

53818 [EAGAIN] The read lock could not be acquired because the maximum number of read  
53819 locks for *rwlock* has been exceeded.

53820 The *pthread\_rwlock\_rdlock()* function may fail if:

53821 [EDEADLK] A deadlock condition was detected or the current thread already owns the  
53822 read-write lock for writing.

53823 These functions shall not return an error code of [EINTR].

**53824 EXAMPLES**

53825 None.

**53826 APPLICATION USAGE**

53827 Applications using these functions may be subject to priority inversion, as discussed in XBD  
53828 [Section 3.285](#) (on page 79).

**53829 RATIONALE**

53830 If an implementation detects that the value specified by the *rwlock* argument to  
53831 *pthread\_rwlock\_rdlock()* or *pthread\_rwlock\_tryrdlock()* does not refer to an initialized read-write  
53832 lock object, it is recommended that the function should fail and report an [EINVAL] error.

**53833 FUTURE DIRECTIONS**

53834 None.

**53835 SEE ALSO**

53836 *pthread\_rwlock\_destroy()*, *pthread\_rwlock\_timedrdlock()*, *pthread\_rwlock\_timedwrlock()*,  
53837 *pthread\_rwlock\_trywrlock()*, *pthread\_rwlock\_unlock()*

53838 XBD [Section 3.285](#) (on page 79), [Section 4.11](#) (on page 110), [<pthread.h>](#)

**53839 CHANGE HISTORY**

53840 First released in Issue 5.

**53841 Issue 6**

53842 The following changes are made for alignment with IEEE Std 1003.1j-2000:

53843 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
53844 now part of the Threads option (previously it was part of the Read-Write Locks option in  
53845 IEEE Std 1003.1j-2000 and also part of the XSI extension).

53846 • The DESCRIPTION is updated as follows:

53847 — Conditions under which writers have precedence over readers are specified.

53848 — Failure of *pthread\_rwlock\_tryrdlock()* is clarified.

53849 — A paragraph on the maximum number of read locks is added.

53850 • In the ERRORS sections, [EBUSY] is modified to take into account write priority, and  
53851 [EDEADLK] is deleted as a *pthread\_rwlock\_tryrdlock()* error.

**pthread\_rwlock\_rdlock()**

- 53852           • The SEE ALSO section is updated.
- 53853           IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/101 is applied, updating the ERRORS  
53854           section so that the [EDEADLK] error includes detection of a deadlock condition.
- 53855   **Issue 7**
- 53856           The *pthread\_rwlock\_rdlock()* and *pthread\_rwlock\_tryrdlock()* functions are moved from the Threads  
53857           option to the Base.
- 53858           The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results  
53859           in undefined behavior.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

53860 **NAME**

53861 pthread\_rwlock\_timedrdlock — lock a read-write lock for reading

53862 **SYNOPSIS**

53863 #include &lt;pthread.h&gt;

53864 #include &lt;time.h&gt;

```
53865 int pthread_rwlock_timedrdlock(pthread_rwlock_t *restrict rwlock,
53866     const struct timespec *restrict abstime);
```

53867 **DESCRIPTION**

53868 The *pthread\_rwlock\_timedrdlock()* function shall apply a read lock to the read-write lock  
 53869 referenced by *rwlock* as in the *pthread\_rwlock\_rdlock()* function. However, if the lock cannot be  
 53870 acquired without waiting for other threads to unlock the lock, this wait shall be terminated  
 53871 when the specified timeout expires. The timeout shall expire when the absolute time specified  
 53872 by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value  
 53873 of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already  
 53874 been passed at the time of the call.

53875 The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall  
 53876 be the resolution of the CLOCK\_REALTIME clock. The **timespec** data type is defined in the  
 53877 **<time.h>** header. Under no circumstances shall the function fail with a timeout if the lock can be  
 53878 acquired immediately. The validity of the *abstime* parameter need not be checked if the lock can  
 53879 be immediately acquired.

53880 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-  
 53881 write lock via a call to *pthread\_rwlock\_timedrdlock()*, upon return from the signal handler the  
 53882 thread shall resume waiting for the lock as if it was not interrupted.

53883 The calling thread may deadlock if at the time the call is made it holds a write lock on *rwlock*.  
 53884 The results are undefined if this function is called with an uninitialized read-write lock.

53885 **RETURN VALUE**

53886 The *pthread\_rwlock\_timedrdlock()* function shall return zero if the lock for reading on the read-  
 53887 write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned  
 53888 to indicate the error.

53889 **ERRORS**

53890 The *pthread\_rwlock\_timedrdlock()* function shall fail if:

53891 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

53892 The *pthread\_rwlock\_timedrdlock()* function may fail if:

53893 [EAGAIN] The read lock could not be acquired because the maximum number of read  
 53894 locks for lock would be exceeded.

53895 [EDEADLK] A deadlock condition was detected or the calling thread already holds a write  
 53896 lock on *rwlock*.

53897 [EINVAL] The *abstime* nanosecond value is less than zero or greater than or equal to 1 000  
 53898 million.

53899 This function shall not return an error code of [EINTR].

**pthread\_rwlock\_timedrdlock()**

System Interfaces

53900 **EXAMPLES**

53901 None.

53902 **APPLICATION USAGE**53903 Applications using this function may be subject to priority inversion, as discussed in XBD  
53904 [Section 3.285](#) (on page 79).53905 **RATIONALE**53906 If an implementation detects that the value specified by the *rwlock* argument to  
53907 *pthread\_rwlock\_timedrdlock()* does not refer to an initialized read-write lock object, it is  
53908 recommended that the function should fail and report an [EINVAL] error.53909 **FUTURE DIRECTIONS**

53910 None.

53916 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

53917 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/102 is applied, updating the ERRORS  
53918 section so that the [EDEADLK] error includes detection of a deadlock condition.53919 **Issue 7**53920 The *pthread\_rwlock\_timedrdlock()* function is moved from the Timeouts option to the Base.53921 The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results  
53922 in undefined behavior.

53923 **NAME**

53924 pthread\_rwlock\_timedwrlock — lock a read-write lock for writing

53925 **SYNOPSIS**

53926 #include &lt;pthread.h&gt;

53927 #include &lt;time.h&gt;

53928 int pthread\_rwlock\_timedwrlock(pthread\_rwlock\_t \*restrict *rwlock*,  
53929 const struct timespec \*restrict *abstime*);53930 **DESCRIPTION**

53931 The *pthread\_rwlock\_timedwrlock()* function shall apply a write lock to the read-write lock  
53932 referenced by *rwlock* as in the *pthread\_rwlock\_wrlock()* function. However, if the lock cannot be  
53933 acquired without waiting for other threads to unlock the lock, this wait shall be terminated  
53934 when the specified timeout expires. The timeout shall expire when the absolute time specified  
53935 by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value  
53936 of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already  
53937 been passed at the time of the call.

53938 The timeout shall be based on the CLOCK\_REALTIME clock. The resolution of the timeout shall  
53939 be the resolution of the CLOCK\_REALTIME clock. The **timespec** data type is defined in the  
53940 **<time.h>** header. Under no circumstances shall the function fail with a timeout if the lock can be  
53941 acquired immediately. The validity of the *abstime* parameter need not be checked if the lock can  
53942 be immediately acquired.

53943 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-  
53944 write lock via a call to *pthread\_rwlock\_timedwrlock()*, upon return from the signal handler the  
53945 thread shall resume waiting for the lock as if it was not interrupted.

53946 The calling thread may deadlock if at the time the call is made it holds the read-write lock. The  
53947 results are undefined if this function is called with an uninitialized read-write lock.

53948 **RETURN VALUE**

53949 The *pthread\_rwlock\_timedwrlock()* function shall return zero if the lock for writing on the read-  
53950 write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned  
53951 to indicate the error.

53952 **ERRORS**53953 The *pthread\_rwlock\_timedwrlock()* function shall fail if:

53954 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

53955 The *pthread\_rwlock\_timedwrlock()* function may fail if:53956 [EDEADLK] A deadlock condition was detected or the calling thread already holds the  
53957 *rwlock*.53958 [EINVAL] The *abstime* nanosecond value is less than zero or greater than or equal to 1 000  
53959 million.

53960 This function shall not return an error code of [EINTR].

**pthread\_rwlock\_timedwrlock()**

System Interfaces

53961 **EXAMPLES**

53962 None.

53963 **APPLICATION USAGE**53964 Applications using this function may be subject to priority inversion, as discussed in XBD  
53965 [Section 3.285](#) (on page 79).53966 **RATIONALE**53967 If an implementation detects that the value specified by the *rwlock* argument to  
53968 *pthread\_rwlock\_timedwrlock()* does not refer to an initialized read-write lock object, it is  
53969 recommended that the function should fail and report an [EINVAL] error.53970 **FUTURE DIRECTIONS**

53971 None.

53977 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

53978 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/103 is applied, updating the ERRORS  
53979 section so that the [EDEADLK] error includes detection of a deadlock condition.53980 **Issue 7**53981 The *pthread\_rwlock\_timedwrlock()* function is moved from the Timeouts option to the Base.53982 The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results  
53983 in undefined behavior.

*System Interfaces***pthread\_rwlock\_tryrdlock()**53984 **NAME**

53985 pthread\_rwlock\_tryrdlock — lock a read-write lock object for reading

53986 **SYNOPSIS**

53987 #include &lt;pthread.h&gt;

53988 int pthread\_rwlock\_tryrdlock(pthread\_rwlock\_t \*rwlock);

53989 **DESCRIPTION**53990 Refer to *pthread\_rwlock\_rdlock()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**pthread\_rwlock\_trywrlock()**53991 **NAME**

53992 pthread\_rwlock\_trywrlock, pthread\_rwlock\_wrlock — lock a read-write lock object for writing

53993 **SYNOPSIS**

53994 #include &lt;pthread.h&gt;

53995 int pthread\_rwlock\_trywrlock(pthread\_rwlock\_t \*rwlck);

53996 int pthread\_rwlock\_wrlock(pthread\_rwlock\_t \*rwlck);

53997 **DESCRIPTION**53998 The *pthread\_rwlock\_trywrlock()* function shall apply a write lock like the *pthread\_rwlock\_wrlock()*  
53999 function, with the exception that the function shall fail if any thread currently holds *rwlck* (for  
54000 reading or writing).54001 The *pthread\_rwlock\_wrlock()* function shall apply a write lock to the read-write lock referenced by  
54002 *rwlck*. The calling thread acquires the write lock if no other thread (reader or writer) holds the  
54003 read-write lock *rwlck*. Otherwise, the thread shall block until it can acquire the lock. The calling  
54004 thread may deadlock if at the time the call is made it holds the read-write lock (whether a read  
54005 or write lock).

54006 Implementations may favor writers over readers to avoid writer starvation.

54007 Results are undefined if any of these functions are called with an uninitialized read-write lock.

54008 If a signal is delivered to a thread waiting for a read-write lock for writing, upon return from the  
54009 signal handler the thread resumes waiting for the read-write lock for writing as if it was not  
54010 interrupted.54011 **RETURN VALUE**54012 The *pthread\_rwlock\_trywrlock()* function shall return zero if the lock for writing on the read-write  
54013 lock object referenced by *rwlck* is acquired. Otherwise, an error number shall be returned to  
54014 indicate the error.54015 If successful, the *pthread\_rwlock\_wrlock()* function shall return zero; otherwise, an error number  
54016 shall be returned to indicate the error.54017 **ERRORS**54018 The *pthread\_rwlock\_trywrlock()* function shall fail if:54019 [EBUSY] The read-write lock could not be acquired for writing because it was already  
54020 locked for reading or writing.54021 The *pthread\_rwlock\_wrlock()* function may fail if:54022 [EDEADLK] A deadlock condition was detected or the current thread already owns the  
54023 read-write lock for writing or reading.

54024 These functions shall not return an error code of [EINTR].

54025 **EXAMPLES**

54026 None.

54027 **APPLICATION USAGE**54028 Applications using these functions may be subject to priority inversion, as discussed in XBD  
54029 [Section 3.285](#) (on page 79).54030 **RATIONALE**54031 If an implementation detects that the value specified by the *rwlck* argument to  
54032 *pthread\_rwlock\_trywrlock()* or *pthread\_rwlock\_wrlock()* does not refer to an initialized read-write  
54033 lock object, it is recommended that the function should fail and report an [EINVAL] error.

54034 **FUTURE DIRECTIONS**

54035 None.

54036 **SEE ALSO**54037 *pthread\_rwlock\_destroy()*, *pthread\_rwlock\_rdlock()*, *pthread\_rwlock\_timedrdlock()*,  
54038 *pthread\_rwlock\_timedwrlock()*, *pthread\_rwlock\_unlock()*

54039 XBD Section 3.285 (on page 79), Section 4.11 (on page 110), &lt;pthread.h&gt;

54040 **CHANGE HISTORY**

54041 First released in Issue 5.

54042 **Issue 6**

54043 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 54044 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
54045 now part of the Threads option (previously it was part of the Read-Write Locks option in  
54046 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 54047 • The [EDEADLK] error is deleted as a *pthread\_rwlock\_trywrlock()* error.
- 54048 • The SEE ALSO section is updated.

