| 84093 | <i>LC_ALL</i>   | If set to a non-empty string value, override the values of all the other<br>internationalization variables.                                                                                                                              |
| 84095 | <i>LC_CTYPE</i> | Determine the locale for the interpretation of sequences of bytes of text data as<br>characters (for example, single-byte as opposed to multi-byte characters in<br>arguments).                                                          |

84098 *LC\_MESSAGES*  
 84099 Determine the locale that should be used to affect the format and contents of  
 84100 diagnostic messages written to standard error.

84101 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 84102 ASYNCHRONOUS EVENTS

84103 Default.

#### 84104 STDOUT

84105 The *dirname* utility shall write a line to the standard output in the following format:

84106 "%s\n", <resulting string>

#### 84107 STDERR

84108 The standard error shall be used only for diagnostic messages.

#### 84109 OUTPUT FILES

84110 None.

#### 84111 EXTENDED DESCRIPTION

84112 None.

#### 84113 EXIT STATUS

84114 The following exit values shall be returned:

84115 0 Successful completion.

84116 >0 An error occurred.

#### 84117 CONSEQUENCES OF ERRORS

84118 Default.

#### 84119 APPLICATION USAGE

84120 The definition of *pathname* specifies implementation-defined behavior for pathnames starting  
 84121 with two <slash> characters. Therefore, applications shall not arbitrarily add <slash> characters  
 84122 to the beginning of a *pathname* unless they can ensure that there are more or less than two or are  
 84123 prepared to deal with the implementation-defined consequences.

| <i>dirname</i> /a/b     | /a          |
| <i>dirname</i> a/b      | a           |

#### 84136 RATIONALE

84137 The *dirname* utility originated in System III. It has evolved through the System V releases to a  
 84138 version that matches the requirements specified in this description in System V Release 3. 4.3  
 84139 BSD and earlier versions did not include *dirname*.

84140 The behaviors of *basename* and *dirname* in this volume of POSIX.1-2008 have been coordinated so

**dirname**

Utilities

84141 that when *string* is a valid pathname:

84142 `$(basename "string")`

84143 would be a valid filename for the file in the directory:

84144 `$(dirname "string")`

84145 This would not work for the versions of these utilities in early proposals due to the way  
84146 processing of trailing <slash> characters was specified. Consideration was given to leaving  
84147 processing unspecified if there were trailing <slash> characters, but this cannot be done. XBD  
84148 [Section 3.266](#) (on page 75) allows trailing <slash> characters. The *basename* and *dirname* utilities  
84149 have to specify consistent handling for all valid pathnames.

84150 **FUTURE DIRECTIONS**

84151 None.

84157 **NAME**

84158 du — estimate file space usage

84159 **SYNOPSIS**84160 du [-a|-s] [-kx] [-H|-L] [*file*...]84161 **DESCRIPTION**

84162 By default, the *du* utility shall write to standard output the size of the file space allocated to, and  
 84163 the size of the file space allocated to each subdirectory of, the file hierarchy rooted in each of the  
 84164 specified files. By default, when a symbolic link is encountered on the command line or in the  
 84165 file hierarchy, *du* shall count the size of the symbolic link (rather than the file referenced by the  
 84166 link), and shall not follow the link to another portion of the file hierarchy. The size of the file  
 84167 space allocated to a file of type directory shall be defined as the sum total of space allocated to  
 84168 all files in the file hierarchy rooted in the directory plus the space allocated to the directory itself.

84169 When *du* cannot *stat()* files or *stat()* or read directories, it shall report an error condition and the  
 84170 final exit status is affected. Files with multiple links shall be counted and written for only one  
 84171 entry. The directory entry that is selected in the report is unspecified. By default, file sizes shall  
 84172 be written in 512-byte units, rounded up to the next 512-byte unit.

84173 **OPTIONS**84174 The *du* utility shall conform to XBD Section 12.2 (on page 215).

84175 The following options shall be supported:

84176 **-a** In addition to the default output, report the size of each file not of type directory in  
 84177 the file hierarchy rooted in the specified file. Regardless of the presence of the **-a**  
 84178 option, non-directories given as *file* operands shall always be listed.

84179 **-H** If a symbolic link is specified on the command line, *du* shall count the size of the  
 84180 file or file hierarchy referenced by the link.

84181 **-k** Write the files sizes in units of 1024 bytes, rather than the default 512-byte units.

84182 **-L** If a symbolic link is specified on the command line or encountered during the  
 84183 traversal of a file hierarchy, *du* shall count the size of the file or file hierarchy  
 84184 referenced by the link.

84185 **-s** Instead of the default output, report only the total sum for each of the specified  
 84186 files.

84187 **-x** When evaluating file sizes, evaluate only those files that have the same device as  
 84188 the file specified by the *file* operand.

84189 Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered  
 84190 an error. The last option specified shall determine the behavior of the utility.

84191 **OPERANDS**

84192 The following operand shall be supported:

84193 *file* The pathname of a file whose size is to be written. If no *file* is specified, the current  
 84194 directory shall be used.

84195 **STDIN**

84196 Not used.

84197 **INPUT FILES**

84198 None.

84199 **ENVIRONMENT VARIABLES**84200 The following environment variables shall affect the execution of *du*:84201 *LANG* Provide a default value for the internationalization variables that are unset or null.  
84202 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
84203 variables used to determine the values of locale categories.)84204 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
84205 internationalization variables.84206 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
84207 characters (for example, single-byte as opposed to multi-byte characters in  
84208 arguments).84209 *LC\_MESSAGES*84210 Determine the locale that should be used to affect the format and contents of  
84211 diagnostic messages written to standard error.84212 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.84213 **ASYNCHRONOUS EVENTS**

84214 Default.

84215 **STDOUT**84216 The output from *du* shall consist of the amount of space allocated to a file and the name of the  
84217 file, in the following format:

84218 "%d %s\n", &lt;size&gt;, &lt;pathname&gt;

84219 **STDERR**

84220 The standard error shall be used only for diagnostic messages.

84221 **OUTPUT FILES**

84222 None.

84223 **EXTENDED DESCRIPTION**

84224 None.

84225 **EXIT STATUS**

84226 The following exit values shall be returned:

84227 0 Successful completion.

84228 &gt;0 An error occurred.

84229 **CONSEQUENCES OF ERRORS**

84230 Default.

84231 **APPLICATION USAGE**

84232 None.

84233 **EXAMPLES**

84234 None.

84235 **RATIONALE**84236 The use of 512-byte units is historical practice and maintains compatibility with *ls* and other  
84237 utilities in this volume of POSIX.1-2008. This does not mandate that the file system itself be  
84238 based on 512-byte blocks. The *-k* option was added as a compromise measure. It was agreed by  
84239 the standard developers that 512 bytes was the best default unit because of its complete  
84240 historical consistency on System V (*versus* the mixed 512/1024-byte usage on BSD systems), and  
84241 that a *-k* option to switch to 1024-byte units was a good compromise. Users who prefer the

84242 1 024-byte quantity can easily alias *du* to *du -k* without breaking the many historical scripts  
84243 relying on the 512-byte units.

84244 The **-b** option was added to an early proposal to provide a resolution to the situation where  
84245 System V and BSD systems give figures for file sizes in *blocks*, which is an implementation-  
84246 defined concept. (In common usage, the block size is 512 bytes for System V and 1 024 bytes for  
84247 BSD systems.) However, **-b** was later deleted, since the default was eventually decided as  
84248 512-byte units.

84249 Historical file systems provided no way to obtain exact figures for the space allocation given to  
84250 files. There are two known areas of inaccuracies in historical file systems: cases of *indirect blocks*  
84251 being used by the file system or *sparse* files yielding incorrectly high values. An indirect block is  
84252 space used by the file system in the storage of the file, but that need not be counted in the space  
84253 allocated to the file. A *sparse* file is one in which an *lseek()* call has been made to a position  
84254 beyond the end of the file and data has subsequently been written at that point. A file system  
84255 need not allocate all the intervening zero-filled blocks to such a file. It is up to the  
84256 implementation to define exactly how accurate its methods are.

84257 The **-a** and **-s** options were mutually-exclusive in the original version of *du*. The POSIX Shell  
84258 and Utilities description is implied by the language in the SVID where **-s** is described as causing  
84259 “only the grand total” to be reported. Some systems may produce output for **-sa**, but a Strictly  
84260 Conforming POSIX Shell and Utilities Application cannot use that combination.

84261 The **-a** and **-s** options were adopted from the SVID except that the System V behavior of not  
84262 listing non-directories explicitly given as operands, unless the **-a** option is specified, was  
84263 considered a bug; the BSD-based behavior (report for all operands) is mandated. The default  
84264 behavior of *du* in the SVID with regard to reporting the failure to read files (it produces no  
84265 messages) was considered counter-intuitive, and thus it was specified that the POSIX Shell and  
84266 Utilities default behavior shall be to produce such messages. These messages can be turned off  
84267 with shell redirection to achieve the System V behavior.

84268 The **-x** option is historical practice on recent BSD systems. It has been adopted by this volume of  
84269 POSIX.1-2008 because there was no other historical method of limiting the *du* search to a single  
84270 file hierarchy. This limitation of the search is necessary to make it possible to obtain file space  
84271 usage information about a file system on which other file systems are mounted, without having  
84272 to resort to a lengthy *find* and *awk* script.

#### 84273 FUTURE DIRECTIONS

#### 84279 CHANGE HISTORY

84280 First released in Issue 2.

#### 84281 Issue 6

84282 This utility is marked as part of the User Portability Utilities option.

84283 The APPLICATION USAGE section is added.

84284 The obsolescent **-r** option is removed.

84285 The Open Group Corrigendum U025/3 is applied. The *du* utility is reinstated, as it had  
84286 incorrectly been marked LEGACY in Issue 5.

**du***Utilities*

- 84287 The **-H** and **-L** options for symbolic links are added as described in the IEEE P1003.2b draft standard.
- 84288
- 84289 **Issue 7**
- 84290 The *du* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.
- 84291
- 84292 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84293 **NAME**

84294 echo — write arguments to standard output

84295 **SYNOPSIS**84296 echo [*string...*]84297 **DESCRIPTION**84298 The *echo* utility writes its arguments to standard output, followed by a <newline>. If there are  
84299 no arguments, only the <newline> is written.84300 **OPTIONS**84301 The *echo* utility shall not recognize the "--" argument in the manner specified by Guideline 10  
84302 of XBD Section 12.2 (on page 215); "--" shall be recognized as a string operand.

84303 Implementations shall not support any options.

84304 **OPERANDS**

84305 The following operands shall be supported:

84306 *string* A string to be written to standard output. If the first operand is **-n**, or if any of the  
84307 operands contain a <backslash> character, the results are implementation-defined.84308 XSI On XSI-conformant systems, if the first operand is **-n**, it shall be treated as a string,  
84309 not an option. The following character sequences shall be recognized on XSI-  
84310 conformant systems within any of the arguments:

84311 \a Write an &lt;alert&gt;.

84312 \b Write a &lt;backspace&gt;.

84313 \c Suppress the <newline> that otherwise follows the final argument in the  
84314 output. All characters following the '\c' in the arguments shall be  
84315 ignored.

84316 \f Write a &lt;form-feed&gt;.

84317 \n Write a &lt;newline&gt;.

84318 \r Write a &lt;carriage-return&gt;.

84319 \t Write a &lt;tab&gt;.

84320 \v Write a &lt;vertical-tab&gt;.

84321 \ Write a &lt;backslash&gt; character.

84322 \0*num* Write an 8-bit value that is the zero, one, two, or three-digit octal number  
84323 *num*.84324 **STDIN**

84325 Not used.

84326 **INPUT FILES**

84327 None.

84328 **ENVIRONMENT VARIABLES**84329 The following environment variables shall affect the execution of *echo*:84330 *LANG* Provide a default value for the internationalization variables that are unset or null.  
84331 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
84332 variables used to determine the values of locale categories.)

| 84369 |     |                               | <pre>if [ "X\$1" = "X-n" ] then     shift     printf "%s" "\$*" else     printf "%s\n" "\$*" fi </pre>                                                                                                                                               |
| 84370 |     |                               |                                                                                                                                                                                                                                                      |
| 84371 |     |                               |                                                                                                                                                                                                                                                      |
| 84372 |     |                               |                                                                                                                                                                                                                                                      |
| 84373 |     |                               |                                                                                                                                                                                                                                                      |
| 84374 |     |                               |                                                                                                                                                                                                                                                      |
| 84375 |     |                               |                                                                                                                                                                                                                                                      |

84376 New applications are encouraged to use *printf* instead of *echo*.

#### 84377 EXAMPLES

84378 None.

#### 84379 RATIONALE

84380 The *echo* utility has not been made obsolescent because of its extremely widespread use in  
84381 historical applications. Conforming applications that wish to do prompting without <newline>  
84382 characters or that could possibly be expecting to echo a **-n**, should use the *printf* utility derived  
84383 from the Ninth Edition system.

84384 As specified, *echo* writes its arguments in the simplest of ways. The two different historical  
84385 versions of *echo* vary in fatally incompatible ways.

84386 The BSD *echo* checks the first argument for the string **-n** which causes it to suppress the  
84387 <newline> that would otherwise follow the final argument in the output.

84388 The System V *echo* does not support any options, but allows escape sequences within its  
84389 operands, as described for XSI implementations in the OPERANDS section.

84390 The *echo* utility does not support Utility Syntax Guideline 10 because historical applications  
84391 depend on *echo* to echo *all* of its arguments, except for the **-n** option in the BSD version.

#### 84392 FUTURE DIRECTIONS

84393 None.

#### 84394 SEE ALSO

84395 *printf*

84396 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

#### 84397 CHANGE HISTORY

84398 First released in Issue 2.

#### 84399 Issue 5

84400 In the OPTIONS section, the last sentence is changed to indicate that implementations “do not”  
84401 support any options; in the previous issue this said “need not”.

#### 84402 Issue 6

84403 The following new requirements on POSIX implementations derive from alignment with the  
84404 Single UNIX Specification:

- 84405 • A set of character sequences is defined as *string* operands.
- 84406 • *LC\_CTYPE* is added to the list of environment variables affecting *echo*.
- 84407 • In the OPTIONS section, implementations shall not support any options.

84408 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/21 is applied, so that the *echo* utility can  
84409 accommodate historical BSD behavior.

#### 84410 Issue 7

84411 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**ed**84412 **NAME**

84413 ed — edit text

84414 **SYNOPSIS**84415 ed [-p *string*] [-s] [*file*]84416 **DESCRIPTION**

84417 The *ed* utility is a line-oriented text editor that uses two modes: *command mode* and *input mode*. In  
 84418 command mode the input characters shall be interpreted as commands, and in input mode they  
 84419 shall be interpreted as text. See the EXTENDED DESCRIPTION section.

84420 If an operand is '-', the results are unspecified.

84421 **OPTIONS**

84422 The *ed* utility shall conform to XBD Section 12.2 (on page 215), except for the unspecified usage  
 84423 of '-'.

84424 The following options shall be supported:

84425 **-p** *string* Use *string* as the prompt string when in command mode. By default, there shall be  
 84426 no prompt string.

84427 **-s** Suppress the writing of byte counts by **e**, **E**, **r**, and **w** commands and of the '!'  
 84428 prompt after a *!command*.

84429 **OPERANDS**

84430 The following operand shall be supported:

84431 *file* If the *file* argument is given, *ed* shall simulate an **e** command on the file named by  
 84432 the pathname, *file*, before accepting commands from the standard input.

84433 **STDIN**

84434 The standard input shall be a text file consisting of commands, as described in the EXTENDED  
 84435 DESCRIPTION section.

84436 **INPUT FILES**

84437 The input files shall be text files.

84438 **ENVIRONMENT VARIABLES**84439 The following environment variables shall affect the execution of *ed*:

84440 **HOME** Determine the pathname of the user's home directory.

84441 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 84442 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 84443 variables used to determine the values of locale categories.)

84444 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 84445 internationalization variables.

84446 **LC\_COLLATE**

84447 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 84448 character collating elements within regular expressions.

84449 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 84450 characters (for example, single-byte as opposed to multi-byte characters in  
 84451 arguments and input files) and the behavior of character classes within regular  
 84452 expressions.

- 84453 *LC\_MESSAGES*
- 84454 Determine the locale that should be used to affect the format and contents of
- 84455 diagnostic messages written to standard error and informative messages written to
- 84456 standard output.
- 84457 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 84458 **ASYNCHRONOUS EVENTS**
- 84459 The *ed* utility shall take the standard action for all signals (see the ASYNCHRONOUS EVENTS
- 84460 section in [Section 1.4](#), on page 2288) with the following exceptions:
- 84461 **SIGINT** The *ed* utility shall interrupt its current activity, write the string "?\n" to standard
- 84462 output, and return to command mode (see the EXTENDED DESCRIPTION
- 84463 section).
- 84464 **SIGHUP** If the buffer is not empty and has changed since the last write, the *ed* utility shall
- 84465 attempt to write a copy of the buffer in a file. First, the file named **ed.hup** in the
- 84466 current directory shall be used; if that fails, the file named **ed.hup** in the directory
- 84467 named by the *HOME* environment variable shall be used. In any case, the *ed* utility
- 84468 shall exit without writing the file to the currently remembered pathname and
- 84469 without returning to command mode.
- 84470 **SIGQUIT** The *ed* utility shall ignore this event.
- 84471 **STDOUT**
- 84472 Various editing commands and the prompting feature (see **-p**) write to standard output, as
- 84473 described in the EXTENDED DESCRIPTION section.
- 84474 **STDERR**
- 84475 The standard error shall be used only for diagnostic messages.
- 84476 **OUTPUT FILES**
- 84477 The output files shall be text files whose formats are dependent on the editing commands given.
- 84478 **EXTENDED DESCRIPTION**
- 84479 The *ed* utility shall operate on a copy of the file it is editing; changes made to the copy shall have
- 84480 no effect on the file until a **w** (write) command is given. The copy of the text is called the *buffer*.
- 84481 Commands to *ed* have a simple and regular structure: zero, one, or two *addresses* followed by a
- 84482 single-character *command*, possibly followed by parameters to that command. These addresses
- 84483 specify one or more lines in the buffer. Every command that requires addresses has default
- 84484 addresses, so that the addresses very often can be omitted. If the **-p** option is specified, the
- 84485 prompt string shall be written to standard output before each command is read.
- 84486 In general, only one command can appear on a line. Certain commands allow text to be input.
- 84487 This text is placed in the appropriate place in the buffer. While *ed* is accepting text, it is said to be
- 84488 in *input mode*. In this mode, no commands shall be recognized; all input is merely collected.
- 84489 Input mode is terminated by entering a line consisting of two characters: a <period> ( '.' )
- 84490 followed by a <newline>. This line is not considered part of the input text.

84491 **Regular Expressions in ed**

84492 The *ed* utility shall support basic regular expressions, as described in XBD Section 9.3 (on page  
84493 183). Since regular expressions in *ed* are always matched against single lines (excluding the  
84494 terminating <newline> characters), never against any larger section of text, there is no way for a  
84495 regular expression to match a <newline>.

84496 A null RE shall be equivalent to the last RE encountered.

84497 Regular expressions are used in addresses to specify lines, and in some commands (for example,  
84498 the *s* substitute command) to specify portions of a line to be substituted.

84499 **Addresses in ed**

84500 Addressing in *ed* relates to the current line. Generally, the current line is the last line affected by a  
84501 command. The current line number is the address of the current line. If the edit buffer is not  
84502 empty, the initial value for the current line shall be the last line in the edit buffer; otherwise, zero.

84503 Addresses shall be constructed as follows:

- 84504 1. The <period> character ( ' . ' ) shall address the current line.
- 84505 2. The <dollar-sign> character ( ' \$ ' ) shall address the last line of the edit buffer.
- 84506 3. The positive decimal number *n* shall address the *n*th line of the edit buffer.
- 84507 4. The <apostrophe>-*x* character pair ( " ' x " ) shall address the line marked with the mark  
84508 name character *x*, which shall be a lowercase letter from the portable character set. It shall  
84509 be an error if the character has not been set to mark a line or if the line that was marked is  
84510 not currently present in the edit buffer.
- 84511 5. A BRE enclosed by <slash> characters ( ' / ' ) shall address the first line found by  
84512 searching forwards from the line following the current line toward the end of the edit  
84513 buffer and stopping at the first line for which the line excluding the terminating  
84514 <newline> matches the BRE. The BRE consisting of a null BRE delimited by a pair of  
84515 <slash> characters shall address the next line for which the line excluding the terminating  
84516 <newline> matches the last BRE encountered. In addition, the second <slash> can be  
84517 omitted at the end of a command line. Within the BRE, a <backslash>-<slash> pair ( " \ / " )  
84518 shall represent a literal <slash> instead of the BRE delimiter. If necessary, the search shall  
84519 wrap around to the beginning of the buffer and continue up to and including the current  
84520 line, so that the entire buffer is searched.
- 84521 6. A BRE enclosed by <question-mark> characters ( ' ? ' ) shall address the first line found by  
84522 searching backwards from the line preceding the current line toward the beginning of the  
84523 edit buffer and stopping at the first line for which the line excluding the terminating  
84524 <newline> matches the BRE. The BRE consisting of a null BRE delimited by a pair of  
84525 <question-mark> characters ( " ? ? " ) shall address the previous line for which the line  
84526 excluding the terminating <newline> matches the last BRE encountered. In addition, the  
84527 second <question-mark> can be omitted at the end of a command line. Within the BRE, a  
84528 <backslash>-<question-mark> pair ( " \ ? " ) shall represent a literal <question-mark>  
84529 instead of the BRE delimiter. If necessary, the search shall wrap around to the end of the  
84530 buffer and continue up to and including the current line, so that the entire buffer is  
84531 searched.
- 84532 7. A <plus-sign> ( ' + ' ) or <hyphen> character ( ' - ' ) followed by a decimal number shall  
84533 address the current line plus or minus the number. A <plus-sign> or <hyphen> character  
84534 not followed by a decimal number shall address the current line plus or minus 1.

84535 Addresses can be followed by zero or more address offsets, optionally <blank>-separated.  
84536 Address offsets are constructed as follows:

- 84537 • A <plus-sign> or <hyphen> character followed by a decimal number shall add or subtract,  
84538 respectively, the indicated number of lines to or from the address. A <plus-sign> or  
84539 <hyphen> character not followed by a decimal number shall add or subtract 1 to or from  
84540 the address.
- 84541 • A decimal number shall add the indicated number of lines to the address.

84542 It shall not be an error for an intermediate address value to be less than zero or greater than the  
84543 last line in the edit buffer. It shall be an error for the final address value to be less than zero or  
84544 greater than the last line in the edit buffer. It shall be an error if a search for a BRE fails to find a  
84545 matching line.

84546 Commands accept zero, one, or two addresses. If more than the required number of addresses  
84547 are provided to a command that requires zero addresses, it shall be an error. Otherwise, if more  
84548 than the required number of addresses are provided to a command, the addresses specified first  
84549 shall be evaluated and then discarded until the maximum number of valid addresses remain, for  
84550 the specified command.

84551 Addresses shall be separated from each other by a <comma> (','') or <semicolon> character  
84552 (';'). In the case of a <semicolon> separator, the current line ('.') shall be set to the first  
84553 address, and only then will the second address be calculated. This feature can be used to  
84554 determine the starting line for forwards and backwards searches; see rules 5. and 6.

84555 Addresses can be omitted on either side of the <comma> or <semicolon> separator, in which  
84556 case the resulting address pairs shall be as follows:

| Specified | Resulting   |
|-----------|-------------|
| ,         | 1 , \$      |
| , addr    | 1 , addr    |
| addr ,    | addr , addr |
| ;         | . ; \$      |
| ; addr    | . ; addr    |
| addr ;    | addr ; addr |

84564 Any <blank> characters included between addresses, address separators, or address offsets shall  
84565 be ignored.

#### 84566 Commands in ed

84567 In the following list of *ed* commands, the default addresses are shown in parentheses. The  
84568 number of addresses shown in the default shall be the number expected by the command. The  
84569 parentheses are not part of the address; they show that the given addresses are the default.

84570 It is generally invalid for more than one command to appear on a line. However, any command  
84571 (except **e**, **E**, **f**, **q**, **Q**, **r**, **w**, and **!**) can be suffixed by the letter **l**, **n**, or **p**; in which case, except for  
84572 the **l**, **n**, and **p** commands, the command shall be executed and then the new current line shall be  
84573 written as described below under the **l**, **n**, and **p** commands. When an **l**, **n**, or **p** suffix is used  
84574 with an **l**, **n**, or **p** command, the command shall write to standard output as described below, but  
84575 it is unspecified whether the suffix writes the current line again in the requested format or  
84576 whether the suffix has no effect. For example, the **pl** command (base **p** command with an **l**  
84577 suffix) shall either write just the current line or write it twice—once as specified for **p** and once  
84578 as specified for **l**. Also, the **g**, **G**, **v**, and **V** commands shall take a command as a parameter.

84579 Each address component can be preceded by zero or more <blank> characters. The command

- 84580 letter can be preceded by zero or more <blank> characters. If a suffix letter (**l**, **n**, or **p**) is given,  
84581 the application shall ensure that it immediately follows the command.
- 84582 The **e**, **E**, **f**, **r**, and **w** commands shall take an optional *file* parameter, separated from the  
84583 command letter by one or more <blank> characters.
- 84584 If changes have been made in the buffer since the last **w** command that wrote the entire buffer, *ed*  
84585 shall warn the user if an attempt is made to destroy the editor buffer via the **e** or **q** commands.  
84586 The *ed* utility shall write the string:
- 84587 " ? \n "
- 84588 (followed by an explanatory message if *help mode* has been enabled via the **H** command) to  
84589 standard output and shall continue in command mode with the current line number unchanged.  
84590 If the **e** or **q** command is repeated with no intervening command, it shall take effect.
- 84591 If a terminal disconnect (see XBD Chapter 11 (on page 199), Modem Disconnect and Closing a  
84592 Device Terminal), is detected:
- 84593 • If accompanied by a SIGHUP signal, the *ed* utility shall operate as described in the  
84594 ASYNCHRONOUS EVENTS section for a SIGHUP signal.
  - 84595 • If not accompanied by a SIGHUP signal, the *ed* utility shall act as if an end-of-file had been  
84596 detected on standard input.
- 84597 If an end-of-file is detected on standard input:
- 84598 • If the *ed* utility is in input mode, *ed* shall terminate input mode and return to command  
84599 mode. It is unspecified if any partially entered lines (that is, input text without a  
84600 terminating <newline>) are discarded from the input text.
  - 84601 • If the *ed* utility is in command mode, it shall act as if a **q** command had been entered.
- 84602 If the closing delimiter of an RE or of a replacement string (for example, ' / ' ) in a **g**, **G**, **s**, **v**, or **V**  
84603 command would be the last character before a <newline>, that delimiter can be omitted, in  
84604 which case the addressed line shall be written. For example, the following pairs of commands  
84605 are equivalent:
- 84606 *s/s1/s2*      *s/s1/s2/p*  
84607 *g/s1*          *g/s1/p*  
84608 *?s1*            *?s1?*
- 84609 If an invalid command is entered, *ed* shall write the string:
- 84610 " ? \n "
- 84611 (followed by an explanatory message if *help mode* has been enabled via the **H** command) to  
84612 standard output and shall continue in command mode with the current line number unchanged.
- 84613 **Append Command**
- 84614 *Synopsis:*      (.) *a*  
84615                    <*text*>  
84616                    .
- 84617 The **a** command shall read the given text and append it after the addressed line; the current line  
84618 number shall become the address of the last inserted line or, if there were none, the addressed  
84619 line. Address 0 shall be valid for this command; it shall cause the appended text to be placed at  
84620 the beginning of the buffer.

84621 **Change Command**

84622 *Synopsis:*     (.,.)c  
 84623                 <text>  
 84624                 .

84625         The **c** command shall delete the addressed lines, then accept input text that replaces these lines;  
 84626         the current line shall be set to the address of the last line input; or, if there were none, at the line  
 84627         after the last line deleted; if the lines deleted were originally at the end of the buffer, the current  
 84628         line number shall be set to the address of the new last line; if no lines remain in the buffer, the  
 84629         current line number shall be set to zero. Address 0 shall be valid for this command; it shall be  
 84630         interpreted as if address 1 were specified.

84631 **Delete Command**

84632 *Synopsis:*     (.,.)d

84633         The **d** command shall delete the addressed lines from the buffer. The address of the line after the  
 84634         last line deleted shall become the current line number; if the lines deleted were originally at the  
 84635         end of the buffer, the current line number shall be set to the address of the new last line; if no  
 84636         lines remain in the buffer, the current line number shall be set to zero.

84637 **Edit Command**

84638 *Synopsis:*     e [*file*]

84639         The **e** command shall delete the entire contents of the buffer and then read in the file named by  
 84640         the pathname *file*. The current line number shall be set to the address of the last line of the  
 84641         buffer. If no pathname is given, the currently remembered pathname, if any, shall be used (see  
 84642         the **f** command). The number of bytes read shall be written to standard output, unless the **-s**  
 84643         option was specified, in the following format:

84644         "%d\n", <number of bytes read>

84645         The name *file* shall be remembered for possible use as a default pathname in subsequent **e**, **E**, **r**,  
 84646         and **w** commands. If *file* is replaced by '!', the rest of the line shall be taken to be a shell  
 84647         command line whose output is to be read. Such a shell command line shall not be remembered  
 84648         as the current *file*. All marks shall be discarded upon the completion of a successful **e** command.  
 84649         If the buffer has changed since the last time the entire buffer was written, the user shall be  
 84650         warned, as described previously.

84651 **Edit Without Checking Command**

84652 *Synopsis:*     E [*file*]

84653         The **E** command shall possess all properties and restrictions of the **e** command except that the  
 84654         editor shall not check to see whether any changes have been made to the buffer since the last **w**  
 84655         command.

84656 **Filename Command**84657 *Synopsis:*    *f* [*file*]

84658 If *file* is given, the **f** command shall change the currently remembered pathname to *file*; whether  
 84659 the name is changed or not, it shall then write the (possibly new) currently remembered  
 84660 pathname to the standard output in the following format:

84661 "%s\n", &lt;pathname&gt;

84662 The current line number shall be unchanged.

84663 **Global Command**84664 *Synopsis:*    (1, \$) *g*/RE/*command list*

84665 In the **g** command, the first step shall be to mark every line for which the line excluding the  
 84666 terminating <newline> matches the given RE. Then, going sequentially from the beginning of  
 84667 the file to the end of the file, the given *command list* shall be executed for each marked line, with  
 84668 the current line number set to the address of that line. Any line modified by the *command list*  
 84669 shall be unmarked. When the **g** command completes, the current line number shall have the  
 84670 value assigned by the last command in the *command list*. If there were no matching lines, the  
 84671 current line number shall not be changed. A single command or the first of a list of commands  
 84672 shall appear on the same line as the global command. All lines of a multi-line list except the last  
 84673 line shall be ended with a <backslash> preceding the terminating <newline>; the **a**, **i**, and **c**  
 84674 commands and associated input are permitted. The '.' terminating input mode can be omitted  
 84675 if it would be the last line of the *command list*. An empty *command list* shall be equivalent to the **p**  
 84676 command. The use of the **g**, **G**, **v**, **V**, and **!** commands in the *command list* produces undefined  
 84677 results. Any character other than <space> or <newline> can be used instead of a <slash> to  
 84678 delimit the RE. Within the RE, the RE delimiter itself can be used as a literal character if it is  
 84679 preceded by a <backslash>.

84680 **Interactive Global Command**84681 *Synopsis:*    (1, \$) *G*/RE/

84682 In the **G** command, the first step shall be to mark every line for which the line excluding the  
 84683 terminating <newline> matches the given RE. Then, for every such line, that line shall be  
 84684 written, the current line number shall be set to the address of that line, and any one command  
 84685 (other than one of the **a**, **c**, **i**, **g**, **G**, **v**, and **V** commands) shall be read and executed. A <newline>  
 84686 shall act as a null command (causing no action to be taken on the current line); an '&' shall  
 84687 cause the re-execution of the most recent non-null command executed within the current  
 84688 invocation of **G**. Note that the commands input as part of the execution of the **G** command can  
 84689 address and affect any lines in the buffer. Any line modified by the command shall be  
 84690 unmarked. The final value of the current line number shall be the value set by the last command  
 84691 successfully executed. (Note that the last command successfully executed shall be the **G**  
 84692 command itself if a command fails or the null command is specified.) If there were no matching  
 84693 lines, the current line number shall not be changed. The **G** command can be terminated by a  
 84694 SIGINT signal. Any character other than <space> or <newline> can be used instead of a <slash>  
 84695 to delimit the RE and the replacement. Within the RE, the RE delimiter itself can be used as a  
 84696 literal character if it is preceded by a <backslash>.

84697 **Help Command**84698 *Synopsis:* h84699 The **h** command shall write a short message to standard output that explains the reason for the  
84700 most recent '?' notification. The current line number shall be unchanged.84701 **Help-Mode Command**84702 *Synopsis:* H84703 The **H** command shall cause *ed* to enter a mode in which help messages (see the **h** command)  
84704 shall be written to standard output for all subsequent '?' notifications. The **H** command  
84705 alternately shall turn this mode on and off; it is initially off. If the help-mode is being turned on,  
84706 the **H** command also explains the previous '?' notification, if there was one. The current line  
84707 number shall be unchanged.84708 **Insert Command**84709 *Synopsis:* (.) i  
84710 <text>  
84711 .84712 The **i** command shall insert the given text before the addressed line; the current line is set to the  
84713 last inserted line or, if there was none, to the addressed line. This command differs from the **a**  
84714 command only in the placement of the input text. Address 0 shall be valid for this command; it  
84715 shall be interpreted as if address 1 were specified.84716 **Join Command**84717 *Synopsis:* (.,.+1) j84718 The **j** command shall join contiguous lines by removing the appropriate <newline> characters. If  
84719 exactly one address is given, this command shall do nothing. If lines are joined, the current line  
84720 number shall be set to the address of the joined line; otherwise, the current line number shall be  
84721 unchanged.84722 **Mark Command**84723 *Synopsis:* (.) x x84724 The **k** command shall mark the addressed line with name *x*, which the application shall ensure  
84725 is a lowercase letter from the portable character set. The address "' x'" shall then refer to this  
84726 line; the current line number shall be unchanged.84727 **List Command**84728 *Synopsis:* (.,.) l84729 The **l** command shall write to standard output the addressed lines in a visually unambiguous  
84730 form. The characters listed in XBD Table 5-1 (on page 121) ('\ ', '\a', '\b', '\f', '\r',  
84731 '\t', '\v') shall be written as the corresponding escape sequence; the '\n' in that table is not  
84732 applicable. Non-printable characters not in the table shall be written as one three-digit octal  
84733 number (with a preceding <backslash> character) for each byte in the character (most significant  
84734 byte first).84735 Long lines shall be folded, with the point of folding indicated by <newline> preceded by a  
84736 <backslash>; the length at which folding occurs is unspecified, but should be appropriate for the

84737 output device. The end of each line shall be marked with a '\$', and '\$' characters within the  
 84738 text shall be written with a preceding <backslash>. An I command can be appended to any  
 84739 other command other than e, E, f, q, Q, r, w, or !. The current line number shall be set to the  
 84740 address of the last line written.

#### 84741 **Move Command**

84742 *Synopsis:* (.,.)*address*

84743 The m command shall reposition the addressed lines after the line addressed by *address*.  
 84744 Address 0 shall be valid for *address* and cause the addressed lines to be moved to the beginning  
 84745 of the buffer. It shall be an error if *address* falls within the range of moved lines. The  
 84746 current line number shall be set to the address of the last line moved.

#### 84747 **Number Command**

84748 *Synopsis:* (.,.)*n*

84749 The n command shall write to standard output the addressed lines, preceding each line by its  
 84750 line number and a <tab>; the current line number shall be set to the address of the last line  
 84751 written. The n command can be appended to any command other than e, E, f, q, Q, r, w, or !.

#### 84752 **Print Command**

84753 *Synopsis:* (.,.)*p*

84754 The p command shall write to standard output the addressed lines; the current line number shall  
 84755 be set to the address of the last line written. The p command can be appended to any command  
 84756 other than e, E, f, q, Q, r, w, or !.

#### 84757 **Prompt Command**

84758 *Synopsis:* P

84759 The P command shall cause *ed* to prompt with an <asterisk> ('\*') (or *string*, if -p is specified)  
 84760 for all subsequent commands. The P command alternatively shall turn this mode on and off; it  
 84761 shall be initially on if the -p option is specified; otherwise, off. The current line number shall be  
 84762 unchanged.

#### 84763 **Quit Command**

84764 *Synopsis:* q

84765 The q command shall cause *ed* to exit. If the buffer has changed since the last time the entire  
 84766 buffer was written, the user shall be warned, as described previously.

#### 84767 **Quit Without Checking Command**

84768 *Synopsis:* Q

84769 The Q command shall cause *ed* to exit without checking whether changes have been made in the  
 84770 buffer since the last w command.

84771 **Read Command**84772 *Synopsis:* (\$)r [*file*]

84773 The **r** command shall read in the file named by the pathname *file* and append it after the  
 84774 addressed line. If no *file* argument is given, the currently remembered pathname, if any, shall be  
 84775 used (see the **e** and **f** commands). The currently remembered pathname shall not be changed  
 84776 unless there is no remembered pathname. Address 0 shall be valid for **r** and shall cause the file  
 84777 to be read at the beginning of the buffer. If the read is successful, and **-s** was not specified, the  
 84778 number of bytes read shall be written to standard output in the following format:

84779 "%d\n", &lt;number of bytes read&gt;

84780 The current line number shall be set to the address of the last line read in. If *file* is replaced by  
 84781 '!', the rest of the line shall be taken to be a shell command line whose output is to be read.  
 84782 Such a shell command line shall not be remembered as the current pathname.

84783 **Substitute Command**84784 *Synopsis:* (.,.)s/RE/replacement/flags

84785 The **s** command shall search each addressed line for an occurrence of the specified RE and  
 84786 replace either the first or all (non-overlapped) matched strings with the *replacement*; see the  
 84787 following description of the **g** suffix. It is an error if the substitution fails on every addressed  
 84788 line. Any character other than <space> or <newline> can be used instead of a <slash> to delimit  
 84789 the RE and the replacement. Within the RE, the RE delimiter itself can be used as a literal  
 84790 character if it is preceded by a <backslash>. The current line shall be set to the address of the  
 84791 last line on which a substitution occurred.

84792 An <ampersand> ('&') appearing in the *replacement* shall be replaced by the string matching the  
 84793 RE on the current line. The special meaning of '&' in this context can be suppressed by  
 84794 preceding it by <backslash>. As a more general feature, the characters '\n', where *n* is a digit,  
 84795 shall be replaced by the text matched by the corresponding back-reference expression. If the  
 84796 corresponding back-reference expression does not match, then the characters '\n' shall be  
 84797 replaced by the empty string. When the character '%' is the only character in the *replacement*, the  
 84798 *replacement* used in the most recent substitute command shall be used as the *replacement* in the  
 84799 current substitute command; if there was no previous substitute command, the use of '%' in this  
 84800 manner shall be an error. The '%' shall lose its special meaning when it is in a replacement  
 84801 string of more than one character or is preceded by a <backslash>. For each <backslash>  
 84802 encountered in scanning *replacement* from beginning to end, the following character shall lose its  
 84803 special meaning (if any). It is unspecified what special meaning is given to any character other  
 84804 than <backslash>, '&', '%', or digits.

84805 A line can be split by substituting a <newline> into it. The application shall ensure it escapes the  
 84806 <newline> in the *replacement* by preceding it by <backslash>. Such substitution cannot be done  
 84807 as part of a **g** or **v** command list. The current line number shall be set to the address of the last  
 84808 line on which a substitution is performed. If no substitution is performed, the current line  
 84809 number shall be unchanged. If a line is split, a substitution shall be considered to have been  
 84810 performed on each of the new lines for the purpose of determining the new current line number.  
 84811 A substitution shall be considered to have been performed even if the replacement string is  
 84812 identical to the string that it replaces.

84813 The application shall ensure that the value of *flags* is zero or more of:84814 *count* Substitute for the *count*th occurrence only of the RE found on each addressed line.

- 84815 **g** Globally substitute for all non-overlapping instances of the RE rather than just the first  
84816 one. If both **g** and *count* are specified, the results are unspecified.
- 84817 **l** Write to standard output the final line in which a substitution was made. The line shall  
84818 be written in the format specified for the **l** command.
- 84819 **n** Write to standard output the final line in which a substitution was made. The line shall  
84820 be written in the format specified for the **n** command.
- 84821 **p** Write to standard output the final line in which a substitution was made. The line shall  
84822 be written in the format specified for the **p** command.

### 84823 Copy Command

84824 *Synopsis:* (*. , .*)*t**address*

84825 The **t** command shall be equivalent to the **m** command, except that a copy of the addressed lines  
84826 shall be placed after address *address* (which can be 0); the current line number shall be set to the  
84827 address of the last line added.

### 84828 Undo Command

84829 *Synopsis:* *u*

84830 The **u** command shall nullify the effect of the most recent command that modified anything in  
84831 the buffer, namely the most recent **a**, **c**, **d**, **g**, **i**, **j**, **m**, **r**, **s**, **t**, **u**, **v**, **G**, or **V** command. All changes  
84832 made to the buffer by a **g**, **G**, **v**, or **V** global command shall be undone as a single change; if no  
84833 changes were made by the global command (such as with **g**/RE/**p**), the **u** command shall have  
84834 no effect. The current line number shall be set to the value it had immediately before the  
84835 command being undone started.

### 84836 Global Non-Matched Command

84837 *Synopsis:* (*1, \$*)*v*/RE/*command list*

84838 This command shall be equivalent to the global command **g** except that the lines that are marked  
84839 during the first step shall be those for which the line excluding the terminating <newline> does  
84840 not match the RE.

### 84841 Interactive Global Not-Matched Command

84842 *Synopsis:* (*1, \$*)*V*/RE/

84843 This command shall be equivalent to the interactive global command **G** except that the lines that  
84844 are marked during the first step shall be those for which the line excluding the terminating  
84845 <newline> does not match the RE.

### 84846 Write Command

84847 *Synopsis:* (*1, \$*)*w* [*file*]

84848 The **w** command shall write the addressed lines into the file named by the pathname *file*. The  
84849 command shall create the file, if it does not exist, or shall replace the contents of the existing file.  
84850 The currently remembered pathname shall not be changed unless there is no remembered  
84851 pathname. If no pathname is given, the currently remembered pathname, if any, shall be used  
84852 (see the **e** and **f** commands); the current line number shall be unchanged. If the command is  
84853 successful, the number of bytes written shall be written to standard output, unless the **-s** option  
84854 was specified, in the following format:

84855 "%d\n", <number of bytes written>

84856 If *file* begins with '!', the rest of the line shall be taken to be a shell command line whose  
 84857 standard input shall be the addressed lines. Such a shell command line shall not be remembered  
 84858 as the current pathname. This usage of the write command with '!' shall not be considered as a  
 84859 "last **w** command that wrote the entire buffer", as described previously; thus, this alone shall  
 84860 not prevent the warning to the user if an attempt is made to destroy the editor buffer via the **e** or  
 84861 **q** commands.

#### 84862 **Line Number Command**

84863 *Synopsis:* (\$) =

84864 The line number of the addressed line shall be written to standard output in the following  
 84865 format:

84866 "%d\n", <line number>

84867 The current line number shall be unchanged by this command.

#### 84868 **Shell Escape Command**

84869 *Synopsis:* !*command*

84870 The remainder of the line after the '!' shall be sent to the command interpreter to be  
 84871 interpreted as a shell command line. Within the text of that shell command line, the unescaped  
 84872 character '%' shall be replaced with the remembered pathname; if a '!' appears as the first  
 84873 character of the command, it shall be replaced with the text of the previous shell command  
 84874 executed via '!'. Thus, "!!" shall repeat the previous !*command*. If any replacements of '%' or  
 84875 '!' are performed, the modified line shall be written to the standard output before *command* is  
 84876 executed. The ! command shall write:

84877 "! \n"

84878 to standard output upon completion, unless the **-s** option is specified. The current line number  
 84879 shall be unchanged.

#### 84880 **Null Command**

84881 *Synopsis:* (.+1)

84882 An address alone on a line shall cause the addressed line to be written. A <newline> alone shall  
 84883 be equivalent to "+1p". The current line number shall be set to the address of the written line.

#### 84884 **EXIT STATUS**

84885 The following exit values shall be returned:

84886 0 Successful completion without any file or command errors.

84887 >0 An error occurred.

#### 84888 **CONSEQUENCES OF ERRORS**

84889 When an error in the input script is encountered, or when an error is detected that is a  
 84890 consequence of the data (not) present in the file or due to an external condition such as a read or  
 84891 write error:

- 84892 • If the standard input is a terminal device file, all input shall be flushed, and a new  
 84893 command read.

- 84894 • If the standard input is a regular file, *ed* shall terminate with a non-zero exit status.

#### 84895 APPLICATION USAGE

84896 Because of the extremely terse nature of the default error messages, the prudent script writer  
84897 begins the *ed* input commands with an **H** command, so that if any errors do occur at least some  
84898 clue as to the cause is made available.

84899 In earlier versions of this standard, an obsolescent `-` option was described. This is no longer  
84900 specified. Applications should use the `-s` option. Using `-` as a *file* operand now produces  
84901 unspecified results. This allows implementations to continue to support the former required  
84902 behavior.

#### 84903 EXAMPLES

84904 None.

#### 84905 RATIONALE

84906 The initial description of this utility was adapted from the SVID. It contains some features not  
84907 found in Version 7 or BSD-derived systems. Some of the differences between the POSIX and  
84908 BSD *ed* utilities include, but need not be limited to:

- 84909 • The BSD `-` option does not suppress the `' ! '` prompt after a `!` command.
- 84910 • BSD does not support the special meanings of the `' % '` and `' ! '` characters within a `!`  
84911 command.
- 84912 • BSD does not support the *addresses* `' ; '` and `' . '`.
- 84913 • BSD allows the command/suffix pairs `pp`, `ll`, and so on, which are unspecified in this  
84914 volume of POSIX.1-2008.
- 84915 • BSD does not support the `' ! '` character part of the `e`, `r`, or `w` commands.
- 84916 • A failed `g` command in BSD sets the line number to the last line searched if there are no  
84917 matches.
- 84918 • BSD does not default the *command list* to the `p` command.
- 84919 • BSD does not support the `G`, `h`, `H`, `n`, or `V` commands.
- 84920 • On BSD, if there is no inserted text, the insert command changes the current line to the  
84921 referenced line `-1`; that is, the line before the specified line.
- 84922 • On BSD, the *join* command with only a single address changes the current line to that  
84923 address.
- 84924 • BSD does not support the `P` command; moreover, in BSD it is synonymous with the `p`  
84925 command.
- 84926 • BSD does not support the *undo* of the commands `j`, `m`, `r`, `s`, or `t`.
- 84927 • The Version 7 *ed* command `W`, and the BSD *ed* commands `W`, `wq`, and `z` are not present in  
84928 this volume of POSIX.1-2008.

84929 The `-s` option was added to allow the functionality of the removed `-` option in a manner  
84930 compatible with the Utility Syntax Guidelines.

84931 In early proposals there was a limit, `{ED_FILE_MAX}`, that described the historical limitations of  
84932 some *ed* utilities in their handling of large files; some of these have had problems with files  
84933 larger than 100 000 bytes. It was this limitation that prompted much of the desire to include a  
84934 *split* command in this volume of POSIX.1-2008. Since this limit was removed, this volume of  
84935 POSIX.1-2008 requires that implementations document the file size limits imposed by *ed* in the

- 84936 conformance document. The limit {ED\_LINE\_MAX} was also removed; therefore, the global  
84937 limit {LINE\_MAX} is used for input and output lines.
- 84938 The manner in which the **I** command writes non-printable characters was changed to avoid the  
84939 historical backspace-overstrike method. On video display terminals, the overstrike is ambiguous  
84940 because most terminals simply replace overstruck characters, making the **I** format not useful for  
84941 its intended purpose of unambiguously understanding the content of the line. The historical  
84942 <backslash>-escapes were also ambiguous. (The string "a\0011" could represent a line  
84943 containing those six characters or a line containing the three characters ' a ', a byte with a binary  
84944 value of 1, and a 1.) In the format required here, a <backslash> appearing in the line is written as  
84945 "\\\" so that the output is truly unambiguous. The method of marking the ends of lines was  
84946 adopted from the *ex* editor and is required for any line ending in <space> characters; the '\$' is  
84947 placed on all lines so that a real '\$' at the end of a line cannot be misinterpreted.
- 84948 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
84949 but this has been modified in this version.
- 84950 The description of how a NUL is written was removed. The NUL character cannot be in text  
84951 files, and this volume of POSIX.1-2008 should not dictate behavior in the case of undefined,  
84952 erroneous input.
- 84953 Unlike some of the other editing utilities, the filenames accepted by the **E**, **e**, **R**, and **r** commands  
84954 are not patterns.
- 84955 Early proposals stated that the **-p** option worked only when standard input was associated with  
84956 a terminal device. This has been changed to conform to historical implementations, thereby  
84957 allowing applications to interpose themselves between a user and the *ed* utility.
- 84958 The form of the substitute command that uses the **n** suffix was limited in some historical  
84959 documentation (where this was described incorrectly as "backreferencing"). This limit has been  
84960 omitted because there is no reason why an editor processing lines of {LINE\_MAX} length should  
84961 have this restriction. The command **s/x/X/2047** should be able to substitute the 2 047th occurrence  
84962 of ' x ' on a line.
- 84963 The use of printing commands with printing suffixes (such as **pn**, **lp**, and so on) was made  
84964 unspecified because BSD-based systems allow this, whereas System V does not.
- 84965 Some BSD-based systems exit immediately upon receipt of end-of-file if all of the lines in the file  
84966 have been deleted. Since this volume of POSIX.1-2008 refers to the **q** command in this instance,  
84967 such behavior is not allowed.
- 84968 Some historical implementations returned exit status zero even if command errors had occurred;  
84969 this is not allowed by this volume of POSIX.1-2008.
- 84970 Some historical implementations contained a bug that allowed a single <period> to be entered in  
84971 input mode as <backslash> <period> <newline>. This is not allowed by *ed* because there is no  
84972 description of escaping any of the characters in input mode; <backslash> characters are entered  
84973 into the buffer exactly as typed. The typical method of entering a single <period> has been to  
84974 precede it with another character and then use the substitute command to delete that character.
- 84975 It is difficult under some modes of some versions of historical operating system terminal drivers  
84976 to distinguish between an end-of-file condition and terminal disconnect. POSIX.1-2008 does not  
84977 require implementations to distinguish between the two situations, which permits historical  
84978 implementations of the *ed* utility on historical platforms to conform. Implementations are  
84979 encouraged to distinguish between the two, if possible, and take appropriate action on terminal  
84980 disconnect.
- 84981 Historically, *ed* accepted a zero address for the **a** and **r** commands in order to insert text at the

84982 start of the edit buffer. When the buffer was empty the command `.=` returned zero. POSIX.1-2008  
 84983 requires conformance to historical practice.

84984 For consistency with the `a` and `r` commands and better user functionality, the `i` and `c` commands  
 84985 must also accept an address of 0, in which case `0i` is treated as `1i` and likewise for the `c`  
 84986 command.

84987 All of the following are valid addresses:

- 84988 `+++` Three lines after the current line.
- 84989 `/pattern/-` One line before the next occurrence of pattern.
- 84990 `-2` Two lines before the current line.
- 84991 `3 ---- 2` Line one (note the intermediate negative address).
- 84992 `1 2 3` Line six.

84993 Any number of addresses can be provided to commands taking addresses; for example,  
 84994 `"1, 2, 3, 4, 5p"` prints lines 4 and 5, because two is the greatest valid number of addresses  
 84995 accepted by the `print` command. This, in combination with the `<semicolon>` delimiter, permits  
 84996 users to create commands based on ordered patterns in the file. For example, the command  
 84997 `"3; /foo/; +2p"` will display the first line after line 3 that contains the pattern `foo`, plus the next  
 84998 two lines. Note that the address `"3;"` must still be evaluated before being discarded, because  
 84999 the search origin for the `"/foo/"` command depends on this.

85000 Historically, `ed` disallowed address chains, as discussed above, consisting solely of `<comma>` or  
 85001 `<semicolon>` separators; for example, `","` or `";;"` were considered an error. For  
 85002 consistency of address specification, this restriction is removed. The following table lists some of  
 85003 the address forms now possible:

| Address  | Addr1 | Addr2 | Status     | Comment               |
|----------|-------|-------|------------|-----------------------|
| 7,       | 7     | 7     | Historical |                       |
| 7, 5,    | 5     | 5     | Historical |                       |
| 7, 5, 9  | 5     | 9     | Historical |                       |
| 7, 9     | 7     | 9     | Historical |                       |
| 7, +     | 7     | 8     | Historical |                       |
| ,        | 1     | \$    | Historical |                       |
| , 7      | 1     | 7     | Extension  |                       |
| , \$     | \$    | \$    | Extension  |                       |
| , ;      | \$    | \$    | Extension  |                       |
| 7;       | 7     | 7     | Historical |                       |
| 7; 5;    | 5     | 5     | Historical |                       |
| 7; 5; 9  | 5     | 9     | Historical |                       |
| 7; 5, 9  | 5     | 9     | Historical |                       |
| 7; \$; 4 | \$    | 4     | Historical | Valid, but erroneous. |
| 7; 9     | 7     | 9     | Historical |                       |
| 7; +     | 7     | 8     | Historical |                       |
| ;        | .     | \$    | Historical |                       |
| ; 7      | .     | 7     | Extension  |                       |
| ; ;      | \$    | \$    | Extension  |                       |
| ; ,      | \$    | \$    | Extension  |                       |

85025 Historically, `ed` accepted the `'^'` character as an address, in which case it was identical to the  
 85026 `<hyphen>` character. POSIX.1-2008 does not require or prohibit this behavior.

85027 **FUTURE DIRECTIONS**

85028 None.

85029 **SEE ALSO**85030 [Section 1.4](#) (on page 2288), *ex*, *sed*, *sh*, *vi*85031 XBD [Table 5-1](#) (on page 121), [Chapter 8](#) (on page 173), [Section 9.3](#) (on page 183), [Chapter 11](#) (on page 199), [Section 12.2](#) (on page 215)85033 **CHANGE HISTORY**

85034 First released in Issue 2.

85035 **Issue 5**85036 In the OPTIONS section, the meaning of `-s` and `-` is clarified.

85037 A second FUTURE DIRECTION is added.

85038 **Issue 6**

85039 The obsolescent single-minus form is removed.

85040 A second APPLICATION USAGE note is added.

85041 The Open Group Corrigendum U025/2 is applied, correcting the description of the Edit section.

85042 The *ed* utility is updated to align with the IEEE P1003.2b draft standard. This includes addition of the treatment of the SIGQUIT signal, changes to *ed* addressing, and changes to processing when end-of-file is detected and when terminal disconnect is detected.

85045 The normative text is reworded to avoid use of the term “must” for application requirements.

85046 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/22 is applied, adding the text: “Any line modified by the *command list* shall be unmarked.” to the **G** command. This change corresponds to a similar change made to the **g** command in the first version of this standard.

85049 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/7 is applied, removing text describing behavior on systems with bytes consisting of more than eight bits.

85051 **Issue 7**85052 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if an operand is `' - ' .`

85054 Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.

85055 SD5-XCU-ERN-94 is applied, updating text in the EXTENDED DESCRIPTION where a terminal disconnect is detected (in Commands in *ed*).

85057 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

85058 SD5-XCU-ERN-135 is applied, removing some RATIONALE text that is no longer applicable.

85059 **NAME**

85060 env — set the environment for command invocation

85061 **SYNOPSIS**85062 env [-i] [*name=value*...]... [*utility* [*argument...*]]85063 **DESCRIPTION**85064 The *env* utility shall obtain the current environment, modify it according to its arguments, then  
85065 invoke the utility named by the *utility* operand with the modified environment.85066 Optional arguments shall be passed to *utility*.85067 If no *utility* operand is specified, the resulting environment shall be written to the standard  
85068 output, with one *name=value* pair per line.

85069 If the first argument is '-', the results are unspecified.

85070 **OPTIONS**85071 The *env* utility shall conform to XBD Section 12.2 (on page 215), except for the unspecified usage  
85072 of '-'.  
85073 The following options shall be supported:

85074 -i

85075 Invoke *utility* with exactly the environment specified by the arguments; the  
inherited environment shall be ignored completely.85076 **OPERANDS**

85077 The following operands shall be supported:

85078 *name=value* Arguments of the form *name=value* shall modify the execution environment, and  
85079 shall be placed into the inherited environment before the *utility* is invoked.85080 *utility* The name of the utility to be invoked. If the *utility* operand names any of the  
85081 special built-in utilities in Section 2.14 (on page 2334), the results are undefined.85082 *argument* A string to pass as an argument for the invoked utility.85083 **STDIN**

85084 Not used.

85085 **INPUT FILES**

85086 None.

85087 **ENVIRONMENT VARIABLES**85088 The following environment variables shall affect the execution of *env*:85089 *LANG* Provide a default value for the internationalization variables that are unset or null.  
85090 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
85091 variables used to determine the values of locale categories.)85092 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
85093 internationalization variables.85094 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
85095 characters (for example, single-byte as opposed to multi-byte characters in  
85096 arguments).85097 *LC\_MESSAGES*85098 Determine the locale that should be used to affect the format and contents of  
85099 diagnostic messages written to standard error.

|       |     |                               |                                                                                                                                                     |
|-------|-----|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 85100 | XSI | <b>NLSPATH</b>                | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                               |
| 85101 |     | <b>PATH</b>                   | Determine the location of the <i>utility</i> , as described in XBD Chapter 8 (on page 173).                                                         |
| 85102 |     |                               | If <i>PATH</i> is specified as a <i>name=value</i> operand to <i>env</i> , the <i>value</i> given shall be used in                                  |
| 85103 |     |                               | the search for <i>utility</i> .                                                                                                                     |
| 85104 |     | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                                                                     |
| 85105 |     |                               | Default.                                                                                                                                            |
| 85106 |     | <b>STDOUT</b>                 |                                                                                                                                                     |
| 85107 |     |                               | If no <i>utility</i> operand is specified, each <i>name=value</i> pair in the resulting environment shall be                                        |
| 85108 |     |                               | written in the form:                                                                                                                                |
| 85109 |     |                               | "%s=%s\n", <name>, <value>                                                                                                                          |
| 85110 |     |                               | If the <i>utility</i> operand is specified, the <i>env</i> utility shall not write to standard output.                                              |
| 85111 |     | <b>STDERR</b>                 |                                                                                                                                                     |
| 85112 |     |                               | The standard error shall be used only for diagnostic messages.                                                                                      |
| 85113 |     | <b>OUTPUT FILES</b>           |                                                                                                                                                     |
| 85114 |     |                               | None.                                                                                                                                               |
| 85115 |     | <b>EXTENDED DESCRIPTION</b>   |                                                                                                                                                     |
| 85116 |     |                               | None.                                                                                                                                               |
| 85117 |     | <b>EXIT STATUS</b>            |                                                                                                                                                     |
| 85118 |     |                               | If <i>utility</i> is invoked, the exit status of <i>env</i> shall be the exit status of <i>utility</i> ; otherwise, the <i>env</i>                  |
| 85119 |     |                               | utility shall exit with one of the following values:                                                                                                |
| 85120 |     | 0                             | The <i>env</i> utility completed successfully.                                                                                                      |
| 85121 |     | 1–125                         | An error occurred in the <i>env</i> utility.                                                                                                        |

| 85123 |     | 127                           | The utility specified by <i>utility</i> could not be found.                                                                                         |
| 85124 |     | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                     |
| 85125 |     |                               | Default.                                                                                                                                            |
| 85126 |     | <b>APPLICATION USAGE</b>      |                                                                                                                                                     |
| 85127 |     |                               | The <i>command</i> , <i>env</i> , <i>nice</i> , <i>nohup</i> , <i>time</i> , and <i>xargs</i> utilities have been specified to use exit code 127 if |
| 85128 |     |                               | an error occurs so that applications can distinguish “failure to find a utility” from “invoked                                                      |
| 85129 |     |                               | utility exited with an error indication”. The value 127 was chosen because it is not commonly                                                       |
| 85130 |     |                               | used for other meanings; most utilities use small values for “normal error conditions” and the                                                      |
| 85131 |     |                               | values above 128 can be confused with termination due to receipt of a signal. The value 126 was                                                     |
| 85132 |     |                               | chosen in a similar manner to indicate that the utility could be found, but not invoked. Some                                                       |
| 85133 |     |                               | scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction                                                    |
| 85134 |     |                               | between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to                                                    |
| 85135 |     |                               | <i>exec</i> the utility fail with [ENOENT], and uses 126 when any attempt to <i>exec</i> the utility fails for                                      |
| 85136 |     |                               | any other reason.                                                                                                                                   |
| 85137 |     |                               | Historical implementations of the <i>env</i> utility use the <i>execop()</i> or <i>execlp()</i> functions defined in the                            |
| 85138 |     |                               | System Interfaces volume of POSIX.1-2008 to invoke the specified utility; this provides better                                                      |
| 85139 |     |                               | performance and keeps users from having to escape characters with special meaning to the shell.                                                     |
| 85140 |     |                               | Therefore, shell functions, special built-ins, and built-ins that are only provided by the shell are                                                |
| 85141 |     |                               | not found.                                                                                                                                          |

85142 **EXAMPLES**

85143 The following command:

85144 `env -i PATH=/mybin:"$PATH" $(getconf V7_ENV) mygrep xyz myfile`85145 invokes the command *mygrep* with a new *PATH* value as the only entry in its environment other  
85146 than any variables required by the implementation for conformance. In this case, *PATH* is used  
85147 to locate *mygrep*, which is expected to reside in */mybin*.85148 **RATIONALE**85149 As with all other utilities that invoke other utilities, this volume of POSIX.1-2008 only specifies  
85150 what *env* does with standard input, standard output, standard error, input files, and output files.  
85151 If a utility is executed, it is not constrained by the specification of input and output by *env*.85152 The *-i* option was added to allow the functionality of the removed *-* option in a manner  
85153 compatible with the Utility Syntax Guidelines. It is possible to create a non-conforming  
85154 environment using the *-i* option, as it may remove environment variables required by the  
85155 implementation for conformance. The following will preserve these environment variables as  
85156 well as preserve the *PATH* for conforming utilities:

```

85157 IFS='
85158 '
85159 # The preceding value should be <space><tab><newline>.
85160 # Set IFS to its default value.

85161 set -f
85162 # disable pathname expansion

85163 \unalias -a
85164 # Unset all possible aliases.
85165 # Note that unalias is escaped to prevent an alias
85166 # being used for unalias.
85167 # This step is not strictly necessary, since aliases are not inherited,
85168 # and the ENV environment variable is only used by interactive shells,
85169 # the only way any aliases can exist in a script is if it defines them
85170 # itself.

85171 unset -f env getconf
85172 # Ensure env and getconf are not user functions.

85173 env -i $(getconf V7_ENV) PATH="$(getconf PATH)" command

```

85174 Some have suggested that *env* is redundant since the same effect is achieved by:85175 `name=value ... utility [ argument ... ]`85176 The example is equivalent to *env* when an environment variable is being added to the  
85177 environment of the command, but not when the environment is being set to the given value.  
85178 The *env* utility also writes out the current environment if invoked without arguments. There is  
85179 sufficient functionality beyond what the example provides to justify inclusion of *env*.85180 **FUTURE DIRECTIONS**

85181 None.

85182 **SEE ALSO**85183 [Section 2.14](#) (on page 2334), [Section 2.5](#) (on page 2301)85184 [XBD Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

85185 **CHANGE HISTORY**

85186 First released in Issue 2.

85187 **Issue 7**85188 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
85189 argument is ' - ' .85190 Austin Group Interpretation 1003.1-2001 #047 is applied, providing RATIONALE on how to use  
85191 the *env* utility to preserve a conforming environment.

85192 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

85193 The EXAMPLES section is revised to change the use of *env* -i.

## 85194 NAME

85195 ex — text editor

## 85196 SYNOPSIS

85197 UP `ex [-rR] [-s|-v] [-c command] [-t tagstring] [-w size] [file...]`

## 85198 DESCRIPTION

85199 The *ex* utility is a line-oriented text editor. There are two other modes of the editor—open and  
 85200 visual—in which screen-oriented editing is available. This is described more fully by the *ex* **open**  
 85201 and **visual** commands and in *vi*.

85202 If an operand is *'-'*, the results are unspecified.

85203 This section uses the term *edit buffer* to describe the current working text. No specific  
 85204 implementation is implied by this term. All editing changes are performed on the edit buffer,  
 85205 and no changes to it shall affect any file until an editor command writes the file.

85206 Certain terminals do not have all the capabilities necessary to support the complete *ex* definition,  
 85207 such as the full-screen editing commands (*visual mode* or *open mode*). When these commands  
 85208 cannot be supported on such terminals, this condition shall not produce an error message such  
 85209 as “not an editor command” or report a syntax error. The implementation may either accept the  
 85210 commands and produce results on the screen that are the result of an unsuccessful attempt to  
 85211 meet the requirements of this volume of POSIX.1-2008 or report an error describing the terminal-  
 85212 related deficiency.

## 85213 OPTIONS

85214 The *ex* utility shall conform to XBD Section 12.2 (on page 215), except for the unspecified usage  
 85215 of *'-'*, and that *'+'* may be recognized as an option delimiter as well as *'-'*.

85216 The following options shall be supported:

85217 **-c *command*** Specify an initial command to be executed in the first edit buffer loaded from an  
 85218 existing file (see the EXTENDED DESCRIPTION section). Implementations may  
 85219 support more than a single **-c** option. In such implementations, the specified  
 85220 commands shall be executed in the order specified on the command line.

85221 **-r** Recover the named files (see the EXTENDED DESCRIPTION section). Recovery  
 85222 information for a file shall be saved during an editor or system crash (for example,  
 85223 when the editor is terminated by a signal which the editor can catch), or after the  
 85224 use of an *ex* **preserve** command.

85225 A *crash* in this context is an unexpected failure of the system or utility that requires  
 85226 restarting the failed system or utility. A system crash implies that any utilities  
 85227 running at the time also crash. In the case of an editor or system crash, the number  
 85228 of changes to the edit buffer (since the most recent **preserve** command) that will be  
 85229 recovered is unspecified.

85230 If no *file* operands are given and the **-t** option is not specified, all other options, the  
 85231 *EXINIT* variable, and any *.exrc* files shall be ignored; a list of all recoverable files  
 85232 available to the invoking user shall be written, and the editor shall exit normally  
 85233 without further action.

85234 **-R** Set **readonly** edit option.

85235 **-s** Prepare *ex* for batch use by taking the following actions:

- 85236 • Suppress writing prompts and informational (but not diagnostic) messages.
- 85237 • Ignore the value of *TERM* and any implementation default terminal type and
- 85238 assume the terminal is a type incapable of supporting open or visual modes;
- 85239 see the **visual** command and the description of *vi*.
- 85240 • Suppress the use of the *EXINIT* environment variable and the reading of any
- 85241 **.exrc** file; see the EXTENDED DESCRIPTION section.
- 85242 • Suppress autoindentation, ignoring the value of the **autoindent** edit option.
- 85243 **-t tagstring** Edit the file containing the specified *tagstring*; see *ctags*. The **tags** feature
- 85244 represented by **-t tagstring** and the **tag** command is optional. It shall be provided
- 85245 on any system that also provides a conforming implementation of *ctags*; otherwise,
- 85246 the use of **-t** produces undefined results. On any system, it shall be an error to
- 85247 specify more than a single **-t** option.
- 85248 **-v** Begin in visual mode (see *vi*).
- 85249 **-w size** Set the value of the *window* editor option to *size*.

**OPERANDS**

85250 The following operand shall be supported:

85251 *file* A pathname of a file to be edited.

**STDIN**

85252 The standard input consists of a series of commands and input text, as described in the

85253 EXTENDED DESCRIPTION section. The implementation may limit each line of standard input

85254 to a length of {LINE\_MAX}.

85255 If the standard input is not a terminal device, it shall be as if the **-s** option had been specified.

85256 If a read from the standard input returns an error, or if the editor detects an end-of-file condition

85257 from the standard input, it shall be equivalent to a SIGHUP asynchronous event.

**INPUT FILES**

85260 Input files shall be text files or files that would be text files except for an incomplete last line that

85261 is not longer than {LINE\_MAX}-1 bytes in length and contains no NUL characters. By default,

85262 any incomplete last line shall be treated as if it had a trailing <newline>. The editing of other

85263 forms of files may optionally be allowed by *ex* implementations.

85264 The **.exrc** files and source files shall be text files consisting of *ex* commands; see the EXTENDED

85265 DESCRIPTION section.

85266 By default, the editor shall read lines from the files to be edited without interpreting any of those

85267 lines as any form of editor command.

**ENVIRONMENT VARIABLES**

85270 The following environment variables shall affect the execution of *ex*:

85271 **COLUMNS** Override the system-selected horizontal screen size. See XBD Chapter 8 (on page

85272 173) for valid values and results when it is unset or null.

85273 **EXINIT** Determine a list of *ex* commands that are executed on editor start-up. See the

85274 EXTENDED DESCRIPTION section for more details of the initialization phase.

85275 **HOME** Determine a pathname of a directory that shall be searched for an editor start-up

85276 file named **.exrc**; see the EXTENDED DESCRIPTION section.

|       |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 85277 | <i>LANG</i>                | Provide a default value for the internationalization variables that are unset or null. (See XBD <a href="#">Section 8.2</a> (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)                                                                                                                                                |
| 85278 |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85279 |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85280 | <i>LC_ALL</i>              | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                          |
| 85281 |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |

| 85301 |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85302 | <i>TERM</i>                | Determine the name of the terminal type. If this variable is unset or null, an unspecified default terminal type shall be used.                                                                                                                                                                                                                                                                   |
| 85303 |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85304 | <b>ASYNCHRONOUS EVENTS</b> |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85305 |                            | The following term is used in this and following sections to specify command and asynchronous event actions:                                                                                                                                                                                                                                                                                      |
| 85306 |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85307 | <i>complete write</i>      |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85308 |                            | A complete write is a write of the entire contents of the edit buffer to a file of a type other than a terminal device, or the saving of the edit buffer caused by the user executing the <i>ex</i> <b>preserve</b> command. Writing the contents of the edit buffer to a temporary file that will be removed when the editor exits shall not be considered a complete write.                     |
| 85309 |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85310 |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85311 |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85312 |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85313 |                            | The following actions shall be taken upon receipt of signals:                                                                                                                                                                                                                                                                                                                                     |
| 85314 | <i>SIGINT</i>              | If the standard input is not a terminal device, <i>ex</i> shall not write the file or return to command or text input mode, and shall exit with a non-zero exit status.                                                                                                                                                                                                                           |
| 85315 |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85316 |                            | Otherwise, if executing an open or visual text input mode command, <i>ex</i> in receipt of <i>SIGINT</i> shall behave identically to its receipt of the <ESC> character.                                                                                                                                                                                                                          |
| 85317 |                            |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 85318 |                            | Otherwise:                                                                                                                                                                                                                                                                                                                                                                                        |

- 85319 1. If executing an *ex* text input mode command, all input lines that have been  
85320 completely entered shall be resolved into the edit buffer, and any partially  
85321 entered line shall be discarded.
- 85322 2. If there is a currently executing command, it shall be aborted and a message  
85323 displayed. Unless otherwise specified by the *ex* or *vi* command descriptions,  
85324 it is unspecified whether any lines modified by the executing command  
85325 appear modified, or as they were before being modified by the executing  
85326 command, in the buffer.
- 85327 If the currently executing command was a motion command, its associated  
85328 command shall be discarded.
- 85329 3. If in open or visual command mode, the terminal shall be alerted.
- 85330 4. The editor shall then return to command mode.
- 85331 **SIGCONT** The screen shall be refreshed if in open or visual mode.
- 85332 **SIGHUP** If the edit buffer has been modified since the last complete write, *ex* shall attempt  
85333 to save the edit buffer so that it can be recovered later using the **-r** option or the *ex*  
85334 **recover** command. The editor shall not write the file or return to command or text  
85335 input mode, and shall terminate with a non-zero exit status.
- 85336 **SIGTERM** Refer to **SIGHUP**.
- 85337 The action taken for all other signals is unspecified.
- 85338 **STDOUT**
- 85339 The standard output shall be used only for writing prompts to the user, for informational  
85340 messages, and for writing lines from the file.
- 85341 **STDERR**
- 85342 The standard error shall be used only for diagnostic messages.
- 85343 **OUTPUT FILES**
- 85344 The output from *ex* shall be text files.
- 85345 **EXTENDED DESCRIPTION**
- 85346 Only the *ex* mode of the editor is described in this section. See *vi* for additional editing  
85347 capabilities available in *ex*.
- 85348 When an error occurs, *ex* shall write a message. If the terminal supports a standout mode (such  
85349 as inverse video), the message shall be written in standout mode. If the terminal does not  
85350 support a standout mode, and the edit option **errorbells** is set, an alert action shall precede the  
85351 error message.
- 85352 By default, *ex* shall start in command mode, which shall be indicated by a **:** prompt; see the  
85353 **prompt** command. Text input mode can be entered by the **append**, **insert**, or **change** commands;  
85354 it can be exited (and command mode re-entered) by typing a <period> (**'.'**) alone at the  
85355 beginning of a line.

85356 **Initialization in ex and vi**

85357 The following symbols are used in this and following sections to specify locations in the edit  
85358 buffer:

85359 *alternate and current pathnames*

85360 Two pathnames, named *current* and *alternate*, are maintained by the editor. Any *ex*  
85361 commands that take filenames as arguments shall set them as follows:

- 85362 1. If a *file* argument is specified to the *ex* **edit**, **ex**, or **recover** commands, or if an *ex* **tag**  
85363 command replaces the contents of the edit buffer.
  - 85364 a. If the command replaces the contents of the edit buffer, the *current* pathname  
85365 shall be set to the *file* argument or the file indicated by the tag, and the  
85366 alternate pathname shall be set to the previous value of the *current* pathname.
  - 85367 b. Otherwise, the alternate pathname shall be set to the *file* argument.
- 85368 2. If a *file* argument is specified to the *ex* **next** command:
  - 85369 a. If the command replaces the contents of the edit buffer, the *current* pathname  
85370 shall be set to the first *file* argument, and the alternate pathname shall be set to  
85371 the previous value of the *current* pathname.
- 85372 3. If a *file* argument is specified to the *ex* **file** command, the *current* pathname shall be  
85373 set to the *file* argument, and the alternate pathname shall be set to the previous value  
85374 of the *current* pathname.
- 85375 4. If a *file* argument is specified to the *ex* **read** and **write** commands (that is, when  
85376 reading or writing a file, and not to the program named by the **shell** edit option), or a  
85377 *file* argument is specified to the *ex* **xit** command:
  - 85378 a. If the *current* pathname has no value, the *current* pathname shall be set to the  
85379 *file* argument.
  - 85380 b. Otherwise, the alternate pathname shall be set to the *file* argument.

85381 If the alternate pathname is set to the previous value of the *current* pathname when the  
85382 *current* pathname had no previous value, then the alternate pathname shall have no value  
85383 as a result.

85384 *current line*

85385 The line of the edit buffer referenced by the cursor. Each command description specifies the  
85386 *current line* after the command has been executed, as the *current line value*. When the edit  
85387 buffer contains no lines, the *current line* shall be zero; see [Addressing in ex](#) (on page 2644).

85388 *current column*

85389 The current display line column occupied by the cursor. (The columns shall be numbered  
85390 beginning at 1.) Each command description specifies the *current column* after the command  
85391 has been executed, as the *current column value*. This column is an *ideal* column that is  
85392 remembered over the lifetime of the editor. The actual display line column upon which the  
85393 cursor rests may be different from the *current column*; see the cursor positioning discussion  
85394 in [Command Descriptions in vi](#) (on page 3310).

85395 *set to non-<blank>*

85396 A description for a *current column* value, meaning that the *current column* shall be set to  
85397 the last display line column on which is displayed any part of the first non-<blank> of the  
85398 line. If the line has no non-<blank> non-<newline> characters, the *current column* shall be  
85399 set to the last display line column on which is displayed any part of the last non-<newline>

- 85400 character in the line. If the line is empty, the current column shall be set to column position  
85401 1.
- 85402 The length of lines in the edit buffer may be limited to {LINE\_MAX} bytes. In open and visual  
85403 mode, the length of lines in the edit buffer may be limited to the number of characters that will  
85404 fit in the display. If either limit is exceeded during editing, an error message shall be written. If  
85405 either limit is exceeded by a line read in from a file, an error message shall be written and the  
85406 edit session may be terminated.
- 85407 If the editor stops running due to any reason other than a user command, and the edit buffer has  
85408 been modified since the last complete write, it shall be equivalent to a SIGHUP asynchronous  
85409 event. If the system crashes, it shall be equivalent to a SIGHUP asynchronous event.
- 85410 During initialization (before the first file is copied into the edit buffer or any user commands  
85411 from the terminal are processed) the following shall occur:
- 85412 1. If the environment variable *EXINIT* is set, the editor shall execute the *ex* commands  
85413 contained in that variable.
  - 85414 2. If the *EXINIT* variable is not set, and all of the following are true:
    - 85415 a. The *HOME* environment variable is not null and not empty.
    - 85416 b. The file *.exrc* in the directory referred to by the *HOME* environment variable:
      - 85417 i. Exists
      - 85418 ii. Is owned by the same user ID as the real user ID of the process or the  
85419 process has appropriate privileges
      - 85420 iii. Is not writable by anyone other than the owner

85421 the editor shall execute the *ex* commands contained in that file.
  - 85422 3. If and only if all of the following are true:
    - 85423 a. The current directory is not referred to by the *HOME* environment variable.
    - 85424 b. A command in the *EXINIT* environment variable or a command in the *.exrc* file in  
85425 the directory referred to by the *HOME* environment variable sets the editor option  
85426 **exrc**.
    - 85427 c. The *.exrc* file in the current directory:
      - 85428 i. Exists
      - 85429 ii. Is owned by the same user ID as the real user ID of the process, or by one of  
85430 a set of implementation-defined user IDs
      - 85431 iii. Is not writable by anyone other than the owner

85432 the editor shall attempt to execute the *ex* commands contained in that file.
- 85433 Lines in any *.exrc* file that are blank lines shall be ignored. If any *.exrc* file exists, but is not read  
85434 for ownership or permission reasons, it shall be an error.
- 85435 After the *EXINIT* variable and any *.exrc* files are processed, the first file specified by the user  
85436 shall be edited, as follows:
- 85437 1. If the user specified the *-t* option, the effect shall be as if the *ex tag* command was entered  
85438 with the specified argument, with the exception that if tag processing does not result in a  
85439 file to edit, the effect shall be as described in step 3. below.

- 85440 2. Otherwise, if the user specified any command line *file* arguments, the effect shall be as if  
85441 the *ex edit* command was entered with the first of those arguments as its *file* argument.
- 85442 3. Otherwise, the effect shall be as if the *ex edit* command was entered with a nonexistent  
85443 filename as its *file* argument. It is unspecified whether this action shall set the current  
85444 pathname. In an implementation where this action does not set the current pathname, any  
85445 editor command using the current pathname shall fail until an editor command sets the  
85446 current pathname.

85447 If the *-r* option was specified, the first time a file in the initial argument list or a file specified by  
85448 the *-t* option is edited, if recovery information has previously been saved about it, that  
85449 information shall be recovered and the editor shall behave as if the contents of the edit buffer  
85450 have already been modified. If there are multiple instances of the file to be recovered, the one  
85451 most recently saved shall be recovered, and an informational message that there are previous  
85452 versions of the file that can be recovered shall be written. If no recovery information about a file  
85453 is available, an informational message to this effect shall be written, and the edit shall proceed as  
85454 usual.

85455 If the *-c* option was specified, the first time a file that already exists (including a file that might  
85456 not exist but for which recovery information is available, when the *-r* option is specified)  
85457 replaces or initializes the contents of the edit buffer, the current line shall be set to the last line of  
85458 the edit buffer, the current column shall be set to non-*<blank>*, and the *ex* commands specified  
85459 with the *-c* option shall be executed. In this case, the current line and current column shall not  
85460 be set as described for the command associated with the replacement or initialization of the edit  
85461 buffer contents. However, if the *-t* option or a *tag* command is associated with this action, the *-c*  
85462 option commands shall be executed and then the movement to the tag shall be performed.

85463 The current argument list shall initially be set to the filenames specified by the user on the  
85464 command line. If no filenames are specified by the user, the current argument list shall be empty.  
85465 If the *-t* option was specified, it is unspecified whether any filename resulting from tag  
85466 processing shall be prepended to the current argument list. In the case where the filename is  
85467 added as a prefix to the current argument list, the current argument list reference shall be set to  
85468 that filename. In the case where the filename is not added as a prefix to the current argument  
85469 list, the current argument list reference shall logically be located before the first of the filenames  
85470 specified on the command line (for example, a subsequent *ex next* command shall edit the first  
85471 filename from the command line). If the *-t* option was not specified, the current argument list  
85472 reference shall be to the first of the filenames on the command line.

### 85473 Addressing in *ex*

85474 Addressing in *ex* relates to the current line and the current column; the address of a line is its  
85475 1-based line number, the address of a column is its 1-based count from the beginning of the line.  
85476 Generally, the current line is the last line affected by a command. The current line number is the  
85477 address of the current line. In each command description, the effect of the command on the  
85478 current line number and the current column is described.

85479 Addresses are constructed as follows:

- 85480 1. The character ' .' (period) shall address the current line.
- 85481 2. The character ' \$' shall address the last line of the edit buffer.
- 85482 3. The positive decimal number *n* shall address the *n*th line of the edit buffer.
- 85483 4. The address " ' x" refers to the line marked with the mark name character ' x', which  
85484 shall be a lowercase letter from the portable character set, the backquote character, or the  
85485 single-quote character. It shall be an error if the line that was marked is not currently

85486 present in the edit buffer or the mark has not been set. Lines can be marked with the *ex*  
85487 **mark** or **k** commands, or the *vi* **m** command.

85488 5. A regular expression enclosed by <slash> characters ('/') shall address the first line  
85489 found by searching forwards from the line following the current line toward the end of  
85490 the edit buffer and stopping at the first line for which the line excluding the terminating  
85491 <newline> matches the regular expression. As stated in [Regular Expressions in ex](#) (on  
85492 page 2675), an address consisting of a null regular expression delimited by <slash>  
85493 characters ("/") shall address the next line for which the line excluding the terminating  
85494 <newline> matches the last regular expression encountered. In addition, the second  
85495 <slash> can be omitted at the end of a command line. If the **wrapsan** edit option is set,  
85496 the search shall wrap around to the beginning of the edit buffer and continue up to and  
85497 including the current line, so that the entire edit buffer is searched. Within the regular  
85498 expression, the sequence "\/" shall represent a literal <slash> instead of the regular  
85499 expression delimiter.

85500 6. A regular expression enclosed in <question-mark> characters ('?') shall address the first  
85501 line found by searching backwards from the line preceding the current line toward the  
85502 beginning of the edit buffer and stopping at the first line for which the line excluding the  
85503 terminating <newline> matches the regular expression. An address consisting of a null  
85504 regular expression delimited by <question-mark> characters ("??") shall address the  
85505 previous line for which the line excluding the terminating <newline> matches the last  
85506 regular expression encountered. In addition, the second <question-mark> can be omitted  
85507 at the end of a command line. If the **wrapsan** edit option is set, the search shall wrap  
85508 around from the beginning of the edit buffer to the end of the edit buffer and continue up  
85509 to and including the current line, so that the entire edit buffer is searched. Within the  
85510 regular expression, the sequence "\?" shall represent a literal <question-mark> instead  
85511 of the RE delimiter.

85512 7. A <plus-sign> ('+') or a minus-sign ('-') followed by a decimal number shall address  
85513 the current line plus or minus the number. A '+' or '-' not followed by a decimal  
85514 number shall address the current line plus or minus 1.

85515 Addresses can be followed by zero or more address offsets, optionally <blank>-separated.  
85516 Address offsets are constructed as follows:

85517 1. A '+' or '-' immediately followed by a decimal number shall add (subtract) the  
85518 indicated number of lines to (from) the address. A '+' or '-' not followed by a decimal  
85519 number shall add (subtract) 1 to (from) the address.

85520 2. A decimal number shall add the indicated number of lines to the address.

85521 It shall not be an error for an intermediate address value to be less than zero or greater than the  
85522 last line in the edit buffer. It shall be an error for the final address value to be less than zero or  
85523 greater than the last line in the edit buffer.

85524 Commands take zero, one, or two addresses; see the descriptions of *1addr* and *2addr* in  
85525 [Command Descriptions in ex](#) (on page 2651). If more than the required number of addresses are  
85526 provided to a command that requires zero addresses, it shall be an error. Otherwise, if more than  
85527 the required number of addresses are provided to a command, the addresses specified first shall  
85528 be evaluated and then discarded until the maximum number of valid addresses remain.

85529 Addresses shall be separated from each other by a <comma> (',') or a <semicolon> (;'). If  
85530 no address is specified before or after a <comma> or <semicolon> separator, it shall be as if the  
85531 address of the current line was specified before or after the separator. In the case of a  
85532 <semicolon> separator, the current line ('.') shall be set to the first address, and only then will

85533 the next address be calculated. This feature can be used to determine the starting line for  
85534 forwards and backwards searches (see rules 5. and 6.).

85535 A <percent-sign> ('%') shall be equivalent to entering the two addresses "1, \$".

85536 Any delimiting <blank> characters between addresses, address separators, or address offsets  
85537 shall be discarded.

### 85538 Command Line Parsing in ex

85539 The following symbol is used in this and following sections to describe parsing behavior:

85540 *escape* If a character is referred to as "<backslash>-escaped" or "<control>-V-escaped", it  
85541 shall mean that the character acquired or lost a special meaning by virtue of being  
85542 preceded, respectively, by a <backslash> or <control>-V character. Unless  
85543 otherwise specified, the escaping character shall be discarded at that time and shall  
85544 not be further considered for any purpose.

85545 Command-line parsing shall be done in the following steps. For each step, characters already  
85546 evaluated shall be ignored; that is, the phrase "leading character" refers to the next character  
85547 that has not yet been evaluated.

- 85548 1. Leading <colon> characters shall be skipped.
- 85549 2. Leading <blank> characters shall be skipped.
- 85550 3. If the leading character is a double-quote character, the characters up to and including the  
85551 next non-<backslash>-escaped <newline> shall be discarded, and any subsequent  
85552 characters shall be parsed as a separate command.
- 85553 4. Leading characters that can be interpreted as addresses shall be evaluated; see  
85554 [Addressing in ex](#) (on page 2644).
- 85555 5. Leading <blank> characters shall be skipped.
- 85556 6. If the next character is a <vertical-line> character or a <newline>:  
85557 a. If the next character is a <newline>:  
85558 i. If *ex* is in open or visual mode, the current line shall be set to the last  
85559 address specified, if any.  
85560 ii. Otherwise, if the last command was terminated by a <vertical-line>  
85561 character, no action shall be taken; for example, the command  
85562 "||<newline>" shall execute two implied commands, not three.  
85563 iii. Otherwise, step 6.b. shall apply.
- 85564 b. Otherwise, the implied command shall be the **print** command. The last #, **p**, and **l**  
85565 flags specified to any *ex* command shall be remembered and shall apply to this  
85566 implied command. Executing the *ex* **number**, **print**, or **list** command shall set the  
85567 remembered flags to #, nothing, and **l**, respectively, plus any other flags specified  
85568 for that execution of the **number**, **print**, or **list** command.

85569 If *ex* is not currently performing a **global** or **v** command, and no address or count  
85570 is specified, the current line shall be incremented by 1 before the command is  
85571 executed. If incrementing the current line would result in an address past the last  
85572 line in the edit buffer, the command shall fail, and the increment shall not happen.

- 85573 c. The <newline> or <vertical-line> character shall be discarded and any subsequent  
85574 characters shall be parsed as a separate command.
- 85575 7. The command name shall be comprised of the next character (if the character is not  
85576 alphabetic), or the next character and any subsequent alphabetic characters (if the  
85577 character is alphabetic), with the following exceptions:
- 85578 a. Commands that consist of any prefix of the characters in the command name  
85579 **delete**, followed immediately by any of the characters 'l', 'p', '+', '-', or '#'  
85580 shall be interpreted as a **delete** command, followed by a <blank>, followed by the  
85581 characters that were not part of the prefix of the **delete** command. The maximum  
85582 number of characters shall be matched to the command name **delete**, for example,  
85583 "del" shall not be treated as "de" followed by the flag l.
- 85584 b. Commands that consist of the character 'k', followed by a character that can be  
85585 used as the name of a mark, shall be equivalent to the mark command followed by  
85586 a <blank>, followed by the character that followed the 'k'.
- 85587 c. Commands that consist of the character 's', followed by characters that could be  
85588 interpreted as valid options to the s command, shall be the equivalent of the s  
85589 command, without any pattern or replacement values, followed by a <blank>,  
85590 followed by the characters after the 's'.
- 85591 8. The command name shall be matched against the possible command names, and a  
85592 command name that contains a prefix matching the characters specified by the user shall  
85593 be the executed command. In the case of commands where the characters specified by the  
85594 user could be ambiguous, the executed command shall be as follows:

85595  
85596  
85597  
85598  
85599  
85600

|    |        |    |       |    |       |
|----|--------|----|-------|----|-------|
| a  | append | n  | next  | t  | t     |
| c  | change | p  | print | u  | undo  |
| ch | change | pr | print | un | undo  |
| e  | edit   | r  | read  | v  | v     |
| m  | move   | re | read  | w  | write |
| ma | mark   | s  | s     |    |       |

- 85601 Implementation extensions with names causing similar ambiguities shall not be checked  
85602 for a match until all possible matches for commands specified by POSIX.1-2008 have been  
85603 checked.
- 85604 9. If the command is a ! command, or if the command is a **read** command followed by zero  
85605 or more <blank> characters and a !, or if the command is a **write** command followed by  
85606 one or more <blank> characters and a !, the rest of the command shall include all  
85607 characters up to a non-<backslash>-escaped <newline>. The <newline> shall be  
85608 discarded and any subsequent characters shall be parsed as a separate *ex* command.
- 85609 10. Otherwise, if the command is an **edit**, **ex**, or **next** command, or a **visual** command while  
85610 in open or visual mode, the next part of the command shall be parsed as follows:
- 85611 a. Any '!' character immediately following the command shall be skipped and be  
85612 part of the command.
- 85613 b. Any leading <blank> characters shall be skipped and be part of the command.
- 85614 c. If the next character is a '+', characters up to the first non-<backslash>-escaped  
85615 <newline> or non-<backslash>-escaped <blank> shall be skipped and be part of  
85616 the command.

- 85617 d. The rest of the command shall be determined by the steps specified in paragraph  
85618 12.
- 85619 11. Otherwise, if the command is a **global**, **open**, **s**, or **v** command, the next part of the  
85620 command shall be parsed as follows:
- 85621 a. Any leading <blank> characters shall be skipped and be part of the command.
- 85622 b. If the next character is not an alphanumeric, double-quote, <newline>,  
85623 <backslash>, or <vertical-line> character:
- 85624 i. The next character shall be used as a command delimiter.
- 85625 ii. If the command is a **global**, **open**, or **v** command, characters up to the first  
85626 non-<backslash>-escaped <newline>, or first non-<backslash>-escaped  
85627 delimiter character, shall be skipped and be part of the command.
- 85628 iii. If the command is an **s** command, characters up to the first  
85629 non-<backslash>-escaped <newline>, or second non-<backslash>-escaped  
85630 delimiter character, shall be skipped and be part of the command.
- 85631 c. If the command is a **global** or **v** command, characters up to the first  
85632 non-<backslash>-escaped <newline> shall be skipped and be part of the  
85633 command.
- 85634 d. Otherwise, the rest of the command shall be determined by the steps specified in  
85635 paragraph 12.
- 85636 12. Otherwise:
- 85637 a. If the command was a **map**, **unmap**, **abbreviate**, or **unabbreviate** command,  
85638 characters up to the first non-<control>-V-escaped <newline>, <vertical-line>, or  
85639 double-quote character shall be skipped and be part of the command.
- 85640 b. Otherwise, characters up to the first non-<backslash>-escaped <newline>,  
85641 <vertical-line>, or double-quote character shall be skipped and be part of the  
85642 command.
- 85643 c. If the command was an **append**, **change**, or **insert** command, and the step 12.b.  
85644 ended at a <vertical-line> character, any subsequent characters, up to the next  
85645 non-<backslash>-escaped <newline> shall be used as input text to the command.
- 85646 d. If the command was ended by a double-quote character, all subsequent characters,  
85647 up to the next non-<backslash>-escaped <newline>, shall be discarded.
- 85648 e. The terminating <newline> or <vertical-line> character shall be discarded and any  
85649 subsequent characters shall be parsed as a separate *ex* command.
- 85650 Command arguments shall be parsed as described by the Synopsis and Description of each  
85651 individual *ex* command. This parsing shall not be <blank>-sensitive, except for the **!** argument,  
85652 which must follow the command name without intervening <blank> characters, and where it  
85653 would otherwise be ambiguous. For example, *count* and *flag* arguments need not be  
85654 <blank>-separated because "d22p" is not ambiguous, but *file* arguments to the *ex* **next**  
85655 command must be separated by one or more <blank> characters. Any <blank> in command  
85656 arguments for the **abbreviate**, **unabbreviate**, **map**, and **unmap** commands can be  
85657 <control>-V-escaped, in which case the <blank> shall not be used as an argument delimiter. Any  
85658 <blank> in the command argument for any other command can be <backslash>-escaped, in  
85659 which case that <blank> shall not be used as an argument delimiter.
- 85660 Within command arguments for the **abbreviate**, **unabbreviate**, **map**, and **unmap** commands,

85661 any character can be <control>-V-escaped. All such escaped characters shall be treated literally  
 85662 and shall have no special meaning. Within command arguments for all other *ex* commands that  
 85663 are not regular expressions or replacement strings, any character that would otherwise have a  
 85664 special meaning can be <backslash>-escaped. Escaped characters shall be treated literally,  
 85665 without special meaning as shell expansion characters or `'!'`, `'%'`, and `'#'` expansion  
 85666 characters. See [Regular Expressions in ex](#) (on page 2675) and [Replacement Strings in ex](#) (on page  
 85667 2676) for descriptions of command arguments that are regular expressions or replacement  
 85668 strings.

85669 Non-<backslash>-escaped `'%'` characters appearing in *file* arguments to any *ex* command shall  
 85670 be replaced by the current pathname; unescaped `'#'` characters shall be replaced by the  
 85671 alternate pathname. It shall be an error if `'%'` or `'#'` characters appear unescaped in an  
 85672 argument and their corresponding values are not set.