54049 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/104 is applied, updating the ERRORS  
54050 section so that the [EDEADLK] error includes detection of a deadlock condition.54051 **Issue 7**54052 The *pthread\_rwlock\_trywrlock()* and *pthread\_rwlock\_wrlock()* functions are moved from the  
54053 Threads option to the Base.54054 The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results  
54055 in undefined behavior.

**pthread\_rwlock\_unlock()**

System Interfaces

54056 **NAME**

54057 pthread\_rwlock\_unlock — unlock a read-write lock object

54058 **SYNOPSIS**

54059 #include &lt;pthread.h&gt;

54060 int pthread\_rwlock\_unlock(pthread\_rwlock\_t \*rwlock);

54061 **DESCRIPTION**

54062 The *pthread\_rwlock\_unlock()* function shall release a lock held on the read-write lock object  
 54063 referenced by *rwlock*. Results are undefined if the read-write lock *rwlock* is not held by the  
 54064 calling thread.

54065 If this function is called to release a read lock from the read-write lock object and there are other  
 54066 read locks currently held on this read-write lock object, the read-write lock object remains in the  
 54067 read locked state. If this function releases the last read lock for this read-write lock object, the  
 54068 read-write lock object shall be put in the unlocked state with no owners.

54069 If this function is called to release a write lock for this read-write lock object, the read-write lock  
 54070 object shall be put in the unlocked state.

54071 If there are threads blocked on the lock when it becomes available, the scheduling policy shall  
 54072 TPS determine which thread(s) shall acquire the lock. If the Thread Execution Scheduling option is  
 54073 supported, when threads executing with the scheduling policies SCHED\_FIFO, SCHED\_RR, or  
 54074 SCHED\_SPORADIC are waiting on the lock, they shall acquire the lock in priority order when  
 54075 the lock becomes available. For equal priority threads, write locks shall take precedence over  
 54076 read locks. If the Thread Execution Scheduling option is not supported, it is implementation-  
 54077 defined whether write locks take precedence over read locks.

54078 Results are undefined if this function is called with an uninitialized read-write lock.

54079 **RETURN VALUE**

54080 If successful, the *pthread\_rwlock\_unlock()* function shall return zero; otherwise, an error number  
 54081 shall be returned to indicate the error.

54082 **ERRORS**

54083 The *pthread\_rwlock\_unlock()* function shall not return an error code of [EINTR].

54084 **EXAMPLES**

54085 None.

54086 **APPLICATION USAGE**

54087 None.

54088 **RATIONALE**

54089 If an implementation detects that the value specified by the *rwlock* argument to  
 54090 *pthread\_rwlock\_unlock()* does not refer to an initialized read-write lock object, it is recommended  
 54091 that the function should fail and report an [EINVAL] error.

54092 If an implementation detects that the value specified by the *rwlock* argument to  
 54093 *pthread\_rwlock\_unlock()* refers to a read-write lock object for which the current thread does not  
 54094 hold a lock, it is recommended that the function should fail and report an [EPERM] error.

54095 **FUTURE DIRECTIONS**

54096 None.

54097 **SEE ALSO**

54098 *pthread\_rwlock\_destroy()*, *pthread\_rwlock\_rdlock()*, *pthread\_rwlock\_timedrdlock()*,  
 54099 *pthread\_rwlock\_timedwrlock()*, *pthread\_rwlock\_trywrlock()*

54100 XBD Section 4.11 (on page 110), **<pthread.h>**

54101 **CHANGE HISTORY**

54102 First released in Issue 5.

54103 **Issue 6**

54104 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 54105 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is  
 54106 now part of the Threads option (previously it was part of the Read-Write Locks option in  
 54107 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 54108 • The DESCRIPTION is updated as follows:
  - 54109 — The conditions under which writers have precedence over readers are specified.
  - 54110 — The concept of read-write lock owner is deleted.
- 54111 • The SEE ALSO section is updated.

54112 **Issue 7**

54113 SD5-XSH-ERN-183 is applied.

54114 The *pthread\_rwlock\_unlock()* function is moved from the Threads option to the Base.

54115 The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results  
 54116 in undefined behavior.

54117 The [EPERM] error for a read-write lock object for which the current thread does not hold a lock  
 54118 is removed; this condition results in undefined behavior.

**pthread\_rwlock\_wrlock()***System Interfaces*54119 **NAME**

54120 pthread\_rwlock\_wrlock — lock a read-write lock object for writing

54121 **SYNOPSIS**

54122 #include &lt;pthread.h&gt;

54123 int pthread\_rwlock\_wrlock(pthread\_rwlock\_t \*rwlock);

54124 **DESCRIPTION**54125 Refer to *pthread\_rwlock\_trywrlock()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**54126 NAME**

54127 `pthread_rwlockattr_destroy`, `pthread_rwlockattr_init` — destroy and initialize the read-write  
54128 lock attributes object

**54129 SYNOPSIS**

```
54130 #include <pthread.h>
54131 int pthread_rwlockattr_destroy(pthread_rwlockattr_t *attr);
54132 int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);
```

**54133 DESCRIPTION**

54134 The `pthread_rwlockattr_destroy()` function shall destroy a read-write lock attributes object. A  
54135 destroyed `attr` attributes object can be reinitialized using `pthread_rwlockattr_init()`; the results of  
54136 otherwise referencing the object after it has been destroyed are undefined. An implementation  
54137 may cause `pthread_rwlockattr_destroy()` to set the object referenced by `attr` to an invalid value.

54138 The `pthread_rwlockattr_init()` function shall initialize a read-write lock attributes object `attr` with  
54139 the default value for all of the attributes defined by the implementation.

54140 Results are undefined if `pthread_rwlockattr_init()` is called specifying an already initialized `attr`  
54141 attributes object.

54142 After a read-write lock attributes object has been used to initialize one or more read-write locks,  
54143 any function affecting the attributes object (including destruction) shall not affect any previously  
54144 initialized read-write locks.

54145 The behavior is undefined if the value specified by the `attr` argument to  
54146 `pthread_rwlockattr_destroy()` does not refer to an initialized read-write lock attributes object.

**54147 RETURN VALUE**

54148 If successful, the `pthread_rwlockattr_destroy()` and `pthread_rwlockattr_init()` functions shall return  
54149 zero; otherwise, an error number shall be returned to indicate the error.

**54150 ERRORS**

54151 The `pthread_rwlockattr_init()` function shall fail if:

54152 [ENOMEM] Insufficient memory exists to initialize the read-write lock attributes object.

54153 These functions shall not return an error code of [EINTR].

**54154 EXAMPLES**

54155 None.

**54156 APPLICATION USAGE**

54157 None.

**54158 RATIONALE**

54159 If an implementation detects that the value specified by the `attr` argument to  
54160 `pthread_rwlockattr_destroy()` does not refer to an initialized read-write lock attributes object, it is  
54161 recommended that the function should fail and report an [EINVAL] error.

**54162 FUTURE DIRECTIONS**

54163 None.

**54164 SEE ALSO**

System Interfaces

54167 **CHANGE HISTORY**

54168 First released in Issue 5.

54169 **Issue 6**

54170 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 54171 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
- 54172 now part of the Threads option (previously it was part of the Read-Write Locks option in
- 54173 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 54174 • The SEE ALSO section is updated.

54175 **Issue 7**54176 The *pthread\_rwlockattr\_destroy()* and *pthread\_rwlockattr\_init()* functions are moved from the

54177 Threads option to the Base.

54178 The [EINVAL] error for an uninitialized read-write lock attributes object is removed; this

54179 condition results in undefined behavior.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

54180 **NAME**

54181 pthread\_rwlockattr\_getpshared, pthread\_rwlockattr\_setpshared — get and set the process-  
 54182 shared attribute of the read-write lock attributes object

54183 **SYNOPSIS**

```
54184 TSH #include <pthread.h>
54185
54185 int pthread_rwlockattr_getpshared(const pthread_rwlockattr_t
54186 *restrict attr, int *restrict pshared);
54187 int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
54188 int pshared);
```

54189 **DESCRIPTION**

54190 The *pthread\_rwlockattr\_getpshared()* function shall obtain the value of the *process-shared* attribute  
 54191 from the initialized attributes object referenced by *attr*. The *pthread\_rwlockattr\_setpshared()*  
 54192 function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

54193 The *process-shared* attribute shall be set to `PTHREAD_PROCESS_SHARED` to permit a read-write  
 54194 lock to be operated upon by any thread that has access to the memory where the read-write lock  
 54195 is allocated, even if the read-write lock is allocated in memory that is shared by multiple  
 54196 processes. If the *process-shared* attribute is `PTHREAD_PROCESS_PRIVATE`, the read-write lock  
 54197 shall only be operated upon by threads created within the same process as the thread that  
 54198 initialized the read-write lock; if threads of differing processes attempt to operate on such a  
 54199 read-write lock, the behavior is undefined. The default value of the *process-shared* attribute shall  
 54200 be `PTHREAD_PROCESS_PRIVATE`.

54201 Additional attributes, their default values, and the names of the associated functions to get and  
 54202 set those attribute values are implementation-defined.

54203 The behavior is undefined if the value specified by the *attr* argument to  
 54204 *pthread\_rwlockattr\_getpshared()* or *pthread\_rwlockattr\_setpshared()* does not refer to an initialized  
 54205 read-write lock attributes object.

54206 **RETURN VALUE**

54207 Upon successful completion, the *pthread\_rwlockattr\_getpshared()* function shall return zero and  
 54208 store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared*  
 54209 parameter. Otherwise, an error number shall be returned to indicate the error.

54210 If successful, the *pthread\_rwlockattr\_setpshared()* function shall return zero; otherwise, an error  
 54211 number shall be returned to indicate the error.

54212 **ERRORS**

54213 The *pthread\_rwlockattr\_setpshared()* function may fail if:

54214 [EINVAL] The new value specified for the attribute is outside the range of legal values  
 54215 for that attribute.

54216 These functions shall not return an error code of [EINTR].

54263 #include &lt;pthread.h&gt;

54264 pthread\_t pthread\_self(void);

54265 **DESCRIPTION**54266 The *pthread\_self()* function shall return the thread ID of the calling thread.54267 **RETURN VALUE**54268 The *pthread\_self()* function shall always be successful and no return value is reserved to indicate  
54269 an error.54270 **ERRORS**

54271 No errors are defined.

54272 **EXAMPLES**

54273 None.

54274 **APPLICATION USAGE**

54275 None.

54276 **RATIONALE**54277 The *pthread\_self()* function provides a capability similar to the *getpid()* function for processes  
54278 and the rationale is the same: the creation call does not provide the thread ID to the created  
54279 thread.54280 **FUTURE DIRECTIONS**

54281 None.

54282 **SEE ALSO**54283 *pthread\_create()*, *pthread\_equal()*

54284 XBD &lt;pthread.h&gt;

54285 **CHANGE HISTORY**

54286 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

54287 **Issue 6**54288 The *pthread\_self()* function is marked as part of the Threads option.54289 **Issue 7**

54290 Austin Group Interpretation 1003.1-2001 #063 is applied, updating the RETURN VALUE section.

54291 The *pthread\_self()* function is moved from the Threads option to the Base.

**pthread\_setcancelstate()**

System Interfaces

54292 **NAME**

54293 pthread\_setcancelstate, pthread\_setcanceltype, pthread\_testcancel — set cancelability state

54294 **SYNOPSIS**

```
54295 #include <pthread.h>
54296 int pthread_setcancelstate(int state, int *oldstate);
54297 int pthread_setcanceltype(int type, int *oldtype);
54298 void pthread_testcancel(void);
```

54299 **DESCRIPTION**

54300 The *pthread\_setcancelstate()* function shall atomically both set the calling thread's cancelability state to the indicated *state* and return the previous cancelability state at the location referenced by *oldstate*. Legal values for *state* are PTHREAD\_CANCEL\_ENABLE and PTHREAD\_CANCEL\_DISABLE.

54304 The *pthread\_setcanceltype()* function shall atomically both set the calling thread's cancelability type to the indicated *type* and return the previous cancelability type at the location referenced by *oldtype*. Legal values for *type* are PTHREAD\_CANCEL\_DEFERRED and PTHREAD\_CANCEL\_ASYNCHRONOUS.

54308 The cancelability state and type of any newly created threads, including the thread in which *main()* was first invoked, shall be PTHREAD\_CANCEL\_ENABLE and PTHREAD\_CANCEL\_DEFERRED respectively.

54311 The *pthread\_testcancel()* function shall create a cancellation point in the calling thread. The *pthread\_testcancel()* function shall have no effect if cancelability is disabled.

54313 **RETURN VALUE**

54314 If successful, the *pthread\_setcancelstate()* and *pthread\_setcanceltype()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

54316 **ERRORS**

54317 The *pthread\_setcancelstate()* function may fail if:

54318 [EINVAL] The specified state is not PTHREAD\_CANCEL\_ENABLE or PTHREAD\_CANCEL\_DISABLE.

54320 The *pthread\_setcanceltype()* function may fail if:

54321 [EINVAL] The specified type is not PTHREAD\_CANCEL\_DEFERRED or PTHREAD\_CANCEL\_ASYNCHRONOUS.

54323 These functions shall not return an error code of [EINTR].

54324 **EXAMPLES**

54325 None.

54326 **APPLICATION USAGE**

54327 None.

54328 **RATIONALE**

54329 The *pthread\_setcancelstate()* and *pthread\_setcanceltype()* functions control the points at which a thread may be asynchronously canceled. For cancellation control to be usable in modular fashion, some rules need to be followed.

54332 An object can be considered to be a generalization of a procedure. It is a set of procedures and global variables written as a unit and called by clients not known by the object. Objects may depend on other objects.

54335 First, cancelability should only be disabled on entry to an object, never explicitly enabled. On

54336 exit from an object, the cancelability state should always be restored to its value on entry to the  
54337 object.

54338 This follows from a modularity argument: if the client of an object (or the client of an object that  
54339 uses that object) has disabled cancelability, it is because the client does not want to be concerned  
54340 about cleaning up if the thread is canceled while executing some sequence of actions. If an object  
54341 is called in such a state and it enables cancelability and a cancellation request is pending for that  
54342 thread, then the thread is canceled, contrary to the wish of the client that disabled.

54343 Second, the cancelability type may be explicitly set to either *deferred* or *asynchronous* upon entry  
54344 to an object. But as with the cancelability state, on exit from an object the cancelability type  
54345 should always be restored to its value on entry to the object.

54346 Finally, only functions that are cancel-safe may be called from a thread that is asynchronously  
54347 cancelable.

**pthread\_setschedprio()**

System Interfaces

54377 **NAME**

54378 pthread\_setschedprio — dynamic thread scheduling parameters access (**REALTIME**  
54379 **THREADS**)

54380 **SYNOPSIS**

```
54381 TPS #include <pthread.h>
54382 int pthread_setschedprio(pthread_t thread, int prio);
```

54383 **DESCRIPTION**

54384 The *pthread\_setschedprio()* function shall set the scheduling priority for the thread whose thread  
54385 ID is given by *thread* to the value given by *prio*. See [Scheduling Policies](#) (on page 501) for a  
54386 description on how this function call affects the ordering of the thread in the thread list for its  
54387 new priority.

54388 If the *pthread\_setschedprio()* function fails, the scheduling priority of the target thread shall not be  
54389 changed.

54390 **RETURN VALUE**

54391 If successful, the *pthread\_setschedprio()* function shall return zero; otherwise, an error number  
54392 shall be returned to indicate the error.

54393 **ERRORS**

54394 The *pthread\_setschedprio()* function may fail if:

54395 [EINVAL] The value of *prio* is invalid for the scheduling policy of the specified thread.

54396 [ENOTSUP] An attempt was made to set the priority to an unsupported value.

54397 [EPERM] The caller does not have appropriate privileges to set the scheduling priority  
54398 of the specified thread.

54399 The *pthread\_setschedprio()* function shall not return an error code of [EINTR].

54400 **EXAMPLES**

54401 None.

54402 **APPLICATION USAGE**

54403 None.

54404 **RATIONALE**

54405 The *pthread\_setschedprio()* function provides a way for an application to temporarily raise its  
54406 priority and then lower it again, without having the undesired side-effect of yielding to other  
54407 threads of the same priority. This is necessary if the application is to implement its own  
54408 strategies for bounding priority inversion, such as priority inheritance or priority ceilings. This  
54409 capability is especially important if the implementation does not support the Thread Priority  
54410 Protection or Thread Priority Inheritance options, but even if those options are supported it is  
54411 needed if the application is to bound priority inheritance for other resources, such as  
54412 semaphores.

54413 The standard developers considered that while it might be preferable conceptually to solve this  
54414 problem by modifying the specification of *pthread\_setschedparam()*, it was too late to make such a  
54415 change, as there may be implementations that would need to be changed. Therefore, this new  
54416 function was introduced.

54417 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended  
54418 that the function should fail and report an [ESRCH] error.

54419 **FUTURE DIRECTIONS**

54420 None.

54421 **SEE ALSO**54422 [Scheduling Policies](#) (on page 501), [pthread\\_getschedparam\(\)](#)54423 XBD [<pthread.h>](#)54424 **CHANGE HISTORY**

54425 First released in Issue 6. Included as a response to IEEE PASC Interpretation 1003.1 #96.

54426 **Issue 7**54427 The `pthread_setschedprio()` function is moved from the Threads option.

54428 Austin Group Interpretation 1003.1-2001 #069 is applied, updating the [EPEM] error.

54429 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

**pthread\_setspecific()***System Interfaces*54430 **NAME**

54431 pthread\_setspecific — thread-specific data management

54432 **SYNOPSIS**

54433 #include &lt;pthread.h&gt;

54434 int pthread\_setspecific(pthread\_key\_t key, const void \*value);

54435 **DESCRIPTION**54436 Refer to *pthread\_getspecific()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

54437 **NAME**

54438 pthread\_sigmask, sigprocmask — examine and change blocked signals

54439 **SYNOPSIS**

```
54440 CX #include <signal.h>
54441 int pthread_sigmask(int how, const sigset_t *restrict set,
54442 sigset_t *restrict oset);
54443 int sigprocmask(int how, const sigset_t *restrict set,
54444 sigset_t *restrict oset);
```

54445 **DESCRIPTION**

54446 The *pthread\_sigmask()* function shall examine or change (or both) the calling thread's signal mask, regardless of the number of threads in the process. The function shall be equivalent to *sigprocmask()*, without the restriction that the call be made in a single-threaded process.

54449 In a single-threaded process, the *sigprocmask()* function shall examine or change (or both) the signal mask of the calling thread.

54451 If the argument *set* is not a null pointer, it points to a set of signals to be used to change the currently blocked set.

54453 The argument *how* indicates the way in which the set is changed, and the application shall ensure it consists of one of the following values:

54455 SIG\_BLOCK The resulting set shall be the union of the current set and the signal set pointed to by *set*.

54457 SIG\_SETMASK The resulting set shall be the signal set pointed to by *set*.

54458 SIG\_UNBLOCK The resulting set shall be the intersection of the current set and the complement of the signal set pointed to by *set*.

54460 If the argument *oset* is not a null pointer, the previous mask shall be stored in the location pointed to by *oset*. If *set* is a null pointer, the value of the argument *how* is not significant and the thread's signal mask shall be unchanged; thus the call can be used to enquire about currently blocked signals.

54464 If there are any pending unblocked signals after the call to *sigprocmask()*, at least one of those signals shall be delivered before the call to *sigprocmask()* returns.

54466 It is not possible to block those signals which cannot be ignored. This shall be enforced by the system without causing an error to be indicated.

54468 If any of the SIGFPE, SIGILL, SIGSEGV, or SIGBUS signals are generated while they are blocked, the result is undefined, unless the signal was generated by the *kill()* function, the *sigqueue()* function, or the *raise()* function.

54471 If *sigprocmask()* fails, the thread's signal mask shall not be changed.

54472 The use of the *sigprocmask()* function is unspecified in a multi-threaded process.

54473 **RETURN VALUE**

54474 Upon successful completion *pthread\_sigmask()* shall return 0; otherwise, it shall return the corresponding error number.

54476 Upon successful completion, *sigprocmask()* shall return 0; otherwise, -1 shall be returned, *errno* shall be set to indicate the error, and the signal mask of the process shall be unchanged.

**pthread\_sigmask()**54478 **ERRORS**54479 The *pthread\_sigmask()* and *sigprocmask()* functions shall fail if:54480 [EINVAL] The value of the *how* argument is not equal to one of the defined values.54481 The *pthread\_sigmask()* function shall not return an error code of [EINTR].54482 **EXAMPLES**54483 **Signaling in a Multi-Threaded Process**54484 This example shows the use of *pthread\_sigmask()* in order to deal with signals in a multi-  
54485 threaded process. It provides a fairly general framework that could be easily adapted/extended.

```

54486 #include <stdio.h>
54487 #include <stdlib.h>
54488 #include <pthread.h>
54489 #include <signal.h>
54490 #include <string.h>
54491 #include <errno.h>
54492 ...
54493 static sigset_t  signal_mask; /* signals to block          */
54494 int main (int argc, char *argv[])
54495 {
54496     pthread_t  sig_thr_id; /* signal handler thread ID */
54497     int        rc; /* return code          */
54498     sigemptyset (&signal_mask);
54499     sigaddset (&signal_mask, SIGINT);
54500     sigaddset (&signal_mask, SIGTERM);
54501     rc = pthread_sigmask (SIG_BLOCK, &signal_mask, NULL);
54502     if (rc != 0) {
54503         /* handle error */
54504         ...
54505     }
54506     /* any newly created threads inherit the signal mask */
54507     rc = pthread_create (&sig_thr_id, NULL, signal_thread, NULL);
54508     if (rc != 0) {
54509         /* handle error */
54510         ...
54511     }
54512     /* APPLICATION CODE */
54513     ...
54514 }
54515 void *signal_thread (void *arg)
54516 {
54517     int        sig_caught; /* signal caught          */
54518     int        rc; /* returned code          */
54519     rc = sigwait (&signal_mask, &sig_caught);
54520     if (rc != 0) {
54521         /* handle error */
54522     }

```

```

54523         switch (sig_caught)
54524         {
54525             case SIGINT:      /* process SIGINT */
54526                 ...
54527                 break;
54528             case SIGTERM:    /* process SIGTERM */
54529                 ...
54530                 break;
54531             default:         /* should normally not happen */
54532                 fprintf (stderr, "\nUnexpected signal %d\n", sig_caught);
54533                 break;
54534         }
54535     }

```

**54536 APPLICATION USAGE**

54537 None.

**54538 RATIONALE**

54539 When a thread's signal mask is changed in a signal-catching function that is installed by  
54540 *sigaction()*, the restoration of the signal mask on return from the signal-catching function  
54541 overrides that change (see *sigaction()*). If the signal-catching function was installed with  
54542 *signal()*, it is unspecified whether this occurs.

54543 See *kill()* for a discussion of the requirement on delivery of signals.

54549 XBD <[signal.h](#)>

**54550 CHANGE HISTORY**

54551 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**54552 Issue 5**

54553 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

54554 The *pthread\_sigmask()* function is added for alignment with the POSIX Threads Extension.

**54555 Issue 6**

54556 The *pthread\_sigmask()* function is marked as part of the Threads option.

54557 The SYNOPSIS for *sigprocmask()* is marked as a CX extension to note that the presence of this  
54558 function in the <[signal.h](#)> header is an extension to the ISO C standard.

54559 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 54560 • The DESCRIPTION is updated to explicitly state the functions which may generate the  
54561 signal.

54562 The normative text is updated to avoid use of the term "must" for application requirements.

54563 The **restrict** keyword is added to the *pthread\_sigmask()* and *sigprocmask()* prototypes for  
54564 alignment with the ISO/IEC 9899: 1999 standard.

54565 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/105 is applied, updating "process' signal  
54566 mask" to "thread's signal mask" in the DESCRIPTION and RATIONALE sections.

**pthread\_sigmask()**

- 54567 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/106 is applied, adding the example to the  
54568 EXAMPLES section.
- 54569 **Issue 7**  
54570 The *pthread\_sigmask()* function is moved from the Threads option to the Base.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

54571 **NAME**

54572 pthread\_spin\_destroy, pthread\_spin\_init — destroy or initialize a spin lock object

54573 **SYNOPSIS**

54574 #include &lt;pthread.h&gt;

54575 int pthread\_spin\_destroy(pthread\_spinlock\_t \*lock);

54576 int pthread\_spin\_init(pthread\_spinlock\_t \*lock, int pshared);

54577 **DESCRIPTION**

54578 The *pthread\_spin\_destroy()* function shall destroy the spin lock referenced by *lock* and release any  
 54579 resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is  
 54580 reinitialized by another call to *pthread\_spin\_init()*. The results are undefined if  
 54581 *pthread\_spin\_destroy()* is called when a thread holds the lock, or if this function is called with an  
 54582 uninitialized thread spin lock.

54583 The *pthread\_spin\_init()* function shall allocate any resources required to use the spin lock  
 54584 referenced by *lock* and initialize the lock to an unlocked state.

54585 TSH If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is  
 54586 PTHREAD\_PROCESS\_SHARED, the implementation shall permit the spin lock to be operated  
 54587 upon by any thread that has access to the memory where the spin lock is allocated, even if it is  
 54588 allocated in memory that is shared by multiple processes.

54589 If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is  
 54590 PTHREAD\_PROCESS\_PRIVATE, or if the option is not supported, the spin lock shall only be  
 54591 operated upon by threads created within the same process as the thread that initialized the spin  
 54592 lock. If threads of differing processes attempt to operate on such a spin lock, the behavior is  
 54593 undefined.

54594 The results are undefined if *pthread\_spin\_init()* is called specifying an already initialized spin  
 54595 lock. The results are undefined if a spin lock is used without first being initialized.

54596 If the *pthread\_spin\_init()* function fails, the lock is not initialized and the contents of *lock* are  
 54597 undefined.