85673 Non-<backslash>-escaped `'!'` characters in the arguments to either the *ex !* command or the  
 85674 open and visual mode *! command*, or in the arguments to the *ex read* command, where the first  
 85675 non-<blank> after the command name is a `'!'` character, or in the arguments to the *ex write*  
 85676 command where the command name is followed by one or more <blank> characters and the  
 85677 first non-<blank> after the command name is a `'!'` character, shall be replaced with the  
 85678 arguments to the last of those three commands as they appeared after all unescaped `'%'`, `'#'`,  
 85679 and `'!'` characters were replaced. It shall be an error if `'!'` characters appear unescaped in one  
 85680 of these commands and there has been no previous execution of one of these commands.

85681 If an error occurs during the parsing or execution of an *ex* command:

- 85682 • An informational message to this effect shall be written. Execution of the *ex* command shall  
 85683 stop, and the cursor (for example, the current line and column) shall not be further  
 85684 modified.
- 85685 • If the *ex* command resulted from a map expansion, all characters from that map expansion  
 85686 shall be discarded, except as otherwise specified by the **map** command.
- 85687 • Otherwise, if the *ex* command resulted from the processing of an *EXINIT* environment  
 85688 variable, a **.exrc** file, a **source** command, a **-c** option, or a **+command** specified to an *ex edit*,  
 85689 **ex next**, or **visual** command, no further commands from the source of the commands shall  
 85690 be executed.
- 85691 • Otherwise, if the *ex* command resulted from the execution of a buffer or a **global** or **v**  
 85692 command, no further commands caused by the execution of the buffer or the **global** or **v**  
 85693 command shall be executed.
- 85694 • Otherwise, if the *ex* command was not terminated by a <newline>, all characters up to and  
 85695 including the next non-<backslash>-escaped <newline> shall be discarded.

#### 85696 **Input Editing in ex**

85697 The following symbol is used in this and the following sections to specify command actions:

85698 *word* In the POSIX locale, a word consists of a maximal sequence of letters, digits, and  
 85699 underscores, delimited at both ends by characters other than letters, digits, or  
 85700 underscores, or by the beginning or end of a line or the edit buffer.

85701 When accepting input characters from the user, in either *ex* command mode or *ex* text input  
 85702 mode, *ex* shall enable canonical mode input processing, as defined in the System Interfaces  
 85703 volume of POSIX.1-2008.

85704 If in *ex* text input mode:

- 85705 1. If the **number** edit option is set, *ex* shall prompt for input using the line number that  
85706 would be assigned to the line if it is entered, in the format specified for the *ex* **number**  
85707 command.
- 85708 2. If the **autoindent** edit option is set, *ex* shall prompt for input using **autoindent** characters,  
85709 as described by the **autoindent** edit option. **autoindent** characters shall follow the line  
85710 number, if any.

85711 If in *ex* command mode:

- 85712 1. If the **prompt** edit option is set, input shall be prompted for using a single **prompt** character;  
85713 otherwise, there shall be no prompt.

85714 The input characters in the following sections shall have the following effects on the input line.

### 85715 Scroll

85716 *Synopsis:* eof

85717 See the description of the *stty* eof character in *stty*.

85718 If in *ex* command mode:

85719 If the eof character is the first character entered on the line, the line shall be evaluated as if  
85720 it contained two characters: a <control>-D and a <newline>.

85721 Otherwise, the eof character shall have no special meaning.

85722 If in *ex* text input mode:

85723 If the cursor follows an **autoindent** character, the **autoindent** characters in the line shall be  
85724 modified so that a part of the next text input character will be displayed on the first  
85725 column in the line after the previous **shiftwidth** edit option column boundary, and the  
85726 user shall be prompted again for input for the same line.

85727 Otherwise, if the cursor follows a '0', which follows an **autoindent** character, and the '0'  
85728 was the previous text input character, the '0' and all **autoindent** characters in the line  
85729 shall be discarded, and the user shall be prompted again for input for the same line.

85730 Otherwise, if the cursor follows a '^', which follows an **autoindent** character, and the '^'  
85731 was the previous text input character, the '^' and all **autoindent** characters in the line  
85732 shall be discarded, and the user shall be prompted again for input for the same line. In  
85733 addition, the **autoindent** level for the next input line shall be derived from the same line  
85734 from which the **autoindent** level for the current input line was derived.

85735 Otherwise, if there are no **autoindent** or text input characters in the line, the eof character  
85736 shall be discarded.

85737 Otherwise, the eof character shall have no special meaning.

- 85738           **<newline>**
- 85739           *Synopsis:*     <newline>  
85740                            <control>-J
- 85741           If in *ex* command mode:
- 85742                    Cause the command line to be parsed; <control>-J shall be mapped to the <newline> for  
85743                    this purpose.
- 85744           If in *ex* text input mode:
- 85745                    Terminate the current line. If there are no characters other than **autoindent** characters on  
85746                    the line, all characters on the line shall be discarded.
- 85747                    Prompt for text input on a new line after the current line. If the **autoindent** edit option is  
85748                    set, an appropriate number of **autoindent** characters shall be added as a prefix to the line  
85749                    as described by the *ex* **autoindent** edit option.
- 85750           **<backslash>**
- 85751           *Synopsis:*     <backslash>
- 85752            Allow the entry of a subsequent <newline> or <control>-J as a literal character, removing any  
85753            special meaning that it may have to the editor during text input mode. The <backslash>  
85754            character shall be retained and evaluated when the command line is parsed, or retained and  
85755            included when the input text becomes part of the edit buffer.
- 85756           **<control>-V**
- 85757           *Synopsis:*     <control>-V
- 85758            Allow the entry of any subsequent character as a literal character, removing any special meaning  
85759            that it may have to the editor during text input mode. The <control>-V character shall be  
85760            discarded before the command line is parsed or the input text becomes part of the edit buffer.
- 85761            If the “literal next” functionality is performed by the underlying system, it is implementation-  
85762            defined whether a character other than <control>-V performs this function.
- 85763           **<control>-W**
- 85764           *Synopsis:*     <control>-W
- 85765            Discard the <control>-W, and the word previous to it in the input line, including any <blank>  
85766            characters following the word and preceding the <control>-W. If the “word erase” functionality  
85767            is performed by the underlying system, it is implementation-defined whether a character other  
85768            than <control>-W performs this function.
- 85769           **Command Descriptions in ex**
- 85770            The following symbols are used in this section to represent command modifiers. Some of these  
85771            modifiers can be omitted, in which case the specified defaults shall be used.
- 85772            *laddr*        A single line address, given in any of the forms described in [Addressing in ex](#) (on  
85773            page 2644); the default shall be the current line (‘.’), unless otherwise specified.
- 85774            If the line address is zero, it shall be an error, unless otherwise specified in the  
85775            following command descriptions.

|       |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 85776 |               | If the edit buffer is empty, and the address is specified with a command other than =, <b>append</b> , <b>insert</b> , <b>open</b> , <b>put</b> , <b>read</b> , or <b>visual</b> , or the address is not zero, it shall be an error.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 85777 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 85778 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 85779 | <i>2addr</i>  | Two addresses specifying an inclusive range of lines. If no addresses are specified, the default for <i>2addr</i> shall be the current line only (" ., . "), unless otherwise specified in the following command descriptions. If one address is specified, <i>2addr</i> shall specify that line only, unless otherwise specified in the following command descriptions.                                                                                                                                                                                                                                                                                  |
| 85780 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 85781 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 85782 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 85783 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 85808 |               | The default for <i>flags</i> shall be none.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 85809 | <i>buffer</i> | One of a number of named areas for holding text. The named buffers are specified by the alphanumeric characters of the POSIX locale. There shall also be one "unnamed" buffer. When no buffer is specified for editor commands that use a buffer, the unnamed buffer shall be used. Commands that store text into buffers shall store the text as it was before the command took effect, and shall store text occurring earlier in the file before text occurring later in the file, regardless of how the text region was specified. Commands that store text into buffers shall store the text into the unnamed buffer as well as any specified buffer. |

| 85817 |               | In <i>ex</i> commands, buffer names are specified as the name by itself. In open or visual mode commands the name is preceded by a double-quote (' "') character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 85818 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 85819 |               | If the specified buffer name is an uppercase character, and the buffer contents are to be modified, the buffer shall be appended to rather than being overwritten. If                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 85820 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

- 85821 the buffer is not being modified, specifying the buffer name in lowercase and  
85822 uppercase shall have identical results.
- 85823 There shall also be buffers named by the numbers 1 through 9. In open and visual  
85824 mode, if a region of text including characters from more than a single line is being  
85825 modified by the *vi* **c** or **d** commands, the motion character associated with the **c** or  
85826 **d** commands specifies that the buffer text shall be in line mode, or the commands  
85827 **%**, **'**, **/**, **?**, **(**, **)**, **N**, **n**, **{**, or **}** are used to define a region of text for the **c** or **d** commands,  
85828 the contents of buffers 1 through 8 shall be moved into the buffer named by the  
85829 next numerically greater value, the contents of buffer 9 shall be discarded, and the  
85830 region of text shall be copied into buffer 1. This shall be in addition to copying the  
85831 text into a user-specified buffer or unnamed buffer, or both. Numeric buffers can  
85832 be specified as a source buffer for open and visual mode commands; however,  
85833 specifying a numeric buffer as the write target of an open or visual mode  
85834 command shall have unspecified results.
- 85835 The text of each buffer shall have the characteristic of being in either line or  
85836 character mode. Appending text to a non-empty buffer shall set the mode to match  
85837 the characteristic of the text being appended. Appending text to a buffer shall  
85838 cause the creation of at least one additional line in the buffer. All text stored into  
85839 buffers by *ex* commands shall be in line mode. The *ex* commands that use buffers  
85840 as the source of text specify individually how buffers of different modes are  
85841 handled. Each open or visual mode command that uses buffers for any purpose  
85842 specifies individually the mode of the text stored into the buffer and how buffers  
85843 of different modes are handled.
- 85844 *file* Command text used to derive a pathname. The default shall be the current  
85845 pathname, as defined previously, in which case, if no current pathname has yet  
85846 been established it shall be an error, except where specifically noted in the  
85847 individual command descriptions that follow. If the command text contains any of  
85848 the characters **'** **~** **'** **{** **'** **[** **'** **\*** **'** **?** **'** **\$** **'** **"** **'**, backquote, single-quote, and  
85849 **<backslash>**, it shall be subjected to the process of "shell expansions", as described  
85850 below; if more than a single pathname results and the command expects only one,  
85851 it shall be an error.
- 85852 The process of shell expansions in the editor shall be done as follows. The *ex* utility  
85853 shall pass two arguments to the program named by the shell edit option; the first  
85854 shall be **-c**, and the second shall be the string "echo" and the command text as a  
85855 single argument. The standard output and standard error of that command shall  
85856 replace the command text.
- 85857 **!** A character that can be appended to the command name to modify its operation,  
85858 as detailed in the individual command descriptions. With the exception of the *ex*  
85859 **read**, **write**, and **!** commands, the **' !'** character shall only act as a modifier if there  
85860 are no **<blank>** characters between it and the command name.
- 85861 *remembered search direction*  
85862 The *vi* commands **N** and **n** begin searching in a forwards or backwards direction in  
85863 the edit buffer based on a remembered search direction, which is initially unset,  
85864 and is set by the *ex* **global**, **v**, **s**, and **tag** commands, and the *vi* **/** and **?** commands.

85865 **Abbreviate**85866 *Synopsis:* `ab[breviate] [lhs rhs]`85867 If *lhs* and *rhs* are not specified, write the current list of abbreviations and do nothing more.85868 Implementations may restrict the set of characters accepted in *lhs* or *rhs*, except that printable  
85869 characters and <blank> characters shall not be restricted. Additional restrictions shall be  
85870 implementation-defined.85871 In both *lhs* and *rhs*, any character may be escaped with a <control>-V, in which case the character  
85872 shall not be used to delimit *lhs* from *rhs*, and the escaping <control>-V shall be discarded.85873 In open and visual text input mode, if a non-word or <ESC> character that is not escaped by a  
85874 <control>-V character is entered after a word character, a check shall be made for a set of  
85875 characters matching *lhs*, in the text input entered during this command. If it is found, the effect  
85876 shall be as if *rhs* was entered instead of *lhs*.

85877 The set of characters that are checked is defined as follows:

- 85878 1. If there are no characters inserted before the word and non-word or <ESC> characters  
85879 that triggered the check, the set of characters shall consist of the word character.
- 85880 2. If the character inserted before the word and non-word or <ESC> characters that  
85881 triggered the check is a word character, the set of characters shall consist of the characters  
85882 inserted immediately before the triggering characters that are word characters, plus the  
85883 triggering word character.
- 85884 3. If the character inserted before the word and non-word or <ESC> characters that  
85885 triggered the check is not a word character, the set of characters shall consist of the  
85886 characters that were inserted before the triggering characters that are neither <blank>  
85887 characters nor word characters, plus the triggering word character.

85888 It is unspecified whether the *lhs* argument entered for the *ex* **abbreviate** and **unabbreviate**  
85889 commands is replaced in this fashion. Regardless of whether or not the replacement occurs, the  
85890 effect of the command shall be as if the replacement had not occurred.85891 *Current line:* Unchanged.85892 *Current column:* Unchanged.85893 **Append**85894 *Synopsis:* `[laddr] a[ppend] [!]`85895 Enter *ex* text input mode; the input text shall be placed after the specified line. If line zero is  
85896 specified, the text shall be placed at the beginning of the edit buffer.85897 This command shall be affected by the **number** and **autoindent** edit options; following the  
85898 command name with '!' shall cause the **autoindent** edit option setting to be toggled for the  
85899 duration of this command only.85900 *Current line:* Set to the last input line; if no lines were input, set to the specified line, or to the first  
85901 line of the edit buffer if a line of zero was specified, or zero if the edit buffer is empty.85902 *Current column:* Set to non-<blank>.

85903 **Arguments**85904 *Synopsis:* ar[gs]85905 Write the current argument list, with the current argument-list entry, if any, between '[' and  
85906 ']' characters.85907 *Current line:* Unchanged.85908 *Current column:* Unchanged.85909 **Change**85910 *Synopsis:* [2addr] c[hange][!][count]85911 Enter *ex* text input mode; the input text shall replace the specified lines. The specified lines shall  
85912 be copied into the unnamed buffer, which shall become a line mode buffer.85913 This command shall be affected by the **number** and **autoindent** edit options; following the  
85914 command name with '!' shall cause the **autoindent** edit option setting to be toggled for the  
85915 duration of this command only.85916 *Current line:* Set to the last input line; if no lines were input, set to the line before the first  
85917 address, or to the first line of the edit buffer if there are no lines preceding the first address, or to  
85918 zero if the edit buffer is empty.85919 *Current column:* Set to non-<blank>.85920 **Change Directory**85921 *Synopsis:* chd[ir][!][directory]

85922 cd[!][directory]

85923 Change the current working directory to *directory*.85924 If no *directory* argument is specified, and the *HOME* environment variable is set to a non-null  
85925 and non-empty value, *directory* shall default to the value named in the *HOME* environment  
85926 variable. If the *HOME* environment variable is empty or is undefined, the default value of  
85927 *directory* is implementation-defined.85928 If no '!' is appended to the command name, and the edit buffer has been modified since the  
85929 last complete write, and the current pathname does not begin with a '/', it shall be an error.85930 *Current line:* Unchanged.85931 *Current column:* Unchanged.85932 **Copy**85933 *Synopsis:* [2addr] co[py] laddr [flags]

85934 [2addr] t laddr [flags]

85935 Copy the specified lines after the specified destination line; line zero specifies that the lines shall  
85936 be placed at the beginning of the edit buffer.85937 *Current line:* Set to the last line copied.85938 *Current column:* Set to non-<blank>.

85939 **Delete**85940 *Synopsis:* `[2addr] d[etele][buffer][count][flags]`85941 Delete the specified lines into a buffer (defaulting to the unnamed buffer), which shall become a  
85942 line-mode buffer.85943 Flags can immediately follow the command name; see [Command Line Parsing in ex](#) (on page  
85944 2646).85945 *Current line:* Set to the line following the deleted lines, or to the last line in the edit buffer if that  
85946 line is past the end of the edit buffer, or to zero if the edit buffer is empty.85947 *Current column:* Set to non-<blank>.85948 **Edit**85949 *Synopsis:* `e[dit][!][+command][file]`85950 `ex[!][+command][file]`85951 If no '!' is appended to the command name, and the edit buffer has been modified since the  
85952 last complete write, it shall be an error.85953 If *file* is specified, replace the current contents of the edit buffer with the current contents of *file*,  
85954 and set the current pathname to *file*. If *file* is not specified, replace the current contents of the  
85955 edit buffer with the current contents of the file named by the current pathname. If for any reason  
85956 the current contents of the file cannot be accessed, the edit buffer shall be empty.85957 The *+command* option shall be <blank>-delimited; <blank> characters within the *+command* can  
85958 be escaped by preceding them with a <backslash> character. The *+command* shall be interpreted  
85959 as an *ex* command immediately after the contents of the edit buffer have been replaced and the  
85960 current line and column have been set.

85961 If the edit buffer is empty:

85962 *Current line:* Set to 0.85963 *Current column:* Set to 1.85964 Otherwise, if executed while in *ex* command mode or if the *+command* argument is specified:85965 *Current line:* Set to the last line of the edit buffer.85966 *Current column:* Set to non-<blank>.85967 Otherwise, if *file* is omitted or results in the current pathname:85968 *Current line:* Set to the first line of the edit buffer.85969 *Current column:* Set to non-<blank>.85970 Otherwise, if *file* is the same as the last file edited, the line and column shall be set as follows; if  
85971 the file was previously edited, the line and column may be set as follows:85972 *Current line:* Set to the last value held when that file was last edited. If this value is not a valid  
85973 line in the new edit buffer, set to the first line of the edit buffer.85974 *Current column:* If the current line was set to the last value held when the file was last edited, set  
85975 to the last value held when the file was last edited. Otherwise, or if the last value is not a valid  
85976 column in the new edit buffer, set to non-<blank>.

85977 Otherwise:

85978 *Current line*: Set to the first line of the edit buffer.

85979 *Current column*: Set to non-<blank>.

## 85980 File

85981 *Synopsis*: `f[file] [file]`

85982 If a *file* argument is specified, the alternate pathname shall be set to the current pathname, and  
85983 the current pathname shall be set to *file*.

85984 Write an informational message. If the file has a current pathname, it shall be included in this  
85985 message; otherwise, the message shall indicate that there is no current pathname. If the edit  
85986 buffer contains lines, the current line number and the number of lines in the edit buffer shall be  
85987 included in this message; otherwise, the message shall indicate that the edit buffer is empty. If  
85988 the edit buffer has been modified since the last complete write, this fact shall be included in this  
85989 message. If the **readonly** edit option is set, this fact shall be included in this message. The  
85990 message may contain other unspecified information.

85991 *Current line*: Unchanged.

85992 *Current column*: Unchanged.

## 85993 Global

85994 *Synopsis*: `[2addr] g[lobal] /pattern/ [commands]`  
85995 `[2addr] v /pattern/ [commands]`

85996 The optional **'!** character after the **global** command shall be the same as executing the **v**  
85997 command.

85998 If *pattern* is empty (for example, `"/*"`) or not specified, the last regular expression used in the  
85999 editor command shall be used as the *pattern*. The *pattern* can be delimited by <slash> characters  
86000 (shown in the Synopsis), as well as any non-alphanumeric or non-<blank> other than  
86001 <backslash>, <vertical-line>, <newline>, or double-quote.

86002 If no lines are specified, the lines shall default to the entire file.

86003 The **global** and **v** commands are logically two-pass operations. First, mark the lines within the  
86004 specified lines for which the line excluding the terminating <newline> matches (**global**) or does  
86005 not match (**v** or **global!**) the specified pattern. Second, execute the *ex* commands given by  
86006 *commands*, with the current line (`'.'`) set to each marked line. If an error occurs during this  
86007 process or the contents of the edit buffer are replaced (for example, by the *ex* **edit** command) an  
86008 error message shall be written and no more commands resulting from the execution of this  
86009 command shall be processed.

86010 Multiple *ex* commands can be specified by entering multiple commands on a single line using a  
86011 <vertical-line> to delimit them, or one per line, by escaping each <newline> with a <backslash>.

86012 If no commands are specified:

- 86013 1. If in *ex* command mode, it shall be as if the **print** command were specified.
- 86014 2. Otherwise, no command shall be executed.

86015 For the **append**, **change**, and **insert** commands, the input text shall be included as part of the  
86016 command, and the terminating <period> can be omitted if the command ends the list of  
86017 commands. The **open** and **visual** commands can be specified as one of the commands, in which

86018 case each marked line shall cause the editor to enter open or visual mode. If open or visual mode  
86019 is exited using the *vi* **Q** command, the current line shall be set to the next marked line, and open  
86020 or visual mode reentered, until the list of marked lines is exhausted.

86021 The **global**, **v**, and **undo** commands cannot be used in *commands*. Marked lines may be deleted  
86022 by commands executed for lines occurring earlier in the file than the marked lines. In this case,  
86023 no commands shall be executed for the deleted lines.

86024 If the remembered search direction is not set, the **global** and **v** commands shall set it to forward.

86025 The **autoprint** and **autoindent** edit options shall be inhibited for the duration of the **g** or **v**  
86026 command.

86027 *Current line*: If no commands executed, set to the last marked line. Otherwise, as specified for the  
86028 executed *ex* commands.

86029 *Current column*: If no commands are executed, set to non-<blank>; otherwise, as specified for the  
86030 individual *ex* commands.

### 86031 **Insert**

86032 *Synopsis*: `[1addr] i[nsert][!]`

86033 Enter *ex* text input mode; the input text shall be placed before the specified line. If the line is zero  
86034 or 1, the text shall be placed at the beginning of the edit buffer.

86035 This command shall be affected by the **number** and **autoindent** edit options; following the  
86036 command name with '!' shall cause the **autoindent** edit option setting to be toggled for the  
86037 duration of this command only.

86038 *Current line*: Set to the last input line; if no lines were input, set to the line before the specified  
86039 line, or to the first line of the edit buffer if there are no lines preceding the specified line, or zero  
86040 if the edit buffer is empty.

86041 *Current column*: Set to non-<blank>.

### 86042 **Join**

86043 *Synopsis*: `[2addr] j[oin][!][count][flags]`

86044 If *count* is specified:

86045 If no address was specified, the **join** command shall behave as if *2addr* were the current  
86046 line and the current line plus *count* (*.,. + count*).

86047 If one address was specified, the **join** command shall behave as if *2addr* were the specified  
86048 address and the specified address plus *count* (*addr,addr + count*).

86049 If two addresses were specified, the **join** command shall behave as if an additional  
86050 address, equal to the last address plus *count* -1 (*addr1,addr2,addr2 + count -1*), was  
86051 specified.

86052 If this would result in a second address greater than the last line of the edit buffer, it shall  
86053 be corrected to be equal to the last line of the edit buffer.

86054 If no *count* is specified:

86055 If no address was specified, the **join** command shall behave as if *2addr* were the current  
86056 line and the next line (*.,. +1*).

86057 If one address was specified, the **join** command shall behave as if *2addr* were the specified  
86058 address and the next line (*addr,addr +1*).

86059 Join the text from the specified lines together into a single line, which shall replace the specified  
86060 lines.

86061 If a **' !'** character is appended to the command name, the **join** shall be without modification of  
86062 any line, independent of the current locale.

86063 Otherwise, in the POSIX locale, set the current line to the first of the specified lines, and then, for  
86064 each subsequent line, proceed as follows:

- 86065 1. Discard leading <space> characters from the line to be joined.
- 86066 2. If the line to be joined is now empty, delete it, and skip steps 3 through 5.
- 86067 3. If the current line ends in a <blank>, or the first character of the line to be joined is a **' )'**  
86068 character, join the lines without further modification.
- 86069 4. If the last character of the current line is a **' . '**, join the lines with two <space> characters  
86070 between them.
- 86071 5. Otherwise, join the lines with a single <space> between them.

86072 *Current line*: Set to the first line specified.

86073 *Current column*: Set to non-<blank>.

#### 86074 **List**

86075 *Synopsis*: `[2addr] l[ist][count][flags]`

86076 This command shall be equivalent to the *ex* command:

86077 `[2addr] p[rint][count] l[flags]`

86078 See [Print](#) (on page 2663).

#### 86079 **Map**

86080 *Synopsis*: `map[!][lhs rhs]`

86081 If *lhs* and *rhs* are not specified:

- 86082 1. If **' !'** is specified, write the current list of text input mode maps.
- 86083 2. Otherwise, write the current list of command mode maps.
- 86084 3. Do nothing more.

86085 Implementations may restrict the set of characters accepted in *lhs* or *rhs*, except that printable  
86086 characters and <blank> characters shall not be restricted. Additional restrictions shall be  
86087 implementation-defined. In both *lhs* and *rhs*, any character can be escaped with a <control>-V, in  
86088 which case the character shall not be used to delimit *lhs* from *rhs*, and the escaping <control>-V  
86089 shall be discarded.

86090 If the character **' !'** is appended to the **map** command name, the mapping shall be effective  
86091 during open or visual text input mode rather than **open** or **visual** command mode. This allows  
86092 *lhs* to have two different **map** definitions at the same time: one for command mode and one for

- 86093 text input mode.
- 86094 For command mode mappings:
- 86095 When the *lhs* is entered as any part of a *vi* command in open or visual mode (but not as  
86096 part of the arguments to the command), the action shall be as if the corresponding *rhs* had  
86097 been entered.
- 86098 If any character in the command, other than the first, is escaped using a <control>-V  
86099 character, that character shall not be part of a match to an *lhs*.
- 86100 It is unspecified whether implementations shall support **map** commands where the *lhs* is  
86101 more than a single character in length, where the first character of the *lhs* is printable.
- 86102 If *lhs* contains more than one character and the first character is '#', followed by a  
86103 sequence of digits corresponding to a numbered function key, then when this function key  
86104 is typed it shall be mapped to *rhs*. Characters other than digits following a '#' character  
86105 also represent the function key named by the characters in the *lhs* following the '#' and  
86106 may be mapped to *rhs*. It is unspecified how function keys are named or what function  
86107 keys are supported.
- 86108 For text input mode mappings:
- 86109 When the *lhs* is entered as any part of text entered in open or visual text input modes, the  
86110 action shall be as if the corresponding *rhs* had been entered.
- 86111 If any character in the input text is escaped using a <control>-V character, that character  
86112 shall not be part of a match to an *lhs*.
- 86113 It is unspecified whether the *lhs* text entered for subsequent **map** or **unmap** commands is  
86114 replaced with the *rhs* text for the purposes of the screen display; regardless of whether or  
86115 not the display appears as if the corresponding *rhs* text was entered, the effect of the  
86116 command shall be as if the *lhs* text was entered.
- 86117 If only part of the *lhs* is entered, it is unspecified how long the editor will wait for additional,  
86118 possibly matching characters before treating the already entered characters as not matching the  
86119 *lhs*.
- 86120 The *rhs* characters shall themselves be subject to remapping, unless otherwise specified by the  
86121 **remap** edit option, except that if the characters in *lhs* occur as prefix characters in *rhs*, those  
86122 characters shall not be remapped.
- 86123 On block-mode terminals, the mapping need not occur immediately (for example, it may occur  
86124 after the terminal transmits a group of characters to the system), but it shall achieve the same  
86125 results as if it occurred immediately.
- 86126 *Current line*: Unchanged.
- 86127 *Current column*: Unchanged.

86128 **Mark**86129 *Synopsis:* `[laddr] ma[rk] character`86130 `[laddr] k character`

86131 Implementations shall support *character* values of a single lowercase letter of the POSIX locale  
 86132 and the backquote and single-quote characters; support of other characters is implementation-  
 86133 defined.

86134 If executing the *vi m* command, set the specified mark to the current line and 1-based numbered  
 86135 character referenced by the current column, if any; otherwise, column position 1.

86136 Otherwise, set the specified mark to the specified line and 1-based numbered first non-<blank>  
 86137 non-<newline> in the line, if any; otherwise, the last non-<newline> in the line, if any;  
 86138 otherwise, column position 1.

86139 The mark shall remain associated with the line until the mark is reset or the line is deleted. If a  
 86140 deleted line is restored by a subsequent **undo** command, any marks previously associated with  
 86141 the line, which have not been reset, shall be restored as well. Any use of a mark not associated  
 86142 with a current line in the edit buffer shall be an error.

86143 The marks ' and ' shall be set as described previously, immediately before the following events  
 86144 occur in the editor:

- 86145 1. The use of '\$' as an *ex* address
- 86146 2. The use of a positive decimal number as an *ex* address
- 86147 3. The use of a search command as an *ex* address
- 86148 4. The use of a mark reference as an *ex* address
- 86149 5. The use of the following open and visual mode commands: <control>-], %, (, ), [, ], {, }
- 86150 6. The use of the following open and visual mode commands: ', G, H, L, M, z if the current  
 86151 line will change as a result of the command
- 86152 7. The use of the open and visual mode commands: /, ?, N, ', n if the current line or column  
 86153 will change as a result of the command
- 86154 8. The use of the *ex* mode commands: z, **undo**, **global**, v

86155 For rules 1., 2., 3., and 4., the ' and ' marks shall not be set if the *ex* command is parsed as  
 86156 specified by rule 6.a. in [Command Line Parsing in ex](#) (on page 2646).

86157 For rules 5., 6., and 7., the ' and ' marks shall not be set if the commands are used as motion  
 86158 commands in open and visual mode.

86159 For rules 1., 2., 3., 4., 5., 6., 7., and 8., the ' and ' marks shall not be set if the command fails.

86160 The ' and ' marks shall be set as described previously, each time the contents of the edit buffer  
 86161 are replaced (including the editing of the initial buffer), if in open or visual mode, or if in **ex**  
 86162 mode and the edit buffer is not empty, before any commands or movements (including  
 86163 commands or movements specified by the **-c** or **-t** options or the **+command** argument) are  
 86164 executed on the edit buffer. If in open or visual mode, the marks shall be set as if executing the *vi*  
 86165 **m** command; otherwise, as if executing the *ex mark* command.

86166 When changing from **ex** mode to open or visual mode, if the ' and ' marks are not already set,  
 86167 the ' and ' marks shall be set as described previously.

86168 *Current line:* Unchanged.

86169 *Current column*: Unchanged.

### 86170 **Move**

86171 *Synopsis*: `[2addr] m[ove] laddr [flags]`

86172 Move the specified lines after the specified destination line. A destination of line zero specifies  
86173 that the lines shall be placed at the beginning of the edit buffer. It shall be an error if the  
86174 destination line is within the range of lines to be moved.

86175 *Current line*: Set to the last of the moved lines.

86176 *Current column*: Set to non-<blank>.

### 86177 **Next**

86178 *Synopsis*: `n[ext] [!] [+command] [file ...]`

86179 If no '!' is appended to the command name, and the edit buffer has been modified since the  
86180 last complete write, it shall be an error, unless the file is successfully written as specified by the  
86181 **autowrite** option.

86182 If one or more files is specified:

- 86183 1. Set the argument list to the specified filenames.
- 86184 2. Set the current argument list reference to be the first entry in the argument list.
- 86185 3. Set the current pathname to the first filename specified.

86186 Otherwise:

- 86187 1. It shall be an error if there are no more filenames in the argument list after the filename  
86188 currently referenced.
- 86189 2. Set the current pathname and the current argument list reference to the filename after the  
86190 filename currently referenced in the argument list.

86191 Replace the contents of the edit buffer with the contents of the file named by the current  
86192 pathname. If for any reason the contents of the file cannot be accessed, the edit buffer shall be  
86193 empty.

86194 This command shall be affected by the **autowrite** and **writeany** edit options.

86195 The *+command* option shall be <blank>-delimited; <blank> characters can be escaped by  
86196 preceding them with a <backslash> character. The *+command* shall be interpreted as an *ex*  
86197 command immediately after the contents of the edit buffer have been replaced and the current  
86198 line and column have been set.

86199 *Current line*: Set as described for the **edit** command.

86200 *Current column*: Set as described for the **edit** command.

86201 **Number**86202 *Synopsis:* [2addr] nu[mber] [count] [flags]

86203 [2addr] #[count] [flags]

86204 These commands shall be equivalent to the *ex* command:

86205 [2addr] p[rint] [count] #[flags]

86206 See [Print](#).86207 **Open**86208 *Synopsis:* [1addr] o[pen] /pattern/ [flags]

86209 This command need not be supported on block-mode terminals or terminals with insufficient  
 86210 capabilities. If standard input, standard output, or standard error are not terminal devices, the  
 86211 results are unspecified.

86212 Enter open mode.

86213 The trailing delimiter can be omitted from *pattern* at the end of the command line. If *pattern* is  
 86214 empty (for example, "//") or not specified, the last regular expression used in the editor shall  
 86215 be used as the pattern. The pattern can be delimited by <slash> characters (shown in the  
 86216 Synopsis), as well as any alphanumeric, or non-<blank> other than <backslash>, <vertical-line>,  
 86217 <newline>, or double-quote.

86218 *Current line:* Set to the specified line.86219 *Current column:* Set to non-<blank>.86220 **Preserve**86221 *Synopsis:* pre[serve]

86222 Save the edit buffer in a form that can later be recovered by using the `-r` option or by using the  
 86223 *ex* **recover** command. After the file has been preserved, a mail message shall be sent to the user.  
 86224 This message shall be readable by invoking the *mailx* utility. The message shall contain the name  
 86225 of the file, the time of preservation, and an *ex* command that could be used to recover the file.  
 86226 Additional information may be included in the mail message.

86227 *Current line:* Unchanged.86228 *Current column:* Unchanged.86229 **Print**86230 *Synopsis:* [2addr] p[rint] [count] [flags]

86231 Write the addressed lines. The behavior is unspecified if the number of columns on the display is  
 86232 less than the number of columns required to write any single character in the lines being written.

86233 Non-printable characters, except for the <tab>, shall be written as implementation-defined  
 86234 multi-character sequences.

86235 If the # flag is specified or the **number** edit option is set, each line shall be preceded by its line  
 86236 number in the following format:

86237 "%6dΔΔ", &lt;line number&gt;

86238 If the **l** flag is specified or the **list** edit option is set:

- 86239 1. The characters listed in XBD Table 5-1 (on page 121) shall be written as the corresponding  
86240 escape sequence.
- 86241 2. Non-printable characters not in XBD Table 5-1 (on page 121) shall be written as one three-  
86242 digit octal number (with a preceding <backslash>) for each byte in the character (most  
86243 significant byte first).
- 86244 3. The end of each line shall be marked with a '\$', and literal '\$' characters within the line  
86245 shall be written with a preceding <backslash>.

86246 Long lines shall be folded; the length at which folding occurs is unspecified, but should be  
86247 appropriate for the output terminal, considering the number of columns of the terminal.

86248 If a line is folded, and the **l** flag is not specified and the **list** edit option is not set, it is unspecified  
86249 whether a multi-column character at the folding position is separated; it shall not be discarded.

86250 *Current line*: Set to the last written line.

86251 *Current column*: Unchanged if the current line is unchanged; otherwise, set to non-<blank>.

### 86252 Put

86253 *Synopsis*: `[laddr] pu[t][buffer]`

86254 Append text from the specified buffer (by default, the unnamed buffer) to the specified line; line  
86255 zero specifies that the text shall be placed at the beginning of the edit buffer. Each portion of a  
86256 line in the buffer shall become a new line in the edit buffer, regardless of the mode of the buffer.

86257 *Current line*: Set to the last line entered into the edit buffer.

86258 *Current column*: Set to non-<blank>.

### 86259 Quit

86260 *Synopsis*: `q[uit][!]`

86261 If no '!' is appended to the command name:

- 86262 1. If the edit buffer has been modified since the last complete write, it shall be an error.
- 86263 2. If there are filenames in the argument list after the filename currently referenced, and the  
86264 last command was not a **quit**, **wq**, **xit**, or **ZZ** (see **Exit**, on page 3344) command, it shall be  
86265 an error.

86266 Otherwise, terminate the editing session.

### 86267 Read

86268 *Synopsis*: `[laddr] r[ead][!][file]`

86269 If '!' is not the first non-<blank> to follow the command name, a copy of the specified file shall  
86270 be appended into the edit buffer after the specified line; line zero specifies that the copy shall be  
86271 placed at the beginning of the edit buffer. The number of lines and bytes read shall be written. If  
86272 no *file* is named, the current pathname shall be the default. If there is no current pathname, then  
86273 *file* shall become the current pathname. If there is no current pathname or *file* operand, it shall be  
86274 an error. Specifying a *file* that is not of type regular shall have unspecified results.

86275 Otherwise, if *file* is preceded by '!', the rest of the line after the '!' shall have '%', '#', and  
86276 '!' characters expanded as described in **Command Line Parsing in ex** (on page 2646).

86277 The *ex* utility shall then pass two arguments to the program named by the shell edit option; the

86278 first shall be `-c` and the second shall be the expanded arguments to the **read** command as a  
 86279 single argument. The standard input of the program shall be set to the standard input of the *ex*  
 86280 program when it was invoked. The standard error and standard output of the program shall be  
 86281 appended into the edit buffer after the specified line.

86282 Each line in the copied file or program output (as delimited by `<newline>` characters or the end  
 86283 of the file or output if it is not immediately preceded by a `<newline>`), shall be a separate line in  
 86284 the edit buffer. Any occurrences of `<carriage-return>` and `<newline>` pairs in the output shall be  
 86285 treated as single `<newline>` characters.

86286 The special meaning of the `' !'` following the **read** command can be overridden by escaping it  
 86287 with a `<backslash>` character.

86288 *Current line*: If no lines are added to the edit buffer, unchanged. Otherwise, if in open or visual  
 86289 mode, set to the first line entered into the edit buffer. Otherwise, set to the last line entered into  
 86290 the edit buffer.

86291 *Current column*: Set to non-`<blank>`.

## 86292 **Recover**

86293 *Synopsis*: `rec[over] [!] file`

86294 If no `' !'` is appended to the command name, and the edit buffer has been modified since the  
 86295 last complete write, it shall be an error.

86296 If no *file* operand is specified, then the current pathname shall be used. If there is no current  
 86297 pathname or *file* operand, it shall be an error.

86298 If no recovery information has previously been saved about *file*, the **recover** command shall  
 86299 behave identically to the **edit** command, and an informational message to this effect shall be  
 86300 written.

86301 Otherwise, set the current pathname to *file*, and replace the current contents of the edit buffer  
 86302 with the recovered contents of *file*. If there are multiple instances of the file to be recovered, the  
 86303 one most recently saved shall be recovered, and an informational message that there are  
 86304 previous versions of the file that can be recovered shall be written. The editor shall behave as if  
 86305 the contents of the edit buffer have already been modified.

86306 *Current file*: Set as described for the **edit** command.

86307 *Current column*: Set as described for the **edit** command.

## 86308 **Rewind**

86309 *Synopsis*: `rew[ind] [!]`

86310 If no `' !'` is appended to the command name, and the edit buffer has been modified since the  
 86311 last complete write, it shall be an error, unless the file is successfully written as specified by the  
 86312 **autowrite** option.

86313 If the argument list is empty, it shall be an error.

86314 The current argument list reference and the current pathname shall be set to the first filename in  
 86315 the argument list.

86316 Replace the contents of the edit buffer with the contents of the file named by the current  
 86317 pathname. If for any reason the contents of the file cannot be accessed, the edit buffer shall be  
 86318 empty.

86319 This command shall be affected by the **autowrite** and **writeany** edit options.

86320 *Current line*: Set as described for the **edit** command.

86321 *Current column*: Set as described for the **edit** command.

### 86322 **Set**

86323 *Synopsis*: `se[t][option]=[value] ...][nooption ...][option? ...][all]`

86324 When no arguments are specified, write the value of the **term** edit option and those options  
86325 whose values have been changed from the default settings; when the argument *all* is specified,  
86326 write all of the option values.

86327 Giving an option name followed by the character '?' shall cause the current value of that  
86328 option to be written. The '?' can be separated from the option name by zero or more <blank>  
86329 characters. The '?' shall be necessary only for Boolean valued options. Boolean options can be  
86330 given values by the form **set option** to turn them on or **set nooption** to turn them off; string and  
86331 numeric options can be assigned by the form **set option=value**. Any <blank> characters in strings  
86332 can be included as is by preceding each <blank> with an escaping <backslash>. More than one  
86333 option can be set or listed by a single set command by specifying multiple arguments, each  
86334 separated from the next by one or more <blank> characters.

86335 See [Edit Options in ex](#) (on page 2676) for details about specific options.

86336 *Current line*: Unchanged.

86337 *Current column*: Unchanged.

### 86338 **Shell**

86339 *Synopsis*: `sh[ell]`

86340 Invoke the program named in the **shell** edit option with the single argument **-i** (interactive  
86341 mode). Editing shall be resumed when the program exits.

86342 *Current line*: Unchanged.

86343 *Current column*: Unchanged.

### 86344 **Source**

86345 *Synopsis*: `so[urce] file`

86346 Read and execute *ex* commands from *file*. Lines in the file that are blank lines shall be ignored.

86347 *Current line*: As specified for the individual *ex* commands.

86348 *Current column*: As specified for the individual *ex* commands.

### 86349 **Substitute**

86350 *Synopsis*: `[2addr] s[substitute] [/pattern/repl/ [options] [count] [flags]]`  
86351 `[2addr] & [options] [count] [flags]`  
86352 `[2addr] ~ [options] [count] [flags]`

86353 Replace the first instance of the pattern *pattern* by the string *repl* on each specified line. (See  
86354 [Regular Expressions in ex](#) (on page 2675) and [Replacement Strings in ex](#) (on page 2676).) Any  
86355 non-alphabetic, non-<blank> delimiter other than <backslash>, '|', <newline>, or double-  
86356 quote can be used instead of '/'. <backslash> characters can be used to escape delimiters,  
86357 <backslash> characters, and other special characters.

- 86358 The trailing delimiter can be omitted from *pattern* or from *repl* at the end of the command line. If  
 86359 both *pattern* and *repl* are not specified or are empty (for example, "//"), the last **s** command  
 86360 shall be repeated. If only *pattern* is not specified or is empty, the last regular expression used in  
 86361 the editor shall be used as the pattern. If only *repl* is not specified or is empty, the pattern shall be  
 86362 replaced by nothing. If the entire replacement pattern is '%', the last replacement pattern to an  
 86363 **s** command shall be used.
- 86364 Entering a <carriage-return> in *repl* (which requires an escaping <backslash> in *ex* mode and an  
 86365 escaping <control>-V in open or *vi* mode) shall split the line at that point, creating a new line in  
 86366 the edit buffer. The <carriage-return> shall be discarded.
- 86367 If *options* includes the letter 'g' (**global**), all non-overlapping instances of the pattern in the line  
 86368 shall be replaced.
- 86369 If *options* includes the letter 'c' (**confirm**), then before each substitution the line shall be written;  
 86370 the written line shall reflect all previous substitutions. On the following line, <space> characters  
 86371 shall be written beneath the characters from the line that are before the *pattern* to be replaced,  
 86372 and '^' characters written beneath the characters included in the *pattern* to be replaced. The *ex*  
 86373 utility shall then wait for a response from the user. An affirmative response shall cause the  
 86374 substitution to be done, while any other input shall not make the substitution. An affirmative  
 86375 response shall consist of a line with the affirmative response (as defined by the current locale) at  
 86376 the beginning of the line. This line shall be subject to editing in the same way as the *ex* command  
 86377 line.
- 86378 If interrupted (see the ASYNCHRONOUS EVENTS section), any modifications confirmed by the  
 86379 user shall be preserved in the edit buffer after the interrupt.
- 86380 If the remembered search direction is not set, the **s** command shall set it to forward.
- 86381 In the second Synopsis, the **&** command shall repeat the previous substitution, as if the **&**  
 86382 command were replaced by:
- 86383 *s/pattern/repl/*
- 86384 where *pattern* and *repl* are as specified in the previous **s**, **&**, or **~** command.
- 86385 In the third Synopsis, the **~** command shall repeat the previous substitution, as if the '**~**' were  
 86386 replaced by:
- 86387 *s/pattern/repl/*
- 86388 where *pattern* shall be the last regular expression specified to the editor, and *repl* shall be from  
 86389 the previous substitution (including **&** and **~**) command.
- 86390 These commands shall be affected by the *LC\_MESSAGES* environment variable.
- 86391 *Current line*: Set to the last line in which a substitution occurred, or, unchanged if no substitution  
 86392 occurred.
- 86393 *Current column*: Set to non-<blank>.

86394 **Suspend**

86395 *Synopsis:*    su[spend][!]  
86396            st[op][!]

86397 Allow control to return to the invoking process; *ex* shall suspend itself as if it had received the  
86398 SIGTSTP signal. The suspension shall occur only if job control is enabled in the invoking shell  
86399 (see the description of *set -m*).

86400 These commands shall be affected by the **autowrite** and **writeany** edit options.

86401 The current **susp** character (see *stty*) shall be equivalent to the **suspend** command.

86402 **Tag**

86403 *Synopsis:*    ta[g][!] *tagstring*

86404 The results are unspecified if the format of a tags file is not as specified by the *ctags* utility (see  
86405 *ctags*) description.

86406 The **tag** command shall search for *tagstring* in the tag files referred to by the **tag** edit option, in  
86407 the order they are specified, until a reference to *tagstring* is found. Files shall be searched from  
86408 beginning to end. If no reference is found, it shall be an error and an error message to this effect  
86409 shall be written. If the reference is not found, or if an error occurs while processing a file referred  
86410 to in the **tag** edit option, it shall be an error, and an error message shall be written at the first  
86411 occurrence of such an error.

86412 Otherwise, if the tags file contained a pattern, the pattern shall be treated as a regular expression  
86413 used in the editor; for example, for the purposes of the **s** command.

86414 If the *tagstring* is in a file with a different name than the current pathname, set the current  
86415 pathname to the name of that file, and replace the contents of the edit buffer with the contents of  
86416 that file. In this case, if no '!' is appended to the command name, and the edit buffer has been  
86417 modified since the last complete write, it shall be an error, unless the file is successfully written  
86418 as specified by the **autowrite** option.

86419 This command shall be affected by the **autowrite**, **tag**, **taglength**, and **writeany** edit options.

86420 *Current line:* If the tags file contained a line number, set to that line number. If the line number is  
86421 larger than the last line in the edit buffer, an error message shall be written and the current line  
86422 shall be set as specified for the **edit** command.

86423 If the tags file contained a pattern, set to the first occurrence of the pattern in the file. If no  
86424 matching pattern is found, an error message shall be written and the current line shall be set as  
86425 specified for the **edit** command.

86426 *Current column:* If the tags file contained a line-number reference and that line-number was not  
86427 larger than the last line in the edit buffer, or if the tags file contained a pattern and that pattern  
86428 was found, set to non-<blank>. Otherwise, set as specified for the **edit** command.

86429 **Unabbreviate**86430 *Synopsis:*    una[bbrev] lhs86431 If *lhs* is not an entry in the current list of abbreviations (see [Abbreviate](#), on page 2654), it shall be  
86432 an error. Otherwise, delete *lhs* from the list of abbreviations.86433 *Current line:* Unchanged.86434 *Current column:* Unchanged.86435 **Undo**86436 *Synopsis:*    u[ndo]86437 Reverse the changes made by the last command that modified the contents of the edit buffer,  
86438 including **undo**. For this purpose, the **global**, **v**, **open**, and **visual** commands, and commands  
86439 resulting from buffer executions and mapped character expansions, are considered single  
86440 commands.86441 If no action that can be undone preceded the **undo** command, it shall be an error.86442 If the **undo** command restores lines that were marked, the mark shall also be restored unless it  
86443 was reset subsequent to the deletion of the lines.86444 *Current line:*

- 86445       1. If lines are added or changed in the file, set to the first line added or changed.
- 
- 86446       2. Set to the line before the first line deleted, if it exists.
- 
- 86447       3. Set to 1 if the edit buffer is not empty.
- 
- 86448       4. Set to zero.

86449 *Current column:* Set to non-<blank>.86450 **Unmap**86451 *Synopsis:*    unm[ap][!]*lhs*86452 If '!' is appended to the command name, and if *lhs* is not an entry in the list of text input mode  
86453 map definitions, it shall be an error. Otherwise, delete *lhs* from the list of text input mode map  
86454 definitions.86455 If no '!' is appended to the command name, and if *lhs* is not an entry in the list of command  
86456 mode map definitions, it shall be an error. Otherwise, delete *lhs* from the list of command mode  
86457 map definitions.86458 *Current line:* Unchanged.86459 *Current column:* Unchanged.

86460 **Version**86461 *Synopsis:* `ve[rsion]`86462 Write a message containing version information for the editor. The format of the message is  
86463 unspecified.86464 *Current line:* Unchanged.86465 *Current column:* Unchanged.86466 **Visual**86467 *Synopsis:* `[laddr] vi[sual][type][count][flags]`86468 If *ex* is currently in open or visual mode, the *Synopsis* and behavior of the *visual* command shall  
86469 be the same as the **edit** command, as specified by **Edit** (on page 2656).86470 Otherwise, this command need not be supported on block-mode terminals or terminals with  
86471 insufficient capabilities. If standard input, standard output, or standard error are not terminal  
86472 devices, the results are unspecified.86473 If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in  
86474 **window**, on page 2683). If the '^' type character was also specified, the **window** edit option  
86475 shall be set before being used by the type character.86476 Enter visual mode. If *type* is not specified, it shall be as if a *type* of '+' was specified. The *type*  
86477 shall cause the following effects:

86478 + Place the beginning of the specified line at the top of the display.

86479 - Place the end of the specified line at the bottom of the display.

86480 . Place the beginning of the specified line in the middle of the display.

86481 ^ If the specified line is less than or equal to the value of the **window** edit option, set the line  
86482 to 1; otherwise, decrement the line by the value of the **window** edit option minus 1. Place  
86483 the beginning of this line as close to the bottom of the displayed lines as possible, while still  
86484 displaying the value of the **window** edit option number of lines.86485 *Current line:* Set to the specified line.86486 *Current column:* Set to non-<blank>.86487 **Write**86488 *Synopsis:* `[2addr] w[rite][!][>>][file]`86489 `[2addr] w[rite][!][file]`86490 `[2addr] wq[!][>>][file]`

86491 If no lines are specified, the lines shall default to the entire file.

86492 The command **wq** shall be equivalent to a **write** command followed by a **quit** command; **wq!**  
86493 shall be equivalent to **write!** followed by **quit**. In both cases, if the **write** command fails, the  
86494 **quit** shall not be attempted.86495 If the command name is not followed by one or more <blank> characters, or *file* is not preceded  
86496 by a '!' character, the **write** shall be to a file.86497 1. If the >> argument is specified, and the file already exists, the lines shall be appended to  
86498 the file instead of replacing its contents. If the >> argument is specified, and the file does  
86499 not already exist, it is unspecified whether the write shall proceed as if the >> argument

- 86500 had not been specified or if the write shall fail.
- 86501 2. If the **readonly** edit option is set (see **readonly**, on page 2680), the **write** shall fail.
- 86502 3. If *file* is specified, and is not the current pathname, and the file exists, the **write** shall fail.
- 86503 4. If *file* is not specified, the current pathname shall be used. If there is no current pathname,
- 86504 the **write** command shall fail.
- 86505 5. If the current pathname is used, and the current pathname has been changed by the **file**
- 86506 or **read** commands, and the file exists, the **write** shall fail. If the **write** is successful,
- 86507 subsequent **writes** shall not fail for this reason (unless the current pathname is changed
- 86508 again).
- 86509 6. If the whole edit buffer is not being written, and the file to be written exists, the **write**
- 86510 shall fail.
- 86511 For rules 1., 2., 3., and 5., the **write** can be forced by appending the character '!' to the
- 86512 command name.
- 86513 For rules 2., 3., and 5., the **write** can be forced by setting the **writeany** edit option.
- 86514 Additional, implementation-defined tests may cause the **write** to fail.
- 86515 If the edit buffer is empty, a file without any contents shall be written.
- 86516 An informational message shall be written noting the number of lines and bytes written.
- 86517 Otherwise, if the command is followed by one or more <blank> characters, and the file is
- 86518 preceded by '!', the rest of the line after the '!' shall have '%', '#', and '!' characters
- 86519 expanded as described in **Command Line Parsing in ex** (on page 2646).
- 86520 The *ex* utility shall then pass two arguments to the program named by the **shell** edit option; the
- 86521 first shall be **-c** and the second shall be the expanded arguments to the **write** command as a
- 86522 single argument. The specified lines shall be written to the standard input of the command. The
- 86523 standard error and standard output of the program, if any, shall be written as described for the
- 86524 **print** command. If the last character in that output is not a <newline>, a <newline> shall be
- 86525 written at the end of the output.
- 86526 The special meaning of the '!' following the **write** command can be overridden by escaping it
- 86527 with a <backslash> character.
- 86528 *Current line*: Unchanged.
- 86529 *Current column*: Unchanged.
- 86530 **Write and Exit**
- 86531 *Synopsis*: [2addr] x[it][!][file]
- 86532 If the edit buffer has not been modified since the last complete **write**, **xit** shall be equivalent to
- 86533 the **quit** command, or if a '!' is appended to the command name, to **quit!**.
- 86534 Otherwise, **xit** shall be equivalent to the **wq** command, or if a '!' is appended to the command
- 86535 name, to **wq!**.
- 86536 *Current line*: Unchanged.
- 86537 *Current column*: Unchanged.

86538 **Yank**86539 *Synopsis:* `[2addr] ya[nk][buffer][count]`86540 Copy the specified lines to the specified buffer (by default, the unnamed buffer), which shall  
86541 become a line-mode buffer.86542 *Current line:* Unchanged.86543 *Current column:* Unchanged.86544 **Adjust Window**86545 *Synopsis:* `[1addr] z[!][type ...][count][flags]`86546 If no line is specified, the current line shall be the default; if *type* is omitted as well, the current  
86547 line value shall first be incremented by 1. If incrementing the current line would cause it to be  
86548 greater than the last line in the edit buffer, it shall be an error.86549 If there are <blank> characters between the *type* argument and the preceding *z* command name  
86550 or optional '!' character, it shall be an error.86551 If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in  
86552 **window**, on page 2683). If *count* is omitted, it shall default to 2 times the value of the **scroll** edit  
86553 option, or if ! was specified, the number of lines in the display minus 1.86554 If *type* is omitted, then *count* lines starting with the specified line shall be written. Otherwise,  
86555 *count* lines starting with the line specified by the *type* argument shall be written.86556 The *type* argument shall change the lines to be written. The possible values of *type* are as follows:

86557 – The specified line shall be decremented by the following value:

86558  $((\text{number of ``-'' characters}) \times \text{count}) - 1$ 86559 If the calculation would result in a number less than 1, it shall be an error. Write lines from  
86560 the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit  
86561 buffer has been written.

86562 + The specified line shall be incremented by the following value:

86563  $((\text{number of ``+'' characters}) - 1) \times \text{count} + 1$ 86564 If the calculation would result in a number greater than the last line in the edit buffer, it  
86565 shall be an error. Write lines from the edit buffer, starting at the new value of line, until *count*  
86566 lines or the last line in the edit buffer has been written.86567 =, . If more than a single ' .' or '= ' is specified, it shall be an error. The following steps shall  
86568 be taken:86569 1. If *count* is zero, nothing shall be written.86570 2. Write as many of the *N* lines before the current line in the edit buffer as exist. If *count*  
86571 or '!' was specified, *N* shall be:86572  $(\text{count} - 1) / 2$ 86573 Otherwise, *N* shall be:86574  $(\text{count} - 3) / 2$ 86575 If *N* is a number less than 3, no lines shall be written.

- 86576 3. If '=' was specified as the type character, write a line consisting of the smaller of the  
86577 number of columns in the display divided by two, or 40 '-' characters.
- 86578 4. Write the current line.
- 86579 5. Repeat step 3.
- 86580 6. Write as many of the *N* lines after the current line in the edit buffer as exist. *N* shall  
86581 be defined as in step 2. If *N* is a number less than 3, no lines shall be written. If *count*  
86582 is less than 3, no lines shall be written.

86583 ^ The specified line shall be decremented by the following value:

86584  $((\text{number of } \text{'^'} \text{ characters}) + 1) \times \text{count} - 1$

86585 If the calculation would result in a number less than 1, it shall be an error. Write lines from  
86586 the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit  
86587 buffer has been written.

86588 *Current line*: Set to the last line written, unless the type is =, in which case, set to the specified  
86589 line.

86590 *Current column*: Set to non-<blank>.

### 86591 Escape

86592 *Synopsis*: ! *command*  
86593 [*addr*] ! *command*

86594 The contents of the line after the '!' shall have '%', '#', and '!' characters expanded as  
86595 described in [Command Line Parsing in ex](#) (on page 2646). If the expansion causes the text of the  
86596 line to change, it shall be redisplayed, preceded by a single '!' character.

86597 The *ex* utility shall execute the program named by the **shell** edit option. It shall pass two  
86598 arguments to the program; the first shall be **-c**, and the second shall be the expanded arguments  
86599 to the ! command as a single argument.

86600 If no lines are specified, the standard input, standard output, and standard error of the program  
86601 shall be set to the standard input, standard output, and standard error of the *ex* program when it  
86602 was invoked. In addition, a warning message shall be written if the edit buffer has been  
86603 modified since the last complete write, and the **warn** edit option is set.

86604 If lines are specified, they shall be passed to the program as standard input, and the standard  
86605 output and standard error of the program shall replace those lines in the edit buffer. Each line in  
86606 the program output (as delimited by <newline> characters or the end of the output if it is not  
86607 immediately preceded by a <newline>), shall be a separate line in the edit buffer. Any  
86608 occurrences of <carriage-return> and <newline> pairs in the output shall be treated as single  
86609 <newline> characters. The specified lines shall be copied into the unnamed buffer before they  
86610 are replaced, and the unnamed buffer shall become a line-mode buffer.

86611 If in *ex* mode, a single '!' character shall be written when the program completes.

86612 This command shall be affected by the **shell** and **warn** edit options. If no lines are specified, this  
86613 command shall be affected by the **autowrite** and **writeany** edit options. If lines are specified, this  
86614 command shall be affected by the **autoprint** edit option.

86615 *Current line:*

- 86616 1. If no lines are specified, unchanged.
- 86617 2. Otherwise, set to the last line read in, if any lines are read in.
- 86618 3. Otherwise, set to the line before the first line of the lines specified, if that line exists.
- 86619 4. Otherwise, set to the first line of the edit buffer if the edit buffer is not empty.
- 86620 5. Otherwise, set to zero.

86621 *Current column:* If no lines are specified, unchanged. Otherwise, set to non-<blank>.

### 86622 **Shift Left**

86623 *Synopsis:* [2addr] <[< ...] [count] [flags]

86624 Shift the specified lines to the start of the line; the number of column positions to be shifted shall  
86625 be the number of command characters times the value of the **shiftwidth** edit option. Only  
86626 leading <blank> characters shall be deleted or changed into other <blank> characters in shifting;  
86627 other characters shall not be affected.

86628 Lines to be shifted shall be copied into the unnamed buffer, which shall become a line-mode  
86629 buffer.

86630 This command shall be affected by the **autoprint** edit option.

86631 *Current line:* Set to the last line in the lines specified.

86632 *Current column:* Set to non-<blank>.

### 86633 **Shift Right**

86634 *Synopsis:* [2addr] >[> ...] [count] [flags]

86635 Shift the specified lines away from the start of the line; the number of column positions to be  
86636 shifted shall be the number of command characters times the value of the **shiftwidth** edit  
86637 option. The shift shall be accomplished by adding <blank> characters as a prefix to the line or  
86638 changing leading <blank> characters into other <blank> characters. Empty lines shall not be  
86639 changed.

86640 Lines to be shifted shall be copied into the unnamed buffer, which shall become a line-mode  
86641 buffer.

86642 This command shall be affected by the **autoprint** edit option.

86643 *Current line:* Set to the last line in the lines specified.

86644 *Current column:* Set to non-<blank>.

### 86645 **<control>-D**

86646 *Synopsis:* <control>-D

86647 Write the next *n* lines, where *n* is the minimum of the values of the **scroll** edit option and the  
86648 number of lines after the current line in the edit buffer. If the current line is the last line of the  
86649 edit buffer it shall be an error.

86650 *Current line:* Set to the last line written.

86651 *Current column:* Set to non-<blank>.

86652 **Write Line Number**86653 *Synopsis:* `[1addr] = [flags]`86654 If *line* is not specified, it shall default to the last line in the edit buffer. Write the line number of  
86655 the specified line.86656 *Current line:* Unchanged.86657 *Current column:* Unchanged.86658 **Execute**86659 *Synopsis:* `[2addr] @ buffer`86660 `[2addr] * buffer`86661 If no buffer is specified or is specified as '@' or '\* ', the last buffer executed shall be used. If no  
86662 previous buffer has been executed, it shall be an error.86663 For each line specified by the addresses, set the current line (' ') to the specified line, and  
86664 execute the contents of the named *buffer* (as they were at the time the @ command was executed)  
86665 as *ex* commands. For each line of a line-mode buffer, and all but the last line of a character-mode  
86666 buffer, the *ex* command parser shall behave as if the line was terminated by a <newline>.86667 If an error occurs during this process, or a line specified by the addresses does not exist when  
86668 the current line would be set to it, or more than a single line was specified by the addresses, and  
86669 the contents of the edit buffer are replaced (for example, by the *ex* :edit command) an error  
86670 message shall be written, and no more commands resulting from the execution of this command  
86671 shall be processed.86672 *Current line:* As specified for the individual *ex* commands.86673 *Current column:* As specified for the individual *ex* commands.86674 **Regular Expressions in ex**86675 The *ex* utility shall support regular expressions that are a superset of the basic regular  
86676 expressions described in XBD Section 9.3 (on page 183). A null regular expression (" / ") shall  
86677 be equivalent to the last regular expression encountered.86678 Regular expressions can be used in addresses to specify lines and, in some commands (for  
86679 example, the **substitute** command), to specify portions of a line to be substituted.

86680 The following constructs can be used to enhance the basic regular expressions:

86681 \< Match the beginning of a *word*. (See the definition of *word* at the beginning of **Command**  
86682 **Descriptions in ex** (on page 2651).)86683 \> Match the end of a *word*.86684 ~ Match the replacement part of the last **substitute** command. The <tilde> (' ~ ') character can  
86685 be escaped in a regular expression to become a normal character with no special meaning.  
86686 The <backslash> shall be discarded.86687 When the editor option **magic** is not set, the only characters with special meanings shall be '^ '  
86688 at the beginning of a pattern, '\$ ' at the end of a pattern, and <backslash>. The characters '.',  
86689 '\*', '[', and '~ ' shall be treated as ordinary characters unless preceded by a <backslash>;  
86690 when preceded by a <backslash> they shall regain their special meaning, or in the case of  
86691 <backslash>, be handled as a single <backslash>. <backslash> characters used to escape other  
86692 characters shall be discarded.

86693 **Replacement Strings in ex**

86694 The character '&' ('\&' if the editor option **magic** is not set) in the replacement string shall  
 86695 stand for the text matched by the pattern to be replaced. The character '~' ('\~' if **magic** is not  
 86696 set) shall be replaced by the replacement part of the previous **substitute** command. The  
 86697 sequence '\n', where *n* is an integer, shall be replaced by the text matched by the  
 86698 corresponding back-reference expression. If the corresponding back-reference expression does  
 86699 not match, then the characters '\n' shall be replaced by the empty string.

86700 The strings '\l', '\u', '\L', and '\U' can be used to modify the case of elements in the  
 86701 replacement string (using the '\&' or "\"digit) notation. The string '\l' ('\u') shall cause  
 86702 the character that follows to be converted to lowercase (uppercase). The string '\L' ('\U') shall  
 86703 cause all characters subsequent to it to be converted to lowercase (uppercase) as they are  
 86704 inserted by the substitution until the string '\e' or '\E', or the end of the replacement string,  
 86705 is encountered.

86706 Otherwise, any character following a <backslash> shall be treated as that literal character, and  
 86707 the escaping <backslash> shall be discarded.

86708 An example of case conversion with the **s** command is as follows:

```
86709 :p
86710 The cat sat on the mat.
86711 :s/\<.at\>/\u&/gp
86712 The Cat Sat on the Mat.
86713 :s/S\ (. * \) M/S\U\1\eM/p
86714 The Cat SAT ON THE Mat.
```

86715 **Edit Options in ex**

86716 The *ex* utility has a number of options that modify its behavior. These options have default  
 86717 settings, which can be changed using the **set** command.

86718 Options are Boolean unless otherwise specified.

86719 **autoindent, ai**

86720 [Default *unset*]

86721 If **autoindent** is set, each line in input mode shall be indented (using first as many <tab>  
 86722 characters as possible, as determined by the editor option **tabstop**, and then using <space>  
 86723 characters) to align with another line, as follows:

- 86724 1. If in open or visual mode and the text input is part of a line-oriented command (see the  
 86725 EXTENDED DESCRIPTION in *vi*), align to the first column.
- 86726 2. Otherwise, if in open or visual mode, indentation for each line shall be set as follows:
  - 86727 a. If a line was previously inserted as part of this command, it shall be set to the  
 86728 indentation of the last inserted line by default, or as otherwise specified for the  
 86729 <control>-D character in **Input Mode Commands** in *vi* (on page 3344).
  - 86730 b. Otherwise, it shall be set to the indentation of the previous current line, if any;  
 86731 otherwise, to the first column.
- 86732 3. For the *ex* **a**, **i**, and **c** commands, indentation for each line shall be set as follows:

- 86733 a. If a line was previously inserted as part of this command, it shall be set to the  
86734 indentation of the last inserted line by default, or as otherwise specified for the *eof*  
86735 character in **Scroll** (on page 2650).
- 86736 b. Otherwise, if the command is the *ex a* command, it shall be set to the line  
86737 appended after, if any; otherwise to the first column.
- 86738 c. Otherwise, if the command is the *ex i* command, it shall be set to the line inserted  
86739 before, if any; otherwise to the first column.
- 86740 d. Otherwise, if the command is the *ex c* command, it shall be set to the indentation of  
86741 the line replaced.

#### 86742 **autoprint, ap**

86743 [Default *set*]

86744 If **autoprint** is set, the current line shall be written after each *ex* command that modifies the  
86745 contents of the current edit buffer, and after each **tag** command for which the tag search pattern  
86746 was found or tag line number was valid, unless:

- 86747 1. The command was executed while in open or visual mode.
- 86748 2. The command was executed as part of a **global** or **v** command or **@** buffer execution.
- 86749 3. The command was the form of the **read** command that reads a file into the edit buffer.
- 86750 4. The command was the **append**, **change**, or **insert** command.
- 86751 5. The command was not terminated by a <newline>.
- 86752 6. The current line shall be written by a flag specified to the command; for example, **delete #**  
86753 shall write the current line as specified for the flag modifier to the **delete** command, and  
86754 not as specified by the **autoprint** edit option.

#### 86755 **autowrite, aw**

86756 [Default *unset*]

86757 If **autowrite** is set, and the edit buffer has been modified since it was last completely written to  
86758 any file, the contents of the edit buffer shall be written as if the *ex write* command had been  
86759 specified without arguments, before each command affected by the **autowrite** edit option is  
86760 executed. Appending the character '!' to the command name of any of the *ex* commands  
86761 except '!' shall prevent the write. If the write fails, it shall be an error and the command shall  
86762 not be executed.

#### 86763 **beautify, bf**

86764 XSI [Default *unset*]

86765 If **beautify** is set, all non-printable characters, other than <tab>, <newline>, and <form-feed>  
86766 characters, shall be discarded from text read in from files.

- 86767           **directory, dir**  
 86768           [Default *implementation-defined*]  
 86769           The value of this option specifies the directory in which the editor buffer is to be placed. If this  
 86770           directory is not writable by the user, the editor shall quit.
- 86771           **edcompatible, ed**  
 86772           [Default *unset*]  
 86773           Causes the presence of **g** and **c** suffixes on substitute commands to be remembered, and toggled  
 86774           by repeating the suffixes.
- 86775           **errorbells, eb**  
 86776           [Default *unset*]  
 86777           If the editor is in *ex* mode, and the terminal does not support a standout mode (such as inverse  
 86778           video), and **errorbells** is set, error messages shall be preceded by alerting the terminal.
- 86779           **exrc**  
 86780           [Default *unset*]  
 86781           If **exrc** is set, *ex* shall access any **.exrc** file in the current directory, as described in [Initialization in](#)  
 86782           [ex and vi](#) (on page 2642). If **exrc** is not set, *ex* shall ignore any **.exrc** file in the current directory  
 86783           during initialization, unless the current directory is that named by the *HOME* environment  
 86784           variable.
- 86785           **ignorecase, ic**  
 86786           [Default *unset*]  
 86787           If **ignorecase** is set, characters that have uppercase and lowercase representations shall have  
 86788           those representations considered as equivalent for purposes of regular expression comparison.  
 86789           The **ignorecase** edit option shall affect all remembered regular expressions; for example,  
 86790           unsetting the **ignorecase** edit option shall cause a subsequent *vi n* command to search for the  
 86791           last basic regular expression in a case-sensitive fashion.
- 86792           **list**  
 86793           [Default *unset*]  
 86794           If **list** is set, edit buffer lines written while in *ex* command mode shall be written as specified for  
 86795           the **print** command with the **l** flag specified. In open or visual mode, each edit buffer line shall  
 86796           be displayed as specified for the *ex print* command with the **l** flag specified. In open or visual  
 86797           text input mode, when the cursor does not rest on any character in the line, it shall rest on the  
 86798           ' \$ ' marking the end of the line.

- 86799           **magic**
- 86800           [Default *set*]
- 86801           If **magic** is set, modify the interpretation of characters in regular expressions and substitution replacement strings (see [Regular Expressions in ex](#) (on page 2675) and [Replacement Strings in ex](#), on page 2676).
- 86802
- 86803
- 86804           **mesg**
- 86805           [Default *set*]
- 86806           If **mesg** is set, the permission for others to use the **write** or **talk** commands to write to the terminal shall be turned on while in open or visual mode. The shell-level command *mesg n* shall take precedence over any setting of the *ex mesg* option; that is, if **mesg y** was issued before the editor started (or in a shell escape), such as:
- 86807
- 86808
- 86809
- 86810           : !mesg y
- 86811           the **mesg** option in *ex* shall suppress incoming messages, but the **mesg** option shall not enable incoming messages if **mesg n** was issued.
- 86812
- 86813           **number, nu**
- 86814           [Default *unset*]
- 86815           If **number** is set, edit buffer lines written while in *ex* command mode shall be written with line numbers, in the format specified by the **print** command with the # flag specified. In *ex* text input mode, each line shall be preceded by the line number it will have in the file.
- 86816
- 86817
- 86818           In open or visual mode, each edit buffer line shall be displayed with a preceding line number, in the format specified by the *ex print* command with the # flag specified. This line number shall not be considered part of the line for the purposes of evaluating the current column; that is, column position 1 shall be the first column position after the format specified by the **print** command.
- 86819
- 86820
- 86821
- 86822
- 86823           **paragraphs, para**
- 86824           [Default in the POSIX locale IPLPPPQPP LIpplpipbp]
- 86825           The **paragraphs** edit option shall define additional paragraph boundaries for the open and visual mode commands. The **paragraphs** edit option can be set to a character string consisting of zero or more character pairs. It shall be an error to set it to an odd number of characters.
- 86826
- 86827
- 86828           **prompt**
- 86829           [Default *set*]
- 86830           If **prompt** is set, *ex* command mode input shall be prompted for with a <colon> (':'); when unset, no prompt shall be written.
- 86831

86832 **readonly**86833 [Default *see text*]

86834 If the **readonly** edit option is set, read-only mode shall be enabled (see [Write](#), on page 2670). The  
 86835 **readonly** edit option shall be initialized to set if either of the following conditions are true:

- 86836 • The command-line option `-R` was specified.
- 86837 • Performing actions equivalent to the `access()` function called with the following arguments  
 86838 indicates that the file lacks write permission:
  - 86839 1. The current pathname is used as the *path* argument.
  - 86840 2. The constant `W_OK` is used as the *amode* argument.

86841 The **readonly** edit option may be initialized to set for other, implementation-defined reasons.  
 86842 The **readonly** edit option shall not be initialized to unset based on any special privileges of the  
 86843 user or process. The **readonly** edit option shall be reinitialized each time that the contents of the  
 86844 edit buffer are replaced (for example, by an **edit** or **next** command) unless the user has explicitly  
 86845 set it, in which case it shall remain set until the user explicitly unsets it. Once unset, it shall again  
 86846 be reinitialized each time that the contents of the edit buffer are replaced.

86847 **redraw**86848 [Default *unset*]

86849 The editor simulates an intelligent terminal on a dumb terminal. (Since this is likely to require a  
 86850 large amount of output to the terminal, it is useful only at high transmission speeds.)

86851 **remap**86852 [Default *set*]

86853 If **remap** is set, map translation shall allow for maps defined in terms of other maps; translation  
 86854 shall continue until a final product is obtained. If unset, only a one-step translation shall be  
 86855 done.

86856 **report**

86857 [Default 5]

86858 The value of this **report** edit option specifies what number of lines being added, copied, deleted,  
 86859 or modified in the edit buffer will cause an informational message to be written to the user. The  
 86860 following conditions shall cause an informational message. The message shall contain the  
 86861 number of lines added, copied, deleted, or modified, but is otherwise unspecified.

- 86862 • An *ex* or *vi* editor command, other than **open**, **undo**, or **visual**, that modifies at least the  
 86863 value of the **report** edit option number of lines, and which is not part of an *ex* **global** or **v**  
 86864 command, or *ex* or *vi* buffer execution, shall cause an informational message to be written.
- 86865 • An *ex* **yank** or *vi* **y** or **Y** command, that copies at least the value of the **report** edit option  
 86866 plus 1 number of lines, and which is not part of an *ex* **global** or **v** command, or *ex* or *vi*  
 86867 buffer execution, shall cause an informational message to be written.
- 86868 • An *ex* **global**, **v**, **open**, **undo**, or **visual** command or *ex* or *vi* buffer execution, that adds or  
 86869 deletes a total of at least the value of the **report** edit option number of lines, and which is  
 86870 not part of an *ex* **global** or **v** command, or *ex* or *vi* buffer execution, shall cause an  
 86871 informational message to be written. (For example, if 3 lines were added and 8 lines  
 86872 deleted during an *ex* **visual** command, 5 would be the number compared against the

- 86873 **report** edit option after the command completed.)
- 86874 **scroll, scr**
- 86875 [Default (number of lines in the display -1)/2]
- 86876 The value of the **scroll** edit option shall determine the number of lines scrolled by the *ex*  
86877 <control>-D and **z** commands. For the *vi* <control>-D and <control>-U commands, it shall be the  
86878 initial number of lines to scroll when no previous <control>-D or <control>-U command has  
86879 been executed.
- 86880 **sections**
- 86881 [Default in the POSIX locale `NHSHH HUnhsh`]
- 86882 The **sections** edit option shall define additional section boundaries for the open and visual mode  
86883 commands. The **sections** edit option can be set to a character string consisting of zero or more  
86884 character pairs; it shall be an error to set it to an odd number of characters.
- 86885 **shell, sh**
- 86886 [Default from the environment variable `SHELL`]
- 86887 The value of this option shall be a string. The default shall be taken from the `SHELL`  
86888 environment variable. If the `SHELL` environment variable is null or empty, the *sh* (see *sh*) utility  
86889 shall be the default.
- 86890 **shiftwidth, sw**
- 86891 [Default 8]
- 86892 The value of this option shall give the width in columns of an indentation level used during  
86893 autoindentation and by the shift commands (< and >).
- 86894 **showmatch, sm**
- 86895 [Default *unset*]
- 86896 The functionality described for the **showmatch** edit option need not be supported on block-  
86897 mode terminals or terminals with insufficient capabilities.
- 86898 If **showmatch** is set, in open or visual mode, when a ' ) ' or ' } ' is typed, if the matching ' ( ' or  
86899 ' { ' is currently visible on the display, the matching ' ( ' or ' { ' shall be flagged moving the  
86900 cursor to its location for an unspecified amount of time.
- 86901 **showmode**
- 86902 [Default *unset*]
- 86903 If **showmode** is set, in open or visual mode, the current mode that the editor is in shall be  
86904 displayed on the last line of the display. Command mode and text input mode shall be  
86905 differentiated; other unspecified modes and implementation-defined information may be  
86906 displayed.

- 86907           **slowopen**
- 86908           [Default *unset*]
- 86909           If **slowopen** is set during open and visual text input modes, the editor shall not update portions  
86910           of the display other than those display line columns that display the characters entered by the  
86911           user (see [Input Mode Commands in vi](#), on page 3344).
- 86912           **tabstop, ts**
- 86913           [Default 8]
- 86914           The value of this edit option shall specify the column boundary used by a <tab> in the display  
86915           (see [autoprint, ap](#) (on page 2677) and [Input Mode Commands in vi](#), on page 3344).
- 86916           **taglength, tl**
- 86917           [Default zero]
- 86918           The value of this edit option shall specify the maximum number of characters that are  
86919           considered significant in the user-specified tag name and in the tag name from the tags file. If  
86920           the value is zero, all characters in both tag names shall be significant.
- 86921           **tags**
- 86922           [Default *see text*]
- 86923           The value of this edit option shall be a string of <blank>-delimited pathnames of files used by  
86924           the **tag** command. The default value is unspecified.
- 86925           **term**
- 86926           [Default from the environment variable *TERM*]
- 86927           The value of this edit option shall be a string. The default shall be taken from the *TERM* variable  
86928           in the environment. If the *TERM* environment variable is empty or null, the default is  
86929           unspecified. The editor shall use the value of this edit option to determine the type of the display  
86930           device.
- 86931           The results are unspecified if the user changes the value of the term edit option after editor  
86932           initialization.
- 86933           **terse**
- 86934           [Default *unset*]
- 86935           If **terse** is set, error messages may be less verbose. However, except for this caveat, error  
86936           messages are unspecified. Furthermore, not all error messages need change for different settings  
86937           of this option.

- 86938           **warn**
- 86939           [Default *set*]
- 86940           If **warn** is set, and the contents of the edit buffer have been modified since they were last  
86941 completely written, the editor shall write a warning message before certain ! commands (see  
86942 [Escape](#), on page 2673).
- 86943           **window**
- 86944           [Default *see text*]
- 86945           A value used in open and visual mode, by the <control>-B and <control>-F commands, and, in  
86946 visual mode, to specify the number of lines displayed when the screen is repainted.
- 86947           If the **-w** command-line option is not specified, the default value shall be set to the value of the  
86948 *LINES* environment variable. If the *LINES* environment variable is empty or null, the default  
86949 shall be the number of lines in the display minus 1.
- 86950           Setting the **window** edit option to zero or to a value greater than the number of lines in the  
86951 display minus 1 (either explicitly or based on the **-w** option or the *LINES* environment variable)  
86952 shall cause the **window** edit option to be set to the number of lines in the display minus 1.
- 86953           The baud rate of the terminal line may change the default in an implementation-defined manner.
- 86954           **wrapmargin, wm**
- 86955           [Default 0]
- 86956           If the value of this edit option is zero, it shall have no effect.
- 86957           If not in the POSIX locale, the effect of this edit option is implementation-defined.
- 86958           Otherwise, it shall specify a number of columns from the ending margin of the terminal.
- 86959           During open and visual text input modes, for each character for which any part of the character  
86960 is displayed in a column that is less than **wrapmargin** columns from the ending margin of the  
86961 display line, the editor shall behave as follows:
- 86962           1. If the character triggering this event is a <blank>, it, and all immediately preceding  
86963 <blank> characters on the current line entered during the execution of the current text  
86964 input command, shall be discarded, and the editor shall behave as if the user had entered  
86965 a single <newline> instead. In addition, if the next user-entered character is a <space>, it  
86966 shall be discarded as well.
- 86967           2. Otherwise, if there are one or more <blank> characters on the current line immediately  
86968 preceding the last group of inserted non-<blank> characters which was entered during  
86969 the execution of the current text input command, the <blank> characters shall be replaced  
86970 as if the user had entered a single <newline> instead.
- 86971           If the **autoindent** edit option is set, and the events described in 1. or 2. are performed, any  
86972 <blank> characters at or after the cursor in the current line shall be discarded.
- 86973           The ending margin shall be determined by the system or overridden by the user, as described for  
86974 *COLUMNS* in the ENVIRONMENT VARIABLES section and XBD [Chapter 8](#) (on page 173).

- 86975           **wrapscan, ws**
- 86976           [Default *set*]
- 86977           If **wrapscan** is set, searches (the *ex* / or ? addresses, or open and visual mode /, ?, N, and n commands) shall wrap around the beginning or end of the edit buffer; when unset, searches shall stop at the beginning or end of the edit buffer.
- 86978
- 86979
- 86980           **writeany, wa**
- 86981           [Default *unset*]
- 86982           If **writeany** is set, some of the checks performed when executing the *ex* **write** commands shall be inhibited, as described in editor option **autowrite**.
- 86983
- 86984   **EXIT STATUS**
- 86985           The following exit values shall be returned:
- 86986           0   Successful completion.
- 86987           >0   An error occurred.
- 86988   **CONSEQUENCES OF ERRORS**
- 86989           When any error is encountered and the standard input is not a terminal device file, *ex* shall not write the file or return to command or text input mode, and shall terminate with a non-zero exit status.
- 86990
- 86991
- 86992           Otherwise, when an unrecoverable error is encountered, it shall be equivalent to a SIGHUP asynchronous event.
- 86993
- 86994           Otherwise, when an error is encountered, the editor shall behave as specified in [Command Line Parsing in ex](#) (on page 2646).
- 86995
- 86996   **APPLICATION USAGE**
- 86997           If a SIGSEGV signal is received while *ex* is saving a file, the file might not be successfully saved.
- 86998           The **next** command can accept more than one file, so usage such as:
- 86999           next `ls [abc]\*`
- 87000           is valid; it would not be valid for the **edit** or **read** commands, for example, because they expect only one file and unspecified results occur.
- 87001
- 87002   **EXAMPLES**
- 87003           None.
- 87004   **RATIONALE**
- 87005           The *ex/vi* specification is based on the historical practice found in the 4 BSD and System V implementations of *ex* and *vi*.
- 87006
- 87007           A *restricted editor* (both the historical *red* utility and modifications to *ex*) were considered and rejected for inclusion. Neither option provided the level of security that users might expect.
- 87008
- 87009           It is recognized that *ex* visual mode and related features would be difficult, if not impossible, to implement satisfactorily on a block-mode terminal, or a terminal without any form of cursor addressing; thus, it is not a mandatory requirement that such features should work on all terminals. It is the intention, however, that an *ex* implementation should provide the full set of capabilities on all terminals capable of supporting them.
- 87010
- 87011
- 87012
- 87013

87014 **Options**

87015 The **-c** replacement for **+command** was inspired by the **-e** option of *sed*. Historically, all such  
 87016 commands (see **edit** and **next** as well) were executed from the last line of the edit buffer. This  
 87017 meant, for example, that **"/pattern"** would fail unless the **wrapsan** option was set.  
 87018 POSIX.1-2008 requires conformance to historical practice. The **+command** option is no longer  
 87019 specified by POSIX.1-2008 but may be present in some implementations. Historically, some  
 87020 implementations restricted the *ex* commands that could be listed as part of the command line  
 87021 arguments. For consistency, POSIX.1-2008 does not permit these restrictions.

87022 In historical implementations of the editor, the **-R** option (and the **readonly** edit option) only  
 87023 prevented overwriting of files; appending to files was still permitted, mapping loosely into the  
 87024 *cs*h **noclobber** variable. Some implementations, however, have not followed this semantic, and  
 87025 **readonly** does not permit appending either. POSIX.1-2008 follows the latter practice, believing  
 87026 that it is a more obvious and intuitive meaning of **readonly**.

87027 The **-s** option suppresses all interactive user feedback and is useful for editing scripts in batch  
 87028 jobs. The list of specific effects is historical practice. The terminal type "incapable of supporting  
 87029 open and visual modes" has historically been named "dumb".

87030 The **-t** option was required because the *ctags* utility appears in POSIX.1-2008 and the option is  
 87031 available in all historical implementations of *ex*.

87032 Historically, the *ex* and *vi* utilities accepted a **-x** option, which did encryption based on the  
 87033 algorithm found in the historical *crypt* utility. The **-x** option for encryption, and the associated  
 87034 *crypt* utility, were omitted because the algorithm used was not specifiable and the export control  
 87035 laws of some nations make it difficult to export cryptographic technology. In addition, it did not  
 87036 historically provide the level of security that users might expect.

87037 **Standard Input**

87038 An end-of-file condition is not equivalent to an end-of-file character. A common end-of-file  
 87039 character, <control>-D, is historically an *ex* command.

87040 There was no maximum line length in historical implementations of *ex*. Specifically, as it was  
 87041 parsed in chunks, the addresses had a different maximum length than the filenames. Further, the  
 87042 maximum line buffer size was declared as BUFSIZ, which was different lengths on different  
 87043 systems. This version selected the value of {LINE\_MAX} to impose a reasonable restriction on  
 87044 portable usage of *ex* and to aid test suite writers in their development of realistic tests that  
 87045 exercise this limit.

87046 **Input Files**

87047 It was an explicit decision by the standard developers that a <newline> be added to any file  
 87048 lacking one. It was believed that this feature of *ex* and *vi* was relied on by users in order to make  
 87049 text files lacking a trailing <newline> more portable. It is recognized that this will require a user-  
 87050 specified option or extension for implementations that permit *ex* and *vi* to edit files of type other  
 87051 than text if such files are not otherwise identified by the system. It was agreed that the ability to  
 87052 edit files of arbitrary type can be useful, but it was not considered necessary to mandate that an  
 87053 *ex* or *vi* implementation be required to handle files other than text files.

87054 The paragraph in the INPUT FILES section, "By default, ...", is intended to close a long-  
 87055 standing security problem in *ex* and *vi*; that of the "modeline" or "modelines" edit option. This  
 87056 feature allows any line in the first or last five lines of the file containing the strings "ex:" or  
 87057 "vi:" (and, apparently, "ei:" or "vx:") to be a line containing editor commands, and *ex*  
 87058 interprets all the text up to the next ':' or <newline> as a command. Consider the

87059 consequences, for example, of an unsuspecting user using *ex* or *vi* as the editor when replying to  
87060 a mail message in which a line such as:

87061 `ex:! rm -rf :`

87062 appeared in the signature lines. The standard developers believed strongly that an editor should  
87063 not by default interpret any lines of a file. Vendors are strongly urged to delete this feature from  
87064 their implementations of *ex* and *vi*.

### 87065 **Asynchronous Events**

87066 The intention of the phrase “complete write” is that the entire edit buffer be written to stable  
87067 storage. The note regarding temporary files is intended for implementations that use temporary  
87068 files to back edit buffers unnamed by the user.

87069 Historically, SIGQUIT was ignored by *ex*, but was the equivalent of the Q command in visual  
87070 mode; that is, it exited visual mode and entered *ex* mode. POSIX.1-2008 permits, but does not  
87071 require, this behavior. Historically, SIGINT was often used by *vi* users to terminate text input  
87072 mode (<control>-C is often easier to enter than <ESC>). Some implementations of *vi* alerted the  
87073 terminal on this event, and some did not. POSIX.1-2008 requires that SIGINT behave identically  
87074 to <ESC>, and that the terminal not be alerted.

87075 Historically, suspending the *ex* editor during text input mode was similar to SIGINT, as  
87076 completed lines were retained, but any partial line discarded, and the editor returned to  
87077 command mode. POSIX.1-2008 is silent on this issue; implementations are encouraged to follow  
87078 historical practice, where possible.

87079 Historically, the *vi* editor did not treat SIGTSTP as an asynchronous event, and it was therefore  
87080 impossible to suspend the editor in visual text input mode. There are two major reasons for this.  
87081 The first is that SIGTSTP is a broadcast signal on UNIX systems, and the chain of events where  
87082 the shell *execs* an application that then *execs vi* usually caused confusion for the terminal state if  
87083 SIGTSTP was delivered to the process group in the default manner. The second was that most  
87084 implementations of the UNIX *curses* package did not handle SIGTSTP safely, and the receipt of  
87085 SIGTSTP at the wrong time would cause them to crash. POSIX.1-2008 is silent on this issue;  
87086 implementations are encouraged to treat suspension as an asynchronous event if possible.

87087 Historically, modifications to the edit buffer made before SIGINT interrupted an operation were  
87088 retained; that is, anywhere from zero to all of the lines to be modified might have been modified  
87089 by the time the SIGINT arrived. These changes were not discarded by the arrival of SIGINT.  
87090 POSIX.1-2008 permits this behavior, noting that the **undo** command is required to be able to  
87091 undo these partially completed commands.

87092 The action taken for signals other than SIGINT, SIGCONT, SIGHUP, and SIGTERM is  
87093 unspecified because some implementations attempt to save the edit buffer in a useful state when  
87094 other signals are received.

### 87095 **Standard Error**

87096 For *ex/vi*, diagnostic messages are those messages reported as a result of a failed attempt to  
87097 invoke *ex* or *vi*, such as invalid options or insufficient resources, or an abnormal termination  
87098 condition. Diagnostic messages should not be confused with the error messages generated by  
87099 inappropriate or illegal user commands.

87100 **Initialization in ex and vi**

87101 If an *ex* command (other than **cd**, **chdir**, or **source**) has a filename argument, one or both of the  
87102 alternate and current pathnames will be set. Informally, they are set as follows:

- 87103 1. If the *ex* command is one that replaces the contents of the edit buffer, and it succeeds, the  
87104 current pathname will be set to the filename argument (the first filename argument in the  
87105 case of the **next** command) and the alternate pathname will be set to the previous current  
87106 pathname, if there was one.
- 87107 2. In the case of the file read/write forms of the **read** and **write** commands, if there is no  
87108 current pathname, the current pathname will be set to the filename argument.
- 87109 3. Otherwise, the alternate pathname will be set to the filename argument.

87110 For example, **:edit foo** and **:recover foo**, when successful, set the current pathname, and, if there  
87111 was a previous current pathname, the alternate pathname. The commands **:write**, **!command**,  
87112 and **:edit** set neither the current or alternate pathnames. If the **:edit foo** command were to fail for  
87113 some reason, the alternate pathname would be set. The **read** and **write** commands set the  
87114 alternate pathname to their *file* argument, unless the current pathname is not set, in which case  
87115 they set the current pathname to their *file* arguments. The alternate pathname was not  
87116 historically set by the **:source** command. POSIX.1-2008 requires conformance to historical  
87117 practice. Implementations adding commands that take filenames as arguments are encouraged  
87118 to set the alternate pathname as described here.

87119 Historically, *ex* and *vi* read the **.exrc** file in the *\$HOME* directory twice, if the editor was executed  
87120 in the *\$HOME* directory. POSIX.1-2008 prohibits this behavior.

87121 Historically, the 4 BSD *ex* and *vi* read the *\$HOME* and local **.exrc** files if they were owned by the  
87122 real ID of the user, or the **sourceany** option was set, regardless of other considerations. This was  
87123 a security problem because it is possible to put normal UNIX system commands inside a **.exrc**  
87124 file. POSIX.1-2008 does not specify the **sourceany** option, and historical implementations are  
87125 encouraged to delete it.

87126 The **.exrc** files must be owned by the real ID of the user, and not writable by anyone other than  
87127 the owner. The appropriate privileges exception is intended to permit users to acquire special  
87128 privileges, but continue to use the **.exrc** files in their home directories.

87129 System V Release 3.2 and later *vi* implementations added the option **[no]exrc**. The behavior is  
87130 that local **.exrc** files are read-only if the **exrc** option is set. The default for the **exrc** option was off,  
87131 so by default local **.exrc** files were not read. The problem this was intended to solve was that  
87132 System V permitted users to give away files, so there is no possible ownership or writeability  
87133 test to ensure that the file is safe. This is still a security problem on systems where users can give  
87134 away files, but there is nothing additional that POSIX.1-2008 can do. The implementation-  
87135 defined exception is intended to permit groups to have local **.exrc** files that are shared by users,  
87136 by creating pseudo-users to own the shared files.

87137 POSIX.1-2008 does not mention system-wide *ex* and *vi* start-up files. While they exist in several  
87138 implementations of *ex* and *vi*, they are not present in any implementations considered historical  
87139 practice by POSIX.1-2008. Implementations that have such files should use them only if they are  
87140 owned by the real user ID or an appropriate user (for example, root on UNIX systems) and if  
87141 they are not writable by any user other than their owner. System-wide start-up files should be  
87142 read before the *EXINIT* variable, *\$HOME/.exrc*, or local **.exrc** files are evaluated.

87143 Historically, any *ex* command could be entered in the *EXINIT* variable or the **.exrc** file, although  
87144 ones requiring that the edit buffer already contain lines of text generally caused historical  
87145 implementations of the editor to drop **core**. POSIX.1-2008 requires that any *ex* command be

87146 permitted in the *EXINIT* variable and *.exrc* files, for simplicity of specification and consistency,  
 87147 although many of them will obviously fail under many circumstances.

87148 The initialization of the contents of the edit buffer uses the phrase “the effect shall be” with  
 87149 regard to various *ex* commands. The intent of this phrase is that edit buffer contents loaded  
 87150 during the initialization phase not be lost; that is, loading the edit buffer should fail if the *.exrc*  
 87151 file read in the contents of a file and did not subsequently write the edit buffer. An additional  
 87152 intent of this phrase is to specify that the initial current line and column is set as specified for the  
 87153 individual *ex* commands.

87154 Historically, the *-t* option behaved as if the tag search were a *+command*; that is, it was executed  
 87155 from the last line of the file specified by the tag. This resulted in the search failing if the pattern  
 87156 was a forward search pattern and the *wrapsan* edit option was not set. POSIX.1-2008 does not  
 87157 permit this behavior, requiring that the search for the tag pattern be performed on the entire file,  
 87158 and, if not found, that the current line be set to a more reasonable location in the file.

87159 Historically, the empty edit buffer presented for editing when a file was not specified by the user  
 87160 was unnamed. This is permitted by POSIX.1-2008; however, implementations are encouraged to  
 87161 provide users a temporary filename for this buffer because it permits them the use of *ex*  
 87162 commands that use the current pathname during temporary edit sessions.

87163 Historically, the file specified using the *-t* option was not part of the current argument list. This  
 87164 practice is permitted by POSIX.1-2008; however, implementations are encouraged to include its  
 87165 name in the current argument list for consistency.

87166 Historically, the *-c* command was generally not executed until a file that already exists was  
 87167 edited. POSIX.1-2008 requires conformance to this historical practice. Commands that could  
 87168 cause the *-c* command to be executed include the *ex* commands *edit*, *next*, *recover*, *rewind*, and  
 87169 *tag*, and the *vi* commands *<control>-^* and *<control>-]*. Historically, reading a file into an edit  
 87170 buffer did not cause the *-c* command to be executed (even though it might set the current  
 87171 pathname) with the exception that it did cause the *-c* command to be executed if: the editor was  
 87172 in *ex* mode, the edit buffer had no current pathname, the edit buffer was empty, and no read  
 87173 commands had yet been attempted. For consistency and simplicity of specification,  
 87174 POSIX.1-2008 does not permit this behavior.

87175 Historically, the *-r* option was the same as a normal edit session if there was no recovery  
 87176 information available for the file. This allowed users to enter:

87177 `vi -r *.c`

87178 and recover whatever files were recoverable. In some implementations, recovery was attempted  
 87179 only on the first file named, and the file was not entered into the argument list; in others,  
 87180 recovery was attempted for each file named. In addition, some historical implementations  
 87181 ignored *-r* if *-t* was specified or did not support command line *file* arguments with the *-t* option.  
 87182 For consistency and simplicity of specification, POSIX.1-2008 disallows these special cases, and  
 87183 requires that recovery be attempted the first time each file is edited.