54598 Only the object referenced by *lock* may be used for performing synchronization.

54599 The result of referring to copies of that object in calls to *pthread\_spin\_destroy()*,  
 54600 *pthread\_spin\_lock()*, *pthread\_spin\_trylock()*, or *pthread\_spin\_unlock()* is undefined.

54601 **RETURN VALUE**

54602 Upon successful completion, these functions shall return zero; otherwise, an error number shall  
 54603 be returned to indicate the error.

54604 **ERRORS**

54605 The *pthread\_spin\_init()* function shall fail if:

54606 [EAGAIN] The system lacks the necessary resources to initialize another spin lock.

54607 [ENOMEM] Insufficient memory exists to initialize the lock.

54608 These functions shall not return an error code of [EINTR].

**pthread\_spin\_destroy()**

System Interfaces

54609 **EXAMPLES**

54610 None.

54611 **APPLICATION USAGE**

54612 None.

54613 **RATIONALE**

54614 If an implementation detects that the value specified by the *lock* argument to  
 54615 *pthread\_spin\_destroy()* does not refer to an initialized spin lock object, it is recommended that the  
 54616 function should fail and report an [EINVAL] error.

54617 If an implementation detects that the value specified by the *lock* argument to  
 54618 *pthread\_spin\_destroy()* or *pthread\_spin\_init()* refers to a locked spin lock object, or detects that the  
 54619 value specified by the *lock* argument to *pthread\_spin\_init()* refers to an already initialized spin  
 54620 lock object, it is recommended that the function should fail and report an [EBUSY] error.

54621 **FUTURE DIRECTIONS**

54622 None.

54623 **SEE ALSO**54624 *pthread\_spin\_lock()*, *pthread\_spin\_unlock()*54625 XBD `<pthread.h>`54626 **CHANGE HISTORY**

54627 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

54628 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.54629 **Issue 7**

54630 The *pthread\_spin\_destroy()* and *pthread\_spin\_init()* functions are moved from the Spin Locks  
 54631 option to the Base.

54632 The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in  
 54633 undefined behavior.

54634 The [EBUSY] error for a locked spin lock object or an already initialized spin lock object is  
 54635 removed; this condition results in undefined behavior.

54636 **NAME**

54637 pthread\_spin\_lock, pthread\_spin\_trylock — lock a spin lock object

54638 **SYNOPSIS**

54639 #include &lt;pthread.h&gt;

54640 int pthread\_spin\_lock(pthread\_spinlock\_t \*lock);

54641 int pthread\_spin\_trylock(pthread\_spinlock\_t \*lock);

54642 **DESCRIPTION**

54643 The *pthread\_spin\_lock()* function shall lock the spin lock referenced by *lock*. The calling thread shall acquire the lock if it is not held by another thread. Otherwise, the thread shall spin (that is, shall not return from the *pthread\_spin\_lock()* call) until the lock becomes available. The results are undefined if the calling thread holds the lock at the time the call is made. The *pthread\_spin\_trylock()* function shall lock the spin lock referenced by *lock* if it is not held by any thread. Otherwise, the function shall fail.

54649 The results are undefined if any of these functions is called with an uninitialized spin lock.

54650 **RETURN VALUE**

54651 Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

54653 **ERRORS**54654 The *pthread\_spin\_lock()* function may fail if:

54655 [EDEADLK] A deadlock condition was detected.

54656 The *pthread\_spin\_trylock()* function shall fail if:

54657 [EBUSY] A thread currently holds the lock.

54658 These functions shall not return an error code of [EINTR].

54659 **EXAMPLES**

54660 None.

54661 **APPLICATION USAGE**

54662 Applications using this function may be subject to priority inversion, as discussed in XBD  
54663 Section 3.285 (on page 79).

54664 **RATIONALE**

54665 If an implementation detects that the value specified by the *lock* argument to *pthread\_spin\_lock()*  
54666 or *pthread\_spin\_trylock()* does not refer to an initialized spin lock object, it is recommended that  
54667 the function should fail and report an [EINVAL] error.

54668 If an implementation detects that the value specified by the *lock* argument to *pthread\_spin\_lock()*  
54669 refers to a spin lock object for which the calling thread already holds the lock, it is recommended  
54670 that the function should fail and report an [EDEADLK] error.

54671 **FUTURE DIRECTIONS**

54672 None.

54673 **SEE ALSO**54674 *pthread\_spin\_destroy()*, *pthread\_spin\_unlock()*

54675 XBD Section 3.285 (on page 79), Section 4.11 (on page 110), &lt;pthread.h&gt;

**pthread\_spin\_lock()**

System Interfaces

54676 **CHANGE HISTORY**

54677 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

54678 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.54679 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/107 is applied, updating the ERRORS  
54680 section so that the [EDEADLK] error includes detection of a deadlock condition.54681 **Issue 7**54682 The `pthread_spin_lock()` and `pthread_spin_trylock()` functions are moved from the Spin Locks  
54683 option to the Base.54684 The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in  
54685 undefined behavior.54686 The [EDEADLK] error for a spin lock object for which the calling thread already holds the lock is  
54687 removed; this condition results in undefined behavior.

54688 **NAME**

54689 pthread\_spin\_unlock — unlock a spin lock object

54690 **SYNOPSIS**

54691 #include &lt;pthread.h&gt;

54692 int pthread\_spin\_unlock(pthread\_spinlock\_t \*lock);

54693 **DESCRIPTION**54694 The *pthread\_spin\_unlock()* function shall release the spin lock referenced by *lock* which was  
54695 locked via the *pthread\_spin\_lock()* or *pthread\_spin\_trylock()* functions.

54696 The results are undefined if the lock is not held by the calling thread.

54697 If there are threads spinning on the lock when *pthread\_spin\_unlock()* is called, the lock becomes  
54698 available and an unspecified spinning thread shall acquire the lock.

54699 The results are undefined if this function is called with an uninitialized thread spin lock.

54700 **RETURN VALUE**54701 Upon successful completion, the *pthread\_spin\_unlock()* function shall return zero; otherwise, an  
54702 error number shall be returned to indicate the error.54703 **ERRORS**

54704 This function shall not return an error code of [EINTR].

54705 **EXAMPLES**

54706 None.

54707 **APPLICATION USAGE**

54708 None.

54709 **RATIONALE**54710 If an implementation detects that the value specified by the *lock* argument to  
54711 *pthread\_spin\_unlock()* does not refer to an initialized spin lock object, it is recommended that the  
54712 function should fail and report an [EINVAL] error.54713 If an implementation detects that the value specified by the *lock* argument to  
54714 *pthread\_spin\_unlock()* refers to a spin lock object for which the current thread does not hold the  
54715 lock, it is recommended that the function should fail and report an [EPERM] error.54716 **FUTURE DIRECTIONS**

54717 None.

54718 **SEE ALSO**54719 *pthread\_spin\_destroy()*, *pthread\_spin\_lock()*

54720 XBD Section 4.11 (on page 110), &lt;pthread.h&gt;

54721 **CHANGE HISTORY**

54722 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

54723 In the SYNOPSIS, the inclusion of &lt;sys/types.h&gt; is no longer required.

54724 **Issue 7**54725 The *pthread\_spin\_unlock()* function is moved from the Spin Locks option to the Base.54726 The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in  
54727 undefined behavior.

## **pthread\_spin\_unlock()**

*System Interfaces*

54728  
54729

The [EPERM] error for a spin lock object for which the current thread does not hold the lock is removed; this condition results in undefined behavior.

**ptsname()**54737 **NAME**

54738 ptsname — get name of the slave pseudo-terminal device

54739 **SYNOPSIS**

```
54740 xSI #include <stdlib.h>
54741 char *ptsname(int fildes);
```

54742 **DESCRIPTION**

54743 The *ptsname()* function shall return the name of the slave pseudo-terminal device associated  
 54744 with a master pseudo-terminal device. The *fildes* argument is a file descriptor that refers to the  
 54745 master device. The *ptsname()* function shall return a pointer to a string containing the pathname  
 54746 of the corresponding slave device.

54747 The *ptsname()* function need not be thread-safe.54748 **RETURN VALUE**

54749 Upon successful completion, *ptsname()* shall return a pointer to a string which is the name of the  
 54750 pseudo-terminal slave device. Upon failure, *ptsname()* shall return a null pointer. This could  
 54751 occur if *fildes* is an invalid file descriptor or if the slave device name does not exist in the file  
 54752 system.

54753 **ERRORS**

54754 No errors are defined.

54755 **EXAMPLES**

54756 None.

54757 **APPLICATION USAGE**54758 The value returned may point to a static data area that is overwritten by each call to *ptsname()*.54759 **RATIONALE**

54760 None.

54761 **FUTURE DIRECTIONS**

54762 None.

54763 **SEE ALSO**54764 *grantpt()*, *open()*, *ttyname()*, *unlockpt()*

54765 XBD &lt;stdlib.h&gt;

54766 **CHANGE HISTORY**

54767 First released in Issue 4, Version 2.

54768 **Issue 5**

54769 Moved from X/OPEN UNIX extension to BASE.

54770 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

54771 **Issue 7**

54772 Austin Group Interpretation 1003.1-2001 #156 is applied.

54773 **NAME**54774        `putc` — put a byte on a stream54775 **SYNOPSIS**54776        `#include <stdio.h>`54777        `int putc(int c, FILE *stream);`54778 **DESCRIPTION**54779 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
54780 conflict between the requirements described here and the ISO C standard is unintentional. This  
54781 volume of POSIX.1-2008 defers to the ISO C standard.54782        The `putc()` function shall be equivalent to `fputc()`, except that if it is implemented as a macro it  
54783 may evaluate `stream` more than once, so the argument should never be an expression with side-  
54784 effects.54785 **RETURN VALUE**54786        Refer to `fputc()`.54787 **ERRORS**54788        Refer to `fputc()`.54789 **EXAMPLES**

54790        None.

54791 **APPLICATION USAGE**54792        Since it may be implemented as a macro, `putc()` may treat a `stream` argument with side-effects  
54793 incorrectly. In particular, `putc(c,*f++)` does not necessarily work correctly. Therefore, use of this  
54794 function is not recommended in such situations; `fputc()` should be used instead.54795 **RATIONALE**

54796        None.

54797 **FUTURE DIRECTIONS**

54798        None.

54811 **NAME**54812            **putchar** — put a byte on a stdout stream54813 **SYNOPSIS**

54814            #include &lt;stdio.h&gt;

54815            int putchar(int c);

54816 **DESCRIPTION**

54817 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
 54818 conflict between the requirements described here and the ISO C standard is unintentional. This  
 54819 volume of POSIX.1-2008 defers to the ISO C standard.

54820            The function call *putchar(c)* shall be equivalent to *putc(c,stdout)*.54821 **RETURN VALUE**54822            Refer to *fputc()*.54823 **ERRORS**54824            Refer to *fputc()*.54825 **EXAMPLES**

54826            None.

54827 **APPLICATION USAGE**

54828            None.

54829 **RATIONALE**

54830            None.

54831 **FUTURE DIRECTIONS**

54832            None.

54833 **SEE ALSO**54834            *putc()*

54835            XBD &lt;stdio.h&gt;

54836 **CHANGE HISTORY**

54837            First released in Issue 1. Derived from Issue 1 of the SVID.

**putchar\_unlocked()***System Interfaces*54838 **NAME**

54839 putchar\_unlocked — stdio with explicit client locking

54840 **SYNOPSIS**

```
54841 CX #include <stdio.h>  
54842 int putchar_unlocked(int c);
```

54843 **DESCRIPTION**54844 Refer to *getc\_unlocked()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

54845 **NAME**

54846 putenv — change or add a value to an environment

54847 **SYNOPSIS**

```
54848 XSI #include <stdlib.h>
54849 int putenv(char *string);
```

54850 **DESCRIPTION**

54851 The *putenv()* function shall use the *string* argument to set environment variable values. The  
 54852 *string* argument should point to a string of the form "*name=value*". The *putenv()* function shall  
 54853 make the value of the environment variable *name* equal to *value* by altering an existing variable  
 54854 or creating a new one. In either case, the string pointed to by *string* shall become part of the  
 54855 environment, so altering the string shall change the environment. The space used by *string* is no  
 54856 longer used once a new string which defines *name* is passed to *putenv()*.

54857 The *putenv()* function need not be thread-safe.

54858 **RETURN VALUE**

54859 Upon successful completion, *putenv()* shall return 0; otherwise, it shall return a non-zero value  
 54860 and set *errno* to indicate the error.

54861 **ERRORS**

54862 The *putenv()* function may fail if:

54863 [ENOMEM] Insufficient memory was available.

54864 **EXAMPLES**54865 **Changing the Value of an Environment Variable**

54866 The following example changes the value of the *HOME* environment variable to the value  
 54867 */usr/home*.

```
54868 #include <stdlib.h>
54869 ...
54870 static char *var = "HOME=/usr/home";
54871 int ret;
54872 ret = putenv(var);
```

54873 **APPLICATION USAGE**

54874 The *putenv()* function manipulates the environment pointed to by *environ*, and can be used in  
 54875 conjunction with *getenv()*.

54876 See *exec()* for restrictions on changing the environment in multi-threaded applications.

54877 This routine may use *malloc()* to enlarge the environment.

54878 A potential error is to call *putenv()* with an automatic variable as the argument, then return from  
 54879 the calling function while *string* is still part of the environment.

54880 The *setenv()* function is preferred over this function.

54881 **RATIONALE**

54882 The standard developers noted that *putenv()* is the only function available to add to the  
 54883 environment without permitting memory leaks.

**putenv()**54884 **FUTURE DIRECTIONS**

54885 None.

54886 **SEE ALSO**54887 *exec*, *getenv()*, *malloc()*, *setenv()*54888 XBD `<stdlib.h>`54889 **CHANGE HISTORY**

54890 First released in Issue 1. Derived from Issue 1 of the SVID.

54891 **Issue 5**54892 The type of the argument to this function is changed from **const char \*** to **char \***. This was  
54893 indicated as a FUTURE DIRECTION in previous issues.

54894 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

54895 **Issue 6**54896 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/48 is applied, clarifying wording in the  
54897 DESCRIPTION and adding a new paragraph into APPLICATION USAGE referring readers to  
54898 *exec*.54899 **Issue 7**

54900 Austin Group Interpretation 1003.1-2001 #156 is applied.

54901 **NAME**

54902 putmsg, putpmsg — send a message on a STREAM (STREAMS)

54903 **SYNOPSIS**

```
54904 OB XSR #include <stropts.h>
54905 int putmsg(int fildes, const struct strbuf *ctlptr,
54906           const struct strbuf *dataptr, int flags);
54907 int putpmsg(int fildes, const struct strbuf *ctlptr,
54908            const struct strbuf *dataptr, int band, int flags);
```

54909 **DESCRIPTION**

54910 The *putmsg()* function shall create a message from a process buffer(s) and send the message to a  
 54911 STREAMS file. The message may contain either a data part, a control part, or both. The data and  
 54912 control parts are distinguished by placement in separate buffers, as described below. The  
 54913 semantics of each part are defined by the STREAMS module that receives the message.

54914 The *putpmsg()* function is equivalent to *putmsg()*, except that the process can send messages in  
 54915 different priority bands. Except where noted, all requirements on *putmsg()* also pertain to  
 54916 *putpmsg()*.

54917 The *fildes* argument specifies a file descriptor referencing an open STREAM. The *ctlptr* and  
 54918 *dataptr* arguments each point to a **strbuf** structure.

54919 The *ctlptr* argument points to the structure describing the control part, if any, to be included in  
 54920 the message. The *buf* member in the **strbuf** structure points to the buffer where the control  
 54921 information resides, and the *len* member indicates the number of bytes to be sent. The *maxlen*  
 54922 member is not used by *putmsg()*. In a similar manner, the argument *dataptr* specifies the data, if  
 54923 any, to be included in the message. The *flags* argument indicates what type of message should be  
 54924 sent and is described further below.

54925 To send the data part of a message, the application shall ensure that *dataptr* is not a null pointer  
 54926 and the *len* member of *dataptr* is 0 or greater. To send the control part of a message, the  
 54927 application shall ensure that the corresponding values are set for *ctlptr*. No data (control) part  
 54928 shall be sent if either *dataptr* (*ctlptr*) is a null pointer or the *len* member of *dataptr* (*ctlptr*) is set to  
 54929 -1.

54930 For *putmsg()*, if a control part is specified and *flags* is set to RS\_HIPRI, a high priority message  
 54931 shall be sent. If no control part is specified, and *flags* is set to RS\_HIPRI, *putmsg()* shall fail and  
 54932 set *errno* to [EINVAL]. If *flags* is set to 0, a normal message (priority band equal to 0) shall be  
 54933 sent. If a control part and data part are not specified and *flags* is set to 0, no message shall be  
 54934 sent and 0 shall be returned.

54935 For *putpmsg()*, the flags are different. The *flags* argument is a bitmask with the following  
 54936 mutually-exclusive flags defined: MSG\_HIPRI and MSG\_BAND. If *flags* is set to 0, *putpmsg()*  
 54937 shall fail and set *errno* to [EINVAL]. If a control part is specified and *flags* is set to MSG\_HIPRI  
 54938 and *band* is set to 0, a high-priority message shall be sent. If *flags* is set to MSG\_HIPRI and either  
 54939 no control part is specified or *band* is set to a non-zero value, *putpmsg()* shall fail and set *errno* to  
 54940 [EINVAL]. If *flags* is set to MSG\_BAND, then a message shall be sent in the priority band  
 54941 specified by *band*. If a control part and data part are not specified and *flags* is set to MSG\_BAND,  
 54942 no message shall be sent and 0 shall be returned.

**putmsg()**

54943 The *putmsg()* function shall block if the STREAM write queue is full due to internal flow control  
54944 conditions, with the following exceptions:

- 54945 • For high-priority messages, *putmsg()* shall not block on this condition and continues  
54946 processing the message.
- 54947 • For other messages, *putmsg()* shall not block but shall fail when the write queue is full and  
54948 *O\_NONBLOCK* is set.

54949 The *putmsg()* function shall also block, unless prevented by lack of internal resources, while  
54950 waiting for the availability of message blocks in the STREAM, regardless of priority or whether  
54951 *O\_NONBLOCK* has been specified. No partial message shall be sent.

**RETURN VALUE**

54952 Upon successful completion, *putmsg()* and *putpmsg()* shall return 0; otherwise, they shall return  
54953 -1 and set *errno* to indicate the error.  
54954

**ERRORS**

54955 The *putmsg()* and *putpmsg()* functions shall fail if:  
54956

- |       |                  |  |
|-------|------------------|--|
| 54957 | [EAGAIN]         | A non-priority message was specified, the <i>O_NONBLOCK</i> flag is set, and the STREAM write queue is full due to internal flow control conditions; or buffers could not be allocated for the message that was to be created.   |
| 54958 |                  |  |
| 54959 |                  |  |
| 54960 | [EBADF]          | <i>fildev</i> is not a valid file descriptor open for writing.   |
| 54961 | [EINTR]          | A signal was caught during <i>putmsg()</i> .   |
| 54962 | [EINVAL]         | An undefined value is specified in <i>flags</i> , or <i>flags</i> is set to <i>RS_HIPRI</i> or <i>MSG_HIPRI</i> and no control part is supplied, or the STREAM or multiplexer referenced by <i>fildev</i> is linked (directly or indirectly) downstream from a multiplexer, or <i>flags</i> is set to <i>MSG_HIPRI</i> and <i>band</i> is non-zero (for <i>putpmsg()</i> only).                                |
| 54963 |                  |  |
| 54964 |                  |  |
| 54965 |                  |  |
| 54966 |                  |  |
| 54967 | [ENOSR]          | Buffers could not be allocated for the message that was to be created due to insufficient STREAMS memory resources.  |
| 54968 |                  |  |
| 54969 | [ENOSTR]         | A STREAM is not associated with <i>fildev</i> .  |
| 54970 | [ENXIO]          | A hangup condition was generated downstream for the specified STREAM.  |
| 54971 | [EPIPE] or [EIO] | The <i>fildev</i> argument refers to a STREAMS-based pipe and the other end of the pipe is closed. A SIGPIPE signal is generated for the calling thread.   |
| 54972 |                  |  |
| 54973 | [ERANGE]         | The size of the data part of the message does not fall within the range specified by the maximum and minimum packet sizes of the topmost STREAM module. This value is also returned if the control part of the message is larger than the maximum configured size of the control part of a message, or if the data part of a message is larger than the maximum configured size of the data part of a message. |
| 54974 |                  |  |
| 54975 |                  |  |
| 54976 |                  |  |
| 54977 |                  |  |
| 54978 |                  |  |

54979 In addition, *putmsg()* and *putpmsg()* shall fail if the STREAM head had processed an  
54980 asynchronous error before the call. In this case, the value of *errno* does not reflect the result of  
54981 *putmsg()* or *putpmsg()*, but reflects the prior error.

54982 **EXAMPLES**54983 **Sending a High-Priority Message**

54984 The value of *fd* is assumed to refer to an open STREAMS file. This call to *putmsg()* does the  
54985 following:

- 54986 1. Creates a high-priority message with a control part and a data part, using the buffers  
54987 pointed to by *ctrlbuf* and *databuf*, respectively.
- 54988 2. Sends the message to the STREAMS file identified by *fd*.

```
54989 #include <stropts.h>
54990 #include <string.h>
54991 ...
54992 int fd;
54993 char *ctrlbuf = "This is the control part";
54994 char *databuf = "This is the data part";
54995 struct strbuf ctrl;
54996 struct strbuf data;
54997 int ret;

54998 ctrl.buf = ctrlbuf;
54999 ctrl.len = strlen(ctrlbuf);

55000 data.buf = databuf;
55001 data.len = strlen(databuf);

55002 ret = putmsg(fd, &ctrl, &data, MSG_HIPRI);
```

55003 **Using putpmsg()**

55004 This example has the same effect as the previous example. In this example, however, the  
55005 *putpmsg()* function creates and sends the message to the STREAMS file.

```
55006 #include <stropts.h>
55007 #include <string.h>
55008 ...
55009 int fd;
55010 char *ctrlbuf = "This is the control part";
55011 char *databuf = "This is the data part";
55012 struct strbuf ctrl;
55013 struct strbuf data;
55014 int ret;

55015 ctrl.buf = ctrlbuf;
55016 ctrl.len = strlen(ctrlbuf);

55017 data.buf = databuf;
55018 data.len = strlen(databuf);

55019 ret = putpmsg(fd, &ctrl, &data, 0, MSG_HIPRI);
```

55020 **APPLICATION USAGE**

55021 None.

**putmsg()**55022 **RATIONALE**

55023 None.

55024 **FUTURE DIRECTIONS**55025 The *putmsg()* and *putpmsg()* functions may be removed in a future version.55026 **SEE ALSO**55027 [Section 2.6](#) (on page 494), *getmsg()*, *poll()*, *read()*, *write()*55028 XBD [<stropts.h>](#)55029 **CHANGE HISTORY**

55030 First released in Issue 4, Version 2.

55031 **Issue 5**

55032 Moved from X/OPEN UNIX extension to BASE.

55033 The following text is removed from the DESCRIPTION: “The STREAM head guarantees that the  
55034 control part of a message generated by *putmsg()* is at least 64 bytes in length”.55035 **Issue 6**

55036 This function is marked as part of the XSI STREAMS Option Group.

55037 The normative text is updated to avoid use of the term “must” for application requirements.

55038 **Issue 7**55039 The *putmsg()* and *putpmsg()* functions are marked obsolescent.

55040 **NAME**

55041 puts — put a string on standard output

55042 **SYNOPSIS**

55043 #include &lt;stdio.h&gt;

55044 int puts(const char \*s);

55045 **DESCRIPTION**

55046 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 55047 conflict between the requirements described here and the ISO C standard is unintentional. This  
 55048 volume of POSIX.1-2008 defers to the ISO C standard.

55049 The *puts()* function shall write the string pointed to by *s*, followed by a <newline>, to the  
 55050 standard output stream *stdout*. The terminating null byte shall not be written.

55051 CX The last data modification and last file status change timestamps of the file shall be marked for  
 55052 update between the successful execution of *puts()* and the next successful completion of a call to  
 55053 *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

55054 **RETURN VALUE**

55055 Upon successful completion, *puts()* shall return a non-negative number. Otherwise, it shall  
 55056 CX return EOF, shall set an error indicator for the stream, and *errno* shall be set to indicate the error.

55057 **ERRORS**55058 Refer to *fputc()*.55059 **EXAMPLES**55060 **Printing to Standard Output**

55061 The following example gets the current time, converts it to a string using *localtime()* and  
 55062 *asctime()*, and prints it to standard output using *puts()*. It then prints the number of minutes to  
 55063 an event for which it is waiting.

```
55064 #include <time.h>
55065 #include <stdio.h>
55066 ...
55067 time_t now;
55068 int minutes_to_event;
55069 ...
55070 time(&now);
55071 printf("The time is ");
55072 puts(asctime(localtime(&now)));
55073 printf("There are %d minutes to the event.\n",
55074        minutes_to_event);
55075 ...
```

55076 **APPLICATION USAGE**55077 The *puts()* function appends a <newline>, while *fputs()* does not.55078 **RATIONALE**

55079 None.

**puts()**55080 **FUTURE DIRECTIONS**

55081 None.

55082 **SEE ALSO**55083 *fopen()*, *fputs()*, *putc()*55084 XBD [<stdio.h>](#)55085 **CHANGE HISTORY**

55086 First released in Issue 1. Derived from Issue 1 of the SVID.

55087 **Issue 6**

55088 Extensions beyond the ISO C standard are marked.

55089 **Issue 7**

55090 Changes are made related to support for finegrained timestamps.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

55091 **NAME**

55092 pututxline — put an entry into the user accounting database

55093 **SYNOPSIS**

55094 XSI #include &lt;utmpx.h&gt;

55095 struct utmpx \*pututxline(const struct utmpx \*utmpx);

55096 **DESCRIPTION**55097 Refer to *endutxent()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**putwc()**55098 **NAME**55099 `putwc` — put a wide character on a stream55100 **SYNOPSIS**55101 `#include <stdio.h>`55102 `#include <wchar.h>`55103 `wint_t putwc(wchar_t wc, FILE *stream);`55104 **DESCRIPTION**

55105 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 55106 conflict between the requirements described here and the ISO C standard is unintentional. This  
 55107 volume of POSIX.1-2008 defers to the ISO C standard.