87184 Historically, *vi* initialized the *'* and *'* marks, but *ex* did not. This meant that if the first command  
 87185 in *ex* mode was *visual* or if an *ex* command was executed first (for example, *vi +10 file*), *vi*  
 87186 was entered without the marks being initialized. Because the standard developers believed the marks  
 87187 to be generally useful, and for consistency and simplicity of specification, POSIX.1-2008 requires  
 87188 that they always be initialized if in open or visual mode, or if in *ex* mode and the edit buffer is  
 87189 not empty. Not initializing it in *ex* mode if the edit buffer is empty is historical practice; however,  
 87190 it has always been possible to set (and use) marks in empty edit buffers in open and visual mode  
 87191 edit sessions.

87192 **Addressing**

87193 Historically, *ex* and *vi* accepted the additional addressing forms '`\/'` and '`\?'`. They were  
87194 equivalent to "`//`" and "`??`", respectively. They are not required by POSIX.1-2008, mostly  
87195 because nobody can remember whether they ever did anything different historically.

87196 Historically, *ex* and *vi* permitted an address of zero for several commands, and permitted the %  
87197 address in empty files for others. For consistency, POSIX.1-2008 requires support for the former  
87198 in the few commands where it makes sense, and disallows it otherwise. In addition, because  
87199 POSIX.1-2008 requires that % be logically equivalent to "`1, $`", it is also supported where it  
87200 makes sense and disallowed otherwise.

87201 Historically, the % address could not be followed by further addresses. For consistency and  
87202 simplicity of specification, POSIX.1-2008 requires that additional addresses be supported.

87203 All of the following are valid *addresses*:

|       |                       |                                                    |
|-------|-----------------------|----------------------------------------------------|
| 87204 | <code>+++</code>      | Three lines after the current line.                |
| 87205 | <code>/re/-</code>    | One line before the next occurrence of <i>re</i> . |
| 87206 | <code>-2</code>       | Two lines before the current line.                 |
| 87207 | <code>3 ---- 2</code> | Line one (note intermediate negative address).     |
| 87208 | <code>1 2 3</code>    | Line six.                                          |

87209 Any number of addresses can be provided to commands taking addresses; for example,  
87210 "`1, 2, 3, 4, 5p`" prints lines 4 and 5, because two is the greatest valid number of addresses  
87211 accepted by the **print** command. This, in combination with the <semicolon> delimiter, permits  
87212 users to create commands based on ordered patterns in the file. For example, the command  
87213 **3;/foo/;+2print** will display the first line after line 3 that contains the pattern *foo*, plus the next  
87214 two lines. Note that the address **3;** must be evaluated before being discarded because the search  
87215 origin for the **/foo/** command depends on this.

87216 Historically, values could be added to addresses by including them after one or more <blank>  
87217 characters; for example, `3 - 5p` wrote the seventh line of the file, and **/foo/ 5** was the same as  
87218 **/foo/+5**. However, only absolute values could be added; for example, `5 /foo/` was an error.  
87219 POSIX.1-2008 requires conformance to historical practice. Address offsets are separately  
87220 specified from addresses because they could historically be provided to visual mode search  
87221 commands.

87222 Historically, any missing addresses defaulted to the current line. This was true for leading and  
87223 trailing <comma>-delimited addresses, and for trailing <semicolon>-delimited addresses. For  
87224 consistency, POSIX.1-2008 requires it for leading <semicolon> addresses as well.

87225 Historically, *ex* and *vi* accepted the '`^`' character as both an address and as a flag offset for  
87226 commands. In both cases it was identical to the '`-`' character. POSIX.1-2008 does not require or  
87227 prohibit this behavior.

87228 Historically, the enhancements to basic regular expressions could be used in addressing; for  
87229 example, '`~`', '`\<`', and '`\>`'. POSIX.1-2008 requires conformance to historical practice; that  
87230 is, that regular expression usage be consistent, and that regular expression enhancements be  
87231 supported wherever regular expressions are used.

87232 **Command Line Parsing in ex**

87233 Historical *ex* command parsing was even more complex than that described here. POSIX.1-2008  
 87234 requires the subset of the command parsing that the standard developers believed was  
 87235 documented and that users could reasonably be expected to use in a portable fashion, and that  
 87236 was historically consistent between implementations. (The discarded functionality is obscure, at  
 87237 best.) Historical implementations will require changes in order to comply with POSIX.1-2008;  
 87238 however, users are not expected to notice any of these changes. Most of the complexity in *ex*  
 87239 parsing is to handle three special termination cases:

- 87240 1. The **!**, **global**, **v**, and the filter versions of the **read** and **write** commands are delimited by  
 87241 <newline> characters (they can contain <vertical-line> characters that are usually shell  
 87242 pipes).
- 87243 2. The **ex**, **edit**, **next**, and **visual** in open and visual mode commands all take *ex* commands,  
 87244 optionally containing <vertical-line> characters, as their first arguments.
- 87245 3. The **s** command takes a regular expression as its first argument, and uses the delimiting  
 87246 characters to delimit the command.

87247 Historically, <vertical-line> characters in the *+command* argument of the **ex**, **edit**, **next**, **vi**, and  
 87248 **visual** commands, and in the *pattern* and *replacement* parts of the **s** command, did not delimit the  
 87249 command, and in the filter cases for **read** and **write**, and the **!**, **global**, and **v** commands, they did  
 87250 not delimit the command at all. For example, the following commands are all valid:

```
87251 :edit +25 | s/abc/ABC/ file.c
87252 :s/ | /PIPE/
87253 :read !spell % | columnate
87254 :global/pattern/p | l
87255 :s/a/b/ | s/c/d | set
```

87256 Historically, empty or <blank> filled lines in **.exrc** files and **sourced** files (as well as *EXINIT*  
 87257 variables and *ex* command scripts) were treated as default commands; that is, **print** commands.  
 87258 POSIX.1-2008 specifically requires that they be ignored when encountered in **.exrc** and **sourced**  
 87259 files to eliminate a common source of new user error.

87260 Historically, *ex* commands with multiple adjacent (or <blank>-separated) vertical lines were  
 87261 handled oddly when executed from *ex* mode. For example, the command `||| <carriage-return>`,  
 87262 when the cursor was on line 1, displayed lines 2, 3, and 5 of the file. In addition, the command `|`  
 87263 would only display the line after the next line, instead of the next two lines. The former worked  
 87264 more logically when executed from *vi* mode, and displayed lines 2, 3, and 4. POSIX.1-2008  
 87265 requires the *vi* behavior; that is, a single default command and line number increment for each  
 87266 command separator, and trailing <newline> characters after <vertical-line> separators are  
 87267 discarded.

87268 Historically, *ex* permitted a single extra <colon> as a leading command character; for example,  
 87269 **:g/pattern/:p** was a valid command. POSIX.1-2008 generalizes this to require that any number of  
 87270 leading <colon> characters be stripped.

87271 Historically, any prefix of the **delete** command could be followed without intervening <blank>  
 87272 characters by a flag character because in the command **d p**, *p* is interpreted as the buffer *p*.  
 87273 POSIX.1-2008 requires conformance to historical practice.

87274 Historically, the **k** command could be followed by the mark name without intervening <blank>  
 87275 characters. POSIX.1-2008 requires conformance to historical practice.

87276 Historically, the **s** command could be immediately followed by flag and option characters; for  
 87277 example, **s/e/E/l s |sgc3p** was a valid command. However, flag characters could not stand alone;

87278 for example, the commands **sp** and **s l** would fail, while the command **sgp** and **s gl** would  
 87279 succeed. (Obviously, the '#' flag character was used as a delimiter character if it followed the  
 87280 command.) Another issue was that option characters had to precede flag characters even when  
 87281 the command was fully specified; for example, the command **s/e/E/pg** would fail, while the  
 87282 command **s/e/E/gp** would succeed. POSIX.1-2008 requires conformance to historical practice.

87283 Historically, the first command name that had a prefix matching the input from the user was the  
 87284 executed command; for example, **ve**, **ver**, and **vers** all executed the **version** command.  
 87285 Commands were in a specific order, however, so that **a** matched **append**, not **abbreviate**.  
 87286 POSIX.1-2008 requires conformance to historical practice. The restriction on command search  
 87287 order for implementations with extensions is to avoid the addition of commands such that the  
 87288 historical prefixes would fail to work portably.

87289 Historical implementations of *ex* and *vi* did not correctly handle multiple *ex* commands,  
 87290 separated by <vertical-line> characters, that entered or exited visual mode or the editor. Because  
 87291 implementations of *vi* exist that do not exhibit this failure mode, POSIX.1-2008 does not permit  
 87292 it.

87293 The requirement that alphabetic command names consist of all following alphabetic characters  
 87294 up to the next non-alphabetic character means that alphabetic command names must be  
 87295 separated from their arguments by one or more non-alphabetic characters, normally a <blank>  
 87296 or '!' character, except as specified for the exceptions, the **delete**, **k**, and **s** commands.

87297 Historically, the repeated execution of the *ex* default **print** commands (<control>-D, *eof*,  
 87298 <newline>, <carriage-return>) erased any prompting character and displayed the next lines  
 87299 without scrolling the terminal; that is, immediately below any previously displayed lines. This  
 87300 provided a cleaner presentation of the lines in the file for the user. POSIX.1-2008 does not require  
 87301 this behavior because it may be impossible in some situations; however, implementations are  
 87302 strongly encouraged to provide this semantic if possible.

87303 Historically, it was possible to change files in the middle of a command, and have the rest of the  
 87304 command executed in the new file; for example:

```
87305 :edit +25 file.c | s/abc/ABC/ | 1
```

87306 was a valid command, and the substitution was attempted in the newly edited file.  
 87307 POSIX.1-2008 requires conformance to historical practice. The following commands are  
 87308 examples that exercise the *ex* parser:

```
87309 echo 'foo | bar' > file1; echo 'foo/bar' > file2;
```

```
87310 vi
```

```
87311 :edit +1 | s/|/PIPE/ | w file1 | e file2 | 1 | s/\/SLASH/ | wq
```

87312 Historically, there was no protection in editor implementations to avoid *ex* **global**, **v**, **@**, or **\***  
 87313 commands changing edit buffers during execution of their associated commands. Because this  
 87314 would almost invariably result in catastrophic failure of the editor, and implementations exist  
 87315 that do exhibit these problems, POSIX.1-2008 requires that changing the edit buffer during a  
 87316 **global** or **v** command, or during a **@** or **\*** command for which there will be more than a single  
 87317 execution, be an error. Implementations supporting multiple edit buffers simultaneously are  
 87318 strongly encouraged to apply the same semantics to switching between buffers as well.

87319 The *ex* command quoting required by POSIX.1-2008 is a superset of the quoting in historical  
 87320 implementations of the editor. For example, it was not historically possible to escape a <blank>  
 87321 in a filename; for example, **:edit foo\\ bar** would report that too many filenames had been  
 87322 entered for the edit command, and there was no method of escaping a <blank> in the first  
 87323 argument of an **edit**, **ex**, **next**, or **visual** command at all. POSIX.1-2008 extends historical  
 87324 practice, requiring that quoting behavior be made consistent across all *ex* commands, except for

87325 the **map**, **unmap**, **abbreviate**, and **unabbreviate** commands, which historically used <control>-V  
87326 instead of <backslash> characters for quoting. For those four commands, POSIX.1-2008 requires  
87327 conformance to historical practice.

87328 Backslash quoting in *ex* is non-intuitive. <backslash>-escapes are ignored unless they escape a  
87329 special character; for example, when performing *file* argument expansion, the string "\\%" is  
87330 equivalent to '\%', not "\<current\_pathname>". This can be confusing for users because  
87331 <backslash> is usually one of the characters that causes shell expansion to be performed, and  
87332 therefore shell quoting rules must be taken into consideration. Generally, quoting characters are  
87333 only considered if they escape a special character, and a quoting character must be provided for  
87334 each layer of parsing for which the character is special. As another example, only a single  
87335 <backslash> is necessary for the '\1' sequence in substitute replacement patterns, because the  
87336 character '1' is not special to any parsing layer above it.

87337 <control>-V quoting in *ex* is slightly different from backslash quoting. In the four commands  
87338 where <control>-V quoting applies (**abbreviate**, **unabbreviate**, **map**, and **unmap**), any character  
87339 may be escaped by a <control>-V whether it would have a special meaning or not. POSIX.1-2008  
87340 requires conformance to historical practice.

87341 Historical implementations of the editor did not require delimiters within character classes to be  
87342 escaped; for example, the command **s[/][/]** on the string "xxx/yyy" would delete the '/' from  
87343 the string. POSIX.1-2008 disallows this historical practice for consistency and because it places a  
87344 large burden on implementations by requiring that knowledge of regular expressions be built  
87345 into the editor parser.

87346 Historically, quoting <newline> characters in *ex* commands was handled inconsistently. In most  
87347 cases, the <newline> character always terminated the command, regardless of any preceding  
87348 escape character, because <backslash> characters did not escape <newline> characters for most  
87349 *ex* commands. However, some *ex* commands (for example, **s**, **map**, and **abbreviation**) permitted  
87350 <newline> characters to be escaped (although in the case of **map** and **abbreviation**, <control>-V  
87351 characters escaped them instead of <backslash> characters). This was true in not only the  
87352 command line, but also **.exrc** and **sourced** files. For example, the command:

```
87353 map = foo<control-V><newline>bar
```

87354 would succeed, although it was sometimes difficult to get the <control>-V and the inserted  
87355 <newline> passed to the *ex* parser. For consistency and simplicity of specification, POSIX.1-2008  
87356 requires that it be possible to escape <newline> characters in *ex* commands at all times, using  
87357 <backslash> characters for most *ex* commands, and using <control>-V characters for the **map**  
87358 and **abbreviation** commands. For example, the command **print<newline>list** is required to be  
87359 parsed as the single command **print<newline>list**. While this differs from historical practice,  
87360 POSIX.1-2008 developers believed it unlikely that any script or user depended on the historical  
87361 behavior.

87362 Historically, an error in a command specified using the **-c** option did not cause the rest of the **-c**  
87363 commands to be discarded. POSIX.1-2008 disallows this for consistency with mapped keys, the  
87364 **@**, **global**, **source**, and **v** commands, the *EXINIT* environment variable, and the **.exrc** files.

87365 **Input Editing in *ex***

87366 One of the common uses of the historical *ex* editor is over slow network connections. Editors that  
 87367 run in canonical mode can require far less traffic to and from, and far less processing on, the host  
 87368 machine, as well as more easily supporting block-mode terminals. For these reasons,  
 87369 POSIX.1-2008 requires that *ex* be implemented using canonical mode input processing, as was  
 87370 done historically.

87371 POSIX.1-2008 does not require the historical 4 BSD input editing characters “word erase” or  
 87372 “literal next”. For this reason, it is unspecified how they are handled by *ex*, although they must  
 87373 have the required effect. Implementations that resolve them after the line has been ended using a  
 87374 <newline> or <control>-M character, and implementations that rely on the underlying system  
 87375 terminal support for this processing, are both conforming. Implementations are strongly urged  
 87376 to use the underlying system functionality, if at all possible, for compatibility with other system  
 87377 text input interfaces.

87378 Historically, when the *eof* character was used to decrement the **autoindent** level, the cursor  
 87379 moved to display the new end of the **autoindent** characters, but did not move the cursor to a  
 87380 new line, nor did it erase the <control>-D character from the line. POSIX.1-2008 does not specify  
 87381 that the cursor remain on the same line or that the rest of the line is erased; however,  
 87382 implementations are strongly encouraged to provide the best possible user interface; that is, the  
 87383 cursor should remain on the same line, and any <control>-D character on the line should be  
 87384 erased.

87385 POSIX.1-2008 does not require the historical 4 BSD input editing character “reprint”,  
 87386 traditionally <control>-R, which redisplayed the current input from the user. For this reason,  
 87387 and because the functionality cannot be implemented after the line has been terminated by the  
 87388 user, POSIX.1-2008 makes no requirements about this functionality. Implementations are  
 87389 strongly urged to make this historical functionality available, if possible.

87390 Historically, <control>-Q did not perform a literal next function in *ex*, as it did in *vi*.  
 87391 POSIX.1-2008 requires conformance to historical practice to avoid breaking historical *ex* scripts  
 87392 and **.exrc** files.

87393 **eof**

87394 Whether the *eof* character immediately modifies the **autoindent** characters in the prompt is left  
 87395 unspecified so that implementations can conform in the presence of systems that do not support  
 87396 this functionality. Implementations are encouraged to modify the line and redisplay it  
 87397 immediately, if possible.

87398 The specification of the handling of the *eof* character differs from historical practice only in that  
 87399 *eof* characters are not discarded if they follow normal characters in the text input. Historically,  
 87400 they were always discarded.

87401 **Command Descriptions in *ex***

87402 Historically, several commands (for example, **global**, **v**, **visual**, **s**, **write**, **wq**, **yank**, **!**, **<**, **>**, **&**, and  
 87403 **~**) were executable in empty files (that is, the default address(es) were 0), or permitted explicit  
 87404 addresses of 0 (for example, 0 was a valid address, or 0,0 was a valid range). Addresses of 0, or  
 87405 command execution in an empty file, make sense only for commands that add new text to the  
 87406 edit buffer or write commands (because users may wish to write empty files). POSIX.1-2008  
 87407 requires this behavior for such commands and disallows it otherwise, for consistency and  
 87408 simplicity of specification.

87409 A count to an *ex* command has been historically corrected to be no greater than the last line in a

87410 file; for example, in a five-line file, the command **1,6print** would fail, but the command  
87411 **1print300** would succeed. POSIX.1-2008 requires conformance to historical practice.

87412 Historically, the use of flags in *ex* commands could be obscure. General historical practice was as  
87413 described by POSIX.1-2008, but there were some special cases. For instance, the **list**, **number**,  
87414 and **print** commands ignored trailing address offsets; for example, **3p +++#** would display line  
87415 3, and 3 would be the current line after the execution of the command. The **open** and **visual**  
87416 commands ignored both the trailing offsets and the trailing flags. Also, flags specified to the  
87417 **open** and **visual** commands interacted badly with the **list** edit option, and setting and then  
87418 unsetting it during the open/visual session would cause *vi* to stop displaying lines in the  
87419 specified format. For consistency and simplicity of specification, POSIX.1-2008 does not permit  
87420 any of these exceptions to the general rule.

87421 POSIX.1-2008 uses the word *copy* in several places when discussing buffers. This is not intended  
87422 to imply implementation.

87423 Historically, *ex* users could not specify numeric buffers because of the ambiguity this would  
87424 cause; for example, in the command **3 delete 2**, it is unclear whether 2 is a buffer name or a  
87425 *count*. POSIX.1-2008 requires conformance to historical practice by default, but does not  
87426 preclude extensions.

87427 Historically, the contents of the unnamed buffer were frequently discarded after commands that  
87428 did not explicitly affect it; for example, when using the **edit** command to switch files. For  
87429 consistency and simplicity of specification, POSIX.1-2008 does not permit this behavior.

87430 The *ex* utility did not historically have access to the numeric buffers, and, furthermore, deleting  
87431 lines in *ex* did not modify their contents. For example, if, after doing a delete in *vi*, the user  
87432 switched to *ex*, did another delete, and then switched back to *vi*, the contents of the numeric  
87433 buffers would not have changed. POSIX.1-2008 requires conformance to historical practice.  
87434 Numeric buffers are described in the *ex* utility in order to confine the description of buffers to a  
87435 single location in POSIX.1-2008.

87436 The metacharacters that trigger shell expansion in *file* arguments match historical practice, as  
87437 does the method for doing shell expansion. Implementations wishing to provide users with the  
87438 flexibility to alter the set of metacharacters are encouraged to provide a **shellmeta** string edit  
87439 option.

87440 Historically, *ex* commands executed from *vi* refreshed the screen when it did not strictly need to  
87441 do so; for example, **!date > /dev/null** does not require a screen refresh because the output of  
87442 the UNIX *date* command requires only a single line of the screen. POSIX.1-2008 requires that the  
87443 screen be refreshed if it has been overwritten, but makes no requirements as to how an  
87444 implementation should make that determination. Implementations may prompt and refresh the  
87445 screen regardless.

#### 87446 **Abbreviate**

87447 Historical practice was that characters that were entered as part of an abbreviation replacement  
87448 were subject to **map** expansions, the **showmatch** edit option, further abbreviation expansions,  
87449 and so on; that is, they were logically pushed onto the terminal input queue, and were not a  
87450 simple replacement. POSIX.1-2008 requires conformance to historical practice. Historical  
87451 practice was that whenever a non-word character (that had not been escaped by a <control>-V)  
87452 was entered after a word character, *vi* would check for abbreviations. The check was based on  
87453 the type of the character entered before the word character of the word/non-word pair that  
87454 triggered the check. The word character of the word/non-word pair that triggered the check and  
87455 all characters entered before the trigger pair that were of that type were included in the check,  
87456 with the exception of <blank> characters, which always delimited the abbreviation.

87457 This means that, for the abbreviation to work, the *lhs* must end with a word character, there can  
 87458 be no transitions from word to non-word characters (or *vice versa*) other than between the last  
 87459 and next-to-last characters in the *lhs*, and there can be no <blank> characters in the *lhs*. In  
 87460 addition, because of the historical quoting rules, it was impossible to enter a literal <control>-V  
 87461 in the *lhs*. POSIX.1-2008 requires conformance to historical practice. Historical implementations  
 87462 did not inform users when abbreviations that could never be used were entered;  
 87463 implementations are strongly encouraged to do so.

87464 For example, the following abbreviations will work:

```
87465 :ab (p REPLACE
87466 :ab p REPLACE
87467 :ab ( (p REPLACE
```

87468 The following abbreviations will not work:

```
87469 :ab ( REPLACE
87470 :ab (pp REPLACE
```

87471 Historical practice is that words on the *vi* colon command line were subject to abbreviation  
 87472 expansion, including the arguments to the **abbrev** (and more interestingly) the **unabbrev**  
 87473 command. Because there are implementations that do not do abbreviation expansion for the first  
 87474 argument to those commands, this is permitted, but not required, by POSIX.1-2008. However,  
 87475 the following sequence:

```
87476 :ab foo bar
87477 :ab foo baz
```

87478 resulted in the addition of an abbreviation of "baz" for the string "bar" in historical *ex/vi*, and  
 87479 the sequence:

```
87480 :ab fool bar
87481 :ab foo2 bar
87482 :unabbreviate foo2
```

87483 deleted the abbreviation "fool", not "foo2". These behaviors are not permitted by  
 87484 POSIX.1-2008 because they clearly violate the expectations of the user.

87485 It was historical practice that <control>-V, not <backslash>, characters be interpreted as escaping  
 87486 subsequent characters in the **abbreviate** command. POSIX.1-2008 requires conformance to  
 87487 historical practice; however, it should be noted that an abbreviation containing a <blank> will  
 87488 never work.

## 87489 Append

87490 Historically, any text following a <vertical-line> command separator after an **append**, **change**, or  
 87491 **insert** command became part of the insert text. For example, in the command:

```
87492 :g/pattern/append|stuff1
```

87493 a line containing the text "stuff1" would be appended to each line matching pattern. It was  
 87494 also historically valid to enter:

```
87495 :append|stuff1
87496 stuff2
87497 .
```

87498 and the text on the *ex* command line would be appended along with the text inserted after it.  
 87499 There was an historical bug, however, that the user had to enter two terminating lines (the ' . '

87500 lines) to terminate text input mode in this case. POSIX.1-2008 requires conformance to historical  
87501 practice, but disallows the historical need for multiple terminating lines.

### 87502 **Change**

87503 See the RATIONALE for the **append** command. Historical practice for cursor positioning after  
87504 the change command when no text is input, is as described in POSIX.1-2008. However, one  
87505 System V implementation is known to have been modified such that the cursor is positioned on  
87506 the first address specified, and not on the line before the first address. POSIX.1-2008 disallows  
87507 this modification for consistency.

87508 Historically, the **change** command did not support buffer arguments, although some  
87509 implementations allow the specification of an optional buffer. This behavior is neither required  
87510 nor disallowed by POSIX.1-2008.

### 87511 **Change Directory**

87512 A common extension in *ex* implementations is to use the elements of a **cdpath** edit option as  
87513 prefix directories for *path* arguments to **chdir** that are relative pathnames and that do not have  
87514 `'.'` or `".."` as their first component. Elements in the **cdpath** edit option are `<colon>`-separated.  
87515 The initial value of the **cdpath** edit option is the value of the shell `CDPATH` environment  
87516 variable. This feature was not included in POSIX.1-2008 because it does not exist in any of the  
87517 implementations considered historical practice.

### 87518 **Copy**

87519 Historical implementations of *ex* permitted copies to lines inside of the specified range; for  
87520 example, **:2,5copy3** was a valid command. POSIX.1-2008 requires conformance to historical  
87521 practice.

### 87522 **Delete**

87523 POSIX.1-2008 requires support for the historical parsing of a **delete** command followed by flags,  
87524 without any intervening `<blank>` characters. For example:

87525 **1dp** Deletes the first line and prints the line that was second.

87526 **1delep** As for **1dp**.

87527 **1d** Deletes the first line, saving it in buffer *p*.

87528 **1d p1l** (Pee one-ell.) Deletes the first line, saving it in buffer *p*, and listing the line that was  
87529 second.

### 87530 **Edit**

87531 Historically, any *ex* command could be entered as a *+command* argument to the **edit** command,  
87532 although some (for example, **insert** and **append**) were known to confuse historical  
87533 implementations. For consistency and simplicity of specification, POSIX.1-2008 requires that any  
87534 command be supported as an argument to the **edit** command.

87535 Historically, the command argument was executed with the current line set to the last line of the  
87536 file, regardless of whether the **edit** command was executed from visual mode or not.  
87537 POSIX.1-2008 requires conformance to historical practice.

87538 Historically, the *+command* specified to the **edit** and **next** commands was delimited by the first  
87539 `<blank>`, and there was no way to quote them. For consistency, POSIX.1-2008 requires that the  
87540 usual *ex* backslash quoting be provided.

87541 Historically, specifying the *+command* argument to the edit command required a filename to be  
 87542 specified as well; for example, **:edit +100** would always fail. For consistency and simplicity of  
 87543 specification, POSIX.1-2008 does not permit this usage to fail for that reason.

87544 Historically, only the cursor position of the last file edited was remembered by the editor.  
 87545 POSIX.1-2008 requires that this be supported; however, implementations are permitted to  
 87546 remember and restore the cursor position for any file previously edited.

#### 87547 **File**

87548 Historical versions of the *ex* editor **file** command displayed a current line and number of lines in  
 87549 the edit buffer of 0 when the file was empty, while the *vi* <control>-G command displayed a  
 87550 current line and number of lines in the edit buffer of 1 in the same situation. POSIX.1-2008 does  
 87551 not permit this discrepancy, instead requiring that a message be displayed indicating that the file  
 87552 is empty.

#### 87553 **Global**

87554 The two-pass operation of the **global** and **v** commands is not intended to imply implementation,  
 87555 only the required result of the operation.

87556 The current line and column are set as specified for the individual *ex* commands. This  
 87557 requirement is cumulative; that is, the current line and column must track across all the  
 87558 commands executed by the **global** or **v** commands.

#### 87559 **Insert**

87560 See the RATIONALE for the **append** command.

87561 Historically, **insert** could not be used with an address of zero; that is, not when the edit buffer  
 87562 was empty. POSIX.1-2008 requires that this command behave consistently with the **append**  
 87563 command.

#### 87564 **Join**

87565 The action of the **join** command in relation to the special characters is only defined for the  
 87566 POSIX locale because the correct amount of white space after a period varies; in Japanese none is  
 87567 required, in French only a single space, and so on.

#### 87568 **List**

87569 The historical output of the **list** command was potentially ambiguous. The standard developers  
 87570 believed correcting this to be more important than adhering to historical practice, and  
 87571 POSIX.1-2008 requires unambiguous output.

#### 87572 **Map**

87573 Historically, command mode maps only applied to command names; for example, if the  
 87574 character 'x' was mapped to 'y', the command **fx** searched for the 'x' character, not the 'y'  
 87575 character. POSIX.1-2008 requires this behavior. Historically, entering <control>-V as the first  
 87576 character of a *vi* command was an error. Several implementations have extended the semantics  
 87577 of *vi* such that <control>-V means that the subsequent command character is not mapped. This  
 87578 is permitted, but not required, by POSIX.1-2008. Regardless, using <control>-V to escape the  
 87579 second or later character in a sequence of characters that might match a **map** command, or any  
 87580 character in text input mode, is historical practice, and stops the entered keys from matching a  
 87581 map. POSIX.1-2008 requires conformance to historical practice.

- 87582 Historical implementations permitted digits to be used as a **map** command *lhs*, but then ignored  
87583 the map. POSIX.1-2008 requires that the mapped digits not be ignored.
- 87584 The historical implementation of the **map** command did not permit **map** commands that were  
87585 more than a single character in length if the first character was printable. This behavior is  
87586 permitted, but not required, by POSIX.1-2008.
- 87587 Historically, mapped characters were remapped unless the **remap** edit option was not set, or the  
87588 prefix of the mapped characters matched the mapping characters; for example, in the **map**:
- 87589 `:map ab abcd`
- 87590 the characters "ab" were used as is and were not remapped, but the characters "cd" were  
87591 mapped if appropriate. This can cause infinite loops in the *vi* mapping mechanisms.  
87592 POSIX.1-2008 requires conformance to historical practice, and that such loops be interruptible.
- 87593 Text input maps had the same problems with expanding the *lhs* for the **ex map!** and **unmap!**  
87594 command as did the **ex abbreviate** and **unabbreviate** commands. See the RATIONALE for the **ex**  
87595 **abbreviate** command. POSIX.1-2008 requires similar modification of some historical practice for  
87596 the **map** and **unmap** commands, as described for the **abbreviate** and **unabbreviate** commands.
- 87597 Historically, **maps** that were subsets of other **maps** behaved differently depending on the order  
87598 in which they were defined. For example:
- 87599 `:map! ab short`  
87600 `:map! abc long`
- 87601 would always translate the characters "ab" to "short", regardless of how fast the characters  
87602 "abc" were entered. If the entry order was reversed:
- 87603 `:map! abc long`  
87604 `:map! ab short`
- 87605 the characters "ab" would cause the editor to pause, waiting for the completing 'c' character,  
87606 and the characters might never be mapped to "short". For consistency and simplicity of  
87607 specification, POSIX.1-2008 requires that the shortest match be used at all times.
- 87608 The length of time the editor spends waiting for the characters to complete the *lhs* is unspecified  
87609 because the timing capabilities of systems are often inexact and variable, and it may depend on  
87610 other factors such as the speed of the connection. The time should be long enough for the user to  
87611 be able to complete the sequence, but not long enough for the user to have to wait. Some  
87612 implementations of *vi* have added a **keytime** option, which permits users to set the number of  
87613 0,1 seconds the editor waits for the completing characters. Because mapped terminal function  
87614 and cursor keys tend to start with an <ESC> character, and <ESC> is the key ending *vi* text input  
87615 mode, **maps** starting with <ESC> characters are generally exempted from this timeout period,  
87616 or, at least timed out differently.
- 87617 **Mark**
- 87618 Historically, users were able to set the "previous context" marks explicitly. In addition, the **ex**  
87619 commands `"` and `'` and the *vi* commands `"`, `'`, `,"`, and `'` all referred to the same mark. In addition,  
87620 the previous context marks were not set if the command, with which the address setting the  
87621 mark was associated, failed. POSIX.1-2008 requires conformance to historical practice.  
87622 Historically, if marked lines were deleted, the mark was also deleted, but would reappear if the  
87623 change was undone. POSIX.1-2008 requires conformance to historical practice.
- 87624 The description of the special events that set the `'` and `'` marks matches historical practice. For  
87625 example, historically the command `/a/`/`b/` did not set the `'` and `'` marks, but the command

87626 **/a/,b/delete** did.

### 87627 **Next**

87628 Historically, any *ex* command could be entered as a *+command* argument to the **next** command,  
87629 although some (for example, **insert** and **append**) were known to confuse historical  
87630 implementations. POSIX.1-2008 requires that any command be permitted and that it behave as  
87631 specified. The **next** command can accept more than one file, so usage such as:

87632 `next `ls [abc] ``

87633 is valid; it need not be valid for the **edit** or **read** commands, for example, because they expect  
87634 only one filename.

87635 Historically, the **next** command behaved differently from the **:rewind** command in that it  
87636 ignored the force flag if the **autowrite** flag was set. For consistency, POSIX.1-2008 does not  
87637 permit this behavior.

87638 Historically, the **next** command positioned the cursor as if the file had never been edited before,  
87639 regardless. POSIX.1-2008 does not permit this behavior, for consistency with the **edit** command.

87640 Implementations wanting to provide a counterpart to the **next** command that edited the  
87641 previous file have used the command **prev[ious]**, which takes no *file* argument. POSIX.1-2008  
87642 does not require this command.

### 87643 **Open**

87644 Historically, the **open** command would fail if the **open** edit option was not set. POSIX.1-2008  
87645 does not mention the **open** edit option and does not require this behavior. Some historical  
87646 implementations do not permit entering open mode from open or visual mode, only from *ex*  
87647 mode. For consistency, POSIX.1-2008 does not permit this behavior.

87648 Historically, entering open mode from the command line (that is, *vi +open*) resulted in  
87649 anomalous behaviors; for example, the *ex* file and *set* commands, and the *vi* command  
87650 <control>-G did not work. For consistency, POSIX.1-2008 does not permit this behavior.

87651 Historically, the **open** command only permitted ' / ' characters to be used as the search pattern  
87652 delimiter. For consistency, POSIX.1-2008 requires that the search delimiters used by the **s**, **global**,  
87653 and **v** commands be accepted as well.

### 87654 **Preserve**

87655 The **preserve** command does not historically cause the file to be considered unmodified for the  
87656 purposes of future commands that may exit the editor. POSIX.1-2008 requires conformance to  
87657 historical practice.

87658 Historical documentation stated that mail was not sent to the user when preserve was executed;  
87659 however, historical implementations did send mail in this case. POSIX.1-2008 requires  
87660 conformance to the historical implementations.

87661 **Print**

87662 The writing of NUL by the **print** command is not specified as a special case because the standard  
87663 developers did not want to require *ex* to support NUL characters. Historically, characters were  
87664 displayed using the ARPA standard mappings, which are as follows:

- 87665 1. Printable characters are left alone.
- 87666 2. Control characters less than \177 are represented as '^' followed by the character offset  
87667 from the '@' character in the ASCII map; for example, \007 is represented as '^G'.
- 87668 3. \177 is represented as '^?' followed by '?'. .

87669 The display of characters having their eighth bit set was less standard. Existing implementations  
87670 use hex (0x00), octal (\000), and a meta-bit display. (The latter displayed bytes that had their  
87671 eighth bit set as the two characters "M-" followed by the seven-bit display as described above.)  
87672 The latter probably has the best claim to historical practice because it was used for the **-v** option  
87673 of 4 BSD and 4 BSD-derived versions of the *cat* utility since 1980.

87674 No specific display format is required by POSIX.1-2008.

87675 Explicit dependence on the ASCII character set has been avoided where possible, hence the use  
87676 of the phrase an "implementation-defined multi-character sequence" for the display of non-  
87677 printable characters in preference to the historical usage of, for instance, "^I" for the <tab>.  
87678 Implementations are encouraged to conform to historical practice in the absence of any strong  
87679 reason to diverge.

87680 Historically, all *ex* commands beginning with the letter 'p' could be entered using capitalized  
87681 versions of the commands; for example, **P[rint]**, **Pre[serve]**, and **Pu[t]** were all valid command  
87682 names. POSIX.1-2008 permits, but does not require, this historical practice because capital forms  
87683 of the commands are used by some implementations for other purposes.

87684 **Put**

87685 Historically, an *ex* **put** command, executed from open or visual mode, was the same as the open  
87686 or visual mode **P** command, if the buffer was named and was cut in character mode, and the  
87687 same as the **p** command if the buffer was named and cut in line mode. If the unnamed buffer  
87688 was the source of the text, the entire line from which the text was taken was usually **put**, and the  
87689 buffer was handled as if in line mode, but it was possible to get extremely anomalous behavior.  
87690 In addition, using the **Q** command to switch into *ex* mode, and then doing a **put** often resulted in  
87691 errors as well, such as appending text that was unrelated to the (supposed) contents of the  
87692 buffer. For consistency and simplicity of specification, POSIX.1-2008 does not permit these  
87693 behaviors. All *ex* **put** commands are required to operate in line mode, and the contents of the  
87694 buffers are not altered by changing the mode of the editor.

87695 **Read**

87696 Historically, an *ex* **read** command executed from open or visual mode, executed in an empty file,  
87697 left an empty line as the first line of the file. For consistency and simplicity of specification,  
87698 POSIX.1-2008 does not permit this behavior. Historically, a **read** in open or visual mode from a  
87699 program left the cursor at the last line read in, not the first. For consistency, POSIX.1-2008 does  
87700 not permit this behavior.

87701 Historical implementations of *ex* were unable to undo **read** commands that read from the output  
87702 of a program. For consistency, POSIX.1-2008 does not permit this behavior.

87703 Historically, the *ex* and *vi* message after a successful **read** or **write** command specified  
87704 "characters", not "bytes". POSIX.1-2008 requires that the number of bytes be displayed, not the

87705 number of characters, because it may be difficult in multi-byte implementations to determine the  
87706 number of characters read. Implementations are encouraged to clarify the message displayed to  
87707 the user.

87708 Historically, reads were not permitted on files other than type regular, except that FIFO files  
87709 could be read (probably only because they did not exist when *ex* and *vi* were originally written).  
87710 Because the historical *ex* evaluated **read!** and **read !** equivalently, there can be no optional way  
87711 to force the read. POSIX.1-2008 permits, but does not require, this behavior.

#### 87712 **Recover**

87713 Some historical implementations of the editor permitted users to recover the edit buffer contents  
87714 from a previous edit session, and then exit without saving those contents (or explicitly  
87715 discarding them). The intent of POSIX.1-2008 in requiring that the edit buffer be treated as  
87716 already modified is to prevent this user error.

#### 87717 **Rewind**

87718 Historical implementations supported the **rewind** command when the user was editing the first  
87719 file in the list; that is, the file that the **rewind** command would edit. POSIX.1-2008 requires  
87720 conformance to historical practice.

#### 87721 **Substitute**

87722 Historically, *ex* accepted an **r** option to the **s** command. The effect of the **r** option was to use the  
87723 last regular expression used in any command as the pattern, the same as the **~** command. The **r**  
87724 option is not required by POSIX.1-2008. Historically, the **c** and **g** options were toggled; for  
87725 example, the command **:s/abc/def/** was the same as **s/abc/def/ccccgggg**. For simplicity of  
87726 specification, POSIX.1-2008 does not permit this behavior.

87727 The tilde command is often used to replace the last search RE. For example, in the sequence:

```
87728 s/red/blue/
87729 /green
87730 ~
```

87731 the **~** command is equivalent to:

```
87732 s/green/blue/
```

87733 Historically, *ex* accepted all of the following forms:

```
87734 s/abc/def/
87735 s/abc/def
87736 s/abc/
87737 s/abc
```

87738 POSIX.1-2008 requires conformance to this historical practice.

87739 The **s** command presumes that the **'^'** character only occupies a single column in the display.  
87740 Much of the *ex* and *vi* specification presumes that the **<space>** only occupies a single column in  
87741 the display. There are no known character sets for which this is not true.

87742 Historically, the final column position for the substitute commands was based on previous  
87743 column movements; a search for a pattern followed by a substitution would leave the column  
87744 position unchanged, while a **0** command followed by a substitution would change the column  
87745 position to the first non-**<blank>**. For consistency and simplicity of specification, POSIX.1-2008  
87746 requires that the final column position always be set to the first non-**<blank>**.

- 87747           **Set**
- 87748           Historical implementations redisplayed all of the options for each occurrence of the **all** keyword.  
87749           POSIX.1-2008 permits, but does not require, this behavior.
- 87750           **Tag**
- 87751           No requirement is made as to where *ex* and *vi* shall look for the file referenced by the tag entry.  
87752           Historical practice has been to look for the path found in the **tags** file, based on the current  
87753           directory. A useful extension found in some implementations is to look based on the directory  
87754           containing the tags file that held the entry, as well. No requirement is made as to which reference  
87755           for the tag in the tags file is used. This is deliberate, in order to permit extensions such as  
87756           multiple entries in a tags file for a tag.
- 87757           Because users often specify many different tags files, some of which need not be relevant or exist  
87758           at any particular time, POSIX.1-2008 requires that error messages about problem tags files be  
87759           displayed only if the requested tag is not found, and then, only once for each time that the **tag**  
87760           edit option is changed.
- 87761           The requirement that the current edit buffer be unmodified is only necessary if the file indicated  
87762           by the tag entry is not the same as the current file (as defined by the current pathname).  
87763           Historically, the file would be reloaded if the filename had changed, as well as if the filename  
87764           was different from the current pathname. For consistency and simplicity of specification,  
87765           POSIX.1-2008 does not permit this behavior, requiring that the name be the only factor in the  
87766           decision.
- 87767           Historically, *vi* only searched for tags in the current file from the current cursor to the end of the  
87768           file, and therefore, if the **wrapsan** option was not set, tags occurring before the current cursor  
87769           were not found. POSIX.1-2008 considers this a bug, and implementations are required to search  
87770           for the first occurrence in the file, regardless.
- 87771           **Undo**
- 87772           The **undo** description deliberately uses the word “modified”. The **undo** command is not  
87773           intended to undo commands that replace the contents of the edit buffer, such as **edit**, **next**, **tag**,  
87774           or **recover**.
- 87775           Cursor positioning after the **undo** command was inconsistent in the historical *vi*, sometimes  
87776           attempting to restore the original cursor position (**global**, **undo**, and **v** commands), and  
87777           sometimes, in the presence of maps, placing the cursor on the last line added or changed instead  
87778           of the first. POSIX.1-2008 requires a simplified behavior for consistency and simplicity of  
87779           specification.
- 87780           **Version**
- 87781           The **version** command cannot be exactly specified since there is no widely-accepted definition of  
87782           what the version information should contain. Implementations are encouraged to do something  
87783           reasonably intelligent.

87784 **Write**

87785 Historically, the *ex* and *vi* message after a successful **read** or **write** command specified  
 87786 “characters”, not “bytes”. POSIX.1-2008 requires that the number of bytes be displayed, not the  
 87787 number of characters because it may be difficult in multi-byte implementations to determine the  
 87788 number of characters written. Implementations are encouraged to clarify the message displayed  
 87789 to the user.

87790 Implementation-defined tests are permitted so that implementations can make additional  
 87791 checks; for example, for locks or file modification times.

87792 Historically, attempting to append to a nonexistent file caused an error. It has been left  
 87793 unspecified in POSIX.1-2008 to permit implementations to let the **write** succeed, so that the  
 87794 append semantics are similar to those of the historical *cs/h*.

87795 Historical *vi* permitted empty edit buffers to be written. However, since the way *vi* got around  
 87796 dealing with “empty” files was to always have a line in the edit buffer, no matter what, it wrote  
 87797 them as files of a single, empty line. POSIX.1-2008 does not permit this behavior.

87798 Historically, *ex* restored standard output and standard error to their values as of when *ex* was  
 87799 invoked, before writes to programs were performed. This could disturb the terminal  
 87800 configuration as well as be a security issue for some terminals. POSIX.1-2008 does not permit  
 87801 this, requiring that the program output be captured and displayed as if by the *ex print*  
 87802 command.

87803 **Adjust Window**

87804 Historically, the line count was set to the value of the **scroll** option if the type character was end-  
 87805 of-file. This feature was broken on most historical implementations long ago, however, and is  
 87806 not documented anywhere. For this reason, POSIX.1-2008 is resolutely silent.

87807 Historically, the **z** command was <blank>-sensitive and **z +** and **z -** did different things than **z+**  
 87808 and **z-** because the type could not be distinguished from a flag. (The commands **z .** and **z =**  
 87809 were historically invalid.) POSIX.1-2008 requires conformance to this historical practice.

87810 Historically, the **z** command was further <blank>-sensitive in that the *count* could not be  
 87811 <blank>-delimited; for example, the commands **z= 5** and **z- 5** were also invalid. Because the  
 87812 *count* is not ambiguous with respect to either the type character or the flags, this is not permitted  
 87813 by POSIX.1-2008.

87814 **Escape**

87815 Historically, *ex* filter commands only read the standard output of the commands, letting  
 87816 standard error appear on the terminal as usual. The *vi* utility, however, read both standard  
 87817 output and standard error. POSIX.1-2008 requires the latter behavior for both *ex* and *vi*, for  
 87818 consistency.

87819 **Shift Left and Shift Right**

87820 Historically, it was possible to add shift characters to increase the effect of the command; for  
 87821 example, <<< outdented (or >>> indented) the lines 3 levels of indentation instead of the default  
 87822 1. POSIX.1-2008 requires conformance to historical practice.

- 87823            **<control>-D**
- 87824            Historically, the **<control>-D** command erased the prompt, providing the user with an unbroken  
87825            presentation of lines from the edit buffer. This is not required by POSIX.1-2008; implementations  
87826            are encouraged to provide it if possible. Historically, the **<control>-D** command took, and then  
87827            ignored, a *count*. POSIX.1-2008 does not permit this behavior.
- 87828            **Write Line Number**
- 87829            Historically, the **ex =** command, when executed in *ex* mode in an empty edit buffer, reported 0,  
87830            and from open or visual mode, reported 1. For consistency and simplicity of specification,  
87831            POSIX.1-2008 does not permit this behavior.
- 87832            **Execute**
- 87833            Historically, *ex* did not correctly handle the inclusion of text input commands (that is, **append**,  
87834            **insert**, and **change**) in executed buffers. POSIX.1-2008 does not permit this exclusion for  
87835            consistency.
- 87836            Historically, the logical contents of the buffer being executed did not change if the buffer itself  
87837            were modified by the commands being executed; that is, buffer execution did not support self-  
87838            modifying code. POSIX.1-2008 requires conformance to historical practice.
- 87839            Historically, the **@** command took a range of lines, and the **@** buffer was executed once per line,  
87840            with the current line ( *' . '* ) set to each specified line. POSIX.1-2008 requires conformance to  
87841            historical practice.
- 87842            Some historical implementations did not notice if errors occurred during buffer execution. This,  
87843            coupled with the ability to specify a range of lines for the *ex @* command, makes it trivial to  
87844            cause them to drop **core**. POSIX.1-2008 requires that implementations stop buffer execution if  
87845            any error occurs, if the specified line doesn't exist, or if the contents of the edit buffer itself are  
87846            replaced (for example, the buffer executes the *ex :edit* command).
- 87847            **Regular Expressions in ex**
- 87848            Historical practice is that the characters in the replacement part of the last **s** command—that is,  
87849            those matched by entering a *' ~ '* in the regular expression—were not further expanded by the  
87850            regular expression engine. So, if the characters contained the string "a . , " they would match  
87851            *' a '* followed by ". , " and not *' a '* followed by any character. POSIX.1-2008 requires  
87852            conformance to historical practice.
- 87853            **Edit Options in ex**
- 87854            The following paragraphs describe the historical behavior of some edit options that were not, for  
87855            whatever reason, included in POSIX.1-2008. Implementations are strongly encouraged to only  
87856            use these names if the functionality described here is fully supported.
- 87857            **extended**    The **extended** edit option has been used in some implementations of *vi* to provide  
87858            extended regular expressions instead of basic regular expressions This option was  
87859            omitted from POSIX.1-2008 because it is not widespread historical practice.
- 87860            **flash**        The **flash** edit option historically caused the screen to flash instead of beeping on  
87861            error. This option was omitted from POSIX.1-2008 because it is not found in some  
87862            historical implementations.

|       |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 87863 | <b>hardtabs</b>  | The <b>hardtabs</b> edit option historically defined the number of columns between hardware tab settings. This option was omitted from POSIX.1-2008 because it was believed to no longer be generally useful.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 87864 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 87884 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 87885 | <b>timeout</b>   | The <b>timeout</b> edit option historically enabled the (now standard) feature of only waiting for a short period before returning keys that could be part of a macro. This feature was omitted from POSIX.1-2008 because its behavior is now standard, it is not widely useful, and it was rarely documented.                                                                                                                                                                                                                                                                                                                                                                                                               |
| 87886 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 87887 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 87888 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 87889 | <b>verbose</b>   | The <b>verbose</b> edit option has been used in some implementations of <i>vi</i> to cause <i>vi</i> to output error messages for common errors; for example, attempting to move the cursor past the beginning or end of the line instead of only alerting the screen. (The historical <i>vi</i> only alerted the terminal and presented no message for such errors. The historical editor option <b>terse</b> did not select when to present error messages, it only made existing error messages more or less verbose.) This option was omitted from POSIX.1-2008 because it is not widespread historical practice; however, implementors are encouraged to use it if they wish to provide error messages for naive users. |
| 87890 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 87894 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 87895 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 87896 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 87897 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 87898 | <b>wraplen</b>   | The <b>wraplen</b> edit option has been used in some implementations of <i>vi</i> to specify an automatic margin measured from the left margin instead of from the right margin. This is useful when multiple screen sizes are being used to edit a single file. This option was omitted from POSIX.1-2008 because it is not widespread historical practice; however, implementors are encouraged to use it if they add this functionality.                                                                                                                                                                                                                                                                                  |
| 87899 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 87900 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 87901 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 87902 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 87903 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

87904 **autoindent, ai**

87905 Historically, the command **0a** did not do any autoindentation, regardless of the current  
87906 indentation of line 1. POSIX.1-2008 requires that any indentation present in line 1 be used.

87907 **autoprint, ap**

87908 Historically, the **autoprint** edit option was not completely consistent or based solely on  
87909 modifications to the edit buffer. Exceptions were the **read** command (when reading from a file,  
87910 but not from a filter), the **append**, **change**, **insert**, **global**, and **v** commands, all of which were not  
87911 affected by **autoprint**, and the **tag** command, which was affected by **autoprint**. POSIX.1-2008  
87912 requires conformance to historical practice.

87913 Historically, the **autoprint** option only applied to the last of multiple commands entered using  
87914 <vertical-line> delimiters; for example, **delete** <newline> was affected by **autoprint**, but  
87915 **delete | version** <newline> was not. POSIX.1-2008 requires conformance to historical practice.

87916 **autowrite, aw**

87917 Appending the '!' character to the *ex* **next** command to avoid performing an automatic write  
87918 was not supported in historical implementations. POSIX.1-2008 requires that the behavior match  
87919 the other *ex* commands for consistency.

87920 **ignorecase, ic**

87921 Historical implementations of case-insensitive matching (the **ignorecase** edit option) lead to  
87922 counter-intuitive situations when uppercase characters were used in range expressions.  
87923 Historically, the process was as follows:

- 87924 1. Take a line of text from the edit buffer.
- 87925 2. Convert uppercase to lowercase in text line.
- 87926 3. Convert uppercase to lowercase in regular expressions, except in character class  
87927 specifications.
- 87928 4. Match regular expressions against text.

87929 This would mean that, with **ignorecase** in effect, the text:

87930 The cat sat on the mat

87931 would be matched by

87932 /<sup>^</sup>the/

87933 but not by:

87934 /<sup>^</sup>[A-Z]he/

87935 For consistency with other commands implementing regular expressions, POSIX.1-2008 does not  
87936 permit this behavior.

87937 **paragraphs, para**

87938 The ISO POSIX-2:1993 standard made the default **paragraphs** and **sections** edit options  
 87939 implementation-defined, arguing they were historically oriented to the UNIX system *troff* text  
 87940 formatter, and a “portable user” could use the {, }, [[, ]], (, and ) commands in open or visual  
 87941 mode and have the cursor stop in unexpected places. POSIX.1-2008 specifies their values in the  
 87942 POSIX locale because the unusual grouping (they only work when grouped into two characters  
 87943 at a time) means that they cannot be used for general-purpose movement, regardless.

87944 **readonly**

87945 Implementations are encouraged to provide the best possible information to the user as to the  
 87946 read-only status of the file, with the exception that they should not consider the current special  
 87947 privileges of the process. This provides users with a safety net because they must force the  
 87948 overwrite of read-only files, even when running with additional privileges.

87949 The **readonly** edit option specification largely conforms to historical practice. The only  
 87950 difference is that historical implementations did not notice that the user had set the **readonly**  
 87951 edit option in cases where the file was already marked read-only for some reason, and would  
 87952 therefore reinitialize the **readonly** edit option the next time the contents of the edit buffer were  
 87953 replaced. This behavior is disallowed by POSIX.1-2008.

87954 **report**

87955 The requirement that lines copied to a buffer interact differently than deleted lines is historical  
 87956 practice. For example, if the **report** edit option is set to 3, deleting 3 lines will cause a report to be  
 87957 written, but 4 lines must be copied before a report is written.

87958 The requirement that the *ex* **global**, **v**, **open**, **undo**, and **visual** commands present reports based  
 87959 on the total number of lines added or deleted during the command execution, and that  
 87960 commands executed by the **global** and **v** commands not present reports, is historical practice.  
 87961 POSIX.1-2008 extends historical practice by requiring that buffer execution be treated similarly.  
 87962 The reasons for this are two-fold. Historically, only the report by the last command executed  
 87963 from the buffer would be seen by the user, as each new report would overwrite the last. In  
 87964 addition, the standard developers believed that buffer execution had more in common with  
 87965 **global** and **v** commands than it did with other *ex* commands, and should behave similarly, for  
 87966 consistency and simplicity of specification.

87967 **showmatch, sm**

87968 The length of time the cursor spends on the matching character is unspecified because the  
 87969 timing capabilities of systems are often inexact and variable. The time should be long enough for  
 87970 the user to notice, but not long enough for the user to become annoyed. Some implementations  
 87971 of *vi* have added a **matchtime** option that permits users to set the number of 0,1 second intervals  
 87972 the cursor pauses on the matching character.

87973 **showmode**

87974 The **showmode** option has been used in some historical implementations of *ex* and *vi* to display  
 87975 the current editing mode when in open or visual mode. The editing modes have generally  
 87976 included “command” and “input”, and sometimes other modes such as “replace” and  
 87977 “change”. The string was usually displayed on the bottom line of the screen at the far right-hand  
 87978 corner. In addition, a preceding ‘\*’ character often denoted whether the contents of the edit  
 87979 buffer had been modified. The latter display has sometimes been part of the **showmode** option,  
 87980 and sometimes based on another option. This option was not available in the 4 BSD historical

87981 implementation of *vi*, but was viewed as generally useful, particularly to novice users, and is  
87982 required by POSIX.1-2008.

87983 The **smd** shorthand for the **showmode** option was not present in all historical implementations  
87984 of the editor. POSIX.1-2008 requires it, for consistency.

87985 Not all historical implementations of the editor displayed a mode string for command mode,  
87986 differentiating command mode from text input mode by the absence of a mode string.  
87987 POSIX.1-2008 permits this behavior for consistency with historical practice, but implementations  
87988 are encouraged to provide a display string for both modes.

#### 87989 **slowopen**

87990 Historically, the **slowopen** option was automatically set if the terminal baud rate was less than  
87991 1 200 baud, or if the baud rate was 1 200 baud and the **redraw** option was not set. The **slowopen**  
87992 option had two effects. First, when inserting characters in the middle of a line, characters after  
87993 the cursor would not be pushed ahead, but would appear to be overwritten. Second, when  
87994 creating a new line of text, lines after the current line would not be scrolled down, but would  
87995 appear to be overwritten. In both cases, ending text input mode would cause the screen to be  
87996 refreshed to match the actual contents of the edit buffer. Finally, terminals that were sufficiently  
87997 intelligent caused the editor to ignore the **slowopen** option. POSIX.1-2008 permits most  
87998 historical behavior, extending historical practice to require **slowopen** behaviors if the edit option  
87999 is set by the user.

#### 88000 **tags**

88001 The default path for tags files is left unspecified as implementations may have their own **tags**  
88002 implementations that do not correspond to the historical ones. The default **tags** option value  
88003 should probably at least include the file **./tags**.

#### 88004 **term**

88005 Historical implementations of *ex* and *vi* ignored changes to the **term** edit option after the initial  
88006 terminal information was loaded. This is permitted by POSIX.1-2008; however, implementations  
88007 are encouraged to permit the user to modify their terminal type at any time.

#### 88008 **terse**

88009 Historically, the **terse** edit option optionally provided a shorter, less descriptive error message,  
88010 for some error messages. This is permitted, but not required, by POSIX.1-2008. Historically, most  
88011 common visual mode errors (for example, trying to move the cursor past the end of a line) did  
88012 not result in an error message, but simply alerted the terminal. Implementations wishing to  
88013 provide messages for novice users are urged to do so based on the **edit** option **verbose**, and not  
88014 **terse**.

#### 88015 **window**

88016 In historical implementations, the default for the **window** edit option was based on the baud  
88017 rate as follows:

88018 1. If the baud rate was less than 1 200, the **edit** option **w300** set the window value; for  
88019 example, the line:

88020 `set w300=12`

88021 would set the window option to 12 if the baud rate was less than 1 200.

88022 2. If the baud rate was equal to 1 200, the **edit** option **w1200** set the window value.

88023 3. If the baud rate was greater than 1 200, the **edit** option **w9600** set the window value.

88024 The **w300**, **w1200**, and **w9600** options do not appear in POSIX.1-2008 because of their  
88025 dependence on specific baud rates.

88026 In historical implementations, the size of the window displayed by various commands was  
88027 related to, but not necessarily the same as, the **window** edit option. For example, the size of the  
88028 window was set by the *ex* command **visual 10**, but it did not change the value of the **window**  
88029 edit option. However, changing the value of the **window** edit option did change the number of  
88030 lines that were displayed when the screen was repainted. POSIX.1-2008 does not permit this  
88031 behavior in the interests of consistency and simplicity of specification, and requires that all  
88032 commands that change the number of lines that are displayed do it by setting the value of the  
88033 **window** edit option.

#### 88034 **wrapmargin, wm**

88035 Historically, the **wrapmargin** option did not affect maps inserting characters that also had  
88036 associated *counts*; for example **:map K 5aABC DEF**. Unfortunately, there are widely used  
88037 maps that depend on this behavior. For consistency and simplicity of specification,  
88038 POSIX.1-2008 does not permit this behavior.

88039 Historically, **wrapmargin** was calculated using the column display width of all characters on the  
88040 screen. For example, an implementation using "**^I**" to represent <tab> characters when the **list**  
88041 edit option was set, where '**^**' and '**I**' each took up a single column on the screen, would  
88042 calculate the **wrapmargin** based on a value of 2 for each <tab>. The **number** edit option  
88043 similarly changed the effective length of the line as well. POSIX.1-2008 requires conformance to  
88044 historical practice.

88045 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
88046 but this has been modified in this version.

#### 88047 **FUTURE DIRECTIONS**

88048 None.

#### 88054 **CHANGE HISTORY**

88055 First released in Issue 2.

#### 88056 **Issue 5**

88057 The FUTURE DIRECTIONS section is added.

#### 88058 **Issue 6**

88059 This utility is marked as part of the User Portability Utilities option.

88060 The obsolescent SYNOPSIS is removed, removing the *+command* and *-* options.

- 88061 The following new requirements on POSIX implementations derive from alignment with the  
88062 Single UNIX Specification:
- 88063 • In the **map** command description, the sequence *#digit* is added.
  - 88064 • The **directory**, **edcompatible**, **redraw**, and **slowopen** edit options are added.
- 88065 The *ex* utility is extensively changed for alignment with the IEEE P1003.2b draft standard. This  
88066 includes changes as a result of the IEEE PASC Interpretations 1003.2 #31, #38, #49, #50, #51, #52,  
88067 #55, #56, #57, #61, #62, #63, #64, #65, and #78.
- 88068 The **-l** option is removed.
- 88069 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/23 is applied, correcting a URL.
- 88070 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/8 is applied, making an editorial  
88071 correction in the EXTENDED DESCRIPTION.
- 88072 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/9 is applied, removing text describing  
88073 behavior on systems with bytes consisting of more than eight bits.
- 88074 **Issue 7**
- 88075 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if an operand is  
88076 ' - ' .
- 88077 Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.
- 88078 Austin Group Interpretation 1003.1-2001 #121 is applied, clarifying the *ex write* command.
- 88079 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 88080 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

88081 **NAME**88082 `expand` — convert tabs to spaces88083 **SYNOPSIS**88084 `expand [-t tablist] [file...]`88085 **DESCRIPTION**

88086 The *expand* utility shall write files or the standard input to the standard output with `<tab>`  
 88087 characters replaced with one or more `<space>` characters needed to pad to the next tab stop. Any  
 88088 `<backspace>` characters shall be copied to the output and cause the column position count for  
 88089 tab stop calculations to be decremented; the column position count shall not be decremented  
 88090 below zero.

88091 **OPTIONS**88092 The *expand* utility shall conform to XBD Section 12.2 (on page 215).

88093 The following option shall be supported:

88094 `-t tablist` Specify the tab stops. The application shall ensure that the argument *tablist* consists  
 88095 of either a single positive decimal integer or a list of tabstops. If a single number is  
 88096 given, tabs shall be set that number of column positions apart instead of the  
 88097 default 8.

88098 If a list of tabstops is given, the application shall ensure that it consists of a list of  
 88099 two or more positive decimal integers, separated by `<blank>` or `<comma>`  
 88100 characters, in ascending order. The `<tab>` characters shall be set at those specific  
 88101 column positions. Each tab stop *N* shall be an integer value greater than zero, and  
 88102 the list is in strictly ascending order. This is taken to mean that, from the start of a  
 88103 line of output, tabbing to position *N* shall cause the next character output to be in  
 88104 the (*N*+1)th column position on that line.

88105 In the event of *expand* having to process a `<tab>` at a position beyond the last of  
 88106 those specified in a multiple tab-stop list, the `<tab>` shall be replaced by a single  
 88107 `<space>` in the output.

88108 **OPERANDS**

88109 The following operand shall be supported:

88110 *file* The pathname of a text file to be used as input.88111 **STDIN**

88112 See the INPUT FILES section.

88113 **INPUT FILES**

88114 Input files shall be text files.

88115 **ENVIRONMENT VARIABLES**88116 The following environment variables shall affect the execution of *expand*:

88117 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 88118 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 88119 variables used to determine the values of locale categories.)

88120 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 88121 internationalization variables.

88122 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 88123 characters (for example, single-byte as opposed to multi-byte characters in  
 88124 arguments and input files), the processing of `<tab>` and `<space>` characters, and  
 88125 for the determination of the width in column positions each character would

**expand**

Utilities

- 88126 occupy on an output device.
- 88127 *LC\_MESSAGES*
- 88128 Determine the locale that should be used to affect the format and contents of  
88129 diagnostic messages written to standard error.
- 88130 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 88131 **ASYNCHRONOUS EVENTS**
- 88132 Default.
- 88133 **STDOUT**
- 88134 The standard output shall be equivalent to the input files with <tab> characters converted into  
88135 the appropriate number of <space> characters.
- 88136 **STDERR**
- 88137 The standard error shall be used only for diagnostic messages.
- 88138 **OUTPUT FILES**
- 88139 None.
- 88140 **EXTENDED DESCRIPTION**
- 88141 None.
- 88142 **EXIT STATUS**
- 88143 The following exit values shall be returned:
- 88144 0 Successful completion
- 88145 >0 An error occurred.
- 88146 **CONSEQUENCES OF ERRORS**
- 88147 The *expand* utility shall terminate with an error message and non-zero exit status upon  
88148 encountering difficulties accessing one of the *file* operands.
- 88149 **APPLICATION USAGE**
- 88150 None.
- 88151 **EXAMPLES**
- 88152 None.
- 88153 **RATIONALE**
- 88154 The *expand* utility is useful for preprocessing text files (before sorting, looking at specific  
88155 columns, and so on) that contain <tab> characters.
- 88156 See XBD Section 3.103 (on page 50).
- 88157 The *tablist* option-argument consists of integers in ascending order. Utility Syntax Guideline 8  
88158 mandates that *expand* shall accept the integers (within the single argument) separated using  
88159 either <comma> or <blank> characters.
- 88160 Earlier versions of this standard allowed the following form in the SYNOPSIS:
- 88161 `expand [-tabstop] [-tab1,tab2,...,tabn] [file ...]`
- 88162 This form is no longer specified by POSIX.1-2008 but may be present in some implementations.
- 88163 **FUTURE DIRECTIONS**
- 88164 None.

88165 **SEE ALSO**88166 *tabs, unexpand*88167 XBD [Section 3.103](#) (on page 50), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)88168 **CHANGE HISTORY**

88169 First released in Issue 4.

88170 **Issue 6**

88171 This utility is marked as part of the User Portability Utilities option.

88172 The APPLICATION USAGE section is added.

88173 The obsolescent SYNOPSIS is removed.

88174 The *LC\_CTYPE* environment variable description is updated to align with the IEEE P1003.2b  
88175 draft standard.

88176 The normative text is reworded to avoid use of the term “must” for application requirements.

88177 **Issue 7**

88178 Austin Group Interpretation 1003.1-2001 #027 is applied.

88179 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

88180 The *expand* utility is moved from the User Portability Utilities option to the Base. User  
88181 Portability Utilities is now an option for interactive utilities.

**expr**

Utilities

88182 **NAME**88183 `expr` — evaluate arguments as an expression88184 **SYNOPSIS**88185 `expr operand...`88186 **DESCRIPTION**88187 The `expr` utility shall evaluate an expression and write the result to standard output.88188 **OPTIONS**

88189 None.

88190 **OPERANDS**88191 The single expression evaluated by `expr` shall be formed from the `operand` operands, as described  
88192 in the EXTENDED DESCRIPTION section. The application shall ensure that each of the  
88193 expression operator symbols:88194 `( ) | & = > >= < <= != + - * / % :`88195 and the symbols *integer* and *string* in the table are provided as separate arguments to `expr`.88196 **STDIN**

88197 Not used.

88198 **INPUT FILES**

88199 None.

88200 **ENVIRONMENT VARIABLES**88201 The following environment variables shall affect the execution of `expr`:88202 `LANG` Provide a default value for the internationalization variables that are unset or null.  
88203 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
88204 variables used to determine the values of locale categories.)88205 `LC_ALL` If set to a non-empty string value, override the values of all the other  
88206 internationalization variables.88207 `LC_COLLATE`88208 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
88209 character collating elements within regular expressions and by the string  
88210 comparison operators.88211 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
88212 characters (for example, single-byte as opposed to multi-byte characters in  
88213 arguments) and the behavior of character classes within regular expressions.88214 `LC_MESSAGES`88215 Determine the locale that should be used to affect the format and contents of  
88216 diagnostic messages written to standard error.88217 XSI `NLSPATH` Determine the location of message catalogs for the processing of `LC_MESSAGES`.88218 **ASYNCHRONOUS EVENTS**

88219 Default.

88220 **STDOUT**88221 The `expr` utility shall evaluate the expression and write the result, followed by a <newline>, to  
88222 standard output.

88223 **STDERR**

88224 The standard error shall be used only for diagnostic messages.

88225 **OUTPUT FILES**

88226 None.

88227 **EXTENDED DESCRIPTION**

88228 The formation of the expression to be evaluated is shown in the following table. The symbols  
 88229 *expr*, *expr1*, and *expr2* represent expressions formed from *integer* and *string* symbols and the  
 88230 expression operator symbols (all separate arguments) by recursive application of the constructs  
 88231 described in the table. The expressions are listed in order of increasing precedence, with equal-  
 88232 precedence operators grouped between horizontal lines. All of the operators shall be left-  
 88233 associative.

| Expression                                                                                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>expr1</i>   <i>expr2</i>                                                                                                                                                               | Returns the evaluation of <i>expr1</i> if it is neither null nor zero; otherwise, returns the evaluation of <i>expr2</i> if it is not null; otherwise, zero.                                                                                                                                                                                                                                               |
| <i>expr1</i> & <i>expr2</i>                                                                                                                                                               | Returns the evaluation of <i>expr1</i> if neither expression evaluates to null or zero; otherwise, returns zero.                                                                                                                                                                                                                                                                                           |
| <i>expr1</i> = <i>expr2</i><br><i>expr1</i> > <i>expr2</i><br><i>expr1</i> >= <i>expr2</i><br><i>expr1</i> < <i>expr2</i><br><i>expr1</i> <= <i>expr2</i><br><i>expr1</i> != <i>expr2</i> | Returns the result of a decimal integer comparison if both arguments are integers; otherwise, returns the result of a string comparison using the locale-specific collation sequence. | <i>expr1</i> : <i>expr2</i>                                                                                                                                                               | Matching expression; see below.                                                                                                                                                                                                                                                                                                                                                                            |
| ( <i>expr</i> )                                                                                                                                                                           | Grouping symbols. Any expression can be placed within parentheses. Parentheses can be nested to a depth of {EXPR_NEST_MAX}.                                                                                                                                                                                                                                                                                |
| <i>integer</i>                                                                                                                                                                            | An argument consisting only of an (optional) unary minus followed by digits.                                                                                                                                                                                                                                                                                                                               |
| <i>string</i>                                                                                                                                                                             | A string argument; see below.                                                                                                                                                                                                                                                                                                                                                                              |

88265 **Matching Expression**

88266 The `' : '` matching operator shall compare the string resulting from the evaluation of *expr1* with  
 88267 the regular expression pattern resulting from the evaluation of *expr2*. Regular expression syntax  
 88268 shall be that defined in XBD Section 9.3 (on page 183), except that all patterns are anchored to  
 88269 the beginning of the string (that is, only sequences starting at the first character of a string are  
 88270 matched by the regular expression) and, therefore, it is unspecified whether `' ^ '` is a special  
 88271 character in that context. Usually, the matching operator shall return a string representing the  
 88272 number of characters matched (`' 0 '` on failure). Alternatively, if the pattern contains at least one  
 88273 regular expression subexpression `"[\(.\.\.)]"`, the string matched by the back-reference  
 88274 expression `"\1"` shall be returned. If the back-reference expression `"\1"` does not match, then  
 88275 the null string shall be returned.

88276 **String Operand**

88277 A string argument is an argument that cannot be identified as an *integer* argument or as one of  
 88278 the expression operator symbols shown in the OPERANDS section.

88279 The use of string arguments **length**, **substr**, **index**, or **match** produces unspecified results.

88280 **EXIT STATUS**

88281 The following exit values shall be returned:

- 88282 0 The *expression* evaluates to neither null nor zero.
- 88283 1 The *expression* evaluates to null or zero.
- 88284 2 Invalid *expression*.
- 88285 >2 An error occurred.

88286 **CONSEQUENCES OF ERRORS**

88287 Default.

88288 **APPLICATION USAGE**

88289 After argument processing by the shell, *expr* is not required to be able to tell the difference  
 88290 between an operator and an operand except by the value. If `"$a"` is `' = '`, the command:

88291 `expr $a = '='`

88292 looks like:

88293 `expr = = =`

88294 as the arguments are passed to *expr* (and they all may be taken as the `' = '` operator). The  
 88295 following works reliably:

88296 `expr X$a = X=`

88297 Also note that this volume of POSIX.1-2008 permits implementations to extend utilities. The *expr*  
 88298 utility permits the integer arguments to be preceded with a unary minus. This means that an  
 88299 integer argument could look like an option. Therefore, the conforming application must employ  
 88300 the `"--"` construct of Guideline 10 of XBD Section 12.2 (on page 215) to protect its operands if  
 88301 there is any chance the first operand might be a negative integer (or any string with a leading  
 88302 minus).

88303 **EXAMPLES**88304 The *expr* utility has a rather difficult syntax:

- 88305 • Many of the operators are also shell control operators or reserved words, so they have to  
88306 be escaped on the command line.
- 88307 • Each part of the expression is composed of separate arguments, so liberal usage of <blank>  
88308 characters is required. For example:

| Invalid                 | Valid                        |
|-------------------------|------------------------------|
| <i>expr</i> 1+2         | <i>expr</i> 1 + 2            |
| <i>expr</i> "1 + 2"     | <i>expr</i> 1 + 2            |
| <i>expr</i> 1 + (2 * 3) | <i>expr</i> 1 + \( 2 \* 3 \) |

88313 In many cases, the arithmetic and string features provided as part of the shell command  
88314 language are easier to use than their equivalents in *expr*. Newly written scripts should avoid  
88315 *expr* in favor of the new features within the shell; see [Section 2.5](#) (on page 2301) and [Section 2.6.4](#)  
88316 (on page 2310).

88317 The following command:

88318 `a=$(expr $a + 1)`88319 adds 1 to the variable *a*.88320 The following command, for "*\$a*" equal to either `/usr/abc/file` or just `file`:88321 `expr $a : '.*\/(.*\)' \| $a`

88322 returns the last segment of a pathname (that is, `file`). Applications should avoid the character  
88323 `/` used alone as an argument; *expr* may interpret it as the division operator.

88324 The following command:

88325 `expr "//$a" : '.*\/(.*\)'`

88326 is a better representation of the previous example. The addition of the `"/"` characters  
88327 eliminates any ambiguity about the division operator and simplifies the whole expression. Also  
88328 note that pathnames may contain characters contained in the *IFS* variable and should be quoted  
88329 to avoid having "*\$a*" expand into multiple arguments.

88330 The following command:

88331 `expr "$VAR" : '.*'`88332 returns the number of characters in *VAR*.88333 **RATIONALE**

88334 In an early proposal, EREs were used in the matching expression syntax. This was changed to  
88335 BREs to avoid breaking historical applications.

88336 The use of a leading <circumflex> in the BRE is unspecified because many historical  
88337 implementations have treated it as a special character, despite their system documentation. For  
88338 example:

88339 `expr foo : ^foo`      `expr ^foo : ^foo`

88340 return 3 and 0, respectively, on those systems; their documentation would imply the reverse.  
88341 Thus, the anchoring condition is left unspecified to avoid breaking historical scripts relying on  
88342 this undocumented feature.

88343 **FUTURE DIRECTIONS**

88344 None.

88345 **SEE ALSO**88346 [Section 2.5](#) (on page 2301), [Section 2.6.4](#) (on page 2310)88347 XBD [Chapter 8](#) (on page 173), [Section 9.3](#) (on page 183), [Section 12.2](#) (on page 215)88348 **CHANGE HISTORY**

88349 First released in Issue 2.

88350 **Issue 5**

88351 The FUTURE DIRECTIONS section is added.

88352 **Issue 6**88353 The *expr* utility is aligned with the IEEE P1003.2b draft standard, to include resolution of IEEE  
88354 PASC Interpretation 1003.2 #104.

88355 The normative text is reworded to avoid use of the term “must” for application requirements.

88356 **Issue 7**

88357 Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.

88358 The SYNOPSIS and OPERANDS sections are revised to explicitly state that the name of each of  
88359 the operands is *operand*.

88400 **CHANGE HISTORY**

88401 First released in Issue 2.

88402 **Issue 6**

88403 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/24 is applied, changing the STDERR  
88404 section from "None." to "Not used." for alignment with [Section 1.4](#) (on page 2288).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

88405 **NAME**88406 `fc` — process the command history list88407 **SYNOPSIS**88408 UP `fc [-r] [-e editor] [first [last]]`88409 `fc -l [-nr] [first [last]]`88410 `fc -s [old=new] [first]`88411 **DESCRIPTION**88412 The `fc` utility shall list, or shall edit and re-execute, commands previously entered to an  
88413 interactive `sh`.

88414 The command history list shall reference commands by number. The first number in the list is  
88415 selected arbitrarily. The relationship of a number to its command shall not change except when  
88416 the user logs in and no other process is accessing the list, at which time the system may reset the  
88417 numbering to start the oldest retained command at another number (usually 1). When the  
88418 number reaches an implementation-defined upper limit, which shall be no smaller than the  
88419 value in `HISTSIZE` or 32767 (whichever is greater), the shell may wrap the numbers, starting the  
88420 next command with a lower number (usually 1). However, despite this optional wrapping of  
88421 numbers, `fc` shall maintain the time-ordering sequence of the commands. For example, if four  
88422 commands in sequence are given the numbers 32766, 32767, 1 (wrapped), and 2 as they are  
88423 executed, command 32767 is considered the command previous to 1, even though its number is  
88424 higher.

88425 When commands are edited (when the `-l` option is not specified), the resulting lines shall be  
88426 entered at the end of the history list and then re-executed by `sh`. The `fc` command that caused the  
88427 editing shall not be entered into the history list. If the editor returns a non-zero exit status, this  
88428 shall suppress the entry into the history list and the command re-execution. Any command line  
88429 variable assignments or redirection operators used with `fc` shall affect both the `fc` command itself  
88430 as well as the command that results; for example:

88431 `fc -s -- -l 2>/dev/null`88432 reinvoke the previous command, suppressing standard error for both `fc` and the previous  
88433 command.88434 **OPTIONS**88435 The `fc` utility shall conform to XBD Section 12.2 (on page 215).

88436 The following options shall be supported:

88437 **-e** *editor* Use the editor named by *editor* to edit the commands. The *editor* string is a utility  
88438 name, subject to search via the `PATH` variable (see XBD Chapter 8, on page 173).  
88439 The value in the `FCEDIT` variable shall be used as a default when `-e` is not  
88440 specified. If `FCEDIT` is null or unset, *ed* shall be used as the editor.

88441 **-l** (The letter ell.) List the commands rather than invoking an editor on them. The  
88442 commands shall be written in the sequence indicated by the *first* and *last* operands,  
88443 as affected by `-r`, with each command preceded by the command number.

88444 **-n** Suppress command numbers when listing with `-l`.

88445 **-r** Reverse the order of the commands listed (with `-l`) or edited (with neither `-l` nor  
88446 `-s`).

88447            -s            Re-execute the command without invoking an editor.

88448   **OPERANDS**

88449            The following operands shall be supported:

88450            *first, last*       Select the commands to list or edit. The number of previous commands that can be  
88451                                   accessed shall be determined by the value of the *HISTSIZE* variable. The value of  
88452                                   *first* or *last* or both shall be one of the following:

88453            [+]*number*       A positive number representing a command number; command  
88454                                   numbers can be displayed with the -I option.

88455            -*number*       A negative decimal number representing the command that was  
88456                                   executed *number* of commands previously. For example, -1 is the  
88457                                   immediately previous command.

88458            *string*         A string indicating the most recently entered command that begins  
88459                                   with that string. If the *old=new* operand is not also specified with -s,  
88460                                   the string form of the *first* operand cannot contain an embedded  
88461                                   <equals-sign>.

88462            When the synopsis form with -s is used:

- 88463                   • If *first* is omitted, the previous command shall be used.

88464            For the synopsis forms without -s:

- 88465                   • If *last* is omitted, *last* shall default to the previous command when -I is  
88466                                   specified; otherwise, it shall default to *first*.

- 88467                   • If *first* and *last* are both omitted, the previous 16 commands shall be listed or  
88468                                   the previous single command shall be edited (based on the -I option).

- 88469                   • If *first* and *last* are both present, all of the commands from *first* to *last* shall be  
88470                                   edited (without -I) or listed (with -I). Editing multiple commands shall be  
88471                                   accomplished by presenting to the editor all of the commands at one time,  
88472                                   each command starting on a new line. If *first* represents a newer command  
88473                                   than *last*, the commands shall be listed or edited in reverse sequence,  
88474                                   equivalent to using -r. For example, the following commands on the first  
88475                                   line are equivalent to the corresponding commands on the second:

88476                   fc -r 10 20       fc     30 40

88477                   fc     20 10       fc -r 40 30

- 88478                   • When a range of commands is used, it shall not be an error to specify *first* or  
88479                                   *last* values that are not in the history list; *fc* shall substitute the value  
88480                                   representing the oldest or newest command in the list, as appropriate. For  
88481                                   example, if there are only ten commands in the history list, numbered 1 to 10:

88482                   fc -l

88483                   fc 1 99

88484                   shall list and edit, respectively, all ten commands.

88485            *old=new*       Replace the first occurrence of string *old* in the commands to be re-executed by the  
88486                                   string *new*.

88487 **STDIN**

88488 Not used.

88489 **INPUT FILES**

88490 None.

88491 **ENVIRONMENT VARIABLES**88492 The following environment variables shall affect the execution of *fc*:

88493 *FCEDIT* This variable, when expanded by the shell, shall determine the default value for  
 88494 the *-e editor* option's *editor* option-argument. If *FCEDIT* is null or unset, *ed* shall be  
 88495 used as the editor.

88496 *HISTFILE* Determine a pathname naming a command history file. If the *HISTFILE* variable is  
 88497 not set, the shell may attempt to access or create a file *.sh\_history* in the directory  
 88498 referred to by the *HOME* environment variable. If the shell cannot obtain both read  
 88499 and write access to, or create, the history file, it shall use an unspecified  
 88500 mechanism that allows the history to operate properly. (References to history "file"  
 88501 in this section shall be understood to mean this unspecified mechanism in such  
 88502 cases.) An implementation may choose to access this variable only when  
 88503 initializing the history file; this initialization shall occur when *fc* or *sh* first attempt  
 88504 to retrieve entries from, or add entries to, the file, as the result of commands issued  
 88505 by the user, the file named by the *ENV* variable, or implementation-defined system  
 88506 start-up files. In some historical shells, the history file is initialized just after the  
 88507 *ENV* file has been processed. Therefore, it is implementation-defined whether  
 88508 changes made to *HISTFILE* after the history file has been initialized are effective.  
 88509 Implementations may choose to disable the history list mechanism for users with  
 88510 appropriate privileges who do not set *HISTFILE*; the specific circumstances under  
 88511 which this occurs are implementation-defined. If more than one instance of the  
 88512 shell is using the same history file, it is unspecified how updates to the history file  
 88513 from those shells interact. As entries are deleted from the history file, they shall be  
 88514 deleted oldest first. It is unspecified when history file entries are physically  
 88515 removed from the history file.

88516 *HISTSIZE* Determine a decimal number representing the limit to the number of previous  
 88517 commands that are accessible. If this variable is unset, an unspecified default  
 88518 greater than or equal to 128 shall be used. The maximum number of commands in  
 88519 the history list is unspecified, but shall be at least 128. An implementation may  
 88520 choose to access this variable only when initializing the history file, as described  
 88521 under *HISTFILE*. Therefore, it is unspecified whether changes made to *HISTSIZE*  
 88522 after the history file has been initialized are effective.

88523 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 88524 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 88525 variables used to determine the values of locale categories.)

88526 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 88527 internationalization variables.

88528 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 88529 characters (for example, single-byte as opposed to multi-byte characters in  
 88530 arguments and input files).

88531 *LC\_MESSAGES*

88532 Determine the locale that should be used to affect the format and contents of  
 88533 diagnostic messages written to standard error.

- 88534 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 88535 **ASYNCHRONOUS EVENTS**
- 88536 Default.
- 88537 **STDOUT**
- 88538 When the **-l** option is used to list commands, the format of each command in the list shall be as follows:
- 88539
- 88540 "%d\t%s\n", <line number>, <command>
- 88541 If both the **-l** and **-n** options are specified, the format of each command shall be:
- 88542 "\t%s\n", <command>
- 88543 If the <command> consists of more than one line, the lines after the first shall be displayed as:
- 88544 "\t%s\n", <continued-command>
- 88545 **STDERR**
- 88546 The standard error shall be used only for diagnostic messages.
- 88547 **OUTPUT FILES**
- 88548 None.
- 88549 **EXTENDED DESCRIPTION**
- 88550 None.
- 88551 **EXIT STATUS**
- 88552 The following exit values shall be returned:
- 88553 0 Successful completion of the listing.
- 88554 >0 An error occurred.
- 88555 Otherwise, the exit status shall be that of the commands executed by *fc*.
- 88556 **CONSEQUENCES OF ERRORS**
- 88557 Default.
- 88558 **APPLICATION USAGE**
- 88559 Since editors sometimes use file descriptors as integral parts of their editing, redirecting their file descriptors as part of the *fc* command can produce unexpected results. For example, if *vi* is the *FCEDIT* editor, the command:
- 88560
- 88561 *fc -s | more*
- 88562
- 88563 does not work correctly on many systems.
- 88564 Users on windowing systems may want to have separate history files for each window by setting *HISTFILE* as follows:
- 88565
- 88566 *HISTFILE=\$HOME/.sh\_hist\$\$*
- 88567 **EXAMPLES**
- 88568 None.
- 88569 **RATIONALE**
- 88570 This utility is based on the *fc* built-in of the KornShell.
- 88571 An early proposal specified the **-e** option as [**-e** *editor* [*old= new* ]], which is not historical practice. Historical practice in *fc* of either [**-e** *editor*] or [**-e** - [*old= new* ]] is acceptable, but not both together. To clarify this, a new option **-s** was introduced replacing the [**-e** -]. This resolves

88574 the conflict and makes *fc* conform to the Utility Syntax Guidelines.

88575 *HISTFILE* Some implementations of the KornShell check for the superuser and do not create  
88576 a history file unless *HISTFILE* is set. This is done primarily to avoid creating  
88577 unlinked files in the root file system when logging in during single-user mode.  
88578 *HISTFILE* must be set for the superuser to have history.

88579 *HISTSIZE* Needed to limit the size of history files. It is the intent of the standard developers  
88580 that when two shells share the same history file, commands that are entered in one  
88581 shell shall be accessible by the other shell. Because of the difficulties of  
88582 synchronization over a network, the exact nature of the interaction is unspecified.

88583 The initialization process for the history file can be dependent on the system start-up files, in  
88584 that they may contain commands that effectively preempt the settings the user has for *HISTFILE*  
88585 and *HISTSIZE*. For example, function definition commands are recorded in the history file. If  
88586 the system administrator includes function definitions in some system start-up file called before  
88587 the *ENV* file, the history file is initialized before the user can influence its characteristics. In some  
88588 historical shells, the history file is initialized just after the *ENV* file has been processed. Because  
88589 of these situations, the text requires the initialization process to be implementation-defined.

88590 Consideration was given to omitting the *fc* utility in favor of the command line editing feature in  
88591 *sh*. For example, in *vi* editing mode, typing "<ESC> v" is equivalent to:

88592 EDITOR=vi fc

88593 However, the *fc* utility allows the user the flexibility to edit multiple commands simultaneously  
88594 (such as *fc 10 20*) and to use editors other than those supported by *sh* for command line editing.

88595 In the KornShell, the alias *r* ("re-do") is preset to *fc -e -* (equivalent to the POSIX *fc -s*). This is  
88596 probably an easier command name to remember than *fc* ("fix command"), but it does not meet  
88597 the Utility Syntax Guidelines. Renaming *fc* to *hist* or *redo* was considered, but since this  
88598 description closely matches historical KornShell practice already, such a renaming was seen as  
88599 gratuitous. Users are free to create aliases whenever odd historical names such as *fc*, *awk*, *cat*,  
88600 *grep*, or *yacc* are standardized by POSIX.

88601 Command numbers have no ordering effects; they are like serial numbers. The *-r* option and  
88602 *-number* operand address the sequence of command execution, regardless of serial numbers. So,  
88603 for example, if the command number wrapped back to 1 at some arbitrary point, there would be  
88604 no ambiguity associated with traversing the wrap point. For example, if the command history  
88605 were:

88606 32766: echo 1  
88607 32767: echo 2  
88608 1: echo 3

88609 the number *-2* refers to command 32767 because it is the second previous command, regardless  
88610 of serial number.

#### 88611 FUTURE DIRECTIONS

88612 None.

#### 88613 SEE ALSO

88614 *sh*

88615 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

88616 **CHANGE HISTORY**

88617 First released in Issue 4.

88618 **Issue 5**

88619 The FUTURE DIRECTIONS section is added.

88620 **Issue 6**

88621 This utility is marked as part of the User Portability Utilities option.

88622 In the ENVIRONMENT VARIABLES section, the text “user’s home directory” is updated to  
88623 “directory referred to by the *HOME* environment variable”.88624 **Issue 7**

88625 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

88626 **NAME**

88627 fg — run jobs in the foreground

88628 **SYNOPSIS**88629 UP fg [*job\_id*]88630 **DESCRIPTION**88631 If job control is enabled (see the description of *set -m*), the *fg* utility shall move a background job  
88632 from the current environment (see Section 2.12, on page 2331) into the foreground.88633 Using *fg* to place a job into the foreground shall remove its process ID from the list of those  
88634 “known in the current shell execution environment”; see Section 2.9.3.1 (on page 2319).88635 **OPTIONS**

88636 None.

88637 **OPERANDS**

88638 The following operand shall be supported:

88639 *job\_id* Specify the job to be run as a foreground job. If no *job\_id* operand is given, the  
88640 *job\_id* for the job that was most recently suspended, placed in the background, or  
88641 run as a background job shall be used. The format of *job\_id* is described in XBD  
88642 Section 3.203 (on page 65).88643 **STDIN**

88644 Not used.

88645 **INPUT FILES**

88646 None.

88647 **ENVIRONMENT VARIABLES**88648 The following environment variables shall affect the execution of *fg*:88649 *LANG* Provide a default value for the internationalization variables that are unset or null.  
88650 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
88651 variables used to determine the values of locale categories.)88652 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
88653 internationalization variables.88654 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
88655 characters (for example, single-byte as opposed to multi-byte characters in  
88656 arguments).88657 *LC\_MESSAGES*88658 Determine the locale that should be used to affect the format and contents of  
88659 diagnostic messages written to standard error.88660 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.88661 **ASYNCHRONOUS EVENTS**

88662 Default.

88663 **STDOUT**88664 The *fg* utility shall write the command line of the job to standard output in the following format:88665 "%s\n", <*command*>

88666 **STDERR**

88667 The standard error shall be used only for diagnostic messages.

88668 **OUTPUT FILES**

88669 None.

88670 **EXTENDED DESCRIPTION**

88671 None.

88672 **EXIT STATUS**

88673 The following exit values shall be returned:

88674 0 Successful completion.

88675 &gt;0 An error occurred.

88676 **CONSEQUENCES OF ERRORS**88677 If job control is disabled, the *fg* utility shall exit with an error and no job shall be placed in the foreground.  
8867888679 **APPLICATION USAGE**88680 The *fg* utility does not work as expected when it is operating in its own utility execution environment because that environment has no applicable jobs to manipulate. See the APPLICATION USAGE section for *bg*. For this reason, *fg* is generally implemented as a shell regular built-in.  
88681  
88682  
8868388684 **EXAMPLES**

88685 None.

88686 **RATIONALE**88687 The extensions to the shell specified in this volume of POSIX.1-2008 have mostly been based on features provided by the KornShell. The job control features provided by *bg*, *fg*, and *jobs* are also based on the KornShell. The standard developers examined the characteristics of the C shell versions of these utilities and found that differences exist. Despite widespread use of the C shell, the KornShell versions were selected for this volume of POSIX.1-2008 to maintain a degree of uniformity with the rest of the KornShell features selected (such as the very popular command line editing features).  
88688  
88689  
88690  
88691  
88692  
8869388694 **FUTURE DIRECTIONS**

88695 None.

88696 **SEE ALSO**88697 [Section 2.9.3.1](#) (on page 2319), [Section 2.12](#) (on page 2331), *bg*, *kill*, *jobs*, *wait*88698 [XBD Section 3.203](#) (on page 65), [Chapter 8](#) (on page 173)88699 **CHANGE HISTORY**

88700 First released in Issue 4.

88701 **Issue 6**

88702 This utility is marked as part of the User Portability Utilities option.

88703 The APPLICATION USAGE section is added.

88704 The JC marking is removed from the SYNOPSIS since job control is mandatory in this version.

88705 **NAME**

88706 file — determine file type

88707 **SYNOPSIS**

88708 file [-dh] [-M file] [-m file] file...

88709 file -i [-h] file...

88710 **DESCRIPTION**88711 The *file* utility shall perform a series of tests in sequence on each specified *file* in an attempt to  
88712 classify it:

- 88713 1. If *file* does not exist, cannot be read, or its file status could not be determined, the output  
88714 shall indicate that the file was processed, but that its type could not be determined.
- 88715 2. If the file is not a regular file, its file type shall be identified. The file types directory,  
88716 FIFO, socket, block special, and character special shall be identified as such. Other  
88717 implementation-defined file types may also be identified. If *file* is a symbolic link, by  
88718 default the link shall be resolved and *file* shall test the type of file referenced by the  
88719 symbolic link. (See the **-h** and **-i** options below.)
- 88720 3. If the length of *file* is zero, it shall be identified as an empty file.
- 88721 4. The *file* utility shall examine an initial segment of *file* and shall make a guess at  
88722 identifying its contents based on position-sensitive tests. (The answer is not guaranteed to  
88723 be correct; see the **-d**, **-M**, and **-m** options below.)
- 88724 5. The *file* utility shall examine *file* and make a guess at identifying its contents based on  
88725 context-sensitive default system tests. (The answer is not guaranteed to be correct.)
- 88726 6. The file shall be identified as a data file.

88727 If *file* does not exist, cannot be read, or its file status could not be determined, the output shall  
88728 indicate that the file was processed, but that its type could not be determined.88729 If *file* is a symbolic link, by default the link shall be resolved and *file* shall test the type of file  
88730 referenced by the symbolic link.88731 **OPTIONS**88732 The *file* utility shall conform to XBD Section 12.2 (on page 215), except that the order of the **-m**,  
88733 **-d**, and **-M** options shall be significant.

88734 The following options shall be supported by the implementation:

- 88735 **-d** Apply any position-sensitive default system tests and context-sensitive default  
88736 system tests to the file. This is the default if no **-M** or **-m** option is specified.
- 88737 **-h** When a symbolic link is encountered, identify the file as a symbolic link. If **-h** is  
88738 not specified and *file* is a symbolic link that refers to a nonexistent file, *file* shall  
88739 identify the file as a symbolic link, as if **-h** had been specified.
- 88740 **-i** If a file is a regular file, do not attempt to classify the type of the file further, but  
88741 identify the file as specified in the STDOUT section.
- 88742 **-M file** Specify the name of a file containing position-sensitive tests that shall be applied to  
88743 a file in order to classify it (see the EXTENDED DESCRIPTION). No position-  
88744 sensitive default system tests nor context-sensitive default system tests shall be  
88745 applied unless the **-d** option is also specified.

88746 **-m file** Specify the name of a file containing position-sensitive tests that shall be applied to  
88747 a file in order to classify it (see the EXTENDED DESCRIPTION).

88748 If the **-m** option is specified without specifying the **-d** option or the **-M** option, position-  
88749 sensitive default system tests shall be applied after the position-sensitive tests specified by the  
88750 **-m** option. If the **-M** option is specified with the **-d** option, the **-m** option, or both, or the **-m**  
88751 option is specified with the **-d** option, the concatenation of the position-sensitive tests specified  
88752 by these options shall be applied in the order specified by the appearance of these options. If a  
88753 **-M** or **-m file** option-argument is **-**, the results are unspecified.

#### 88754 OPERANDS

88755 The following operand shall be supported:

88756 *file* A pathname of a file to be tested.

#### 88757 STDIN

88758 The standard input shall be used if a *file* operand is **'-'** and the implementation treats the **'-'**  
88759 as meaning standard input. Otherwise, the standard input shall not be used.

#### 88760 INPUT FILES

88761 The *file* can be any file type.

#### 88762 ENVIRONMENT VARIABLES

88763 The following environment variables shall affect the execution of *file*:

88764 *LANG* Provide a default value for the internationalization variables that are unset or null.  
88765 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
88766 variables used to determine the values of locale categories.)

88767 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
88768 internationalization variables.

88769 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
88770 characters (for example, single-byte as opposed to multi-byte characters in  
88771 arguments and input files).

88772 *LC\_MESSAGES*

88773 Determine the locale that should be used to affect the format and contents of  
88774 diagnostic messages written to standard error and informative messages written to  
88775 standard output.

88776 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 88777 ASYNCHRONOUS EVENTS

88778 Default

#### 88779 STDOUT

88780 In the POSIX locale, the following format shall be used to identify each operand, *file* specified:

88781 "%s: %s\n", <file>, <type>

88782 The values for <type> are unspecified, except that in the POSIX locale, if *file* is identified as one  
88783 of the types listed in the following table, <type> shall contain (but is not limited to) the  
88784 corresponding string, unless the file is identified by a position-sensitive test specified by a **-M** or  
88785 **-m** option. Each <space> shown in the strings shall be exactly one <space>.

88786

Table 4-9 File Utility Output Strings

|       | If <i>file</i> is:                                           | < <i>type</i> > shall contain the string: | Notes |
|-------|--------------------------------------------------------------|-------------------------------------------|-------|
| 88787 | Nonexistent                                                  | cannot open                               |       |
| 88788 | Block special                                                | block special                             | 1     |
| 88789 | Character special                                            | character special                         | 1     |
| 88790 | Directory                                                    | directory                                 | 1     |
| 88791 | FIFO                                                         | fifo                                      | 1     |
| 88792 | Socket                                                       | socket                                    | 1     |
| 88793 | Symbolic link                                                | symbolic link to                          | 1     |
| 88794 | Regular file                                                 | regular file                              | 1,2   |
| 88795 | Empty regular file                                           | empty                                     | 3     |
| 88796 | Regular file that cannot be read                             | cannot open                               | 3     |
| 88798 | Executable binary                                            | executable                                | 3,4,6 |
| 88799 | <i>ar</i> archive library (see <i>ar</i> )                   | archive                                   | 3,4,6 |
| 88800 | Extended <i>cpio</i> format (see <i>pax</i> )                | <i>cpio</i> archive                       | 3,4,6 |

88806 **Notes:**

- 88807 1. This is a file type test.
- 88808 2. This test is applied only if the **-i** option is specified.
- 88809 3. This test is applied only if the **-i** option is not specified.
- 88810 4. This is a position-sensitive default system test.
- 88811 5. This is a context-sensitive default system test.
- 88812 6. Position-sensitive default system tests and context-sensitive default system tests are not
- 88813 applied if the **-M** option is specified unless the **-d** option is also specified.

88814 In the POSIX locale, if *file* is identified as a symbolic link (see the **-h** option), the following

88815 alternative output format shall be used:

88816 "%s: %s %s\n", <*file*>, <*type*>, <*contents of link*>"

88817 If the file named by the *file* operand does not exist, cannot be read, or the type of the file named

88818 by the *file* operand cannot be determined, this shall not be considered an error that affects the

88819 exit status.

88820 **STDERR**

88821 The standard error shall be used only for diagnostic messages.

88822 **OUTPUT FILES**

88823 None.

## 88824 EXTENDED DESCRIPTION

88825 A file specified as an option-argument to the `-m` or `-M` options shall contain one position-  
 88826 sensitive test per line, which shall be applied to the file. If the test succeeds, the message field of  
 88827 the line shall be printed and no further tests shall be applied, with the exception that tests on  
 88828 immediately following lines beginning with a single `'>'` character shall be applied.

88829 Each line shall be composed of the following four <tab>-separated fields. (Implementations may  
 88830 allow any combination of one or more white-space characters other than <newline> to act as  
 88831 field separators.)

88832 *offset* An unsigned number (optionally preceded by a single `'>'` character) specifying  
 88833 the *offset*, in bytes, of the value in the file that is to be compared against the *value*  
 88834 field of the line. If the file is shorter than the specified offset, the test shall fail.

88835 If the *offset* begins with the character `'>'`, the test contained in the line shall not be  
 88836 applied to the file unless the test on the last line for which the *offset* did not begin  
 88837 with a `'>'` was successful. By default, the *offset* shall be interpreted as an unsigned  
 88838 decimal number. With a leading `0x` or `0X`, the *offset* shall be interpreted as a  
 88839 hexadecimal number; otherwise, with a leading `0`, the *offset* shall be interpreted as  
 88840 an octal number.

88841 *type* The type of the value in the file to be tested. The type shall consist of the type  
 88842 specification characters `d`, `s`, and `u`, specifying signed decimal, string, and  
 88843 unsigned decimal, respectively.

88844 The *type* string shall be interpreted as the bytes from the file starting at the  
 88845 specified *offset* and including the same number of bytes specified by the *value* field.  
 88846 If insufficient bytes remain in the file past the *offset* to match the *value* field, the test  
 88847 shall fail.

88848 The type specification characters `d` and `u` can be followed by an optional unsigned  
 88849 decimal integer that specifies the number of bytes represented by the type. The  
 88850 type specification characters `d` and `u` can be followed by an optional `C`, `S`, `I`, or `L`,  
 88851 indicating that the value is of type **char**, **short**, **int**, or **long**, respectively.

88852 The default number of bytes represented by the type specifiers `d`, `f`, and `u` shall  
 88853 correspond to their respective C-language types as follows. If the system claims  
 88854 conformance to the C-Language Development Utilities option, those specifiers  
 88855 shall correspond to the default sizes used in the `c99` utility. Otherwise, the default  
 88856 sizes shall be implementation-defined.

88857 For the type specifier characters `d` and `u`, the default number of bytes shall  
 88858 correspond to the size of a basic integer type of the implementation. For these  
 88859 specifier characters, the implementation shall support values of the optional  
 88860 number of bytes to be converted corresponding to the number of bytes in the C-  
 88861 language types **char**, **short**, **int**, or **long**. These numbers can also be specified by an  
 88862 application as the characters `C`, `S`, `I`, and `L`, respectively. The byte order used when  
 88863 interpreting numeric values is implementation-defined, but shall correspond to the  
 88864 order in which a constant of the corresponding type is stored in memory on the  
 88865 system.

88866 All type specifiers, except for `s`, can be followed by a mask specifier of the form  
 88867 `&number`. The mask value shall be AND'ed with the value of the input file before  
 88868 the comparison with the *value* field of the line is made. By default, the mask shall  
 88869 be interpreted as an unsigned decimal number. With a leading `0x` or `0X`, the mask  
 88870 shall be interpreted as an unsigned hexadecimal number; otherwise, with a leading

|       |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 88871 |                   | 0, the mask shall be interpreted as an unsigned octal number.                                                                                                                                                                                                                                                                                                                                          |
| 88872 |                   | The strings <b>byte</b> , <b>short</b> , <b>long</b> , and <b>string</b> shall also be supported as type fields, being interpreted as <i>dC</i> , <i>dS</i> , <i>dL</i> , and <i>s</i> , respectively.                                                                                                                                                                                                 |
| 88873 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88874 | <i>value</i>      | The <i>value</i> to be compared with the value from the file.                                                                                                                                                                                                                                                                                                                                          |
| 88875 |                   | If the specifier from the type field is <i>s</i> or <b>string</b> , then interpret the value as a string. Otherwise, interpret it as a number. If the value is a string, then the test shall succeed only when a string value exactly matches the bytes from the file.                                                                                                                                 |
| 88876 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88877 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88878 |                   | If the <i>value</i> is a string, it can contain the following sequences:                                                                                                                                                                                                                                                                                                                               |
| 88879 | <i>\character</i> | The <backslash>-escape sequences as specified in XBD Table 5-1 (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v'). In addition, the escape sequence '\ ' (the <backslash> character followed by a <space> character) shall be recognized to represent a <space> character. The results of using any other character, other than an octal digit, following the <backslash> are unspecified. |
| 88880 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88881 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88882 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88883 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88884 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88885 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88886 | <i>\octal</i>     | Octal sequences that can be used to represent characters with specific coded values. An octal sequence shall consist of a <backslash> followed by the longest sequence of one, two, or three octal-digit characters (01234567).                                                                                                                                                                        |
| 88887 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88888 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88889 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88890 |                   | By default, any value that is not a string shall be interpreted as a signed decimal number. Any such value, with a leading 0x or 0X, shall be interpreted as an unsigned hexadecimal number; otherwise, with a leading zero, the value shall be interpreted as an unsigned octal number.                                                                                                               |
| 88891 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88892 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88893 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88894 |                   | If the value is not a string, it can be preceded by a character indicating the comparison to be performed. Permissible characters and the comparisons they specify are as follows:                                                                                                                                                                                                                     |
| 88895 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88896 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88897 | =                 | The test shall succeed if the value from the file equals the <i>value</i> field.                                                                                                                                                                                                                                                                                                                       |
| 88898 | <                 | The test shall succeed if the value from the file is less than the <i>value</i> field.                                                                                                                                                                                                                                                                                                                 |

| 88902 | ^                 | The test shall succeed if at least one of the set bits in the <i>value</i> field is not set in the value from the file.                                                                                                                                                                                                                                                                                |
| 88903 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88904 | x                 | The test shall succeed if the file is large enough to contain a value of the type specified starting at the offset specified.                                                                                                                                                                                                                                                                          |
| 88905 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88906 | <i>message</i>    | The <i>message</i> to be printed if the test succeeds. The <i>message</i> shall be interpreted using the notation for the <i>printf</i> formatting specification; see <i>printf</i> . If the <i>value</i> field was a string, then the value from the file shall be the argument for the <i>printf</i> formatting specification; otherwise, the value from the file shall be the argument.             |
| 88907 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88908 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |
| 88909 |                   |                                                                                                                                                                                                                                                                                                                                                                                                        |

88910 **EXIT STATUS**

88911 The following exit values shall be returned:

88912 0 Successful completion.

88913 &gt;0 An error occurred.

88914 **CONSEQUENCES OF ERRORS**

88915 Default.

88916 **APPLICATION USAGE**

88917 The *file* utility can only be required to guess at many of the file types because only exhaustive  
 88918 testing can determine some types with certainty. For example, binary data on some  
 88919 implementations might match the initial segment of an executable or a *tar* archive.

88920 Note that the table indicates that the output contains the stated string. Systems may add text  
 88921 before or after the string. For executables, as an example, the machine architecture and various  
 88922 facts about how the file was link-edited may be included. Note also that on systems that  
 88923 recognize shell script files starting with "#!" as executable files, these may be identified as  
 88924 executable binary files rather than as shell scripts.

88925 **EXAMPLES**

88926 Determine whether an argument is a binary executable file:

```
88927 file -- "$1" | grep -q '.*executable' &&  
88928 printf "%s is executable.\n" "$1"
```

88929 **RATIONALE**88930 The *-f* option was omitted because the same effect can (and should) be obtained using the *xargs*  
88931 utility.

88932 Historical versions of the *file* utility attempt to identify the following types of files: symbolic link,  
 88933 directory, character special, block special, socket, *tar* archive, *cpio* archive, SCCS archive, archive  
 88934 library, empty, *compress* output, *pack* output, binary data, C source, FORTRAN source, assembler  
 88935 source, *nroff/troff/eqn/tbl* source *troff* output, shell script, C shell script, English text, ASCII text,  
 88936 various executables, APL workspace, compiled terminfo entries, and CURSES screen images.  
 88937 Only those types that are reasonably well specified in POSIX or are directly related to POSIX  
 88938 utilities are listed in the table.

88939 Historical systems have used a "magic file" named */etc/magic* to help identify file types. Because  
 88940 it is generally useful for users and scripts to be able to identify special file types, the *-m* flag and  
 88941 a portable format for user-created magic files has been specified. No requirement is made that an  
 88942 implementation of *file* use this method of identifying files, only that users be permitted to add  
 88943 their own classifying tests.

88944 In addition, three options have been added to historical practice. The *-d* flag has been added to  
 88945 permit users to cause their tests to follow any default system tests. The *-i* flag has been added to  
 88946 permit users to test portably for regular files in shell scripts. The *-M* flag has been added to  
 88947 permit users to ignore any default system tests.

88948 The POSIX.1-2008 description of default system tests and the interaction between the *-d*, *-M*,  
 88949 and *-m* options did not clearly indicate that there were two types of "default system tests". The  
 88950 "position-sensitive tests" determine file types by looking for certain string or binary values at  
 88951 specific offsets in the file being examined. These position-sensitive tests were implemented in  
 88952 historical systems using the magic file described above. Some of these tests are now built into  
 88953 the *file* utility itself on some implementations so the output can provide more detail than can be  
 88954 provided by magic files. For example, a magic file can easily identify a *core* file on most  
 88955 implementations, but cannot name the program file that dropped the core. A magic file could

88956 produce output such as:

88957 /home/dwc/core: ELF 32-bit MSB core file SPARC Version 1

88958 but by building the test into the *file* utility, you could get output such as:

88959 /home/dwc/core: ELF 32-bit MSB core file SPARC Version 1, from 'testprog'

88960 These extended built-in tests are still to be treated as position-sensitive default system tests even  
88961 if they are not listed in */etc/magic* or any other magic file.

88962 The context-sensitive default system tests were always built into the *file* utility. These tests  
88963 looked for language constructs in text files trying to identify shell scripts, C, FORTRAN, and  
88964 other computer language source files, and even plain text files. With the addition of the *-m* and  
88965 *-M* options the distinction between position-sensitive and context-sensitive default system tests  
88966 became important because the order of testing is important. The context-sensitive system default  
88967 tests should never be applied before any position-sensitive tests even if the *-d* option is specified  
88968 before a *-m* option or *-M* option due to the high probability that the context-sensitive system  
88969 default tests will incorrectly identify arbitrary text files as text files before position-sensitive tests  
88970 specified by the *-m* or *-M* option would be applied to give a more accurate identification.

88971 Leaving the meaning of *-M* – and *-m* – unspecified allows an existing prototype of these  
88972 options to continue to work in a backwards-compatible manner. (In that implementation, *-M* –  
88973 was roughly equivalent to *-d* in POSIX.1-2008.)

88974 The historical *-c* option was omitted as not particularly useful to users or portable shell scripts.  
88975 In addition, a reasonable implementation of the *file* utility would report any errors found each  
88976 time the magic file is read.

88977 The historical format of the magic file was the same as that specified by the Rationale in the  
88978 ISO POSIX-2:1993 standard for the *offset value*, and *message* fields; however, it used less precise  
88979 type fields than the format specified by the current normative text. The new type field values are  
88980 a superset of the historical ones.

88981 The following is an example magic file:

88982 0 short 070707 cpio archive  
88983 0 short 0143561 Byte-swapped cpio archive  
88984 0 string 070707 ASCII cpio archive  
88985 0 long 0177555 Very old archive  
88986 0 short 0177545 Old archive  
88987 0 short 017437 Old packed data  
88988 0 string \037\036 Packed data  
88989 0 string \377\037 Compacted data  
88990 0 string \037\235 Compressed data  
88991 >2 byte&0x80 >0 Block compressed  
88992 >2 byte&0x1f x %d bits  
88993 0 string \032\001 Compiled Terminfo Entry  
88994 0 short 0433 Curses screen image  
88995 0 short 0434 Curses screen image  
88996 0 string <ar> System V Release 1 archive  
88997 0 string !<arch>\n\_\_\_.SYMDEF Archive random library  
88998 0 string !<arch> Archive  
88999 0 string ARF\_BEGARF PHIGS clear text archive  
89000 0 long 0x137A2950 Scalable OpenFont binary  
89001 0 long 0x137A2951 Encrypted scalable OpenFont binary

- 89002 The use of a basic integer data type is intended to allow the implementation to choose a word  
89003 size commonly used by applications on that architecture.
- 89004 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
89005 but this has been modified in this version.
- 89006 **FUTURE DIRECTIONS**
- 89007 None.
- 89008 **SEE ALSO**
- 89009 *ar, ls, pax, printf*
- 89010 XBD [Table 5-1](#) (on page 121), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)
- 89011 **CHANGE HISTORY**
- 89012 First released in Issue 4.
- 89013 **Issue 6**
- 89014 This utility is marked as part of the User Portability Utilities option.
- 89015 Options and an EXTENDED DESCRIPTION are added as specified in the IEEE P1003.2b draft  
89016 standard.
- 89017 IEEE PASC Interpretations 1003.2 #192 and #178 are applied.
- 89018 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/25 is applied, making major changes to  
89019 address ambiguities raised in defect reports.
- 89020 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/26 is applied, making it clear in the  
89021 OPTIONS section that the **-m**, **-d**, and **-M** options do not comply with Guideline 11 of the  
89022 Utility Syntax Guidelines.
- 89023 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/10 is applied, clarifying the specification  
89024 characters.
- 89025 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/11 is applied, allowing application  
89026 developers to create portable magic files that can match characters in strings, and allowing  
89027 common extensions found in existing implementations.
- 89028 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/12 is applied, removing text describing  
89029 behavior on systems with bytes consisting of more than eight bits.
- 89030 **Issue 7**
- 89031 Austin Group Interpretation 1003.1-2001 #092 is applied.
- 89032 SD5-XCU-ERN-4 is applied, adding further entries in the Notes column in [Table 4-9](#).
- 89033 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 89034 The *file* utility is moved from the User Portability Utilities option to the Base. User Portability  
89035 Utilities is now an option for interactive utilities.
- 89036 The EXAMPLES section is revised to correct an error with the pathname "`$1`".

89037 **NAME**

89038 find — find files

89039 **SYNOPSIS**89040 find [-H|-L] *path...* [*operand\_expression...*]89041 **DESCRIPTION**

89042 The *find* utility shall recursively descend the directory hierarchy from each file specified by *path*,  
 89043 evaluating a Boolean expression composed of the primaries described in the OPERANDS section  
 89044 for each file encountered. Each *path* operand shall be evaluated unaltered as it was provided,  
 89045 including all trailing <slash> characters; all pathnames for other files encountered in the  
 89046 hierarchy shall consist of the concatenation of the current *path* operand, a <slash> if the current  
 89047 *path* operand did not end in one, and the filename relative to the *path* operand. The relative  
 89048 portion shall contain no dot or dot-dot components, no trailing <slash> characters, and only  
 89049 single <slash> characters between pathname components.

89050 The *find* utility shall be able to descend to arbitrary depths in a file hierarchy and shall not fail  
 89051 due to path length limitations (unless a *path* operand specified by the application exceeds  
 89052 {PATH\_MAX} requirements).

89053 The *find* utility shall detect infinite loops; that is, entering a previously visited directory that is an  
 89054 ancestor of the last file encountered. When it detects an infinite loop, *find* shall write a  
 89055 diagnostic message to standard error and shall either recover its position in the hierarchy or  
 89056 terminate.

89057 **OPTIONS**89058 The *find* utility shall conform to XBD Section 12.2 (on page 215).

89059 The following options shall be supported by the implementation:

89060 **-H** Cause the file information and file type evaluated for each symbolic link  
 89061 encountered as a *path* operand on the command line to be those of the file  
 89062 referenced by the link, and not the link itself. If the referenced file does not exist,  
 89063 the file information and type shall be for the link itself. File information and type  
 89064 for symbolic links encountered during the traversal of a file hierarchy shall be that  
 89065 of the link itself.

89066 **-L** Cause the file information and file type evaluated for each symbolic link  
 89067 encountered as a *path* operand on the command line or encountered during the  
 89068 traversal of a file hierarchy to be those of the file referenced by the link, and not the  
 89069 link itself. If the referenced file does not exist, the file information and type shall be  
 89070 for the link itself.

89071 Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered  
 89072 an error. The last option specified shall determine the behavior of the utility. If neither the **-H**  
 89073 nor the **-L** option is specified, then the file information and type for symbolic links encountered  
 89074 as a *path* operand on the command line or encountered during the traversal of a file hierarchy  
 89075 shall be that of the link itself.

89076 **OPERANDS**

89077 The following operands shall be supported:

89078 The first operand and subsequent operands up to but not including the first operand that starts  
 89079 with a '-', or is a '!' or a '(', shall be interpreted as *path* operands. If the first operand starts  
 89080 with a '-', or is a '!' or a '(', the behavior is unspecified. Each *path* operand is a pathname of  
 89081 a starting point in the file hierarchy.

89082 The first operand that starts with a '-', or is a '!' or a '(', and all subsequent arguments shall

**find**

89083 be interpreted as an *expression* made up of the following primaries and operators. In the  
 89084 descriptions, wherever *n* is used as a primary argument, it shall be interpreted as a decimal  
 89085 integer optionally preceded by a plus ('+') or minus-sign ('-') sign, as follows:

89086 **+n** More than *n*.

89087 **n** Exactly *n*.

89088 **-n** Less than *n*.

89089 The following primaries shall be supported:

89090 **-name** *pattern*

89091 The primary shall evaluate as true if the basename of the current pathname  
 89092 matches *pattern* using the pattern matching notation described in Section 2.13 (on  
 89093 page 2332). The additional rules in Section 2.13.3 (on page 2333) do not apply as  
 89094 this is a matching operation, not an expansion.

89095 **-path** *pattern*

89096 The primary shall evaluate as true if the current pathname matches *pattern* using  
 89097 the pattern matching notation described in Section 2.13 (on page 2332). The  
 89098 additional rules in Section 2.13.3 (on page 2333) do not apply as this is a matching  
 89099 operation, not an expansion.

89100 **-nouser**

89101 The primary shall evaluate as true if the file belongs to a user ID for which the  
 89102 *getpwuid()* function defined in the System Interfaces volume of POSIX.1-2008 (or  
 equivalent) returns NULL.

89103 **-nogroup**

89104 The primary shall evaluate as true if the file belongs to a group ID for which the  
 89105 *getgrgid()* function defined in the System Interfaces volume of POSIX.1-2008 (or  
 equivalent) returns NULL.

89106 **-xdev**

89107 The primary shall always evaluate as true; it shall cause *find* not to continue  
 89108 descending past directories that have a different device ID (*st\_dev*, see the *stat()*  
 89109 function defined in the System Interfaces volume of POSIX.1-2008). If any **-xdev**  
 89110 primary is specified, it shall apply to the entire expression even if the **-xdev**  
 primary would not normally be evaluated.

89111 **-prune**

89112 The primary shall always evaluate as true; it shall cause *find* not to descend the  
 89113 current pathname if it is a directory. If the **-depth** primary is specified, the **-prune**  
 primary shall have no effect.

89114 **-perm** [-]*mode*

89115 The *mode* argument is used to represent file mode bits. It shall be identical in  
 89116 format to the *symbolic\_mode* operand described in *chmod*, and shall be interpreted  
 89117 as follows. To start, a template shall be assumed with all file mode bits cleared. An  
 89118 *op* symbol of '+' shall set the appropriate mode bits in the template; '-' shall  
 89119 clear the appropriate bits; '=' shall set the appropriate mode bits, without regard  
 89120 to the contents of the file mode creation mask of the process. The *op* symbol of '-'  
 89121 cannot be the first character of *mode*; this avoids ambiguity with the optional  
 89122 leading <hyphen>. Since the initial mode is all bits off, there are not any symbolic  
 89123 modes that need to use '-' as the first character.

89124 If the <hyphen> is omitted, the primary shall evaluate as true when the file  
 89125 permission bits exactly match the value of the resulting template.

89126 Otherwise, if *mode* is prefixed by a <hyphen>, the primary shall evaluate as true if  
 89127 at least all the bits in the resulting template are set in the file permission bits.

- 89128        **-perm** [-] *onum*
- 89129            If the <hyphen> is omitted, the primary shall evaluate as true when the file mode bits exactly match the value of the octal number *onum* (see the description of the octal *mode* in *chmod*). Otherwise, if *onum* is prefixed by a <hyphen>, the primary shall evaluate as true if at least all of the bits specified in *onum* are set. In both cases, the behavior is unspecified when *onum* exceeds 07777.
- 89130
- 89131
- 89132
- 89133
- 89134        **-type** *c*
- 89135            The primary shall evaluate as true if the type of the file is *c*, where *c* is 'b', 'c', 'd', 'l', 'p', 'f', or 's' for block special file, character special file, directory, symbolic link, FIFO, regular file, or socket, respectively.
- 89136
- 89137        **-links** *n*
- 89138            The primary shall evaluate as true if the file has *n* links.
- 89139
- 89140        **-user** *uname*
- 89141            The primary shall evaluate as true if the file belongs to the user *uname*. If *uname* is a decimal integer and the *getpwnam()* (or equivalent) function does not return a valid user name, *uname* shall be interpreted as a user ID.
- 89142
- 89143
- 89144        **-group** *gname*
- 89145            The primary shall evaluate as true if the file belongs to the group *gname*. If *gname* is a decimal integer and the *getgrnam()* (or equivalent) function does not return a valid group name, *gname* shall be interpreted as a group ID.
- 89146
- 89147        **-size** *n*[*c*]
- 89148            The primary shall evaluate as true if the file size in bytes, divided by 512 and rounded up to the next integer, is *n*. If *n* is followed by the character '*c*', the size shall be in bytes.
- 89149
- 89148        **-atime** *n*
- 89149            The primary shall evaluate as true if the file access time subtracted from the initialization time, divided by 86 400 (with any remainder discarded), is *n*.
- 89150
- 89151        **-ctime** *n*
- 89152            The primary shall evaluate as true if the time of last change of file status information subtracted from the initialization time, divided by 86 400 (with any remainder discarded), is *n*.
- 89153
- 89154        **-mtime** *n*
- 89155            The primary shall evaluate as true if the file modification time subtracted from the initialization time, divided by 86 400 (with any remainder discarded), is *n*.
- 89155        **-exec** *utility\_name* [*argument* ...];
- 89156        **-exec** *utility\_name* [*argument* ...] {} +
- 89157            The end of the primary expression shall be punctuated by a <semicolon> or by a <plus-sign>. Only a <plus-sign> that immediately follows an argument containing the two characters "{}" shall punctuate the end of the primary expression. Other uses of the <plus-sign> shall not be treated as special.
- 89158
- 89159
- 89160
- 89161            If the primary expression is punctuated by a <semicolon>, the utility *utility\_name* shall be invoked once for each pathname and the primary shall evaluate as true if the utility returns a zero value as exit status. A *utility\_name* or *argument* containing only the two characters "{}" shall be replaced by the current pathname.
- 89162
- 89163
- 89164
- 89165            If the primary expression is punctuated by a <plus-sign>, the primary shall always evaluate as true, and the pathnames for which the primary is evaluated shall be aggregated into sets. The utility *utility\_name* shall be invoked once for each set of aggregated pathnames. Each invocation shall begin after the last pathname in the set is aggregated, and shall be completed before the *find* utility exits and before the first pathname in the next set (if any) is aggregated for this primary, but it is otherwise unspecified whether the invocation occurs before, during, or after the evaluations of other primaries. If any invocation returns a non-zero value as exit status, the *find* utility shall return a non-zero exit status. An argument containing
- 89166
- 89167
- 89168
- 89169
- 89170
- 89171
- 89172
- 89173

## find

## Utilities

- 89174 only the two characters "{}" shall be replaced by the set of aggregated  
 89175 pathnames, with each pathname passed as a separate argument to the invoked  
 89176 utility in the same order that it was aggregated. The size of any set of two or more  
 89177 pathnames shall be limited such that execution of the utility does not cause the  
 89178 system's {ARG\_MAX} limit to be exceeded. If more than one argument containing  
 89179 only the two characters "{}" is present, the behavior is unspecified.
- 89180 If a *utility\_name* or *argument* string contains the two characters "{}", but not just  
 89181 the two characters "{}", it is implementation-defined whether *find* replaces those  
 89182 two characters or uses the string without change. The current directory for the  
 89183 invocation of *utility\_name* shall be the same as the current directory when the *find*  
 89184 utility was started. If the *utility\_name* names any of the special built-in utilities (see  
 89185 [Section 2.14](#), on page 2334), the results are undefined.
- 89186 **-ok** *utility\_name* [*argument* ...];  
 89187 The **-ok** primary shall be equivalent to **-exec**, except that the use of a <plus-sign>  
 89188 to punctuate the end of the primary expression need not be supported, and *find*  
 89189 shall request affirmation of the invocation of *utility\_name* using the current file as  
 89190 an argument by writing to standard error as described in the STDERR section. If  
 89191 the response on standard input is affirmative, the utility shall be invoked.  
 89192 Otherwise, the command shall not be invoked and the value of the **-ok** operand  
 89193 shall be false.
- 89194 **-print** The primary shall always evaluate as true; it shall cause the current pathname to  
 89195 be written to standard output.
- 89196 **-newer** *file* The primary shall evaluate as true if the modification time of the current file is  
 89197 more recent than the modification time of the file named by the pathname *file*.
- 89198 **-depth** The primary shall always evaluate as true; it shall cause descent of the directory  
 89199 hierarchy to be done so that all entries in a directory are acted on before the  
 89200 directory itself. If a **-depth** primary is not specified, all entries in a directory shall  
 89201 be acted on after the directory itself. If any **-depth** primary is specified, it shall  
 89202 apply to the entire expression even if the **-depth** primary would not normally be  
 89203 evaluated.
- 89204 The primaries can be combined using the following operators (in order of decreasing  
 89205 precedence):
- 89206 (*expression*) True if *expression* is true.
- 89207 ! *expression* Negation of a primary; the unary NOT operator.
- 89208 *expression* [-a] *expression*  
 89209 Conjunction of primaries; the AND operator is implied by the juxtaposition of two  
 89210 primaries or made explicit by the optional **-a** operator. The second expression shall  
 89211 not be evaluated if the first expression is false.
- 89212 *expression* -o *expression*  
 89213 Alternation of primaries; the OR operator. The second expression shall not be  
 89214 evaluated if the first expression is true.
- 89215 If no *expression* is present, **-print** shall be used as the expression. Otherwise, if the given  
 89216 expression does not contain any of the primaries **-exec**, **-ok**, or **-print**, the given expression  
 89217 shall be effectively replaced by:
- 89218 ( *given\_expression* ) -print

- 89219 The **-user**, **-group**, and **-newer** primaries each shall evaluate their respective arguments only  
89220 once.
- 89221 When the file type evaluated for the current file is a symbolic link, the results of evaluating the  
89222 **-perm** primary are implementation-defined.
- 89223 **STDIN**
- 89224 If the **-ok** primary is used, the response shall be read from the standard input. An entire line  
89225 shall be read as the response. Otherwise, the standard input shall not be used.
- 89226 **INPUT FILES**
- 89227 None.
- 89228 **ENVIRONMENT VARIABLES**
- 89229 The following environment variables shall affect the execution of *find*:
- 89230 **LANG** Provide a default value for the internationalization variables that are unset or null.  
89231 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
89232 variables used to determine the values of locale categories.)
- 89233 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
89234 internationalization variables.
- 89235 **LC\_COLLATE**
- 89236 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
89237 character collating elements used in the pattern matching notation for the **-n**  
89238 option and in the extended regular expression defined for the **yesexpr** locale  
89239 keyword in the *LC\_MESSAGES* category.
- 89240 **LC\_CTYPE** This variable determines the locale for the interpretation of sequences of bytes of  
89241 text data as characters (for example, single-byte as opposed to multi-byte  
89242 characters in arguments), the behavior of character classes within the pattern  
89243 matching notation used for the **-n** option, and the behavior of character classes  
89244 within regular expressions used in the extended regular expression defined for the  
89245 **yesexpr** locale keyword in the *LC\_MESSAGES* category.
- 89246 **LC\_MESSAGES**
- 89247 Determine the locale used to process affirmative responses, and the locale used to  
89248 affect the format and contents of diagnostic messages and prompts written to  
89249 standard error.
- 89250 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 89251 **PATH** Determine the location of the *utility\_name* for the **-exec** and **-ok** primaries, as  
89252 described in XBD Chapter 8 (on page 173).
- 89253 **ASYNCHRONOUS EVENTS**
- 89254 Default.
- 89255 **STDOUT**
- 89256 The **-print** primary shall cause the current pathnames to be written to standard output. The  
89257 format shall be:
- 89258 "%s\n", <path>

**find**89259 **STDERR**

89260 The **-ok** primary shall write a prompt to standard error containing at least the *utility\_name* to be  
 89261 invoked and the current pathname. In the POSIX locale, the last non-<blank> in the prompt shall  
 89262 be ' ? '. The exact format used is unspecified.

89263 Otherwise, the standard error shall be used only for diagnostic messages.

89264 **OUTPUT FILES**

89265 None.

89266 **EXTENDED DESCRIPTION**

89267 None.

89268 **EXIT STATUS**

89269 The following exit values shall be returned:

89270 0 All *path* operands were traversed successfully.

89271 >0 An error occurred.

89272 **CONSEQUENCES OF ERRORS**

89273 Default.

89274 **APPLICATION USAGE**

89275 When used in operands, pattern matching notation, <semicolon>, <left-parenthesis>, and  
 89276 <right-parenthesis> characters are special to the shell and must be quoted (see [Section 2.2](#), on  
 89277 page 2298).

89278 The bit that is traditionally used for sticky (historically 01000) is specified in the **-perm** primary  
 89279 using the octal number argument form. Since this bit is not defined by this volume of  
 89280 POSIX.1-2008, applications must not assume that it actually refers to the traditional sticky bit.

89281 **EXAMPLES**

89282 1. The following commands are equivalent:

```
89283 find .
89284 find . -print
```

89285 They both write out the entire directory hierarchy from the current directory.

89286 2. The following command:

```
89287 find / \( -name tmp -o -name '*.xx' \) -atime +7 -exec rm {} \;
```

89288 removes all files named **tmp** or ending in **.xx** that have not been accessed for seven or  
 89289 more 24-hour periods.

89290 3. The following command:

```
89291 find . -perm -o+w,+s
```

89292 prints (**-print** is assumed) the names of all files in or below the current directory, with all  
 89293 of the file permission bits **S\_ISUID**, **S\_ISGID**, and **S\_IWOTH** set.

89294 4. The following command:

```
89295 find . -name SCCS -prune -o -print
```

89296 recursively prints pathnames of all files in the current directory and below, but skips  
 89297 directories named **SCCS** and files in them.

- 89298 5. The following command:
- 89299 `find . -print -name SCCS -prune`
- 89300 behaves as in the previous example, but prints the names of the SCCS directories.
- 89301 6. The following command is roughly equivalent to the `-nt` extension to `test`:
- 89302 `if [ -n "$(find file1 -prune -newer file2)" ]; then`
- 89303 `printf %s\n "file1 is newer than file2"`
- 89304 `fi`
- 89305 7. The descriptions of `-atime`, `-ctime`, and `-mtime` use the terminology  $n$  “86400 second
- 89306 periods (days)”. For example, a file accessed at 23:59 is selected by:
- 89307 `find . -atime -1 -print`
- 89308 at 00:01 the next day (less than 24 hours later, not more than one day ago); the midnight
- 89309 boundary between days has no effect on the 24-hour calculation.
- 89310 8. The following command:
- 89311 `find . ! -name . -prune -name '*.old' -exec \`
- 89312 `sh -c 'mv "$@" ../old/' sh {} +`
- 89313 performs the same task as:
- 89314 `mv /*.old /*.old ../old/`
- 89315 while avoiding an “Argument list too long” error if there are a large number of files
- 89316 ending with `.old` (and avoiding “No such file or directory” errors if no files match `/*.old`
- 89317 or `/*.old`).
- 89318 The alternative:
- 89319 `find . ! -name . -prune -name '*.old' -exec mv {} ../old/ \;`
- 89320 is less efficient if there are many files to move because it executes one `mv` command per
- 89321 file.
- 89322 9. On systems configured to mount removable media on directories under `/media`, the
- 89323 following command searches the file hierarchy for files larger than 100 000 KB without
- 89324 searching any mounted removable media:
- 89325 `find -path /media -prune -o -size +200000 -print`
- 89326 10. Except for the root directory, and `"/"` on implementations where `"/"` does not refer to
- 89327 the root directory, no pattern given to `-name` will match a `<slash>`, because trailing
- 89328 `<slash>` characters are ignored when computing the basename of the file under
- 89329 evaluation. Given two empty directories named `foo` and `bar`, the following command:
- 89330 `find foo/// bar/// -name foo -o -name 'bar?*'`
- 89331 prints only the line `foo///`.

**RATIONALE**

89332 The `-a` operator was retained as an optional operator for compatibility with historical shell

89333 scripts, even though it is redundant with expression concatenation.

89334

89335 The descriptions of the `'-'` modifier on the `mode` and `onum` arguments to the `-perm` primary

89336 agree with historical practice on BSD and System V implementations. System V and BSD

89337 documentation both describe it in terms of checking additional bits; in fact, it uses the same bits,

89338 but checks for having at least all of the matching bits set instead of having exactly the matching

- 89339 bits set.
- 89340 The exact format of the interactive prompts is unspecified. Only the general nature of the  
89341 contents of prompts are specified because:
- 89342 • Implementations may desire more descriptive prompts than those used on historical  
89343 implementations.
  - 89344 • Since the historical prompt strings do not terminate with <newline> characters, there is no  
89345 portable way for another program to interact with the prompts of this utility via pipes.
- 89346 Therefore, an application using this prompting option relies on the system to provide the most  
89347 suitable dialog directly with the user, based on the general guidelines specified.
- 89348 The **-name** *file* operand was changed to use the shell pattern matching notation so that *find* is  
89349 consistent with other utilities using pattern matching.
- 89350 The **-size** operand refers to the size of a file, rather than the number of blocks it may occupy in  
89351 the file system. The intent is that the *st\_size* field defined in the System Interfaces volume of  
89352 POSIX.1-2008 should be used, not the *st\_blocks* found in historical implementations. There are at  
89353 least two reasons for this:
- 89354 1. In both System V and BSD, *find* only uses *st\_size* in size calculations for the operands  
89355 specified by this volume of POSIX.1-2008. (BSD uses *st\_blocks* only when processing the  
89356 **-ls** primary.)
  - 89357 2. Users usually think of file size in terms of bytes, which is also the unit used by the *ls*  
89358 utility for the output from the **-l** option. (In both System V and BSD, *ls* uses *st\_size* for the  
89359 **-l** option size field and uses *st\_blocks* for the *ls -s* calculations. This volume of  
89360 POSIX.1-2008 does not specify *ls -s*.)
- 89361 The descriptions of **-atime**, **-ctime**, and **-mtime** were changed from the SVID description of *n*  
89362 "days" to *n* being the result of the integer division of the time difference in seconds by 86 400.  
89363 The description is also different in terms of the exact timeframe for the *n* case (*versus* the *+n* or  
89364 *-n*), but it matches all known historical implementations. It refers to one 86 400 second period in  
89365 the past, not any time from the beginning of that period to the current time. For example, **-atime**  
89366 2 is true if the file was accessed any time in the period from 72 hours to 48 hours ago.
- 89367 Historical implementations do not modify "{}" when it appears as a substring of an **-exec** or  
89368 **-ok** *utility\_name* or argument string. There have been numerous user requests for this extension,  
89369 so this volume of POSIX.1-2008 allows the desired behavior. At least one recent implementation  
89370 does support this feature, but encountered several problems in managing memory allocation  
89371 and dealing with multiple occurrences of "{}" in a string while it was being developed, so it is  
89372 not yet required behavior.
- 89373 Assuming the presence of **-print** was added to correct a historical pitfall that plagues novice  
89374 users, it is entirely upwards-compatible from the historical System V *find* utility. In its simplest  
89375 form (*find directory*), it could be confused with the historical BSD fast *find*. The BSD developers  
89376 agreed that adding **-print** as a default expression was the correct decision and have added the  
89377 fast *find* functionality within a new utility called *locate*.
- 89378 Historically, the **-L** option was implemented using the primary **-follow**. The **-H** and **-L** options  
89379 were added for two reasons. First, they offer a finer granularity of control and consistency with  
89380 other programs that walk file hierarchies. Second, the **-follow** primary always evaluated to true.  
89381 As they were historically really global variables that took effect before the traversal began, some  
89382 valid expressions had unexpected results. An example is the expression **-print -o -follow**.  
89383 Because **-print** always evaluates to true, the standard order of evaluation implies that **-follow**  
89384 would never be evaluated. This was never the case. Historical practice for the **-follow** primary,

89385 however, is not consistent. Some implementations always follow symbolic links on the  
 89386 command line whether **-follow** is specified or not. Others follow symbolic links on the  
 89387 command line only if **-follow** is specified. Both behaviors are provided by the **-H** and **-L**  
 89388 options, but scripts using the current **-follow** primary would be broken if the **-follow** option is  
 89389 specified to work either way.

89390 Since the **-L** option resolves all symbolic links and the **-type l** primary is true for symbolic links  
 89391 that still exist after symbolic links have been resolved, the command:

```
89392 find -L . -type l
```

89393 prints a list of symbolic links reachable from the current directory that do not resolve to  
 89394 accessible files.

89395 A feature of SVR4's *find* utility was the **-exec** primary's **+** terminator. This allowed filenames  
 89396 containing special characters (especially <newline> characters) to be grouped together without  
 89397 the problems that occur if such filenames are piped to *xargs*. Other implementations have added  
 89398 other ways to get around this problem, notably a **-print0** primary that wrote filenames with a  
 89399 null byte terminator. This was considered here, but not adopted. Using a null terminator meant  
 89400 that any utility that was going to process *find*'s **-print0** output had to add a new option to parse  
 89401 the null terminators it would now be reading.

89402 The "**-exec** ... { } +" syntax adopted was a result of IEEE PASC Interpretation 1003.2 #210.  
 89403 It should be noted that this is an incompatible change to the ISO/IEC 9899:1999 standard. For  
 89404 example, the following command prints all files with a '-' after their name if they are regular  
 89405 files, and a '+' otherwise:

```
89406 find / -type f -exec echo {} - ';' \; -o -exec echo {} + ';' \;
```

89407 The change invalidates usage like this. Even though the previous standard stated that this usage  
 89408 would work, in practice many did not support it and the standard developers felt it better to  
 89409 now state that this was not allowable.

#### 89417 CHANGE HISTORY

89418 First released in Issue 2.

#### 89419 Issue 5

89420 The FUTURE DIRECTIONS section is added.

#### 89421 Issue 6

89422 The following new requirements on POSIX implementations derive from alignment with the  
 89423 Single UNIX Specification:

- 89424 • The **-perm [-]onum** primary is supported.

89425 The *find* utility is aligned with the IEEE P1003.2b draft standard, to include processing of  
 89426 symbolic links and changes to the description of the **atime**, **ctime**, and **mtime** operands.

89427 IEEE PASC Interpretation 1003.2 #210 is applied, extending the **-exec** operand.

- 89428 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/13 is applied, updating the RATIONALE  
89429 section to be consistent with the normative text.
- 89430 **Issue 7**
- 89431 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
89432 *LC\_MESSAGES* environment variable.
- 89433 Austin Group Interpretation 1003.1-2001 #127 is applied, rephrasing the description of the **-exec**  
89434 primary to be “immediately follows”.
- 89435 Austin Group Interpretation 1003.1-2001 #185 is applied, clarifying the requirements for the **-H**  
89436 and **-L** options.
- 89437 Austin Group Interpretation 1003.1-2001 #186 is applied, clarifying the requirements for the  
89438 evaluation of *path* operands.
- 89439 Austin Group Interpretation 1003.1-2001 #195 is applied, clarifying the interpretation of the first  
89440 operand.
- 89441 SD5-XCU-ERN-48 is applied, clarifying the **-L** option in the case that the referenced file does not  
89442 exist.
- 89443 SD5-XCU-ERN-89 is applied, updating the OPERANDS section.
- 89444 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 89445 SD5-XCU-ERN-117 is applied, clarifying the **-perm** operand.
- 89446 SD5-XCU-ERN-122 is applied, adding a new EXAMPLE.
- 89447 The description of the **-name** primary is revised and the **-path** primary is added (with a new  
89448 example).

89449 **NAME**

89450 fold — filter for folding lines

89451 **SYNOPSIS**89452 fold [-bs] [-w *width*] [*file...*]89453 **DESCRIPTION**

89454 The *fold* utility is a filter that shall fold lines from its input files, breaking the lines to have a  
 89455 maximum of *width* column positions (or bytes, if the **-b** option is specified). Lines shall be  
 89456 broken by the insertion of a <newline> such that each output line (referred to later in this section  
 89457 as a *segment*) is the maximum width possible that does not exceed the specified number of  
 89458 column positions (or bytes). A line shall not be broken in the middle of a character. The behavior  
 89459 is undefined if *width* is less than the number of columns any single character in the input would  
 89460 occupy.

89461 If the <carriage-return>, <backspace>, or <tab> characters are encountered in the input, and the  
 89462 **-b** option is not specified, they shall be treated specially:

89463 <backspace> The current count of line width shall be decremented by one, although the count  
 89464 never shall become negative. The *fold* utility shall not insert a <newline>  
 89465 immediately before or after any <backspace>, unless the following character has a  
 89466 width greater than 1 and would cause the line width to exceed *width*.

89467 <carriage-return>

89468 The current count of line width shall be set to zero. The *fold* utility shall not insert a  
 89469 <newline> immediately before or after any <carriage-return>.

89470 <tab> Each <tab> encountered shall advance the column position pointer to the next tab  
 89471 stop. Tab stops shall be at each column position *n* such that *n* modulo 8 equals 1.

89472 **OPTIONS**89473 The *fold* utility shall conform to XBD Section 12.2 (on page 215).

89474 The following options shall be supported:

89475 **-b** Count *width* in bytes rather than column positions.

89476 **-s** If a segment of a line contains a <blank> within the first *width* column positions (or  
 89477 bytes), break the line after the last such <blank> meeting the width constraints. If  
 89478 there is no <blank> meeting the requirements, the **-s** option shall have no effect for  
 89479 that output segment of the input line.

89480 **-w *width*** Specify the maximum line length, in column positions (or bytes if **-b** is specified).  
 89481 The results are unspecified if *width* is not a positive decimal number. The default  
 89482 value shall be 80.

89483 **OPERANDS**

89484 The following operand shall be supported:

89485 *file* A pathname of a text file to be folded. If no *file* operands are specified, the standard  
 89486 input shall be used.

89487 **STDIN**

89488 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 89489 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 89490 the standard input shall not be used. See the INPUT FILES section.

**fold**

Utilities

89491 **INPUT FILES**

89492 If the **-b** option is specified, the input files shall be text files except that the lines are not limited  
 89493 to {LINE\_MAX} bytes in length. If the **-b** option is not specified, the input files shall be text files.

89494 **ENVIRONMENT VARIABLES**

89495 The following environment variables shall affect the execution of *fold*:

89496 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 89497 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 89498 variables used to determine the values of locale categories.)

89499 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 89500 internationalization variables.

89501 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 89502 characters (for example, single-byte as opposed to multi-byte characters in  
 89503 arguments and input files), and for the determination of the width in column  
 89504 positions each character would occupy on a constant-width font output device.

89505 **LC\_MESSAGES**

89506 Determine the locale that should be used to affect the format and contents of  
 89507 diagnostic messages written to standard error.

89508 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

89509 **ASYNCHRONOUS EVENTS**

89510 Default.

89511 **STDOUT**

89512 The standard output shall be a file containing a sequence of characters whose order shall be  
 89513 preserved from the input files, possibly with inserted <newline> characters.

89514 **STDERR**

89515 The standard error shall be used only for diagnostic messages.

89516 **OUTPUT FILES**

89517 None.

89518 **EXTENDED DESCRIPTION**

89519 None.

89520 **EXIT STATUS**

89521 The following exit values shall be returned:

89522 0 All input files were processed successfully.

89523 >0 An error occurred.

89524 **CONSEQUENCES OF ERRORS**

89525 Default.

89526 **APPLICATION USAGE**

89527 The *cut* and *fold* utilities can be used to create text files out of files with arbitrary line lengths.  
 89528 The *cut* utility should be used when the number of lines (or records) needs to remain constant.  
 89529 The *fold* utility should be used when the contents of long lines need to be kept contiguous.

89530 The *fold* utility is frequently used to send text files to printers that truncate, rather than fold, lines  
 89531 wider than the printer is able to print (usually 80 or 132 column positions).

89532 **EXAMPLES**

89533 An example invocation that submits a file of possibly long lines to the printer (under the  
 89534 assumption that the user knows the line width of the printer to be assigned by *lp*):

89535 `fold -w 132 bigfile | lp`

89536 **RATIONALE**

89537 Although terminal input in canonical processing mode requires the erase character (frequently  
 89538 set to <backspace>) to erase the previous character (not byte or column position), terminal  
 89539 output is not buffered and is extremely difficult, if not impossible, to parse correctly; the  
 89540 interpretation depends entirely on the physical device that actually displays/prints/stores the  
 89541 output. In all known internationalized implementations, the utilities producing output for  
 89542 mixed column-width output assume that a <backspace> character backs up one column position  
 89543 and outputs enough <backspace> characters to return to the start of the character when  
 89544 <backspace> is used to provide local line motions to support underlining and boldening  
 89545 operations. Since *fold* without the *-b* option is dealing with these same constraints, <backspace>  
 89546 is always treated as backing up one column position rather than backing up one character.

89547 Historical versions of the *fold* utility assumed 1 byte was one character and occupied one column  
 89548 position when written out. This is no longer always true. Since the most common usage of *fold* is  
 89549 believed to be folding long lines for output to limited-length output devices, this capability was  
 89550 preserved as the default case. The *-b* option was added so that applications could *fold* files with  
 89551 arbitrary length lines into text files that could then be processed by the standard utilities. Note  
 89552 that although the width for the *-b* option is in bytes, a line is never split in the middle of a  
 89553 character. (It is unspecified what happens if a width is specified that is too small to hold a single  
 89554 character found in the input followed by a <newline>.)

89555 The tab stops are hardcoded to be every eighth column to meet historical practice. No new  
 89556 method of specifying other tab stops was invented.

89557 **FUTURE DIRECTIONS**

89558 None.

89559 **SEE ALSO**

89560 *cut*

89561 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

89562 **CHANGE HISTORY**

89563 First released in Issue 4.

89564 **Issue 6**

89565 The normative text is reworded to avoid use of the term “must” for application requirements.

89566 **Issue 7**

89567 Austin Group Interpretation 1003.1-2001 #092 is applied.

**fold**

- 89568 Austin Group Interpretation 1003.1-2001 #204 is applied, updating the DESCRIPTION to clarify when a <newline> can be inserted before or after a <backspace>.
- 89569
- 89570 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89571 **NAME**89572 fort77 — FORTRAN compiler (**FORTRAN**)89573 **SYNOPSIS**

```
89574 FD fort77 [-c] [-g] [-L directory]... [-O optlevel] [-o outfile] [-s]
89575 [-w] operand...
```

89576 **DESCRIPTION**

89577 The *fort77* utility is the interface to the FORTRAN compilation system; it shall accept the full  
 89578 FORTRAN-77 language defined by the ANSI X3.9-1978 standard. The system conceptually  
 89579 consists of a compiler and link editor. The files referenced by *operands* are compiled and linked  
 89580 to produce an executable file. It is unspecified whether the linking occurs entirely within the  
 89581 operation of *fort77*; some implementations may produce objects that are not fully resolved until  
 89582 the file is executed.

89583 If the `-c` option is present, for all pathname operands of the form *file.f*, the files:

89584 `$(basename pathname.f) .o`

89585 shall be created or overwritten as the result of successful compilation. If the `-c` option is not  
 89586 specified, it is unspecified whether such `.o` files are created or deleted for the *file.f* operands.

89587 If there are no options that prevent link editing (such as `-c`) and all operands compile and link  
 89588 without error, the resulting executable file shall be written into the file named by the `-o` option  
 89589 (if present) or to the file **a.out**. The executable file shall be created as specified in the System  
 89590 Interfaces volume of POSIX.1-2008, except that the file permissions shall be set to:

89591 `S_IRWXO | S_IRWXG | S_IRWXU`

89592 and that the bits specified by the *umask* of the process shall be cleared.

89593 **OPTIONS**

89594 The *fort77* utility shall conform to XBD Section 12.2 (on page 215), except that:

- 89595 • The `-l library` operands have the format of options, but their position within a list of  
 89596 operands affects the order in which libraries are searched.
- 89597 • The order of specifying the multiple `-L` options is significant.
- 89598 • Conforming applications shall specify each option separately; that is, grouping option  
 89599 letters (for example, `-cg`) need not be recognized by all implementations.

89600 The following options shall be supported:

- 89601 `-c` Suppress the link-edit phase of the compilation, and do not remove any object files  
 89602 that are produced.
- 89603 `-g` Produce symbolic information in the object or executable files; the nature of this  
 89604 information is unspecified, and may be modified by implementation-defined  
 89605 interactions with other options.
- 89606 `-s` Produce object or executable files, or both, from which symbolic and other  
 89607 information not required for proper execution using the *exec* family of functions  
 89608 defined in the System Interfaces volume of POSIX.1-2008 has been removed  
 89609 (stripped). If both `-g` and `-s` options are present, the action taken is unspecified.
- 89610 `-o outfile` Use the pathname *outfile*, instead of the default **a.out**, for the executable file  
 89611 produced. If the `-o` option is present with `-c`, the result is unspecified.

- 89612        **-L** *directory*    Change the algorithm of searching for the libraries named in **-I** operands to look in  
89613        the directory named by the *directory* pathname before looking in the usual places.  
89614        Directories named in **-L** options shall be searched in the specified order. At least  
89615        ten instances of this option shall be supported in a single *fort77* command  
89616        invocation. If a directory specified by a **-L** option contains a file named **libf.a**, the  
89617        results are unspecified.
- 89618        **-O** *optlevel*    Specify the level of code optimization. If the *optlevel* option-argument is the digit  
89619        '0', all special code optimizations shall be disabled. If it is the digit '1', the  
89620        nature of the optimization is unspecified. If the **-O** option is omitted, the nature of  
89621        the system's default optimization is unspecified. It is unspecified whether code  
89622        generated in the presence of the **-O 0** option is the same as that generated when  
89623        **-O** is omitted. Other *optlevel* values may be supported.
- 89624        **-w**                Suppress warnings.
- 89625        Multiple instances of **-L** options can be specified.

#### 89626 OPERANDS

- 89627        An *operand* is either in the form of a pathname or the form **-I library**. At least one operand of the  
89628        pathname form shall be specified. The following operands shall be supported:
- 89629        *file.f*            The pathname of a FORTRAN source file to be compiled and optionally passed to  
89630        the link editor. The filename operand shall be of this form if the **-c** option is used.
- 89631        *file.a*            A library of object files typically produced by *ar*, and passed directly to the link  
89632        editor. Implementations may recognize implementation-defined suffixes other  
89633        than **.a** as denoting object file libraries.
- 89634        *file.o*            An object file produced by *fort77 -c* and passed directly to the link editor.  
89635        Implementations may recognize implementation-defined suffixes other than **.o** as  
89636        denoting object files.
- 89637        The processing of other files is implementation-defined.
- 89638        **-I library**        (The letter ell.) Search the library named:  
89639        `liblibrary.a`
- 89640        A library is searched when its name is encountered, so the placement of a **-I**  
89641        operand is significant. Several standard libraries can be specified in this manner, as  
89642        described in the EXTENDED DESCRIPTION section. Implementations may  
89643        recognize implementation-defined suffixes other than **.a** as denoting libraries.

#### 89644 STDIN

- 89645        Not used.

#### 89646 INPUT FILES

- 89647        The input file shall be one of the following: a text file containing FORTRAN source code; an  
89648        object file in the format produced by *fort77 -c*; or a library of object files, in the format produced  
89649        by archiving zero or more object files, using *ar*. Implementations may supply additional utilities  
89650        that produce files in these formats. Additional input files are implementation-defined.
- 89651        A <tab> encountered within the first six characters on a line of source code shall cause the  
89652        compiler to interpret the following character as if it were the seventh character on the line (that  
89653        is, in column 7).

89654 **ENVIRONMENT VARIABLES**89655 The following environment variables shall affect the execution of *fort77*:

89656 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 89657 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 89658 variables used to determine the values of locale categories.)

89659 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 89660 internationalization variables.

89661 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 89662 characters (for example, single-byte as opposed to multi-byte characters in  
 89663 arguments and input files).

89664 *LC\_MESSAGES*

89665 Determine the locale that should be used to affect the format and contents of  
 89666 diagnostic messages written to standard error.

89667 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

89668 *TMPDIR* Determine the pathname that should override the default directory for temporary  
 89669 files, if any.

89670 **ASYNCHRONOUS EVENTS**

89671 Default.

89672 **STDOUT**

89673 Not used.

89674 **STDERR**

89675 The standard error shall be used only for diagnostic messages. If more than one *file* operand  
 89676 ending in *.f* (or possibly other unspecified suffixes) is given, for each such file:

89677 "%s:\n", <*file*>

89678 may be written to allow identification of the diagnostic message with the appropriate input file.

89679 This utility may produce warning messages about certain conditions that do not warrant  
 89680 returning an error (non-zero) exit value.

89681 **OUTPUT FILES**

89682 Object files, listing files, and executable files shall be produced in unspecified formats.

89683 **EXTENDED DESCRIPTION**89684 **Standard Libraries**89685 The *fort77* utility shall recognize the following *-l* operand for the standard library:

89686 *-l f* This library contains all functions referenced in the ANSI X3.9-1978 standard. This  
 89687 operand shall not be required to be present to cause a search of this library.

89688 In the absence of options that inhibit invocation of the link editor, such as *-c*, the *fort77* utility  
 89689 shall cause the equivalent of a *-l f* operand to be passed to the link editor as the last *-l* operand,  
 89690 causing it to be searched after all other object files and libraries are loaded.

89691 It is unspecified whether the library *libf.a* exists as a regular file. The implementation may  
 89692 accept as *-l* operands names of objects that do not exist as regular files.

89693 **External Symbols**

89694 The FORTRAN compiler and link editor shall support the significance of external symbols up to  
89695 a length of at least 31 bytes; case folding is permitted. The action taken upon encountering  
89696 symbols exceeding the implementation-defined maximum symbol length is unspecified.

89697 The compiler and link editor shall support a minimum of 511 external symbols per source or  
89698 object file, and a minimum of 4095 external symbols total. A diagnostic message is written to  
89699 standard output if the implementation-defined limit is exceeded; other actions are unspecified.

89700 **EXIT STATUS**

89701 The following exit values shall be returned:

89702 0 Successful compilation or link edit.

89703 >0 An error occurred.

89704 **CONSEQUENCES OF ERRORS**

89705 When *fort77* encounters a compilation error, it shall write a diagnostic to standard error and  
89706 continue to compile other source code operands. It shall return a non-zero exit status, but it is  
89707 implementation-defined whether an object module is created. If the link edit is unsuccessful, a  
89708 diagnostic message shall be written to standard error, and *fort77* shall exit with a non-zero status.

89709 **APPLICATION USAGE**

89710 None.

89711 **EXAMPLES**

89712 The following usage example compiles *xyz.f* and creates the executable file *foo*:

89713 `fort77 -o foo xyz.f`

89714 The following example compiles *xyz.f* and creates the object file *xyz.o*:

89715 `fort77 -c xyz.f`

89716 The following example compiles *xyz.f* and creates the executable file *a.out*:

89717 `fort77 xyz.f`

89718 The following example compiles *xyz.f*, links it with *b.o*, and creates the executable *a.out*:

89719 `fort77 xyz.f b.o`

89720 **RATIONALE**

89721 The name of this utility was chosen as *fort77* to parallel the renaming of the C compiler. The  
89722 name *f77* was not chosen to avoid problems with historical implementations. The  
89723 ANSI X3.9-1978 standard was selected as a normative reference because the ISO/IEC version of  
89724 FORTRAN-77 has been superseded by the ISO/IEC 1539:1991 standard.

89725 The file inclusion and symbol definition **#define** mechanisms used by the *c99* utility were not  
89726 included in this volume of POSIX.1-2008—even though they are commonly implemented—since  
89727 there is no requirement that the FORTRAN compiler use the C preprocessor.

89728 The **-onetrip** option was not included in this volume of POSIX.1-2008, even though many  
89729 historical compilers support it, because it is derived from FORTRAN-66; it is an anachronism  
89730 that should not be perpetuated.

89731 Some implementations produce compilation listings. This aspect of FORTRAN has been left  
89732 unspecified because there was controversy concerning the various methods proposed for  
89733 implementing it: a **-V** option overlapped with historical vendor practice and a naming  
89734 convention of creating files with *.l* suffixes collided with historical *lex* file naming practice.

- 89735 There is no **-I** option in this version of this volume of POSIX.1-2008 to specify a directory for file  
89736 inclusion. An **INCLUDE** directive has been a part of the Fortran-90 discussions, but an interface  
89737 supporting that standard is not in the current scope.
- 89738 It is noted that many FORTRAN compilers produce an object module even when compilation  
89739 errors occur; during a subsequent compilation, the compiler may patch the object module rather  
89740 than recompiling all the code. Consequently, it is left to the implementor whether or not an  
89741 object file is created.
- 89742 A reference to MIL-STD-1753 was removed from an early proposal in response to a request from  
89743 the POSIX FORTRAN-binding standard developers. It was not the intention of the standard  
89744 developers to require certification of the FORTRAN compiler, and IEEE Std 1003.9-1992 does not  
89745 specify the military standard or any special preprocessing requirements. Furthermore, use of  
89746 that document would have been inappropriate for an international standard.
- 89747 The specification of optimization has been subject to changes through early proposals. At one  
89748 time, **-O** and **-N** were Booleans: optimize and do not optimize (with an unspecified default).  
89749 Some historical practice led this to be changed to:
- 89750 **-O 0** No optimization.
  - 89751 **-O 1** Some level of optimization.
  - 89752 **-O n** Other, unspecified levels of optimization.
- 89753 It is not always clear whether “good code generation” is the same thing as optimization. Simple  
89754 optimizations of local actions do not usually affect the semantics of a program. The **-O 0** option  
89755 has been included to accommodate the very particular nature of scientific calculations in a  
89756 highly optimized environment; compilers make errors. Some degree of optimization is expected,  
89757 even if it is not documented here, and the ability to shut it off completely could be important  
89758 when porting an application. An implementation may treat **-O 0** as “do less than normal” if it  
89759 wishes, but this is only meaningful if any of the operations it performs can affect the semantics  
89760 of a program. It is highly dependent on the implementation whether doing less than normal is  
89761 logical. It is not the intent of the **-O 0** option to ask for inefficient code generation, but rather to  
89762 assure that any semantically visible optimization is suppressed.
- 89763 The specification of standard library access is consistent with the C compiler specification.  
89764 Implementations are not required to have **/usr/lib/libf.a**, as many historical implementations do,  
89765 but if not they are required to recognize **f** as a token.
- 89766 External symbol size limits are in normative text; conforming applications need to know these  
89767 limits. However, the minimum maximum symbol length should be taken as a constraint on a  
89768 conforming application, not on an implementation, and consequently the action taken for a  
89769 symbol exceeding the limit is unspecified. The minimum size for the external symbol table was  
89770 added for similar reasons.
- 89771 The CONSEQUENCES OF ERRORS section clearly specifies the behavior of the compiler when  
89772 compilation or link-edit errors occur. The behavior of several historical implementations was  
89773 examined, and the choice was made to be silent on the status of the executable, or **a.out**, file in  
89774 the face of compiler or linker errors. If a linker writes the executable file, then links it on disk  
89775 with *lseek()*s and *write()*s, the partially linked executable file can be left on disk and its execute  
89776 bits turned off if the link edit fails. However, if the linker links the image in memory before  
89777 writing the file to disk, it need not touch the executable file (if it already exists) because the link  
89778 edit fails. Since both approaches are historical practice, a conforming application shall rely on  
89779 the exit status of *fort77*, rather than on the existence or mode of the executable file.
- 89780 The **-g** and **-s** options are not specified as mutually-exclusive. Historically, these two options

- 89781 have been mutually-exclusive, but because both are so loosely specified, it seemed appropriate  
89782 to leave their interaction unspecified.
- 89783 The requirement that conforming applications specify compiler options separately is to reserve  
89784 the multi-character option name space for vendor-specific compiler options, which are known to  
89785 exist in many historical implementations. Implementations are not required to recognize, for  
89786 example, `-gc` as if it were `-g -c`; nor are they forbidden from doing so. The SYNOPSIS shows all  
89787 of the options separately to highlight this requirement on applications.
- 89788 Echoing filenames to standard error is considered a diagnostic message because it would  
89789 otherwise be difficult to associate an error message with the erring file. They are described with  
89790 "may" to allow implementations to use other methods of identifying files and to parallel the  
89791 description in *c99*.
- 89792 **FUTURE DIRECTIONS**
- 89793 A compilation system based on the ISO/IEC 1539:1991 standard may be considered for a future  
89794 version; it may have a different utility name from *fort77*.

- 89799 **CHANGE HISTORY**
- 89800 First released in Issue 4.
- 89801 **Issue 6**
- 89802 This utility is marked as part of the FORTRAN Development Utilities option.
- 89803 The normative text is reworded to avoid use of the term "must" for application requirements.
- 89804 **Issue 7**
- 89805 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89806 **NAME**

89807 fuser — list process IDs of all processes that have one or more files open

89808 **SYNOPSIS**89809 XSI `fuser [-cfu] file...`89810 **DESCRIPTION**89811 The *fuser* utility shall write to standard output the process IDs of processes running on the local  
89812 system that have one or more named files open. For block special devices, all processes using  
89813 any file on that device are listed.89814 The *fuser* utility shall write to standard error additional information about the named files  
89815 indicating how the file is being used.

89816 Any output for processes running on remote systems that have a named file open is unspecified.

89817 A user may need appropriate privileges to invoke the *fuser* utility.89818 **OPTIONS**89819 The *fuser* utility shall conform to XBD Section 12.2 (on page 215).

89820 The following options shall be supported:

89821 **-c** The file is treated as a mount point and the utility shall report on any files open in  
89822 the file system.89823 **-f** The report shall be only for the named files.89824 **-u** The user name, in parentheses, associated with each process ID written to standard  
89825 output shall be written to standard error.89826 **OPERANDS**

89827 The following operand shall be supported:

89828 *file* A pathname on which the file or file system is to be reported.89829 **STDIN**

89830 Not used.

89831 **INPUT FILES**

89832 The user database.

89833 **ENVIRONMENT VARIABLES**89834 The following environment variables shall affect the execution of *fuser*:89835 **LANG** Provide a default value for the internationalization variables that are unset or null.  
89836 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
89837 variables used to determine the values of locale categories.)89838 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
89839 internationalization variables.89840 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
89841 characters (for example, single-byte as opposed to multi-byte characters in  
89842 arguments).89843 **LC\_MESSAGES**89844 Determine the locale that should be used to affect the format and contents of  
89845 diagnostic messages written to standard error.

| 89878 |                               | >0 An error occurred.                                                                                                                                                                                                                                                                                                                                                                                                      |
| 89879 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 89880 |                               | Default.                                                                                                                                                                                                                                                                                                                                                                                                                   |

89881 **APPLICATION USAGE**

89882 None.

89883 **EXAMPLES**

89884 The command:

89885 `fuser -fu .`

89886 writes to standard output the process IDs of processes that are using the current directory and  
 89887 writes to standard error an indication of how those processes are using the directory and the  
 89888 user names associated with the processes that are using the current directory.

89889 `fuser -c <mount point>`

89890 writes to standard output the process IDs of processes that are using any file in the file system  
 89891 which is mounted on <mount point> and writes to standard error an indication of how those  
 89892 processes are using the files.

89893 `fuser <mount point>`

89894 writes to standard output the process IDs of processes that are using the file which is named by  
 89895 <mount point> and writes to standard error an indication of how those processes are using the  
 89896 file.

89897 `fuser <block device>`

89898 writes to standard output the process IDs of processes that are using any file which is on the  
 89899 device named by <block device> and writes to standard error an indication of how those  
 89900 processes are using the file.

89901 `fuser --f <block device>`

89902 writes to standard output the process IDs of processes that are using the file <block device> itself  
 89903 and writes to standard error an indication of how those processes are using the file.

89904 **RATIONALE**89905 The definition of the *fuser* utility follows existing practice.89906 **FUTURE DIRECTIONS**

89907 None.

89908 **SEE ALSO**89909 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)89910 **CHANGE HISTORY**

89911 First released in Issue 5.

89912 **Issue 7**

89913 SD5-XCU-ERN-90 is applied, updating the EXAMPLES section.

89914 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**gencat**

Utilities

89915 **NAME**89916 `gencat` — generate a formatted message catalog89917 **SYNOPSIS**89918 `gencat catfile msgfile...`89919 **DESCRIPTION**

89920 The `gencat` utility shall merge the message text source file `msgfile` into a formatted message  
 89921 catalog `catfile`. The file `catfile` shall be created if it does not already exist. If `catfile` does exist, its  
 89922 messages shall be included in the new `catfile`. If set and message numbers collide, the new  
 89923 message text defined in `msgfile` shall replace the old message text currently contained in `catfile`.

89924 **OPTIONS**

89925 None.

89926 **OPERANDS**

89927 The following operands shall be supported:

89928 `catfile` A pathname of the formatted message catalog. If `'-'` is specified, standard output  
 89929 shall be used. The format of the message catalog produced is unspecified.

89930 `msgfile` A pathname of a message text source file. If `'-'` is specified for an instance of  
 89931 `msgfile`, standard input shall be used. The format of message text source files is  
 89932 defined in the EXTENDED DESCRIPTION section.

89933 **STDIN**89934 The standard input shall not be used unless a `msgfile` operand is specified as `'-'`.89935 **INPUT FILES**

89936 The input files shall be text files.

89937 **ENVIRONMENT VARIABLES**89938 The following environment variables shall affect the execution of `gencat`:

89939 `LANG` Provide a default value for the internationalization variables that are unset or null.  
 89940 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 89941 variables used to determine the values of locale categories.)

89942 `LC_ALL` If set to a non-empty string value, override the values of all the other  
 89943 internationalization variables.

89944 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
 89945 characters (for example, single-byte as opposed to multi-byte characters in  
 89946 arguments and input files).

89947 `LC_MESSAGES`

89948 Determine the locale that should be used to affect the format and contents of  
 89949 diagnostic messages written to standard error.

89950 `NLSPATH` Determine the location of message catalogs for the processing of `LC_MESSAGES`.

89951 **ASYNCHRONOUS EVENTS**

89952 Default.

89953 **STDOUT**89954 The standard output shall not be used unless the `catfile` operand is specified as `'-'`.

89955 **STDERR**

89956 The standard error shall be used only for diagnostic messages.

89957 **OUTPUT FILES**

89958 None.

89959 **EXTENDED DESCRIPTION**89960 The content of a message text file shall be in the format defined as follows. Note that the fields of  
89961 a message text source line are separated by a single <blank> character. Any other <blank>  
89962 characters are considered to be part of the subsequent field.89963 **\$set** *n comment*89964 This line specifies the set identifier of the following messages until the next **\$set** or  
89965 end-of-file appears. The *n* denotes the set identifier, which is defined as a number  
89966 in the range [1, {NL\_SETMAX}] (see the <limits.h> header defined in the Base  
89967 Definitions volume of POSIX.1-2008). The application shall ensure that set  
89968 identifiers are presented in ascending order within a single source file, but need  
89969 not be contiguous. Any string following the set identifier shall be treated as a  
89970 comment. If no **\$set** directive is specified in a message text source file, all messages  
89971 shall be located in an implementation-defined default message set NL\_SETD (see  
89972 the <nl\_types.h> header defined in the Base Definitions volume of POSIX.1-2008).89973 **\$delset** *n comment*89974 This line deletes message set *n* from an existing message catalog. The *n* denotes the  
89975 set number [1, {NL\_SETMAX}]. Any string following the set number shall be  
89976 treated as a comment.89977 **\$ comment** A line beginning with ' \$ ' followed by a <blank> shall be treated as a comment.89978 *m message-text*89979 The *m* denotes the message identifier, which is defined as a number in the range [1,  
89980 {NL\_MSGMAX}] (see the <limits.h> header). The *message-text* shall be stored in the  
89981 message catalog with the set identifier specified by the last **\$set** directive, and with  
89982 message identifier *m*. If the *message-text* is empty, and a <blank> field separator is  
89983 present, an empty string shall be stored in the message catalog. If a message source  
89984 line has a message number, but neither a field separator nor *message-text*, the  
89985 existing message with that number (if any) shall be deleted from the catalog. The  
89986 application shall ensure that message identifiers are in ascending order within a  
89987 single set, but need not be contiguous. The application shall ensure that the length  
89988 of *message-text* is in the range [0, {NL\_TEXTMAX}] (see the <limits.h> header).89989 **\$quote** *n* This line specifies an optional quote character *c*, which can be used to surround  
89990 *message-text* so that trailing <space> characters or null (empty) messages are visible  
89991 in a message source line. By default, or if an empty **\$quote** directive is supplied, no  
89992 quoting of *message-text* shall be recognized.89993 Empty lines in a message text source file shall be ignored. The effects of lines starting with any  
89994 character other than those defined above are implementation-defined.89995 Text strings can contain the special characters and escape sequences defined in the following  
89996 table:

**gencat**

89997  
89998  
89999  
90000  
90001  
90002  
90003  
90004  
90005

| Description       | Symbol | Sequence |
|-------------------|--------|----------|
| <newline>         | NL(LF) | \n       |
| Horizontal-tab    | HT     | \t       |
| <vertical-tab>    | VT     | \v       |
| <backspace>       | BS     | \b       |
| <carriage-return> | CR     | \r       |
| <form-feed>       | FF     | \f       |
| Backslash         | \      | \\       |
| Bit pattern       | ddd    | \ddd     |

90006 The escape sequence "\ddd" consists of <backslash> followed by one, two, or three octal digits,  
90007 which shall be taken to specify the value of the desired character. If the character following a  
90008 <backslash> is not one of those specified, the <backslash> shall be ignored.

90009 A <backslash> followed by a <newline> is also used to continue a string on the following line.  
90010 Thus, the following two lines describe a single message string:

90011 1 This line continues \  
90012 to the next line

90013 which shall be equivalent to:

90014 1 This line continues to the next line

90015 **EXIT STATUS**

90016 The following exit values shall be returned:

90017 0 Successful completion.

90018 >0 An error occurred.

90019 **CONSEQUENCES OF ERRORS**

90020 Default.

90021 **APPLICATION USAGE**

90022 Message catalogs produced by *gencat* are binary encoded, meaning that their portability cannot  
90023 be guaranteed between different types of machine. Thus, just as C programs need to be  
90024 recompiled for each type of machine, so message catalogs must be recreated via *gencat*.

90025 **EXAMPLES**

90026 None.

90027 **RATIONALE**

90028 None.

90029 **FUTURE DIRECTIONS**

90030 None.

90031 **SEE ALSO**

90032 *iconv*

90033 XBD Chapter 8 (on page 173), <limits.h>, <nl\_types.h>

90034 **CHANGE HISTORY**

90035 First released in Issue 3.

90036 **Issue 6**

90037 The normative text is reworded to avoid use of the term “must” for application requirements.

90038 **Issue 7**  
90039

The *gencat* utility is moved from the XSI option to the Base.

**get**90040 **NAME**90041 `get` — get a version of an SCCS file (**DEVELOPMENT**)90042 **SYNOPSIS**90043 xSI `get [-begkmnlLpst] [-c cutoff] [-i list] [-r SID] [-x list] file...`90044 **DESCRIPTION**90045 The `get` utility shall generate a text file from each named SCCS *file* according to the specifications  
90046 given by its options.90047 The generated text shall normally be written into a file called the **g-file** whose name is derived  
90048 from the SCCS filename by simply removing the leading "s.". 90049 **OPTIONS**90050 The `get` utility shall conform to XBD Section 12.2 (on page 215).

90051 The following options shall be supported:

90052 **-r *SID*** Indicate the SCCS Identification String (SID) of the version (delta) of an SCCS file  
90053 to be retrieved. The table shows, for the most useful cases, what version of an  
90054 SCCS file is retrieved (as well as the SID of the version to be eventually created by  
90055 *delta* if the **-e** option is also used), as a function of the SID specified.90056 **-c *cutoff*** Indicate the *cutoff* date-time, in the form:90057 `YY[MM[DD[HH[MM[SS]]]]]`90058 For the YY component, values in the range [69,99] shall refer to years 1969 to 1999  
90059 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.90060 **Note:** It is expected that in a future version of this standard the default century inferred  
90061 from a 2-digit year will change. (This would apply to all commands accepting a  
90062 2-digit year as input.)90063 No changes (deltas) to the SCCS file that were created after the specified *cutoff*  
90064 date-time shall be included in the generated text file. Units omitted from the date-  
90065 time default to their maximum possible values; for example, **-c 7502** is equivalent  
90066 to **-c 750228235959**.90067 Any number of non-numeric characters may separate the various 2-digit pieces of  
90068 the *cutoff* date-time. This feature allows the user to specify a *cutoff* date in the form:  
90069 **-c "77/2/2 9:22:25"**.90070 **-e** Indicate that the `get` is for the purpose of editing or making a change (delta) to the  
90071 SCCS file via a subsequent use of *delta*. The **-e** option used in a `get` for a particular  
90072 version (SID) of the SCCS file shall prevent further `get` commands from editing on  
90073 the same SID until *delta* is executed or the **j** (joint edit) flag is set in the SCCS file.  
90074 Concurrent use of `get -e` for different SIDs is always allowed.90075 If the **g-file** generated by `get` with a **-e** option is accidentally ruined in the process  
90076 of editing, it may be regenerated by re-executing the `get` command with the **-k**  
90077 option in place of the **-e** option.90078 SCCS file protection specified via the ceiling, floor, and authorized user list stored  
90079 in the SCCS file shall be enforced when the **-e** option is used.90080 **-b** Use with the **-e** option to indicate that the new delta should have an SID in a new  
90081 branch as shown in the table below. This option shall be ignored if the **b** flag is not  
90082 present in the file or if the retrieved delta is not a leaf delta. (A leaf delta is one that  
90083 has no successors on the SCCS file tree.)

- 90084                   **Note:**     A branch delta may always be created from a non-leaf delta.
- 90085           **-i list**     Indicate a *list* of deltas to be included (forced to be applied) in the creation of the  
90086                   generated file. The *list* has the following syntax:
- 90087                   <list> ::= <range> | <list> , <range>  
90088                   <range> ::= SID | SID - SID
- 90089                   SID, the SCCS Identification of a delta, may be in any form shown in the "SID  
90090                   Specified" column of the table in the EXTENDED DESCRIPTION section, except  
90091                   that the result of supplying a partial SID is unspecified. A diagnostic message shall  
90092                   be written if the first SID in the range is not an ancestor of the second SID in the  
90093                   range.
- 90094           **-x list**     Indicate a *list* of deltas to be excluded (forced not to be applied) in the creation of  
90095                   the generated file. See the **-i** option for the *list* format.
- 90096           **-k**         Suppress replacement of identification keywords (see below) in the retrieved text  
90097                   by their value. The **-k** option shall be implied by the **-e** option.
- 90098           **-l**         Write a delta summary into an **l-file**.
- 90099           **-L**         Write a delta summary to standard output. All informative output that normally is  
90100                   written to standard output shall be written to standard error instead, unless the **-s**  
90101                   option is used, in which case it shall be suppressed.
- 90102           **-p**         Write the text retrieved from the SCCS file to the standard output. No **g-file** shall  
90103                   be created. All informative output that normally goes to the standard output shall  
90104                   go to standard error instead, unless the **-s** option is used, in which case it shall  
90105                   disappear.
- 90106           **-s**         Suppress all informative output normally written to standard output. However,  
90107                   fatal error messages (which shall always be written to the standard error) shall  
90108                   remain unaffected.
- 90109           **-m**         Precede each text line retrieved from the SCCS file by the SID of the delta that  
90110                   inserted the text line in the SCCS file. The format shall be:
- 90111                   "%s\t%s", <SID>, <text line>
- 90112           **-n**         Precede each generated text line with the **%M%** identification keyword value (see  
90113                   below). The format shall be:
- 90114                   "%s\t%s", <%M% value>, <text line>
- 90115                   When both the **-m** and **-n** options are used, the <text line> shall be replaced by the  
90116                   **-m** option-generated format.
- 90117           **-g**         Suppress the actual retrieval of text from the SCCS file. It is primarily used to  
90118                   generate an **l-file**, or to verify the existence of a particular SID.
- 90119           **-t**         Use to access the most recently created (top) delta in a given release (for example,  
90120                   **-r 1**), or release and level (for example, **-r 1.2**).

90121 **OPERANDS**

90122 The following operands shall be supported:

90123 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *get*  
 90124 utility shall behave as though each file in the directory were specified as a named  
 90125 file, except that non-SCCS files (last component of the pathname does not begin  
 90126 with *s*.) and unreadable files shall be silently ignored.

90127 If exactly one *file* operand appears, and it is *'-'*, the standard input shall be read;  
 90128 each line of the standard input is taken to be the name of an SCCS file to be  
 90129 processed. Non-SCCS files and unreadable files shall be silently ignored.

90130 **STDIN**

90131 The standard input shall be a text file used only if the *file* operand is specified as *'-'*. Each line  
 90132 of the text file shall be interpreted as an SCCS pathname.

90133 **INPUT FILES**

90134 The SCCS files shall be files of an unspecified format.

90135 **ENVIRONMENT VARIABLES**90136 The following environment variables shall affect the execution of *get*:

90137 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 90138 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 90139 variables used to determine the values of locale categories.)

90140 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 90141 internationalization variables.

90142 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 90143 characters (for example, single-byte as opposed to multi-byte characters in  
 90144 arguments and input files).

90145 *LC\_MESSAGES*

90146 Determine the locale that should be used to affect the format and contents of  
 90147 diagnostic messages written to standard error, and informative messages written  
 90148 to standard output (or standard error, if the *-p* option is used).

90149 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

90150 *TZ* Determine the timezone in which the times and dates written in the SCCS file are  
 90151 evaluated. If the *TZ* variable is unset or NULL, an unspecified system default  
 90152 timezone is used.

90153 **ASYNCHRONOUS EVENTS**

90154 Default.

90155 **STDOUT**

90156 For each file processed, *get* shall write to standard output the SID being accessed and the  
 90157 number of lines retrieved from the SCCS file, in the following format:

90158 "%s\n%d lines\n", &lt;SID&gt;, &lt;number of lines&gt;

90159 If the *-e* option is used, the SID of the delta to be made shall appear after the SID accessed and  
 90160 before the number of lines generated, in the POSIX locale:

90161 "%s\nnew delta %s\n%d lines\n", <SID accessed>,  
 90162 <SID to be made>, <number of lines>

90163 If there is more than one named file or if a directory or standard input is named, each pathname

90164 shall be written before each of the lines shown in one of the preceding formats:

90165 `"\n%s:\n", <pathname>`

90166 If the `-L` option is used, a delta summary shall be written following the format specified below  
90167 for **l-files**.

90168 If the `-i` option is used, included deltas shall be listed following the notation, in the POSIX  
90169 locale:

90170 `"Included:\n"`

90171 If the `-x` option is used, excluded deltas shall be listed following the notation, in the POSIX  
90172 locale:

90173 `"Excluded:\n"`

90174 If the `-p` or `-L` options are specified, the standard output shall consist of the text retrieved from  
90175 the SCCS file.

#### 90176 **STDERR**

90177 The standard error shall be used only for diagnostic messages, except if the `-p` or `-L` options are  
90178 specified, it shall include all informative messages normally sent to standard output.

#### 90179 **OUTPUT FILES**

90180 Several auxiliary files may be created by *get*. These files are known generically as the **g-file**, **l-**  
90181 **file**, **p-file**, and **z-file**. The letter before the <hyphen> is called the *tag*. An auxiliary filename  
90182 shall be formed from the SCCS filename: the application shall ensure that the last component of  
90183 all SCCS filenames is of the form *s.module-name*; the auxiliary files shall be named by replacing  
90184 the leading *s* with the tag. The **g-file** shall be an exception to this scheme: the **g-file** is named by  
90185 removing the *s*. prefix. For example, for *s.xyz.c*, the auxiliary filenames would be *xyz.c*, **l.xyz.c**,  
90186 **p.xyz.c**, and **z.xyz.c**, respectively.

90187 The **g-file**, which contains the generated text, shall be created in the current directory (unless the  
90188 `-p` option is used). A **g-file** shall be created in all cases, whether or not any lines of text were  
90189 generated by the *get*. It shall be owned by the real user. If the `-k` option is used or implied, the  
90190 **g-file** shall be writable by the owner only (read-only for everyone else); otherwise, it shall be  
90191 read-only. Only the real user need have write permission in the current directory.

90192 The **l-file** shall contain a table showing which deltas were applied in generating the retrieved  
90193 text. The **l-file** shall be created in the current directory if the `-l` option is used; it shall be read-  
90194 only and it is owned by the real user. Only the real user need have write permission in the  
90195 current directory.

90196 Lines in the **l-file** shall have the following format:

90197 `"%c%c%cΔ%s\t%sΔ%s\n", <code1>, <code2>, <code3>, <SID>, <date-time>, <login>`

90198 where the entries are:

90200 `<code1>` A <space> if the delta was applied; ' \* ' otherwise.

90201 `<code2>` A <space> if the delta was applied or was not applied and ignored; ' \* ' if the delta  
90202 was not applied and was not ignored.

90203 `<code3>` A character indicating a special reason why the delta was or was not applied:

90204 **I** Included.

## get

## Utilities

- 90205                   X   Excluded.
- 90206                   C   Cut off (by a `-c` option).
- 90207           <*date-time*>   Date and time (using the format of the *date* utility's `%Y/%m/%d %T` conversion specification format) of creation.
- 90208
- 90209           <*login*>        Login name of person who created *delta*.
- 90210           The comments and MR data shall follow on subsequent lines, indented one <tab>. A blank line shall terminate each entry.
- 90211
- 90212           The **p-file** shall be used to pass information resulting from a *get* with a `-e` option along to *delta*. Its contents shall also be used to prevent a subsequent execution of *get* with a `-e` option for the same SID until *delta* is executed or the joint edit flag, **j**, is set in the SCCS file. The **p-file** shall be created in the directory containing the SCCS file and the application shall ensure that the effective user has write permission in that directory. It shall be writable by owner only, and owned by the effective user. Each line in the **p-file** shall have the following format:
- 90213
- 90214
- 90215
- 90216
- 90217
- 90218           "`%sΔ%sΔ%sΔ%s%s\n`", <*g-file SID*>,  
 90219                    <*SID of new delta*>, <*login-name of real user*>,  
 90220                    <*date-time*>, <*i-value*>, <*x-value*>
- 90221           where <*i-value*> uses the format " " if no `-i` option was specified, and shall use the format:
- 90222           "`Δ-i%s`", <*-i option option-argument*>
- 90223           if a `-i` option was specified and <*x-value*> uses the format " " if no `-x` option was specified, and shall use the format:
- 90224
- 90225           "`Δ-x%s`", <*-x option option-argument*>
- 90226           if a `-x` option was specified. There can be an arbitrary number of lines in the **p-file** at any time; no two lines shall have the same new delta SID.
- 90227
- 90228           The **z-file** shall serve as a lock-out mechanism against simultaneous updates. Its contents shall be the binary process ID of the command (that is, *get*) that created it. The **z-file** shall be created in the directory containing the SCCS file for the duration of *get*. The same protection restrictions as those for the **p-file** shall apply for the **z-file**. The **z-file** shall be created read-only.
- 90229
- 90230
- 90231

## 90232 EXTENDED DESCRIPTION

| Determination of SCCS Identification String |                    |                                             |               |                            |

| 90252<br>90253<br>R.L                       | yes                | No trunk successor                          | R.L           | R.L.(mB+1).1               |
| 90254<br>90255<br>R.L                       | –                  | Trunk successor in release ≥ R              | R.L           | R.L.(mB+1).1               |
| 90256<br>90257<br>R.L.B                     | no                 | No branch successor                         | R.L.B.mS      | R.L.B.(mS+1)               |
| 90258<br>90259<br>R.L.B                     | yes                | No branch successor                         | R.L.B.mS      | R.L.(mB+1).1               |
| 90260<br>90261<br>R.L.B.S                   | no                 | No branch successor                         | R.L.B.S       | R.L.B.(S+1)                |
| 90262<br>90263<br>R.L.B.S                   | yes                | No branch successor                         | R.L.B.S       | R.L.(mB+1).1               |
| 90264<br>90265<br>R.L.B.S                   | –                  | Branch successor                            | R.L.B.S       | R.L.(mB+1).1               |

90255 \* R, L, B, and S are the release, level, branch, and sequence components of the SID, respectively; m means maximum. Thus, for example, R.mL means “the maximum level number within release R”; R.L.(mB+1).1 means “the first sequence number on the new branch (that is, maximum branch number plus one) of level L within release R”. Note that if the SID specified is of the form R.L, R.L.B, or R.L.B.S, each of the specified components shall exist.

90261 \*\* hR is the highest existing release that is lower than the specified, nonexistent, release R.

90262 \*\*\* This is used to force creation of the first delta in a new release.

90263 † The -b option is effective only if the b flag is present in the file. An entry of ‘-’ means “irrelevant”.

90265 ‡ This case applies if the d (default SID) flag is not present in the file. If the d flag is present in the file, then the SID obtained from the d flag is interpreted as if it had been specified on the command line. Thus, one of the other cases in this table applies.

90268 **System Date and Time**

90269 When a **g-file** is generated, the creation time of deltas in the SCCS file may be taken into  
 90270 account. If any of these times are apparently in the future, the behavior is unspecified.

90271 **Identification Keywords**

90272 Identifying information shall be inserted into the text retrieved from the SCCS file by replacing  
 90273 identification keywords with their value wherever they occur. The following keywords may be  
 90274 used in the text stored in an SCCS file:

|       |     |                                                                                               |
|-------|-----|-----------------------------------------------------------------------------------------------|
| 90275 | %M% | Module name: either the value of the <b>m</b> flag in the file, or if absent, the name of the |
| 90276 |     | SCCS file with the leading <b>s.</b> removed.                                                 |
| 90277 | %I% | SCCS identification (SID) (%R%.%L% or %R%.%L%.%B%.%S%) of the retrieved                       |
| 90278 |     | text.                                                                                         |
| 90279 | %R% | Release.                                                                                      |
| 90280 | %L% | Level.                                                                                        |
| 90281 | %B% | Branch.                                                                                       |
| 90282 | %S% | Sequence.                                                                                     |
| 90283 | %D% | Current date (YY/MM/DD).                                                                      |
| 90284 | %H% | Current date (MM/DD/YY).                                                                      |
| 90285 | %T% | Current time (HH:MM:SS).                                                                      |
| 90286 | %E% | Date newest applied delta was created (YY/MM/DD).                                             |
| 90287 | %G% | Date newest applied delta was created (MM/DD/YY).                                             |
| 90288 | %U% | Time newest applied delta was created (HH:MM:SS).                                             |
| 90289 | %Y% | Module type: value of the <b>t</b> flag in the SCCS file.                                     |
| 90290 | %F% | SCCS filename.                                                                                |
| 90291 | %P% | SCCS absolute pathname.                                                                       |
| 90292 | %Q% | The value of the <b>q</b> flag in the file.                                                   |
| 90293 | %C% | Current line number. This keyword is intended for identifying messages output by              |
| 90294 |     | the program, such as "this should not have happened" type errors. It is not                   |
| 90295 |     | intended to be used on every line to provide sequence numbers.                                |
| 90296 | %Z% | The four-character string "@ (#)" recognizable by <i>what</i> .                               |
| 90297 | %W% | A shorthand notation for constructing <i>what</i> strings:                                    |
| 90298 |     | %W%=%Z%%M%<tab>%I%                                                                            |
| 90299 | %A% | Another shorthand notation for constructing <i>what</i> strings:                              |
| 90300 |     | %A%=%Z%%Y%%M%%I%%Z%                                                                           |

90301 **EXIT STATUS**

90302 The following exit values shall be returned:

90303 0 Successful completion.

90304 >0 An error occurred.

90305 **CONSEQUENCES OF ERRORS**

90306 Default.

90307 **APPLICATION USAGE**

90308 Problems can arise if the system date and time have been modified (for example, put forward  
90309 and then back again, or unsynchronized clocks across a network) and can also arise when  
90310 different values of the *TZ* environment variable are used.

90311 Problems of a similar nature can also arise for the operation of the *delta* utility, which compares  
90312 the previous file body against the working file as part of its normal operation.

90313 **EXAMPLES**

90314 None.

90315 **RATIONALE**

90316 None.

90317 **FUTURE DIRECTIONS**

90318 None.

90319 **SEE ALSO**

90321 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

90322 **CHANGE HISTORY**

90323 First released in Issue 2.

90324 **Issue 5**

90325 A correction is made to the first format string in STDOUT.

90326 The interpretation of the *YY* component of the *-c cutoff* argument is noted.

90327 **Issue 6**

90328 The obsolescent SYNOPSIS is removed, removing the *-lp* option.

90329 The normative text is reworded to avoid use of the term “must” for application requirements.

90330 The Open Group Corrigendum U025/5 is applied, correcting text in the OPTIONS section.

90331 The Open Group Corrigendum U048/1 is applied.

90332 The Open Group Interpretation PIN4C.00014 is applied.

90333 The Open Group Base Resolution bwg2001-007 is applied as follows:

90334 • The EXTENDED DESCRIPTION section is updated to make partial SID handling  
90335 unspecified, reflecting common usage, and to clarify SID ranges.

90336 • New text is added to the EXTENDED DESCRIPTION and APPLICATION USAGE sections  
90337 regarding how the system date and time may be taken into account.

90338 • The *TZ* environment variable is added to the ENVIRONMENT VARIABLES section.

90339 **Issue 7**

90340 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**getconf**

Utilities

90341 **NAME**90342 `getconf` — get configuration values90343 **SYNOPSIS**90344 `getconf [-v specification] system_var`90345 `getconf [-v specification] path_var pathname`90346 **DESCRIPTION**90347 In the first synopsis form, the *getconf* utility shall write to the standard output the value of the  
90348 variable specified by the *system\_var* operand.90349 In the second synopsis form, the *getconf* utility shall write to the standard output the value of the  
90350 variable specified by the *path\_var* operand for the path specified by the *pathname* operand.90351 The value of each configuration variable shall be determined as if it were obtained by calling the  
90352 function from which it is defined to be available by this volume of POSIX.1-2008 or by the  
90353 System Interfaces volume of POSIX.1-2008 (see the OPERANDS section). The value shall reflect  
90354 conditions in the current operating environment.90355 **OPTIONS**90356 The *getconf* utility shall conform to XBD Section 12.2 (on page 215).

90357 The following option shall be supported:

90358 **-v specification**90359 Indicate a specific specification and version for which configuration variables shall  
90360 be determined. If this option is not specified, the values returned correspond to an  
90361 implementation default conforming compilation environment.

90362 If the command:

90363 `getconf _POSIX_V7_ILP32_OFF32`90364 does not write "-1\n" or "undefined\n" to standard output, then commands of  
90365 the form:90366 `getconf -v POSIX_V7_ILP32_OFF32 ...`90367 determine values for configuration variables corresponding to the  
90368 POSIX\_V7\_ILP32\_OFF32 compilation environment specified in c99, the  
90369 EXTENDED DESCRIPTION.