55108 The `putwc()` function shall be equivalent to `fputwc()`, except that if it is implemented as a macro  
 55109 it may evaluate `stream` more than once, so the argument should never be an expression with  
 55110 side-effects.

55111 **RETURN VALUE**55112 Refer to `fputwc()`.55113 **ERRORS**55114 Refer to `fputwc()`.55115 **EXAMPLES**

55116 None.

55117 **APPLICATION USAGE**

55118 Since it may be implemented as a macro, `putwc()` may treat a `stream` argument with side-effects  
 55119 incorrectly. In particular, `putwc(wc,*f++)` need not work correctly. Therefore, use of this function  
 55120 is not recommended; `fputwc()` should be used instead.

55121 **RATIONALE**

55122 None.

55123 **FUTURE DIRECTIONS**

55124 None.

55125 **SEE ALSO**55126 `fputwc()`55127 XBD `<stdio.h>`, `<wchar.h>`55128 **CHANGE HISTORY**

55129 First released as a World-wide Portability Interface in Issue 4.

55130 **Issue 5**

55131 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument `wc`  
 55132 is changed from `wint_t` to `wchar_t`.

55133 The Optional Header (OH) marking is removed from `<stdio.h>`.

55134 **NAME**

55135 putwchar — put a wide character on a stdout stream

55136 **SYNOPSIS**

55137 #include &lt;wchar.h&gt;

55138 wint\_t putwchar(wchar\_t wc);

55139 **DESCRIPTION**

55140 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 55141 conflict between the requirements described here and the ISO C standard is unintentional. This  
 55142 volume of POSIX.1-2008 defers to the ISO C standard.

55143 The function call *putwchar(wc)* shall be equivalent to *putwc(wc,stdout)*.55144 **RETURN VALUE**55145 Refer to *fputwc()*.55146 **ERRORS**55147 Refer to *fputwc()*.55148 **EXAMPLES**

55149 None.

55150 **APPLICATION USAGE**

55151 None.

55152 **RATIONALE**

55153 None.

55159 **CHANGE HISTORY**

55160 First released in Issue 4

55161 **Issue 5**

55162 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*  
 55163 is changed from **wint\_t** to **wchar\_t**.

**pwrite()**55164 **NAME**

55165            pwrite — write on a file

55166 **SYNOPSIS**

55167            #include &lt;unistd.h&gt;

55168            ssize\_t pwrite(int *fildev*, const void \**buf*, size\_t *nbyte*,55169                    off\_t *offset*);55170 **DESCRIPTION**55171            Refer to *write()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

55172 **NAME**

55173 qsort — sort a table of data

55174 **SYNOPSIS**

55175 #include &lt;stdlib.h&gt;

55176 void qsort(void \*base, size\_t nel, size\_t width,  
55177 int (\*compar)(const void \*, const void \*));55178 **DESCRIPTION**55179 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
55180 conflict between the requirements described here and the ISO C standard is unintentional. This  
55181 volume of POSIX.1-2008 defers to the ISO C standard.55182 The *qsort()* function shall sort an array of *nel* objects, the initial element of which is pointed to by  
55183 *base*. The size of each object, in bytes, is specified by the *width* argument. If the *nel* argument has  
55184 the value zero, the comparison function pointed to by *compar* shall not be called and no  
55185 rearrangement shall take place.55186 The application shall ensure that the comparison function pointed to by *compar* does not alter the  
55187 contents of the array. The implementation may reorder elements of the array between calls to the  
55188 comparison function, but shall not alter the contents of any individual element.55189 When the same objects (consisting of *width* bytes, irrespective of their current positions in the  
55190 array) are passed more than once to the comparison function, the results shall be consistent with  
55191 one another. That is, they shall define a total ordering on the array.55192 The contents of the array shall be sorted in ascending order according to a comparison function.  
55193 The *compar* argument is a pointer to the comparison function, which is called with two  
55194 arguments that point to the elements being compared. The application shall ensure that the  
55195 function returns an integer less than, equal to, or greater than 0, if the first argument is  
55196 considered respectively less than, equal to, or greater than the second. If two members compare  
55197 as equal, their order in the sorted array is unspecified.55198 **RETURN VALUE**55199 The *qsort()* function shall not return a value.55200 **ERRORS**

55201 No errors are defined.

55202 **EXAMPLES**

55203 None.

55204 **APPLICATION USAGE**55205 The comparison function need not compare every byte, so arbitrary data may be contained in  
55206 the elements in addition to the values being compared.55207 **RATIONALE**55208 The requirement that each argument (hereafter referred to as *p*) to the comparison function is a  
55209 pointer to elements of the array implies that for every call, for each argument separately, all of  
55210 the following expressions are non-zero:

55211 ((char \*)p - (char \*)base) % width == 0

55212 (char \*)p &gt;= (char \*)base

55213 (char \*)p &lt; (char \*)base + nel \* width

**qsort()**55214 **FUTURE DIRECTIONS**

55215 None.

55216 **SEE ALSO**55217 *alphasort()*

55218 XBD &lt;stdlib.h&gt;

55219 **CHANGE HISTORY**

55220 First released in Issue 1. Derived from Issue 1 of the SVID.

55221 **Issue 6**

55222 The normative text is updated to avoid use of the term “must” for application requirements.

55223 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/49 is applied, adding the last sentence to  
55224 the first non-shaded paragraph in the DESCRIPTION, and the following two paragraphs. The  
55225 RATIONALE is also updated. These changes are for alignment with the ISO C standard.

55226 **NAME**

55227 raise — send a signal to the executing process

55228 **SYNOPSIS**

55229 #include &lt;signal.h&gt;

55230 int raise(int sig);

55231 **DESCRIPTION**55232 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
55233 conflict between the requirements described here and the ISO C standard is unintentional. This  
55234 volume of POSIX.1-2008 defers to the ISO C standard.55235 CX The *raise()* function shall send the signal *sig* to the executing thread or process. If a signal  
55236 handler is called, the *raise()* function shall not return until after the signal handler does.55237 CX The effect of the *raise()* function shall be equivalent to calling:

55238 pthread\_kill(pthread\_self(), sig);

55239 **RETURN VALUE**55240 CX Upon successful completion, 0 shall be returned. Otherwise, a non-zero value shall be returned  
55241 and *errno* shall be set to indicate the error.55242 **ERRORS**55243 The *raise()* function shall fail if:55244 CX [EINVAL] The value of the *sig* argument is an invalid signal number.55245 **EXAMPLES**

55246 None.

55247 **APPLICATION USAGE**

55248 None.

55249 **RATIONALE**

55250 The term “thread” is an extension to the ISO C standard.

55251 **FUTURE DIRECTIONS**

55252 None.

55253 **SEE ALSO**55254 *kill()*, *sigaction()*

55255 XBD &lt;signal.h&gt;, &lt;sys/types.h&gt;

55256 **CHANGE HISTORY**

55257 First released in Issue 4. Derived from the ANSI C standard.

55258 **Issue 5**

55259 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

55260 **Issue 6**

55261 Extensions beyond the ISO C standard are marked.

55262 The following new requirements on POSIX implementations derive from alignment with the  
55263 Single UNIX Specification:

- 55264
- In the RETURN VALUE section, the requirement to set *errno* on error is added.

## raise()

55265

- The [EINVAL] error condition is added.

55266 **Issue 7**

55267

Functionality relating to the Threads option is moved to the Base.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

55268 **NAME**

55269 rand, rand\_r, srand — pseudo-random number generator

55270 **SYNOPSIS**

```
55271     #include <stdlib.h>
55272     int rand(void);
55273 OB CX  int rand_r(unsigned *seed);
55274     void srand(unsigned seed);
```

55275 **DESCRIPTION**

55276 CX For *rand()* and *srand()*: The functionality described on this reference page is aligned with the  
 55277 ISO C standard. Any conflict between the requirements described here and the ISO C standard is  
 55278 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

55279 The *rand()* function shall compute a sequence of pseudo-random integers in the range  
 55280 XSI [0,{RAND\_MAX}] with a period of at least  $2^{32}$ .

55281 CX The *rand()* function need not be thread-safe.

55282 OB CX The *rand\_r()* function shall compute a sequence of pseudo-random integers in the range  
 55283 [0,{RAND\_MAX}]. (The value of the {RAND\_MAX} macro shall be at least 32767.)

55284 If *rand\_r()* is called with the same initial value for the object pointed to by *seed* and that object is  
 55285 not modified between successive returns and calls to *rand\_r()*, the same sequence shall be  
 55286 generated.

55287 The *srand()* function uses the argument as a seed for a new sequence of pseudo-random  
 55288 numbers to be returned by subsequent calls to *rand()*. If *srand()* is then called with the same  
 55289 seed value, the sequence of pseudo-random numbers shall be repeated. If *rand()* is called before  
 55290 any calls to *srand()* are made, the same sequence shall be generated as when *srand()* is first  
 55291 called with a seed value of 1.

55292 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
 55293 *rand()* or *srand()*.

55294 **RETURN VALUE**

55295 The *rand()* function shall return the next pseudo-random number in the sequence.

55296 OB CX The *rand\_r()* function shall return a pseudo-random integer.

55297 The *srand()* function shall not return a value.

55298 **ERRORS**

55299 No errors are defined.

55300 **EXAMPLES**55301 **Generating a Pseudo-Random Number Sequence**

55302 The following example demonstrates how to generate a sequence of pseudo-random numbers.

```
55303     #include <stdio.h>
55304     #include <stdlib.h>
55305     ...
55306     long count, i;
55307     char *keyst;
55308     int elementlen, len;
55309     char c;
55310     ...
```

**rand()**

```

55311     /* Initial random number generator. */
55312     srand(1);

55313     /* Create keys using only lowercase characters */
55314     len = 0;
55315     for (i=0; i<count; i++) {
55316         while (len < elementlen) {
55317             c = (char) (rand() % 128);
55318             if (islower(c))
55319                 keystr[len++] = c;
55320         }

55321         keystr[len] = '\0';
55322         printf("%s Element%0*ld\n", keystr, elementlen, i);
55323         len = 0;
55324     }

```

55325 **Generating the Same Sequence on Different Machines**

55326 The following code defines a pair of functions that could be incorporated into applications  
55327 wishing to ensure that the same sequence of numbers is generated across different machines.

```

55328     static unsigned long next = 1;
55329     int myrand(void) /* RAND_MAX assumed to be 32767. */
55330     {
55331         next = next * 1103515245 + 12345;
55332         return((unsigned)(next/65536) % 32768);
55333     }

55334     void mysrand(unsigned seed)
55335     {
55336         next = seed;
55337     }

```

55338 **APPLICATION USAGE**

55339 The *drand48()* function provides a much more elaborate random number generator.

55340 The limitations on the amount of state that can be carried between one function call and another  
55341 mean the *rand\_r()* function can never be implemented in a way which satisfies all of the  
55342 requirements on a pseudo-random number generator. Therefore this function should be avoided  
55343 whenever non-trivial requirements (including safety) have to be fulfilled.

55344 **RATIONALE**

55345 The ISO C standard *rand()* and *srand()* functions allow per-process pseudo-random streams  
55346 shared by all threads. Those two functions need not change, but there has to be mutual-  
55347 exclusion that prevents interference between two threads concurrently accessing the random  
55348 number generator.

55349 With regard to *rand()*, there are two different behaviors that may be wanted in a multi-threaded  
55350 program:

- 55351 1. A single per-process sequence of pseudo-random numbers that is shared by all threads  
55352 that call *rand()*
- 55353 2. A different sequence of pseudo-random numbers for each thread that calls *rand()*

55354 This is provided by the modified thread-safe function based on whether the seed value is global

55355 to the entire process or local to each thread.

55356 This does not address the known deficiencies of the *rand()* function implementations, which  
55357 have been approached by maintaining more state. In effect, this specifies new thread-safe forms  
55358 of a deficient function.