90370 If the command:

90371 `getconf _POSIX_V7_ILP32_OFFBIG`90372 does not write "-1\n" or "undefined\n" to standard output, then commands of  
90373 the form:90374 `getconf -v POSIX_V7_ILP32_OFFBIG ...`90375 determine values for configuration variables corresponding to the  
90376 POSIX\_V7\_ILP32\_OFFBIG compilation environment specified in c99, the  
90377 EXTENDED DESCRIPTION.

90378 If the command:

90379 `getconf _POSIX_V7_LP64_OFF64`90380 does not write "-1\n" or "undefined\n" to standard output, then commands of  
90381 the form:

90382 `getconf -v POSIX_V7_LP64_OFF64 ...`

90383 determine values for configuration variables corresponding to the  
90384 POSIX\_V7\_LP64\_OFF64 compilation environment specified in *c99*, the  
90385 EXTENDED DESCRIPTION.

90386 If the command:

90387 `getconf _POSIX_V7_LPBIG_OFFBIG`

90388 does not write "-1\n" or "undefined\n" to standard output, then commands of  
90389 the form:

90390 `getconf -v POSIX_V7_LPBIG_OFFBIG ...`

90391 determine values for configuration variables corresponding to the  
90392 POSIX\_V7\_LPBIG\_OFFBIG compilation environment specified in *c99*, the  
90393 EXTENDED DESCRIPTION.

#### 90394 OPERANDS

90395 The following operands shall be supported:

90396 *path\_var* A name of a configuration variable. All of the variables in the Variable column of  
90397 the table in the DESCRIPTION of the *fpathconf()* function defined in the System  
90398 Interfaces volume of POSIX.1-2008, without the enclosing braces, shall be  
90399 supported. The implementation may add other local variables.

90400 *pathname* A pathname for which the variable specified by *path\_var* is to be determined.

90401 *system\_var* A name of a configuration variable. All of the following variables shall be  
90402 supported:

- 90403 • The names in the Variable column of the table in the DESCRIPTION of the
- 90404 *sysconf()* function in the System Interfaces volume of POSIX.1-2008, except
- 90405 for the entries corresponding to `_SC_CLK_TCK`, `_SC_GETGR_R_SIZE_MAX`,
- 90406 and `_SC_GETPW_R_SIZE_MAX`, without the enclosing braces.

90407 For compatibility with earlier versions, the following variable names shall  
90408 also be supported:

90409 `POSIX2_C_BIND`  
90410 `POSIX2_C_DEV`  
90411 `POSIX2_CHAR_TERM`  
90412 `POSIX2_FORT_DEV`  
90413 `POSIX2_FORT_RUN`  
90414 `POSIX2_LOCALEDEF`  
90415 `POSIX2_SW_DEV`  
90416 `POSIX2_UPE`  
90417 `POSIX2_VERSION`

90418 and shall be equivalent to the same name prefixed with an <underscore>.  
90419 This requirement may be removed in a future version.

- 90420 • The names of the symbolic constants used as the *name* argument of the
- 90421 *confstr()* function in the System Interfaces volume of POSIX.1-2008, without
- 90422 the `_CS_` prefix.

**getconf**

Utilities

- 90423 • The names of the symbolic constants listed under the headings “Maximum  
90424 Values” and “Minimum Values” in the description of the `<limits.h>` header  
90425 in the Base Definitions volume of POSIX.1-2008, without the enclosing  
90426 braces.
- 90427 For compatibility with earlier versions, the following variable names shall  
90428 also be supported:
- 90429 POSIX2\_BC\_BASE\_MAX  
90430 POSIX2\_BC\_DIM\_MAX  
90431 POSIX2\_BC\_SCALE\_MAX  
90432 POSIX2\_BC\_STRING\_MAX  
90433 POSIX2\_COLL\_WEIGHTS\_MAX  
90434 POSIX2\_EXPR\_NEST\_MAX  
90435 POSIX2\_LINE\_MAX  
90436 POSIX2\_RE\_DUP\_MAX
- 90437 and shall be equivalent to the same name prefixed with an `<underscore>`.  
90438 This requirement may be removed in a future version.
- 90439 The implementation may add other local values.
- 90440 **STDIN**  
90441 Not used.
- 90442 **INPUT FILES**  
90443 None.
- 90444 **ENVIRONMENT VARIABLES**  
90445 The following environment variables shall affect the execution of `getconf`:
- 90446 `LANG` Provide a default value for the internationalization variables that are unset or null.  
90447 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
90448 variables used to determine the values of locale categories.)
- 90449 `LC_ALL` If set to a non-empty string value, override the values of all the other  
90450 internationalization variables.
- 90451 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
90452 characters (for example, single-byte as opposed to multi-byte characters in  
90453 arguments).
- 90454 `LC_MESSAGES`  
90455 Determine the locale that should be used to affect the format and contents of  
90456 diagnostic messages written to standard error.
- 90457 `XSI` `NLSPATH` Determine the location of message catalogs for the processing of `LC_MESSAGES`.
- 90458 **ASYNCHRONOUS EVENTS**  
90459 Default.
- 90460 **STDOUT**  
90461 If the specified variable is defined on the system and its value is described to be available from  
90462 the `confstr()` function defined in the System Interfaces volume of POSIX.1-2008, its value shall be  
90463 written in the following format:  
90464 `"%s\n", <value>`  
90465 Otherwise, if the specified variable is defined on the system, its value shall be written in the

90466 following format:

90467 "%d\n", <value>

90468 If the specified variable is valid, but is undefined on the system, *getconf* shall write using the  
90469 following format:

90470 "undefined\n"

90471 If the variable name is invalid or an error occurs, nothing shall be written to standard output.

#### 90472 **STDERR**

90473 The standard error shall be used only for diagnostic messages.

#### 90474 **OUTPUT FILES**

90475 None.

#### 90476 **EXTENDED DESCRIPTION**

90477 None.

#### 90478 **EXIT STATUS**

90479 The following exit values shall be returned:

90480 0 The specified variable is valid and information about its current state was written  
90481 successfully.

90482 >0 An error occurred.

#### 90483 **CONSEQUENCES OF ERRORS**

90484 Default.

#### 90485 **APPLICATION USAGE**

90486 None.

#### 90487 **EXAMPLES**

90488 The following example illustrates the value of {NGROUPS\_MAX}:

90489 `getconf NGROUPS_MAX`

90490 The following example illustrates the value of {NAME\_MAX} for a specific directory:

90491 `getconf NAME_MAX /usr`

90492 The following example shows how to deal more carefully with results that might be unspecified:

```
90493 if value=$(getconf PATH_MAX /usr); then
90494     if [ "$value" = "undefined" ]; then
90495         echo PATH_MAX in /usr is indeterminate.
90496     else
90497         echo PATH_MAX in /usr is $value.
90498     fi
90499 else
90500     echo Error in getconf.
90501 fi
```

90502 Note that:

90503 `sysconf (_SC_2_C_BIND) ;`

90504 and:

90505 `system("getconf _POSIX2_C_BIND") ;`

**getconf**

90506 in a C program could give different answers. The *sysconf()* call supplies a value that corresponds  
 90507 to the conditions when the program was either compiled or executed, depending on the  
 90508 implementation; the *system()* call to *getconf* always supplies a value corresponding to conditions  
 90509 when the program is executed.

**RATIONALE**

90510 The original need for this utility, and for the *confstr()* function, was to provide a way of finding  
 90511 the configuration-defined default value for the *PATH* environment variable. Since *PATH* can be  
 90512 modified by the user to include directories that could contain utilities replacing the standard  
 90513 utilities, shell scripts need a way to determine the system-supplied *PATH* environment variable  
 90514 value that contains the correct search path for the standard utilities. It was later suggested that  
 90515 access to the other variables described in this volume of POSIX.1-2008 could also be useful to  
 90516 applications.  
 90517

90518 This functionality of *getconf* would not be adequately subsumed by another command such as:

```
90519 grep var /etc/conf
```

90520 because such a strategy would provide correct values for neither those variables that can vary at  
 90521 runtime, nor those that can vary depending on the path.

90522 Early proposal versions of *getconf* specified exit status 1 when the specified variable was valid,  
 90523 but not defined on the system. The output string "undefined" is now used to specify this case  
 90524 with exit code 0 because so many things depend on an exit code of zero when an invoked utility  
 90525 is successful.

**FUTURE DIRECTIONS**

90526 None.  
 90527

**CHANGE HISTORY**

90532 First released in Issue 4

**Issue 5**

90533 In the OPERANDS section:

- 90536 • {NL\_MAX} is changed to {NL\_NMAX}.
- 90537 • Entries beginning NL\_ are deleted from the list of standard configuration variables.
- 90538 • The list of variables previously marked UX is merged with the list marked EX.
- 90539 • Operands are added to support new Option Groups.
- 90540 • Operands are added so that *getconf* can determine supported programming environments.

**Issue 6**

90541 The Open Group Corrigendum U029/4 is applied, correcting the example command in the last  
 90542 paragraph of the OPTIONS section.  
 90543

90544 The following new requirements on POSIX implementations derive from alignment with the  
 90545 Single UNIX Specification:

- 90546           • Operands are added to determine supported programming environments.
- 90547           This reference page is updated for alignment with the ISO/IEC 9899:1999 standard. Specifically,  
90548           new macros for *c99* programming environments are introduced.
- 90549           XSI marked *system\_var* (XBS5\_\*) values are marked LEGACY.
- 90550           IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/27 is applied, correcting the descriptions  
90551           of *path\_var* and *system\_var* in the OPERANDS section.
- 90552   **Issue 7**
- 90553           SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 90554           The EXAMPLES section is corrected.

**getopts**

Utilities

90555 **NAME**90556 `getopts` — parse utility options90557 **SYNOPSIS**90558 `getopts optstring name [arg...]`90559 **DESCRIPTION**

90560 The *getopts* utility shall retrieve options and option-arguments from a list of parameters. It shall  
 90561 support the Utility Syntax Guidelines 3 to 10, inclusive, described in XBD Section 12.2 (on page  
 90562 215).

90563 Each time it is invoked, the *getopts* utility shall place the value of the next option in the shell  
 90564 variable specified by the *name* operand and the index of the next argument to be processed in the  
 90565 shell variable *OPTIND*. Whenever the shell is invoked, *OPTIND* shall be initialized to 1.

90566 When the option requires an option-argument, the *getopts* utility shall place it in the shell  
 90567 variable *OPTARG*. If no option was found, or if the option that was found does not have an  
 90568 option-argument, *OPTARG* shall be unset.

90569 If an option character not contained in the *optstring* operand is found where an option character  
 90570 is expected, the shell variable specified by *name* shall be set to the <question-mark> ('?')  
 90571 character. In this case, if the first character in *optstring* is a <colon> (':'), the shell variable  
 90572 *OPTARG* shall be set to the option character found, but no output shall be written to standard  
 90573 error; otherwise, the shell variable *OPTARG* shall be unset and a diagnostic message shall be  
 90574 written to standard error. This condition shall be considered to be an error detected in the way  
 90575 arguments were presented to the invoking application, but shall not be an error in *getopts*  
 90576 processing.

90577 If an option-argument is missing:

- 90578 • If the first character of *optstring* is a <colon>, the shell variable specified by *name* shall be  
 90579 set to the <colon> character and the shell variable *OPTARG* shall be set to the option  
 90580 character found.
- 90581 • Otherwise, the shell variable specified by *name* shall be set to the <question-mark>  
 90582 character, the shell variable *OPTARG* shall be unset, and a diagnostic message shall be  
 90583 written to standard error. This condition shall be considered to be an error detected in the  
 90584 way arguments were presented to the invoking application, but shall not be an error in  
 90585 *getopts* processing; a diagnostic message shall be written as stated, but the exit status shall  
 90586 be zero.

90587 When the end of options is encountered, the *getopts* utility shall exit with a return value greater  
 90588 than zero; the shell variable *OPTIND* shall be set to the index of the first non-option-argument,  
 90589 where the first "--" argument is considered to be an option-argument if there are no other non-  
 90590 option-arguments appearing before it, or the value "\$#+1" if there are no non-option-  
 90591 arguments; the *name* variable shall be set to the <question-mark> character. Any of the following  
 90592 shall identify the end of options: the special option "--", finding an argument that does not  
 90593 begin with a '-', or encountering an error.

90594 The shell variables *OPTIND* and *OPTARG* shall be local to the caller of *getopts* and shall not be  
 90595 exported by default.

90596 The shell variable specified by the *name* operand, *OPTIND*, and *OPTARG* shall affect the current  
 90597 shell execution environment; see Section 2.12 (on page 2331).

90598 If the application sets *OPTIND* to the value 1, a new set of parameters can be used: either the  
 90599 current positional parameters or new *arg* values. Any other attempt to invoke *getopts* multiple  
 90600 times in a single shell execution environment with parameters (positional parameters or *arg*

|       |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 90607 | <i>optstring</i>             | A string containing the option characters recognized by the utility invoking <i>getopts</i> .<br>If a character is followed by a <colon>, the option shall be expected to have an<br>argument, which should be supplied as a separate argument. Applications should<br>specify an option character and its option-argument as separate arguments, but<br><i>getopts</i> shall interpret the characters following an option character requiring<br>arguments as an argument whether or not this is done. An explicit null option-<br>argument need not be recognized if it is not supplied as a separate argument when<br><i>getopts</i> is invoked. (See also the <i>getopt()</i> function defined in the System Interfaces<br>volume of POSIX.1-2008.) The characters <question-mark> and <colon> shall not<br>be used as option characters by an application. The use of other option characters<br>that are not alphanumeric produces unspecified results. If the option-argument is<br>not supplied as a separate argument from the option character, the value in<br><i>OPTARG</i> shall be stripped of the option character and the ' - '. The first character<br>in <i>optstring</i> determines how <i>getopts</i> behaves if an option character is not known or<br>an option-argument is missing. |

| 90642 |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 90643 | XSI                          | <i>NLSPATH</i> Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

90685 **EXAMPLES**

90686 The following example script parses and displays its arguments:

```

90687 aflag=
90688 bflag=
90689 while getopts ab: name
90690 do
90691     case $name in
90692         a)     aflag=1;;
90693         b)     bflag=1
90694             bval="$OPTARG";;
90695         ?)    printf "Usage: %s: [-a] [-b value] args\n" $0
90696             exit 2;;
90697     esac
90698 done
90699 if [ ! -z "$aflag" ]; then
90700     printf "Option -a specified\n"
90701 fi
90702 if [ ! -z "$bflag" ]; then
90703     printf 'Option -b "%s" specified\n' "$bval"
90704 fi
90705 shift $(( $OPTIND - 1 ))
90706 printf "Remaining arguments are: %s\n" "$*"

```

90707 **RATIONALE**

90708 The *getopts* utility was chosen in preference to the System V *getopt* utility because *getopts* handles  
 90709 option-arguments containing <blank> characters.

90710 The *OPTARG* variable is not mentioned in the ENVIRONMENT VARIABLES section because it  
 90711 does not affect the execution of *getopts*; it is one of the few “output-only” variables used by the  
 90712 standard utilities.

90713 The <colon> is not allowed as an option character because that is not historical behavior, and it  
 90714 violates the Utility Syntax Guidelines. The <colon> is now specified to behave as in the  
 90715 KornShell version of the *getopts* utility; when used as the first character in the *optstring* operand,  
 90716 it disables diagnostics concerning missing option-arguments and unexpected option characters.  
 90717 This replaces the use of the *OPTERR* variable that was specified in an early proposal.

90718 The formats of the diagnostic messages produced by the *getopts* utility and the *getopt()* function  
 90719 are not fully specified because implementations with superior (“friendlier”) formats objected to  
 90720 the formats used by some historical implementations. The standard developers considered it  
 90721 important that the information in the messages used be uniform between *getopts* and *getopt()*.  
 90722 Exact duplication of the messages might not be possible, particularly if a utility is built on  
 90723 another system that has a different *getopt()* function, but the messages must have specific  
 90724 information included so that the program name, invalid option character, and type of error can  
 90725 be distinguished by a user.

90726 Only a rare application program intercepts a *getopts* standard error message and wants to parse  
 90727 it. Therefore, implementations are free to choose the most usable messages they can devise. The  
 90728 following formats are used by many historical implementations:

```

90729 "%s: illegal option -- %c\n", <program name>, <option character>
90730 "%s: option requires an argument -- %c\n", <program name>, \
90731     <option character>

```

**getopts***Utilities*

90732 Historical shells with built-in versions of *getopt()* or *getopts* have used different formats,  
90733 frequently not even indicating the option character found in error.

90734 **FUTURE DIRECTIONS**

90735 None.

90744 **NAME**90745 `grep` — search a file for a pattern90746 **SYNOPSIS**

```
90747 grep [-E|-F] [-c|-l|-q] [-insvx] -e pattern_list  
90748 [-e pattern_list]... [-f pattern_file]... [file...]  
90749 grep [-E|-F] [-c|-l|-q] [-insvx] [-e pattern_list]...  
90750 -f pattern_file [-f pattern_file]... [file...]  
90751 grep [-E|-F] [-c|-l|-q] [-insvx] pattern_list [file...]
```

90752 **DESCRIPTION**

90753 The `grep` utility shall search the input files, selecting lines matching one or more patterns; the  
90754 types of patterns are controlled by the options specified. The patterns are specified by the `-e`  
90755 option, `-f` option, or the *pattern\_list* operand. The *pattern\_list*'s value shall consist of one or more  
90756 patterns separated by <newline> characters; the *pattern\_file*'s contents shall consist of one or  
90757 more patterns terminated by a <newline> character. By default, an input line shall be selected if  
90758 any pattern, treated as an entire basic regular expression (BRE) as described in XBD Section 9.3  
90759 (on page 183), matches any part of the line excluding the terminating <newline>; a null BRE  
90760 shall match every line. By default, each selected input line shall be written to the standard  
90761 output.

90762 Regular expression matching shall be based on text lines. Since a <newline> separates or  
90763 terminates patterns (see the `-e` and `-f` options below), regular expressions cannot contain a  
90764 <newline>. Similarly, since patterns are matched against individual lines (excluding the  
90765 terminating <newline> characters) of the input, there is no way for a pattern to match a  
90766 <newline> found in the input.

90767 **OPTIONS**90768 The `grep` utility shall conform to XBD Section 12.2 (on page 215).

90769 The following options shall be supported:

90770 `-E` Match using extended regular expressions. Treat each pattern specified as an ERE,  
90771 as described in XBD Section 9.4 (on page 188). If any entire ERE pattern matches  
90772 some part of an input line excluding the terminating <newline>, the line shall be  
90773 matched. A null ERE shall match every line.

90774 `-F` Match using fixed strings. Treat each pattern specified as a string instead of a  
90775 regular expression. If an input line contains any of the patterns as a contiguous  
90776 sequence of bytes, the line shall be matched. A null string shall match every line.

90777 `-c` Write only a count of selected lines to standard output.90778 `-e pattern_list`

90779 Specify one or more patterns to be used during the search for input. The  
90780 application shall ensure that patterns in *pattern\_list* are separated by a <newline>.  
90781 A null pattern can be specified by two adjacent <newline> characters in  
90782 *pattern\_list*. Unless the `-E` or `-F` option is also specified, each pattern shall be  
90783 treated as a BRE, as described in XBD Section 9.3 (on page 183). Multiple `-e` and `-f`  
90784 options shall be accepted by the `grep` utility. All of the specified patterns shall be  
90785 used when matching lines, but the order of evaluation is unspecified.

90786 `-f pattern_file`

90787 Read one or more patterns from the file named by the pathname *pattern\_file*.  
90788 Patterns in *pattern\_file* shall be terminated by a <newline>. A null pattern can be  
90789 specified by an empty line in *pattern\_file*. Unless the `-E` or `-F` option is also

**grep**

Utilities

- 90790 specified, each pattern shall be treated as a BRE, as described in XBD [Section 9.3](#)  
 90791 (on page 183).
- 90792 **-i** Perform pattern matching in searches without regard to case; see XBD [Section 9.2](#)  
 90793 (on page 182).
- 90794 **-l** (The letter ell.) Write only the names of files containing selected lines to standard  
 90795 output. Pathnames shall be written once per file searched. If the standard input is  
 90796 searched, a pathname of "(standard input)" shall be written, in the POSIX  
 90797 locale. In other locales, "standard input" may be replaced by something more  
 90798 appropriate in those locales.
- 90799 **-n** Precede each output line by its relative line number in the file, each file starting at  
 90800 line 1. The line number counter shall be reset for each file processed.
- 90801 **-q** Quiet. Nothing shall be written to the standard output, regardless of matching  
 90802 lines. Exit with zero status if an input line is selected.
- 90803 **-s** Suppress the error messages ordinarily written for nonexistent or unreadable files.  
 90804 Other error messages shall not be suppressed.
- 90805 **-v** Select lines not matching any of the specified patterns. If the **-v** option is not  
 90806 specified, selected lines shall be those that match any of the specified patterns.
- 90807 **-x** Consider only input lines that use all characters in the line excluding the  
 90808 terminating <newline> to match an entire fixed string or regular expression to be  
 90809 matching lines.

**OPERANDS**

- 90810 The following operands shall be supported:
- 90811 *pattern\_list* Specify one or more patterns to be used during the search for input. This operand  
 90812 shall be treated as if it were specified as **-e pattern\_list**.  
 90813
- 90814 *file* A pathname of a file to be searched for the patterns. If no *file* operands are  
 90815 specified, the standard input shall be used.

**STDIN**

- 90816 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 90817 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 90818 the standard input shall not be used. See the INPUT FILES section.  
 90819

**INPUT FILES**

- 90820 The input files shall be text files.

**ENVIRONMENT VARIABLES**

- 90821 The following environment variables shall affect the execution of *grep*:
- 90822 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 90823 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 90824 variables used to determine the values of locale categories.)  
 90825
- 90826 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 90827 internationalization variables.  
 90828
- 90829 **LC\_COLLATE**  
 90830 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 90831 character collating elements within regular expressions.

- 90832 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 90833 characters (for example, single-byte as opposed to multi-byte characters in  
 90834 arguments and input files) and the behavior of character classes within regular  
 90835 expressions.
- 90836 **LC\_MESSAGES**  
 90837 Determine the locale that should be used to affect the format and contents of  
 90838 diagnostic messages written to standard error.
- 90839 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.
- 90840 **ASYNCHRONOUS EVENTS**
- 90841 Default.
- 90842 **STDOUT**
- 90843 If the **-l** option is in effect, the following shall be written for each file containing at least one  
 90844 selected input line:
- 90845 "%s\n", <file>
- 90846 Otherwise, if more than one *file* argument appears, and **-q** is not specified, the *grep* utility shall  
 90847 prefix each output line by:
- 90848 "%s:", <file>
- 90849 The remainder of each output line shall depend on the other options specified:
- 90850 • If the **-c** option is in effect, the remainder of each output line shall contain:
- 90851 "%d\n", <count>
- 90852 • Otherwise, if **-c** is not in effect and the **-n** option is in effect, the following shall be written  
 90853 to standard output:
- 90854 "%d:", <line number>
- 90855 • Finally, the following shall be written to standard output:
- 90856 "%s", <selected-line contents>
- 90857 **STDERR**
- 90858 The standard error shall be used only for diagnostic messages.
- 90859 **OUTPUT FILES**
- 90860 None.
- 90861 **EXTENDED DESCRIPTION**
- 90862 None.
- 90863 **EXIT STATUS**
- 90864 The following exit values shall be returned:
- 90865 0 One or more lines were selected.
  - 90866 1 No lines were selected.
  - 90867 >1 An error occurred.
- 90868 **CONSEQUENCES OF ERRORS**
- 90869 If the **-q** option is specified, the exit status shall be zero if an input line is selected, even if an  
 90870 error was detected. Otherwise, default actions shall be performed.

## 90871 APPLICATION USAGE

90872 Care should be taken when using characters in *pattern\_list* that may also be meaningful to the  
 90873 command interpreter. It is safest to enclose the entire *pattern\_list* argument in single-quotes:

90874 ' ... '

90875 The `-e pattern_list` option has the same effect as the *pattern\_list* operand, but is useful when  
 90876 *pattern\_list* begins with the <hyphen> delimiter. It is also useful when it is more convenient to  
 90877 provide multiple patterns as separate arguments.

90878 Multiple `-e` and `-f` options are accepted and *grep* uses all of the patterns it is given while  
 90879 matching input text lines. (Note that the order of evaluation is not specified. If an  
 90880 implementation finds a null string as a pattern, it is allowed to use that pattern first, matching  
 90881 every line, and effectively ignore any other patterns.)

90882 The `-q` option provides a means of easily determining whether or not a pattern (or string) exists  
 90883 in a group of files. When searching several files, it provides a performance improvement  
 90884 (because it can quit as soon as it finds the first match) and requires less care by the user in  
 90885 choosing the set of files to supply as arguments (because it exits zero if it finds a match even if  
 90886 *grep* detected an access or read error on earlier *file* operands).

## 90887 EXAMPLES

90888 1. To find all uses of the word "Posix" (in any case) in file `text.mm` and write with line  
 90889 numbers:

90890 `grep -i -n posix text.mm`

90891 2. To find all empty lines in the standard input:

90892 `grep ^$`

90893 or:

90894 `grep -v .`

90895 3. Both of the following commands print all lines containing strings "abc" or "def" or  
 90896 both:

90897 `grep -E 'abc|def'`

90898 `grep -F 'abc`  
 90899 `def'`

90900 4. Both of the following commands print all lines matching exactly "abc" or "def":

90901 `grep -E '^abc$|^def$'`

90902 `grep -F -x 'abc`  
 90903 `def'`

## 90904 RATIONALE

90905 This *grep* has been enhanced in an upwards-compatible way to provide the exact functionality of  
 90906 the historical *egrep* and *fgrep* commands as well. It was the clear intention of the standard  
 90907 developers to consolidate the three *greps* into a single command.

90908 The old *egrep* and *fgrep* commands are likely to be supported for many years to come as  
 90909 implementation extensions, allowing historical applications to operate unmodified.

90910 Historical implementations usually silently ignored all but one of multiply-specified `-e` and `-f`  
 90911 options, but were not consistent as to which specification was actually used.

- 90912 The **-b** option was omitted from the OPTIONS section because block numbers are  
90913 implementation-defined.
- 90914 The System V restriction on using **-** to mean standard input was omitted.
- 90915 A definition of action taken when given a null BRE or ERE is specified. This is an error  
90916 condition in some historical implementations.
- 90917 The **-I** option previously indicated that its use was undefined when no files were explicitly  
90918 named. This behavior was historical and placed an unnecessary restriction on future  
90919 implementations. It has been removed.
- 90920 The historical BSD *grep* **-s** option practice is easily duplicated by redirecting standard output to  
90921 **/dev/null**. The **-s** option required here is from System V.
- 90922 The **-x** option, historically available only with *fgrep*, is available here for all of the non-  
90923 obsolescent versions.
- 90924 **FUTURE DIRECTIONS**
- 90925 None.
- 90926 **SEE ALSO**

**hash**90940 **NAME**

90941 hash — remember or report utility locations

90942 **SYNOPSIS**90943 hash [*utility*...]

90944 hash -r

90945 **DESCRIPTION**

90946 The *hash* utility shall affect the way the current shell environment remembers the locations of  
 90947 utilities found as described in Section 2.9.1.1 (on page 2317). Depending on the arguments  
 90948 specified, it shall add utility locations to its list of remembered locations or it shall purge the  
 90949 contents of the list. When no arguments are specified, it shall report on the contents of the list.

90950 Utilities provided as built-ins to the shell shall not be reported by *hash*.90951 **OPTIONS**90952 The *hash* utility shall conform to XBD Section 12.2 (on page 215).

90953 The following option shall be supported:

90954 -r Forget all previously remembered utility locations

90955 **OPERANDS**

90956 The following operand shall be supported:

90957 *utility* The name of a utility to be searched for and added to the list of remembered  
 90958 locations. If *utility* contains one or more <slash> characters, the results are  
 90959 unspecified.

90960 **STDIN**

90961 Not used.

90962 **INPUT FILES**

90963 None.

90964 **ENVIRONMENT VARIABLES**90965 The following environment variables shall affect the execution of *hash*:

90966 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 90967 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 90968 variables used to determine the values of locale categories.)

90969 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 90970 internationalization variables.

90971 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 90972 characters (for example, single-byte as opposed to multi-byte characters in  
 90973 arguments).

90974 *LC\_MESSAGES*

90975 Determine the locale that should be used to affect the format and contents of  
 90976 diagnostic messages written to standard error.

90977 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.90978 *PATH* Determine the location of *utility*, as described in XBD Chapter 8 (on page 173).

90979 **ASYNCHRONOUS EVENTS**

90980 Default.

90981 **STDOUT**

90982 The standard output of *hash* shall be used when no arguments are specified. Its format is  
 90983 unspecified, but includes the pathname of each utility in the list of remembered locations for the  
 90984 current shell environment. This list shall consist of those utilities named in previous *hash*  
 90985 invocations that have been invoked, and may contain those invoked and found through the  
 90986 normal command search process.

90987 **STDERR**

90988 The standard error shall be used only for diagnostic messages.

90989 **OUTPUT FILES**

90990 None.

90991 **EXTENDED DESCRIPTION**

90992 None.

90993 **EXIT STATUS**

90994 The following exit values shall be returned:

90995 0 Successful completion.

90996 &gt;0 An error occurred.

90997 **CONSEQUENCES OF ERRORS**

90998 Default.

90999 **APPLICATION USAGE**

91000 Since *hash* affects the current shell execution environment, it is always provided as a shell  
 91001 regular built-in. If it is called in a separate utility execution environment, such as one of the  
 91002 following:

```
91003 nohup hash -r
91004 find . -type f | xargs hash
```

91005 it does not affect the command search process of the caller's environment.

91006 The *hash* utility may be implemented as an alias—for example, *alias -t -*, in which case utilities  
 91007 found through normal command search are not listed by the *hash* command.

91008 The effects of *hash -r* can also be achieved portably by resetting the value of *PATH*; in the  
 91009 simplest form, this can be:

91010 `PATH="$PATH"`

91011 The use of *hash* with *utility* names is unnecessary for most applications, but may provide a  
 91012 performance improvement on a few implementations; normally, the hashing process is included  
 91013 by default.

91014 **EXAMPLES**

91015 None.

91016 **RATIONALE**

91017 None.

**hash***Utilities*91018 **FUTURE DIRECTIONS**

91019 None.

91020 **SEE ALSO**91021 [Section 2.9.1.1](#) (on page 2317)91022 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)91023 **CHANGE HISTORY**

91024 First released in Issue 2.

91025 **Issue 7**91026 The *hash* utility is moved from the XSI option to the Base.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

91027 **NAME**

91028 head — copy the first part of files

91029 **SYNOPSIS**91030 head [-n *number*] [*file...*]91031 **DESCRIPTION**91032 The *head* utility shall copy its input files to the standard output, ending the output for each file at  
91033 a designated point.91034 Copying shall end at the point in each input file indicated by the **-n** *number* option. The option-  
91035 argument *number* shall be counted in units of lines.91036 **OPTIONS**91037 The *head* utility shall conform to XBD Section 12.2 (on page 215).

91038 The following option shall be supported:

91039 **-n** *number* The first *number* lines of each input file shall be copied to standard output. The  
91040 application shall ensure that the *number* option-argument is a positive decimal  
91041 integer.91042 When a file contains less than *number* lines, it shall be copied to standard output in its entirety.  
91043 This shall not be an error.91044 If no options are specified, *head* shall act as if **-n 10** had been specified.91045 **OPERANDS**

91046 The following operand shall be supported:

91047 *file* A pathname of an input file. If no *file* operands are specified, the standard input  
91048 shall be used.91049 **STDIN**91050 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
91051 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
91052 the standard input shall not be used. See the INPUT FILES section.91053 **INPUT FILES**

91054 Input files shall be text files, but the line length is not restricted to {LINE\_MAX} bytes.

91055 **ENVIRONMENT VARIABLES**91056 The following environment variables shall affect the execution of *head*:91057 **LANG** Provide a default value for the internationalization variables that are unset or null.  
91058 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
91059 variables used to determine the values of locale categories.)91060 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
91061 internationalization variables.91062 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
91063 characters (for example, single-byte as opposed to multi-byte characters in  
91064 arguments and input files).91065 **LC\_MESSAGES**91066 Determine the locale that should be used to affect the format and contents of  
91067 diagnostic messages written to standard error.

**head**

Utilities

91068 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

91069 **ASYNCHRONOUS EVENTS**

91070 Default.

91071 **STDOUT**

91072 The standard output shall contain designated portions of the input files.

91073 If multiple *file* operands are specified, *head* shall precede the output for each with the header:

91074 "`\n==> %s <==\n`", *<pathname>*

91075 except that the first header written shall not include the initial *<newline>*.

91076 **STDERR**

91077 The standard error shall be used only for diagnostic messages.

91078 **OUTPUT FILES**

91079 None.

91080 **EXTENDED DESCRIPTION**

91081 None.

91082 **EXIT STATUS**

91083 The following exit values shall be returned:

91084 0 Successful completion.

91085 >0 An error occurred.

91086 **CONSEQUENCES OF ERRORS**

91087 Default.

91088 **APPLICATION USAGE**

91089 None.

91090 **EXAMPLES**

91091 To write the first ten lines of all files (except those with a leading period) in the directory:

91092 `head -- *`

91093 **RATIONALE**

91094 Although it is possible to simulate *head* with *sed* 10q for a single file, the standard developers decided that the popularity of *head* on historical BSD systems warranted its inclusion alongside *tail*.

91097 POSIX.1-2008 version of *head* follows the Utility Syntax Guidelines. The `-n` option was added to this new interface so that *head* and *tail* would be more logically related. Earlier versions of this standard allowed a `-number` option. This form is no longer specified by POSIX.1-2008 but may be present in some implementations.

91101 There is no `-c` option (as there is in *tail*) because it is not historical practice and because other utilities in this volume of POSIX.1-2008 provide similar functionality.

91103 **FUTURE DIRECTIONS**

91104 None.

91105 **SEE ALSO**

91106 *sed*, *tail*

91107 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

91108 **CHANGE HISTORY**

91109 First released in Issue 4.

91110 **Issue 6**91111 The obsolescent **–number** form is removed.

91112 The normative text is reworded to avoid use of the term “must” for application requirements.

91113 The DESCRIPTION is updated to clarify that when a file contains less than the number of lines  
91114 requested, the entire file is copied to standard output.91115 **Issue 7**

91116 Austin Group Interpretations 1003.1-2001 #027 and #092 are applied.

91117 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91118 The APPLICATION USAGE section is removed and the EXAMPLES section is corrected.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**iconv**

Utilities

91119 **NAME**

91120 iconv — codeset conversion

91121 **SYNOPSIS**91122 iconv [-cs] -f *frommap* -t *tomap* [*file...*]91123 iconv -f *fromcode* [-cs] [-t *tocode*] [*file...*]91124 iconv -t *tocode* [-cs] [-f *fromcode*] [*file...*]

91125 iconv -l

91126 **DESCRIPTION**91127 The *iconv* utility shall convert the encoding of characters in *file* from one codeset to another and  
91128 write the results to standard output.91129 When the options indicate that charmap files are used to specify the codesets (see OPTIONS),  
91130 the codeset conversion shall be accomplished by performing a logical join on the symbolic  
91131 character names in the two charmaps. The implementation need not support the use of charmap  
91132 files for codeset conversion unless the POSIX2\_LOCALEDEF symbol is defined on the system.91133 **OPTIONS**91134 The *iconv* utility shall conform to XBD Section 12.2 (on page 215).

91135 The following options shall be supported:

91136 **-c** Omit any characters that are invalid in the codeset of the input file from the  
91137 output. When **-c** is not used, the results of encountering invalid characters in the  
91138 input stream (either those that are not characters in the codeset of the input file or  
91139 that have no corresponding character in the codeset of the output file) shall be  
91140 specified in the system documentation. The presence or absence of **-c** shall not  
91141 affect the exit status of *iconv*.91142 **-f** *fromcodeset*91143 Identify the codeset of the input file. The implementation shall recognize the  
91144 following two forms of the *fromcodeset* option-argument:91145 *fromcode* The *fromcode* option-argument must not contain a <slash> character.  
91146 It shall be interpreted as the name of one of the codeset descriptions  
91147 provided by the implementation in an unspecified format. Valid  
91148 values of *fromcode* are implementation-defined.91149 *frommap*91150 The *frommap* option-argument must contain a <slash> character. It  
91151 shall be interpreted as the pathname of a charmap file as defined in  
91152 XBD Section 6.4 (on page 129). If the pathname does not represent a  
valid, readable charmap file, the results are undefined.

91153 If this option is omitted, the codeset of the current locale shall be used.

91154 **-l**91155 Write all supported *fromcode* and *tocode* values to standard output in an unspecified  
format.91156 **-s**91157 Suppress any messages written to standard error concerning invalid characters.  
91158 When **-s** is not used, the results of encountering invalid characters in the input  
91159 stream (either those that are not valid characters in the codeset of the input file or  
91160 that have no corresponding character in the codeset of the output file) shall be  
91161 specified in the system documentation. The presence or absence of **-s** shall not  
affect the exit status of *iconv*.

91202 **OUTPUT FILES**

91203 None.

91204 **EXTENDED DESCRIPTION**

91205 None.

91206 **EXIT STATUS**

91207 The following exit values shall be returned:

91208 0 Successful completion.

91209 &gt;0 An error occurred.

91210 **CONSEQUENCES OF ERRORS**

91211 Default.

91212 **APPLICATION USAGE**91213 The user must ensure that both charmap files use the same symbolic names for characters the  
91214 two codesets have in common.91215 **EXAMPLES**91216 The following example converts the contents of file **mail.x400** from the ISO/IEC 6937:2001  
91217 standard codeset to the ISO/IEC 8859-1:1998 standard codeset, and stores the results in file  
91218 **mail.local**:91219 `iconv -f IS6937 -t IS8859 mail.x400 > mail.local`91220 **RATIONALE**91221 The *iconv* utility can be used portably only when the user provides two charmap files as option-  
91222 arguments. This is because a single charmap provided by the user cannot reliably be joined with  
91223 the names in a system-provided character set description. The valid values for *fromcode* and  
91224 *tocode* are implementation-defined and do not have to have any relation to the charmap  
91225 mechanisms. As an aid to interactive users, the `-I` option was adopted from the Plan 9 operating  
91226 system. It writes information concerning these implementation-defined values. The format is  
91227 unspecified because there are many possible useful formats that could be chosen, such as a  
91228 matrix of valid combinations of *fromcode* and *tocode*. The `-I` option is not intended for shell script  
91229 usage; conforming applications will have to use charmaps.91230 **FUTURE DIRECTIONS**

91231 None.

91232 **SEE ALSO**91233 *gencat*91234 XBD [Section 6.4](#) (on page 129), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)91235 **CHANGE HISTORY**

91236 First released in Issue 3.

91237 **Issue 6**91238 This utility has been rewritten to align with the IEEE P1003.2b draft standard. Specifically, the  
91239 ability to use charmap files for conversion has been added.91240 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/29 is applied, making changes to address  
91241 inconsistencies with the *iconv()* function in the System Interfaces volume of POSIX.1-2008.

91242 **Issue 7**91243 Austin Group Interpretation 1003.1-2001 #206 is applied, correcting the *tomap* option.

91244 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**id**

Utilities

91245 **NAME**91246 **id** — return user identity91247 **SYNOPSIS**91248 **id** [*user*]91249 **id** -G [-n] [*user*]91250 **id** -g [-nr] [*user*]91251 **id** -u [-nr] [*user*]91252 **DESCRIPTION**

91253 If no *user* operand is provided, the *id* utility shall write the user and group IDs and the  
 91254 corresponding user and group names of the invoking process to standard output. If the effective  
 91255 and real IDs do not match, both shall be written. If multiple groups are supported by the  
 91256 underlying system (see the description of {NGROUPS\_MAX} in the System Interfaces volume of  
 91257 POSIX.1-2008), the supplementary group affiliations of the invoking process shall also be  
 91258 written.

91259 If a *user* operand is provided and the process has appropriate privileges, the user and group IDs  
 91260 of the selected user shall be written. In this case, effective IDs shall be assumed to be identical to  
 91261 real IDs. If the selected user has more than one allowable group membership listed in the group  
 91262 database, these shall be written in the same manner as the supplementary groups described in  
 91263 the preceding paragraph.

91264 **OPTIONS**91265 The *id* utility shall conform to XBD Section 12.2 (on page 215).

91266 The following options shall be supported:

91267 **-G** Output all different group IDs (effective, real, and supplementary) only, using the  
 91268 format "%u\n". If there is more than one distinct group affiliation, output each  
 91269 such affiliation, using the format " %u", before the <newline> is output.

91270 **-g** Output only the effective group ID, using the format "%u\n".

91271 **-n** Output the name in the format "%s" instead of the numeric ID using the format  
 91272 "%u".

91273 **-r** Output the real ID instead of the effective ID.

91274 **-u** Output only the effective user ID, using the format "%u\n".

91275 **OPERANDS**

91276 The following operand shall be supported:

91277 *user* The login name for which information is to be written.

91278 **STDIN**

91279 Not used.

91280 **INPUT FILES**

91281 None.

91282 **ENVIRONMENT VARIABLES**91283 The following environment variables shall affect the execution of *id*:

91284 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 91285 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 91286 variables used to determine the values of locale categories.)

- 91287 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
91288 internationalization variables.
- 91289 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
91290 characters (for example, single-byte as opposed to multi-byte characters in  
91291 arguments).
- 91292 *LC\_MESSAGES*  
91293 Determine the locale that should be used to affect the format and contents of  
91294 diagnostic messages written to standard error and informative messages written to  
91295 standard output.
- 91296 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 91297 **ASYNCHRONOUS EVENTS**  
91298 Default.
- 91299 **STDOUT**  
91300 The following formats shall be used when the *LC\_MESSAGES* locale category specifies the  
91301 POSIX locale. In other locales, the strings *uid*, *gid*, *euid*, *egid*, and *groups* may be replaced with  
91302 more appropriate strings corresponding to the locale.
- 91303 "uid=%u(%s) gid=%u(%s)\n", <real user ID>, <user-name>,  
91304 <real group ID>, <group-name>
- 91305 If the effective and real user IDs do not match, the following shall be inserted immediately  
91306 before the '\n' character in the previous format:
- 91307 " euid=%u(%s) "
- 91308 with the following arguments added at the end of the argument list:  
91309 <effective user ID>, <effective user-name>
- 91310 If the effective and real group IDs do not match, the following shall be inserted directly before  
91311 the '\n' character in the format string (and after any addition resulting from the effective and  
91312 real user IDs not matching):
- 91313 " egid=%u(%s) "
- 91314 with the following arguments added at the end of the argument list:  
91315 <effective group-ID>, <effective group name>
- 91316 If the process has supplementary group affiliations or the selected user is allowed to belong to  
91317 multiple groups, the first shall be added directly before the <newline> in the format string:
- 91318 " groups=%u(%s) "
- 91319 with the following arguments added at the end of the argument list:  
91320 <supplementary group ID>, <supplementary group name>
- 91321 and the necessary number of the following added after that for any remaining supplementary  
91322 group IDs:
- 91323 ", %u(%s) "
- 91324 and the necessary number of the following arguments added at the end of the argument list:  
91325 <supplementary group ID>, <supplementary group name>
- 91326 If any of the user ID, group ID, effective user ID, effective group ID, or supplementary/multiple

91327 group IDs cannot be mapped by the system into printable user or group names, the  
 91328 corresponding "(%s)" and *name* argument shall be omitted from the corresponding format  
 91329 string.

91330 When any of the options are specified, the output format shall be as described in the OPTIONS  
 91331 section.

#### 91332 **STDERR**

91333 The standard error shall be used only for diagnostic messages.

#### 91334 **OUTPUT FILES**

91335 None.

#### 91336 **EXTENDED DESCRIPTION**

91337 None.

#### 91338 **EXIT STATUS**

91339 The following exit values shall be returned:

91340 0 Successful completion.

91341 >0 An error occurred.

#### 91342 **CONSEQUENCES OF ERRORS**

91343 Default.

#### 91344 **APPLICATION USAGE**

91345 Output produced by the **-G** option and by the default case could potentially produce very long  
 91346 lines on systems that support large numbers of supplementary groups. (On systems with user  
 91347 and group IDs that are 32-bit integers and with group names with a maximum of 8 bytes per  
 91348 name, 93 supplementary groups plus distinct effective and real group and user IDs could  
 91349 theoretically overflow the 2048-byte {LINE\_MAX} text file line limit on the default output case.  
 91350 It would take about 186 supplementary groups to overflow the 2048-byte barrier using *id -G*.)  
 91351 This is not expected to be a problem in practice, but in cases where it is a concern, applications  
 91352 should consider using *fold -s* before post-processing the output of *id*.

#### 91353 **EXAMPLES**

91354 None.

#### 91355 **RATIONALE**

91356 The functionality provided by the 4 BSD *groups* utility can be simulated using:

91357 `id -Gn [ user ]`

91358 The 4 BSD command *groups* was considered, but it was not included because it did not provide  
 91359 the functionality of the *id* utility of the SVID. Also, it was thought that it would be easier to  
 91360 modify *id* to provide the additional functionality necessary to systems with multiple groups than  
 91361 to invent another command.

91362 The options **-u**, **-g**, **-n**, and **-r** were added to ease the use of *id* with shell commands  
 91363 substitution. Without these options it is necessary to use some preprocessor such as *sed* to select  
 91364 the desired piece of information. Since output such as that produced by:

91365 `id -u -n`

91366 is frequently wanted, it seemed desirable to add the options.

91367 **FUTURE DIRECTIONS**

91368 None.

91369 **SEE ALSO**91370 *fold, logname, who*91371 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)91372 XSH [getgid\(\)](#), [getgroups\(\)](#), [getuid\(\)](#)91373 **CHANGE HISTORY**

91374 First released in Issue 2.

91375 **Issue 7**

91376 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**ipcrm**

Utilities

91377 **NAME**91378 `ipcrm` — remove an XSI message queue, semaphore set, or shared memory segment identifier91379 **SYNOPSIS**91380 XSI `ipcrm [-q msgid|-Q msgkey|-s semid|-S semkey|-m shmid|-M shmkey] ...`91381 **DESCRIPTION**91382 The `ipcrm` utility shall remove zero or more message queues, semaphore sets, or shared memory  
91383 segments. The interprocess communication facilities to be removed are specified by the options.91384 Only a user with appropriate privileges shall be allowed to remove an interprocess  
91385 communication facility that was not created by or owned by the user invoking `ipcrm`.91386 **OPTIONS**91387 The `ipcrm` utility shall conform to XBD [Section 12.2](#) (on page 215).

91388 The following options shall be supported:

- 91389 `-q msgid` Remove the message queue identifier `msgid` from the system and destroy the  
91390 message queue and data structure associated with it.
- 91391 `-m shmid` Remove the shared memory identifier `shmid` from the system. The shared memory  
91392 segment and data structure associated with it shall be destroyed after the last  
91393 detach.
- 91394 `-s semid` Remove the semaphore identifier `semid` from the system and destroy the set of  
91395 semaphores and data structure associated with it.
- 91396 `-Q msgkey` Remove the message queue identifier, created with key `msgkey`, from the system  
91397 and destroy the message queue and data structure associated with it.
- 91398 `-M shmkey` Remove the shared memory identifier, created with key `shmkey`, from the system.  
91399 The shared memory segment and data structure associated with it shall be  
91400 destroyed after the last detach.
- 91401 `-S semkey` Remove the semaphore identifier, created with key `semkey`, from the system and  
91402 destroy the set of semaphores and data structure associated with it.

91403 **OPERANDS**

91404 None.

91405 **STDIN**

91406 Not used.

91407 **INPUT FILES**

91408 None.

91409 **ENVIRONMENT VARIABLES**91410 The following environment variables shall affect the execution of `ipcrm`:

- 91411 `LANG` Provide a default value for the internationalization variables that are unset or null.  
91412 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
91413 variables used to determine the values of locale categories.)
- 91414 `LC_ALL` If set to a non-empty string value, override the values of all the other  
91415 internationalization variables.
- 91416 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
91417 characters (for example, single-byte as opposed to multi-byte characters in  
91418 arguments).

- 91419 *LC\_MESSAGES*
- 91420 Determine the locale that should be used to affect the format and contents of
- 91421 diagnostic messages written to standard error.
- 91422 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 91423 **ASYNCHRONOUS EVENTS**
- 91424 Default.
- 91425 **STDOUT**
- 91426 Not used.
- 91427 **STDERR**
- 91428 The standard error shall be used only for diagnostic messages.
- 91429 **OUTPUT FILES**
- 91430 None.
- 91431 **EXTENDED DESCRIPTION**
- 91432 None.
- 91433 **EXIT STATUS**
- 91434 The following exit values shall be returned:
- 91435 0 Successful completion.
- 91436 >0 An error occurred.
- 91437 **CONSEQUENCES OF ERRORS**
- 91438 Default.
- 91439 **APPLICATION USAGE**
- 91440 None.
- 91441 **EXAMPLES**
- 91442 None.
- 91443 **RATIONALE**
- 91444 None.
- 91445 **FUTURE DIRECTIONS**
- 91446 None.

- 91454 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**ipcs**

Utilities

91455 **NAME**91456 `ipcs` — report XSI interprocess communication facilities status91457 **SYNOPSIS**91458 XSI `ipcs [-qms] [-a|-bcopt]`91459 **DESCRIPTION**91460 The *ipcs* utility shall write information about active interprocess communication facilities.

91461 Without options, information shall be written in short format for message queues, shared  
 91462 memory segments, and semaphore sets that are currently active in the system. Otherwise, the  
 91463 information that is displayed is controlled by the options specified.

91464 **OPTIONS**91465 The *ipcs* utility shall conform to XBD Section 12.2 (on page 215).91466 The *ipcs* utility accepts the following options:91467 **-q** Write information about active message queues.91468 **-m** Write information about active shared memory segments.91469 **-s** Write information about active semaphore sets.

91470 If **-q**, **-m**, or **-s** are specified, only information about those facilities shall be written. If none of  
 91471 these three are specified, information about all three shall be written subject to the following  
 91472 options:

91473 **-a** Use all print options. (This is a shorthand notation for **-b**, **-c**, **-o**, **-p**, and **-t**.)

91474 **-b** Write information on maximum allowable size. (Maximum number of bytes in  
 91475 messages on queue for message queues, size of segments for shared memory, and  
 91476 number of semaphores in each set for semaphores.)

91477 **-c** Write creator's user name and group name; see below.

91478 **-o** Write information on outstanding usage. (Number of messages on queue and total  
 91479 number of bytes in messages on queue for message queues, and number of  
 91480 processes attached to shared memory segments.)

91481 **-p** Write process number information. (Process ID of the last process to send a  
 91482 message and process ID of the last process to receive a message on message  
 91483 queues, process ID of the creating process, and process ID of the last process to  
 91484 attach or detach on shared memory segments.)

91485 **-t** Write time information. (Time of the last control operation that changed the access  
 91486 permissions for all facilities, time of the last *msgsnd()* and *msgrcv()* operations on  
 91487 message queues, time of the last *shmat()* and *shmdt()* operations on shared  
 91488 memory, and time of the last *semop()* operation on semaphores.)

91489 **OPERANDS**

91490 None.

91491 **STDIN**

91492 Not used.

91493 **INPUT FILES**

- 91494 • The group database

- 91495 • The user database

#### 91496 ENVIRONMENT VARIABLES

91497 The following environment variables shall affect the execution of *ipcs*:

- 91498 *LANG* Provide a default value for the internationalization variables that are unset or null.  
91499 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
91500 variables used to determine the values of locale categories.)
- 91501 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
91502 internationalization variables.
- 91503 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
91504 characters (for example, single-byte as opposed to multi-byte characters in  
91505 arguments).
- 91506 *LC\_MESSAGES*  
91507 Determine the locale that should be used to affect the format and contents of  
91508 diagnostic messages written to standard error.
- 91509 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 91510 *TZ* Determine the timezone for the date and time strings written by *ipcs*. If *TZ* is unset  
91511 or null, an unspecified default timezone shall be used.

#### 91512 ASYNCHRONOUS EVENTS

91513 Default.

#### 91514 STDOUT

91515 An introductory line shall be written with the format:

91516 "IPC status from %s as of %s\n", <source>, <date>

91517 where <source> indicates the source used to gather the statistics and <date> is the information  
91518 that would be produced by the *date* command when invoked in the POSIX locale.

91519 The *ipcs* utility then shall create up to three reports depending upon the *-q*, *-m*, and *-s* options.  
91520 The first report shall indicate the status of message queues, the second report shall indicate the  
91521 status of shared memory segments, and the third report shall indicate the status of semaphore  
91522 sets.

91523 If the corresponding facility is not installed or has not been used since the last reboot, then the  
91524 report shall be written out in the format:

91525 "%s facility not in system.\n", <facility>

91526 where <facility> is *Message Queue*, *Shared Memory*, or *Semaphore*, as appropriate. If the facility has  
91527 been installed and has been used since the last reboot, column headings separated by one or  
91528 more <space> characters and followed by a <newline> shall be written as indicated below  
91529 followed by the facility name written out using the format:

91530 "%s:\n", <facility>

91531 where <facility> is *Message Queues*, *Shared Memory*, or *Semaphores*, as appropriate. On the second  
91532 and third reports the column headings need not be written if the last column headings written  
91533 already provide column headings for all information in that report.

91534 The column headings provided in the first column below and the meaning of the information in  
91535 those columns shall be given in order below; the letters in parentheses indicate the options that  
91536 shall cause the corresponding column to appear; "all" means that the column shall always  
91537 appear. Each column is separated by one or more <space> characters. Note that these options

|       |            |                                                                                                                                                                                                                                                                                                                                                         |
|-------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 91538 |            | only determine what information is provided for each report; they do not determine which reports are written.                                                                                                                                                                                                                                           |
| 91539 |            |                                                                                                                                                                                                                                                                                                                                                         |
| 91540 | T (all)    | Type of facility:                                                                                                                                                                                                                                                                                                                                       |
| 91541 |            | q Message queue.                                                                                                                                                                                                                                                                                                                                        |
| 91542 |            | m Shared memory segment.                                                                                                                                                                                                                                                                                                                                |

| 91614 | STIME (a,t)   | The time the last message was sent to the associated queue. If a message has been sent to the corresponding message queue, the hour, minute, and second of the last time a message was sent to the queue shall be written using the format %d:%2.2d:%2.2d. Otherwise, the format "no-entry" shall be written. |
| 91615 |               |                                                                                                                                                                                                                                                                                                               |
| 91616 |               |                                                                                                                                                                                                                                                                                                               |
| 91617 |               |                                                                                                                                                                                                                                                                                                               |
| 91618 |               |                                                                                                                                                                                                                                                                                                               |
| 91619 | RTIME (a,t)   | The time the last message was received from the associated queue. If a message has been received from the corresponding message queue, the hour, minute, and second of the last time a message was received from the queue                                                                                    |
| 91620 |               |                                                                                                                                                                                                                                                                                                               |
| 91621 |               |                                                                                                                                                                                                                                                                                                               |

|       |               |                                                                                   |
|-------|---------------|-----------------------------------------------------------------------------------|
| 91622 |               | shall be written using the format %d:%2.2d:%2.2d. Otherwise, the format           |
| 91623 |               | " no-entry" shall be written.                                                     |
| 91624 |               | The following eight columns shall be only written out for shared memory segments. |
| 91625 | CREATOR (a,c) | The user of the creator of the facility entry. If the user name of the creator is |
| 91626 |               | found in the user database, at least the first eight column positions of the      |
| 91627 |               | name shall be written using the format %s. Otherwise, the user ID of the          |
| 91628 |               | creator shall be written using the format %d.                                     |
| 91629 | CGROUP (a,c)  | The group name of the creator of the facility entry. If the group name of the     |
| 91630 |               | creator is found in the group database, at least the first eight column positions |
| 91631 |               | of the name shall be written using the format %s. Otherwise, the group ID of      |
| 91632 |               | the creator shall be written using the format %d.                                 |
| 91633 | NATTCH (a,o)  | The number of processes attached to the associated shared memory segment.         |
| 91634 |               | This field shall be written using the format %d.                                  |
| 91635 | SEGSZ (a,b)   | The size of the associated shared memory segment. This field shall be written     |
| 91636 |               | using the format %d.                                                              |
| 91637 | CPID (a,p)    | The process ID of the creator of the shared memory entry. This field shall be     |
| 91638 |               | written using the format %d.                                                      |
| 91639 | LPID (a,p)    | The process ID of the last process to attach or detach the shared memory          |
| 91640 |               | segment. This field shall be written using the format:                            |
| 91641 |               | "%d", <pid>                                                                       |
| 91642 |               | where <pid> is 0 if no process has attached the corresponding shared memory       |
| 91643 |               | segment; otherwise, <pid> shall be the process ID of the last process to attach   |
| 91644 |               | or detach the segment.                                                            |
| 91645 | ATIME (a,t)   | The time the last attach on the associated shared memory segment was              |
| 91646 |               | completed. If the corresponding shared memory segment has ever been               |
| 91647 |               | attached, the hour, minute, and second of the last time the segment was           |
| 91648 |               | attached shall be written using the format %d:%2.2d:%2.2d. Otherwise, the         |
| 91649 |               | format " no-entry" shall be written.                                              |
| 91650 | DTIME (a,t)   | The time the last detach on the associated shared memory segment was              |
| 91651 |               | completed. If the corresponding shared memory segment has ever been               |
| 91652 |               | detached, the hour, minute, and second of the last time the segment was           |
| 91653 |               | detached shall be written using the format %d:%2.2d:%2.2d. Otherwise, the         |
| 91654 |               | format " no-entry" shall be written.                                              |
| 91655 |               | The following four columns shall be only written out for semaphore sets:          |
| 91656 | CREATOR (a,c) | The user of the creator of the facility entry. If the user name of the creator is |
| 91657 |               | found in the user database, at least the first eight column positions of the      |
| 91658 |               | name shall be written using the format %s. Otherwise, the user ID of the          |
| 91659 |               | creator shall be written using the format %d.                                     |
| 91660 | CGROUP (a,c)  | The group name of the creator of the facility entry. If the group name of the     |
| 91661 |               | creator is found in the group database, at least the first eight column positions |
| 91662 |               | of the name shall be written using the format %s. Otherwise, the group ID of      |
| 91663 |               | the creator shall be written using the format %d.                                 |

- 91664 NSEMS (a,b) The number of semaphores in the set associated with the semaphore entry.  
91665 This field shall be written using the format %d.
- 91666 OTIME (a,t) The time the last semaphore operation on the set associated with the  
91667 semaphore entry was completed. If a semaphore operation has ever been  
91668 performed on the corresponding semaphore set, the hour, minute, and second  
91669 of the last semaphore operation on the semaphore set shall be written using  
91670 the format %d:%2.2d:%2.2d. Otherwise, the format " no-entry" shall be  
91671 written.
- 91672 The following column shall be written for all three reports when it is requested:
- 91673 CTIME (a,t) The time the associated entry was created or changed. The hour, minute, and  
91674 second of the time when the associated entry was created shall be written  
91675 using the format %d:%2.2d:%2.2d.
- 91676 **STDERR**  
91677 The standard error shall be used only for diagnostic messages.
- 91678 **OUTPUT FILES**  
91679 None.
- 91680 **EXTENDED DESCRIPTION**  
91681 None.
- 91682 **EXIT STATUS**  
91683 The following exit values shall be returned:  
91684 0 Successful completion.  
91685 >0 An error occurred.
- 91686 **CONSEQUENCES OF ERRORS**  
91687 Default.
- 91688 **APPLICATION USAGE**  
91689 Things can change while *ipcs* is running; the information it gives is guaranteed to be accurate  
91690 only when it was retrieved.
- 91691 **EXAMPLES**  
91692 None.
- 91693 **RATIONALE**  
91694 None.
- 91695 **FUTURE DIRECTIONS**  
91696 None.
- 91697 **SEE ALSO**

- 91701 **CHANGE HISTORY**  
91702 First released in Issue 5.

91703 **Issue 6**

91704 The Open Group Corrigendum U020/1 is applied, correcting the SYNOPSIS.

91705 The Open Group Corrigenda U032/1 and U032/2 are applied, clarifying the output format.

91706 The Open Group Base Resolution bwg98-004 is applied.

91707 **Issue 7**

91708 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91709 SD5-XCU-ERN-139 is applied, adding the *ipcrm* utility to the SEE ALSO section.

91710 **NAME**

91711 jobs — display status of jobs in the current session

91712 **SYNOPSIS**91713 UP jobs [-l|-p] [*job\_id*...]91714 **DESCRIPTION**91715 The *jobs* utility shall display the status of jobs that were started in the current shell environment;  
91716 see Section 2.12 (on page 2331).91717 When *jobs* reports the termination status of a job, the shell shall remove its process ID from the  
91718 list of those “known in the current shell execution environment”; see Section 2.9.3.1 (on page  
91719 2319).91720 **OPTIONS**91721 The *jobs* utility shall conform to XBD Section 12.2 (on page 215).

91722 The following options shall be supported:

91723 **-l** (The letter ell.) Provide more information about each job listed. This information  
91724 shall include the job number, current job, process group ID, state, and the  
91725 command that formed the job.91726 **-p** Display only the process IDs for the process group leaders of the selected jobs.91727 By default, the *jobs* utility shall display the status of all stopped jobs, running background jobs  
91728 and all jobs whose status has changed and have not been reported by the shell.91729 **OPERANDS**

91730 The following operand shall be supported:

91731 *job\_id* Specifies the jobs for which the status is to be displayed. If no *job\_id* is given, the  
91732 status information for all jobs shall be displayed. The format of *job\_id* is described  
91733 in XBD Section 3.203 (on page 65).91734 **STDIN**

91735 Not used.

91736 **INPUT FILES**

91737 None.

91738 **ENVIRONMENT VARIABLES**91739 The following environment variables shall affect the execution of *jobs*:91740 **LANG** Provide a default value for the internationalization variables that are unset or null.  
91741 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
91742 variables used to determine the values of locale categories.)91743 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
91744 internationalization variables.91745 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
91746 characters (for example, single-byte as opposed to multi-byte characters in  
91747 arguments).91748 **LC\_MESSAGES**91749 Determine the locale that should be used to affect the format and contents of  
91750 diagnostic messages written to standard error and informative messages written to  
91751 standard output.

- 91752 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 91753 **ASYNCHRONOUS EVENTS**
- 91754 Default.
- 91755 **STDOUT**
- 91756 If the **-p** option is specified, the output shall consist of one line for each process ID:
- 91757 "%d\n", <process ID>
- 91758 Otherwise, if the **-l** option is not specified, the output shall be a series of lines of the form:
- 91759 "[%d] %c %s %s\n", <job-number>, <current>, <state>, <command>
- 91760 where the fields shall be as follows:
- 91761 <current> The character '+' identifies the job that would be used as a default for the *fg* or *bg*  
 91762 utilities; this job can also be specified using the *job\_id* %+ or "%%". The character  
 91763 '- ' identifies the job that would become the default if the current default job were  
 91764 to exit; this job can also be specified using the *job\_id* %-. For other jobs, this field is  
 91765 a <space>. At most one job can be identified with '+' and at most one job can be  
 91766 identified with '- '. If there is any suspended job, then the current job shall be a  
 91767 suspended job. If there are at least two suspended jobs, then the previous job also  
 91768 shall be a suspended job.
- 91769 <job-number> A number that can be used to identify the process group to the *wait*, *fg*, *bg*, and *kill*  
 91770 utilities. Using these utilities, the job can be identified by prefixing the job number  
 91771 with '% '.
- 91772 <state> One of the following strings (in the POSIX locale):
- 91773 **Running** Indicates that the job has not been suspended by a signal and has not  
 91774 exited.
- 91775 **Done** Indicates that the job completed and returned exit status zero.
- 91776 **Done(code)** Indicates that the job completed normally and that it exited with the  
 91777 specified non-zero exit status, *code*, expressed as a decimal number.
- 91778 **Stopped** Indicates that the job was suspended by the SIGTSTP signal.
- 91779 **Stopped (SIGTSTP)**  
 91780 Indicates that the job was suspended by the SIGTSTP signal.
- 91781 **Stopped (SIGSTOP)**  
 91782 Indicates that the job was suspended by the SIGSTOP signal.
- 91783 **Stopped (SIGTTIN)**  
 91784 Indicates that the job was suspended by the SIGTTIN signal.
- 91785 **Stopped (SIGTTOU)**  
 91786 Indicates that the job was suspended by the SIGTTOU signal.
- 91787 The implementation may substitute the string **Suspended** in place of **Stopped**. If  
 91788 the job was terminated by a signal, the format of <state> is unspecified, but it shall  
 91789 be visibly distinct from all of the other <state> formats shown here and shall  
 91790 indicate the name or description of the signal causing the termination.
- 91791 <command> The associated command that was given to the shell.
- 91792 If the **-l** option is specified, a field containing the process group ID shall be inserted before the  
 91793 <state> field. Also, more processes in a process group may be output on separate lines, using

91794 only the process ID and *<command>* fields.

#### 91795 **STDERR**

91796 The standard error shall be used only for diagnostic messages.

#### 91797 **OUTPUT FILES**

91798 None.

#### 91799 **EXTENDED DESCRIPTION**

91800 None.

#### 91801 **EXIT STATUS**

91802 The following exit values shall be returned:

91803 0 Successful completion.

91804 >0 An error occurred.

#### 91805 **CONSEQUENCES OF ERRORS**

91806 Default.

#### 91807 **APPLICATION USAGE**

91808 The *-p* option is the only portable way to find out the process group of a job because different  
91809 implementations have different strategies for defining the process group of the job. Usage such  
91810 as *\$(jobs -p)* provides a way of referring to the process group of the job in an implementation-  
91811 independent way.

91812 The *jobs* utility does not work as expected when it is operating in its own utility execution  
91813 environment because that environment has no applicable jobs to manipulate. See the  
91814 APPLICATION USAGE section for *bg*. For this reason, *jobs* is generally implemented as a shell  
91815 regular built-in.

#### 91816 **EXAMPLES**

91817 None.

#### 91818 **RATIONALE**

91819 Both "%%" and "%+" are used to refer to the current job. Both forms are of equal validity—the  
91820 "%%" mirroring "\$\$" and "%+" mirroring the output of *jobs*. Both forms reflect historical  
91821 practice of the KornShell and the C shell with job control.

91822 The job control features provided by *bg*, *fg*, and *jobs* are based on the KornShell. The standard  
91823 developers examined the characteristics of the C shell versions of these utilities and found that  
91824 differences exist. Despite widespread use of the C shell, the KornShell versions were selected for  
91825 this volume of POSIX.1-2008 to maintain a degree of uniformity with the rest of the KornShell  
91826 features selected (such as the very popular command line editing features).

91827 The *jobs* utility is not dependent on the job control option, as are the seemingly related *bg* and *fg*  
91828 utilities because *jobs* is useful for examining background jobs, regardless of the condition of job  
91829 control. When the user has invoked a *set +m* command and job control has been turned off, *jobs*  
91830 can still be used to examine the background jobs associated with that current session. Similarly,  
91831 *kill* can then be used to kill background jobs with *kill %<background job number>*.

91832 The output for terminated jobs is left unspecified to accommodate various historical systems.  
91833 The following formats have been witnessed:

91834 1. **Killed**(*signal name*)

91835 2. *signal name*

- 91836 3. *signal name*(**coredump**)
- 91837 4. *signal description*– **core dumped**
- 91838 Most users should be able to understand these formats, although it means that applications have  
91839 trouble parsing them.
- 91840 The calculation of job IDs was not described since this would suggest an implementation, which  
91841 may impose unnecessary restrictions.
- 91842 In an early proposal, a **-n** option was included to “Display the status of jobs that have changed,  
91843 exited, or stopped since the last status report”. It was removed because the shell always writes  
91844 any changed status of jobs before each prompt.
- 91845 **FUTURE DIRECTIONS**
- 91846 None.

- 91856 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91857 **NAME**

91858 join — relational database operator

91859 **SYNOPSIS**91860 join **[-a file\_number|-v file\_number] [-e string] [-o list] [-t char]**  
91861 **[-1 field] [-2 field] file1 file2**91862 **DESCRIPTION**91863 The *join* utility shall perform an equality join on the files *file1* and *file2*. The joined files shall be  
91864 written to the standard output.91865 The join field is a field in each file on which the files are compared. The *join* utility shall write  
91866 one line in the output for each pair of lines in *file1* and *file2* that have identical join fields. The  
91867 output line by default shall consist of the join field, then the remaining fields from *file1*, then the  
91868 remaining fields from *file2*. This format can be changed by using the **-o** option (see below). The  
91869 **-a** option can be used to add unmatched lines to the output. The **-v** option can be used to  
91870 output only unmatched lines.91871 The files *file1* and *file2* shall be ordered in the collating sequence of **sort -b** on the fields on which  
91872 they shall be joined, by default the first in each line. All selected output shall be written in the  
91873 same collating sequence.91874 The default input field separators shall be <blank> characters. In this case, multiple separators  
91875 shall count as one field separator, and leading separators shall be ignored. The default output  
91876 field separator shall be a <space>.91877 The field separator and collating sequence can be changed by using the **-t** option (see below).91878 If the same key appears more than once in either file, all combinations of the set of remaining  
91879 fields in *file1* and the set of remaining fields in *file2* are output in the order of the lines  
91880 encountered.

91881 If the input files are not in the appropriate collating sequence, the results are unspecified.

91882 **OPTIONS**91883 The *join* utility shall conform to XBD [Section 12.2](#) (on page 215).

91884 The following options shall be supported:

91885 **-a file\_number**91886 Produce a line for each unpairable line in file *file\_number*, where *file\_number* is 1 or  
91887 2, in addition to the default output. If both **-a1** and **-a2** are specified, all unpairable  
91888 lines shall be output.91889 **-e string** Replace empty output fields in the list selected by **-o** with the string *string*.91890 **-o list** Construct the output line to comprise the fields specified in *list*, each element of  
91891 which shall have one of the following two forms:

- 91892 1.
- file\_number.field*
- , where
- file\_number*
- is a file number and
- field*
- is a decimal
- 
- 91893 integer field number
- 
- 91894 2. 0 (zero), representing the join field

91895 The elements of *list* shall be either <comma>-separated or <blank>-separated, as  
91896 specified in Guideline 8 of XBD [Section 12.2](#) (on page 215). The fields specified by  
91897 *list* shall be written for all selected output lines. Fields selected by *list* that do not  
91898 appear in the input shall be treated as empty output fields. (See the **-e** option.)  
91899 Only specifically requested fields shall be written. The application shall ensure that  
91900 *list* is a single command line argument.

## join

Utilities

- 91901        **-t char**        Use character *char* as a separator, for both input and output. Every appearance of *char* in a line shall be significant. When this option is specified, the collating sequence shall be the same as *sort* without the **-b** option.
- 91902
- 91903
- 91904        **-v file\_number**
- 91905                    Instead of the default output, produce a line only for each unpairable line in *file\_number*, where *file\_number* is 1 or 2. If both **-v1** and **-v2** are specified, all unpairable lines shall be output.
- 91906
- 91907
- 91908        **-1 field**        Join on the *fieldth* field of file 1. Fields are decimal integers starting with 1.
- 91909        **-2 field**        Join on the *fieldth* field of file 2. Fields are decimal integers starting with 1.
- 91910        **OPERANDS**
- 91911                    The following operands shall be supported:
- 91912        *file1, file2*        A pathname of a file to be joined. If either of the *file1* or *file2* operands is *'-'*, the standard input shall be used in its place.
- 91913
- 91914        **STDIN**
- 91915                    The standard input shall be used only if the *file1* or *file2* operand is *'-'*. See the INPUT FILES section.
- 91916
- 91917        **INPUT FILES**
- 91918                    The input files shall be text files.
- 91919        **ENVIRONMENT VARIABLES**
- 91920                    The following environment variables shall affect the execution of *join*:
- 91921        *LANG*                Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)
- 91922
- 91923
- 91924        *LC\_ALL*                If set to a non-empty string value, override the values of all the other internationalization variables.
- 91925
- 91926        *LC\_COLLATE*
- 91927                    Determine the locale of the collating sequence *join* expects to have been used when the input files were sorted.
- 91928
- 91929        *LC\_CTYPE*             Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).
- 91930
- 91931
- 91932        *LC\_MESSAGES*
- 91933                    Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
- 91934
- 91935        XSI        *NLSPATH*             Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 91936        **ASYNCHRONOUS EVENTS**
- 91937                    Default.
- 91938        **STDOUT**
- 91939                    The *join* utility output shall be a concatenation of selected character fields. When the **-o** option is not specified, the output shall be:
- 91940
- 91941                    "%s%s%s\n", <join field>, <other file1 fields>,  
91942                    <other file2 fields>
- 91943                    If the join field is not the first field in a file, the <other file fields> for that file shall be:

91944 <fields preceding join field>, <fields following join field>

91945 When the **-o** option is specified, the output format shall be:

91946 "%s\n", <concatenation of fields>

91947 where the concatenation of fields is described by the **-o** option, above.

91948 For either format, each field (except the last) shall be written with its trailing separator character.  
91949 If the separator is the default (<blank> characters), a single <space> shall be written after each  
91950 field (except the last).

#### 91951 **STDERR**

91952 The standard error shall be used only for diagnostic messages.

#### 91953 **OUTPUT FILES**

91954 None.

#### 91955 **EXTENDED DESCRIPTION**

91956 None.

#### 91957 **EXIT STATUS**

91958 The following exit values shall be returned:

91959 0 All input files were output successfully.

91960 >0 An error occurred.

#### 91961 **CONSEQUENCES OF ERRORS**

91962 Default.

#### 91963 **APPLICATION USAGE**

91964 Pathnames consisting of numeric digits or of the form *string.string* should not be specified  
91965 directly following the **-o** list.

#### 91966 **EXAMPLES**

91967 The **-o 0** field essentially selects the union of the join fields. For example, given file **phone**:

| 91968 | !Name   | Phone Number    |
|-------|---------|-----------------|
| 91969 | Don     | +1 123-456-7890 |
| 91970 | Hal     | +1 234-567-8901 |
| 91971 | Yasushi | +2 345-678-9012 |

91972 and file **fax**:

| 91973 | !Name   | Fax Number      |
|-------|---------|-----------------|
| 91974 | Don     | +1 123-456-7899 |
| 91975 | Keith   | +1 456-789-0122 |
| 91976 | Yasushi | +2 345-678-9011 |

91977 (where the large expanses of white space are meant to each represent a single <tab>), the  
91978 command:

91979 `join -t "<tab>" -a 1 -a 2 -e '(unknown)' -o 0,1.2,2.2 phone fax`

91980 would produce:

| 91981 | !Name   | Phone Number    | Fax Number      |
|-------|---------|-----------------|-----------------|
| 91982 | Don     | +1 123-456-7890 | +1 123-456-7899 |
| 91983 | Hal     | +1 234-567-8901 | (unknown)       |
| 91984 | Keith   | (unknown)       | +1 456-789-0122 |
| 91985 | Yasushi | +2 345-678-9012 | +2 345-678-9011 |

91986 Multiple instances of the same key will produce combinatorial results. The following:

91987 fa:

91988 a x

91989 a y

91990 a z

91991 fb:

91992 a p

91993 will produce:

91994 a x p

91995 a y p

91996 a z p

91997 And the following:

91998 fa:

91999 a b c

92000 a d e

92001 fb:

92002 a w x

92003 a y z

92004 a o p

92005 will produce:

92006 a b c w x

92007 a b c y z

92008 a b c o p

92009 a d e w x

92010 a d e y z

92011 a d e o p

## 92012 RATIONALE

92013 The `-e` option is only effective when used with `-o` because, unless specific fields are identified  
 92014 using `-o`, `join` is not aware of what fields might be empty. The exception to this is the join field,  
 92015 but identifying an empty join field with the `-e` string is not historical practice and some scripts  
 92016 might break if this were changed.

92017 The 0 field in the `-o` list was adopted from the Tenth Edition version of `join` to satisfy  
 92018 international objections that the `join` in the base documents does not support the “full join” or  
 92019 “outer join” described in relational database literature. Although it has been possible to include  
 92020 a join field in the output (by default, or by field number using `-o`), the join field could not be  
 92021 included for an unpaired line selected by `-a`. The `-o 0` field essentially selects the union of the  
 92022 join fields.

92023 This sort of outer join was not possible with the `join` commands in the base documents. The `-o 0`  
 92024 field was chosen because it is an upwards-compatible change for applications. An alternative  
 92025 was considered: have the join field represent the union of the fields in the files (where they are  
 92026 identical for matched lines, and one or both are null for unmatched lines). This was not adopted  
 92027 because it would break some historical applications.

92028 The ability to specify `file2` as `-` is not historical practice; it was added for completeness.

92029 The `-v` option is not historical practice, but was considered necessary because it permitted the  
 92030 writing of *only* those lines that do not match on the join field, as opposed to the `-a` option, which  
 92031 prints both lines that do and do not match. This additional facility is parallel with the `-v` option

- 92032 of *grep*.
- 92033 Some historical implementations have been encountered where a blank line in one of the input  
92034 files was considered to be the end of the file; the description in this volume of POSIX.1-2008 does  
92035 not cite this as an allowable case.
- 92036 Earlier versions of this standard allowed *-j*, *-j1*, *-j2* options, and a form of the *-o* option that  
92037 allowed the *list* option-argument to be multiple arguments. These forms are no longer specified  
92038 by POSIX.1-2008 but may be present in some implementations.
- 92039 **FUTURE DIRECTIONS**
- 92040 None.
- 92041 **SEE ALSO**
- 92042 *awk*, *comm*, *sort*, *uniq*
- 92043 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)
- 92044 **CHANGE HISTORY**
- 92045 First released in Issue 2.
- 92046 **Issue 6**
- 92047 The obsolescent *-j* options and the multi-argument *-o* option are removed in this version.
- 92048 The normative text is reworded to avoid use of the term “must” for application requirements.
- 92049 **Issue 7**
- 92050 Austin Group Interpretation 1003.1-2001 #027 is applied.
- 92051 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**kill**

Utilities

92052 **NAME**92053 `kill` — terminate or signal processes92054 **SYNOPSIS**92055 `kill -s signal_name pid...`92056 `kill -l [exit_status]`92057 XSI `kill [-signal_name] pid...`92058 `kill [-signal_number] pid...`92059 **DESCRIPTION**92060 The *kill* utility shall send a signal to the process or processes specified by each *pid* operand.92061 For each *pid* operand, the *kill* utility shall perform actions equivalent to the *kill()* function  
92062 defined in the System Interfaces volume of POSIX.1-2008 called with the following arguments:

- 92063 • The value of the *pid* operand shall be used as the *pid* argument.
- 92064 • The *sig* argument is the value specified by the `-s` option, `-signal_number` option, or the  
92065 `-signal_name` option, or by SIGTERM, if none of these options is specified.

92066 **OPTIONS**92067 XSI The *kill* utility shall conform to XBD Section 12.2 (on page 215), except that in the last two  
92068 SYNOPSIS forms, the `-signal_number` and `-signal_name` options are usually more than a single  
92069 character.

92070 The following options shall be supported:

92071 `-l` (The letter ell.) Write all values of *signal\_name* supported by the implementation, if  
92072 no operand is given. If an *exit\_status* operand is given and it is a value of the `'?'`  
92073 shell special parameter (see Section 2.5.2 (on page 2302) and *wait*) corresponding to  
92074 a process that was terminated by a signal, the *signal\_name* corresponding to the  
92075 signal that terminated the process shall be written. If an *exit\_status* operand is  
92076 given and it is the unsigned decimal integer value of a signal number, the  
92077 *signal\_name* (the symbolic constant name without the **SIG** prefix defined in the  
92078 Base Definitions volume of POSIX.1-2008) corresponding to that signal shall be  
92079 written. Otherwise, the results are unspecified.

92080 `-s signal_name`

92081 Specify the signal to send, using one of the symbolic names defined in the  
92082 `<signal.h>` header. Values of *signal\_name* shall be recognized in a case-independent  
92083 fashion, without the **SIG** prefix. In addition, the symbolic name `0` shall be  
92084 recognized, representing the signal value zero. The corresponding signal shall be  
92085 sent instead of SIGTERM.

92086 XSI `-signal_name`92087 Equivalent to `-s signal_name`.92088 XSI `-signal_number`

92089 Specify a non-negative decimal integer, *signal\_number*, representing the signal to be  
92090 used instead of SIGTERM, as the *sig* argument in the effective call to *kill()*. The  
92091 correspondence between integer values and the *sig* value used is shown in the  
92092 following list.

92093 The effects of specifying any *signal\_number* other than those listed below are  
92094 undefined.

|       |                                                                                                       |         |
|-------|-------------------------------------------------------------------------------------------------------|---------|
| 92095 | 0                                                                                                     | 0       |
| 92096 | 1                                                                                                     | SIGHUP  |
| 92097 | 2                                                                                                     | SIGINT  |
| 92098 | 3                                                                                                     | SIGQUIT |
| 92099 | 6                                                                                                     | SIGABRT |
| 92100 | 9                                                                                                     | SIGKILL |
| 92101 | 14                                                                                                    | SIGALRM |
| 92102 | 15                                                                                                    | SIGTERM |
| 92103 | If the first argument is a negative integer, it shall be interpreted as a <code>-signal_number</code> |         |
| 92104 | option, not as a negative <code>pid</code> operand specifying a process group.                        |         |

**OPERANDS**

92106 The following operands shall be supported:

92107 `pid` One of the following:

- 92108 1. A decimal integer specifying a process or process group to be signaled. The  
92109 process or processes selected by positive, negative, and zero values of the  
92110 `pid` operand shall be as described for the `kill()` function. If process number 0  
92111 is specified, all processes in the current process group shall be signaled. For  
92112 the effects of negative `pid` numbers, see the `kill()` function defined in the  
92113 System Interfaces volume of POSIX.1-2008. If the first `pid` operand is  
92114 negative, it should be preceded by "--" to keep it from being interpreted as  
92115 an option.
- 92116 2. A job control job ID (see XBD Section 3.203, on page 65) that identifies a  
92117 background process group to be signaled. The job control job ID notation is  
92118 applicable only for invocations of `kill` in the current shell execution  
92119 environment; see Section 2.12 (on page 2331).

92120 `exit_status` A decimal integer specifying a signal number or the exit status of a process  
92121 terminated by a signal.

**STDIN**

92123 Not used.

**INPUT FILES**

92125 None.

**ENVIRONMENT VARIABLES**

92127 The following environment variables shall affect the execution of `kill`:

- 92128 `LANG` Provide a default value for the internationalization variables that are unset or null.  
92129 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
92130 variables used to determine the values of locale categories.)
- 92131 `LC_ALL` If set to a non-empty string value, override the values of all the other  
92132 internationalization variables.
- 92133 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
92134 characters (for example, single-byte as opposed to multi-byte characters in  
92135 arguments).

**kill**

Utilities

- 92136 *LC\_MESSAGES*
- 92137 Determine the locale that should be used to affect the format and contents of
- 92138 diagnostic messages written to standard error.
- 92139 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 92140 **ASYNCHRONOUS EVENTS**
- 92141 Default.
- 92142 **STDOUT**
- 92143 When the `-l` option is not specified, the standard output shall not be used.
- 92144 When the `-l` option is specified, the symbolic name of each signal shall be written in the
- 92145 following format:
- 92146 `"%s%c", <signal_name>, <separator>`
- 92147 where the `<signal_name>` is in uppercase, without the **SIG** prefix, and the `<separator>` shall be
- 92148 either a `<newline>` or a `<space>`. For the last signal written, `<separator>` shall be a `<newline>`.
- 92149 When both the `-l` option and `exit_status` operand are specified, the symbolic name of the
- 92150 corresponding signal shall be written in the following format:
- 92151 `"%s\n", <signal_name>`
- 92152 **STDERR**
- 92153 The standard error shall be used only for diagnostic messages.
- 92154 **OUTPUT FILES**
- 92155 None.
- 92156 **EXTENDED DESCRIPTION**
- 92157 None.
- 92158 **EXIT STATUS**
- 92159 The following exit values shall be returned:
- 92160 0 At least one matching process was found for each `pid` operand, and the specified signal was
- 92161 successfully processed for at least one matching process.
- 92162 >0 An error occurred.
- 92163 **CONSEQUENCES OF ERRORS**
- 92164 Default.
- 92165 **APPLICATION USAGE**
- 92166 Process numbers can be found by using `ps`.
- 92167 The job control job ID notation is not required to work as expected when `kill` is operating in its
- 92168 own utility execution environment. In either of the following examples:
- 92169 `nohup kill %1 &`
- 92170 `system("kill %1");`
- 92171 the `kill` operates in a different environment and does not share the shell's understanding of job
- 92172 numbers.
- 92173 **EXAMPLES**
- 92174 Any of the commands:
- 92175 `kill -9 100 -165`
- 92176 `kill -s kill 100 -165`

92177 `kill -s KILL 100 -165`

92178 sends the SIGKILL signal to the process whose process ID is 100 and to all processes whose  
92179 process group ID is 165, assuming the sending process has permission to send that signal to the  
92180 specified processes, and that they exist.

92181 The System Interfaces volume of POSIX.1-2008 and this volume of POSIX.1-2008 do not require  
92182 specific signal numbers for any *signal\_names*. Even the *-signal\_number* option provides symbolic  
92183 (although numeric) names for signals. If a process is terminated by a signal, its exit status  
92184 indicates the signal that killed it, but the exact values are not specified. The *kill -l* option,  
92185 however, can be used to map decimal signal numbers and exit status values into the name of a  
92186 signal. The following example reports the status of a terminated job:

```
92187 job
92188 stat=$?
92189 if [ $stat -eq 0 ]
92190 then
92191     echo job completed successfully.
92192 elif [ $stat -gt 128 ]
92193 then
92194     echo job terminated by signal SIG$(kill -l $stat).
92195 else
92196     echo job terminated with error code $stat.
92197 fi
```

92198 To send the default signal to a process group (say 123), an application should use a command  
92199 similar to one of the following:

```
92200 kill -TERM -123
92201 kill -- -123
```

#### 92202 RATIONALE

92203 The *-l* option originated from the C shell, and is also implemented in the KornShell. The C shell  
92204 output can consist of multiple output lines because the signal names do not always fit on a  
92205 single line on some terminal screens. The KornShell output also included the implementation-  
92206 defined signal numbers and was considered by the standard developers to be too difficult for  
92207 scripts to parse conveniently. The specified output format is intended not only to accommodate  
92208 the historical C shell output, but also to permit an entirely vertical or entirely horizontal listing  
92209 on systems for which this is appropriate.

92210 An early proposal invented the name SIGNULL as a *signal\_name* for signal 0 (used by the System  
92211 Interfaces volume of POSIX.1-2008 to test for the existence of a process without sending it a  
92212 signal). Since the *signal\_name* 0 can be used in this case unambiguously, SIGNULL has been  
92213 removed.

92214 An early proposal also required symbolic *signal\_names* to be recognized with or without the **SIG**  
92215 prefix. Historical versions of *kill* have not written the **SIG** prefix for the *-l* option and have not  
92216 recognized the **SIG** prefix on *signal\_names*. Since neither applications portability nor ease-of-use  
92217 would be improved by requiring this extension, it is no longer required.

92218 To avoid an ambiguity of an initial negative number argument specifying either a signal number  
92219 or a process group, POSIX.1-2008 mandates that it is always considered the former by  
92220 implementations that support the XSI option. It also requires that conforming applications  
92221 always use the "--" options terminator argument when specifying a process group, unless an  
92222 option is also specified.

92223 The *-s* option was added in response to international interest in providing some form of *kill* that

**kill**

Utilities

- 92224 meets the Utility Syntax Guidelines.
- 92225 The job control job ID notation is not required to work as expected when *kill* is operating in its  
 92226 own utility execution environment. In either of the following examples:
- 92227 `nohup kill %1 &`  
 92228 `system("kill %1");`
- 92229 the *kill* operates in a different environment and does not understand how the shell has managed  
 92230 its job numbers.
- 92231 **FUTURE DIRECTIONS**  
 92232 None.

- 92237 **CHANGE HISTORY**  
 92238 First released in Issue 2.
- 92239 **Issue 6**  
 92240 The obsolescent versions of the SYNOPSIS are turned into non-obsolescent features of the XSI  
 92241 option, corresponding to a similar change in the *trap* special built-in.
- 92242 **Issue 7**  
 92243 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

92244 **NAME**92245 lex — generate programs for lexical tasks (**DEVELOPMENT**)92246 **SYNOPSIS**92247 CD `lex [-t] [-n|-v] [file...]`92248 **DESCRIPTION**

92249 The *lex* utility shall generate C programs to be used in lexical processing of character input, and  
 92250 that can be used as an interface to *yacc*. The C programs shall be generated from *lex* source code  
 92251 and conform to the ISO C standard, without depending on any undefined, unspecified, or  
 92252 implementation-defined behavior, except in cases where the code is copied directly from the  
 92253 supplied source, or in cases that are documented by the implementation. Usually, the *lex* utility  
 92254 shall write the program it generates to the file **lex.yy.c**; the state of this file is unspecified if *lex*  
 92255 exits with a non-zero exit status. See the EXTENDED DESCRIPTION section for a complete  
 92256 description of the *lex* input language.

92257 **OPTIONS**92258 The *lex* utility shall conform to XBD Section 12.2 (on page 215), except for Guideline 9.

92259 The following options shall be supported:

- 92260 **-n** Suppress the summary of statistics usually written with the **-v** option. If no table  
 92261 sizes are specified in the *lex* source code and the **-v** option is not specified, then **-n**  
 92262 is implied.
- 92263 **-t** Write the resulting program to standard output instead of **lex.yy.c**.
- 92264 **-v** Write a summary of *lex* statistics to the standard output. (See the discussion of *lex*  
 92265 table sizes in Definitions in *lex* (on page 2828).) If the **-t** option is specified and **-n**  
 92266 is not specified, this report shall be written to standard error. If table sizes are  
 92267 specified in the *lex* source code, and if the **-n** option is not specified, the **-v** option  
 92268 may be enabled.

92269 **OPERANDS**

92270 The following operand shall be supported:

- 92271 *file* A pathname of an input file. If more than one such *file* is specified, all files shall be  
 92272 concatenated to produce a single *lex* program. If no *file* operands are specified, or if  
 92273 a *file* operand is **'-'**, the standard input shall be used.

92274 **STDIN**

92275 The standard input shall be used if no *file* operands are specified, or if a *file* operand is **'-'**. See  
 92276 INPUT FILES.

92277 **INPUT FILES**

92278 The input files shall be text files containing *lex* source code, as described in the EXTENDED  
 92279 DESCRIPTION section.

92280 **ENVIRONMENT VARIABLES**92281 The following environment variables shall affect the execution of *lex*:

- 92282 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 92283 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 92284 variables used to determine the values of locale categories.)
- 92285 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 92286 internationalization variables.

- 92287 *LC\_COLLATE*
- 92288 Determine the locale for the behavior of ranges, equivalence classes, and multi-
- 92289 character collating elements within regular expressions. If this variable is not set to
- 92290 the POSIX locale, the results are unspecified.
- 92291 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
- 92292 characters (for example, single-byte as opposed to multi-byte characters in
- 92293 arguments and input files), and the behavior of character classes within regular
- 92294 expressions. If this variable is not set to the POSIX locale, the results are
- 92295 unspecified.
- 92296 *LC\_MESSAGES*
- 92297 Determine the locale that should be used to affect the format and contents of
- 92298 diagnostic messages written to standard error.
- 92299 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 92300 **ASYNCHRONOUS EVENTS**
- 92301 Default.
- 92302 **STDOUT**
- 92303 If the *-t* option is specified, the text file of C source code output of *lex* shall be written to
- 92304 standard output.
- 92305 If the *-t* option is not specified:
- 92306 • Implementation-defined informational, error, and warning messages concerning the
  - 92307 contents of *lex* source code input shall be written to either the standard output or standard
  - 92308 error.
  - 92309 • If the *-v* option is specified and the *-n* option is not specified, *lex* statistics shall also be
  - 92310 written to either the standard output or standard error, in an implementation-defined
  - 92311 format. These statistics may also be generated if table sizes are specified with a '*%*'
  - 92312 operator in the *Definitions* section, as long as the *-n* option is not specified.
- 92313 **STDERR**
- 92314 If the *-t* option is specified, implementation-defined informational, error, and warning messages
- 92315 concerning the contents of *lex* source code input shall be written to the standard error.
- 92316 If the *-t* option is not specified:
- 92317 1. Implementation-defined informational, error, and warning messages concerning the
  - 92318 contents of *lex* source code input shall be written to either the standard output or
  - 92319 standard error.
  - 92320 2. If the *-v* option is specified and the *-n* option is not specified, *lex* statistics shall also be
  - 92321 written to either the standard output or standard error, in an implementation-defined
  - 92322 format. These statistics may also be generated if table sizes are specified with a '*%*'
  - 92323 operator in the *Definitions* section, as long as the *-n* option is not specified.
- 92324 **OUTPUT FILES**
- 92325 A text file containing C source code shall be written to *lex.yy.c*, or to the standard output if the *-t*
- 92326 option is present.
- 92327 **EXTENDED DESCRIPTION**
- 92328 Each input file shall contain *lex* source code, which is a table of regular expressions with
- 92329 corresponding actions in the form of C program fragments.
- 92330 When *lex.yy.c* is compiled and linked with the *lex* library (using the *-ll* operand with *c99*), the

92331 resulting program shall read character input from the standard input and shall partition it into  
92332 strings that match the given expressions.

92333 When an expression is matched, these actions shall occur:

- 92334 • The input string that was matched shall be left in *yytext* as a null-terminated string; *yytext*  
92335 shall either be an external character array or a pointer to a character string. As explained in  
92336 [Definitions in lex](#) (on page 2828), the type can be explicitly selected using the `%array` or  
92337 `%pointer` declarations, but the default is implementation-defined.
- 92338 • The external `int yyleng` shall be set to the length of the matching string.
- 92339 • The expression's corresponding program fragment, or action, shall be executed.

92340 During pattern matching, *lex* shall search the set of patterns for the single longest possible  
92341 match. Among rules that match the same number of characters, the rule given first shall be  
92342 chosen.

92343 The general format of *lex* source shall be:

```
92344     Definitions
92345     %%
92346     Rules
92347     %%
92348     UserSubroutines
```

92349 The first "%%" is required to mark the beginning of the rules (regular expressions and actions);  
92350 the second "%%" is required only if user subroutines follow.

92351 Any line in the *Definitions* section beginning with a <blank> shall be assumed to be a C program  
92352 fragment and shall be copied to the external definition area of the `lex.yy.c` file. Similarly,  
92353 anything in the *Definitions* section included between delimiter lines containing only "%{" and  
92354 "%}" shall also be copied unchanged to the external definition area of the `lex.yy.c` file.

92355 Any such input (beginning with a <blank> or within "%{" and "%}" delimiter lines) appearing  
92356 at the beginning of the *Rules* section before any rules are specified shall be written to `lex.yy.c`  
92357 after the declarations of variables for the `yylex()` function and before the first line of code in  
92358 `yylex()`. Thus, user variables local to `yylex()` can be declared here, as well as application code to  
92359 execute upon entry to `yylex()`.

92360 The action taken by *lex* when encountering any input beginning with a <blank> or within "%{"  
92361 and "%}" delimiter lines appearing in the *Rules* section but coming after one or more rules is  
92362 undefined. The presence of such input may result in an erroneous definition of the `yylex()`  
92363 function.

92364 C-language code in the input shall not contain C-language trigraphs. The C-language code  
92365 within "%{" and "%}" delimiter lines shall not contain any lines consisting only of "%}", or  
92366 only of "%%".

92367 **Definitions in lex**

92368 *Definitions* appear before the first "%%" delimiter. Any line in this section not contained between  
 92369 "%{" and "%}" lines and not beginning with a <blank> shall be assumed to define a *lex*  
 92370 substitution string. The format of these lines shall be:

92371 *name substitute*

92372 If a *name* does not meet the requirements for identifiers in the ISO C standard, the result is  
 92373 undefined. The string *substitute* shall replace the string {*name*} when it is used in a rule. The *name*  
 92374 string shall be recognized in this context only when the braces are provided and when it does  
 92375 not appear within a bracket expression or within double-quotes.

92376 In the *Definitions* section, any line beginning with a <percent-sign> ('%') character and followed  
 92377 by an alphanumeric word beginning with either 's' or 'S' shall define a set of start conditions.  
 92378 Any line beginning with a '%' followed by a word beginning with either 'x' or 'X' shall  
 92379 define a set of exclusive start conditions. When the generated scanner is in a %s state, patterns  
 92380 with no state specified shall be also active; in a %x state, such patterns shall not be active. The  
 92381 rest of the line, after the first word, shall be considered to be one or more <blank>-separated  
 92382 names of start conditions. Start condition names shall be constructed in the same way as  
 92383 definition names. Start conditions can be used to restrict the matching of regular expressions to  
 92384 one or more states as described in [Regular Expressions in lex](#) (on page 2829).

92385 Implementations shall accept either of the following two mutually-exclusive declarations in the  
 92386 *Definitions* section:

92387 **%array** Declare the type of *yytext* to be a null-terminated character array.

92388 **%pointer** Declare the type of *yytext* to be a pointer to a null-terminated character string.

92389 The default type of *yytext* is implementation-defined. If an application refers to *yytext* outside of  
 92390 the scanner source file (that is, via an **extern**), the application shall include the appropriate  
 92391 **%array** or **%pointer** declaration in the scanner source file.

92392 Implementations shall accept declarations in the *Definitions* section for setting certain internal  
 92393 table sizes. The declarations are shown in the following table.

92394 **Table 4-10** Table Size Declarations in *lex*

| Declaration | Description                        | Minimum Value |
|-------------|------------------------------------|---------------|
| %p <i>n</i> | Number of positions                | 2500          |
| %n <i>n</i> | Number of states                   | 500           |
| %a <i>n</i> | Number of transitions              | 2000          |
| %e <i>n</i> | Number of parse tree nodes         | 1000          |
| %k <i>n</i> | Number of packed character classes | 1000          |
| %o <i>n</i> | Size of the output array           | 3000          |

92402 In the table, *n* represents a positive decimal integer, preceded by one or more <blank>  
 92403 characters. The exact meaning of these table size numbers is implementation-defined. The  
 92404 implementation shall document how these numbers affect the *lex* utility and how they are  
 92405 related to any output that may be generated by the implementation should limitations be  
 92406 encountered during the execution of *lex*. It shall be possible to determine from this output  
 92407 which of the table size values needs to be modified to permit *lex* to successfully generate tables  
 92408 for the input language. The values in the column Minimum Value represent the lowest values  
 92409 conforming implementations shall provide.

92410 **Rules in lex**

92411 The rules in *lex* source files are a table in which the left column contains regular expressions and  
 92412 the right column contains actions (C program fragments) to be executed when the expressions  
 92413 are recognized.

92414 *ERE action*

92415 *ERE action*

92416 . . .

92417 The extended regular expression (ERE) portion of a row shall be separated from *action* by one or  
 92418 more <blank> characters. A regular expression containing <blank> characters shall be  
 92419 recognized under one of the following conditions:

- 92420 • The entire expression appears within double-quotes.
- 92421 • The <blank> characters appear within double-quotes or square brackets.
- 92422 • Each <blank> is preceded by a <backslash> character.

92423 **User Subroutines in lex**

92424 Anything in the user subroutines section shall be copied to *lex.yy.c* following *yylex()*.

92425 **Regular Expressions in lex**

92426 The *lex* utility shall support the set of extended regular expressions (see XBD Section 9.4, on page  
 92427 188), with the following additions and exceptions to the syntax:

92428 ". . ." Any string enclosed in double-quotes shall represent the characters within the  
 92429 double-quotes as themselves, except that <backslash>-escapes (which appear in  
 92430 the following table) shall be recognized. Any <backslash>-escape sequence shall be  
 92431 terminated by the closing quote. For example, "\01"1" represents a single  
 92432 string: the octal value 1 followed by the character ' 1 '.

92433 <state>*r*, <state1, state2, . . .>*r*

92434 The regular expression *r* shall be matched only when the program is in one of the  
 92435 start conditions indicated by *state*, *state1*, and so on; see [Actions in lex](#) (on page  
 92436 2831). (As an exception to the typographical conventions of the rest of this volume  
 92437 of POSIX.1-2008, in this case <state> does not represent a metavariable, but the  
 92438 literal angle-bracket characters surrounding a symbol.) The start condition shall be  
 92439 recognized as such only at the beginning of a regular expression.

92440 *r/x*

92441 The regular expression *r* shall be matched only if it is followed by an occurrence of  
 92442 regular expression *x* (*x* is the instance of trailing context, further defined below).  
 92443 The token returned in *yytext* shall only match *r*. If the trailing portion of *r* matches  
 92444 the beginning of *x*, the result is unspecified. The *r* expression cannot include  
 92445 further trailing context or the '\$' (match-end-of-line) operator; *x* cannot include  
 92446 the '^' (match-beginning-of-line) operator, nor trailing context, nor the '\$'  
 92447 operator. That is, only one occurrence of trailing context is allowed in a *lex* regular  
 92448 expression, and the '^' operator only can be used at the beginning of such an  
 expression.

92449 {*name*}

92450 When *name* is one of the substitution symbols from the *Definitions* section, the  
 92451 string, including the enclosing braces, shall be replaced by the *substitute* value. The  
 92452 *substitute* value shall be treated in the extended regular expression as if it were  
 92453 enclosed in parentheses. No substitution shall occur if {*name*} occurs within a  
 bracket expression or within double-quotes.

92454 Within an ERE, a <backslash> character shall be considered to begin an escape sequence as  
 92455 specified in the table in XBD Chapter 5 (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r',  
 92456 '\t', '\v'). In addition, the escape sequences in the following table shall be recognized.

92457 A literal <newline> cannot occur within an ERE; the escape sequence '\n' can be used to  
 92458 represent a <newline>. A <newline> shall not be matched by a period operator.

Table 4-11 Escape Sequences in *lex*

| Escape Sequence       | Description                                                                                                                                                                                                             | Meaning                                                                                                                                                                                                                         |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\digits</code>  | A <backslash> character followed by the longest sequence of one, two, or three octal-digit characters (01234567). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined. | The character whose encoding is represented by the one, two, or three-digit octal integer. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <backslash> for each byte. |
| <code>\xdigits</code> | A <backslash> character followed by the longest sequence of hexadecimal-digit characters (01234567abcdefABCDEF). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.  | The character whose encoding is represented by the hexadecimal integer.                                                                                                                                                         |
| <code>\c</code>       | A <backslash> character followed by any character not described in this table or in the table in XBD Chapter 5 (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').                                          | The character 'c', unchanged.                                                                                                                                                                                                   |

92481 **Note:** If a '\x' sequence needs to be immediately followed by a hexadecimal digit character, a  
 92482 sequence such as "\x1"1" can be used, which represents a character containing the value 1,  
 92483 followed by the character '1'.

92484 The order of precedence given to extended regular expressions for *lex* differs from that specified  
 92485 in XBD Section 94 (on page 188). The order of precedence for *lex* shall be as shown in the  
 92486 following table, from high to low.

92487 **Note:** The escaped characters entry is not meant to imply that these are operators, but they are  
 92488 included in the table to show their relationships to the true operators. The start condition,  
 92489 trailing context, and anchoring notations have been omitted from the table because of the  
 92490 placement restrictions described in this section; they can only appear at the beginning or ending  
 92491 of an ERE.

Table 4-12 ERE Precedence in *lex*

| Extended Regular Expression              | Precedence                    |
|------------------------------------------|-------------------------------|
| <i>collation-related bracket symbols</i> | [ = ] [ : : ] [ . . ]         |
| <i>escaped characters</i>                | \< <i>special character</i> > |
| <i>bracket expression</i>                | [ ]                           |
| <i>quoting</i>                           | " . . . "                     |
| <i>grouping</i>                          | ( )                           |
| <i>definition</i>                        | { <i>name</i> }               |
| <i>single-character RE duplication</i>   | * + ?                         |
| <i>concatenation</i>                     |                               |
| <i>interval expression</i>               | { <i>m</i> , <i>n</i> }       |
| <i>alternation</i>                       |                               |

The ERE anchoring operators '*^*' and '*\$*' do not appear in the table. With *lex* regular expressions, these operators are restricted in their use: the '*^*' operator can only be used at the beginning of an entire regular expression, and the '*\$*' operator only at the end. The operators apply to the entire regular expression. Thus, for example, the pattern "*(^abc) | (def\$)*" is undefined; it can instead be written as two separate rules, one with the regular expression "*^abc*" and one with "*def\$*", which share a common action via the special '*|*' action (see below). If the pattern were written "*^abc|def\$*", it would match either "*abc*" or "*def*" on a line by itself.

Unlike the general ERE rules, embedded anchoring is not allowed by most historical *lex* implementations. An example of embedded anchoring would be for patterns such as "*(^|)foo(|\$)*" to match "*foo*" when it exists as a complete word. This functionality can be obtained using existing *lex* features:

```

^foo/[ \n]      |
" foo"/[ \n]    /* Found foo as a separate word. */

```

Note also that '*\$*' is a form of trailing context (it is equivalent to "*/\n*") and as such cannot be used with regular expressions containing another instance of the operator (see the preceding discussion of trailing context).

The additional regular expressions trailing-context operator '*/'*' can be used as an ordinary character if presented within double-quotes, "*/"*"; preceded by a <backslash>, "*\"/*"; or within a bracket expression, "*[/]*". The start-condition '*<*' and '*>*' operators shall be special only in a start condition at the beginning of a regular expression; elsewhere in the regular expression they shall be treated as ordinary characters.

### Actions in *lex*

The action to be taken when an ERE is matched can be a C program fragment or the special actions described below; the program fragment can contain one or more C statements, and can also include special actions. The empty C statement '*;*' shall be a valid action; any string in the *lex.yy.c* input that matches the pattern portion of such a rule is effectively ignored or skipped. However, the absence of an action shall not be valid, and the action *lex* takes in such a condition is undefined.

The specification for an action, including C statements and special actions, can extend across several lines if enclosed in braces:

```

ERE <one or more blanks> { program statement
                           program statement }

```

- 92537 The program statements shall not contain unbalanced curly brace preprocessing tokens.
- 92538 The default action when a string in the input to a `lex.yy.c` program is not matched by any  
92539 expression shall be to copy the string to the output. Because the default behavior of a program  
92540 generated by `lex` is to read the input and copy it to the output, a minimal `lex` source program that  
92541 has just `"%%"` shall generate a C program that simply copies the input to the output unchanged.
- 92542 Four special actions shall be available:
- 92543 | `ECHO;` | `REJECT;` | `BEGIN`
- 92544 | The action `'|'` means that the action for the next rule is the action for this rule.  
92545 Unlike the other three actions, `'|'` cannot be enclosed in braces or be  
92546 `<semicolon>`-terminated; the application shall ensure that it is specified alone, with  
92547 no other actions.
- 92548 **ECHO;** Write the contents of the string `yytext` on the output.
- 92549 **REJECT;** Usually only a single expression is matched by a given string in the input.  
92550 **REJECT** means "continue to the next expression that matches the current input",  
92551 and shall cause whatever rule was the second choice after the current rule to be  
92552 executed for the same input. Thus, multiple rules can be matched and executed for  
92553 one input string or overlapping input strings. For example, given the regular  
92554 expressions `"xyz"` and `"xy"` and the input `"xyz"`, usually only the regular  
92555 expression `"xyz"` would match. The next attempted match would start after `z`. If  
92556 the last action in the `"xyz"` rule is **REJECT**, both this rule and the `"xy"` rule  
92557 would be executed. The **REJECT** action may be implemented in such a fashion that  
92558 flow of control does not continue after it, as if it were equivalent to a **goto**  
92559 to another part of `yylex()`. The use of **REJECT** may result in somewhat larger and  
92560 slower scanners.
- 92561 **BEGIN** The action:
- 92562 `BEGIN newstate;`
- 92563 switches the state (start condition) to `newstate`. If the string `newstate` has not been  
92564 declared previously as a start condition in the *Definitions* section, the results are  
92565 unspecified. The initial state is indicated by the digit `'0'` or the token **INITIAL**.
- 92566 The functions or macros described below are accessible to user code included in the `lex` input. It  
92567 is unspecified whether they appear in the C code output of `lex`, or are accessible only through the  
92568 `-ll` operand to `c99` (the `lex` library).
- 92569 **int yylex(void)**  
92570 Performs lexical analysis on the input; this is the primary function generated by the `lex`  
92571 utility. The function shall return zero when the end of input is reached; otherwise, it shall  
92572 return non-zero values (tokens) determined by the actions that are selected.
- 92573 **int yymore(void)**  
92574 When called, indicates that when the next input string is recognized, it is to be appended to  
92575 the current value of `yytext` rather than replacing it; the value in `yylen` shall be adjusted  
92576 accordingly.
- 92577 **int yyless(int n)**  
92578 Retains `n` initial characters in `yytext`, NUL-terminated, and treats the remaining characters as  
92579 if they had not been read; the value in `yylen` shall be adjusted accordingly.

- 92580 **int input(void)**  
 92581 Returns the next character from the input, or zero on end-of-file. It shall obtain input from  
 92582 the stream pointer *yyin*, although possibly via an intermediate buffer. Thus, once scanning  
 92583 has begun, the effect of altering the value of *yyin* is undefined. The character read shall be  
 92584 removed from the input stream of the scanner without any processing by the scanner.
- 92585 **int unput(int c)**  
 92586 Returns the character 'c' to the input; *yytext* and *yytext* are undefined until the next  
 92587 expression is matched. The result of using *unput()* for more characters than have been input  
 92588 is unspecified.
- 92589 The following functions shall appear only in the *lex* library accessible through the `-D` operand;  
 92590 they can therefore be redefined by a conforming application:
- 92591 **int yywrap(void)**  
 92592 Called by *yylex()* at end-of-file; the default *yywrap()* shall always return 1. If the application  
 92593 requires *yylex()* to continue processing with another source of input, then the application  
 92594 can include a function *yywrap()*, which associates another file with the external variable  
 92595 `FILE * yyin` and shall return a value of zero.
- 92596 **int main(int argc, char \*argv[ ])**  
 92597 Calls *yylex()* to perform lexical analysis, then exits. The user code can contain *main()* to  
 92598 perform application-specific operations, calling *yylex()* as applicable.
- 92599 Except for *input()*, *unput()*, and *main()*, all external and static names generated by *lex* shall begin  
 92600 with the prefix `yy` or `YY`.
- 92601 **EXIT STATUS**  
 92602 The following exit values shall be returned:  
 92603 0 Successful completion.  
 92604 >0 An error occurred.
- 92605 **CONSEQUENCES OF ERRORS**  
 92606 Default.
- 92607 **APPLICATION USAGE**  
 92608 Conforming applications are warned that in the *Rules* section, an ERE without an action is not  
 92609 acceptable, but need not be detected as erroneous by *lex*. This may result in compilation or  
 92610 runtime errors.
- 92611 The purpose of *input()* is to take characters off the input stream and discard them as far as the  
 92612 lexical analysis is concerned. A common use is to discard the body of a comment once the  
 92613 beginning of a comment is recognized.
- 92614 The *lex* utility is not fully internationalized in its treatment of regular expressions in the *lex*  
 92615 source code or generated lexical analyzer. It would seem desirable to have the lexical analyzer  
 92616 interpret the regular expressions given in the *lex* source according to the environment specified  
 92617 when the lexical analyzer is executed, but this is not possible with the current *lex* technology.  
 92618 Furthermore, the very nature of the lexical analyzers produced by *lex* must be closely tied to the  
 92619 lexical requirements of the input language being described, which is frequently locale-specific  
 92620 anyway. (For example, writing an analyzer that is used for French text is not automatically  
 92621 useful for processing other languages.)

92622 **EXAMPLES**

92623 The following is an example of a *lex* program that implements a rudimentary scanner for a  
92624 Pascal-like syntax:

```

92625     %{
92626     /* Need this for the call to atof() below. */
92627     #include <math.h>
92628     /* Need this for printf(), fopen(), and stdin below. */
92629     #include <stdio.h>
92630     %}

92631     DIGIT      [0-9]
92632     ID         [a-z][a-z0-9]*

92633     %%

92634     {DIGIT}+ {
92635         printf("An integer: %s (%d)\n", yytext,
92636             atoi(yytext));
92637     }

92638     {DIGIT}+"."{DIGIT}* {
92639         printf("A float: %s (%g)\n", yytext,
92640             atof(yytext));
92641     }

92642     if|then|begin|end|procedure|function {
92643         printf("A keyword: %s\n", yytext);
92644     }

92645     {ID}      printf("An identifier: %s\n", yytext);
92646     "+"|"-"|"*"|"|"      printf("An operator: %s\n", yytext);
92647     "{"[^]\n}*"      /* Eat up one-line comments. */
92648     [ \t\n]+      /* Eat up white space. */
92649     .      printf("Unrecognized character: %s\n", yytext);
92650     %%

92651     int main(int argc, char *argv[])
92652     {
92653         ++argv, --argc; /* Skip over program name. */
92654         if (argc > 0)
92655             yyin = fopen(argv[0], "r");
92656         else
92657             yyin = stdin;
92658         yylex();
92659     }

```

92660 **RATIONALE**

92661 Even though the `-c` option and references to the C language are retained in this description, *lex*  
92662 may be generalized to other languages, as was done at one time for EFL, the Extended  
92663 FORTRAN Language. Since the *lex* input specification is essentially language-independent,  
92664 versions of this utility could be written to produce Ada, Modula-2, or Pascal code, and there are  
92665 known historical implementations that do so.

- 92666 The current description of *lex* bypasses the issue of dealing with internationalized EREs in the *lex*  
 92667 source code or generated lexical analyzer. If it follows the model used by *awk* (the source code is  
 92668 assumed to be presented in the POSIX locale, but input and output are in the locale specified by  
 92669 the environment variables), then the tables in the lexical analyzer produced by *lex* would  
 92670 interpret EREs specified in the *lex* source in terms of the environment variables specified when  
 92671 *lex* was executed. The desired effect would be to have the lexical analyzer interpret the EREs  
 92672 given in the *lex* source according to the environment specified when the lexical analyzer is  
 92673 executed, but this is not possible with the current *lex* technology.
- 92674 The description of octal and hexadecimal-digit escape sequences agrees with the ISO C standard  
 92675 use of escape sequences.
- 92676 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
 92677 but this has been modified in this version.
- 92678 There is no detailed output format specification. The observed behavior of *lex* under four  
 92679 different historical implementations was that none of these implementations consistently  
 92680 reported the line numbers for error and warning messages. Furthermore, there was a desire that  
 92681 *lex* be allowed to output additional diagnostic messages. Leaving message formats unspecified  
 92682 avoids these formatting questions and problems with internationalization.
- 92683 Although the %x specifier for *exclusive* start conditions is not historical practice, it is believed to  
 92684 be a minor change to historical implementations and greatly enhances the usability of *lex*  
 92685 programs since it permits an application to obtain the expected functionality with fewer  
 92686 statements.
- 92687 The %array and %pointer declarations were added as a compromise between historical systems.  
 92688 The System V-based *lex* copies the matched text to a *yytext* array. The *flex* program, supported in  
 92689 BSD and GNU systems, uses a pointer. In the latter case, significant performance improvements  
 92690 are available for some scanners. Most historical programs should require no change in porting  
 92691 from one system to another because the string being referenced is null-terminated in both cases.  
 92692 (The method used by *flex* in its case is to null-terminate the token in place by remembering the  
 92693 character that used to come right after the token and replacing it before continuing on to the next  
 92694 scan.) Multi-file programs with external references to *yytext* outside the scanner source file  
 92695 should continue to operate on their historical systems, but would require one of the new  
 92696 declarations to be considered strictly portable.
- 92697 The description of EREs avoids unnecessary duplication of ERE details because their meanings  
 92698 within a *lex* ERE are the same as that for the ERE in this volume of POSIX.1-2008.
- 92699 The reason for the undefined condition associated with text beginning with a <blank> or within  
 92700 "% { " and "% } " delimiter lines appearing in the *Rules* section is historical practice. Both the BSD  
 92701 and System V *lex* copy the indented (or enclosed) input in the *Rules* section (except at the  
 92702 beginning) to unreachable areas of the *yylex()* function (the code is written directly after a *break*  
 92703 statement). In some cases, the System V *lex* generates an error message or a syntax error,  
 92704 depending on the form of indented input.
- 92705 The intention in breaking the list of functions into those that may appear in *lex.yy.c* versus those  
 92706 that only appear in *libl.a* is that only those functions in *libl.a* can be reliably redefined by a  
 92707 conforming application.
- 92708 The descriptions of standard output and standard error are somewhat complicated because  
 92709 historical *lex* implementations chose to issue diagnostic messages to standard output (unless *-t*  
 92710 was given). POSIX.1-2008 allows this behavior, but leaves an opening for the more expected  
 92711 behavior of using standard error for diagnostics. Also, the System V behavior of writing the  
 92712 statistics when any table sizes are given is allowed, while BSD-derived systems can avoid it. The

- 92713 programmer can always precisely obtain the desired results by using either the `-t` or `-n` options.
- 92714 The OPERANDS section does not mention the use of `-` as a synonym for standard input; not all  
92715 historical implementations support such usage for any of the *file* operands.
- 92716 A description of the *translation table* was deleted from early proposals because of its relatively  
92717 low usage in historical applications.
- 92718 The change to the definition of the *input()* function that allows buffering of input presents the  
92719 opportunity for major performance gains in some applications.
- 92720 The following examples clarify the differences between *lex* regular expressions and regular  
92721 expressions appearing elsewhere in this volume of POSIX.1-2008. For regular expressions of the  
92722 form "*r/x*", the string matching *r* is always returned; confusion may arise when the beginning  
92723 of *x* matches the trailing portion of *r*. For example, given the regular expression "*a\*b/cc*" and  
92724 the input "*aaabcc*", *yytext* would contain the string "*aaab*" on this match. But given the  
92725 regular expression "*x\*/xY*" and the input "*xxxY*", the token *xxx*, not *xx*, is returned by some  
92726 implementations because *xxx* matches "*x\**".
- 92727 In the rule "*ab\*/bc*", the "*b\**" at the end of *r* extends *r*'s match into the beginning of the  
92728 trailing context, so the result is unspecified. If this rule were "*ab/bc*", however, the rule  
92729 matches the text "*ab*" when it is followed by the text "*bc*". In this latter case, the matching of *r*  
92730 cannot extend into the beginning of *x*, so the result is specified.
- 92731 **FUTURE DIRECTIONS**
- 92732 None.
- 92733 **SEE ALSO**
- 92734 *c99*, *ed*, *yacc*
- 92735 XBD [Chapter 5](#) (on page 121), [Chapter 8](#) (on page 173), [Chapter 9](#) (on page 181), [Section 12.2](#) (on  
92736 page 215)
- 92737 **CHANGE HISTORY**
- 92738 First released in Issue 2.
- 92739 **Issue 6**
- 92740 This utility is marked as part of the C-Language Development Utilities option.
- 92741 The obsolescent `-c` option is removed.
- 92742 The normative text is reworded to avoid use of the term "must" for application requirements.
- 92743 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/14 is applied, removing text describing  
92744 behavior on systems with bytes consisting of more than eight bits.
- 92745 **Issue 7**
- 92746 Austin Group Interpretation 1003.1-2001 #190 is applied, clarifying the requirements for  
92747 generated code to conform to the ISO C standard.
- 92748 Austin Group Interpretation 1003.1-2001 #191 is applied, clarifying the handling of C-language  
92749 trigraphs and curly brace preprocessing tokens.
- 92750 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
92751 apply.
- 92752 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

92753 **NAME**92754 link — call *link()* function92755 **SYNOPSIS**92756 XSI `link file1 file2`92757 **DESCRIPTION**92758 The *link* utility shall perform the function call:92759 `link(file1, file2);`92760 A user may need appropriate privileges to invoke the *link* utility.92761 **OPTIONS**

92762 None.

92763 **OPERANDS**

92764 The following operands shall be supported:

92765 *file1* The pathname of an existing file.92766 *file2* The pathname of the new directory entry to be created.92767 **STDIN**

92768 Not used.

92769 **INPUT FILES**

92770 Not used.

92771 **ENVIRONMENT VARIABLES**92772 The following environment variables shall affect the execution of *link*:92773 *LANG* Provide a default value for the internationalization variables that are unset or null.  
92774 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
92775 variables used to determine the values of locale categories.)92776 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
92777 internationalization variables.92778 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
92779 characters (for example, single-byte as opposed to multi-byte characters in  
92780 arguments).92781 *LC\_MESSAGES*  
92782 Determine the locale that should be used to affect the format and contents of  
92783 diagnostic messages written to standard error.92784 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.92785 **ASYNCHRONOUS EVENTS**

92786 Default.

92787 **STDOUT**

92788 None.

92789 **STDERR**

92790 The standard error shall be used only for diagnostic messages.

92815 **NAME**

92816 ln — link files

92817 **SYNOPSIS**92818 ln [-fs] [-L|-P] *source\_file target\_file*92819 ln [-fs] [-L|-P] *source\_file... target\_dir*92820 **DESCRIPTION**

92821 In the first synopsis form, the *ln* utility shall create a new directory entry (link) at the destination  
 92822 path specified by the *target\_file* operand. If the *-s* option is specified, a symbolic link shall be  
 92823 created for the file specified by the *source\_file* operand. This first synopsis form shall be assumed  
 92824 when the final operand does not name an existing directory; if more than two operands are  
 92825 specified and the final is not an existing directory, an error shall result.

92826 In the second synopsis form, the *ln* utility shall create a new directory entry (link), or if the *-s*  
 92827 option is specified a symbolic link, for each file specified by a *source\_file* operand, at a  
 92828 destination path in the existing directory named by *target\_dir*.

92829 If the last operand specifies an existing file of a type not specified by the System Interfaces  
 92830 volume of POSIX.1-2008, the behavior is implementation-defined.

92831 The corresponding destination path for each *source\_file* shall be the concatenation of the target  
 92832 directory pathname, a <slash> character if the target directory pathname did not end in a  
 92833 <slash>, and the last pathname component of the *source\_file*. The second synopsis form shall be  
 92834 assumed when the final operand names an existing directory.

92835 For each *source\_file*:

- 92836 1. If the destination path exists and was created by a previous step, it is unspecified whether  
 92837 *ln* shall write a diagnostic message to standard error, do nothing more with the current  
 92838 *source\_file*, and go on to any remaining *source\_files*; or will continue processing the current  
 92839 *source\_file*. If the destination path exists:
  - 92840 a. If the *-f* option is not specified, *ln* shall write a diagnostic message to standard  
 92841 error, do nothing more with the current *source\_file*, and go on to any remaining  
 92842 *source\_files*.
  - 92843 b. If *destination* names the same directory entry as the current *source\_file* *ln* shall write  
 92844 a diagnostic message to standard error, do nothing more with the current  
 92845 *source\_file*, and go on to any remaining *source\_files*.
  - 92846 c. Actions shall be performed equivalent to the *unlink()* function defined in the  
 92847 System Interfaces volume of POSIX.1-2008, called using *destination* as the *path*  
 92848 argument. If this fails for any reason, *ln* shall write a diagnostic message to  
 92849 standard error, do nothing more with the current *source\_file*, and go on to any  
 92850 remaining *source\_files*.
- 92851 2. If the *-s* option is specified, *ln* shall create a symbolic link named by the destination path  
 92852 and containing as its pathname *source\_file*. The *ln* utility shall do nothing more with  
 92853 *source\_file* and shall go on to any remaining files.
- 92854 3. If *source\_file* is a symbolic link:
  - 92855 a. If the *-P* option is in effect, actions shall be performed equivalent to the *linkat()*  
 92856 function with *source\_file* as the *path1* argument, the destination path as the *path2*  
 92857 argument, *AT\_FDCWD* as the *fd1* and *fd2* arguments, and zero as the *flag*  
 92858 argument.

92859                   b. If the `-L` option is in effect, actions shall be performed equivalent to the `linkat()`  
 92860                   function with `source_file` as the `path1` argument, the destination path as the `path2`  
 92861                   argument, `AT_FDCWD` as the `fd1` and `fd2` arguments, and  
 92862                   `AT_SYMLINK_FOLLOW` as the `flag` argument.

92863                   The `ln` utility shall do nothing more with `source_file` and shall go on to any remaining files.

92864                   4. Actions shall be performed equivalent to the `link()` function defined in the System  
 92865                   Interfaces volume of POSIX.1-2008 using `source_file` as the `path1` argument, and the  
 92866                   destination path as the `path2` argument.

#### 92867 OPTIONS

92868                   The `ln` utility shall conform to XBD Section 12.2 (on page 215).

92869                   The following options shall be supported:

- 92870                   **-f**               Force existing destination pathnames to be removed to allow the link.
- 92871                   **-L**               For each `source_file` operand that names a file of type symbolic link, create a (hard)  
 92872                   link to the file referenced by the symbolic link.
- 92873                   **-P**               For each `source_file` operand that names a file of type symbolic link, create a (hard)  
 92874                   link to the symbolic link itself.
- 92875                   **-s**               Create symbolic links instead of hard links. If the `-s` option is specified, the `-L` and  
 92876                   **-P** options shall be silently ignored.

92877                   Specifying more than one of the mutually-exclusive options `-L` and `-P` shall not be considered  
 92878                   an error. The last option specified shall determine the behavior of the utility (unless the `-s`  
 92879                   option causes it to be ignored).

92880                   If the `-s` option is not specified and neither a `-L` nor a `-P` option is specified, it is  
 92881                   implementation-defined which of the `-L` and `-P` options will be used as the default.

#### 92882 OPERANDS

92883                   The following operands shall be supported:

- 92884                   `source_file`      A pathname of a file to be linked. If the `-s` option is specified, no restrictions on the  
 92885                   type of file or on its existence shall be made. If the `-s` option is not specified,  
 92886                   whether a directory can be linked is implementation-defined.
- 92887                   `target_file`      The pathname of the new directory entry to be created.
- 92888                   `target_dir`      A pathname of an existing directory in which the new directory entries are created.

#### 92889 STDIN

92890                   Not used.

#### 92891 INPUT FILES

92892                   None.

#### 92893 ENVIRONMENT VARIABLES

92894                   The following environment variables shall affect the execution of `ln`:

- 92895                   **LANG**            Provide a default value for the internationalization variables that are unset or null.  
 92896                   (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 92897                   variables used to determine the values of locale categories.)
- 92898                   **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
 92899                   internationalization variables.

|       |                               |                                                                                                                                                                                                                                                                                                                                                   |

| 92928 |                               | The CONSEQUENCES OF ERRORS section does not require <i>ln -f a b</i> to remove <i>b</i> if a subsequent link operation would fail.                                                                                                                                                                                                                |
| 92929 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 92930 |                               | Some historic versions of <i>ln</i> (including the one specified by the SVID) unlink the destination file, if it exists, by default. If the mode does not permit writing, these versions prompt for confirmation before attempting the unlink. In these versions the <i>-f</i> option causes <i>ln</i> not to attempt to prompt for confirmation. |

| 92932 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 92933 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 92934 |                               | This allows <i>ln</i> to succeed in creating links when the target file already exists, even if the file itself is not writable (although the directory must be). Early proposals specified this functionality.                                                                                                                                   |
| 92935 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 92936 |                               | This volume of POSIX.1-2008 does not allow the <i>ln</i> utility to unlink existing destination paths by default for the following reasons:                                                                                                                                                                                                       |
| 92937 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 92938 |                               | • The <i>ln</i> utility has historically been used to provide locking for shell applications, a usage that is incompatible with <i>ln</i> unlinking the destination path by default. There was no corresponding technical advantage to adding this functionality.                                                                                 |
| 92939 |                               |                                                                                                                                                                                                                                                                                                                                                   |
| 92940 |                               |                                                                                                                                                                                                                                                                                                                                                   |

- 92941 • This functionality gave *ln* the ability to destroy the link structure of files, which changes
- 92942 the historical behavior of *ln*.
- 92943 • This functionality is easily replicated with a combination of *rm* and *ln*.
- 92944 • It is not historical practice in many systems; BSD and BSD-derived systems do not support
- 92945 this behavior. Unfortunately, whichever behavior is selected can cause scripts written
- 92946 expecting the other behavior to fail.
- 92947 • It is preferable that *ln* perform in the same manner as the *link()* function, which does not
- 92948 permit the target to exist already.

92949 This volume of POSIX.1-2008 retains the `-f` option to provide support for shell scripts depending  
 92950 on the SVID semantics. It seems likely that shell scripts would not be written to handle  
 92951 prompting by *ln* and would therefore have specified the `-f` option.

92952 The `-f` option is an undocumented feature of many historical versions of the *ln* utility, allowing  
 92953 linking to directories. These versions require modification.

92954 Early proposals of this volume of POSIX.1-2008 also required a `-i` option, which behaved like the  
 92955 `-i` options in *cp* and *mv*, prompting for confirmation before unlinking existing files. This was not  
 92956 historical practice for the *ln* utility and has been omitted.

92957 The `-L` and `-P` options allow for implementing both common behaviors of the *ln* utility. Earlier  
 92958 versions of this standard did not specify these options and required the behavior now described  
 92959 for the `-L` option. Many systems by default or as an alternative provided a non-conforming *ln*  
 92960 utility with the behavior now described for the `-P` option. Since applications could not rely on *ln*  
 92961 following links in practice, the `-L` and `-P` options were added to specify the desired behavior for  
 92962 the application.

92963 The `-L` and `-P` options are ignored when `-s` is specified in order to allow an alias to be created to  
 92964 alter the default behavior when creating hard links (for example, *alias ln='ln -L'*). They serve no  
 92965 purpose when `-s` is specified, since *source\_file* is then just a string to be used as the contents of  
 92966 the created symbolic link and need not exist as a file.

92967 The specification ensures that *ln a a* with or without the `-f` option will not unlink the file *a*.  
 92968 Earlier versions of this standard were unclear in this case.

#### 92969 FUTURE DIRECTIONS

92970 None.

#### 92971 SEE ALSO

92972 *chmod*, *find*, *pax*, *rm*

92973 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

92974 XSH *lnk()*, *unlink()*

#### 92975 CHANGE HISTORY

92976 First released in Issue 2.

#### 92977 Issue 6

92978 The *ln* utility is updated to include symbolic link processing as defined in the IEEE P1003.2b  
 92979 draft standard.

#### 92980 Issue 7

92981 Austin Group Interpretations 1003.1-2001 #164, #168, and #169 are applied.

92982 SD5-XCU-ERN-27 is applied, adding a new paragraph to the RATIONALE.

92983 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

92984  
92985

The **-L** and **-P** options are added to make it implementation-defined whether the *ln* utility follows symbolic links.

**locale**

Utilities

92986 **NAME**

92987 locale — get locale-specific information

92988 **SYNOPSIS**

92989 locale [-a|-m]

92990 locale [-ck] name...

92991 **DESCRIPTION**

92992 The *locale* utility shall write information about the current locale environment, or all public  
 92993 locales, to the standard output. For the purposes of this section, a *public locale* is one provided by  
 92994 the implementation that is accessible to the application.

92995 When *locale* is invoked without any arguments, it shall summarize the current locale  
 92996 environment for each locale category as determined by the settings of the environment variables  
 92997 defined in XBD Chapter 7 (on page 135).

92998 When invoked with operands, it shall write values that have been assigned to the keywords in  
 92999 the locale categories, as follows:

- 93000 • Specifying a keyword name shall select the named keyword and the category containing  
 93001 that keyword.
- 93002 • Specifying a category name shall select the named category and all keywords in that  
 93003 category.

93004 **OPTIONS**93005 The *locale* utility shall conform to XBD Section 12.2 (on page 215).

93006 The following options shall be supported:

- 93007 **-a** Write information about all available public locales. The available locales shall  
 93008 include **POSIX**, representing the POSIX locale. The manner in which the  
 93009 implementation determines what other locales are available is implementation-  
 93010 defined.
- 93011 **-c** Write the names of selected locale categories; see the STDOUT section. The **-c**  
 93012 option increases readability when more than one category is selected (for example,  
 93013 via more than one keyword name or via a category name). It is valid both with  
 93014 and without the **-k** option.
- 93015 **-k** Write the names and values of selected keywords. The implementation may omit  
 93016 values for some keywords; see the OPERANDS section.
- 93017 **-m** Write names of available charmaps; see XBD Section 6.1 (on page 125).

93018 **OPERANDS**

93019 The following operand shall be supported:

- 93020 *name* The name of a locale category as defined in XBD Chapter 7 (on page 135), the name  
 93021 of a keyword in a locale category, or the reserved name **charmap**. The named  
 93022 category or keyword shall be selected for output. If a single *name* represents both a  
 93023 locale category name and a keyword name in the current locale, the results are  
 93024 unspecified. Otherwise, both category and keyword names can be specified as  
 93025 *name* operands, in any sequence. It is implementation-defined whether any  
 93026 keyword values are written for the categories *LC\_CTYPE* and *LC\_COLLATE*.

93027 **STDIN**

93028 Not used.

93029 **INPUT FILES**

93030 None.

93031 **ENVIRONMENT VARIABLES**93032 The following environment variables shall affect the execution of *locale*:

93033 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 93034 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 93035 variables used to determine the values of locale categories.)

93036 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 93037 internationalization variables.

93038 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 93039 characters (for example, single-byte as opposed to multi-byte characters in  
 93040 arguments and input files).

93041 *LC\_MESSAGES*

93042 Determine the locale that should be used to affect the format and contents of  
 93043 diagnostic messages written to standard error.

93044 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

93045 XSI The application shall ensure that the *LANG*, *LC\_\**, and *NLSPATH* environment variables specify  
 93046 the current locale environment to be written out; they shall be used if the *-a* option is not  
 93047 specified.

93048 **ASYNCHRONOUS EVENTS**

93049 Default.

93050 **STDOUT**93051 The *LANG* variable shall be written first using the format:

93052 "LANG=%s\n", &lt;value&gt;

93053 If *LANG* is not set or is an empty string, the value is the empty string.

93054 If *locale* is invoked without any options or operands, the names and values of the *LC\_\**  
 93055 environment variables described in this volume of POSIX.1-2008 shall be written to the standard  
 93056 output, one variable per line, and each line using the following format. Only those variables set  
 93057 in the environment and not overridden by *LC\_ALL* shall be written using this format:

93058 "%s=%s\n", &lt;variable\_name&gt;, &lt;value&gt;

93059 The names of those *LC\_\** variables associated with locale categories defined in this volume of  
 93060 POSIX.1-2008 that are not set in the environment or are overridden by *LC\_ALL* shall be written  
 93061 in the following format:

93062 "%s=\"%s\"\n", &lt;variable\_name&gt;, &lt;implied value&gt;

93063 The <implied value> shall be the name of the locale that has been selected for that category by the  
 93064 implementation, based on the values in *LANG* and *LC\_ALL*, as described in XBD Chapter 8 (on  
 93065 page 173).

93066 The <value> and <implied value> shown above shall be properly quoted for possible later reentry  
 93067 to the shell. The <value> shall not be quoted using double-quotes (so that it can be distinguished  
 93068 by the user from the <implied value> case, which always requires double-quotes).

93069 The *LC\_ALL* variable shall be written last, using the first format shown above. If it is not set, it  
93070 shall be written as:

93071 "LC\_ALL=\n"

93072 If any arguments are specified:

93073 1. If the *-a* option is specified, the names of all the public locales shall be written, each in the  
93074 following format:

93075 "%s\n", <locale name>

93076 2. If the *-c* option is specified, the names of all selected categories shall be written, each in  
93077 the following format:

93078 "%s\n", <category name>

93079 If keywords are also selected for writing (see following items), the category name output  
93080 shall precede the keyword output for that category.

93081 If the *-c* option is not specified, the names of the categories shall not be written; only the  
93082 keywords, as selected by the <name> operand, shall be written.

93083 3. If the *-k* option is specified, the names and values of selected keywords shall be written.  
93084 If a value is non-numeric and is not a compound keyword value, it shall be written in the  
93085 following format:

93086 "%s=\"%s\"\n", <keyword name>, <keyword value>

93087 If a value is a non-numeric compound keyword value, it shall either be written in the  
93088 format:

93089 "%s=\"%s\"\n", <keyword name>, <keyword value>

93090 where the <keyword value> is a single string of values separated by <semicolon>  
93091 characters, or it shall be written in the format:

93092 "%s=%s\n", <keyword name>, <keyword value>

93093 where the <keyword value> is encoded as a set of strings, each enclosed in double-  
93094 quotation-marks, separated by <semicolon> characters.

93095 If the keyword was **charmap**, the name of the charmap (if any) that was specified via the  
93096 *localedef -f* option when the locale was created shall be written, with the word **charmap** as  
93097 <keyword name>.

93098 If a value is numeric, it shall be written in one of the following formats:

93099 "%s=%d\n", <keyword name>, <keyword value>

93100 "%s=%c%o\n", <keyword name>, <escape character>, <keyword value>

93101 "%s=%cx%x\n", <keyword name>, <escape character>, <keyword value>

93102 where the <escape character> is that identified by the **escape\_char** keyword in the current  
93103 locale; see XBD Section 7.3 (on page 136).

93104 Compound keyword values (list entries) shall be separated in the output by <semicolon>  
93105 characters. When included in keyword values, the <semicolon>, <backslash>, double-  
93106 quote, and any control character shall be preceded (escaped) with the escape character.

93107 4. If the **-k** option is not specified, selected keyword values shall be written, each in the  
93108 following format:

93109 "%s\n", <keyword value>

93110 If the keyword was **charmap**, the name of the charmap (if any) that was specified via the  
93111 *localedef* **-f** option when the locale was created shall be written.

93112 5. If the **-m** option is specified, then a list of all available charmaps shall be written, each in  
93113 the format:

93114 "%s\n", <charmap>

93115 where <charmap> is in a format suitable for use as the option-argument to the *localedef* **-f**  
93116 option.

#### 93117 **STDERR**

93118 The standard error shall be used only for diagnostic messages.

#### 93119 **OUTPUT FILES**

93120 None.

#### 93121 **EXTENDED DESCRIPTION**

93122 None.

#### 93123 **EXIT STATUS**

93124 The following exit values shall be returned:

93125 0 All the requested information was found and output successfully.

93126 >0 An error occurred.

#### 93127 **CONSEQUENCES OF ERRORS**

93128 Default.

#### 93129 **APPLICATION USAGE**

93130 If the *LANG* environment variable is not set or set to an empty value, or one of the *LC\_\**  
93131 environment variables is set to an unrecognized value, the actual locales assumed (if any) are  
93132 implementation-defined as described in XBD Chapter 8 (on page 173).

93133 Implementations are not required to write out the actual values for keywords in the categories  
93134 *LC\_CTYPE* and *LC\_COLLATE*; however, they must write out the categories (allowing an  
93135 application to determine, for example, which character classes are available).

#### 93136 **EXAMPLES**

93137 In the following examples, the assumption is that locale environment variables are set as  
93138 follows:

93139 *LANG*=locale\_x

93140 *LC\_COLLATE*=locale\_y

93141 The command *locale* would result in the following output:

93142 *LANG*=locale\_x

93143 *LC\_CTYPE*="locale\_x"

93144 *LC\_COLLATE*=locale\_y

93145 *LC\_TIME*="locale\_x"

93146 *LC\_NUMERIC*="locale\_x"

93147 *LC\_MONETARY*="locale\_x"

93148 *LC\_MESSAGES*="locale\_x"

93149 *LC\_ALL*=

93150 The order of presentation of the categories is not specified by this volume of POSIX.1-2008.

93151 The command:

```
93152 LC_ALL=POSIX locale -ck decimal_point
```

93153 would produce:

```
93154 LC_NUMERIC
93155 decimal_point="."
```

93156 The following command shows an application of *locale* to determine whether a user-supplied  
93157 response is affirmative:

```
93158 if printf "%s\n" "$response" | grep -Eq "$(locale yesexpr)"
93159 then
93160     affirmative processing goes here
93161 else
93162     non-affirmative processing goes here
93163 fi
```

#### 93164 RATIONALE

93165 The output for categories *LC\_CTYPE* and *LC\_COLLATE* has been made implementation-defined  
93166 because there is a questionable value in having a shell script receive an entire array of characters.  
93167 It is also difficult to return a logical collation description, short of returning a complete *localedef*  
93168 source.

93169 The **-m** option was included to allow applications to query for the existence of charmaps. The  
93170 output is a list of the charmaps (implementation-supplied and user-supplied, if any) on the  
93171 system.

93172 The **-c** option was included for readability when more than one category is selected (for  
93173 example, via more than one keyword name or via a category name). It is valid both with and  
93174 without the **-k** option.

93175 The **charmap** keyword, which returns the name of the charmap (if any) that was used when the  
93176 current locale was created, was included to allow applications needing the information to  
93177 retrieve it.

#### 93178 FUTURE DIRECTIONS

93179 None.

#### 93180 SEE ALSO

93181 *localedef*

93182 XBD Section 6.1 (on page 125), Chapter 7 (on page 135), Chapter 8 (on page 173), Section 12.2 (on  
93183 page 215)

#### 93184 CHANGE HISTORY

93185 First released in Issue 4.

#### 93186 Issue 5

93187 The FUTURE DIRECTIONS section is added.

#### 93188 Issue 6

93189 The normative text is reworded to avoid use of the term “must” for application requirements.

93190 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/30 is applied, correcting an editorial error  
93191 in the STDOUT section.

93192 **Issue 7**

93193 Austin Group Interpretations 1003.1-2001 #017, #021, and #088 are applied, clarifying the  
93194 standard output for the `-k` option when `LANG` is not set or is an empty string.

93195 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

## localedef

Utilities

## 93196 NAME

93197 localedef — define locale environment

## 93198 SYNOPSIS

93199 localedef [-c] [-f *charmap*] [-i *sourcefile*] [-u *code\_set\_name*] *name*

## 93200 DESCRIPTION

93201 The *localedef* utility shall convert source definitions for locale categories into a format usable by  
 93202 the functions and utilities whose operational behavior is determined by the setting of the locale  
 93203 environment variables defined in XBD Chapter 7 (on page 135). It is implementation-defined  
 93204 whether users have the capability to create new locales, in addition to those supplied by the  
 93205 implementation. If the symbolic constant POSIX2\_LOCALEDEF is defined, the system supports  
 93206 XSI the creation of new locales. On XSI-conformant systems, the symbolic constant  
 93207 POSIX2\_LOCALEDEF shall be defined.

93208 The utility shall read source definitions for one or more locale categories belonging to the same  
 93209 locale from the file named in the *-i* option (if specified) or from standard input.

93210 The *name* operand identifies the target locale. The utility shall support the creation of *public*, or  
 93211 generally accessible locales, as well as *private*, or restricted-access locales. Implementations may  
 93212 restrict the capability to create or modify public locales to users with appropriate privileges.

93213 Each category source definition shall be identified by the corresponding environment variable  
 93214 name and terminated by an **END** *category-name* statement. The following categories shall be  
 93215 supported. In addition, the input may contain source for implementation-defined categories.

93216 *LC\_CTYPE* Defines character classification and case conversion.

93217 *LC\_COLLATE*

93218 Defines collation rules.

93219 *LC\_MONETARY*

93220 Defines the format and symbols used in formatting of monetary information.

93221 *LC\_NUMERIC*

93222 Defines the decimal delimiter, grouping, and grouping symbol for non-monetary  
 93223 numeric editing.

93224 *LC\_TIME* Defines the format and content of date and time information.

93225 *LC\_MESSAGES*

93226 Defines the format and values of affirmative and negative responses.

## 93227 OPTIONS

93228 The *localedef* utility shall conform to XBD Section 12.2 (on page 215).

93229 The following options shall be supported:

93230 *-c* Create permanent output even if warning messages have been issued.

93231 *-f charmap* Specify the pathname of a file containing a mapping of character symbols and  
 93232 collating element symbols to actual character encodings. The format of the  
 93233 *charmap* is described in XBD Section 6.4 (on page 129). The application shall ensure  
 93234 that this option is specified if symbolic names (other than collating symbols  
 93235 defined in a **collating-symbol** keyword) are used. If the *-f* option is not present, an  
 93236 implementation-defined character mapping shall be used.

93237 *-i inputfile* The pathname of a file containing the source definitions. If this option is not  
 93238 present, source definitions shall be read from standard input. The format of the  
 93239 *inputfile* is described in XBD Section 7.3 (on page 136).

- 93240            **-u** *code\_set\_name*
- 93241                   Specify the name of a codeset used as the target mapping of character symbols and
- 93242                   collating element symbols whose encoding values are defined in terms of the
- 93243                   ISO/IEC 10646-1: 2000 standard position constant values.
- 93244   **OPERANDS**
- 93245            The following operand shall be supported:
- 93246            *name*           Identifies the locale; see XBD Chapter 7 (on page 135) for a description of the use of
- 93247                   this name. If the name contains one or more <slash> characters, *name* shall be
- 93248                   interpreted as a pathname where the created locale definitions shall be stored. If
- 93249                   *name* does not contain any <slash> characters, the interpretation of the name is
- 93250                   implementation-defined and the locale shall be public. The ability to create public
- 93251                   locales in this way may be restricted to users with appropriate privileges. (As a
- 93252                   consequence of specifying one *name*, although several categories can be processed
- 93253                   in one execution, only categories belonging to the same locale can be processed.)
- 93254   **STDIN**
- 93255            Unless the **-i** option is specified, the standard input shall be a text file containing one or more
- 93256            locale category source definitions, as described in XBD Section 7.3 (on page 136). When lines are
- 93257            continued using the escape character mechanism, there is no limit to the length of the
- 93258            accumulated continued line.
- 93259   **INPUT FILES**
- 93260            The character set mapping file specified as the *charmap* option-argument is described in XBD
- 93261            Section 6.4 (on page 129). If a locale category source definition contains a **copy** statement, as
- 93262            defined in XBD Chapter 7 (on page 135), and the **copy** statement names a valid, existing locale,
- 93263            then *localedef* shall behave as if the source definition had contained a valid category source
- 93264            definition for the named locale.
- 93265   **ENVIRONMENT VARIABLES**
- 93266            The following environment variables shall affect the execution of *localedef*.
- 93267            **LANG**            Provide a default value for the internationalization variables that are unset or null.
- 93268                   (See XBD Section 8.2 (on page 174) for the precedence of internationalization
- 93269                   variables used to determine the values of locale categories.)
- 93270            **LC\_ALL**        If set to a non-empty string value, override the values of all the other
- 93271                   internationalization variables.
- 93272            **LC\_COLLATE**
- 93273                   (This variable has no affect on *localedef*; the POSIX locale is used for this category.)
- 93274            **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as
- 93275                   characters (for example, single-byte as opposed to multi-byte characters in
- 93276                   arguments and input files). This variable has no affect on the processing of *localedef*
- 93277                   input data; the POSIX locale is used for this purpose, regardless of the value of this
- 93278                   variable.
- 93279            **LC\_MESSAGES**
- 93280                   Determine the locale that should be used to affect the format and contents of
- 93281                   diagnostic messages written to standard error.
- 93282    XSI        **NLSPATH**    Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

**localedef**

Utilities

93283 **ASYNCHRONOUS EVENTS**

93284 Default.

93285 **STDOUT**

93286 The utility shall report all categories successfully processed, in an unspecified format.

93287 **STDERR**

93288 The standard error shall be used only for diagnostic messages.

93289 **OUTPUT FILES**93290 The format of the created output is unspecified. If the *name* operand does not contain a `/`,  
93291 the existence of an output file for the locale is unspecified.93292 **EXTENDED DESCRIPTION**93293 When the `-u` option is used, the *code\_set\_name* option-argument shall be interpreted as an  
93294 implementation-defined name of a codeset to which the ISO/IEC 10646-1:2000 standard  
93295 position constant values shall be converted via an implementation-defined method. Both the  
93296 ISO/IEC 10646-1:2000 standard position constant values and other formats (decimal,  
93297 hexadecimal, or octal) shall be valid as encoding values within the *charmap* file. The codeset  
93298 represented by the implementation-defined name can be any codeset that is supported by the  
93299 implementation.93300 When conflicts occur between the *charmap* specification of `<code_set_name>`, `<mb_cur_max>`, or  
93301 `<mb_cur_min>` and the implementation-defined interpretation of these respective items for the  
93302 codeset represented by the `-u` option-argument *code\_set\_name*, the result is unspecified.93303 When conflicts occur between the *charmap* encoding values specified for symbolic names of  
93304 characters of the portable character set and the implementation-defined assignment of character  
93305 encoding values, the result is unspecified.93306 If a non-printable character in the *charmap* has a width specified that is not `-1`, the result will be  
93307 undefined.93308 **EXIT STATUS**

93309 The following exit values shall be returned:

93310 0 No errors occurred and the locales were successfully created.

93311 1 Warnings occurred and the locales were successfully created.

93312 2 The locale specification exceeded implementation limits or the coded character set or sets  
93313 used were not supported by the implementation, and no locale was created.

93314 3 The capability to create new locales is not supported by the implementation.

93315 &gt;3 Warnings or errors occurred and no output was created.

93316 **CONSEQUENCES OF ERRORS**

93317 If an error is detected, no permanent output shall be created.

93318 If warnings occur, permanent output shall be created if the `-c` option was specified. The  
93319 following conditions shall cause warning messages to be issued:93320 • If a symbolic name not found in the *charmap* file is used for the descriptions of the  
93321 *LC\_CTYPE* or *LC\_COLLATE* categories (for other categories, this shall be an error  
93322 condition).93323 • If the number of operands to the **order** keyword exceeds the `{COLL_WEIGHTS_MAX}`  
93324 limit.

- 93325 • If optional keywords not supported by the implementation are present in the source.

93326 Other implementation-defined conditions may also cause warnings.

#### 93327 APPLICATION USAGE

93328 The *charmap* definition is optional, and is contained outside the locale definition. This allows  
 93329 both completely self-defined source files, and generic sources (applicable to more than one  
 93330 codeset). To aid portability, all *charmap* definitions must use the same symbolic names for the  
 93331 portable character set. As explained in XBD Section 6.4 (on page 129), it is implementation-  
 93332 defined whether or not users or applications can provide additional character set description  
 93333 files. Therefore, the `-f` option might be operable only when an implementation-defined *charmap*  
 93334 is named.

#### 93335 EXAMPLES

93336 None.

#### 93337 RATIONALE

93338 The output produced by the *localedef* utility is implementation-defined. The *name* operand is  
 93339 used to identify the specific locale. (As a consequence, although several categories can be  
 93340 processed in one execution, only categories belonging to the same locale can be processed.)

#### 93341 FUTURE DIRECTIONS

93342 None.

#### 93343 SEE ALSO

93344 *locale*

93345 XBD Section 6.4 (on page 129), Chapter 7 (on page 135), Chapter 8 (on page 173), Section 12.2 (on  
 93346 page 215)

#### 93347 CHANGE HISTORY

93348 First released in Issue 4.

#### 93349 Issue 6

93350 The `-u` option is added, as specified in the IEEE P1003.2b draft standard.

93351 The normative text is reworded to avoid use of the term “must” for application requirements.

93352 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/15 is applied, rewording text in the  
 93353 OPERANDS section describing the ability to create public locales.

93354 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/16 is applied, making the text consistent  
 93355 with the descriptions of **WIDTH** and **WIDTH\_DEFAULT** in the Base Definitions volume of  
 93356 POSIX.1-2008.

#### 93357 Issue 7

93358 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**logger**

Utilities

93359 **NAME**93360 `logger` — log messages93361 **SYNOPSIS**93362 `logger string...`93363 **DESCRIPTION**

93364 The *logger* utility saves a message, in an unspecified manner and format, containing the *string*  
 93365 operands provided by the user. The messages are expected to be evaluated later by personnel  
 93366 performing system administration tasks.

93367 It is implementation-defined whether messages written in locales other than the POSIX locale  
 93368 are effective.

93369 **OPTIONS**

93370 None.

93371 **OPERANDS**

93372 The following operand shall be supported:

93373 *string* One of the string arguments whose contents are concatenated together, in the order  
 93374 specified, separated by single <space> characters.

93375 **STDIN**

93376 Not used.

93377 **INPUT FILES**

93378 None.

93379 **ENVIRONMENT VARIABLES**93380 The following environment variables shall affect the execution of *logger*:

93381 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 93382 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 93383 variables used to determine the values of locale categories.)

93384 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 93385 internationalization variables.

93386 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 93387 characters (for example, single-byte as opposed to multi-byte characters in  
 93388 arguments).

93389 *LC\_MESSAGES*

93390 Determine the locale that should be used to affect the format and contents of  
 93391 diagnostic messages written to standard error. (This means diagnostics from *logger*  
 93392 to the user or application, not diagnostic messages that the user is sending to the  
 93393 system administrator.)

93394 *XSI NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

93395 **ASYNCHRONOUS EVENTS**

93396 Default.

93397 **STDOUT**

93398 Not used.

93399 **STDERR**

93400 The standard error shall be used only for diagnostic messages.

93401 **OUTPUT FILES**

93402 Unspecified.

93403 **EXTENDED DESCRIPTION**

93404 None.

93405 **EXIT STATUS**

93406 The following exit values shall be returned:

93407 0 Successful completion.

93408 >0 An error occurred.

93409 **CONSEQUENCES OF ERRORS**

93410 Default.

93411 **APPLICATION USAGE**

93412 This utility allows logging of information for later use by a system administrator or programmer  
93413 in determining why non-interactive utilities have failed. The locations of the saved messages,  
93414 their format, and retention period are all unspecified. There is no method for a conforming  
93415 application to read messages, once written.

93416 **EXAMPLES**

93417 A batch application, running non-interactively, tries to read a configuration file and fails; it may  
93418 attempt to notify the system administrator with:

93419 `logger myname: unable to read file foo. [timestamp]`

93420 **RATIONALE**

93421 The standard developers believed strongly that some method of alerting administrators to errors  
93422 was necessary. The obvious example is a batch utility, running non-interactively, that is unable to  
93423 read its configuration files or that is unable to create or write its results file. However, the  
93424 standard developers did not wish to define the format or delivery mechanisms as they have  
93425 historically been (and will probably continue to be) very system-specific, as well as involving  
93426 functionality clearly outside the scope of this volume of POSIX.1-2008.

93427 The text with *LC\_MESSAGES* about diagnostic messages means diagnostics from *logger* to the  
93428 user or application, not diagnostic messages that the user is sending to the system administrator.

93429 Multiple *string* arguments are allowed, similar to *echo*, for ease-of-use.

93430 Like the utilities *mailx* and *lp*, *logger* is admittedly difficult to test. This was not deemed sufficient  
93431 justification to exclude these utilities from this volume of POSIX.1-2008. It is also arguable that  
93432 they are, in fact, testable, but that the tests themselves are not portable.

93433 **FUTURE DIRECTIONS**

93434 None.

93435 **SEE ALSO**

93436 *lp*, *mailx*, *write*

93437 XBD Chapter 8 (on page 173)

93438 **CHANGE HISTORY**

93439 First released in Issue 4.

93442 **NAME**

93443 logname — return the user's login name

93444 **SYNOPSIS**

93445 logname

93446 **DESCRIPTION**

93447 The *logname* utility shall write the user's login name to standard output. The login name shall be  
 93448 the string that would be returned by the *getlogin()* function defined in the System Interfaces  
 93449 volume of POSIX.1-2008. Under the conditions where the *getlogin()* function would fail, the  
 93450 *logname* utility shall write a diagnostic message to standard error and exit with a non-zero exit  
 93451 status.

93452 **OPTIONS**

93453 None.

93454 **OPERANDS**

93455 None.

93456 **STDIN**

93457 Not used.

93458 **INPUT FILES**

93459 None.

93460 **ENVIRONMENT VARIABLES**93461 The following environment variables shall affect the execution of *logname*:

93462 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 93463 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 93464 variables used to determine the values of locale categories.)

93465 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 93466 internationalization variables.

93467 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 93468 characters (for example, single-byte as opposed to multi-byte characters in  
 93469 arguments).

93470 *LC\_MESSAGES*

93471 Determine the locale that should be used to affect the format and contents of  
 93472 diagnostic messages written to standard error.

93473 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

93474 **ASYNCHRONOUS EVENTS**

93475 Default.

93476 **STDOUT**93477 The *logname* utility output shall be a single line consisting of the user's login name:

93478 "%s\n", &lt;login name&gt;

93479 **STDERR**

93480 The standard error shall be used only for diagnostic messages.

93481 **OUTPUT FILES**

93482 None.

**logname***Utilities*93483 **EXTENDED DESCRIPTION**

93484 None.

93485 **EXIT STATUS**

93486 The following exit values shall be returned:

93487 0 Successful completion.

93488 &gt;0 An error occurred.

93489 **CONSEQUENCES OF ERRORS**

93490 Default.

93491 **APPLICATION USAGE**93492 The *logname* utility explicitly ignores the *LOGNAME* environment variable because environment  
93493 changes could produce erroneous results.93494 **EXAMPLES**

93495 None.

93496 **RATIONALE**93497 The **passwd** file is not listed as required because the implementation may have other means of  
93498 mapping login names.93499 **FUTURE DIRECTIONS**

93500 None.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

93507 **NAME**

93508 lp — send files to a printer

93509 **SYNOPSIS**93510 lp [-c] [-d *dest*] [-n *copies*] [-msw] [-o *option*]... [-t *title*] [*file*...]93511 **DESCRIPTION**

93512 The *lp* utility shall copy the input files to an output destination in an unspecified manner. The  
 93513 default output destination should be to a hardcopy device, such as a printer or microfilm  
 93514 recorder, that produces non-volatile, human-readable documents. If such a device is not  
 93515 available to the application, or if the system provides no such device, the *lp* utility shall exit with  
 93516 a non-zero exit status.

93517 The actual writing to the output device may occur some time after the *lp* utility successfully  
 93518 exits. During the portion of the writing that corresponds to each input file, the implementation  
 93519 shall guarantee exclusive access to the device.

93520 The *lp* utility shall associate a unique *request ID* with each request.

93521 Normally, a banner page is produced to separate and identify each print job. This page may be  
 93522 suppressed by implementation-defined conditions, such as an operator command or one of the  
 93523 **-o option** values.

93524 **OPTIONS**93525 The *lp* utility shall conform to XBD Section 12.2 (on page 215).

93526 The following options shall be supported:

93527 **-c** Exit only after further access to any of the input files is no longer required. The  
 93528 application can then safely delete or modify the files without affecting the output  
 93529 operation. Normally, files are not copied, but are linked whenever possible. If the  
 93530 **-c** option is not given, then the user should be careful not to remove any of the  
 93531 files before the request has been printed in its entirety. It should also be noted that  
 93532 in the absence of the **-c** option, any changes made to the named files after the  
 93533 request is made but before it is printed may be reflected in the printed output. On  
 93534 some implementations, **-c** may be on by default.

93535 **-d *dest*** Specify a string that names the destination (*dest*). If *dest* is a printer, the request  
 93536 shall be printed only on that specific printer. If *dest* is a class of printers, the request  
 93537 shall be printed on the first available printer that is a member of the class. Under  
 93538 certain conditions (printer unavailability, file space limitation, and so on), requests  
 93539 for specific destinations need not be accepted. Destination names vary between  
 93540 systems.

93541 If **-d** is not specified, and neither the *LPDEST* nor *PRINTER* environment variable  
 93542 is set, an unspecified destination is used. The **-d *dest*** option shall take precedence  
 93543 over *LPDEST*, which in turn shall take precedence over *PRINTER*. Results are  
 93544 undefined when *dest* contains a value that is not a valid destination name.

93545 **-m** Send mail (see *mailx*) after the files have been printed. By default, no mail is sent  
 93546 upon normal completion of the print request.

93547 **-n *copies*** Write *copies* number of copies of the files, where *copies* is a positive decimal integer.  
 93548 The methods for producing multiple copies and for arranging the multiple copies  
 93549 when multiple *file* operands are used are unspecified, except that each file shall be  
 93550 output as an integral whole, not interleaved with portions of other files.

|       |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 93551 | <b>-o option</b>             | Specify printer-dependent or class-dependent <i>options</i> . Several such <i>options</i> may be collected by specifying the <b>-o</b> option more than once.                                                                                                                                                                                                                                                                                    |

| 93585 | <i>LPDEST</i>                | Determine the destination. If the <i>LPDEST</i> environment variable is not set, the <i>PRINTER</i> environment variable shall be used. The <b>-d dest</b> option takes precedence over <i>LPDEST</i> . Results are undefined when <b>-d</b> is not specified and <i>LPDEST</i> contains a value that is not a valid destination name.                                                                                                           |
| 93586 |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93587 |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93588 |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93589 | XSI <i>NLSPATH</i>           | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                                                                                                                                                                                                                                                                                                            |
| 93590 | <i>PRINTER</i>               | Determine the output device or destination. If the <i>LPDEST</i> and <i>PRINTER</i> environment variables are not set, an unspecified output device is used. The <b>-d dest</b> option and the <i>LPDEST</i> environment variable shall take precedence over <i>PRINTER</i> . Results are undefined when <b>-d</b> is not specified, <i>LPDEST</i> is unset, and <i>PRINTER</i> contains a value that is not a valid device or destination name. |
| 93591 |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93592 |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93593 |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93594 |                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

- 93595            *TZ*            Determine the timezone used to calculate date and time strings displayed in the *lp*  
 93596            banner page, if any. If *TZ* is unset or null, an unspecified default timezone shall be  
 93597            used.
- 93598    **ASYNCHRONOUS EVENTS**
- 93599            Default.
- 93600    **STDOUT**
- 93601            The *lp* utility shall write a *request ID* to the standard output, unless *-s* is specified. The format of  
 93602            the message is unspecified. The request ID can be used on systems supporting the historical  
 93603            *cancel* and *lpstat* utilities.
- 93604    **STDERR**
- 93605            The standard error shall be used only for diagnostic messages.
- 93606    **OUTPUT FILES**
- 93607            None.
- 93608    **EXTENDED DESCRIPTION**
- 93609            None.
- 93610    **EXIT STATUS**
- 93611            The following exit values shall be returned:
- 93612            0    All input files were processed successfully.
- 93613            >0   No output device was available, or an error occurred.
- 93614    **CONSEQUENCES OF ERRORS**
- 93615            Default.
- 93616    **APPLICATION USAGE**
- 93617            The *pr* and *fold* utilities can be used to achieve reasonable formatting for the implementation's  
 93618            default page size.
- 93619            A conforming application can use one of the *file* operands only with the *-c* option or if the file is  
 93620            publicly readable and guaranteed to be available at the time of printing. This is because  
 93621            POSIX.1-2008 gives the implementation the freedom to queue up the request for printing at  
 93622            some later time by a different process that might not be able to access the file.
- 93623    **EXAMPLES**
- 93624            1. To print file *file*:
- 93625            `lp -c file`
- 93626            2. To print multiple files with headers:
- 93627            `pr file1 file2 | lp`
- 93628    **RATIONALE**
- 93629            The *lp* utility was designed to be a basic version of a utility that is already available in many  
 93630            historical implementations. The standard developers considered that it should be implementable  
 93631            simply as:
- 93632            `cat "$@" > /dev/lp`
- 93633            after appropriate processing of options, if that is how the implementation chose to do it and if  
 93634            exclusive access could be granted (so that two users did not write to the device simultaneously).  
 93635            Although in the future the standard developers may add other options to this utility, it should  
 93636            always be able to execute with no options or operands and send the standard input to an

- 93637 unspecified output device.
- 93638 This volume of POSIX.1-2008 makes no representations concerning the format of the printed  
93639 output, except that it must be “human-readable” and “non-volatile”. Thus, writing by default to  
93640 a disk or tape drive or a display terminal would not qualify. (Such destinations are not  
93641 prohibited when `-d dest`, `LPDEST`, or `PRINTER` are used, however.)
- 93642 This volume of POSIX.1-2008 is worded such that a “print job” consisting of multiple input files  
93643 possibly in multiple copies, is guaranteed to print so that any one file is not intermixed with  
93644 another, but there is no statement that all the files or copies have to print out together.
- 93645 The `-c` option may imply a spooling operation, but this is not required. The utility can be  
93646 implemented to wait until the printer is ready and then wait until it is finished. Because of that,  
93647 there is no attempt to define a queuing mechanism (priorities, classes of output, and so on).
- 93648 On some historical systems, the request ID reported on the `STDOUT` can be used to later cancel  
93649 or find the status of a request using utilities not defined in this volume of POSIX.1-2008.
- 93650 Although the historical System V `lp` and BSD `lpr` utilities have provided similar functionality,  
93651 they used different names for the environment variable specifying the destination printer. Since  
93652 the name of the utility here is `lp`, `LPDEST` (used by the System V `lp` utility) was given precedence  
93653 over `PRINTER` (used by the BSD `lpr` utility). Since environments of users frequently contain one  
93654 or the other environment variable, the `lp` utility is required to recognize both. If this was not  
93655 done, many applications would send output to unexpected output devices when users moved  
93656 from system to system.
- 93657 Some have commented that `lp` has far too little functionality to make it worthwhile. Requests  
93658 have proposed additional options or operands or both that added functionality. The requests  
93659 included:
- 93660 • Wording *requiring* the output to be “hardcopy”
  - 93661 • A requirement for multiple printers
  - 93662 • Options for supporting various page-description languages
- 93663 Given that a compliant system is not required to even have a printer, placing further restrictions  
93664 upon the behavior of the printer is not useful. Since hardcopy format is so application-  
93665 dependent, it is difficult, if not impossible, to select a reasonable subset of functionality that  
93666 should be required on all compliant systems.
- 93667 The term *unspecified* is used in this section in lieu of *implementation-defined* as most known  
93668 implementations would not be able to make definitive statements in their conformance  
93669 documents; the existence and usage of printers is very dependent on how the system  
93670 administrator configures each individual system.
- 93671 Since the default destination, device type, queuing mechanisms, and acceptable forms of input  
93672 are all unspecified, usage guidelines for what a conforming application can do are as follows:
- 93673 • Use the command in a pipeline, or with `-c`, so that there are no permission problems and  
93674 the files can be safely deleted or modified.
  - 93675 • Limit output to text files of reasonable line lengths and printable characters and include no  
93676 device-specific formatting information, such as a page description language. The meaning  
93677 of “reasonable” in this context can only be answered as a quality-of-implementation issue,  
93678 but it should be apparent from historical usage patterns in the industry and the locale. The  
93679 `pr` and `fold` utilities can be used to achieve reasonable formatting for the default page size  
93680 of the implementation.

93681 Alternatively, the application can arrange its installation in such a way that it requires the system  
 93682 administrator or operator to provide the appropriate information on *lp* options and environment  
 93683 variable values.

93684 At a minimum, having this utility in this volume of POSIX.1-2008 tells the industry that  
 93685 conforming applications require a means to print output and provides at least a command name  
 93686 and *LPDEST* routing mechanism that can be used for discussions between vendors, application  
 93687 developers, and users. The use of “should” in the DESCRIPTION of *lp* clearly shows the intent  
 93688 of the standard developers, even if they cannot mandate that all systems (such as laptops) have  
 93689 printers.

93690 This volume of POSIX.1-2008 does not specify what the ownership of the process performing the  
 93691 writing to the output device may be. If *-c* is not used, it is unspecified whether the process  
 93692 performing the writing to the output device has permission to read *file* if there are any  
 93693 restrictions in place on who may read *file* until after it is printed. Also, if *-c* is not used, the  
 93694 results of deleting *file* before it is printed are unspecified.

#### 93695 FUTURE DIRECTIONS

93696 None.

#### 93697 SEE ALSO

93698 *mailx*

93699 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

#### 93700 CHANGE HISTORY

93701 First released in Issue 2.

#### 93702 Issue 6

93703 The following new requirements on POSIX implementations derive from alignment with the  
 93704 Single UNIX Specification:

- 93705 • In the DESCRIPTION, the requirement to associate a unique request ID, and the normal  
 93706 generation of a banner page is added.
- 93707 • In the OPTIONS section:
  - 93708 — The *-d dest* description is expanded, but references to *lpstat* are removed.
  - 93709 — The *-m*, *-o*, *-s*, *-t*, and *-w* options are added.
- 93710 • In the ENVIRONMENT VARIABLES section, *LC\_TIME* may now affect the execution.
- 93711 • The STDOUT section is added.

93712 The normative text is reworded to avoid use of the term “must” for application requirements.

93713 The TZ entry is added to the ENVIRONMENT VARIABLES section.

#### 93714 Issue 7

93715 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**ls**93716 **NAME**93717 **ls** — list directory contents93718 **SYNOPSIS**93719 xSI **ls** [-ACFRSacdfiklmnpqrstux1] [-H|-L] [-go] [*file...*]93720 **DESCRIPTION**

93721 For each operand that names a file of a type other than directory or symbolic link to a directory,  
 93722 *ls* shall write the name of the file as well as any requested, associated information. For each  
 93723 operand that names a file of type directory, *ls* shall write the names of files contained within the  
 93724 directory as well as any requested, associated information. Filenames beginning with a <period>  
 93725 ('.') and any associated information shall not be written out unless explicitly referenced, the  
 93726 **-A** or **-a** option is supplied, or an implementation-defined condition causes them to be written.  
 93727 If one or more of the **-d**, **-F**, or **-l** options are specified, and neither the **-H** nor the **-L** option is  
 93728 specified, for each operand that names a file of type symbolic link to a directory, *ls* shall write the  
 93729 name of the file as well as any requested, associated information. If none of the **-d**, **-F**, or **-l**  
 93730 options are specified, or the **-H** or **-L** options are specified, for each operand that names a file of  
 93731 type symbolic link to a directory, *ls* shall write the names of files contained within the directory  
 93732 as well as any requested, associated information. In each case where the names of files contained  
 93733 within a directory are written, if the directory contains any symbolic links then *ls* shall evaluate  
 93734 the file information and file type to be those of the symbolic link itself, unless the **-L** option is  
 93735 specified.

93736 If no operands are specified, *ls* shall behave as if a single operand of dot ('.') had been  
 93737 specified. If more than one operand is specified, *ls* shall write non-directory operands first; it  
 93738 shall sort directory and non-directory operands separately according to the collating sequence in  
 93739 the current locale.

93740 The *ls* utility shall detect infinite loops; that is, entering a previously visited directory that is an  
 93741 ancestor of the last file encountered. When it detects an infinite loop, *ls* shall write a diagnostic  
 93742 message to standard error and shall either recover its position in the hierarchy or terminate.

93743 **OPTIONS**93744 The *ls* utility shall conform to XBD [Section 12.2](#) (on page 215).

93745 The following options shall be supported:

93746 **-A** Write out all directory entries, including those whose names begin with a <period>  
 93747 ('.') but excluding the entries dot and dot-dot (if they exist).

93748 **-C** Write multi-text-column output with entries sorted down the columns, according  
 93749 to the collating sequence. The number of text columns and the column separator  
 93750 characters are unspecified, but should be adapted to the nature of the output  
 93751 device.

93752 **-F** Do not follow symbolic links named as operands unless the **-H** or **-L** options are  
 93753 specified. Write a <slash> ('/') immediately after each pathname that is a  
 93754 directory, an <asterisk> ('\*') after each that is executable, a <vertical-line> ('|')  
 93755 after each that is a FIFO, and an at-sign ('@') after each that is a symbolic link. For  
 93756 other file types, other symbols may be written.

93757 **-H** Evaluate the file information and file type for symbolic links specified on the  
 93758 command line to be those of the file referenced by the link, and not the link itself;  
 93759 however, *ls* shall write the name of the link itself and not the file referenced by the  
 93760 link.

|       |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|-----|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 93761 |     | <b>-L</b> | Evaluate the file information and file type for all symbolic links (whether named on the command line or encountered in a file hierarchy) to be those of the file referenced by the link, and not the link itself; however, <i>ls</i> shall write the name of the link itself and not the file referenced by the link. When <b>-L</b> is used with <b>-l</b> , write the contents of symbolic links in the long format (see the STDOUT section). |

| 93787 |     | <b>-l</b> | (The letter ell.) Do not follow symbolic links named as operands unless the <b>-H</b> or <b>-L</b> options are specified. Write out in long format (see the STDOUT section). When <b>-l</b> (ell) is specified, <b>-l</b> (one) shall be assumed.                                                                                                                                                                                                |
| 93788 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93789 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93790 |     | <b>-m</b> | Stream output format; list files across the page, separated by <comma> characters.                                                                                                                                                                                                                                                                                                                                                               |
| 93791 |     | <b>-n</b> | The same as <b>-l</b> , except that the owner's UID and GID numbers shall be written, rather than the associated character strings.                                                                                                                                                                                                                                                                                                              |
| 93792 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93793 | XSI | <b>-o</b> | The same as <b>-l</b> , except that the group shall not be written.                                                                                                                                                                                                                                                                                                                                                                              |
| 93794 |     | <b>-p</b> | Write a <slash> ('/') after each filename if that file is a directory.                                                                                                                                                                                                                                                                                                                                                                           |
| 93795 |     | <b>-q</b> | Force each instance of non-printable filename characters and <tab> characters to be written as the <question-mark> ('?') character. Implementations may provide this option by default if the output is to a terminal device.                                                                                                                                                                                                                    |
| 93796 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93797 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93798 |     | <b>-r</b> | Reverse the order of the sort to get reverse collating sequence oldest first, or smallest file size first depending on the other options given.                                                                                                                                                                                                                                                                                                  |
| 93799 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93800 |     | <b>-s</b> | Indicate the total number of file system blocks consumed by each file displayed. If the <b>-k</b> option is also specified, the block size shall be 1 024 bytes; otherwise, the block size is implementation-defined.                                                                                                                                                                                                                            |
| 93801 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 93802 |     |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

- 93803        **-t**            Sort with the primary key being time modified (most recently modified first) and  
 93804                    the secondary key being filename in the collating sequence. For a symbolic link,  
 93805                    the time used as the sort key is that of the symbolic link itself, unless *ls* is  
 93806                    evaluating its file information to be that of the file referenced by the link (see the  
 93807                    **-H** and **-L** options).
- 93808        **-u**            Use time of last access (see **<sys/stat.h>**) instead of last modification of the file for  
 93809                    sorting (**-t**) or writing (**-l**).
- 93810        **-x**            The same as **-C**, except that the multi-text-column output is produced with entries  
 93811                    sorted across, rather than down, the columns.
- 93812        **-1**            (The numeric digit one.) Force output to be one entry per line.
- 93813                    Specifying more than one of the options in the following mutually-exclusive pairs shall not be  
 93814                    considered an error: **-C** and **-l** (ell), **-m** and **-l** (ell), **-x** and **-l** (ell), **-C** and **-1** (one), **-H** and **-L**,  
 93815                    **-c** and **-u**, **-t** and **-S**. The last option specified in each pair shall determine the output format.
- 93816        **OPERANDS**
- 93817                    The following operand shall be supported:
- 93818        *file*            A pathname of a file to be written. If the file specified is not found, a diagnostic  
 93819                    message shall be output on standard error.
- 93820        **STDIN**
- 93821                    Not used.
- 93822        **INPUT FILES**
- 93823                    None.
- 93824        **ENVIRONMENT VARIABLES**
- 93825                    The following environment variables shall affect the execution of *ls*:
- 93826        **COLUMNS**    Determine the user's preferred column position width for writing multiple text-  
 93827                    column output. If this variable contains a string representing a decimal integer, the  
 93828                    *ls* utility shall calculate how many pathname text columns to write (see **-C**) based  
 93829                    on the width provided. If **COLUMNS** is not set or invalid, an implementation-  
 93830                    defined number of column positions shall be assumed, based on the  
 93831                    implementation's knowledge of the output device. The column width chosen to  
 93832                    write the names of files in any given directory shall be constant. Filenames shall  
 93833                    not be truncated to fit into the multiple text-column output.
- 93834        **LANG**            Provide a default value for the internationalization variables that are unset or null.  
 93835                    (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 93836                    variables used to determine the values of locale categories.)
- 93837        **LC\_ALL**            If set to a non-empty string value, override the values of all the other  
 93838                    internationalization variables.
- 93839        **LC\_COLLATE**
- 93840                    Determine the locale for character collation information in determining the  
 93841                    pathname collation sequence.
- 93842        **LC\_CTYPE**        Determine the locale for the interpretation of sequences of bytes of text data as  
 93843                    characters (for example, single-byte as opposed to multi-byte characters in  
 93844                    arguments) and which characters are defined as printable (character class **print**).

- 93845 *LC\_MESSAGES*
- 93846 Determine the locale that should be used to affect the format and contents of
- 93847 diagnostic messages written to standard error.
- 93848 *LC\_TIME* Determine the format and contents for date and time strings written by *ls*.
- 93849 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 93850 *TZ* Determine the timezone for date and time strings written by *ls*. If *TZ* is unset or
- 93851 null, an unspecified default timezone shall be used.
- 93852 **ASYNCHRONOUS EVENTS**
- 93853 Default.
- 93854 **STDOUT**
- 93855 The default format shall be to list one entry per line to standard output; the exceptions are to
- 93856 terminals or when one of the *-C*, *-m*, or *-x* options is specified. If the output is to a terminal, the
- 93857 format is implementation-defined.
- 93858 When *-m* is specified, the format used shall be:
- 93859 "%s, %s, ...\n", <filename1>, <filename2>
- 93860 where the largest number of filenames shall be written without exceeding the length of the line.
- 93861 If the *-i* option is specified, the file's file serial number (see <sys/stat.h>) shall be written in the
- 93862 following format before any other output for the corresponding entry:
- 93863 %u ", <file serial number>
- 93864 If the *-l* option is specified without *-L*, the following information shall be written:
- 93865 "%s %u %s %s %u %s %s\n", <file mode>, <number of links>,  
93866 <owner name>, <group name>, <number of bytes in the file>,  
93867 <date and time>, <pathname>
- 93868 If the file is a symbolic link, this information shall be about the link itself and the <pathname>
- 93869 field shall be of the form:
- 93870 "%s -> %s", <pathname of link>, <contents of link>
- 93871 If both *-l* and *-L* are specified, the following information shall be written:
- 93872 "%s %u %s %s %u %s %s\n", <file mode>, <number of links>,  
93873 <owner name>, <group name>, <number of bytes in the file>,  
93874 <date and time>, <pathname of link>
- 93875 where all fields except <pathname of link> shall be for the file resolved from the symbolic link.
- 93876 XSI The *-n*, *-g*, and *-o* options use the same format as *-l*, but with omitted items and their
- 93877 associated <blank> characters. See the OPTIONS section.
- 93878 In both the preceding *-l* forms, if <owner name> or <group name> cannot be determined, or if *-n*
- 93879 is given, they shall be replaced with their associated numeric values using the format %u.
- 93880 The <date and time> field shall contain the appropriate date and timestamp of when the file was
- 93881 last modified. In the POSIX locale, the field shall be the equivalent of the output of the following
- 93882 *date* command:
- 93883 date "+%b %e %H:%M"
- 93884 if the file has been modified in the last six months, or:

93885           date "+%b %e %Y"

93886           (where two <space> characters are used between %e and %Y) if the file has not been modified in  
93887           the last six months or if the modification date is in the future, except that, in both cases, the final  
93888           <newline> produced by *date* shall not be included and the output shall be as if the *date*  
93889           command were executed at the time of the last modification date of the file rather than the  
93890           current time. When the *LC\_TIME* locale category is not set to the POSIX locale, a different format  
93891           and order of presentation of this field may be used.

93892           If the file is a character special or block special file, the size of the file may be replaced with  
93893           implementation-defined information associated with the device in question.

93894           If the pathname was specified as a *file* operand, it shall be written as specified.

93895 XSI        The file mode written under the *-l*, *-n*, *-g*, and *-o* options shall consist of the following format:

93896           "%c%s%s%s", <entry type>, <owner permissions>,  
93897                    <group permissions>, <other permissions>,  
93898                    <optional alternate access method flag>

93899           The <optional alternate access method flag> shall be the empty string if there is no alternate or  
93900           additional access control method associated with the file; otherwise, it shall be a string  
93901           containing a single printable character that is not a <blank>.

93902           The <entry type> character shall describe the type of file, as follows:

93903           d        Directory.  
93904           b        Block special file.  
93905           c        Character special file.  
93906           l (ell) Symbolic link.  
93907           p        FIFO.  
93908           -        Regular file.

93909           Implementations may add other characters to this list to represent other implementation-defined  
93910           file types.

93911           The next three fields shall be three characters each:

93912           <owner permissions>  
93913                Permissions for the file owner class (see XBD Section 4.4, on page 108).  
93914           <group permissions>  
93915                Permissions for the file group class.  
93916           <other permissions>  
93917                Permissions for the file other class.

93918           Each field shall have three character positions:

- 93919           1. If 'r', the file is readable; if '-', the file is not readable.  
93920           2. If 'w', the file is writable; if '-', the file is not writable.  
93921           3. The first of the following that applies:
- 93922           S    If in <owner permissions>, the file is not executable and set-user-ID mode is set. If in  
93923                <group permissions>, the file is not executable and set-group-ID mode is set.

- 93924 s If in *<owner permissions>*, the file is executable and set-user-ID mode is set. If in  
93925 *<group permissions>*, the file is executable and set-group-ID mode is set.
- 93926 XSI T If in *<other permissions>* and the file is a directory, search permission is not granted to  
93927 others, and the restricted deletion flag is set.
- 93928 XSI t If in *<other permissions>* and the file is a directory, search permission is granted to  
93929 others, and the restricted deletion flag is set.
- 93930 x The file is executable or the directory is searchable.
- 93931 – None of the attributes of 'S', 's', 'T', 't', or 'x' applies.
- 93932 Implementations may add other characters to this list for the third character position.  
93933 Such additions shall, however, be written in lowercase if the file is executable or  
93934 searchable, and in uppercase if it is not.
- 93935 XSI If any of the **-l**, **-n**, **-s**, **-g**, or **-o** options is specified, each list of files within the directory shall be  
93936 preceded by a status line indicating the number of file system blocks occupied by files in the  
93937 directory in 512-byte units if the **-k** option is not specified, or 1 024-byte units if the **-k** option is  
93938 specified, rounded up to the next integral number of units, if necessary. In the POSIX locale, the  
93939 format shall be:
- 93940 "total %u\n", *<number of units in the directory>*
- 93941 If more than one directory, or a combination of non-directory files and directories are written,  
93942 either as a result of specifying multiple operands, or the **-R** option, each list of files within a  
93943 directory shall be preceded by:
- 93944 "\n%s:\n", *<directory name>*
- 93945 If this string is the first thing to be written, the first *<newline>* shall not be written. This output  
93946 shall precede the number of units in the directory.
- 93947 If the **-s** option is given, each file shall be written with the number of blocks used by the file.  
93948 XSI Along with **-C**, **-l**, **-m**, or **-x**, the number and a *<space>* shall precede the filename; with **-l**, **-n**,  
93949 **-g**, or **-o**, they shall precede each line describing a file.
- 93950 **STDERR**
- 93951 The standard error shall be used only for diagnostic messages.
- 93952 **OUTPUT FILES**
- 93953 None.
- 93954 **EXTENDED DESCRIPTION**
- 93955 None.
- 93956 **EXIT STATUS**
- 93957 The following exit values shall be returned:
- 93958 0 Successful completion.
- 93959 >0 An error occurred.
- 93960 **CONSEQUENCES OF ERRORS**
- 93961 Default.

## 93962 APPLICATION USAGE

93963 Many implementations use the <equals-sign> ('=') to denote sockets bound to the file system  
 93964 for the **-F** option. Similarly, many historical implementations use the 's' character to denote  
 93965 sockets as the entry type characters for the **-l** option.

93966 It is difficult for an application to use every part of the file modes field of *ls -l* in a portable  
 93967 manner. Certain file types and executable bits are not guaranteed to be exactly as shown, as  
 93968 implementations may have extensions. Applications can use this field to pass directly to a user  
 93969 printout or prompt, but actions based on its contents should generally be deferred, instead, to  
 93970 the *test* utility.

93971 The output of *ls* (with the **-l** and related options) contains information that logically could be  
 93972 used by utilities such as *chmod* and *touch* to restore files to a known state. However, this  
 93973 information is presented in a format that cannot be used directly by those utilities or be easily  
 93974 translated into a format that can be used. A character has been added to the end of the  
 93975 permissions string so that applications at least have an indication that they may be working in  
 93976 an area they do not understand instead of assuming that they can translate the permissions  
 93977 string into something that can be used. Future versions or related documents may define one or  
 93978 more specific characters to be used based on different standard additional or alternative access  
 93979 control mechanisms.

93980 As with many of the utilities that deal with filenames, the output of *ls* for multiple files or in one  
 93981 of the long listing formats must be used carefully on systems where filenames can contain  
 93982 embedded white space. Systems and system administrators should institute policies and user  
 93983 training to limit the use of such filenames.

93984 The number of disk blocks occupied by the file that it reports varies depending on underlying  
 93985 file system type, block size units reported, and the method of calculating the number of blocks.  
 93986 On some file system types, the number is the actual number of blocks occupied by the file  
 93987 (counting indirect blocks and ignoring holes in the file); on others it is calculated based on the  
 93988 file size (usually making an allowance for indirect blocks, but ignoring holes).

## 93989 EXAMPLES

93990 An example of a small directory tree being fully listed with *ls -laRF a* in the POSIX locale:

```
93991 total 11
93992 drwxr-xr-x  3 fox      prog          64 Jul  4 12:07 ./
93993 drwxrwxrwx  4 fox      prog        3264 Jul  4 12:09 ../
93994 drwxr-xr-x  2 fox      prog          48 Jul  4 12:07 b/
93995 -rwxr--r--  1 fox      prog         572 Jul  4 12:07 foo*

93996 a/b:
93997 total 4
93998 drwxr-xr-x  2 fox      prog          48 Jul  4 12:07 ./
93999 drwxr-xr-x  3 fox      prog          64 Jul  4 12:07 ../
94000 -rw-r--r--  1 fox      prog         700 Jul  4 12:07 bar
```

## 94001 RATIONALE

94002 Some historical implementations of the *ls* utility show all entries in a directory except dot and  
 94003 dot-dot when a superuser invokes *ls* without specifying the **-a** option. When "normal" users  
 94004 invoke *ls* without specifying **-a**, they should not see information about any files with names  
 94005 beginning with a <period> unless they were named as *file* operands.

94006 Implementations are expected to traverse arbitrary depths when processing the **-R** option. The  
 94007 only limitation on depth should be based on running out of physical storage for keeping track of  
 94008 untraversed directories.

94009 The `-1` (one) option was historically found in BSD and BSD-derived implementations only. It is  
 94010 required in this volume of POSIX.1-2008 so that conforming applications might ensure that  
 94011 output is one entry per line, even if the output is to a terminal.

94012 The `-S` option was added in Issue 7, but had been provided by several implementations for  
 94013 many years. The description given in the standard documents historic practice, but does not  
 94014 match much of the documentation that described its behavior. Historical documentation  
 94015 typically described it as something like:

94016 `-S` Sort by size (largest size first) instead of by name. Special character devices (listed  
 94017 last) are sorted by name.

94018 even though the file type was never considered when sorting the output. Character special files  
 94019 do typically sort close to the end of the list because their file size on most implementations is  
 94020 zero. But they are sorted alphabetically with any other files that happen to have the same file  
 94021 size (zero), not sorted separately and added to the end.

94022 Generally, this volume of POSIX.1-2008 is silent about what happens when options are given  
 94023 multiple times. In the cases of `-C`, `-l`, and `-1`, however, it does specify the results of these  
 94024 overlapping options. Since `ls` is one of the most aliased commands, it is important that the  
 94025 implementation perform intuitively. For example, if the alias were:

```
94026 alias ls="ls -C"
```

94027 and the user typed `ls -1`, single-text-column output should result, not an error.

94028 Earlier versions of this standard did not describe the BSD `-A` option (like `-a`, but dot and dot-dot  
 94029 are not written out). It has been added due to widespread implementation.

94030 Implementations may make `-q` the default for terminals to prevent trojan horse attacks on  
 94031 terminals with special escape sequences. This is not required because:

- 94032 • Some control characters may be useful on some terminals; for example, a system might  
 94033 write them as `"\001"` or `"^A"`.
- 94034 • Special behavior for terminals is not relevant to applications portability.

94035 An early proposal specified that the *<optional alternate access method flag>* had to be `'+'` if there  
 94036 was an alternate access method used on the file or `<space>` if there was not. This was changed to  
 94037 be `<space>` if there is not and a single printable character if there is. This was done for three  
 94038 reasons:

- 94039 1. There are historical implementations using characters other than `'+'`.
- 94040 2. There are implementations that vary this character used in that position to distinguish  
 94041 between various alternate access methods in use.
- 94042 3. The standard developers did not want to preclude future specifications that might need a  
 94043 way to specify more than one alternate access method.

94044 Nonetheless, implementations providing a single alternate access method are encouraged to use  
 94045 `'+'`.

94046 Earlier versions of this standard did not have the `-k` option, which meant that the `-s` option  
 94047 could not be used portably as its block size was implementation-defined, and the units used to  
 94048 specify the number of blocks occupied by files in a directory in an `ls -l` listing were fixed as  
 94049 512-byte units. The `-k` option has been added to provide a way for the `-s` option to be used  
 94050 portably, and for consistency it also changes the aforementioned units from 512-byte to  
 94051 1024-byte.

- 94052 The *<date and time>* field in the `-l` format is specified only for the POSIX locale. As noted, the  
 94053 format can be different in other locales. No mechanism for defining this is present in this volume  
 94054 of POSIX.1-2008, as the appropriate vehicle is a messaging system; that is, the format should be  
 94055 specified as a “message”.
- 94056 **FUTURE DIRECTIONS**
- 94057 None.
- 94058 **SEE ALSO**
- 94059 *chmod*, *find*
- 94060 XBD Section 4.4 (on page 108), Chapter 8 (on page 173), Section 12.2 (on page 215), `<sys/stat.h>`  
 94061 XSH *fstatat()*
- 94062 **CHANGE HISTORY**
- 94063 First released in Issue 2.
- 94064 **Issue 5**
- 94065 A second FUTURE DIRECTION is added.
- 94066 **Issue 6**
- 94067 The following new requirements on POSIX implementations derive from alignment with the  
 94068 Single UNIX Specification:
- 94069 • In the `-F` option, other symbols are allowed for other file types.
- 94070 Treatment of symbolic links is added, as defined in the IEEE P1003.2b draft standard.
- 94071 The Open Group Base Resolution bwg2001-010 is applied, adding the `T` and `t` fields as part of  
 94072 the XSI option.
- 94073 **Issue 7**
- 94074 Austin Group Interpretation 1003.1-2001 #101 is applied, clarifying the optional alternate access  
 94075 method flag in the `STDOUT` section.
- 94076 Austin Group Interpretation 1003.1-2001 #128 is applied, clarifying the `DESCRIPTION` and the  
 94077 definition of the `-R` option.
- 94078 Austin Group Interpretation 1003.1-2001 #129 is applied, clarifying the behavior of *ls* when no  
 94079 operands are specified.
- 94080 Austin Group Interpretation 1003.1-2001 #198 is applied, clarifying the requirements for the `-H`  
 94081 option.
- 94082 SD5-XCU-ERN-50 is applied, adding the `-A` option.
- 94083 SD5-XCU-ERN-97 is applied, updating the `SYNOPSIS`.
- 94084 The `-S` option is added from The Open Group Technical Standard, 2006, Extended API Set  
 94085 Part 1.
- 94086 The `-f`, `-m`, `-n`, `-p`, `-s`, and `-x` options are moved from the XSI option to the Base.
- 94087 The description of the `-f`, `-s`, and `-t` options are revised and the `-k` option is added.