55359 **FUTURE DIRECTIONS**

55360 The *rand\_r()* function may be removed in a future version.

55361 **SEE ALSO**

55362 *drand48()*

55363 XBD <stdlib.h>

55364 **CHANGE HISTORY**

55365 First released in Issue 1. Derived from Issue 1 of the SVID.

55366 **Issue 5**

55367 The *rand\_r()* function is included for alignment with the POSIX Threads Extension.

55368 A note indicating that the *rand()* function need not be reentrant is added to the DESCRIPTION.

55369 **Issue 6**

55370 Extensions beyond the ISO C standard are marked.

55371 The *rand\_r()* function is marked as part of the Thread-Safe Functions option.

55372 **Issue 7**

55373 Austin Group Interpretation 1003.1-2001 #156 is applied.

55374 The *rand\_r()* function is marked obsolescent.

**random()***System Interfaces*55375 **NAME**

55376 random — generate pseudo-random number

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

55382 **NAME**

55383        pread, read — read from a file

55384 **SYNOPSIS**

55385        #include &lt;unistd.h&gt;

55386        ssize\_t pread(int *fildes*, void \**buf*, size\_t *nbyte*, off\_t *offset*);55387        ssize\_t read(int *fildes*, void \**buf*, size\_t *nbyte*);55388 **DESCRIPTION**

55389        The *read()* function shall attempt to read *nbyte* bytes from the file associated with the open file  
 55390        descriptor, *fildes*, into the buffer pointed to by *buf*. The behavior of multiple concurrent reads on  
 55391        the same pipe, FIFO, or terminal device is unspecified.

55392        Before any action described below is taken, and if *nbyte* is zero, the *read()* function may detect  
 55393        and return errors as described below. In the absence of errors, or if error detection is not  
 55394        performed, the *read()* function shall return zero and have no other results.

55395        On files that support seeking (for example, a regular file), the *read()* shall start at a position in  
 55396        the file given by the file offset associated with *fildes*. The file offset shall be incremented by the  
 55397        number of bytes actually read.

55398        Files that do not support seeking—for example, terminals—always read from the current  
 55399        position. The value of a file offset associated with such a file is undefined.

55400        No data transfer shall occur past the current end-of-file. If the starting position is at or after the  
 55401        end-of-file, 0 shall be returned. If the file refers to a device special file, the result of subsequent  
 55402        *read()* requests is implementation-defined.

55403        If the value of *nbyte* is greater than {SSIZE\_MAX}, the result is implementation-defined.

55404        When attempting to read from an empty pipe or FIFO:

- 55405        • If no process has the pipe open for writing, *read()* shall return 0 to indicate end-of-file.
- 55406        • If some process has the pipe open for writing and O\_NONBLOCK is set, *read()* shall return  
 55407        -1 and set *errno* to [EAGAIN].
- 55408        • If some process has the pipe open for writing and O\_NONBLOCK is clear, *read()* shall  
 55409        block the calling thread until some data is written or the pipe is closed by all processes that  
 55410        had the pipe open for writing.

55411        When attempting to read a file (other than a pipe or FIFO) that supports non-blocking reads and  
 55412        has no data currently available:

- 55413        • If O\_NONBLOCK is set, *read()* shall return -1 and set *errno* to [EAGAIN].
- 55414        • If O\_NONBLOCK is clear, *read()* shall block the calling thread until some data becomes  
 55415        available.
- 55416        • The use of the O\_NONBLOCK flag has no effect if there is some data available.

55417        The *read()* function reads data previously written to a file. If any portion of a regular file prior to  
 55418        the end-of-file has not been written, *read()* shall return bytes with value 0. For example, *lseek()*  
 55419        allows the file offset to be set beyond the end of existing data in the file. If data is later written at  
 55420        this point, subsequent reads in the gap between the previous end of data and the newly written  
 55421        data shall return bytes with value 0 until data is written into the gap.

55422        Upon successful completion, where *nbyte* is greater than 0, *read()* shall mark for update the last  
 55423        data access timestamp of the file, and shall return the number of bytes read. This number shall  
 55424        never be greater than *nbyte*. The value returned may be less than *nbyte* if the number of bytes

**read()**

- 55425 left in the file is less than *nbyte*, if the *read()* request was interrupted by a signal, or if the file is a  
 55426 pipe or FIFO or special file and has fewer than *nbyte* bytes immediately available for reading.  
 55427 For example, a *read()* from a file associated with a terminal may return one typed line of data.
- 55428 If a *read()* is interrupted by a signal before it reads any data, it shall return  $-1$  with *errno* set to  
 55429 `[EINTR]`.
- 55430 If a *read()* is interrupted by a signal after it has successfully read some data, it shall return the  
 55431 number of bytes read.
- 55432 For regular files, no data transfer shall occur past the offset maximum established in the open  
 55433 file description associated with *fildes*.
- 55434 If *fildes* refers to a socket, *read()* shall be equivalent to *recv()* with no flags set.
- 55435 SIO If the `O_DSYNC` and `O_RSYNC` bits have been set, read I/O operations on the file descriptor  
 55436 shall complete as defined by synchronized I/O data integrity completion. If the `O_SYNC` and  
 55437 `O_RSYNC` bits have been set, read I/O operations on the file descriptor shall complete as  
 55438 defined by synchronized I/O file integrity completion.
- 55439 SHM If *fildes* refers to a shared memory object, the result of the *read()* function is unspecified.
- 55440 TYM If *fildes* refers to a typed memory object, the result of the *read()* function is unspecified.
- 55441 OB XSR A *read()* from a STREAMS file can read data in three different modes: *byte-stream* mode, *message-*  
 55442 *nondiscard* mode, and *message-discard* mode. The default shall be *byte-stream* mode. This can be  
 55443 changed using the `I_SRDOPT ioctl()` request, and can be tested with `I_GRDOPT ioctl()`. In *byte-*  
 55444 *stream* mode, *read()* shall retrieve data from the STREAM until as many bytes as were requested  
 55445 are transferred, or until there is no more data to be retrieved. *Byte-stream* mode ignores  
 55446 message boundaries.
- 55447 In STREAMS *message-nondiscard* mode, *read()* shall retrieve data until as many bytes as were  
 55448 requested are transferred, or until a message boundary is reached. If *read()* does not retrieve all  
 55449 the data in a message, the remaining data shall be left on the STREAM, and can be retrieved by  
 55450 the next *read()* call. *Message-discard* mode also retrieves data until as many bytes as were  
 55451 requested are transferred, or a message boundary is reached. However, unread data remaining  
 55452 in a message after the *read()* returns shall be discarded, and shall not be available for a  
 55453 subsequent *read()*, *getmsg()*, or *getpmsg()* call.
- 55454 How *read()* handles zero-byte STREAMS messages is determined by the current read mode  
 55455 setting. In *byte-stream* mode, *read()* shall accept data until it has read *nbyte* bytes, or until there  
 55456 is no more data to read, or until a zero-byte message block is encountered. The *read()* function  
 55457 shall then return the number of bytes read, and place the zero-byte message back on the  
 55458 STREAM to be retrieved by the next *read()*, *getmsg()*, or *getpmsg()*. In *message-nondiscard*  
 55459 mode or *message-discard* mode, a zero-byte message shall return 0 and the message shall be  
 55460 removed from the STREAM. When a zero-byte message is read as the first message on a  
 55461 STREAM, the message shall be removed from the STREAM and 0 shall be returned, regardless  
 55462 of the read mode.
- 55463 A *read()* from a STREAMS file shall return the data in the message at the front of the STREAM  
 55464 head read queue, regardless of the priority band of the message.
- 55465 By default, STREAMS are in *control-normal* mode, in which a *read()* from a STREAMS file can  
 55466 only process messages that contain a data part but do not contain a control part. The *read()* shall  
 55467 fail if a message containing a control part is encountered at the STREAM head. This default  
 55468 action can be changed by placing the STREAM in either *control-data* mode or *control-discard*  
 55469 mode with the `I_SRDOPT ioctl()` command. In *control-data* mode, *read()* shall convert any  
 55470 control part to data and pass it to the application before passing any data part originally present

55471 in the same message. In control-discard mode, *read()* shall discard message control parts but  
55472 return to the process any data part in the message.

55473 In addition, *read()* shall fail if the STREAM head had processed an asynchronous error before  
55474 the call. In this case, the value of *errno* shall not reflect the result of *read()*, but reflect the prior  
55475 error. If a hangup occurs on the STREAM being read, *read()* shall continue to operate normally  
55476 until the STREAM head read queue is empty. Thereafter, it shall return 0.

55477 The *pread()* function shall be equivalent to *read()*, except that it shall read from a given position  
55478 in the file without changing the file pointer. The first three arguments to *pread()* are the same as  
55479 *read()* with the addition of a fourth argument *offset* for the desired position inside the file. An  
55480 attempt to perform a *pread()* on a file that is incapable of seeking shall result in an error.

#### 55481 RETURN VALUE

55482 Upon successful completion, these functions shall return a non-negative integer indicating the  
55483 number of bytes actually read. Otherwise, the functions shall return -1 and set *errno* to indicate  
55484 the error.

#### 55485 ERRORS

55486 These functions shall fail if:

55487 [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor and the thread would be  
55488 delayed.

55489 [EBADF] The *fildev* argument is not a valid file descriptor open for reading.

55490 OB XSR [EBADMSG] The file is a STREAM file that is set to control-normal mode and the message  
55491 waiting to be read includes a control part.

55492 [EINTR] The read operation was terminated due to the receipt of a signal, and no data  
55493 was transferred.

55494 OB XSR [EINVAL] The STREAM or multiplexer referenced by *fildev* is linked (directly or  
55495 indirectly) downstream from a multiplexer.

55496 [EIO] The process is a member of a background process group attempting to read  
55497 from its controlling terminal, the process is ignoring or blocking the SIGTTIN  
55498 signal, or the process group is orphaned. This error may also be generated for  
55499 implementation-defined reasons.

55500 XSI [EISDIR] The *fildev* argument refers to a directory and the implementation does not  
55501 allow the directory to be read using *read()* or *pread()*. The *readdir()* function  
55502 should be used instead.

55503 [EOVERFLOW] The file is a regular file, *nbyte* is greater than 0, the starting position is before  
55504 the end-of-file, and the starting position is greater than or equal to the offset  
55505 maximum established in the open file description associated with *fildev*.

55506 The *read()* function shall fail if:

55507 [EAGAIN] or [EWOULDBLOCK]

55508 The file descriptor is for a socket, is marked O\_NONBLOCK, and no data is  
55509 waiting to be received.

55510 [ECONNRESET] A read was attempted on a socket and the connection was forcibly closed by  
55511 its peer.

55512 [ENOTCONN] A read was attempted on a socket that is not connected.

**read()**

55513	[ETIMEDOUT]	A read was attempted on a socket and a transmission timeout occurred.
55514		These functions may fail if:
55515	[EIO]	A physical I/O error has occurred.
55516	[ENOBUFFS]	Insufficient resources were available in the system to perform the operation.
55517	[ENOMEM]	Insufficient memory was available to fulfill the request.
55518	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.
55519		
55520		The <i>pread()</i> function shall fail, and the file pointer shall remain unchanged, if:
55521	[EINVAL]	The <i>offset</i> argument is invalid. The value is negative.
55522	[EOVERFLOW]	The file is a regular file and an attempt was made to read at or beyond the offset maximum associated with the file.
55523		
55524	[ENXIO]	A request was outside the capabilities of the device.
55525	[ESPIPE]	<i>fildev</i> is associated with a pipe or FIFO.

55526 **EXAMPLES**55527 **Reading Data into a Buffer**

55528 The following example reads data from the file associated with the file descriptor *fd* into the  
55529 buffer pointed to by *buf*.

```
55530 #include <sys/types.h>
55531 #include <unistd.h>
55532 ...
55533 char buf[20];
55534 size_t nbytes;
55535 ssize_t bytes_read;
55536 int fd;
55537 ...
55538 nbytes = sizeof(buf);
55539 bytes_read = read(fd, buf, nbytes);
55540 ...
```

55541 **APPLICATION USAGE**

55542 None.

55543 **RATIONALE**

55544 This volume of POSIX.1-2008 does not specify the value of the file offset after an error is  
55545 returned; there are too many cases. For programming errors, such as [EBADF], the concept is  
55546 meaningless since no file is involved. For errors that are detected immediately, such as  
55547 [EAGAIN], clearly the pointer should not change. After an interrupt or hardware error, however,  
55548 an updated value would be very useful and is the behavior of many implementations.

55549 Note that a *read()* of zero bytes does not modify the last data access timestamp. A *read()* that  
55550 requests more than zero bytes, but returns zero, is required to modify the last data access  
55551 timestamp.

55552 Implementations are allowed, but not required, to perform error checking for *read()* requests of  
55553 zero bytes.

55554 **Input and Output**

55555 The use of I/O with large byte counts has always presented problems. Ideas such as *lread()* and  
 55556 *lwrite()* (using and returning **longs**) were considered at one time. The current solution is to use  
 55557 abstract types on the ISO C standard function to *read()* and *write()*. The abstract types can be  
 55558 declared so that existing functions work, but can also be declared so that larger types can be  
 55559 represented in future implementations. It is presumed that whatever constraints limit the  
 55560 maximum range of **size\_t** also limit portable I/O requests to the same range. This volume of  
 55561 POSIX.1-2008 also limits the range further by requiring that the byte count be limited so that a  
 55562 signed return value remains meaningful. Since the return type is also a (signed) abstract type,  
 55563 the byte count can be defined by the implementation to be larger than an **int** can hold.

55564 The standard developers considered adding atomicity requirements to a pipe or FIFO, but  
 55565 recognized that due to the nature of pipes and FIFOs there could be no guarantee of atomicity of  
 55566 reads of {PIPE\_BUF} or any other size that would be an aid to applications portability.