94088 **NAME**94089 `m4` — macro processor94090 **SYNOPSIS**94091 `m4 [-s] [-D name[=val]]... [-U name]... file...`94092 **DESCRIPTION**94093 The *m4* utility is a macro processor that shall read one or more text files, process them according  
94094 to their included macro statements, and write the results to standard output.94095 **OPTIONS**94096 The *m4* utility shall conform to XBD Section 12.2 (on page 215), except that the order of the `-D`  
94097 and `-U` options shall be significant, and options can be interspersed with operands.

94098 The following options shall be supported:

94099 `-s` Enable line synchronization output for the *c99* preprocessor phase (that is, `#line`  
94100 directives).94101 `-D name[=val]`94102 Define *name* to *val* or to null if *=val* is omitted.94103 `-U name` Undefine *name*.94104 **OPERANDS**

94105 The following operand shall be supported:

94106 *file* A pathname of a text file to be processed. If no *file* is given, or if it is `'-'`, the  
94107 standard input shall be read.94108 **STDIN**94109 The standard input shall be a text file that is used if no *file* operand is given, or if it is `'-'`.94110 **INPUT FILES**94111 The input file named by the *file* operand shall be a text file.94112 **ENVIRONMENT VARIABLES**94113 The following environment variables shall affect the execution of *m4*:94114 *LANG* Provide a default value for the internationalization variables that are unset or null.  
94115 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
94116 variables used to determine the values of locale categories.)94117 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
94118 internationalization variables.94119 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
94120 characters (for example, single-byte as opposed to multi-byte characters in  
94121 arguments and input files).94122 *LC\_MESSAGES*94123 Determine the locale that should be used to affect the format and contents of  
94124 diagnostic messages written to standard error.94125 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.94126 **ASYNCHRONOUS EVENTS**

94127 Default.

94128 **STDOUT**

94129 The standard output shall be the same as the input files, after being processed for macro  
94130 expansion.

94131 **STDERR**

94132 The standard error shall be used to display strings with the **errprint** macro, macro tracing  
94133 enabled by the **traceon** macro, the defined text for macros written by the **dumpdef** macro, or for  
94134 diagnostic messages.

94135 **OUTPUT FILES**

94136 None.

94137 **EXTENDED DESCRIPTION**

94138 The *m4* utility shall compare each token from the input against the set of built-in and user-  
94139 defined macros. If the token matches the name of a macro, then the token shall be replaced by  
94140 the macro's defining text, if any, and rescanned for matching macro names. Once no portion of  
94141 the token matches the name of a macro, it shall be written to standard output. Macros may have  
94142 arguments, in which case the arguments shall be substituted into the defining text before it is  
94143 rescanned.

94144 Macro calls have the form:

94145 *name*(*arg1*, *arg2*, ..., *argn*)

94146 Macro names shall consist of letters, digits, and underscores, where the first character is not a  
94147 digit. Tokens not of this form shall not be treated as macros.

94148 The application shall ensure that the <left-parenthesis> immediately follows the name of the  
94149 macro. If a token matching the name of a macro is not followed by a <left-parenthesis>, it is  
94150 handled as a use of that macro without arguments.

94151 If a macro name is followed by a <left-parenthesis>, its arguments are the <comma>-separated  
94152 tokens between the <left-parenthesis> and the matching <right-parenthesis>. Unquoted white-  
94153 space characters preceding each argument shall be ignored. All other characters, including  
94154 trailing white-space characters, are retained. <comma> characters enclosed between <left-  
94155 parenthesis> and <right-parenthesis> characters do not delimit arguments.

94156 Arguments are positionally defined and referenced. The string "\$1" in the defining text shall be  
94157 replaced by the first argument. Systems shall support at least nine arguments; only the first nine  
94158 can be referenced, using the strings "\$1" to "\$9", inclusive. The string "\$0" is replaced with  
94159 the name of the macro. The string "\$#" is replaced by the number of arguments as a string. The  
94160 string "\$\*" is replaced by a list of all of the arguments, separated by <comma> characters. The  
94161 string "\$@" is replaced by a list of all of the arguments separated by <comma> characters, and  
94162 each argument is quoted using the current left and right quoting strings. The string "\${"  
94163 produces unspecified behavior.

94164 If fewer arguments are supplied than are in the macro definition, the omitted arguments are  
94165 taken to be null. It is not an error if more arguments are supplied than are in the macro  
94166 definition.

94167 No special meaning is given to any characters enclosed between matching left and right quoting  
94168 strings, but the quoting strings are themselves discarded. By default, the left quoting string  
94169 consists of a grave accent (backquote) and the right quoting string consists of an acute accent  
94170 (single-quote); see also the **changequote** macro.

94171 Comments are written but not scanned for matching macro names; by default, the begin-  
94172 comment string consists of the <number-sign> character and the end-comment string consists of  
94173 a <newline>. See also the **changecom** and **dnl** macros.

- 94174 The *m4* utility shall make available the following built-in macros. They can be redefined, but  
 94175 once this is done the original meaning is lost. Their values shall be null unless otherwise stated.  
 94176 In the descriptions below, the term *defining text* refers to the value of the macro: the second  
 94177 argument to the **define** macro, among other things. Except for the first argument to the **eval**  
 94178 macro, all numeric arguments to built-in macros shall be interpreted as decimal values. The  
 94179 string values produced as the defining text of the **decr**, **divnum**, **incr**, **index**, **len**, and **sysval**  
 94180 built-in macros shall be in the form of a decimal-constant as defined in the C language.
- 94181 **changecom** The **changecom** macro shall set the begin-comment and end-comment strings.  
 94182 With no arguments, the comment mechanism shall be disabled. With a single non-  
 94183 null argument, that argument shall become the begin-comment and the <newline>  
 94184 shall become the end-comment string. With two non-null arguments, the first  
 94185 argument shall become the begin-comment string and the second argument shall  
 94186 become the end-comment string. The behavior is unspecified if either argument is  
 94187 provided but null. Systems shall support comment strings of at least five  
 94188 characters.
- 94189 **changequote** The **changequote** macro shall set the begin-quote and end-quote strings. With no  
 94190 arguments, the quote strings shall be set to the default values (that is, `'). The  
 94191 behavior is unspecified if there is a single argument or either argument is null.  
 94192 With two non-null arguments, the first argument shall become the begin-quote  
 94193 string and the second argument shall become the end-quote string. Systems shall  
 94194 support quote strings of at least five characters.
- 94195 **decr** The defining text of the **decr** macro shall be its first argument decremented by 1. It  
 94196 shall be an error to specify an argument containing any non-numeric characters.  
 94197 The behavior is unspecified if **decr** is not immediately followed by a <left-  
 94198 parenthesis>.
- 94199 **define** The second argument shall become the defining text of the macro whose name is  
 94200 the first argument. It is unspecified whether the **define** macro deletes all prior  
 94201 definitions of the macro named by its first argument or preserves all but the  
 94202 current definition of the macro. The behavior is unspecified if **define** is not  
 94203 immediately followed by a <left-parenthesis>.
- 94204 **defn** The defining text of the **defn** macro shall be the quoted definition (using the  
 94205 current quoting strings) of its arguments. The behavior is unspecified if **defn** is not  
 94206 immediately followed by a <left-parenthesis>.
- 94207 **divert** The *m4* utility maintains nine temporary buffers, numbered 1 to 9, inclusive.  
 94208 When the last of the input has been processed, any output that has been placed in  
 94209 these buffers shall be written to standard output in buffer-numerical order. The  
 94210 **divert** macro shall divert future output to the buffer specified by its argument.  
 94211 Specifying no argument or an argument of 0 shall resume the normal output  
 94212 process. Output diverted to a stream with a negative number shall be discarded.  
 94213 Behavior is implementation-defined if a stream number larger than 9 is specified. It  
 94214 shall be an error to specify an argument containing any non-numeric characters.
- 94215 **divnum** The defining text of the **divnum** macro shall be the number of the current output  
 94216 stream as a string.
- 94217 **dnl** The **dnl** macro shall cause *m4* to discard all input characters up to and including  
 94218 the next <newline>.

|       |                 |                                                                                                                                                                                                                                                                                                                   |
|-------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 94219 | <b>dumpdef</b>  | The <b>dumpdef</b> macro shall write the defined text to standard error for each of the macros specified as arguments, or, if no arguments are specified, for all macros.                                                                                                                                         |
| 94220 |                 |                                                                                                                                                                                                                                                                                                                   |
| 94221 | <b>errprint</b> | The <b>errprint</b> macro shall write its arguments to standard error. The behavior is unspecified if <b>errprint</b> is not immediately followed by a <left-parenthesis>.                                                                                                                                        |
| 94222 |                 |                                                                                                                                                                                                                                                                                                                   |
| 94223 | <b>eval</b>     | The <b>eval</b> macro shall evaluate its first argument as an arithmetic expression, using signed integer arithmetic with at least 32-bit precision. At least the following C language operators shall be supported, with precedence, associativity, and behavior as described in Section 1.1.2.1 (on page 2283): |
| 94224 |                 |                                                                                                                                                                                                                                                                                                                   |
| 94225 |                 |                                                                                                                                                                                                                                                                                                                   |
| 94226 |                 |                                                                                                                                                                                                                                                                                                                   |
| 94227 |                 | ( )                                                                                                                                                                                                                                                                                                               |
| 94228 |                 | unary +                                                                                                                                                                                                                                                                                                           |

| 94250 |                 | Systems shall support octal and hexadecimal numbers as in the ISO C standard.                                                                                                                                                                                                                                     |
| 94251 |                 | The second argument, if specified, shall set the radix for the result; if the argument                                                                                                                                                                                                                            |
| 94252 |                 | is blank or unspecified, the default is 10. Behavior is unspecified if the radix falls                                                                                                                                                                                                                            |
| 94253 |                 | outside the range 2 to 36, inclusive. The third argument, if specified, sets the                                                                                                                                                                                                                                  |
| 94254 |                 | minimum number of digits in the result. Behavior is unspecified if the third                                                                                                                                                                                                                                      |
| 94255 |                 | argument is less than zero. It shall be an error to specify the second or third                                                                                                                                                                                                                                   |
| 94256 |                 | argument containing any non-numeric characters. The behavior is unspecified if                                                                                                                                                                                                                                    |
| 94257 |                 | <b>eval</b> is not immediately followed by a <left-parenthesis>.                                                                                                                                                                                                                                                  |
| 94258 | <b>ifdef</b>    | If the first argument to the <b>ifdef</b> macro is defined, the defining text shall be the                                                                                                                                                                                                                        |
| 94259 |                 | second argument. Otherwise, the defining text shall be the third argument, if                                                                                                                                                                                                                                     |
| 94260 |                 | specified, or the null string, if not. The behavior is unspecified if <b>ifdef</b> is not                                                                                                                                                                                                                         |
| 94261 |                 | immediately followed by a <left-parenthesis>.                                                                                                                                                                                                                                                                     |
| 94262 | <b>ifelse</b>   | The <b>ifelse</b> macro takes three or more arguments. If the first two arguments                                                                                                                                                                                                                                 |
| 94263 |                 | compare as equal strings (after macro expansion of both arguments), the defining                                                                                                                                                                                                                                  |
| 94264 |                 | text shall be the third argument. If the first two arguments do not compare as equal                                                                                                                                                                                                                              |
| 94265 |                 | strings and there are three arguments, the defining text shall be null. If the first two                                                                                                                                                                                                                          |
| 94266 |                 | arguments do not compare as equal strings and there are four or five arguments,                                                                                                                                                                                                                                   |

|       |                    |                                                                                                 |
|-------|--------------------|-------------------------------------------------------------------------------------------------|
| 94267 |                    | the defining text shall be the fourth argument. If the first two arguments do not               |
| 94268 |                    | compare as equal strings and there are six or more arguments, the first three                   |
| 94269 |                    | arguments shall be discarded and processing shall restart with the remaining                    |
| 94270 |                    | arguments. The behavior is unspecified if <b>ifelse</b> is not immediately followed by a        |
| 94271 |                    | <left-parenthesis>.                                                                             |
| 94272 | <b>include</b>     | The defining text for the <b>include</b> macro shall be the contents of the file named by       |
| 94273 |                    | the first argument. It shall be an error if the file cannot be read. The behavior is            |
| 94274 |                    | unspecified if <b>include</b> is not immediately followed by a <left-parenthesis>.              |
| 94275 | <b>incr</b>        | The defining text of the <b>incr</b> macro shall be its first argument incremented by 1. It     |
| 94276 |                    | shall be an error to specify an argument containing any non-numeric characters.                 |
| 94277 |                    | The behavior is unspecified if <b>incr</b> is not immediately followed by a <left-              |
| 94278 |                    | parenthesis>.                                                                                   |
| 94279 | <b>index</b>       | The defining text of the <b>index</b> macro shall be the first character position (as a         |
| 94280 |                    | string) in the first argument where a string matching the second argument begins                |
| 94281 |                    | (zero origin), or -1 if the second argument does not occur. The behavior is                     |
| 94282 |                    | unspecified if <b>index</b> is not immediately followed by a <left-parenthesis>.                |
| 94283 | <b>len</b>         | The defining text of the <b>len</b> macro shall be the length (as a string) of the first        |
| 94284 |                    | argument. The behavior is unspecified if <b>len</b> is not immediately followed by a            |
| 94285 |                    | <left-parenthesis>.                                                                             |
| 94286 | <b>m4exit</b>      | Exit from the <i>m4</i> utility. If the first argument is specified, it is the exit code. The   |
| 94287 |                    | default is zero. It shall be an error to specify an argument containing any non-                |
| 94288 |                    | numeric characters.                                                                             |
| 94289 | <b>m4wrap</b>      | The first argument shall be processed when EOF is reached. If the <b>m4wrap</b> macro           |
| 94290 |                    | is used multiple times, the arguments specified shall be processed in the order in              |
| 94291 |                    | which the <b>m4wrap</b> macros were processed. The behavior is unspecified if <b>m4wrap</b>     |
| 94292 |                    | is not immediately followed by a <left-parenthesis>.                                            |
| 94293 | OB <b>maketemp</b> | The defining text shall be the first argument, with any trailing 'X' characters                 |
| 94294 |                    | replaced with the current process ID as a string. The behavior is unspecified if                |
| 94295 |                    | <b>maketemp</b> is not immediately followed by a <left-parenthesis>.                            |
| 94296 | <b>mkstemp</b>     | The first argument shall be taken as a template for creating an empty file, with                |
| 94297 |                    | trailing 'X' characters replaced with characters from the portable filename                     |
| 94298 |                    | character set. The behavior is unspecified if the first argument does not end in at             |
| 94299 |                    | least six 'X' characters. If a temporary file is successfully created, then the                 |
| 94300 |                    | defining text of the macro shall be the name of the new file. The user ID of the file           |
| 94301 |                    | shall be set to the effective user ID of the process. The group ID of the file shall be         |
| 94302 |                    | set to the group ID of the file's parent directory or to the effective group ID of the          |
| 94303 |                    | process. The file access permission bits are set such that only the owner can both              |
| 94304 |                    | read and write the file, regardless of the current <i>umask</i> of the process. If a file could |
| 94305 |                    | not be created, the defining text of the macro shall be the empty string. The                   |
| 94306 |                    | behavior is unspecified if <b>mkstemp</b> is not immediately followed by a <left-               |
| 94307 |                    | parenthesis>.                                                                                   |
| 94308 | <b>popdef</b>      | The <b>popdef</b> macro shall delete the current definition of its arguments, replacing         |
| 94309 |                    | that definition with the previous one. If there is no previous definition, the macro            |
| 94310 |                    | is undefined. The behavior is unspecified if <b>popdef</b> is not immediately followed by       |
| 94311 |                    | a <left-parenthesis>.                                                                           |

| 94322 | <b>substr</b>   | The defining text for the <b>substr</b> macro shall be the substring of the first argument beginning at the zero-offset character position specified by the second argument. The third argument, if specified, shall be the number of characters to select; if not specified, the characters from the starting point to the end of the first argument shall become the defining text. It shall not be an error to specify a starting point beyond the end of the first argument and the defining text shall be null. It shall be an error to specify an argument containing any non-numeric characters. The behavior is unspecified if <b>substr</b> is not immediately followed by a <left-parenthesis>. |

| 94353 | <b>undivert</b> | The <b>undivert</b> macro shall cause immediate output of any text in temporary buffers named as arguments, or all temporary buffers if no arguments are specified. Buffers can be undiverted into other temporary buffers. Undiverting shall discard the contents of the temporary buffer. The behavior is unspecified if an argument contains any non-numeric characters.                                                                                                                                                                                                                                                                                                                               |
| 94354 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 94355 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 94356 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 94357 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

94358 **EXIT STATUS**

94359 The following exit values shall be returned:

94360 0 Successful completion.

94361 &gt;0 An error occurred

94362 If the **m4exit** macro is used, the exit value can be specified by the input file.94363 **CONSEQUENCES OF ERRORS**

94364 Default.

94365 **APPLICATION USAGE**94366 The **defn** macro is useful for renaming macros, especially built-ins.

94367 Since **eval** defers to the ISO C standard, some operations have undefined behavior. In some  
 94368 implementations, division or remainder by zero cause a fatal signal, even if the division occurs  
 94369 on the short-circuited branch of " && " or " || ". Any operation that overflows in signed  
 94370 arithmetic produces undefined behavior. Likewise, using the **shift** operators with a shift amount  
 94371 that is not positive and smaller than the precision is undefined, as is shifting a negative number  
 94372 to the right. Historically, not all implementations obeyed C-language precedence rules: '~' and  
 94373 '! ' were lower than '=='; '==' and '! =' were not lower than '<'; and '| ' was not lower  
 94374 than '^ ' ; the liberal use of " ( ) " can force the desired precedence even with these non-  
 94375 compliant implementations. Furthermore, some traditional implementations treated '^ ' as an  
 94376 exponentiation operator, although most implementations now use " \* \* " as an extension for this  
 94377 purpose.

94378 When a macro has been multiply defined via the **pushdef** macro, it is unspecified whether the  
 94379 **define** macro will alter only the most recent definition (as though by **popdef** and **pushdef**), or  
 94380 replace the entire stack of definitions with a single definition (as though by **undefine** and  
 94381 **pushdef**). An application desiring particular behavior for the **define** macro in this case can  
 94382 redefine it accordingly.

94383 Applications should use the **mkstemp** macro instead of the obsolescent **maketemp** macro for  
 94384 creating temporary files.

94385 **EXAMPLES**94386 If the file **m4src** contains the lines:

```
94387 The value of 'VER' is "VER".
94388 #ifdef('VER', 'VER' is defined to be VER., VER is not defined.)
94389 #ifelse(VER, 1, 'VER' is 'VER'.)
94390 #ifelse(VER, 2, 'VER' is 'VER.', 'VER' is not 2.)
94391 #end
```

94392 then the command

94393 `m4 m4src`

94394 or the command:

94395 `m4 -U VER m4src`

94396 produces the output:

```
94397 The value of VER is "VER".
94398 VER is not defined.
94399 VER is not 2.
94400 #end
```

94401 The command:

94402 `m4 -D VER m4src`

94403 produces the output:

94404 The value of VER is "".

94405 VER is defined to be .

94406 VER is not 2.

94407 end

94408 The command:

94409 `m4 -D VER=1 m4src`

94410 produces the output:

94411 The value of VER is "1".

94412 VER is defined to be 1.

94413 VER is 1.

94414 VER is not 2.

94415 end

94416 The command:

94417 `m4 -D VER=2 m4src`

94418 produces the output:

94419 The value of VER is "2".

94420 VER is defined to be 2.

94421 VER is 2.

94422 end

#### 94423 RATIONALE

94424 Historic System V-based behavior treated "\${" in a macro definition as two literal characters.  
 94425 However, this sequence is left unspecified so that implementations may offer extensions such as  
 94426 "\$ {11}" meaning the eleventh positional parameter. Macros can still be defined with  
 94427 appropriate uses of nested quoting to result in a literal "\${" in the output after rescanning  
 94428 removes the nested quotes.

94429 In the `translit` built-in, historic System V-based behavior treated '-' as a literal; GNU behavior  
 94430 treats it as a range. This version of the standard allows either behavior.

#### 94431 FUTURE DIRECTIONS

94432 None.

#### 94433 SEE ALSO

#### 94436 CHANGE HISTORY

94437 First released in Issue 2.

#### 94438 Issue 5

94439 The phrase "the defined text for macros written by the `dumpdef` macro" is added to the  
 94440 description of `STDERR`, and the description of `dumpdef` is updated to indicate that output is  
 94441 written to standard error. The description of `eval` is updated to indicate that the list of excluded  
 94442 C operators excludes unary '&' and '.'. In the description of `ifdef`, the phrase "and it is not

- 94443 defined to be zero" is deleted.
- 94444 **Issue 6**
- 94445 In the EXTENDED DESCRIPTION, the **eval** text is updated to include a ' & ' character in the
- 94446 excepted list.
- 94447 The EXTENDED DESCRIPTION of **divert** is updated to clarify that there are only nine diversion
- 94448 buffers.
- 94449 The normative text is reworded to avoid use of the term "must" for application requirements.
- 94450 The Open Group Base Resolution bwg2000-006 is applied.
- 94451 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/31 is applied, replacing the EXAMPLES
- 94452 section.
- 94453 **Issue 7**
- 94454 Austin Group Interpretation 1003.1-2001 #117 is applied, marking the **maketemp** macro
- 94455 obsolescent and adding a new **mkstemp** macro.
- 94456 Austin Group Interpretation 1003.1-2001 #207 is applied, clarifying the handling of white-space
- 94457 characters that precede or trail any macro arguments.
- 94458 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not
- 94459 apply (options can be interspersed with operands).
- 94460 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 94461 SD5-XCU-ERN-99 is applied, clarifying the definition of the **divert** macro in the EXTENDED
- 94462 DESCRIPTION.
- 94463 SD5-XCU-ERN-100 is applied, clarifying the definition of the **syscmd** macro in the EXTENDED
- 94464 DESCRIPTION.
- 94465 SD5-XCU-ERN-101 is applied, clarifying the definition of the **undivert** macro in the EXTENDED
- 94466 DESCRIPTION.
- 94467 SD5-XCU-ERN-111 is applied to the EXTENDED DESCRIPTION, clarifying that the string "{ "
- 94468 produces unspecified behavior.
- 94469 SD5-XCU-ERN-112 is applied, updating the **changequote** macro.
- 94470 SD5-XCU-ERN-118 is applied, clarifying the definition of the **define** macro in the EXTENDED
- 94471 DESCRIPTION and APPLICATION USAGE sections.
- 94472 SD5-XCU-ERN-119 is applied, clarifying the definition of the **translit** macro in the EXTENDED
- 94473 DESCRIPTION and RATIONALE sections.
- 94474 SD5-XCU-ERN-130, SD5-XCU-ERN-131, and SD5-XCU-ERN-137 are applied.
- 94475 The *m4* utility is moved from the XSI option to the Base.

**mailx**

Utilities

94476 **NAME**

94477 mailx — process messages

94478 **SYNOPSIS**94479 **Send Mode**94480 mailx [-s *subject*] *address*...94481 **Receive Mode**

94482 UP mailx -e

94483 mailx [-HiNn] [-F] [-u *user*]94484 mailx -f [-HiNn] [-F] [*file*]94485 **DESCRIPTION**

94486 The *mailx* utility provides a message sending and receiving facility. It has two major modes,  
 94487 selected by the options used: Send Mode and Receive Mode.

94488 On systems that do not support the User Portability Utilities option, an application using *mailx*  
 94489 shall have the ability to send messages in an unspecified manner (Send Mode). Unless the first  
 94490 character of one or more lines is <tilde> ('~'), all characters in the input message shall appear in  
 94491 the delivered message, but additional characters may be inserted in the message before it is  
 94492 retrieved.

94493 UP On systems supporting the User Portability Utilities option, mail-receiving capabilities and other  
 94494 interactive features, Receive Mode, described below, also shall be enabled.

94495 **Send Mode**

94496 Send Mode can be used by applications or users to send messages from the text in standard  
 94497 input.

94498 UP **Receive Mode**

94499 Receive Mode is more oriented towards interactive users. Mail can be read and sent in this  
 94500 interactive mode.

94501 When reading mail, *mailx* provides commands to facilitate saving, deleting, and responding to  
 94502 messages. When sending mail, *mailx* allows editing, reviewing, and other modification of the  
 94503 message as it is entered.

94504 Incoming mail shall be stored in one or more unspecified locations for each user, collectively  
 94505 called the system *mailbox* for that user. When *mailx* is invoked in Receive Mode, the system  
 94506 mailbox shall be the default place to find new mail. As messages are read, they shall be marked  
 94507 to be moved to a secondary file for storage, unless specific action is taken. This secondary file is  
 94508 called the **mbox** and is normally located in the directory referred to by the *HOME* environment  
 94509 variable (see *MBOX* in the ENVIRONMENT VARIABLES section for a description of this file).  
 94510 Messages shall remain in this file until explicitly removed. When the **-f** option is used to read  
 94511 mail messages from secondary files, messages shall be retained in those files unless specifically  
 94512 removed. All three of these locations—system mailbox, **mbox**, and secondary file—are referred  
 94513 to in this section as simply “mailboxes”, unless more specific identification is required.

94514 **OPTIONS**

94515 The *mailx* utility shall conform to XBD [Section 12.2](#) (on page 215).

94516 The following options shall be supported. (Only the `-s subject` option shall be required on all  
94517 systems. The other options are required only on systems supporting the User Portability Utilities  
94518 option.)

94519 UP **-e** Test for the presence of mail in the system mailbox. The *mailx* utility shall write  
94520 nothing and exit with a successful return code if there is mail to read.

94521 UP **-f** Read messages from the file named by the *file* operand instead of the system  
94522 mailbox. (See also **folder**.) If no *file* operand is specified, read messages from **mbox**  
94523 instead of the system mailbox.

94524 UP **-F** Record the message in a file named after the first recipient. The name is the login-  
94525 name portion of the address found first on the **To:** line in the mail header.  
94526 Overrides the **record** variable, if set (see [Internal Variables in mailx](#), on page 2889).

94527 UP **-H** Write a header summary only.

94528 UP **-i** Ignore interrupts. (See also **ignore**.)

94529 UP **-n** Do not initialize from the system default start-up file. See the EXTENDED  
94530 DESCRIPTION section.

94531 UP **-N** Do not write an initial header summary.

94532 **-s subject** Set the **Subject** header field to *subject*. All characters in the *subject* string shall  
94533 appear in the delivered message. The results are unspecified if *subject* is longer  
94534 than {LINE\_MAX} – 10 bytes or contains a <newline>.

94535 UP **-u user** Read the system mailbox of the login name *user*. This shall only be successful if  
94536 the invoking user has appropriate privileges to read the system mailbox of that  
94537 user.

94538 **OPERANDS**

94539 The following operands shall be supported:

94540 *address* Addressee of message. When **-n** is specified and no user start-up files are accessed  
94541 (see the EXTENDED DESCRIPTION section), the user or application shall ensure  
94542 this is an address to pass to the mail delivery system. Any system or user start-up  
94543 files may enable aliases (see **alias** under [Commands in mailx](#), on page 2892) that  
94544 may modify the form of *address* before it is passed to the mail delivery system.

94545 UP *file* A pathname of a file to be read instead of the system mailbox when **-f** is specified.  
94546 The meaning of the *file* option-argument shall be affected by the contents of the  
94547 **folder** internal variable; see [Internal Variables in mailx](#) (on page 2889).

94548 **STDIN**

94549 When *mailx* is invoked in Send Mode (the first synopsis line), standard input shall be the  
94550 UP message to be delivered to the specified addresses. When in Receive Mode, user commands  
94551 shall be accepted from *stdin*. If the User Portability Utilities option is not supported, standard  
94552 input lines beginning with a <tilde> ('~') character produce unspecified results.

94553 UP If the User Portability Utilities option is supported, then in both Send and Receive Modes,  
94554 standard input lines beginning with the escape character (usually <tilde> ('~')) shall affect  
94555 processing as described in [Command Escapes in mailx](#) (on page 2901).

## 94556 INPUT FILES

94557 When *mailx* is used as described by this volume of POSIX.1-2008, the *file* option-argument (see  
 94558 the `-f` option) and the **mbox** shall be text files containing mail messages, formatted as described  
 94559 in the OUTPUT FILES section. The nature of the system mailbox is unspecified; it need not be a  
 94560 file.

## 94561 ENVIRONMENT VARIABLES

94562 UP Some of the functionality described in this section shall be provided on implementations that  
 94563 support the User Portability Utilities option as described in the text, and is not further shaded  
 94564 for this option.

94565 The following environment variables shall affect the execution of *mailx*:

94566 *DEAD* Determine the pathname of the file in which to save partial messages in case of  
 94567 interrupts or delivery errors. The default shall be **dead.letter** in the directory  
 94568 named by the *HOME* variable. The behavior of *mailx* in saving partial messages is  
 94569 unspecified if the User Portability Utilities option is not supported and *DEAD* is  
 94570 not defined with the value **/dev/null**.

94571 *EDITOR* Determine the name of a utility to invoke when the **edit** (see [Commands in mailx](#),  
 94572 on page 2892) or **~e** (see [Command Escapes in mailx](#), on page 2901) command is  
 94573 XSI used. The default editor is unspecified. On XSI-conformant systems it is *ed*. The  
 94574 effects of this variable are unspecified if the User Portability Utilities option is not  
 94575 supported.

94576 *HOME* Determine the pathname of the user's home directory.

94577 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 94578 (See [XBD Section 8.2](#) (on page 174) for the precedence of internationalization  
 94579 variables used to determine the values of locale categories.)

94580 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 94581 internationalization variables.

94582 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 94583 characters (for example, single-byte as opposed to multi-byte characters in  
 94584 arguments and input files) and the handling of case-insensitive address and  
 94585 header-field comparisons.

94586 *LC\_TIME* This variable may determine the format and contents of the date and time strings  
 94587 written by *mailx*. This volume of POSIX.1-2008 specifies the effects of this variable  
 94588 only for systems supporting the User Portability Utilities option.

94589 *LC\_MESSAGES*

94590 Determine the locale that should be used to affect the format and contents of  
 94591 diagnostic messages written to standard error and informative messages written to  
 94592 standard output.

94593 *LISTER* Determine a string representing the command for writing the contents of the  
 94594 **folder** directory to standard output when the **folders** command is given (see  
 94595 **folders** in [Commands in mailx](#), on page 2892). Any string acceptable as a  
 94596 *command\_string* operand to the *sh -c* command shall be valid. If this variable is null  
 94597 or not set, the output command shall be *ls*. The effects of this variable are  
 94598 unspecified if the User Portability Utilities option is not supported.

94599 *MAILRC* Determine the pathname of the start-up file. The default shall be **.mailrc** in the  
 94600 directory referred to by the *HOME* environment variable. The behavior of *mailx* is  
 94601 unspecified if the User Portability Utilities option is not supported and *MAILRC* is

|       |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 94644 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

- 94645 UP            b. If the interrupt was received while sending mail, either when in Receive Mode or  
 94646            in Send Mode, a message shall be written, and another subsequent interrupt, with  
 94647            no other intervening characters typed, shall be required to abort the mail message.  
 94648 UP            If in Receive Mode and another interrupt is received, a command-mode prompt  
 94649            shall be written. If in Send Mode and another interrupt is received, *mailx* shall  
 94650            terminate with a non-zero status.

94651            In both cases listed in item b, if the message is not empty:

- 94652 UP            i. If **save** is enabled and the file named by *DEAD* can be created, the message  
 94653            shall be written to the file named by *DEAD*. If the file exists, the message  
 94654            shall be written to replace the contents of the file.
- 94655 UP            ii. If **save** is not enabled, or the file named by *DEAD* cannot be created, the  
 94656            message shall not be saved.

94657            The *mailx* utility shall take the standard action for all other signals.

#### 94658 **STDOUT**

94659            In command and input modes, all output, including prompts and messages, shall be written to  
 94660            standard output.

#### 94661 **STDERR**

94662            The standard error shall be used only for diagnostic messages.

#### 94663 **OUTPUT FILES**

94664            Various *mailx* commands and command escapes can create or add to files, including the **mbox**,  
 94665            the dead-letter file, and secondary mailboxes. When *mailx* is used as described in this volume of  
 94666            POSIX.1-2008, these files shall be text files, formatted as follows:

94667            line beginning with **From<space>**  
 94668            [one or more *header-lines*; see [Commands in mailx](#) (on page 2892)]  
 94669            *empty line*  
 94670            [zero or more *body lines*  
 94671            *empty line*]  
 94672            [line beginning with **From<space>...]**

94673            where each message begins with the **From <space>** line shown, preceded by the beginning of  
 94674            the file or an empty line. (The **From <space>** line is considered to be part of the message header,  
 94675            but not one of the header-lines referred to in [Commands in mailx](#) (on page 2892); thus, it shall  
 94676            not be affected by the **discard**, **ignore**, or **retain** commands.) The formats of the remainder of the  
 94677            **From <space>** line and any additional header lines are unspecified, except that none shall be  
 94678            empty. The format of a message body line is also unspecified, except that no line following an  
 94679            empty line shall start with **From <space>**; *mailx* shall modify any such user-entered message  
 94680            body lines (following an empty line and beginning with **From <space>**) by adding one or more  
 94681            characters to precede the 'F'; it may add these characters to **From <space>** lines that are not  
 94682            preceded by an empty line.

94683            When a message from the system mailbox or entered by the user is not a text file, it is  
 94684            implementation-defined how such a message is stored in files written by *mailx*.

#### 94685 **EXTENDED DESCRIPTION**

94686 UP            The functionality in the entire EXTENDED DESCRIPTION section shall be provided on  
 94687            implementations supporting the User Portability Utilities option. The functionality described in  
 94688            this section shall be provided on implementations that support the User Portability Utilities  
 94689            option (and the rest of this section is not further shaded for this option).

94690 The *mailx* utility need not support for all character encodings in all circumstances. For example,  
 94691 inter-system mail may be restricted to 7-bit data by the underlying network, 8-bit data need not  
 94692 be portable to non-internationalized systems, and so on. Under these circumstances, it is  
 94693 recommended that only characters defined in the ISO/IEC 646:1991 standard International  
 94694 Reference Version (equivalent to ASCII) 7-bit range of characters be used.

94695 When *mailx* is invoked using one of the Receive Mode synopsis forms, it shall write a page of  
 94696 header-summary lines (if `-N` was not specified and there are messages, see below), followed by  
 94697 a prompt indicating that *mailx* can accept regular commands (see [Commands in mailx](#), on page  
 94698 2892); this is termed *command mode*. The page of header-summary lines shall contain the first  
 94699 new message if there are new messages, or the first unread message if there are unread  
 94700 messages, or the first message. When *mailx* is invoked using the Send Mode synopsis and  
 94701 standard input is a terminal, if no subject is specified on the command line and the `asksub`  
 94702 variable is set, a prompt for the subject shall be written. At this point, *mailx* shall be in input  
 94703 mode. This input mode shall also be entered when using one of the Receive Mode synopsis  
 94704 forms and a reply or new message is composed using the `reply`, `Reply`, `followup`, `Followup`, or  
 94705 `mail` commands and standard input is a terminal. When the message is typed and the end of the  
 94706 message is encountered, the message shall be passed to the mail delivery software. Commands  
 94707 can be entered by beginning a line with the escape character (by default, `<tilde>` (`' ~ '`)) followed  
 94708 by a single command letter and optional arguments. See [Commands in mailx](#) (on page 2892) for  
 94709 a summary of these commands. It is unspecified what effect these commands will have if  
 94710 standard input is not a terminal when a message is entered using either the Send Mode  
 94711 synopsis, or the Read Mode commands `reply`, `Reply`, `followup`, `Followup`, or `mail`.

94712 **Note:** For notational convenience, this section uses the default escape character, `<tilde>`, in all  
 94713 references and examples.

94714 At any time, the behavior of *mailx* shall be governed by a set of environmental and internal  
 94715 variables. These are flags and valued parameters that can be set and cleared via the *mailx* `set`  
 94716 and `unset` commands.

94717 Regular commands are of the form:

94718 `[command] [msglist] [argument ...]`

94719 If no *command* is specified in command mode, `next` shall be assumed. In input mode, commands  
 94720 shall be recognized by the escape character, and lines not treated as commands shall be taken as  
 94721 input for the message.

94722 In command mode, each message shall be assigned a sequential number, starting with 1.

94723 All messages have a state that shall affect how they are displayed in the header summary and  
 94724 how they are retained or deleted upon termination of *mailx*. There is at any time the notion of a  
 94725 *current* message, which shall be marked by a `'>'` at the beginning of a line in the header  
 94726 summary. When *mailx* is invoked using one of the Receive Mode synopsis forms, the current  
 94727 message shall be the first new message, if there is a new message, or the first unread message if  
 94728 there is an unread message, or the first message if there are any messages, or unspecified if there  
 94729 are no messages in the mailbox. Each command that takes an optional list of messages (*msglist*)  
 94730 or an optional single message (*message*) on which to operate shall leave the current message set  
 94731 to the highest-numbered message of the messages specified, unless the command deletes  
 94732 messages, in which case the current message shall be set to the first undeleted message (that is, a  
 94733 message not in the deleted state) after the highest-numbered message deleted by the command,  
 94734 if one exists, or the first undeleted message before the highest-numbered message deleted by the  
 94735 command, if one exists, or to an unspecified value if there are no remaining undeleted messages.  
 94736 All messages shall be in one of the following states:

## mailx

## Utilities

|       |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 94737 | <i>new</i>       | The message is present in the system mailbox and has not been viewed by the user or moved to any other state. Messages in state <i>new</i> when <i>mailx</i> quits shall be retained in the system mailbox.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 94738 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 94739 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 94740 | <i>unread</i>    | The message has been present in the system mailbox for more than one invocation of <i>mailx</i> and has not been viewed by the user or moved to any other state. Messages in state <i>unread</i> when <i>mailx</i> quits shall be retained in the system mailbox.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 94741 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 94742 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 94743 | <i>read</i>      | The message has been processed by one of the following commands: <b>~f</b> , <b>~m</b> , <b>~F</b> , <b>M</b> , <b>copy</b> , <b>mbox</b> , <b>next</b> , <b>pipe</b> , <b>print</b> , <b>Print</b> , <b>top</b> , <b>type</b> , <b>Type</b> , <b>undelete</b> . The <b>delete</b> , <b>dp</b> , and <b>dt</b> commands may also cause the next message to be marked as <i>read</i> , depending on the value of the <b>autoprint</b> variable. Messages that are in the system mailbox and in state <i>read</i> when <i>mailx</i> quits shall be saved in the <b>mbox</b> , unless the internal variable <b>hold</b> was set. Messages that are in the <b>mbox</b> or in a secondary mailbox and in state <i>read</i> when <i>mailx</i> quits shall be retained in their current location. |

| 94750 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 94751 | <i>deleted</i>   | The message has been processed by one of the following commands: <b>delete</b> , <b>dp</b> , <b>dt</b> . Messages in state <i>deleted</i> when <i>mailx</i> quits shall be deleted. Deleted messages shall be ignored until <i>mailx</i> quits or changes mailboxes or they are specified to the <b>undelete</b> command; for example, the message specification <i>/string</i> shall only search the subject lines of messages that have not yet been deleted, unless the command operating on the list of messages is <b>undelete</b> . No deleted message or deleted message header shall be displayed by any <i>mailx</i> command other than <b>undelete</b> .                                                                                                                         |

|-------|----------------|--------------------------------------------------------------------------------------------------------------|
| 94779 | <i>n-m</i>     | An inclusive range of message numbers.                                                                       |
| 94780 | <i>address</i> | All messages from <i>address</i> ; any address as shown in a header summary shall be matchable in this form. |
| 94781 |                |                                                                                                              |
| 94782 | <i>/string</i> | All messages with <i>string</i> in the subject line (case ignored).                                          |
| 94783 | <i>:c</i>      | All messages of type <i>c</i> , where <i>c</i> shall be one of:                                              |
| 94784 | <i>d</i>       | Deleted messages.                                                                                            |
| 94785 | <i>n</i>       | New messages.                                                                                                |
| 94786 | <i>o</i>       | Old messages (any not in state <i>read</i> or <i>new</i> ).                                                  |
| 94787 | <i>r</i>       | Read messages.                                                                                               |
| 94788 | <i>u</i>       | Unread messages.                                                                                             |

94789 Other commands take an optional message (*message*) on which to operate, which defaults to the  
 94790 current message. All of the forms allowed for *msglist* are also allowed for *message*, but if more  
 94791 than one message is specified, only the first shall be operated on.

94792 Other arguments are usually arbitrary strings whose usage depends on the command involved.

### 94793 **Start-Up in mailx**

94794 At start-up time, *mailx* shall take the following steps in sequence:

- 94795 1. Establish all variables at their stated default values.
- 94796 2. Process command line options, overriding corresponding default values.
- 94797 3. Import any of the *DEAD*, *EDITOR*, *MBOX*, *LISTER*, *PAGER*, *SHELL*, or *VISUAL* variables  
 94798 that are present in the environment, overriding the corresponding default values.
- 94799 4. Read *mailx* commands from an unspecified system start-up file, unless the *-n* option is  
 94800 given, to initialize any internal *mailx* variables and aliases.
- 94801 5. Process the start-up file of *mailx* commands named in the user *MAILRC* variable.

94802 Most regular *mailx* commands are valid inside start-up files, the most common use being to set  
 94803 up initial display options and alias lists. The following commands shall be invalid in the start-up  
 94804 file: **!**, **edit**, **hold**, **mail**, **preserve**, **reply**, **Reply**, **shell**, **visual**, **Copy**, **followup**, and **Followup**.  
 94805 Any errors in the start-up file shall either cause *mailx* to terminate with a diagnostic message and  
 94806 a non-zero status or to continue after writing a diagnostic message, ignoring the remainder of  
 94807 the lines in the start-up file.

94808 A blank line in a start-up file shall be ignored.

### 94809 **Internal Variables in mailx**

94810 The following variables are internal *mailx* variables. Each internal variable can be set via the  
 94811 *mailx set* command at any time. The **unset** and **set no name** commands can be used to erase  
 94812 variables.

94813 In the following list, variables shown as:

94814 *variable*

94815 represent Boolean values. Variables shown as:

94816 *variable=value*

## mailx

## Utilities

- 94817 shall be assigned string or numeric values. For string values, the rules in [Commands in mailx](#)  
 94818 (on page 2892) concerning filenames and quoting shall also apply.
- 94819 The defaults specified here may be changed by the unspecified system start-up file unless the  
 94820 user specifies the `-n` option.
- 94821 **allnet** All network names whose login name components match shall be treated as  
 94822 identical. This shall cause the `msglist` message specifications to behave similarly.  
 94823 The default shall be **noallnet**. See also the **alternates** command and the **metoo**  
 94824 variable.
- 94825 **append** Append messages to the end of the **mbox** file upon termination instead of placing  
 94826 them at the beginning. The default shall be **noappend**. This variable shall not  
 94827 affect the **save** command when saving to **mbox**.
- 94828 **ask, asksub** Prompt for a subject line on outgoing mail if one is not specified on the command  
 94829 line with the `-s` option. The **ask** and **asksub** forms are synonyms; the system shall  
 94830 refer to **asksub** and **noasksub** in its messages, but shall accept **ask** and **noask** as  
 94831 user input to mean **asksub** and **noasksub**. It shall not be possible to set both **ask**  
 94832 and **noasksub**, or **noask** and **asksub**. The default shall be **asksub**, but no  
 94833 prompting shall be done if standard input is not a terminal.
- 94834 **askbcc** Prompt for the blind copy list. The default shall be **noaskbcc**.
- 94835 **askcc** Prompt for the copy list. The default shall be **noaskcc**.
- 94836 **autoprint** Enable automatic writing of messages after **delete** and **undelete** commands. The  
 94837 default shall be **noautoprint**.
- 94838 **bang** Enable the special-case treatment of <exclamation-mark> characters ('!') in  
 94839 escape command lines; see the **escape** command and [Command Escapes in mailx](#)  
 94840 (on page 2901). The default shall be **nobang**, disabling the expansion of '!' in the  
 94841 `command` argument to the `!` command and the `~!command` escape.
- 94842 **cmd=command**  
 94843 Set the default command to be invoked by the **pipe** command. The default shall be  
 94844 **nocmd**.
- 94845 **crt=number** Pipe messages having more than `number` lines through the command specified by  
 94846 the value of the `PAGER` variable. The default shall be **nocrt**. If it is set to null, the  
 94847 value used is implementation-defined.
- 94848 XSI **debug** Enable verbose diagnostics for debugging. Messages are not delivered. The  
 94849 default shall be **nodebug**.
- 94850 **dot** When **dot** is set, a <period> on a line by itself during message input from a  
 94851 terminal shall also signify end-of-file (in addition to normal end-of-file). The  
 94852 default shall be **nodot**. If **ignoreeof** is set (see below), a setting of **nodot** shall be  
 94853 ignored and the <period> is the only method to terminate input mode.
- 94854 **escape=c** Set the command escape character to be the character 'c'. By default, the  
 94855 command escape character shall be <tilde>. If **escape** is unset, <tilde> shall be  
 94856 used; if it is set to null, command escaping shall be disabled.
- 94857 **flipr** Reverse the meanings of the **R** and **r** commands. The default shall be **noflipr**.
- 94858 **folder=directory**  
 94859 The default directory for saving mail files. User-specified filenames beginning with  
 94860 a <plus-sign> ('+') shall be expanded by preceding the filename with this

|       |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 94861 |                            | directory name to obtain the real pathname. If <i>directory</i> does not start with a <slash> (' / '), the contents of <i>HOME</i> shall be prefixed to it. The default shall be <b>nofolder</b> . If <b>folder</b> is unset or set to null, user-specified filenames beginning with '+' shall refer to files in the current directory that begin with the literal '+' character. See also <b>outfolder</b> below. The <b>folder</b> value need not affect the processing of the files named in <i>MBOX</i> and <i>DEAD</i> . |
| 94862 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 94863 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 94864 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 94865 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 94866 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 94867 | <b>header</b>              | Enable writing of the header summary when entering <i>mailx</i> in Receive Mode. The default shall be <b>header</b> .                                                                                                                                                                                                                                                                                                                                                                                                         |
| 94868 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 94869 | <b>hold</b>                | Preserve all messages that are read in the system mailbox instead of putting them in the <b>mbox</b> save file. The default shall be <b>nohold</b> .                                                                                                                                                                                                                                                                                                                                                                          |
| 94870 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 94871 | <b>ignore</b>              | Ignore interrupts while entering messages. The default shall be <b>noignore</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 94872 | <b>ignoreeof</b>           | Ignore normal end-of-file during message input. Input can be terminated only by entering a <period> (' . ') on a line by itself or by the ~. command escape. The default shall be <b>noignoreeof</b> . See also <b>dot</b> above.                                                                                                                                                                                                                                                                                             |

| 94902 | <b>save</b>                | Enable saving of messages in the dead-letter file on interrupt or delivery error. See the variable <i>DEAD</i> for the location of the dead-letter file. The default shall be <b>save</b> .                                                                                                                                                                                                                                                                                                                                   |
| 94903 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

- 94904 **screen=number**
- 94905 Set the number of lines in a screenful of headers for the **headers** and **z** commands.
- 94906 If **screen** is not specified, a value based on the terminal type identified by the
- 94907 *TERM* environment variable, the window size, the baud rate, or some combination
- 94908 of these shall be used.
- 94909 **sendwait** Wait for the background mailer to finish before returning. The default shall be
- 94910 **nosendwait**.
- 94911 **showto** When the sender of the message was the user who is invoking *mailx*, write the
- 94912 information from the **To:** line instead of the **From:** line in the header summary. The
- 94913 default shall be **noshowto**.
- 94914 **sign=string** Set the variable inserted into the text of a message when the **~a** command escape is
- 94915 given. The default shall be **nosign**. The character sequences **'\t'** and **'\n'** shall
- 94916 be recognized in the variable as **<tab>** and **<newline>** characters, respectively. (See
- 94917 also **~i** in **Command Escapes in mailx** (on page 2901).)
- 94918 **Sign=string** Set the variable inserted into the text of a message when the **~A** command escape is
- 94919 given. The default shall be **noSign**. The character sequences **'\t'** and **'\n'** shall
- 94920 be recognized in the variable as **<tab>** and **<newline>** characters, respectively.
- 94921 **toplines=number**
- 94922 Set the number of lines of the message to write with the **top** command. The default
- 94923 shall be 5.
- 94924 **Commands in mailx**
- 94925 The following *mailx* commands shall be provided. In the following list, header refers to lines
- 94926 from the message header, as shown in the OUTPUT FILES section. Header-line refers to lines
- 94927 within the header that begin with one or more non-white-space characters, immediately
- 94928 followed by a **<colon>** and white space and continuing until the next line beginning with a non-
- 94929 white-space character or an empty line. Header-field refers to the portion of a header line prior
- 94930 to the first **<colon>** in that line.
- 94931 For each of the commands listed below, the command can be entered as the abbreviation (those
- 94932 characters in the Synopsis command word preceding the **' [ '**), the full command (all characters
- 94933 shown for the command word, omitting the **' [ '** and **' ] '**), or any truncation of the full
- 94934 command down to the abbreviation. For example, the **exit** command (shown as **ex[it]** in the
- 94935 Synopsis) can be entered as **ex**, **exi**, or **exit**.
- 94936 The arguments to commands can be quoted, using the following methods:
- 94937 • An argument can be enclosed between paired double-quotes (**" "**) or single-quotes (**' '**);
  - 94938 any white space, shell word expansion, or **<backslash>** characters within the quotes shall
  - 94939 be treated literally as part of the argument. A double-quote shall be treated literally within
  - 94940 single-quotes and *vice versa*. These special properties of the **<quotation-mark>** characters
  - 94941 shall occur only when they are paired at the beginning and end of the argument.
  - 94942 • A **<backslash>** outside of the enclosing quotes shall be discarded and the following
  - 94943 character treated literally as part of the argument.
  - 94944 • An unquoted **<backslash>** at the end of a command line shall be discarded and the next
  - 94945 line shall continue the command.

94946 Filenames, where expected, shall be subjected to the following transformations, in sequence:

- 94947 • If the filename begins with an unquoted <plus-sign>, and the **folder** variable is defined
- 94948 (see the **folder** variable), the <plus-sign> shall be replaced by the value of the **folder**
- 94949 variable followed by a <slash>. If the **folder** variable is unset or is set to null, the filename
- 94950 shall be unchanged.
- 94951 • Shell word expansions shall be applied to the filename (see Section 2.6, on page 2305). If
- 94952 more than a single pathname results from this expansion and the command is expecting
- 94953 one file, the effects are unspecified.

#### 94954 **Declare Aliases**

94955 *Synopsis:*    a[lias] [alias [address...]]  
 94956               g[roup] [alias [address...]]

94957 Add the given addresses to the alias specified by *alias*. The names shall be substituted when  
 94958 *alias* is used as a recipient address specified by the user in an outgoing message (that is, other  
 94959 recipients addressed indirectly through the **reply** command shall not be substituted in this  
 94960 manner). Mail address alias substitution shall apply only when the alias string is used as a full  
 94961 address; for example, when **hlj** is an alias, *hlj@posix.com* does not trigger the alias substitution. If  
 94962 no arguments are given, write a listing of the current aliases to standard output. If only an *alias*  
 94963 argument is given, write a listing of the specified alias to standard output. These listings need  
 94964 not reflect the same order of addresses that were entered.

#### 94965 **Declare Alternatives**

94966 *Synopsis:*    alt[ernates] name...

94967 (See also the **metoo** variable.) Declare a list of alternative names for the user's login. When  
 94968 responding to a message, these names shall be removed from the list of recipients for the  
 94969 response. The comparison of names shall be in a case-insensitive manner. With no arguments,  
 94970 **alternates** shall write the current list of alternative names.

#### 94971 **Change Current Directory**

94972 *Synopsis:*    cd [directory]  
 94973               ch[dir] [directory]

94974 Change directory. If *directory* is not specified, the contents of *HOME* shall be used.

#### 94975 **Copy Messages**

94976 *Synopsis:*    c[opy] [file]  
 94977               c[opy] [msglist] file  
 94978               C[opy] [msglist]

94979 Copy messages to the file named by the pathname *file* without marking the messages as saved.  
 94980 Otherwise, it shall be equivalent to the **save** command.

94981 In the capitalized form, save the specified messages in a file whose name is derived from the  
 94982 author of the message to be saved, without marking the messages as saved. Otherwise, it shall  
 94983 be equivalent to the **Save** command.

94984 **Delete Messages**94985 *Synopsis:* d[etele] [*msglist*]

94986 Mark messages for deletion from the mailbox. The deletions shall not occur until *mailx* quits (see  
 94987 the **quit** command) or changes mailboxes (see the **folder** command). If **autoprint** is set and there  
 94988 are messages remaining after the **delete** command, the current message shall be written as  
 94989 described for the **print** command (see the **print** command); otherwise, the *mailx* prompt shall be  
 94990 written.

94991 **Discard Header Fields**94992 *Synopsis:* di[scard] [*header-field...*]94993 ig[nore] [*header-field...*]

94994 Suppress the specified header fields when writing messages. Specified *header-fields* shall be  
 94995 added to the list of suppressed header fields. Examples of header fields to ignore are **status** and  
 94996 **cc**. The fields shall be included when the message is saved. The **Print** and **Type** commands shall  
 94997 override this command. The comparison of header fields shall be in a case-insensitive manner. If  
 94998 no arguments are specified, write a list of the currently suppressed header fields to standard  
 94999 output; the listing need not reflect the same order of header fields that were entered.

95000 If both **retain** and **discard** commands are given, **discard** commands shall be ignored.95001 **Delete Messages and Display**95002 *Synopsis:* dp [*msglist*]95003 dt [*msglist*]

95004 Delete the specified messages as described for the **delete** command, except that the **autoprint**  
 95005 variable shall have no effect, and the current message shall be written only if it was set to a  
 95006 message after the last message deleted by the command. Otherwise, an informational message  
 95007 to the effect that there are no further messages in the mailbox shall be written, followed by the  
 95008 *mailx* prompt.

95009 **Echo a String**95010 *Synopsis:* ec[ho] *string ...*95011 Echo the given strings, equivalent to the shell *echo* utility.95012 **Edit Messages**95013 *Synopsis:* e[dit] [*msglist*]

95014 Edit the given messages. The messages shall be placed in a temporary file and the utility named  
 95015 by the *EDITOR* variable is invoked to edit each file in sequence. The default *EDITOR* is  
 95016 unspecified.

95017 The **edit** command does not modify the contents of those messages in the mailbox.

95018 **Exit**95019 *Synopsis:*    ex[it]

95020            x[it]

95021 Exit from *mailx* without changing the mailbox. No messages shall be saved in the **mbox** (see also  
95022 **quit**).95023 **Change Folder**95024 *Synopsis:*    fi[le] [file]

95025            fold[er] [file]

95026 Quit (see the **quit** command) from the current file of messages and read in the file named by the  
95027 pathname *file*. If no argument is given, the name and status of the current mailbox shall be  
95028 written.95029 Several unquoted special characters shall be recognized when used as *file* names, with the  
95030 following substitutions:

95031 %            The system mailbox for the invoking user.

95032 %*user*       The system mailbox for *user*.

95033 #            The previous file.

95034 &            The current **mbox**.95035 +*file*       The named file in the **folder** directory. (See the **folder** variable.)

95036 The default file shall be the current mailbox.

95037 **Display List of Folders**95038 *Synopsis:*    folders95039 Write the names of the files in the directory set by the **folder** variable. The command specified  
95040 by the *LISTER* environment variable shall be used (see the ENVIRONMENT VARIABLES  
95041 section).95042 **Follow Up Specified Messages**95043 *Synopsis:*    fo[llowup] [message]

95044            F[ollowup] [msglist]

95045 In the lowercase form, respond to a message, recording the response in a file whose name is  
95046 derived from the author of the message. See also the **save** and **copy** commands and **outfolder**.95047 In the capitalized form, respond to the first message in the *msglist*, sending the message to the  
95048 author of each message in the *msglist*. The subject line shall be taken from the first message and  
95049 the response shall be recorded in a file whose name is derived from the author of the first  
95050 message. See also the **Save** and **Copy** commands and **outfolder**.95051 Both forms shall override the **record** variable, if set.

95052 **Display Header Summary for Specified Messages**95053 *Synopsis:* f[rom] [msglist]

95054 Write the header summary for the specified messages.

95055 **Display Header Summary**95056 *Synopsis:* h[eaders] [message]

95057 Write the page of headers that includes the message specified. If the *message* argument is not  
 95058 specified, the current message shall not change. However, if the *message* argument is specified,  
 95059 the current message shall become the message that appears at the top of the page of headers that  
 95060 includes the message specified. The **screen** variable sets the number of headers per page. See  
 95061 also the **z** command.

95062 **Help**95063 *Synopsis:* hel[p]

95064 ?

95065 Write a summary of commands.

95066 **Hold Messages**95067 *Synopsis:* ho[ld] [msglist]

95068 pre[serve] [msglist]

95069 Mark the messages in *msglist* to be retained in the mailbox when *mailx* terminates. This shall  
 95070 override any commands that might previously have marked the messages to be deleted. During  
 95071 the current invocation of *mailx*, only the **delete**, **dp**, or **dt** commands shall remove the *preserve*  
 95072 marking of a message.

95073 **Execute Commands Conditionally**95074 *Synopsis:* i[f] s|r95075 *mail-commands*

95076 el[se]

95077 *mail-commands*

95078 en[dif]

95079 Execute commands conditionally, where **if s** executes the following *mail-commands*, up to an  
 95080 **else** or **endif**, if the program is in Send Mode, and **if r** shall cause the *mail-commands* to be  
 95081 executed only in Receive Mode.

95082 **List Available Commands**95083 *Synopsis:* l[ist]

95084 Write a list of all commands available. No explanation shall be given.

95085 **Mail a Message**95086 *Synopsis:* m[ail] address...

95087 Mail a message to the specified addresses or aliases.

95088 **Direct Messages to mbox**95089 *Synopsis:* mb[ox] [msglist]95090 Arrange for the given messages to end up in the **mbox** save file when *mailx* terminates normally.  
95091 See **MBOX**. See also the **exit** and **quit** commands.95092 **Process Next Specified Message**95093 *Synopsis:* n[ext] [message]95094 If the current message has not been written (for example, by the **print** command) since *mailx*  
95095 started or since any other message was the current message, behave as if the **print** command  
95096 was entered. Otherwise, if there is an undeleted message after the current message, make it the  
95097 current message and behave as if the **print** command was entered. Otherwise, an informational  
95098 message to the effect that there are no further messages in the mailbox shall be written, followed  
95099 by the *mailx* prompt. Should the current message location be the result of an immediately  
95100 preceding **hold**, **mbox**, **preserve**, or **touch** command, **next** will act as if the current message has  
95101 already been written.95102 **Pipe Message**95103 *Synopsis:* pi[pe] [[msglist] command]  
95104 | [[msglist] command]95105 Pipe the messages through the given *command* by invoking the command interpreter specified  
95106 by *SHELL* with two arguments: **-c** and *command*. (See also *sh -c*.) The application shall ensure  
95107 that the command is given as a single argument. Quoting, described previously, can be used to  
95108 accomplish this. If no arguments are given, the current message shall be piped through the  
95109 command specified by the value of the **cmd** variable. If the **page** variable is set, a <form-feed>  
95110 shall be inserted after each message.95111 **Display Message with Headers**95112 *Synopsis:* P[rint] [msglist]  
95113 T[ype] [msglist]95114 Write the specified messages, including all header lines, to standard output. Override  
95115 suppression of lines by the **discard**, **ignore**, and **retain** commands. If **crt** is set, the messages  
95116 longer than the number of lines specified by the **crt** variable shall be paged through the  
95117 command specified by the *PAGER* environment variable.95118 **Display Message**95119 *Synopsis:* p[rint] [msglist]  
95120 t[ype] [msglist]95121 Write the specified messages to standard output. If **crt** is set, the messages longer than the  
95122 number of lines specified by the **crt** variable shall be paged through the command specified by  
95123 the *PAGER* environment variable.

95124 **Quit**

95125 *Synopsis:*    q[uit]  
 95126            end-of-file

95127 Terminate *mailx*, storing messages that were read in **mbox** (if the current mailbox is the system  
 95128 mailbox and unless **hold** is set), deleting messages that have been explicitly saved (unless  
 95129 **keepsave** is set), discarding messages that have been deleted, and saving all remaining messages  
 95130 in the mailbox.

95131 **Reply to a Message List**

95132 *Synopsis:*    R[eply] [msglist]  
 95133            R[espond] [msglist]

95134 Mail a reply message to the sender of each message in the *msglist*. The subject line shall be  
 95135 formed by concatenating **Re:**<space> (unless it already begins with that string) and the subject  
 95136 from the first message. If **record** is set to a filename, the response shall be saved at the end of that  
 95137 file.

95138 See also the **flipr** variable.

95139 **Reply to a Message**

95140 *Synopsis:*    r[eply] [message]  
 95141            r[espond] [message]

95142 Mail a reply message to all recipients included in the header of the message. The subject line  
 95143 shall be formed by concatenating **Re:**<space> (unless it already begins with that string) and the  
 95144 subject from the message. If **record** is set to a filename, the response shall be saved at the end of  
 95145 that file.

95146 See also the **flipr** variable.

95147 **Retain Header Fields**

95148 *Synopsis:*    ret[ain] [header-field...]

95149 Retain the specified header fields when writing messages. This command shall override all  
 95150 **discard** and **ignore** commands. The comparison of header fields shall be in a case-insensitive  
 95151 manner. If no arguments are specified, write a list of the currently retained header fields to  
 95152 standard output; the listing need not reflect the same order of header fields that were entered.

95153 **Save Messages**

95154 *Synopsis:*    s[ave] [file]  
 95155            s[ave] [msglist] file  
 95156            S[ave] [msglist]

95157 Save the specified messages in the file named by the pathname *file*, or the **mbox** if the *file*  
 95158 argument is omitted. The file shall be created if it does not exist; otherwise, the messages shall be  
 95159 appended to the file. The message shall be put in the state *saved*, and shall behave as specified in  
 95160 the description of the *saved* state when the current mailbox is exited by the **quit** or **file**  
 95161 command.

95162 In the capitalized form, save the specified messages in a file whose name is derived from the  
 95163 author of the first message. The name of the file shall be taken to be the author's name with all  
 95164 network addressing stripped off. See also the **Copy**, **followup**, and **Followup** commands and

95165 **outfolder** variable.

### 95166 **Set Variables**

95167 *Synopsis:* `se[t] [name=[string]] ... [name=number ...] [noname ...]`

95168 Define one or more variables called *name*. The variable can be given a null, string, or numeric  
 95169 value. Quoting and <backslash>-escapes can occur anywhere in *string*, as described previously,  
 95170 as if the *string* portion of the argument were the entire argument. The forms *name* and *name=*  
 95171 shall be equivalent to *name=""* for variables that take string values. The **set** command without  
 95172 arguments shall write a list of all defined variables and their values. The **no name** form shall be  
 95173 equivalent to **unset name**.

### 95174 **Invoke a Shell**

95175 *Synopsis:* `sh[ell]`

95176 Invoke an interactive command interpreter (see also *SHELL*).

### 95177 **Display Message Size**

95178 *Synopsis:* `si[ze] [msglist]`

95179 Write the size in bytes of each of the specified messages.

### 95180 **Read mailx Commands From a File**

95181 *Synopsis:* `so[urce] file`

95182 Read and execute commands from the file named by the pathname *file* and return to command  
 95183 mode.

### 95184 **Display Beginning of Messages**

95185 *Synopsis:* `to[p] [msglist]`

95186 Write the top few lines of each of the specified messages. If the **toplines** variable is set, it is taken  
 95187 as the number of lines to write. The default shall be 5.

### 95188 **Touch Messages**

95189 *Synopsis:* `to[uch] [msglist]`

95190 Touch the specified messages. If any message in *msglist* is not specifically deleted nor saved in a  
 95191 file, it shall be placed in the **mbox** upon normal termination. See **exit** and **quit**.

### 95192 **Delete Aliases**

95193 *Synopsis:* `una[lia] [alias]...`

95194 Delete the specified alias names. If a specified alias does not exist, the results are unspecified.

95195 **Undelete Messages**95196 *Synopsis:* `u[ndelete] [msglist]`95197 Change the state of the specified messages from deleted to read. If **autoprint** is set, the last  
95198 message of those restored shall be written. If *msglist* is not specified, the message shall be  
95199 selected as follows:

- 95200 • If there are any deleted messages that follow the current message, the first of these shall be  
95201 chosen.
- 95202 • Otherwise, the last deleted message that also precedes the current message shall be chosen.

95203 **Unset Variables**95204 *Synopsis:* `uns[et] name...`

95205 Cause the specified variables to be erased.

95206 **Edit Message with Full-Screen Editor**95207 *Synopsis:* `v[isual] [msglist]`95208 Edit the given messages with a screen editor. Each message shall be placed in a temporary file,  
95209 and the utility named by the *VISUAL* variable shall be invoked to edit each file in sequence. The  
95210 default editor shall be *vi*.95211 The **visual** command does not modify the contents of those messages in the mailbox.95212 **Write Messages to a File**95213 *Synopsis:* `w[rite] [msglist] file`95214 Write the given messages to the file specified by the pathname *file*, minus the message header.  
95215 Otherwise, it shall be equivalent to the **save** command.95216 **Scroll Header Display**95217 *Synopsis:* `z[+|-]`95218 Scroll the header display forward (if '+' is specified or if no option is specified) or backward (if  
95219 '-' is specified) one screenful. The number of headers written shall be set by the **screen**  
95220 variable.95221 **Invoke Shell Command**95222 *Synopsis:* `!command`95223 Invoke the command interpreter specified by *SHELL* with two arguments: **-c** and *command*. (See  
95224 also *sh -c*.) If the **bang** variable is set, each unescaped occurrence of '!' in *command* shall be  
95225 replaced with the command executed by the previous ! command or ~! command escape.

95226 **Null Command**95227 *Synopsis:* # *comment*95228 This null command (*comment*) shall be ignored by *mailx*.95229 **Display Current Message Number**95230 *Synopsis:* =

95231 Write the current message number.

95232 **Command Escapes in mailx**

95233 The following commands can be entered only from input mode, by beginning a line with the  
 95234 escape character (by default, <tilde> ('~')). See the **escape** variable description for changing  
 95235 this special character. The format for the commands shall be:

95236 *<escape-character><command-char><separator>[<argument(s)>]*95237 where the *<separator>* can be zero or more <blank> characters.

95238 In the following descriptions, the application shall ensure that the argument *command* (but not  
 95239 *mailx-command*) is a shell command string. Any string acceptable to the command interpreter  
 95240 specified by the *SHELL* variable when it is invoked as *SHELL -c command\_string* shall be valid.  
 95241 The command can be presented as multiple arguments (that is, quoting is not required).

95242 Command escapes that are listed with *msglist* or *mailx-command* arguments are invalid in Send  
 95243 Mode and produce unspecified results.

95244 **~! *command*** Invoke the command interpreter specified by *SHELL* with two arguments: **-c** and  
 95245 *command*; and then return to input mode. If the **bang** variable is set, each  
 95246 unescaped occurrence of '~!' in *command* shall be replaced with the command  
 95247 executed by the previous ! command or ~! command escape.

95248 **~.** Simulate end-of-file (terminate message input).

95249 **~: *mailx-command*, ~\_ *mailx-command***  
 95250 Perform the command-level request.

95251 **~?** Write a summary of command escapes.95252 **~A** This shall be equivalent to **~i Sign**.95253 **~a** This shall be equivalent to **~i sign**.95254 **~b *name...*** Add the *names* to the blind carbon copy (**Bcc**) list.95255 **~c *name...*** Add the *names* to the carbon copy (**Cc**) list.95256 **~d** Read in the dead-letter file. See *DEAD* for a description of this file.95257 **~e** Invoke the editor, as specified by the *EDITOR* environment variable, on the partial  
95258 message.

95259 **~f [*msglist*]** Forward the specified messages. The specified messages shall be inserted into the  
 95260 current message without alteration. This command escape also shall insert  
 95261 message headers into the message with field selection affected by the **discard**,  
 95262 **ignore**, and **retain** commands.

## mailx

## Utilities

- 95263           ~F [*msglist*] This shall be the equivalent of the ~f command escape, except that all headers shall  
95264           be included in the message, regardless of previous **discard**, **ignore**, and **retain**  
95265           commands.
- 95266           ~h           If standard input is a terminal, prompt for a **Subject** line and the **To**, **Cc**, and **Bcc**  
95267           lists. Other implementation-defined headers may also be presented for editing. If  
95268           the field is written with an initial value, it can be edited as if it had just been typed.
- 95269           ~i *string*    Insert the value of the named variable, followed by a <newline>, into the text of  
95270           the message. If the string is unset or null, the message shall not be changed.
- 95271           ~m [*msglist*] Insert the specified messages into the message, prefixing non-empty lines with the  
95272           string in the **indentprefix** variable. This command escape also shall insert message  
95273           headers into the message, with field selection affected by the **discard**, **ignore**, and  
95274           **retain** commands.
- 95275           ~M [*msglist*] This shall be the equivalent of the ~m command escape, except that all headers  
95276           shall be included in the message, regardless of previous **discard**, **ignore**, and **retain**  
95277           commands.
- 95278           ~p           Write the message being entered. If the message is longer than **crt** lines (see  
95279           [Internal Variables in mailx](#), on page 2889), the output shall be paginated as  
95280           described for the **PAGER** variable.
- 95281           ~q           Quit (see the **quit** command) from input mode by simulating an interrupt. If the  
95282           body of the message is not empty, the partial message shall be saved in the dead-  
95283           letter file. See **DEAD** for a description of this file.
- 95284           ~r *file*, ~< *file*, ~r !*command*, ~< !*command*  
95285           Read in the file specified by the pathname *file*. If the argument begins with an  
95286           <exclamation-mark> ('!'), the rest of the string shall be taken as an arbitrary  
95287           system command; the command interpreter specified by **SHELL** shall be invoked  
95288           with two arguments: **-c** and *command*. The standard output of *command* shall be  
95289           inserted into the message.
- 95290           ~s *string*    Set the subject line to *string*.
- 95291           ~t *name...*    Add the given *names* to the **To** list.
- 95292           ~v           Invoke the full-screen editor, as specified by the **VISUAL** environment variable, on  
95293           the partial message.
- 95294           ~w *file*       Write the partial message, without the header, onto the file named by the  
95295           pathname *file*. The file shall be created or the message shall be appended to it if  
95296           the file exists.
- 95297           ~x           Exit as with ~q, except the message shall not be saved in the dead-letter file.
- 95298           ~| *command*   Pipe the body of the message through the given *command* by invoking the  
95299           command interpreter specified by **SHELL** with two arguments: **-c** and *command*. If  
95300           the *command* returns a successful exit status, the standard output of the command  
95301           shall replace the message. Otherwise, the message shall remain unchanged. If the  
95302           *command* fails, an error message giving the exit status shall be written.

95303 **EXIT STATUS**95304 UP When the `-e` option is specified, the following exit values are returned:

95305 0 Mail was found.

95306 &gt;0 Mail was not found or an error occurred.

95307 Otherwise, the following exit values are returned:

95308 0 Successful completion; note that this status implies that all messages were *sent*, but it gives  
95309 no assurances that any of them were actually *delivered*.

95310 &gt;0 An error occurred.

95311 **CONSEQUENCES OF ERRORS**95312 UP When in `input mode (Receive Mode)` or `Send Mode`:95313 • If an error is encountered processing an input line beginning with a <tilde> ('~')  
95314 UP character, (see [Command Escapes in mailx](#), on page 2901), a diagnostic message shall be  
95315 written to standard error, and the message being composed may be modified, but this  
95316 condition shall not prevent the message from being sent.

95317 • Other errors shall prevent the sending of the message.

95318 UP When in `command mode`:

95319 • Default.

95320 **APPLICATION USAGE**95321 Delivery of messages to remote systems requires the existence of communication paths to such  
95322 systems. These need not exist.95323 Input lines are limited to {LINE\_MAX} bytes, but mailers between systems may impose more  
95324 severe line-length restrictions. This volume of POSIX.1-2008 does not place any restrictions on  
95325 the length of messages handled by *mailx*, and for delivery of local messages the only limitations  
95326 should be the normal problems of available disk space for the target mail file. When sending  
95327 messages to external machines, applications are advised to limit messages to less than 100 000  
95328 bytes because some mail gateways impose message-length restrictions.95329 The format of the system mailbox is intentionally unspecified. Not all systems implement  
95330 system mailboxes as flat files, particularly with the advent of multimedia mail messages. Some  
95331 system mailboxes may be multiple files, others records in a database. The internal format of the  
95332 messages themselves is specified with the historical format from Version 7, but only after the  
95333 messages have been saved in some file other than the system mailbox. This was done so that  
95334 many historical applications expecting text-file mailboxes are not broken.95335 Some new formats for messages can be expected in the future, probably including binary data,  
95336 bit maps, and various multimedia objects. As described here, *mailx* is not prohibited from  
95337 handling such messages, but it must store them as text files in secondary mailboxes (unless some  
95338 extension, such as a variable or command line option, is used to change the stored format). Its  
95339 method of doing so is implementation-defined and might include translating the data into text  
95340 file-compatible or readable form or omitting certain portions of the message from the stored  
95341 output.95342 The **discard** and **ignore** commands are not inverses of the **retain** command. The **retain**  
95343 command discards all header-fields except those explicitly retained. The **discard** command  
95344 keeps all header-fields except those explicitly discarded. If headers exist on the retained header

95345 list, **discard** and **ignore** commands are ignored.

#### 95346 EXAMPLES

95347 None.

#### 95348 RATIONALE

95349 The standard developers felt strongly that a method for applications to send messages to specific  
95350 users was necessary. The obvious example is a batch utility, running non-interactively, that  
95351 wishes to communicate errors or results to a user. However, the actual format, delivery  
95352 mechanism, and method of reading the message are clearly beyond the scope of this volume of  
95353 POSIX.1-2008.

95354 The intent of this command is to provide a simple, portable interface for sending messages non-  
95355 interactively. It merely defines a “front-end” to the historical mail system. It is suggested that  
95356 implementations explicitly denote the sender and recipient in the body of the delivered message.  
95357 Further specification of formats for either the message envelope or the message itself were  
95358 deliberately not made, as the industry is in the midst of changing from the current standards to a  
95359 more internationalized standard and it is probably incorrect, at this time, to require either one.

95360 Implementations are encouraged to conform to the various delivery mechanisms described in  
95361 the CCITT X.400 standards or to the equivalent Internet standards, described in Internet Request  
95362 for Comment (RFC) documents RFC 819, RFC 822, RFC 920, RFC 921, and RFC 1123.

95363 Many historical systems modified each body line that started with **From** by prefixing the 'F'  
95364 with '>'. It is unnecessary, but allowed, to do that when the string does not follow a blank line  
95365 because it cannot be confused with the next header.

95366 The **edit** and **visual** commands merely edit the specified messages in a temporary file. They do  
95367 not modify the contents of those messages in the mailbox; such a capability could be added as an  
95368 extension, such as by using different command names.

95369 The restriction on a subject line being {LINE\_MAX}-10 bytes is based on the historical format  
95370 that consumes 10 bytes for **Subject:** and the trailing <newline>. Many historical mailers that a  
95371 message may encounter on other systems are not able to handle lines that long, however.

95372 Like the utilities *logger* and *lp*, *mailx* admittedly is difficult to test. This was not deemed sufficient  
95373 justification to exclude this utility from this volume of POSIX.1-2008. It is also arguable that it is,  
95374 in fact, testable, but that the tests themselves are not portable.

95375 When *mailx* is being used by an application that wishes to receive the results as if none of the  
95376 User Portability Utilities option features were supported, the *DEAD* environment variable must  
95377 be set to */dev/null*. Otherwise, it may be subject to the file creations described in *mailx*  
95378 ASYNCHRONOUS EVENTS. Similarly, if the *MAILRC* environment variable is not set to  
95379 */dev/null*, historical versions of *mailx* and *Mail* read initialization commands from a file before  
95380 processing begins. Since the initialization that a user specifies could alter the contents of  
95381 messages an application is trying to send, such applications must set *MAILRC* to */dev/null*.

95382 The description of *LC\_TIME* uses “may affect” because many historical implementations do not  
95383 or cannot manipulate the date and time strings in the incoming mail headers. Some headers  
95384 found in incoming mail do not have enough information to determine the timezone in which the  
95385 mail originated, and, therefore, *mailx* cannot convert the date and time strings into the internal  
95386 form that then is parsed by routines like *strftime()* that can take *LC\_TIME* settings into account.  
95387 Changing all these times to a user-specified format is allowed, but not required.

95388 The paginator selected when *PAGER* is null or unset is partially unspecified to allow the System  
95389 V historical practice of using *pg* as the default. Bypassing the pagination function, such as by  
95390 declaring that *cat* is the paginator, would not meet with the intended meaning of this

95391 description. However, any “portable user” would have to set *PAGER* explicitly to get his or her  
 95392 preferred paginator on all systems. The paginator choice was made partially unspecified, unlike  
 95393 the *VISUAL* editor choice (mandated to be *vi*) because most historical pagers follow a common  
 95394 theme of user input, whereas editors differ dramatically.

95395 Options to specify addresses as **cc** (carbon copy) or **bcc** (blind carbon copy) were considered to  
 95396 be format details and were omitted.

95397 A zero exit status implies that all messages were *sent*, but it gives no assurances that any of them  
 95398 were actually *delivered*. The reliability of the delivery mechanism is unspecified and is an  
 95399 appropriate marketing distinction between systems.

95400 In order to conform to the Utility Syntax Guidelines, a solution was required to the optional *file*  
 95401 option-argument to **-f**. By making *file* an operand, the guidelines are satisfied and users remain  
 95402 portable. However, it does force implementations to support usage such as:

```
95403 mailx -fin mymail.box
```

95404 The **no name** method of unsetting variables is not present in all historical systems, but it is in  
 95405 System V and provides a logical set of commands corresponding to the format of the display of  
 95406 options from the *mailx set* command without arguments.

95407 The **ask** and **asksub** variables are the names selected by BSD and System V, respectively, for the  
 95408 same feature. They are synonyms in this volume of POSIX 1-2008.

95409 The *mailx echo* command was not documented in the BSD version and has been omitted here  
 95410 because it is not obviously useful for interactive users.

95411 The default prompt on the System V *mailx* is a <question-mark>, on BSD *Mail* an <ampersand>.  
 95412 Since this volume of POSIX.1-2008 chose the *mailx* name, it kept the System V default, assuming  
 95413 that BSD users would not have difficulty with this minor incompatibility (that they can  
 95414 override).

95415 The meanings of **r** and **R** are reversed between System V *mailx* and SunOS *Mail*. Once again,  
 95416 since this volume of POSIX.1-2008 chose the *mailx* name, it kept the System V default, but allows  
 95417 the SunOS user to achieve the desired results using **flipr**, an internal variable in System V *mailx*,  
 95418 although it has not been documented in the SVID.

95419 The **indentprefix** variable, the **retain** and **unalias** commands, and the **~F** and **~M** command  
 95420 escapes were adopted from 4.3 BSD *Mail*.

95421 The **version** command was not included because no sufficiently general specification of the  
 95422 version information could be devised that would still be useful to a portable user. This  
 95423 command name should be used by suppliers who wish to provide version information about the  
 95424 *mailx* command.

95425 The “implementation-specific (unspecified) system start-up file” historically has been named  
 95426 **/etc/mailx.rc**, but this specific name and location are not required.

95427 The intent of the wording for the **next** command is that if any command has already displayed  
 95428 the current message it should display a following message, but, otherwise, it should display the  
 95429 current message. Consider the command sequence:

```
95430 next 3
95431 delete 3
95432 next
```

95433 where the **autoprint** option was not set. The normative text specifies that the second **next**  
 95434 command should display a message following the third message, because even though the

95435 current message has not been displayed since it was set by the **delete** command, it has been  
 95436 displayed since the current message was anything other than message number 3. This does not  
 95437 always match historical practice in some implementations, where the command file address  
 95438 followed by **next** (or the default command) would skip the message for which the user had  
 95439 searched.

#### 95440 FUTURE DIRECTIONS

95441 None.

#### 95442 SEE ALSO

95443 [Chapter 2](#) (on page 2297), *ed*, *ls*, *more*, *vi*

95444 [XBD Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 95445 CHANGE HISTORY

95446 First released in Issue 2.

#### 95447 Issue 5

95448 The description of the *EDITOR* environment variable is changed to indicate that *ed* is the default  
 95449 editor if this variable is not set. In previous issues, this default was not stated explicitly at this  
 95450 point but was implied further down in the text.

95451 The FUTURE DIRECTIONS section is added.

#### 95452 Issue 6

95453 The following new requirements on POSIX implementations derive from alignment with the  
 95454 Single UNIX Specification:

- 95455 • The **-F** option is added.
- 95456 • The **allnet**, **debug**, and **sendwait** internal variables are added.
- 95457 • The **C**, **ec**, **fo**, **F**, and **S** *mailx* commands are added.

95458 In the DESCRIPTION and ENVIRONMENT VARIABLES sections, text stating “*HOME*  
 95459 directory” is replaced by “directory referred to by the *HOME* environment variable”.

95460 The *mailx* utility is aligned with the IEEE P1003.2b draft standard, which includes various  
 95461 clarifications to resolve IEEE PASC Interpretations submitted for the ISO POSIX-2:1993  
 95462 standard. In particular, the changes here address IEEE PASC Interpretations 1003.2 #10, #11,  
 95463 #103, #106, #108, #114, #115, #122, and #129.

95464 The normative text is reworded to avoid use of the term “must” for application requirements.

95465 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

95466 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/32 is applied, applying a change to the  
 95467 EXTENDED DESCRIPTION, raised by IEEE PASC Interpretation 1003.2 #122, which was  
 95468 overlooked in the first version of this standard.

95469 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/17 is applied, updating the EXTENDED  
 95470 DESCRIPTION (Internal Variables in *mailx*). The system start-up file is changed from  
 95471 “implementation-defined” to “unspecified” for consistency with other text in the EXTENDED  
 95472 DESCRIPTION.

#### 95473 Issue 7

95474 Austin Group Interpretation 1003.1-2001 #089 is applied, clarifying the effect of the *LC\_TIME*  
 95475 environment variable.

95476 Austin Group Interpretation 1003.1-2001 #090 is applied, updating the description of the **next**  
 95477 command.

- 95478 SD5-XCU-ERN-69 is applied.
- 95479 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 95480 Shading to indicate support for the User Portability Utilities option is added.

**make**

Utilities

95481 **NAME**95482 **make** — maintain, update, and regenerate groups of programs (**DEVELOPMENT**)95483 **SYNOPSIS**

```
95484 SD make [-einpqrst] [-f makefile]... [-k|-S] [macro=value...]
95485 [target_name...]
```

95486 **DESCRIPTION**

95487 The *make* utility shall update files that are derived from other files. A typical case is one where  
 95488 object files are derived from the corresponding source files. The *make* utility examines time  
 95489 relationships and shall update those derived files (called targets) that have modified times  
 95490 earlier than the modified times of the files (called prerequisites) from which they are derived. A  
 95491 description file (makefile) contains a description of the relationships between files, and the  
 95492 commands that need to be executed to update the targets to reflect changes in their  
 95493 prerequisites. Each specification, or rule, shall consist of a target, optional prerequisites, and  
 95494 optional commands to be executed when a prerequisite is newer than the target. There are two  
 95495 types of rule:

- 95496 1. *Inference rules*, which have one target name with at least one <period> ('.') and no  
 95497 <slash> ('/')
- 95498 2. *Target rules*, which can have more than one target name

95499 In addition, *make* shall have a collection of built-in macros and inference rules that infer  
 95500 prerequisite relationships to simplify maintenance of programs.

95501 To receive exactly the behavior described in this section, the user shall ensure that a portable  
 95502 makefile shall:

- 95503 • Include the special target **.POSIX**.
- 95504 • Omit any special target reserved for implementations (a leading period followed by  
 95505 uppercase letters) that has not been specified by this section

95506 The behavior of *make* is unspecified if either or both of these conditions are not met.

95507 **OPTIONS**

95508 The *make* utility shall conform to XBD Section 12.2 (on page 215), except for Guideline 9.

95509 The following options shall be supported:

- 95510 **-e** Cause environment variables, including those with null values, to override macro  
 95511 assignments within makefiles.
- 95512 **-f *makefile*** Specify a different makefile. The argument *makefile* is a pathname of a description  
 95513 file, which is also referred to as the *makefile*. A pathname of '-' shall denote the  
 95514 standard input. There can be multiple instances of this option, and they shall be  
 95515 processed in the order specified. The effect of specifying the same option-argument  
 95516 more than once is unspecified.
- 95517 **-i** Ignore error codes returned by invoked commands. This mode is the same as if the  
 95518 special target **.IGNORE** were specified without prerequisites.
- 95519 **-k** Continue to update other targets that do not depend on the current target if a non-  
 95520 ignored error occurs while executing the commands to bring a target up-to-date.
- 95521 **-n** Write commands that would be executed on standard output, but do not execute  
 95522 them. However, lines with a <plus-sign> ('+') prefix shall be executed. In this  
 95523 mode, lines with an at-sign ('@') character prefix shall be written to standard

- 95524 output.
- 95525 **-p** Write to standard output the complete set of macro definitions and target  
95526 descriptions. The output format is unspecified.
- 95527 **-q** Return a zero exit value if the target file is up-to-date; otherwise, return an exit  
95528 value of 1. Targets shall not be updated if this option is specified. However, a  
95529 makefile command line (associated with the targets) with a <plus-sign> ('+')  
95530 prefix shall be executed.
- 95531 **-r** Clear the suffix list and do not use the built-in rules.
- 95532 **-S** Terminate *make* if an error occurs while executing the commands to bring a target  
95533 up-to-date. This shall be the default and the opposite of **-k**.
- 95534 **-s** Do not write makefile command lines or touch messages (see **-t**) to standard  
95535 output before executing. This mode shall be the same as if the special target  
95536 **.SILENT** were specified without prerequisites.
- 95537 **-t** Update the modification time of each target as though a *touch target* had been  
95538 executed. Targets that have prerequisites but no commands (see **Target Rules**, on  
95539 page 2913), or that are already up-to-date, shall not be touched in this manner.  
95540 Write messages to standard output for each target file indicating the name of the  
95541 file and that it was touched. Normally, the *makefile* command lines associated with  
95542 each target are not executed. However, a command line with a <plus-sign> ('+')  
95543 prefix shall be executed.

95544 Any options specified in the *MAKEFLAGS* environment variable shall be evaluated before any  
95545 options specified on the *make* utility command line. If the **-k** and **-S** options are both specified  
95546 on the *make* utility command line or by the *MAKEFLAGS* environment variable, the last option  
95547 specified shall take precedence. If the **-f** or **-p** options appear in the *MAKEFLAGS* environment  
95548 variable, the result is undefined.

#### 95549 OPERANDS

95550 The following operands shall be supported:

95551 *target\_name* Target names, as defined in the EXTENDED DESCRIPTION section. If no target is  
95552 specified, while *make* is processing the makefiles, the first target that *make*  
95553 encounters that is not a special target or an inference rule shall be used.

95554 *macro=value* Macro definitions, as defined in **Macros** (on page 2914).

95555 If the *target\_name* and *macro=value* operands are intermixed on the *make* utility command line,  
95556 the results are unspecified.

#### 95557 STDIN

95558 The standard input shall be used only if the *makefile* option-argument is **'-'**. See the INPUT  
95559 FILES section.

#### 95560 INPUT FILES

95561 The input file, otherwise known as the makefile, is a text file containing rules, macro definitions,  
95562 and comments. See the EXTENDED DESCRIPTION section.

#### 95563 ENVIRONMENT VARIABLES

95564 The following environment variables shall affect the execution of *make*:

95565 **LANG** Provide a default value for the internationalization variables that are unset or null.  
95566 (See XBD **Section 8.2** (on page 174) for the precedence of internationalization  
95567 variables used to determine the values of locale categories.)

| 95592 |     |                            | Provide a directory to be used to search for SCCS files not found in the current directory. In all of the following cases, the search for SCCS files is made in the directory <b>SCCS</b> in the identified directory. If the value of <i>PROJECTDIR</i> begins with a <slash>, it shall be considered an absolute pathname; otherwise, the value of <i>PROJECTDIR</i> is treated as a user name and that user's initial working directory shall be examined for a subdirectory <b>src</b> or <b>source</b> . If such a directory is found, it shall be used. Otherwise, the value is used as a relative pathname.                   |

| 95610 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 95611 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 95612 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 95613 |     |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

95614 **STDOUT**

95615 The *make* utility shall write all commands to be executed to standard output unless the `-s` option  
 95616 was specified, the command is prefixed with an at-sign, or the special target **.SILENT** has either  
 95617 the current target as a prerequisite or has no prerequisites. If *make* is invoked without any work  
 95618 needing to be done, it shall write a message to standard output indicating that no action was  
 95619 taken. If the `-t` option is present and a file is touched, *make* shall write to standard output a  
 95620 message of unspecified format indicating that the file was touched, including the filename of the  
 95621 file.

95622 **STDERR**

95623 The standard error shall be used only for diagnostic messages.

95624 **OUTPUT FILES**

95625 Files can be created when the `-t` option is present. Additional files can also be created by the  
 95626 utilities invoked by *make*.

95627 **EXTENDED DESCRIPTION**

95628 The *make* utility attempts to perform the actions required to ensure that the specified targets are  
 95629 up-to-date. A target is considered out-of-date if it is older than any of its prerequisites or if it  
 95630 does not exist. The *make* utility shall treat all prerequisites as targets themselves and recursively  
 95631 ensure that they are up-to-date, processing them in the order in which they appear in the rule.  
 95632 The *make* utility shall use the modification times of files to determine whether the corresponding  
 95633 targets are out-of-date.

95634 After *make* has ensured that all of the prerequisites of a target are up-to-date and if the target is  
 95635 out-of-date, the commands associated with the target entry shall be executed. If there are no  
 95636 commands listed for the target, the target shall be treated as up-to-date.

95637 **Makefile Syntax**

95638 A makefile can contain rules, macro definitions (see [Macros](#), on page 2914), include lines, and  
 95639 comments. There are two kinds of rules: *inference rules* and *target rules*. The *make* utility shall  
 95640 contain a set of built-in inference rules. If the `-r` option is present, the built-in rules shall not be  
 95641 used and the suffix list shall be cleared. Additional rules of both types can be specified in a  
 95642 makefile. If a rule is defined more than once, the value of the rule shall be that of the last one  
 95643 specified. Macros can also be defined more than once, and the value of the macro is specified in  
 95644 [Macros](#) (on page 2914). Comments start with a <number-sign> ('#') and continue until an  
 95645 unescaped <newline> is reached.

95646 By default, the following files shall be tried in sequence: **.makefile** and **.Makefile**. If neither  
 95647 **.makefile** or **.Makefile** are found, other implementation-defined files may also be tried. On  
 95648 XSI-conformant systems, the additional files **.s.makefile**, **SCCS/s.makefile**, **.s.Makefile**, and  
 95649 **SCCS/s.Makefile** shall also be tried.

95650 The `-f` option shall direct *make* to ignore any of these default files and use the specified argument  
 95651 as a makefile instead. If the `'-'` argument is specified, standard input shall be used.

95652 The term *makefile* is used to refer to any rules provided by the user, whether in **.makefile** or its  
 95653 variants, or specified by the `-f` option.

95654 The rules in makefiles shall consist of the following types of lines: target rules, including special  
 95655 targets (see [Target Rules](#), on page 2913), inference rules (see [Inference Rules](#), on page 2916),  
 95656 macro definitions (see [Macros](#), on page 2914), empty lines, and comments.

95657 Target and Inference Rules may contain *command lines*. Command lines can have a prefix that  
 95658 shall be removed before execution (see [Makefile Execution](#), on page 2912).

95659 When an escaped <newline> (one preceded by a <backslash>) is found anywhere in the  
 95660 makefile except in a command line, an include line, or a line immediately preceding an include  
 95661 line, it shall be replaced, along with any leading white space on the following line, with a single  
 95662 <space>. When an escaped <newline> is found in a command line in a makefile, the command  
 95663 line shall contain the <backslash>, the <newline>, and the next line, except that the first  
 95664 character of the next line shall not be included if it is a <tab>. When an escaped <newline> is  
 95665 found in an include line or in a line immediately preceding an include line, the behavior is  
 95666 unspecified.

#### 95667 **Include Lines**

95668 If the word **include** appears at the beginning of a line and is followed by one or more <blank>  
 95669 characters, the string formed by the remainder of the line shall be processed as follows to  
 95670 produce a pathname:

- 95671 • The trailing <newline> and any comment shall be discarded. If the resulting string  
 95672 contains any double-quote characters ( ' " ' ) the behavior is unspecified.
- 95673 • The resulting string shall be processed for macro expansion (see **Macros** (on page 2914).
- 95674 • Any <blank> characters that appear after the first non-<blank> shall be used as separators  
 95675 to divide the macro-expanded string into fields. It is unspecified whether any other white-  
 95676 space characters are also used as separators. It is unspecified whether pathname expansion  
 95677 (see **Section 2.13**, on page 2332) is also performed.
- 95678 • If the processing of separators and optional pathname expansion results in either zero or  
 95679 two or more non-empty fields, the behavior is unspecified. If it results in one non-empty  
 95680 field, that field is taken as the pathname.

95681 If the pathname does not begin with a '/' it shall be treated as relative to the current working  
 95682 directory of the process, not relative to the directory containing the makefile. If the file does not  
 95683 exist in this location, it is unspecified whether additional directories are searched.

95684 The contents of the file specified by the pathname shall be read and processed as if they  
 95685 appeared in the makefile in place of the include line. If the file ends with an escaped <newline>  
 95686 the behavior is unspecified.

95687 The file may itself contain further include lines. Implementations shall support nesting of  
 95688 include files up to a depth of at least 16.

#### 95689 **Makefile Execution**

95690 Makefile command lines shall be processed one at a time.

95691 Makefile command lines can have one or more of the following prefixes: a <hyphen> ('-'), an  
 95692 at-sign ('@'), or a <plus-sign> ('+'). These shall modify the way in which *make* processes the  
 95693 command.