55567 This volume of POSIX.1-2008 requires that no action be taken for *read()* or *write()* when *nbyte* is  
 55568 zero. This is not intended to take precedence over detection of errors (such as invalid buffer  
 55569 pointers or file descriptors). This is consistent with the rest of this volume of POSIX.1-2008, but  
 55570 the phrasing here could be misread to require detection of the zero case before any other errors.  
 55571 A value of zero is to be considered a correct value, for which the semantics are a no-op.

55572 I/O is intended to be atomic to ordinary files and pipes and FIFOs. Atomic means that all the  
 55573 bytes from a single operation that started out together end up together, without interleaving  
 55574 from other I/O operations. It is a known attribute of terminals that this is not honored, and  
 55575 terminals are explicitly (and implicitly permanently) excepted, making the behavior unspecified.  
 55576 The behavior for other device types is also left unspecified, but the wording is intended to imply  
 55577 that future standards might choose to specify atomicity (or not).

55578 There were recommendations to add format parameters to *read()* and *write()* in order to handle  
 55579 networked transfers among heterogeneous file system and base hardware types. Such a facility  
 55580 may be required for support by the OSI presentation of layer services. However, it was  
 55581 determined that this should correspond with similar C-language facilities, and that is beyond  
 55582 the scope of this volume of POSIX.1-2008. The concept was suggested to the developers of the  
 55583 ISO C standard for their consideration as a possible area for future work.

55584 In 4.3 BSD, a *read()* or *write()* that is interrupted by a signal before transferring any data does  
 55585 not by default return an [EINTR] error, but is restarted. In 4.2 BSD, 4.3 BSD, and the Eighth  
 55586 Edition, there is an additional function, *select()*, whose purpose is to pause until specified  
 55587 activity (data to read, space to write, and so on) is detected on specified file descriptors. It is  
 55588 common in applications written for those systems for *select()* to be used before *read()* in  
 55589 situations (such as keyboard input) where interruption of I/O due to a signal is desired.

55590 The issue of which files or file types are interruptible is considered an implementation design  
 55591 issue. This is often affected primarily by hardware and reliability issues.

55592 There are no references to actions taken following an “unrecoverable error”. It is considered  
 55593 beyond the scope of this volume of POSIX.1-2008 to describe what happens in the case of  
 55594 hardware errors.

55595 Earlier versions of this standard allowed two very different behaviors with regard to the  
 55596 handling of interrupts. In order to minimize the resulting confusion, it was decided that  
 55597 POSIX.1-2008 should support only one of these behaviors. Historical practice on AT&T-derived  
 55598 systems was to have *read()* and *write()* return  $-1$  and set *errno* to [EINTR] when interrupted after  
 55599 some, but not all, of the data requested had been transferred. However, the US Department of  
 55600 Commerce FIPS 151-1 and FIPS 151-2 require the historical BSD behavior, in which *read()* and

**read()**

55601 *write()* return the number of bytes actually transferred before the interrupt. If  $-1$  is returned  
 55602 when any data is transferred, it is difficult to recover from the error on a seekable device and  
 55603 impossible on a non-seekable device. Most new implementations support this behavior. The  
 55604 behavior required by POSIX.1-2008 is to return the number of bytes transferred.

55605 POSIX.1-2008 does not specify when an implementation that buffers *read()*s actually moves the  
 55606 data into the user-supplied buffer, so an implementation may choose to do this at the latest  
 55607 possible moment. Therefore, an interrupt arriving earlier may not cause *read()* to return a  
 55608 partial byte count, but rather to return  $-1$  and set *errno* to [EINTR].

55609 Consideration was also given to combining the two previous options, and setting *errno* to  
 55610 [EINTR] while returning a short count. However, not only is there no existing practice that  
 55611 implements this, it is also contradictory to the idea that when *errno* is set, the function  
 55612 responsible shall return  $-1$ .

55613 **FUTURE DIRECTIONS**

55614 None.

55618 **CHANGE HISTORY**

55619 First released in Issue 1. Derived from Issue 1 of the SVID.

55620 **Issue 5**

55621 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 55622 Threads Extension.

55623 Large File Summit extensions are added.

55624 The *pread()* function is added.

55625 **Issue 6**

55626 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are  
 55627 marked as part of the XSI STREAMS Option Group.

55628 The following new requirements on POSIX implementations derive from alignment with the  
 55629 Single UNIX Specification:

55630 • The DESCRIPTION now states that if *read()* is interrupted by a signal after it has  
 55631 successfully read some data, it returns the number of bytes read. In Issue 3, it was optional  
 55632 whether *read()* returned the number of bytes read, or whether it returned  $-1$  with *errno* set  
 55633 to [EINTR]. This is a FIPS requirement.

55634 • In the DESCRIPTION, text is added to indicate that for regular files, no data transfer  
 55635 occurs past the offset maximum established in the open file description associated with  
 55636 *files*. This change is to support large files.

55637 • The [Eoverflow] mandatory error condition is added.

55638 • The [ENxio] optional error condition is added.

55639 Text referring to sockets is added to the DESCRIPTION.

55640 The following changes were made to align with the IEEE P1003.1a draft standard:

55641 • The effect of reading zero bytes is clarified.

55642 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that

- 55643 *read()* results are unspecified for typed memory objects.
- 55644 New RATIONALE is added to explain the atomicity requirements for input and output  
55645 operations.
- 55646 The following error conditions are added for operations on sockets: [EAGAIN],  
55647 [ECONNRESET], [ENOTCONN], and [ETIMEDOUT].
- 55648 The [EIO] error is made optional.
- 55649 The following error conditions are added for operations on sockets: [ENOBUFS] and  
55650 [ENOMEM].
- 55651 The *readv()* function is split out into a separate reference page.
- 55652 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/108 is applied, updating the [EAGAIN]  
55653 error in the ERRORS section from “the process would be delayed” to “the thread would be  
55654 delayed”.
- 55655 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/109 is applied, making an editorial  
55656 correction in the RATIONALE section.
- 55657 **Issue 7**
- 55658 The *pread()* function is moved from the XSI option to the Base.
- 55659 Functionality relating to the XSI STREAMS option is marked obsolescent.
- 55660 Changes are made related to support for finegrained timestamps.

**readdir()**55661 **NAME**

55662 readdir, readdir\_r — read a directory

55663 **SYNOPSIS**

```
55664 #include <dirent.h>
55665 struct dirent *readdir(DIR *dirp);
55666 int readdir_r(DIR *restrict dirp, struct dirent *restrict entry,
55667 struct dirent **restrict result);
```

55668 **DESCRIPTION**

55669 The type **DIR**, which is defined in the **<dirent.h>** header, represents a *directory stream*, which is  
 55670 an ordered sequence of all the directory entries in a particular directory. Directory entries  
 55671 represent files; files may be removed from a directory or added to a directory asynchronously to  
 55672 the operation of *readdir()*.

55673 The *readdir()* function shall return a pointer to a structure representing the directory entry at the  
 55674 current position in the directory stream specified by the argument *dirp*, and position the  
 55675 directory stream at the next entry. It shall return a null pointer upon reaching the end of the  
 55676 directory stream. The structure **dirent** defined in the **<dirent.h>** header describes a directory  
 55677 entry. The value of the structure's *d\_ino* member shall be set to the file serial number of the file  
 55678 named by the *d\_name* member. If the *d\_name* member names a symbolic link, the value of the  
 55679 *d\_ino* member shall be set to the file serial number of the symbolic link itself.

55680 The *readdir()* function shall not return directory entries containing empty names. If entries for  
 55681 dot or dot-dot exist, one entry shall be returned for dot and one entry shall be returned for dot-  
 55682 dot; otherwise, they shall not be returned.

55683 The pointer returned by *readdir()* points to data which may be overwritten by another call to  
 55684 *readdir()* on the same directory stream. This data is not overwritten by another call to *readdir()*  
 55685 on a different directory stream.

55686 If a file is removed from or added to the directory after the most recent call to *opendir()* or  
 55687 *rewinddir()*, whether a subsequent call to *readdir()* returns an entry for that file is unspecified.

55688 The *readdir()* function may buffer several directory entries per actual read operation; *readdir()*  
 55689 shall mark for update the last data access timestamp of the directory each time the directory is  
 55690 actually read.

55691 After a call to *fork()*, either the parent or child (but not both) may continue processing the  
 55692 XSI directory stream using *readdir()*, *rewinddir()*, or *seekdir()*. If both the parent and child processes  
 55693 use these functions, the result is undefined.

55694 The *readdir()* function need not be thread-safe.

55695 Applications wishing to check for error situations should set *errno* to 0 before calling *readdir()*. If  
 55696 *errno* is set to non-zero on return, an error occurred.

55697 The *readdir\_r()* function shall initialize the **dirent** structure referenced by *entry* to represent the  
 55698 directory entry at the current position in the directory stream referred to by *dirp*, store a pointer  
 55699 to this structure at the location referenced by *result*, and position the directory stream at the next  
 55700 entry.

55701 The storage pointed to by *entry* shall be large enough for a **dirent** with an array of **char** *d\_name*  
 55702 members containing at least **[NAME\_MAX]+1** elements.

55703 Upon successful return, the pointer returned at *\*result* shall have the same value as the argument  
 55704 *entry*. Upon reaching the end of the directory stream, this pointer shall have the value **NULL**.

55705 The *readdir\_r()* function shall not return directory entries containing empty names.

55706 If a file is removed from or added to the directory after the most recent call to *opendir()* or  
55707 *rewinddir()*, whether a subsequent call to *readdir\_r()* returns an entry for that file is unspecified.

55708 The *readdir\_r()* function may buffer several directory entries per actual read operation;  
55709 *readdir\_r()* shall mark for update the last data access timestamp of the directory each time the  
55710 directory is actually read.

#### 55711 RETURN VALUE

55712 Upon successful completion, *readdir()* shall return a pointer to an object of type **struct dirent**.  
55713 When an error is encountered, a null pointer shall be returned and *errno* shall be set to indicate  
55714 the error. When the end of the directory is encountered, a null pointer shall be returned and  
55715 *errno* is not changed.

55716 If successful, the *readdir\_r()* function shall return zero; otherwise, an error number shall be  
55717 returned to indicate the error.

#### 55718 ERRORS

55719 These functions shall fail if:

55720 [EOVERFLOW] One of the values in the structure to be returned cannot be represented  
55721 correctly.

55722 These functions may fail if:

55723 [EBADF] The *dirp* argument does not refer to an open directory stream.

55724 [ENOENT] The current position of the directory stream is invalid.

#### 55725 EXAMPLES

55726 The following sample program searches the current directory for each of the arguments supplied  
55727 on the command line.

```
55728 #include <dirent.h>
55729 #include <errno.h>
55730 #include <stdio.h>
55731 #include <string.h>

55732 static void lookup(const char *arg)
55733 {
55734     DIR *dirp;
55735     struct dirent *dp;

55736     if ((dirp = opendir(".")) == NULL) {
55737         perror("couldn't open '.'");
55738         return;
55739     }

55740     do {
55741         errno = 0;
55742         if ((dp = readdir(dirp)) != NULL) {
55743             if (strcmp(dp->d_name, arg) != 0)
55744                 continue;

55745             (void) printf("found %s\n", arg);
55746             (void) closedir(dirp);
55747             return;
55748         }
55749     } while (dp != NULL);
```

**readdir()**

```

55750         if (errno != 0)
55751             perror("error reading directory");
55752         else
55753             (void) printf("failed to find %s\n", arg);
55754             (void) closedir(dirp);
55755             return;
55756     }

55757     int main(int argc, char *argv[])
55758     {
55759         int i;
55760         for (i = 1; i < argc; i++)
55761             lookup(argv[i]);
55762         return (0);
55763     }

```

**55764 APPLICATION USAGE**

55765 The *readdir()* function should be used in conjunction with *opendir()*, *closedir()*, and *rewinddir()* to  
 55766 examine the contents of the directory.

55767 The *readdir\_r()* function is thread-safe and shall return values in a user-supplied buffer instead  
 55768 of possibly using a static data area that may be overwritten by each call.

**55769 RATIONALE**

55770 The returned value of *readdir()* merely *represents* a directory entry. No equivalence should be  
 55771 inferred.

55772 Historical implementations of *readdir()* obtain multiple directory entries on a single read  
 55773 operation, which permits subsequent *readdir()* operations to operate from the buffered  
 55774 information. Any wording that required each successful *readdir()* operation to mark the  
 55775 directory last data access timestamp for update would disallow such historical performance-  
 55776 oriented implementations.

55777 When returning a directory entry for the root of a mounted file system, some historical  
 55778 implementations of *readdir()* returned the file serial number of the underlying mount point,  
 55779 rather than of the root of the mounted file system. This behavior is considered to be a bug, since  
 55780 the underlying file serial number has no significance to applications.

55781 Since *readdir()* returns NULL when it detects an error and when the end of the directory is  
 55782 encountered, an application that needs to tell the difference must set *errno* to zero before the call  
 55783 and check if NULL is returned. Since the function must not change *errno* in the second case  
 55784 and must set it to a non-zero value in the first case, a zero *errno* after a call returning NULL