- 95694 – If the command prefix contains a <hyphen>, or the **-i** option is present, or the special target  
 95695 **.IGNORE** has either the current target as a prerequisite or has no prerequisites, any error  
 95696 found while executing the command shall be ignored.
- 95697 @ If the command prefix contains an at-sign and the *make* utility command line **-n** option is  
 95698 not specified, or the **-s** option is present, or the special target **.SILENT** has either the current  
 95699 target as a prerequisite or has no prerequisites, the command shall not be written to  
 95700 standard output before it is executed.

95701 + If the command prefix contains a <plus-sign>, this indicates a makefile command line that  
95702 shall be executed even if **-n**, **-q**, or **-t** is specified.

95703 An *execution line* is built from the command line by removing any prefix characters. Except as  
95704 described under the at-sign prefix, the execution line shall be written to the standard output,  
95705 optionally preceded by a <tab>. The execution line shall then be executed by a shell as if it were  
95706 passed as the argument to the *system()* interface, except that the shell **-e** option shall also be in  
95707 effect. The environment for the command being executed shall contain all of the variables in the  
95708 environment of *make*.

95709 By default, when *make* receives a non-zero status from the execution of a command, it shall  
95710 terminate with an error message to standard error.

### 95711 Target Rules

95712 Target rules are formatted as follows:

```
95713 target [target...]: [prerequisite...] [; command]
95714 [command
95715 <tab>command
95716 ...]
```

95717 *line that does not begin with <tab>*

95718 Target entries are specified by a <blank>-separated, non-null list of targets, then a <colon>, then  
95719 a <blank>-separated, possibly empty list of prerequisites. Text following a <semicolon>, if any,  
95720 and all following lines that begin with a <tab>, are makefile command lines to be executed to  
95721 update the target. The first non-empty line that does not begin with a <tab> or '#' shall begin a  
95722 new entry. An empty or blank line, or a line beginning with '#', may begin a new entry.

95723 Applications shall select target names from the set of characters consisting solely of periods,  
95724 underscores, digits, and alphabets from the portable character set (see XBD Section 6.1, on  
95725 page 125). Implementations may allow other characters in target names as extensions. The  
95726 interpretation of targets containing the characters '%' and '"' is implementation-defined.

95727 A target that has prerequisites, but does not have any commands, can be used to add to the  
95728 prerequisite list for that target. Only one target rule for any given target can contain commands.

95729 Lines that begin with one of the following are called *special targets* and control the operation of  
95730 *make*:

95731 **.DEFAULT** If the makefile uses this special target, the application shall ensure that it is  
95732 specified with commands, but without prerequisites. The commands shall be used  
95733 by *make* if there are no other rules available to build a target.

95734 **.IGNORE** Prerequisites of this special target are targets themselves; this shall cause errors  
95735 from commands associated with them to be ignored in the same manner as  
95736 specified by the **-i** option. Subsequent occurrences of **.IGNORE** shall add to the  
95737 list of targets ignoring command errors. If no prerequisites are specified, *make* shall  
95738 behave as if the **-i** option had been specified and errors from all commands  
95739 associated with all targets shall be ignored.

95740 **.POSIX** The application shall ensure that this special target is specified without  
95741 prerequisites or commands. If it appears as the first non-comment line in the  
95742 makefile, *make* shall process the makefile as specified by this section; otherwise, the  
95743 behavior of *make* is unspecified.

95744 **.PRECIOUS** Prerequisites of this special target shall not be removed if *make* receives one of the  
 95745 asynchronous events explicitly described in the ASYNCHRONOUS EVENTS  
 95746 section. Subsequent occurrences of **.PRECIOUS** shall add to the list of precious  
 95747 files. If no prerequisites are specified, all targets in the makefile shall be treated as  
 95748 if specified with **.PRECIOUS**.

95749 XSI **.SCCS\_GET** The application shall ensure that this special target is specified without  
 95750 prerequisites. If this special target is included in a makefile, the commands  
 95751 specified with this target shall replace the default commands associated with this  
 95752 special target (see [Default Rules](#), on page 2919). The commands specified with this  
 95753 target are used to get all SCCS files that are not found in the current directory.

95754 When source files are named in a dependency list, *make* shall treat them just like  
 95755 any other target. Because the source file is presumed to be present in the directory,  
 95756 there is no need to add an entry for it to the makefile. When a target has no  
 95757 dependencies, but is present in the directory, *make* shall assume that that file is up-  
 95758 to-date. If, however, an SCCS file named **SCCS/s.source\_file** is found for a target  
 95759 *source\_file*, *make* compares the timestamp of the target file with that of the  
 95760 **SCCS/s.source\_file** to ensure the target is up-to-date. If the target is missing, or if  
 95761 the SCCS file is newer, *make* shall automatically issue the commands specified for  
 95762 the **.SCCS\_GET** special target to retrieve the most recent version. However, if the  
 95763 target is writable by anyone, *make* shall not retrieve a new version.

95764 **.SILENT** Prerequisites of this special target are targets themselves; this shall cause  
 95765 commands associated with them not to be written to the standard output before  
 95766 they are executed. Subsequent occurrences of **.SILENT** shall add to the list of  
 95767 targets with silent commands. If no prerequisites are specified, *make* shall behave  
 95768 as if the **-s** option had been specified and no commands or touch messages  
 95769 associated with any target shall be written to standard output.

95770 **.SUFFIXES** Prerequisites of **.SUFFIXES** shall be appended to the list of known suffixes and are  
 95771 used in conjunction with the inference rules (see [Inference Rules](#), on page 2916). If  
 95772 **.SUFFIXES** does not have any prerequisites, the list of known suffixes shall be  
 95773 cleared.

95774 The special targets **.IGNORE**, **.POSIX**, **.PRECIOUS**, **.SILENT**, and **.SUFFIXES** shall be specified  
 95775 without commands.

95776 Targets with names consisting of a leading <period> followed by the uppercase letters "POSIX"  
 95777 and then any other characters are reserved for future standardization. Targets with names  
 95778 consisting of a leading <period> followed by one or more uppercase letters are reserved for  
 95779 implementation extensions.

## 95780 **Macros**

95781 Macro definitions are in the form:

```
95782 string1 = [string2]
```

95783 The macro named *string1* is defined as having the value of *string2*, where *string2* is defined as all  
 95784 characters, if any, after the <equals-sign>, up to a comment character ('#') or an unescaped  
 95785 <newline>. Any <blank> characters immediately before or after the <equals-sign> shall be  
 95786 ignored.

95787 Applications shall select macro names from the set of characters consisting solely of periods,  
 95788 underscores, digits, and alphabetic characters from the portable character set (see [XBD Section 6.1](#), on  
 95789 page 125). A macro name shall not contain an <equals-sign>. Implementations may allow other

95790 characters in macro names as extensions.

95791 Macros can appear anywhere in the makefile. Macro expansions using the forms  $\$(string1)$  or  
95792  $\${string1}$  shall be replaced by  $string2$ , as follows:

- 95793 • Macros in target lines shall be evaluated when the target line is read.
- 95794 • Macros in makefile command lines shall be evaluated when the command is executed.
- 95795 • Macros in the string before the <equals-sign> in a macro definition shall be evaluated  
95796 when the macro assignment is made.
- 95797 • Macros after the <equals-sign> in a macro definition shall not be evaluated until the  
95798 defined macro is used in a rule or command, or before the <equals-sign> in a macro  
95799 definition.

95800 The parentheses or braces are optional if  $string1$  is a single character. The macro  $\$\$$  shall be  
95801 replaced by the single character '\$'. If  $string1$  in a macro expansion contains a macro  
95802 expansion, the results are unspecified.

95803 Macro expansions using the forms  $\$(string1[:subst1=[subst2]])$  or  $\${string1[:subst1=[subst2]]}$  can  
95804 be used to replace all occurrences of  $subst1$  with  $subst2$  when the macro substitution is  
95805 performed. The  $subst1$  to be replaced shall be recognized when it is a suffix at the end of a word  
95806 in  $string1$  (where a *word*, in this context, is defined to be a string delimited by the beginning of  
95807 the line, a <blank>, or a <newline>). If  $string1$  in a macro expansion contains a macro expansion,  
95808 the results are unspecified.

95809 Macro expansions in  $string1$  of macro definition lines shall be evaluated when read. Macro  
95810 expansions in  $string2$  of macro definition lines shall be performed when the macro identified by  
95811  $string1$  is expanded in a rule or command.

95812 Macro definitions shall be taken from the following sources, in the following logical order,  
95813 before the makefile(s) are read.

- 95814 1. Macros specified on the *make* utility command line, in the order specified on the  
95815 command line. It is unspecified whether the internal macros defined in [Internal Macros](#)  
95816 (on page 2917) are accepted from this source.
- 95817 2. Macros defined by the *MAKEFLAGS* environment variable, in the order specified in the  
95818 environment variable. It is unspecified whether the internal macros defined in [Internal](#)  
95819 [Macros](#) (on page 2917) are accepted from this source.
- 95820 3. The contents of the environment, excluding the *MAKEFLAGS* and *SHELL* variables and  
95821 including the variables with null values.
- 95822 4. Macros defined in the inference rules built into *make*.

95823 Macro definitions from these sources shall not override macro definitions from a lower-  
95824 numbered source. Macro definitions from a single source (for example, the *make* utility  
95825 command line, the *MAKEFLAGS* environment variable, or the other environment variables)  
95826 shall override previous macro definitions from the same source.

95827 Macros defined in the makefile(s) shall override macro definitions that occur before them in the  
95828 makefile(s) and macro definitions from source 4. If the *-e* option is not specified, macros defined  
95829 in the makefile(s) shall override macro definitions from source 3. Macros defined in the  
95830 makefile(s) shall not override macro definitions from source 1 or source 2.

95831 Before the makefile(s) are read, all of the *make* utility command line options (except *-f* and *-p*)  
95832 and *make* utility command line macro definitions (except any for the *MAKEFLAGS* macro), not  
95833 already included in the *MAKEFLAGS* macro, shall be added to the *MAKEFLAGS* macro, quoted

95834 in an implementation-defined manner such that when *MAKEFLAGS* is read by another instance  
 95835 of the *make* command, the original macro's value is recovered. Other implementation-defined  
 95836 options and macros may also be added to the *MAKEFLAGS* macro. If this modifies the value of  
 95837 the *MAKEFLAGS* macro, or, if the *MAKEFLAGS* macro is modified at any subsequent time, the  
 95838 *MAKEFLAGS* environment variable shall be modified to match the new value of the  
 95839 *MAKEFLAGS* macro. The result of setting *MAKEFLAGS* in the Makefile is unspecified.

95840 Before the makefile(s) are read, all of the *make* utility command line macro definitions (except the  
 95841 *MAKEFLAGS* macro or the *SHELL* macro) shall be added to the environment of *make*. Other  
 95842 implementation-defined variables may also be added to the environment of *make*.

95843 The **SHELL** macro shall be treated specially. It shall be provided by *make* and set to the  
 95844 pathname of the shell command language interpreter (see *sh*). The *SHELL* environment variable  
 95845 shall not affect the value of the **SHELL** macro. If **SHELL** is defined in the makefile or is specified  
 95846 on the command line, it shall replace the original value of the **SHELL** macro, but shall not affect  
 95847 the *SHELL* environment variable. Other effects of defining **SHELL** in the makefile or on the  
 95848 command line are implementation-defined.

#### 95849 Inference Rules

95850 Inference rules are formatted as follows:

```
95851 target:
95852 <tab>command
95853 [<tab>command]
95854 ...
95855 line that does not begin with <tab> or #
```

95856 The application shall ensure that the *target* portion is a valid target name (see [Target Rules](#), on  
 95857 page 2913) of the form *.s2* or *.s1.s2* (where *.s1* and *.s2* are suffixes that have been given as  
 95858 prerequisites of the **.SUFFIXES** special target and *s1* and *s2* do not contain any *<slash>* or  
 95859 *<period>* characters.) If there is only one *<period>* in the target, it is a single-suffix inference  
 95860 rule. Targets with two periods are double-suffix inference rules. Inference rules can have only  
 95861 one target before the *<colon>*.

95862 The application shall ensure that the makefile does not specify prerequisites for inference rules;  
 95863 no characters other than white space shall follow the *<colon>* in the first line, except when  
 95864 creating the *empty rule*, described below. Prerequisites are inferred, as described below.

95865 Inference rules can be redefined. A target that matches an existing inference rule shall overwrite  
 95866 the old inference rule. An empty rule can be created with a command consisting of simply a  
 95867 *<semicolon>* (that is, the rule still exists and is found during inference rule search, but since it is  
 95868 empty, execution has no effect). The empty rule can also be formatted as follows:

```
95869 rule: ;
```

95870 where zero or more *<blank>* characters separate the *<colon>* and *<semicolon>*.

95871 The *make* utility uses the suffixes of targets and their prerequisites to infer how a target can be  
 95872 made up-to-date. A list of inference rules defines the commands to be executed. By default, *make*  
 95873 contains a built-in set of inference rules. Additional rules can be specified in the makefile.

95874 The special target **.SUFFIXES** contains as its prerequisites a list of suffixes that shall be used by  
 95875 the inference rules. The order in which the suffixes are specified defines the order in which the  
 95876 inference rules for the suffixes are used. New suffixes shall be appended to the current list by  
 95877 specifying a **.SUFFIXES** special target in the makefile. A **.SUFFIXES** target with no prerequisites  
 95878 shall clear the list of suffixes. An empty **.SUFFIXES** target followed by a new **.SUFFIXES** list is

95879 required to change the order of the suffixes.

95880 Normally, the user would provide an inference rule for each suffix. The inference rule to update  
 95881 a target with a suffix **.s1** from a prerequisite with a suffix **.s2** is specified as a target **.s2.s1**. The  
 95882 internal macros provide the means to specify general inference rules (see [Internal Macros](#)).

95883 When no target rule is found to update a target, the inference rules shall be checked. The suffix  
 95884 of the target (**.s1**) to be built is compared to the list of suffixes specified by the **.SUFFIXES** special  
 95885 targets. If the **.s1** suffix is found in **.SUFFIXES**, the inference rules shall be searched in the order  
 95886 defined for the first **.s2.s1** rule whose prerequisite file (**\$.s2**) exists. If the target is out-of-date  
 95887 with respect to this prerequisite, the commands for that inference rule shall be executed.

95888 If the target to be built does not contain a suffix and there is no rule for the target, the single  
 95889 suffix inference rules shall be checked. The single-suffix inference rules define how to build a  
 95890 target if a file is found with a name that matches the target name with one of the single suffixes  
 95891 appended. A rule with one suffix **.s2** is the definition of how to build *target* from **target.s2**. The  
 95892 other suffix (**.s1**) is treated as null.

95893 XSI A `<tilde>` ('~') in the above rules refers to an SCCS file in the current directory. Thus, the rule  
 95894 **.c~.o** would transform an SCCS C-language source file into an object file (**.o**). Because the **s.** of  
 95895 the SCCS files is a prefix, it is incompatible with *make*'s suffix point of view. Hence, the '~' is a  
 95896 way of changing any file reference into an SCCS file reference.

### 95897 Libraries

95898 If a target or prerequisite contains parentheses, it shall be treated as a member of an archive  
 95899 library. For the *lib(member.o)* expression *lib* refers to the name of the archive library and *member.o*  
 95900 to the member name. The application shall ensure that the member is an object file with the **.o**  
 95901 suffix. The modification time of the expression is the modification time for the member as kept  
 95902 in the archive library; see *ar*. The **.a** suffix shall refer to an archive library. The **.s2.a** rule shall be  
 95903 used to update a member in the library from a file with a suffix **.s2**.

### 95904 Internal Macros

95905 The *make* utility shall maintain five internal macros that can be used in target and inference rules.  
 95906 In order to clearly define the meaning of these macros, some clarification of the terms *target rule*,  
 95907 *inference rule*, *target*, and *prerequisite* is necessary.

95908 Target rules are specified by the user in a makefile for a particular target. Inference rules are  
 95909 user-specified or *make*-specified rules for a particular class of target name. Explicit prerequisites  
 95910 are those prerequisites specified in a makefile on target lines. Implicit prerequisites are those  
 95911 prerequisites that are generated when inference rules are used. Inference rules are applied to  
 95912 implicit prerequisites or to explicit prerequisites that do not have target rules defined for them in  
 95913 the makefile. Target rules are applied to targets specified in the makefile.

95914 Before any target in the makefile is updated, each of its prerequisites (both explicit and implicit)  
 95915 shall be updated. This shall be accomplished by recursively processing each prerequisite. Upon  
 95916 recursion, each prerequisite shall become a target itself. Its prerequisites in turn shall be  
 95917 processed recursively until a target is found that has no prerequisites, at which point the  
 95918 recursion stops. The recursion shall then back up, updating each target as it goes.

95919 In the definitions that follow, the word *target* refers to one of:

- 95920 • A target specified in the makefile

95921 • An explicit prerequisite specified in the makefile that becomes the target when *make*  
95922 processes it during recursion

95923 • An implicit prerequisite that becomes a target when *make* processes it during recursion

95924 In the definitions that follow, the word *prerequisite* refers to one of the following:

95925 • An explicit prerequisite specified in the makefile for a particular target

95926 • An implicit prerequisite generated as a result of locating an appropriate inference rule and  
95927 corresponding file that matches the suffix of the target

95928 The five internal macros are:

95929 **\$@** The **\$@** shall evaluate to the full target name of the current target, or the archive  
95930 filename part of a library archive target. It shall be evaluated for both target and  
95931 inference rules.

95932 For example, in the **.c.a** inference rule, **\$@** represents the out-of-date **.a** file to be built.  
95933 Similarly, in a makefile target rule to build **lib.a** from **file.c**, **\$@** represents the out-of-  
95934 date **lib.a**.

95935 **\$\$** The **\$\$** macro shall be evaluated only when the current target is an archive library  
95936 member of the form *libname(member.o)*. In these cases, **\$@** shall evaluate to *libname* and  
95937 **\$\$** shall evaluate to *member.o*. The **\$\$** macro shall be evaluated for both target and  
95938 inference rules.

95939 For example, in a makefile target rule to build **lib.a(file.o)**, **\$\$** represents **file.o**, as  
95940 opposed to **\$@**, which represents **lib.a**.

95941 **\$\$?** The **\$\$?** macro shall evaluate to the list of prerequisites that are newer than the current  
95942 target. It shall be evaluated for both target and inference rules.

95943 For example, in a makefile target rule to build *prog* from **file1.o**, **file2.o**, and **file3.o**, and  
95944 where *prog* is not out-of-date with respect to **file1.o**, but is out-of-date with respect to  
95945 **file2.o** and **file3.o**, **\$\$?** represents **file2.o** and **file3.o**.

95946 **\$\$<** In an inference rule, the **\$\$<** macro shall evaluate to the filename whose existence  
95947 allowed the inference rule to be chosen for the target. In the **.DEFAULT** rule, the **\$\$<**  
95948 macro shall evaluate to the current target name. The meaning of the **\$\$<** macro shall be  
95949 otherwise unspecified.

95950 For example, in the **.c.a** inference rule, **\$\$<** represents the prerequisite **.c** file.

95951 **\$\$\*** The **\$\$\*** macro shall evaluate to the current target name with its suffix deleted. It shall be  
95952 evaluated at least for inference rules.

95953 For example, in the **.c.a** inference rule, **\$\$\*.o** represents the out-of-date **.o** file that  
95954 corresponds to the prerequisite **.c** file.

95955 Each of the internal macros has an alternative form. When an uppercase 'D' or 'F' is appended  
95956 to any of the macros, the meaning shall be changed to the *directory part* for 'D' and *filename part*  
95957 for 'F'. The directory part is the path prefix of the file without a trailing <slash>; for the current  
95958 directory, the directory part is '.'. When the **\$\$?** macro contains more than one prerequisite  
95959 filename, the **\$\$(?D)** and **\$\$(?F)** (or **\$\${?D}** and **\$\${?F}**) macros expand to a list of directory name parts  
95960 and filename parts respectively.

95961 For the target *lib(member.o)* and the **s2.a** rule, the internal macros shall be defined as:

## Utilities

## make

95962        \$<     *member.s2*  
 95963        \$\*     *member*  
 95964        \$@     *lib*  
 95965        \$?     *member.s2*  
 95966        \$%     *member.o*

95967        **Default Rules**

95968        The default rules for *make* shall achieve results that are the same as if the following were used.  
 95969        Implementations that do not support the C-Language Development Utilities option may omit  
 95970        **CC**, **CFLAGS**, **YACC**, **YFLAGS**, **LEX**, **LFLAGS**, **LDFLAGS**, and the **.c**, **.y**, and **.l** inference rules.  
 95971        Implementations that do not support FORTRAN may omit **FC**, **FFLAGS**, and the **.f** inference  
 95972        rules. Implementations may provide additional macros and rules.

95973        *SPECIAL TARGETS*

95974    XSI     **.SCCS\_GET:** *sccs \$(SCCSFLAGS) get \$(SCCSGETFLAGS) \$@*

95975    XSI     **.SUFFIXES:** *.o .c .y .l .a .sh .f .c~ .y~ .l~ .sh~ .f~*

95976        **MACROS**

95977        MAKE=make  
 95978        AR=ar  
 95979        ARFLAGS=-rv  
 95980        YACC=yacc  
 95981        YFLAGS=  
 95982        LEX=lex  
 95983        LFLAGS=  
 95984        LDFLAGS=  
 95985        CC=c99  
 95986        CFLAGS=-O  
 95987        FC=fort77  
 95988        FFLAGS=-O 1

95989    XSI     **GET=get**  
 95990        **GFLAGS=**  
 95991        **SCCSFLAGS=**  
 95992        **SCCSGETFLAGS=-s**

95993        *SINGLE SUFFIX RULES*

95994        **.c:**  
 95995        \$ (CC) \$ (CFLAGS) \$ (LDFLAGS) -o \$@ \$<

95996        **.f:**  
 95997        \$ (FC) \$ (FFLAGS) \$ (LDFLAGS) -o \$@ \$<

95998        **.sh:**  
 95999        cp \$< \$@  
 96000        chmod a+x \$@

96001    XSI     **.c~:**  
 96002        \$ (GET) \$ (GFLAGS) -p \$< > \$\*.c

## make

## Utilities

```

96003      $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $*.c
96004 .f~:
96005      $(GET) $(GFLAGS) -p $< > $*.f
96006      $(FC) $(FFLAGS) $(LDFLAGS) -o $@ $*.f

96007 .sh~:
96008      $(GET) $(GFLAGS) -p $< > $*.sh
96009      cp $*.sh $@
96010      chmod a+x $@

```

96011 *DOUBLE SUFFIX RULES*

```

96012 .c.o:
96013      $(CC) $(CFLAGS) -c $<

96014 .f.o:
96015      $(FC) $(FFLAGS) -c $<

96016 .y.o:
96017      $(YACC) $(YFLAGS) $<
96018      $(CC) $(CFLAGS) -c y.tab.c
96019      rm -f y.tab.c
96020      mv y.tab.o $@

96021 .l.o:
96022      $(LEX) $(LFLAGS) $<
96023      $(CC) $(CFLAGS) -c lex.yy.c
96024      rm -f lex.yy.c
96025      mv lex.yy.o $@

96026 .y.c:
96027      $(YACC) $(YFLAGS) $<
96028      mv y.tab.c $@

96029 .l.c:
96030      $(LEX) $(LFLAGS) $<
96031      mv lex.yy.c $@

```

```

96032 XSI .c~.o:
96033      $(GET) $(GFLAGS) -p $< > $*.c
96034      $(CC) $(CFLAGS) -c $*.c

96035 .f~.o:
96036      $(GET) $(GFLAGS) -p $< > $*.f
96037      $(FC) $(FFLAGS) -c $*.f

96038 .y~.o:
96039      $(GET) $(GFLAGS) -p $< > $*.y
96040      $(YACC) $(YFLAGS) $*.y
96041      $(CC) $(CFLAGS) -c y.tab.c
96042      rm -f y.tab.c
96043      mv y.tab.o $@

96044 .l~.o:
96045      $(GET) $(GFLAGS) -p $< > $*.l
96046      $(LEX) $(LFLAGS) $*.l

```

```

96047     $(CC) $(CFLAGS) -c lex.yy.c
96048     rm -f lex.yy.c
96049     mv lex.yy.o $@

96050 .y~.c:
96051     $(GET) $(GFLAGS) -p $< > $*.y
96052     $(YACC) $(YFLAGS) $*.y
96053     mv y.tab.c $@

96054 .l~.c:
96055     $(GET) $(GFLAGS) -p $< > $*.l
96056     $(LEX) $(LFLAGS) $*.l
96057     mv lex.yy.c $@

```

```

96058 .c.a:
96059     $(CC) -c $(CFLAGS) $<
96060     $(AR) $(ARFLAGS) $@ $*.o
96061     rm -f $*.o

96062 .f.a:
96063     $(FC) -c $(FFLAGS) $<
96064     $(AR) $(ARFLAGS) $@ $*.o
96065     rm -f $*.o

```

#### 96066 EXIT STATUS

96067 When the `-q` option is specified, the *make* utility shall exit with one of the following values:

- 96068 0 Successful completion.
- 96069 1 The target was not up-to-date.
- 96070 >1 An error occurred.

96071 When the `-q` option is not specified, the *make* utility shall exit with one of the following values:

- 96072 0 Successful completion.
- 96073 >0 An error occurred.

#### 96074 CONSEQUENCES OF ERRORS

96075 Default.

#### 96076 APPLICATION USAGE

96077 If there is a source file (such as `./source.c`) and there are two SCCS files corresponding to it  
 96078 (`./s.source.c` and `./SCCS/s.source.c`), on XSI-conformant systems *make* uses the SCCS file in the  
 96079 current directory. However, users are advised to use the underlying SCCS utilities (*admin*, *delta*,  
 96080 *get*, and so on) or the *sccs* utility for all source files in a given directory. If both forms are used for  
 96081 a given source file, future developers are very likely to be confused.

96082 It is incumbent upon portable makefiles to specify the `.POSIX` special target in order to  
 96083 guarantee that they are not affected by local extensions.

96084 The `-k` and `-S` options are both present so that the relationship between the command line, the  
 96085 `MAKEFLAGS` variable, and the makefile can be controlled precisely. If the `k` flag is passed in  
 96086 `MAKEFLAGS` and a command is of the form:

```
96087 $(MAKE) -S foo
```

96088 then the default behavior is restored for the child *make*.

96089 When the `-n` option is specified, it is always added to `MAKEFLAGS`. This allows a recursive  
96090 `make -n target` to be used to see all of the action that would be taken to update `target`.

96091 Because of widespread historical practice, interpreting a `<number-sign>` (`'#'`) inside a variable  
96092 as the start of a comment has the unfortunate side-effect of making it impossible to place a  
96093 `<number-sign>` in a variable, thus forbidding something like:

```
96094 CFLAGS = "-D COMMENT_CHAR='#'"
```

96095 Many historical `make` utilities stop chaining together inference rules when an intermediate target  
96096 is nonexistent. For example, it might be possible for a `make` to determine that both `.y.c` and `.c.o`  
96097 could be used to convert a `.y` to a `.o`. Instead, in this case, `make` requires the use of a `.y.o` rule.

96098 The best way to provide portable makefiles is to include all of the rules needed in the makefile  
96099 itself. The rules provided use only features provided by other parts of this volume of  
96100 POSIX.1-2008. The default rules include rules for optional commands in this volume of  
96101 POSIX.1-2008. Only rules pertaining to commands that are provided are needed in an  
96102 implementation's default set.

96103 Macros used within other macros are evaluated when the new macro is used rather than when  
96104 the new macro is defined. Therefore:

```
96105 MACRO = value1
96106 NEW = $(MACRO)
96107 MACRO = value2
```

```
96108 target:
96109     echo $(NEW)
```

96110 would produce `value2` and not `value1` since `NEW` was not expanded until it was needed in the  
96111 `echo` command line.

96112 Some historical applications have been known to intermix `target_name` and `macro=name` operands  
96113 on the command line, expecting that all of the macros are processed before any of the targets are  
96114 dealt with. Conforming applications do not do this, although some backwards-compatibility  
96115 support may be included in some implementations.

96116 The following characters in filenames may give trouble: `'='`, `':'`, `'\'`, single-quote, and `'@'`.  
96117 In include filenames, pattern matching characters and `'\"'` should also be avoided, as they may  
96118 be treated as special by some implementations.

96119 For inference rules, the description of `$<` and `$?` seem similar. However, an example shows the  
96120 minor difference. In a makefile containing:

```
96121 foo.o: foo.h
```

96122 if `foo.h` is newer than `foo.o`, yet `foo.c` is older than `foo.o`, the built-in rule to make `foo.o` from  
96123 `foo.c` is used, with `$<` equal to `foo.c` and `$?` equal to `foo.h`. If `foo.c` is also newer than `foo.o`, `$<` is  
96124 equal to `foo.c` and `$?` is equal to `foo.h`.

## 96125 EXAMPLES

- 96126 1. The following command:  
96127 `make`  
96128 makes the first target found in the makefile.
- 96129 2. The following command:  
96130 `make junk`

- 96131 makes the target **junk**.
- 96132 3. The following makefile says that **pgm** depends on two files, **a.o** and **b.o**, and that they in  
96133 turn depend on their corresponding source files (**a.c** and **b.c**), and a common file **incl.h**:
- ```
96134 pgm: a.o b.o
96135     c99 a.o b.o -o pgm
96136 a.o: incl.h a.c
96137     c99 -c a.c
96138 b.o: incl.h b.c
96139     c99 -c b.c
```
- 96140 4. An example for making optimized **.o** files from **.c** files is:
- ```
96141 .c.o:
96142     c99 -c -O $*.c
```
- 96143 or:
- ```
96144 .c.o:
96145     c99 -c -O $<
```
- 96146 5. The most common use of the archive interface follows. Here, it is assumed that the source  
96147 files are all C-language source:
- ```
96148 lib: lib(file1.o) lib(file2.o) lib(file3.o)
96149     @echo lib is now up-to-date
```
- 96150 The **.c.a** rule is used to make **file1.o**, **file2.o**, and **file3.o** and insert them into **lib**.
- 96151 The treatment of escaped <newline> characters throughout the makefile is historical  
96152 practice. For example, the inference rule:
- ```
96153 .c.o\
96154 :
```
- 96155 works, and the macro:
- ```
96156 f= bar baz\
96157     biz
96158 a:
96159     echo ==$f==
```
- 96160 echoes "==bar baz biz==".
- 96161 If **?** were:
- ```
96162 /usr/include/stdio.h /usr/include/unistd.h foo.h
```
- 96163 then **\$(?D)** would be:
- ```
96164 /usr/include /usr/include .
```
- 96165 and **\$(?F)** would be:
- ```
96166 stdio.h unistd.h foo.h
```
- 96167 6. The contents of the built-in rules can be viewed by running:
- ```
96168 make -p -f /dev/null 2>/dev/null
```

## 96169 RATIONALE

96170 The *make* utility described in this volume of POSIX.1-2008 is intended to provide the means for  
 96171 changing portable source code into executables that can be run on an POSIX.1-2008-conforming  
 96172 system. It reflects the most common features present in System V and BSD *makes*.

96173 Historically, the *make* utility has been an especially fertile ground for vendor and research  
 96174 organization-specific syntax modifications and extensions. Examples include:

- 96175 • Syntax supporting parallel execution (such as from various multi-processor vendors, GNU,  
 96176 and others)
- 96177 • Additional “operators” separating targets and their prerequisites (System V, BSD, and  
 96178 others)
- 96179 • Specifying that command lines containing the strings “\${MAKE}” and “\$(MAKE)” are  
 96180 executed when the `-n` option is specified (GNU and System V)
- 96181 • Modifications of the meaning of internal macros when referencing libraries (BSD and  
 96182 others)
- 96183 • Using a single instance of the shell for all of the command lines of the target (BSD and  
 96184 others)
- 96185 • Allowing <space> characters as well as <tab> characters to delimit command lines (BSD)
- 96186 • Adding C preprocessor-style “include” and “ifdef” constructs (System V, GNU, BSD, and  
 96187 others)
- 96188 • Remote execution of command lines (Sprite and others)
- 96189 • Specifying additional special targets (BSD, System V, and most others)

96190 Additionally, many vendors and research organizations have rethought the basic concepts of  
 96191 *make*, creating vastly extended, as well as completely new, syntaxes. Each of these versions of  
 96192 *make* fulfills the needs of a different community of users; it is unreasonable for this volume of  
 96193 POSIX.1-2008 to require behavior that would be incompatible (and probably inferior) to  
 96194 historical practice for such a community.

96195 In similar circumstances, when the industry has enough sufficiently incompatible formats as to  
 96196 make them irreconcilable, this volume of POSIX.1-2008 has followed one or both of two courses  
 96197 of action. Commands have been renamed (*cksum*, *echo*, and *pax*) and/or command line options  
 96198 have been provided to select the desired behavior (*grep*, *od*, and *pax*).

96199 Because the syntax specified for the *make* utility is, by and large, a subset of the syntaxes  
 96200 accepted by almost all versions of *make*, it was decided that it would be counter-productive to  
 96201 change the name. And since the makefile itself is a basic unit of portability, it would not be  
 96202 completely effective to reserve a new option letter, such as *make -P*, to achieve the portable  
 96203 behavior. Therefore, the special target **.POSIX** was added to the makefile, allowing users to  
 96204 specify “standard” behavior. This special target does not preclude extensions in the *make* utility,  
 96205 nor does it preclude such extensions being used by the makefile specifying the target; it does,  
 96206 however, preclude any extensions from being applied that could alter the behavior of previously  
 96207 valid syntax; such extensions must be controlled via command line options or new special  
 96208 targets. It is incumbent upon portable makefiles to specify the **.POSIX** special target in order to  
 96209 guarantee that they are not affected by local extensions.

96210 The portable version of *make* described in this reference page is not intended to be the state-of-  
 96211 the-art software generation tool and, as such, some newer and more leading-edge features have  
 96212 not been included. An attempt has been made to describe the portable makefile in a manner that  
 96213 does not preclude such extensions as long as they do not disturb the portable behavior described

- 96214 here.
- 96215 When the `-n` option is specified, it is always added to `MAKEFLAGS`. This allows a recursive  
96216 `make -n target` to be used to see all of the action that would be taken to update `target`.
- 96217 The definition of `MAKEFLAGS` allows both the System V letter string and the BSD command  
96218 line formats. The two formats are sufficiently different to allow implementations to support both  
96219 without ambiguity.
- 96220 Early proposals stated that an “unquoted” `<number-sign>` was treated as the start of a  
96221 comment. The `make` utility does not pay any attention to quotes. A `<number-sign>` starts a  
96222 comment regardless of its surroundings.
- 96223 The text about “other implementation-defined pathnames may also be tried” in addition to  
96224 `./makefile` and `./Makefile` is to allow such extensions as `SCCS/s.Makefile` and other variations.  
96225 It was made an implementation-defined requirement (as opposed to unspecified behavior) to  
96226 highlight surprising implementations that might select something unexpected like  
96227 `/etc/Makefile`. XSI-conformant systems also try `./s.makefile`, `SCCS/s.makefile`, `./s.Makefile`,  
96228 and `SCCS/s.Makefile`.
- 96229 Early proposals contained the macro `NPROC` as a means of specifying that `make` should use `n`  
96230 processes to do the work required. While this feature is a valuable extension for many systems, it  
96231 is not common usage and could require other non-trivial extensions to makefile syntax. This  
96232 extension is not required by this volume of POSIX.1-2008, but could be provided as a compatible  
96233 extension. The macro `PARALLEL` is used by some historical systems with essentially the same  
96234 meaning (but without using a name that is a common system limit value). It is suggested that  
96235 implementors recognize the existing use of `NPROC` and/or `PARALLEL` as extensions to `make`.
- 96236 The default rules are based on System V. The default `CC=` value is `c99` instead of `cc` because this  
96237 volume of POSIX.1-2008 does not standardize the utility named `cc`. Thus, every conforming  
96238 application would be required to define `CC=c99` to expect to run. There is no advantage  
96239 conferred by the hope that the makefile might hit the “preferred” compiler because this cannot  
96240 be guaranteed to work. Also, since the portable makescript can only use the `c99` options, no  
96241 advantage is conferred in terms of what the script can do. It is a quality-of-implementation issue  
96242 as to whether `c99` is as valuable as `cc`.
- 96243 The `-d` option to `make` is frequently used to produce debugging information, but is too  
96244 implementation-defined to add to this volume of POSIX.1-2008.
- 96245 The `-p` option is not passed in `MAKEFLAGS` on most historical implementations and to change  
96246 this would cause many implementations to break without sufficiently increased portability.
- 96247 Commands that begin with a `<plus-sign>` (`'+'`) are executed even if the `-n` option is present.  
96248 Based on the GNU version of `make`, the behavior of `-n` when the `<plus-sign>` prefix is  
96249 encountered has been extended to apply to `-q` and `-t` as well. However, the System V  
96250 convention of forcing command execution with `-n` when the command line of a target contains  
96251 either of the strings `"$(MAKE)"` or `"${MAKE}"` has not been adopted. This functionality  
96252 appeared in early proposals, but the danger of this approach was pointed out with the following  
96253 example of a portion of a makefile:
- ```
96254 subdir:
96255     cd subdir; rm all_the_files; $(MAKE)
```
- 96256 The loss of the System V behavior in this case is well-balanced by the safety afforded to other  
96257 makefiles that were not aware of this situation. In any event, the command line `<plus-sign>`  
96258 prefix can provide the desired functionality.
- 96259 The double `<colon>` in the target rule format is supported in BSD systems to allow more than

96260 one target line containing the same target name to have commands associated with it. Since this  
 96261 is not functionality described in the SVID or XPG3 it has been allowed as an extension, but not  
 96262 mandated.

96263 The default rules are provided with text specifying that the built-in rules shall be the same as if  
 96264 the listed set were used. The intent is that implementations should be able to use the rules  
 96265 without change, but will be allowed to alter them in ways that do not affect the primary  
 96266 behavior.

96267 The best way to provide portable makefiles is to include all of the rules needed in the makefile  
 96268 itself. The rules provided use only features provided by other portions of this volume of  
 96269 POSIX.1-2008. The default rules include rules for optional commands in this volume of  
 96270 POSIX.1-2008. Only rules pertaining to commands that are provided are needed in the default  
 96271 set of an implementation.

96272 One point of discussion was whether to drop the default rules list from this volume of  
 96273 POSIX.1-2008. They provide convenience, but do not enhance portability of applications. The  
 96274 prime benefit is in portability of users who wish to type *make command* and have the command  
 96275 build from a **command.c** file.

96276 The historical *MAKESHELL* feature was omitted. In some implementations it is used to let a user  
 96277 override the shell to be used to run *make* commands. This was confusing; for a portable *make*, the  
 96278 shell should be chosen by the makefile writer or specified on the *make* command line and not by  
 96279 a user running *make*.

96280 The *make* utilities in most historical implementations process the prerequisites of a target in left-  
 96281 to-right order, and the makefile format requires this. It supports the standard idiom used in  
 96282 many makefiles that produce *yacc* programs; for example:

```
96283 foo: y.tab.o lex.o main.o
96284      $(CC) $(CFLAGS) -o $@ t.tab.o lex.o main.o
```

96285 In this example, if *make* chose any arbitrary order, the **lex.o** might not be made with the correct  
 96286 **y.tab.h**. Although there may be better ways to express this relationship, it is widely used  
 96287 historically. Implementations that desire to update prerequisites in parallel should require an  
 96288 explicit extension to *make* or the makefile format to accomplish it, as described previously.

96289 The algorithm for determining a new entry for target rules is partially unspecified. Some  
 96290 historical *makes* allow blank, empty, or comment lines within the collection of commands  
 96291 marked by leading <tab> characters. A conforming makefile must ensure that each command  
 96292 starts with a <tab>, but implementations are free to ignore blank, empty, and comment lines  
 96293 without triggering the start of a new entry.

96294 The ASYNCHRONOUS EVENTS section includes having SIGTERM and SIGHUP, along with  
 96295 the more traditional SIGINT and SIGQUIT, remove the current target unless directed not to do  
 96296 so. SIGTERM and SIGHUP were added to parallel other utilities that have historically cleaned  
 96297 up their work as a result of these signals. When *make* receives any signal other than SIGQUIT, it  
 96298 is required to resend itself the signal it received so that it exits with a status that reflects the  
 96299 signal. The results from SIGQUIT are partially unspecified because, on systems that create **core**  
 96300 files upon receipt of SIGQUIT, the **core** from *make* would conflict with a **core** file from the  
 96301 command that was running when the SIGQUIT arrived. The main concern was to prevent  
 96302 damaged files from appearing up-to-date when *make* is rerun.

96303 The **.PRECIOUS** special target was extended to affect all targets globally (by specifying no  
 96304 prerequisites). The **.IGNORE** and **.SILENT** special targets were extended to allow prerequisites;  
 96305 it was judged to be more useful in some cases to be able to turn off errors or echoing for a list of  
 96306 targets than for the entire makefile. These extensions to *make* in System V were made to match

96307 historical practice from the BSD *make*.

96308 Macros are not exported to the environment of commands to be run. This was never the case in  
96309 any historical *make* and would have serious consequences. The environment is the same as the  
96310 environment to *make* except that *MAKEFLAGS* and macros defined on the *make* command line  
96311 are added.

96312 Some implementations do not use *system()* for all command lines, as required by the portable  
96313 makefile format; as a performance enhancement, they select lines without shell metacharacters  
96314 for direct execution by *execve()*. There is no requirement that *system()* be used specifically, but  
96315 merely that the same results be achieved. The metacharacters typically used to bypass the direct  
96316 *execve()* execution have been any of:

96317 = | ^ ( ) ; & < > \* ? [ ] : \$ \ ' " \ \n

96318 The default in some advanced versions of *make* is to group all the command lines for a target and  
96319 execute them using a single shell invocation; the System V method is to pass each line  
96320 individually to a separate shell. The single-shell method has the advantages in performance and  
96321 the lack of a requirement for many continued lines. However, converting to this newer method  
96322 has caused portability problems with many historical makefiles, so the behavior with the POSIX  
96323 makefile is specified to be the same as that of System V. It is suggested that the special target  
96324 *.ONESHELL* be used as an implementation extension to achieve the single-shell grouping for a  
96325 target or group of targets.

96326 Novice users of *make* have had difficulty with the historical need to start commands with a  
96327 <tab>. Since it is often difficult to discern differences between <tab> and <space> characters on  
96328 terminals or printed listings, confusing bugs can arise. In early proposals, an attempt was made  
96329 to correct this problem by allowing leading <blank> characters instead of <tab> characters.  
96330 However, implementors reported many makefiles that failed in subtle ways following this  
96331 change, and it is difficult to implement a *make* that unambiguously can differentiate between  
96332 macro and command lines. There is extensive historical practice of allowing leading <space>  
96333 characters before macro definitions. Forcing macro lines into column 1 would be a significant  
96334 backwards-compatibility problem for some makefiles. Therefore, historical practice was  
96335 restored.

96336 There is substantial variation in the handling of include lines by different implementations.  
96337 However, there is enough commonality for the standard to be able to specify a minimum set of  
96338 requirements that allow the feature to be used portably. Known variations have been explicitly  
96339 called out as unspecified behavior in the description.

96340 The System V dynamic dependency feature was not included. It would support:

96341 `cat: $$e.c`

96342 that would expand to;

96343 `cat: cat.c`

96344 This feature exists only in the new version of System V *make* and, while useful, is not in wide  
96345 usage. This means that macros are expanded twice for prerequisites: once at makefile parse time  
96346 and once at target update time.

96347 Consideration was given to adding metarules to the POSIX *make*. This would make *%.o: %.c* the  
96348 same as *.c.o:*. This is quite useful and available from some vendors, but it would cause too many  
96349 changes to this *make* to support. It would have introduced rule chaining and new substitution  
96350 rules. However, the rules for target names have been set to reserve the '%' and '"' characters.  
96351 These are traditionally used to implement metarules and quoting of target names, respectively.  
96352 Implementors are strongly encouraged to use these characters only for these purposes.

- 96353 A request was made to extend the suffix delimiter character from a <period> to any character.  
96354 The metarules feature in newer *makes* solves this problem in a more general way. This volume of  
96355 POSIX.1-2008 is staying with the more conservative historical definition.
- 96356 The standard output format for the `-p` option is not described because it is primarily a  
96357 debugging option and because the format is not generally useful to programs. In historical  
96358 implementations the output is not suitable for use in generating makefiles. The `-p` format has  
96359 been variable across historical implementations. Therefore, the definition of `-p` was only to  
96360 provide a consistently named option for obtaining *make* script debugging information.
- 96361 Some historical implementations have not cleared the suffix list with `-r`.
- 96362 Implementations should be aware that some historical applications have intermixed *target\_name*  
96363 and *macro=value* operands on the command line, expecting that all of the macros are processed  
96364 before any of the targets are dealt with. Conforming applications do not do this, but some  
96365 backwards-compatibility support may be warranted.
- 96366 Empty inference rules are specified with a <semicolon> command rather than omitting all  
96367 commands, as described in an early proposal. The latter case has no traditional meaning and is  
96368 reserved for implementation extensions, such as in GNU *make*.
- 96369 **FUTURE DIRECTIONS**
- 96370 None.
- 96371 **SEE ALSO**
- 96372 [Chapter 2](#) (on page 2297), *ar*, *c99*, *get*, *lex*, *sccs*, *sh*, *yacc*
- 96373 [XBD Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)
- 96374 [XSH \*exec\*, \*system\(\)\*](#)
- 96375 **CHANGE HISTORY**
- 96376 First released in Issue 2.
- 96377 **Issue 5**
- 96378 The FUTURE DIRECTIONS section is added.
- 96379 **Issue 6**
- 96380 This utility is marked as part of the Software Development Utilities option.
- 96381 The Open Group Corrigendum U029/1 is applied, correcting a typographical error in the  
96382 SPECIAL TARGETS section.
- 96383 In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from  
96384 “otherwise, the home directory of a user of that name is examined” to “otherwise, the value of  
96385 *PROJECTDIR* is treated as a user name and that user’s initial working directory is examined”.
- 96386 It is specified whether the command line is related to the makefile or to the *make* command, and  
96387 the macro processing rules are updated to align with the IEEE P1003.2b draft standard.
- 96388 The normative text is reworded to avoid use of the term “must” for application requirements.
- 96389 PASC Interpretation 1003.2 #193 is applied.
- 96390 **Issue 7**
- 96391 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
96392 apply.
- 96393 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 96394 Include lines in makefiles are introduced.

96395  
96396

Austin Group Interpretation 1003.1-2001 #131 is applied, changing the **Makefile Execution** section.

96397 **NAME**

96398 man — display system documentation

96399 **SYNOPSIS**96400 man [-k] *name* . . .96401 **DESCRIPTION**

96402 The *man* utility shall write information about each of the *name* operands. If *name* is the name of a  
 96403 standard utility, *man* at a minimum shall write a message describing the syntax used by the  
 96404 standard utility, its options, and operands. If more information is available, the *man* utility shall  
 96405 provide it in an implementation-defined manner.

96406 An implementation may provide information for values of *name* other than the standard utilities.  
 96407 Standard utilities that are listed as optional and that are not supported by the implementation  
 96408 either shall cause a brief message indicating that fact to be displayed or shall cause a full display  
 96409 of information as described previously.

96410 **OPTIONS**96411 The *man* utility shall conform to XBD Section 12.2 (on page 215).

96412 The following option shall be supported:

96413 **-k** Interpret *name* operands as keywords to be used in searching a utilities summary  
 96414 database that contains a brief purpose entry for each standard utility and write lines  
 96415 from the summary database that match any of the keywords. The keyword search shall  
 96416 produce results that are the equivalent of the output of the following command:

```
96417 grep -Ei '  
96418     name  
96419     name  
96420     . . .  
96421     ' summary-database
```

96422 This assumes that the *summary-database* is a text file with a single entry per line; this  
 96423 organization is not required and the example using *grep -Ei* is merely illustrative of the  
 96424 type of search intended. The purpose entry to be included in the database shall consist  
 96425 of a terse description of the purpose of the utility.

96426 **OPERANDS**

96427 The following operand shall be supported:

96428 *name* A keyword or the name of a standard utility. When **-k** is not specified and *name*  
 96429 does not represent one of the standard utilities, the results are unspecified.

96430 **STDIN**

96431 Not used.

96432 **INPUT FILES**

96433 None.

96434 **ENVIRONMENT VARIABLES**96435 The following environment variables shall affect the execution of *man*:

96436 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 96437 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 96438 variables used to determine the values of locale categories.)

96439 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 96440 internationalization variables.

- 96441 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 96442 characters (for example, single-byte as opposed to multi-byte characters in  
 96443 arguments and in the summary database). The value of *LC\_CTYPE* need not affect  
 96444 the format of the information written about the *name* operands.
- 96445 **LC\_MESSAGES**  
 96446 Determine the locale that should be used to affect the format and contents of  
 96447 diagnostic messages written to standard error and informative messages written to  
 96448 standard output.
- 96449 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 96450 **PAGER** Determine an output filtering command for writing the output to a terminal. Any  
 96451 string acceptable as a *command\_string* operand to the *sh -c* command shall be valid.  
 96452 When standard output is a terminal device, the reference page output shall be  
 96453 piped through the command. If the *PAGER* variable is null or not set, the command  
 96454 shall be either *more* or another paginator utility documented in the system  
 96455 documentation.
- 96456 **ASYNCHRONOUS EVENTS**  
 96457 Default.
- 96458 **STDOUT**  
 96459 The *man* utility shall write text describing the syntax of the utility *name*, its options and its  
 96460 operands, or, when *-k* is specified, lines from the summary database. The format of this text is  
 96461 implementation-defined.
- 96462 **STDERR**  
 96463 The standard error shall be used for diagnostic messages, and may also be used for  
 96464 informational messages of unspecified format.
- 96465 **OUTPUT FILES**  
 96466 None.
- 96467 **EXTENDED DESCRIPTION**  
 96468 None.
- 96469 **EXIT STATUS**  
 96470 The following exit values shall be returned:  
 96471 0 Successful completion.  
 96472 >0 An error occurred.
- 96473 **CONSEQUENCES OF ERRORS**  
 96474 Default.
- 96475 **APPLICATION USAGE**  
 96476 None.
- 96477 **EXAMPLES**  
 96478 None.
- 96479 **RATIONALE**  
 96480 It is recognized that the *man* utility is only of minimal usefulness as specified. The opinion of the  
 96481 standard developers was strongly divided as to how much or how little information *man* should  
 96482 be required to provide. They considered, however, that the provision of some portable way of  
 96483 accessing documentation would aid user portability. The arguments against a fuller specification  
 96484 were:

- 96485 • Large quantities of documentation should not be required on a system that does not have
- 96486 excess disk space.
- 96487 • The current manual system does not present information in a manner that greatly aids user
- 96488 portability.
- 96489 • A “better help system” is currently an area in which vendors feel that they can add value
- 96490 to their POSIX implementations.

96491 The `-f` option was considered, but due to implementation differences, it was not included in this  
 96492 volume of POSIX.1-2008.

96493 The description was changed to be more specific about what has to be displayed for a utility. The  
 96494 standard developers considered it insufficient to allow a display of only the synopsis without  
 96495 giving a short description of what each option and operand does.

96496 The “purpose” entry to be included in the database can be similar to the section title (less the  
 96497 numeric prefix) from this volume of POSIX.1-2008 for each utility. These titles are similar to  
 96498 those used in historical systems for this purpose.

96499 See *mailx* for rationale concerning the default paginator.

96500 The caveat in the *LC\_CTYPE* description was added because it is not a requirement that an  
 96501 implementation provide reference pages for all of its supported locales on each system;  
 96502 changing *LC\_CTYPE* does not necessarily translate the reference page into another language.  
 96503 This is equivalent to the current state of *LC\_MESSAGES* in POSIX.1-2008—locale-specific  
 96504 messages are not yet a requirement.

96505 The historical *MANPATH* variable is not included in POSIX because no attempt is made to  
 96506 specify naming conventions for reference page files, nor even to mandate that they are files at  
 96507 all. On some implementations they could be a true database, a hypertext file, or even fixed  
 96508 strings within the *man* executable. The standard developers considered the portability of  
 96509 reference pages to be outside their scope of work. However, users should be aware that  
 96510 *MANPATH* is implemented on a number of historical systems and that it can be used to tailor  
 96511 the search pattern for reference pages from the various categories (utilities, functions, file  
 96512 formats, and so on) when the system administrator reveals the location and conventions for  
 96513 reference pages on the system.

96514 The keyword search can rely on at least the text of the section titles from these utility  
 96515 descriptions, and the implementation may add more keywords. The term “section titles” refers  
 96516 to the strings such as:

```
96517 man - Display system documentation
96518 ps - Report process status
```

#### 96519 FUTURE DIRECTIONS

96520 None.

96525 First released in Issue 4.

96526 **Issue 5**

96527 The FUTURE DIRECTIONS section is added.

96528 **Issue 7**96529 Austin Group Interpretation 1003.1-2001 #108 is applied, clarifying that informational messages  
96530 may appear on standard error.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**mesg**96531 **NAME**

96532           mesg — permit or deny messages

96533 **SYNOPSIS**

96534           mesg [y|n]

96535 **DESCRIPTION**

96536           The *mesg* utility shall control whether other users are allowed to send messages via *write*, *talk*, or  
 96537           other utilities to a terminal device. The terminal device affected shall be determined by searching  
 96538           for the first terminal in the sequence of devices associated with standard input, standard output,  
 96539           and standard error, respectively. With no arguments, *mesg* shall report the current state without  
 96540           changing it. Processes with appropriate privileges may be able to send messages to the terminal  
 96541           independent of the current state.

96542 **OPTIONS**

96543           None.

96544 **OPERANDS**

96545           The following operands shall be supported in the POSIX locale:

96546           *y*           Grant permission to other users to send messages to the terminal device.96547           *n*           Deny permission to other users to send messages to the terminal device.96548 **STDIN**

96549           Not used.

96550 **INPUT FILES**

96551           None.

96552 **ENVIRONMENT VARIABLES**96553           The following environment variables shall affect the execution of *mesg*:

96554           *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 96555                       (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 96556                       variables used to determine the values of locale categories.)

96557           *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 96558                       internationalization variables.

96559           *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 96560                       characters (for example, single-byte as opposed to multi-byte characters in  
 96561                       arguments).

96562           *LC\_MESSAGES*

96563                       Determine the locale that should be used to affect the format and contents of  
 96564                       diagnostic messages written (by *mesg*) to standard error.

96565           XSI       *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

96566 **ASYNCHRONOUS EVENTS**

96567           Default.

96568 **STDOUT**96569           If no operand is specified, *mesg* shall display the current terminal state in an unspecified format.96570 **STDERR**

96571           The standard error shall be used only for diagnostic messages.

96572 **OUTPUT FILES**

96573 None.

96574 **EXTENDED DESCRIPTION**

96575 None.

96576 **EXIT STATUS**

96577 The following exit values shall be returned:

96578 0 Receiving messages is allowed.

96579 1 Receiving messages is not allowed.

96580 &gt;1 An error occurred.

96581 **CONSEQUENCES OF ERRORS**

96582 Default.

96583 **APPLICATION USAGE**

96584 The mechanism by which the message status of the terminal is changed is unspecified.  
 96585 Therefore, unspecified actions may cause the status of the terminal to change after *mesg* has  
 96586 successfully completed. These actions may include, but are not limited to: another invocation of  
 96587 the *mesg* utility, login procedures; invocation of the *stty* utility, invocation of the *chmod* utility or  
 96588 *chmod()* function, and so on.

96589 **EXAMPLES**

96590 None.

96591 **RATIONALE**

96592 The terminal changed by *mesg* is that associated with the standard input, output, or error, rather  
 96593 than the controlling terminal for the session. This is because users logged in more than once  
 96594 should be able to change any of their login terminals without having to stop the job running in  
 96595 those sessions. This is not a security problem involving the terminals of other users because  
 96596 appropriate privileges would be required to affect the terminal of another user.

96597 The method of checking each of the first three file descriptors in sequence until a terminal is  
 96598 found was adopted from System V.

96599 The file */dev/tty* is not specified for the terminal device because it was thought to be too  
 96600 restrictive. Typical environment changes for the *n* operand are that write permissions are  
 96601 removed for *others* and *group* from the appropriate device. It was decided to leave the actual  
 96602 description of what is done as unspecified because of potential differences between  
 96603 implementations.

96604 The format for standard output is unspecified because of differences between historical  
 96605 implementations. This output is generally not useful to shell scripts (they can use the exit status),  
 96606 so exact parsing of the output is unnecessary.

96607 **FUTURE DIRECTIONS**

96608 None.

96609 **SEE ALSO**96610 *talk*, *write*

96611 XBD Chapter 8 (on page 173)

**mesg***Utilities*96612 **CHANGE HISTORY**

96613 First released in Issue 2.

96614 **Issue 6**

96615 This utility is marked as part of the User Portability Utilities option.

96616 **Issue 7**96617 The *mesg* utility is moved from the User Portability Utilities option to the Base. User Portability  
96618 Utilities is now an option for interactive utilities.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

96619 **NAME**

96620 mkdir — make directories

96621 **SYNOPSIS**96622 mkdir [-p] [-m *mode*] *dir*...96623 **DESCRIPTION**96624 The *mkdir* utility shall create the directories specified by the operands, in the order specified.96625 For each *dir* operand, the *mkdir* utility shall perform actions equivalent to the *mkdir()* function  
96626 defined in the System Interfaces volume of POSIX.1-2008, called with the following arguments:

- 96627 1. The *dir* operand is used as the *path* argument.
- 96628 2. The value of the bitwise-inclusive OR of S\_IRWXU, S\_IRWXG, and S\_IRWXO is used as  
96629 the *mode* argument. (If the **-m** option is specified, the value of the *mkdir()* *mode* argument  
96630 is unspecified, but the directory shall at no time have permissions less restrictive than the  
96631 **-m mode** option-argument.)

96632 **OPTIONS**96633 The *mkdir* utility shall conform to XBD Section 12.2 (on page 215).

96634 The following options shall be supported:

96635 **-m mode** Set the file permission bits of the newly-created directory to the specified *mode*  
96636 value. The *mode* option-argument shall be the same as the *mode* operand defined  
96637 for the *chmod* utility. In the *symbolic\_mode* strings, the *op* characters '+' and '-'  
96638 shall be interpreted relative to an assumed initial mode of *a=rwx*; '+' shall add  
96639 permissions to the default mode; '-' shall delete permissions from the default  
96640 mode.

96641 **-p** Create any missing intermediate pathname components.

96642 For each *dir* operand that does not name an existing directory, effects equivalent to  
96643 those caused by the following command shall occur:

```
96644 mkdir -p -m $(umask -S),u+wx $(dirname dir) &&
96645 mkdir [-m mode] dir
```

96646 where the **-m mode** option represents that option supplied to the original  
96647 invocation of *mkdir*, if any.

96648 Each *dir* operand that names an existing directory shall be ignored without error.

96649 **OPERANDS**

96650 The following operand shall be supported:

96651 *dir* A pathname of a directory to be created.

96652 **STDIN**

96653 Not used.

96654 **INPUT FILES**

96655 None.

96656 **ENVIRONMENT VARIABLES**96657 The following environment variables shall affect the execution of *mkdir*:

96658 **LANG** Provide a default value for the internationalization variables that are unset or null.  
96659 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
96660 variables used to determine the values of locale categories.)

**mkdir**

Utilities

96661	<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
96662		
96663	<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).
96664		
96665		
96666	<i>LC_MESSAGES</i>	
96667		Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
96668		
96669	XSI <i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
96670	<b>ASYNCHRONOUS EVENTS</b>	
96671		Default.
96672	<b>STDOUT</b>	
96673		Not used.
96674	<b>STDERR</b>	
96675		The standard error shall be used only for diagnostic messages.
96676	<b>OUTPUT FILES</b>	
96677		None.
96678	<b>EXTENDED DESCRIPTION</b>	
96679		None.
96680	<b>EXIT STATUS</b>	
96681		The following exit values shall be returned:
96682	0	All the specified directories were created successfully or the <b>-p</b> option was specified and all the specified directories now exist.
96683		
96684	>0	An error occurred.
96685	<b>CONSEQUENCES OF ERRORS</b>	
96686		Default.
96687	<b>APPLICATION USAGE</b>	
96688		The default file mode for directories is <i>a=rwx</i> (777 on most systems) with selected permissions removed in accordance with the file mode creation mask. For intermediate pathname components created by <i>mkdir</i> , the mode is the default modified by <i>u+wx</i> so that the subdirectories can always be created regardless of the file mode creation mask; if different ultimate permissions are desired for the intermediate directories, they can be changed afterwards with <i>chmod</i> .
96689		
96690		
96691		
96692		
96693		
96694		Note that some of the requested directories may have been created even if an error occurs.
96695	<b>EXAMPLES</b>	
96696		None.
96697	<b>RATIONALE</b>	
96698		The System V <b>-m</b> option was included to control the file mode.
96699		The System V <b>-p</b> option was included to create any needed intermediate directories and to complement the functionality provided by <i>rmdir</i> for removing directories in the path prefix as they become empty. Because no error is produced if any path component already exists, the <b>-p</b> option is also useful to ensure that a particular directory exists.
96700		
96701		
96702		
96703		The functionality of <i>mkdir</i> is described substantially through a reference to the <i>mkdir()</i> function

96704 in the System Interfaces volume of POSIX.1-2008. For example, by default, the mode of the  
96705 directory is affected by the file mode creation mask in accordance with the specified behavior of  
96706 the *mkdir()* function. In this way, there is less duplication of effort required for describing details  
96707 of the directory creation.

96708 **FUTURE DIRECTIONS**

96709 None.

96710 **SEE ALSO**

96711 *chmod, rm, rmdir, umask*

96712 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

96713 XSH *mkdir()*

96714 **CHANGE HISTORY**

96715 First released in Issue 2.

96716 **Issue 5**

96717 The FUTURE DIRECTIONS section is added.

96718 **Issue 7**

96719 SD5-XCU-ERN-56 is applied, aligning the *-m* option with the IEEE P1003.2b draft standard to  
96720 clarify an ambiguity.

96721 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**mkfifo**

Utilities

96722 **NAME**

96723 mkfifo — make FIFO special files

96724 **SYNOPSIS**96725 mkfifo [-m *mode*] *file*...96726 **DESCRIPTION**96727 The *mkfifo* utility shall create the FIFO special files specified by the operands, in the order  
96728 specified.96729 For each *file* operand, the *mkfifo* utility shall perform actions equivalent to the *mkfifo()* function  
96730 defined in the System Interfaces volume of POSIX.1-2008, called with the following arguments:

- 96731 1. The *file* operand is used as the *path* argument.
- 96732 2. The value of the bitwise-inclusive OR of S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP,  
96733 S\_IROTH, and S\_IWOTH is used as the *mode* argument. (If the **-m** option is specified, the  
96734 value of the *mkfifo()* *mode* argument is unspecified, but the FIFO shall at no time have  
96735 permissions less restrictive than the **-m mode** option-argument.)

96736 **OPTIONS**96737 The *mkfifo* utility shall conform to XBD Section 12.2 (on page 215).

96738 The following option shall be supported:

96739 **-m mode** Set the file permission bits of the newly-created FIFO to the specified *mode* value.  
96740 The *mode* option-argument shall be the same as the *mode* operand defined for the  
96741 *chmod* utility. In the *symbolic\_mode* strings, the *op* characters '+' and '-' shall be  
96742 interpreted relative to an assumed initial mode of *a=rw*.

96743 **OPERANDS**

96744 The following operand shall be supported:

96745 *file* A pathname of the FIFO special file to be created.96746 **STDIN**

96747 Not used.

96748 **INPUT FILES**

96749 None.

96750 **ENVIRONMENT VARIABLES**96751 The following environment variables shall affect the execution of *mkfifo*:

96752 **LANG** Provide a default value for the internationalization variables that are unset or null.  
96753 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
96754 variables used to determine the values of locale categories.)

96755 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
96756 internationalization variables.

96757 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
96758 characters (for example, single-byte as opposed to multi-byte characters in  
96759 arguments).

96760 **LC\_MESSAGES**

96761 Determine the locale that should be used to affect the format and contents of  
96762 diagnostic messages written to standard error.

- 96763 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 96764 **ASYNCHRONOUS EVENTS**
- 96765 Default.
- 96766 **STDOUT**
- 96767 Not used.
- 96768 **STDERR**
- 96769 The standard error shall be used only for diagnostic messages.
- 96770 **OUTPUT FILES**
- 96771 None.
- 96772 **EXTENDED DESCRIPTION**
- 96773 None.
- 96774 **EXIT STATUS**
- 96775 The following exit values shall be returned:
- 96776 0 All the specified FIFO special files were created successfully.
- 96777 >0 An error occurred.
- 96778 **CONSEQUENCES OF ERRORS**
- 96779 Default.
- 96780 **APPLICATION USAGE**
- 96781 None.
- 96782 **EXAMPLES**
- 96783 None.
- 96784 **RATIONALE**
- 96785 This utility was added to permit shell applications to create FIFO special files.
- 96786 The **-m** option was added to control the file mode, for consistency with the similar functionality provided by the *mkdir* utility.
- 96787
- 96788 Early proposals included a **-p** option similar to the *mkdir -p* option that created intermediate directories leading up to the FIFO specified by the final component. This was removed because it is not commonly needed and is not common practice with similar utilities.
- 96789
- 96790
- 96791 The functionality of *mkfifo* is described substantially through a reference to the *mkfifo()* function in the System Interfaces volume of POSIX.1-2008. For example, by default, the mode of the FIFO file is affected by the file mode creation mask in accordance with the specified behavior of the *mkfifo()* function. In this way, there is less duplication of effort required for describing details of the file creation.
- 96792
- 96793
- 96794
- 96795
- 96796 **FUTURE DIRECTIONS**
- 96797 None.
- 96798 **SEE ALSO**
- 96799 *chmod*, *umask*
- 96800 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

96802 **CHANGE HISTORY**

96803 First released in Issue 3.

96804 **Issue 6**

96805 The **-m** option is aligned with the IEEE P1003.2b draft standard to clarify an ambiguity.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

96806 **NAME**96807 `more` — display files on a page-by-page basis96808 **SYNOPSIS**96809 UP `more [-ceisu] [-n number] [-p command] [-t tagstring] [file...]`96810 **DESCRIPTION**

96811 The *more* utility shall read files and either write them to the terminal on a page-by-page basis or  
 96812 filter them to standard output. If standard output is not a terminal device, all input files shall be  
 96813 copied to standard output in their entirety, without modification, except as specified for the `-s`  
 96814 option. If standard output is a terminal device, the files shall be written a number of lines (one  
 96815 screenful) at a time under the control of user commands. See the EXTENDED DESCRIPTION  
 96816 section.

96817 Certain block-mode terminals do not have all the capabilities necessary to support the complete  
 96818 *more* definition; they are incapable of accepting commands that are not terminated with a  
 96819 `<newline>`. Implementations that support such terminals shall provide an operating mode to  
 96820 *more* in which all commands can be terminated with a `<newline>` on those terminals. This mode:

- 96821 • Shall be documented in the system documentation
- 96822 • Shall, at invocation, inform the user of the terminal deficiency that requires the `<newline>`  
 96823 usage and provide instructions on how this warning can be suppressed in future  
 96824 invocations
- 96825 • Shall not be required for implementations supporting only fully capable terminals
- 96826 • Shall not affect commands already requiring `<newline>` characters
- 96827 • Shall not affect users on the capable terminals from using *more* as described in this volume  
 96828 of POSIX.1-2008

96829 **OPTIONS**

96830 The *more* utility shall conform to XBD [Section 12.2](#) (on page 215), except that `'+'` may be  
 96831 recognized as an option delimiter as well as `'-'`.

96832 The following options shall be supported:

- 96833 `-c` If a screen is to be written that has no lines in common with the current screen, or  
 96834 *more* is writing its first screen, *more* shall not scroll the screen, but instead shall  
 96835 redraw each line of the screen in turn, from the top of the screen to the bottom. In  
 96836 addition, if *more* is writing its first screen, the screen shall be cleared. This option  
 96837 may be silently ignored on devices with insufficient terminal capabilities.
- 96838 `-e` By default, *more* shall exit immediately after writing the last line of the last file in  
 96839 the argument list. If the `-e` option is specified:
  - 96840 1. If there is only a single file in the argument list and that file was completely  
 96841 displayed on a single screen, *more* shall exit immediately after writing the  
 96842 last line of that file.
  - 96843 2. Otherwise, *more* shall exit only after reaching end-of-file on the last file in  
 96844 the argument list twice without an intervening operation. See the  
 96845 EXTENDED DESCRIPTION section.
- 96846 `-i` Perform pattern matching in searches without regard to case; see XBD [Section 9.2](#)  
 96847 (on page 182).

96892 **INPUT FILES**

96893 The input files being examined shall be text files. If standard output is a terminal, standard error  
 96894 shall be used to read commands from the user. If standard output is a terminal, standard error is  
 96895 not readable, and command input is needed, *more* may attempt to obtain user commands from  
 96896 the controlling terminal (for example, */dev/tty*); otherwise, *more* shall terminate with an error  
 96897 indicating that it was unable to read user commands. If standard output is not a terminal, no  
 96898 error shall result if standard error cannot be opened for reading.

96899 **ENVIRONMENT VARIABLES**

96900 The following environment variables shall affect the execution of *more*:

96901 *COLUMNS* Override the system-selected horizontal display line size. See XBD Chapter 8 (on  
 96902 page 173) for valid values and results when it is unset or null.

96903 *EDITOR* Used by the *v* command to select an editor. See the EXTENDED DESCRIPTION  
 96904 section.

96905 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 96906 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 96907 variables used to determine the values of locale categories.)

96908 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 96909 internationalization variables.

96910 *LC\_COLLATE*

96911 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 96912 character collating elements within regular expressions.

96913 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 96914 characters (for example, single-byte as opposed to multi-byte characters in  
 96915 arguments and input files) and the behavior of character classes within regular  
 96916 expressions.

96917 *LC\_MESSAGES*

96918 Determine the locale that should be used to affect the format and contents of  
 96919 diagnostic messages written to standard error and informative messages written to  
 96920 standard output.

96921 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

96922 *LINES* Override the system-selected vertical screen size, used as the number of lines in a  
 96923 screenful. See XBD Chapter 8 (on page 173) for valid values and results when it is  
 96924 unset or null. The *-n* option shall take precedence over the *LINES* variable for  
 96925 determining the number of lines in a screenful.

96926 *MORE*

96927 Determine a string containing options described in the OPTIONS section preceded  
 96928 with <hyphen> characters and <blank>-separated as on the command line. Any  
 96929 command line options shall be processed after those in the *MORE* variable, as if  
 the command line were:

96930 `more $MORE options operands`

96931 The *MORE* variable shall take precedence over the *TERM* and *LINES* variables for  
 96932 determining the number of lines in a screenful.

96933 *TERM* Determine the name of the terminal type. If this variable is unset or null, an  
 96934 unspecified default terminal type is used.

96935 **ASYNCHRONOUS EVENTS**

96936 Default.

96937 **STDOUT**

96938 The standard output shall be used to write the contents of the input files.

96939 **STDERR**

96940 The standard error shall be used for diagnostic messages and user commands (see the INPUT  
 96941 FILES section), and, if standard output is a terminal device, to write a prompting string. The  
 96942 prompting string shall appear on the screen line below the last line of the file displayed in the  
 96943 current screenful. The prompt shall contain the name of the file currently being examined and  
 96944 shall contain an end-of-file indication and the name of the next file, if any, when prompting at  
 96945 the end-of-file. If an error or informational message is displayed, it is unspecified whether it is  
 96946 contained in the prompt. If it is not contained in the prompt, it shall be displayed and then the  
 96947 user shall be prompted for a continuation character, at which point another message or the user  
 96948 prompt may be displayed. The prompt is otherwise unspecified. It is unspecified whether  
 96949 informational messages are written for other user commands.

96950 **OUTPUT FILES**

96951 None.

96952 **EXTENDED DESCRIPTION**

96953 The following section describes the behavior of *more* when the standard output is a terminal  
 96954 device. If the standard output is not a terminal device, no options other than `-s` shall have any  
 96955 effect, and all input files shall be copied to standard output otherwise unmodified, at which time  
 96956 *more* shall exit without further action.

96957 The number of lines available per screen shall be determined by the `-n` option, if present, or by  
 96958 examining values in the environment (see the ENVIRONMENT VARIABLES section). If neither  
 96959 method yields a number, an unspecified number of lines shall be used.

96960 The maximum number of lines written shall be one less than this number, because the screen  
 96961 line after the last line written shall be used to write a user prompt and user input. If the number  
 96962 of lines in the screen is less than two, the results are undefined. It is unspecified whether user  
 96963 input is permitted to be longer than the remainder of the single line where the prompt has been  
 96964 written.

96965 The number of columns available per line shall be determined by examining values in the  
 96966 environment (see the ENVIRONMENT VARIABLES section), with a default value as described  
 96967 in XBD Chapter 8 (on page 173).

96968 Lines that are longer than the display shall be folded; the length at which folding occurs is  
 96969 unspecified, but should be appropriate for the output device. Folding may occur between glyphs  
 96970 of single characters that take up multiple display columns.

96971 When standard output is a terminal and `-u` is not specified, *more* shall treat `<backspace>` and  
 96972 `<carriage-return>` characters specially:

- 96973 • A character, followed first by a sequence of  $n$  `<backspace>` characters (where  $n$  is the same  
 96974 as the number of column positions that the character occupies), then by  $n$  `<underscore>`  
 96975 characters (`'_'`), shall cause that character to be written as underlined text, if the terminal  
 96976 type supports that. The  $n$  `<underscore>` characters, followed first by  $n$  `<backspace>`  
 96977 characters, then any character with  $n$  column positions, shall also cause that character to be  
 96978 written as underlined text, if the terminal type supports that.

- 96979 • A sequence of  $n$  <backspace> characters (where  $n$  is the same as the number of column  
96980 positions that the previous character occupies) that appears between two identical  
96981 printable characters shall cause the first of those two characters to be written as  
96982 emboldened text (that is, visually brighter, standout mode, or inverse-video mode), if the  
96983 terminal type supports that, and the second to be discarded. Immediately subsequent  
96984 occurrences of <backspace>/character pairs for that same character shall also be  
96985 discarded. (For example, the sequence "a\ba\ba\ba" is interpreted as a single  
96986 emboldened 'a'.)
- 96987 • The *more* utility shall logically discard all other <backspace> characters from the line as  
96988 well as the character which precedes them, if any.
- 96989 • A <carriage-return> at the end of a line shall be ignored, rather than being written as a  
96990 non-printable character, as described in the next paragraph.

96991 It is implementation-defined how other non-printable characters are written. Implementations  
96992 should use the same format that they use for the *ex print* command; see the OPTIONS section  
96993 within the *ed* utility. It is unspecified whether a multi-column character shall be separated if it  
96994 crosses a display line boundary; it shall not be discarded. The behavior is unspecified if the  
96995 number of columns on the display is less than the number of columns any single character in the  
96996 line being displayed would occupy.

96997 When each new file is displayed (or redisplayed), *more* shall write the first screen of the file.  
96998 Once the initial screen has been written, *more* shall prompt for a user command. If the execution  
96999 of the user command results in a screen that has lines in common with the current screen, and  
97000 the device has sufficient terminal capabilities, *more* shall scroll the screen; otherwise, it is  
97001 unspecified whether the screen is scrolled or redrawn.

97002 For all files but the last (including standard input if no file was specified, and for the last file as  
97003 well, if the *-e* option was not specified), when *more* has written the last line in the file, *more* shall  
97004 prompt for a user command. This prompt shall contain the name of the next file as well as an  
97005 indication that *more* has reached end-of-file. If the user command is *f*, <control>-F, <space>, *j*,  
97006 <newline>, *d*, <control>-D, or *s*, *more* shall display the next file. Otherwise, if displaying the last  
97007 file, *more* shall exit. Otherwise, *more* shall execute the user command specified.

97008 Several of the commands described in this section display a previous screen from the input  
97009 stream. In the case that text is being taken from a non-rewindable stream, such as a pipe, it is  
97010 implementation-defined how much backwards motion is supported. If a command cannot be  
97011 executed because of a limitation on backwards motion, an error message to this effect shall be  
97012 displayed, the current screen shall not change, and the user shall be prompted for another  
97013 command.

97014 If a command cannot be performed because there are insufficient lines to display, *more* shall alert  
97015 the terminal. If a command cannot be performed because there are insufficient lines to display or  
97016 a / command fails: if the input is the standard input, the last screen in the file may be displayed;  
97017 otherwise, the current file and screen shall not change, and the user shall be prompted for  
97018 another command.

97019 The interactive commands in the following sections shall be supported. Some commands can be  
97020 preceded by a decimal integer, called *count* in the following descriptions. If not specified with  
97021 the command, *count* shall default to 1. In the following descriptions, *pattern* is a basic regular  
97022 expression, as described in XBD Section 9.3 (on page 183). The term "examine" is historical  
97023 usage meaning "open the file for viewing"; for example, *more foo* would be expressed as  
97024 examining file *foo*.

97025 In the following descriptions, unless otherwise specified, *line* is a line in the *more* display, not a

97026 line from the file being examined.

97027 In the following descriptions, the *current position* refers to two things:

- 97028 1. The position of the current line on the screen
- 97029 2. The line number (in the file) of the current line on the screen

97030 Usually, the line on the screen corresponding to the current position is the third line on the  
 97031 screen. If this is not possible (there are fewer than three lines to display or this is the first page of  
 97032 the file, or it is the last page of the file), then the current position is either the first or last line on  
 97033 the screen as described later.

### 97034 Help

97035 *Synopsis:*     h

97036 Write a summary of these commands and other implementation-defined commands. The  
 97037 behavior shall be as if the *more* utility were executed with the *-e* option on a file that contained  
 97038 the summary information. The user shall be prompted as described earlier in this section when  
 97039 end-of-file is reached. If the user command is one of those specified to continue to the next file,  
 97040 *more* shall return to the file and screen state from which the *h* command was executed.

### 97041 Scroll Forward One Screenful

97042 *Synopsis:*     [*count*] f  
 97043                 [*count*] <control>--F

97044 Scroll forward *count* lines, with a default of one screenful. If *count* is more than the screen size,  
 97045 only the final screenful shall be written.

### 97046 Scroll Backward One Screenful

97047 *Synopsis:*     [*count*] b  
 97048                 [*count*] <control>--B

97049 Scroll backward *count* lines, with a default of one screenful (see the *-n* option). If *count* is more  
 97050 than the screen size, only the final screenful shall be written.

### 97051 Scroll Forward One Line

97052 *Synopsis:*     [*count*] <space>  
 97053                 [*count*] j  
 97054                 [*count*] <newline>

97055 Scroll forward *count* lines. The default *count* for the <space> shall be one screenful; for *j* and  
 97056 <newline>, one line. The entire *count* lines shall be written, even if *count* is more than the screen  
 97057 size.

### 97058 Scroll Backward One Line

97059 *Synopsis:*     [*count*] k

97060 Scroll backward *count* lines. The entire *count* lines shall be written, even if *count* is more than the  
 97061 screen size.

97062 **Scroll Forward One Half Screenful**

97063 *Synopsis:*     [*count*]d  
 97064                   [*count*]<control>-D

97065 Scroll forward *count* lines, with a default of one half of the screen size. If *count* is specified, it  
 97066 shall become the new default for subsequent **d**, <control>-D, and **u** commands.

97067 **Skip Forward One Line**

97068 *Synopsis:*     [*count*]s

97069 Display the screenful beginning with the line *count* lines after the last line on the current screen.  
 97070 If *count* would cause the current position to be such that less than one screenful would be  
 97071 written, the last screenful in the file shall be written.

97072 **Scroll Backward One Half Screenful**

97073 *Synopsis:*     [*count*]u  
 97074                   [*count*]<control>-U

97075 Scroll backward *count* lines, with a default of one half of the screen size. If *count* is specified, it  
 97076 shall become the new default for subsequent **d**, <control>-D, **u**, and <control>-U commands.  
 97077 The entire *count* lines shall be written, even if *count* is more than the screen size.

97078 **Go to Beginning of File**

97079 *Synopsis:*     [*count*]g

97080 Display the screenful beginning with line *count*.

97081 **Go to End-of-File**

97082 *Synopsis:*     [*count*]G

97083 If *count* is specified, display the screenful beginning with the line *count*. Otherwise, display the  
 97084 last screenful of the file.

97085 **Refresh the Screen**

97086 *Synopsis:*     r  
 97087                   <control>-L

97088 Refresh the screen.

97089 **Discard and Refresh**

97090 *Synopsis:*     R

97091 Refresh the screen, discarding any buffered input. If the current file is non-seekable, buffered  
 97092 input shall not be discarded and the **R** command shall be equivalent to the **r** command.

97093 **Mark Position**97094 *Synopsis:* `mletter`

97095 Mark the current position with the letter named by *letter*, where *letter* represents the name of one  
 97096 of the lowercase letters of the portable character set. When a new file is examined, all marks may  
 97097 be lost.

97098 **Return to Mark**97099 *Synopsis:* `' letter`

97100 Return to the position that was previously marked with the letter named by *letter*, making that  
 97101 line the current position.

97102 **Return to Previous Position**97103 *Synopsis:* `''`

97104 Return to the position from which the last large movement command was executed (where a  
 97105 "large movement" is defined as any movement of more than a screenful of lines). If no such  
 97106 movements have been made, return to the beginning of the file.

97107 **Search Forward for Pattern**97108 *Synopsis:* `[count]/[!]pattern<newline>`

97109 Display the screenful beginning with the *count*th line containing the pattern. The search shall  
 97110 start after the first line currently displayed. The null regular expression (`'/'` followed by a  
 97111 `<newline>`) shall repeat the search using the previous regular expression, with a default *count*. If  
 97112 the character `'!'` is included, the matching lines shall be those that do not contain the *pattern*. If  
 97113 no match is found for the *pattern*, a message to that effect shall be displayed.

97114 **Search Backward for Pattern**97115 *Synopsis:* `[count]?[!]pattern<newline>`

97116 Display the screenful beginning with the *count*th previous line containing the pattern. The search  
 97117 shall start on the last line before the first line currently displayed. The null regular expression  
 97118 (`'?'` followed by a `<newline>`) shall repeat the search using the previous regular expression,  
 97119 with a default *count*. If the character `'!'` is included, matching lines shall be those that do not  
 97120 contain the *pattern*. If no match is found for the *pattern*, a message to that effect shall be  
 97121 displayed.

97122 **Repeat Search**97123 *Synopsis:* `[count]n`

97124 Repeat the previous search for *count*th line containing the last *pattern* (or not containing the last  
 97125 *pattern*, if the previous search was `"!/"` or `"?!"`).

97126 **Repeat Search in Reverse**97127 *Synopsis:*     [*count*]N97128 Repeat the search in the opposite direction of the previous search for the *count*th line containing  
97129 the last *pattern* (or not containing the last *pattern*, if the previous search was `"/!"` or `"?!"`).97130 **Examine New File**97131 *Synopsis:*     :e [*filename*]  
<newline>97132 Examine a new file. If the *filename* argument is not specified, the current file (see the `:n` and `:p`  
97133 commands below) shall be re-examined. The *filename* shall be subjected to the process of shell  
97134 word expansions (see Section 2.6, on page 2305); if more than a single pathname results, the  
97135 effects are unspecified. If *filename* is a <number-sign> (`'#'`), the previously examined file shall  
97136 be re-examined. If *filename* is not accessible for any reason (including that it is a non-seekable  
97137 file), an error message to this effect shall be displayed and the current file and screen shall not  
97138 change.97139 **Examine Next File**97140 *Synopsis:*     [*count*]:n97141 Examine the next file. If a number *count* is specified, the *count*th next file shall be examined. If  
97142 *filename* refers to a non-seekable file, the results are unspecified.97143 **Examine Previous File**97144 *Synopsis:*     [*count*]:p97145 Examine the previous file. If a number *count* is specified, the *count*th previous file shall be  
97146 examined. If *filename* refers to a non-seekable file, the results are unspecified.97147 **Go to Tag**97148 *Synopsis:*     :t *tagstring*  
<newline>97149 If the file containing the tag named by the *tagstring* argument is not the current file, examine the  
97150 file, as if the `:e` command was executed with that file as the argument. Otherwise, or in addition,  
97151 display the screenful beginning with the tag, as described for the `-t` option (see the OPTIONS  
97152 section). If the *ctags* utility is not supported by the system, the use of `:t` produces undefined  
97153 results.97154 **Invoke Editor**97155 *Synopsis:*     v97156 Invoke an editor to edit the current file being examined. If standard input is being examined, the  
97157 results are unspecified. The name of the editor shall be taken from the environment variable  
97158 *EDITOR*, or shall default to *vi*. If the last pathname component in *EDITOR* is either *vi* or *ex*, the  
97159 editor shall be invoked with a `-c linenum` command line argument, where *linenum* is the  
97160 line number of the file line containing the display line currently displayed as the first line of the  
97161 screen. It is implementation-defined whether line-setting options are passed to editors other  
97162 than *vi* and *ex*.97163 When the editor exits, *more* shall resume with the same file and screen as when the editor was  
97164 invoked.

97165 **Display Position**

97166 *Synopsis:* =  
 97167 <control>-G

97168 Write a message for which the information references the first byte of the line after the last line of  
 97169 the file on the screen. This message shall include the name of the file currently being examined,  
 97170 its number relative to the total number of files there are to examine, the line number in the file  
 97171 the byte number and the total bytes in the file, and what percentage of the file precedes the  
 97172 current position. If *more* is reading from standard input, or the file is shorter than a single screen,  
 97173 the line number, the byte number, the total bytes, and the percentage need not be written.

97174 **Quit**

97175 *Synopsis:* q  
 97176 :q  
 97177 ZZ

97178 Exit *more*.

97179 **EXIT STATUS**

97180 The following exit values shall be returned:

97181 0 Successful completion.

97182 >0 An error occurred.

97183 **CONSEQUENCES OF ERRORS**

97184 If an error is encountered accessing a file when using the **:n** command, *more* shall attempt to  
 97185 examine the next file in the argument list, but the final exit status shall be affected. If an error is  
 97186 encountered accessing a file via the **:p** command, *more* shall attempt to examine the previous file  
 97187 in the argument list, but the final exit status shall be affected. If an error is encountered accessing  
 97188 a file via the **:e** command, *more* shall remain in the current file and the final exit status shall not  
 97189 be affected.

97190 **APPLICATION USAGE**

97191 When the standard output is not a terminal, only the **-s** filter-modification option is effective.  
 97192 This is based on historical practice. For example, a typical implementation of *man* pipes its  
 97193 output through *more -s* to squeeze excess white space for terminal users. When *man* is piped to  
 97194 *lp*, however, it is undesirable for this squeezing to happen.

97195 **EXAMPLES**

97196 The **-p** allows arbitrary commands to be executed at the start of each file. Examples are:

97197 *more -p G file1 file2*

97198 Examine each file starting with its last screenful.

97199 *more -p 100 file1 file2*

97200 Examine each file starting with line 100 in the current position (usually the third line, so line  
 97201 98 would be the first line written).

97202 *more -p /100 file1 file2*

97203 Examine each file starting with the first line containing the string "100" in the current  
 97204 position

## 97205 RATIONALE

97206 The *more* utility, available in BSD and BSD-derived systems, was chosen as the prototype for the  
 97207 POSIX file display program since it is more widely available than either the public-domain  
 97208 program *less* or than *pg*, a pager provided in System V. The 4.4 BSD *more* is the model for the  
 97209 features selected; it is almost fully upwards-compatible from the 4.3 BSD version in wide use  
 97210 and has become more amenable for *vi* users. Several features originally derived from various file  
 97211 editors, found in both *less* and *pg*, have been added to this volume of POSIX.1-2008 as they have  
 97212 proved extremely popular with users.

97213 There are inconsistencies between *more* and *vi* that result from historical practice. For example,  
 97214 the single-character commands **h**, **f**, **b**, and <space> are screen movers in *more*, but cursor  
 97215 movers in *vi*. These inconsistencies were maintained because the cursor movements are not  
 97216 applicable to *more* and the powerful functionality achieved without the use of the control key  
 97217 justifies the differences.

97218 The tags interface has been included in a program that is not a text editor because it promotes  
 97219 another degree of consistent operation with *vi*. It is conceivable that the paging environment of  
 97220 *more* would be superior for browsing source code files in some circumstances.

97221 The operating mode referred to for block-mode terminals effectively adds a <newline> to each  
 97222 Synopsis line that currently has none. So, for example, **d**<newline> would page one screenful.  
 97223 The mode could be triggered by a command line option, environment variable, or some other  
 97224 method. The details are not imposed by this volume of POSIX.1-2008 because there are so few  
 97225 systems known to support such terminals. Nevertheless, it was considered that all systems  
 97226 should be able to support *more* given the exception cited for this small community of terminals  
 97227 because, in comparison to *vi*, the cursor movements are few and the command set relatively  
 97228 amenable to the optional <newline> characters.

97229 Some versions of *more* provide a shell-escaping mechanism similar to the *ex !* command. The  
 97230 standard developers did not consider that this was necessary in a paginator, particularly given  
 97231 the wide acceptance of multiple window terminals and job control features. (They chose to  
 97232 retain such features in the editors and *mailx* because the shell interaction also gives an  
 97233 opportunity to modify the editing buffer, which is not applicable to *more*.)

97234 The **-p** (position) option replaces the **+** command because of the Utility Syntax Guidelines. The  
 97235 **+command** option is no longer specified by POSIX.1-2008 but may be present in some  
 97236 implementations. In early proposals, it took a *pattern* argument, but historical *less* provided the  
 97237 *more* general facility of a command. It would have been desirable to use the same **-c** as *ex* and *vi*,  
 97238 but the letter was already in use.

97239 The text stating “from a non-rewindable stream ... implementations may limit the amount of  
 97240 backwards motion supported” would allow an implementation that permitted no backwards  
 97241 motion beyond text already on the screen. It was not possible to require a minimum amount of  
 97242 backwards motion that would be effective for all conceivable device types. The implementation  
 97243 should allow the user to back up as far as possible, within device and reasonable memory  
 97244 allocation constraints.

97245 Historically, non-printable characters were displayed using the ARPA standard mappings,  
 97246 which are as follows:

- 97247 1. Printable characters are left alone.
- 97248 2. Control characters less than \177 are represented as followed by the character offset from  
 97249 the '@' character in the ASCII map; for example, \007 is represented as '@G'.

- 97250 3. \177 is represented as followed by ' ? ' .
- 97251 The display of characters having their eighth bit set was less standard. Existing implementations  
97252 use hex (0x00), octal (\000), and a meta-bit display. (The latter displayed characters with their  
97253 eighth bit set as the two characters "M-", followed by the seven-bit display as described  
97254 previously.) The latter probably has the best claim to historical practice because it was used with  
97255 the `-v` option of 4 BSD and 4 BSD-derived versions of the `cat` utility since 1980.
- 97256 No specific display format is required by POSIX.1-2008. Implementations are encouraged to  
97257 conform to historic practice in the absence of any strong reason to diverge.
- 97258 **FUTURE DIRECTIONS**
- 97259 None.
- 97260 **SEE ALSO**

97263 (on page 215)
- 97264 **CHANGE HISTORY**
- 97265 First released in Issue 4.
- 97266 **Issue 5**
- 97267 The FUTURE DIRECTIONS section is added.
- 97268 **Issue 6**
- 97269 This utility is marked as part of the User Portability Utilities option.
- 97270 The obsolescent SYNOPSIS is removed.
- 97271 The utility has been extensively reworked for alignment with the IEEE P1003.2b draft standard:
- 97272
  - Changes have been made as a result of IEEE PASC Interpretations 1003.2 #37 and #109.
  - The `more` utility should be able to handle underlined and emboldened displays of  
97273 characters that are wider than a single column position.
- 97274
- 97275 **Issue 7**
- 97276 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that '+' may be recognized  
97277 as an option delimiter in the OPTIONS section.
- 97278 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

97279 **NAME**

97280 mv — move files

97281 **SYNOPSIS**97282 mv [-if] *source\_file target\_file*97283 mv [-if] *source\_file... target\_dir*97284 **DESCRIPTION**

97285 In the first synopsis form, the *mv* utility shall move the file named by the *source\_file* operand to  
 97286 the destination specified by the *target\_file*. This first synopsis form is assumed when the final  
 97287 operand does not name an existing directory and is not a symbolic link referring to an existing  
 97288 directory. In this case, if *target\_file* ends with a trailing <slash> character, *mv* shall treat this as an  
 97289 error and no *source\_file* operands will be processed.

97290 In the second synopsis form, *mv* shall move each file named by a *source\_file* operand to a  
 97291 destination file in the existing directory named by the *target\_dir* operand, or referenced if  
 97292 *target\_dir* is a symbolic link referring to an existing directory. The destination path for each  
 97293 *source\_file* shall be the concatenation of the target directory, a single <slash> character if the  
 97294 target did not end in a <slash>, and the last pathname component of the *source\_file*. This second  
 97295 form is assumed when the final operand names an existing directory.

97296 If any operand specifies an existing file of a type not specified by the System Interfaces volume  
 97297 of POSIX.1-2008, the behavior is implementation-defined.

97298 For each *source\_file* the following steps shall be taken.

- 97299 1. If the destination path exists, the *-f* option is not specified, and either of the following  
 97300 conditions is true:
  - 97301 a. The permissions of the destination path do not permit writing and the standard  
 97302 input is a terminal.
  - 97303 b. The *-i* option is specified.

97304 the *mv* utility shall write a prompt to standard error and read a line from standard input.  
 97305 If the response is not affirmative, *mv* shall do nothing more with the current *source\_file*  
 97306 and go on to any remaining *source\_files*.

- 97307 2. If the *source\_file* operand and destination path name the same existing file, then the  
 97308 destination path shall not be removed, and one of the following shall occur:
  - 97309 a. No change is made to *source\_file*, no error occurs, and no diagnostic is issued.
  - 97310 b. No change is made to *source\_file*, a diagnostic is issued to standard error  
 97311 identifying the two names, and the exit status is affected.
  - 97312 c. If the *source\_file* operand and destination path name distinct directory entries, then  
 97313 the *source\_file* operand is removed, no error occurs, and no diagnostic is issued.

97314 The *mv* utility shall do nothing more with the current *source\_file*, and go on to any  
 97315 remaining *source\_files*.

- 97316 3. The *mv* utility shall perform actions equivalent to the *rename()* function defined in the  
 97317 System Interfaces volume of POSIX.1-2008, called with the following arguments:
  - 97318 a. The *source\_file* operand is used as the *old* argument.
  - 97319 b. The destination path is used as the *new* argument.

97320 If this succeeds, *mv* shall do nothing more with the current *source\_file* and go on to any  
 97321 remaining *source\_files*. If this fails for any reasons other than those described for the *errno*

- 97322 [EXDEV] in the System Interfaces volume of POSIX.1-2008, *mv* shall write a diagnostic  
 97323 message to standard error, do nothing more with the current *source\_file*, and go on to any  
 97324 remaining *source\_files*.
- 97325 4. If the destination path exists, and it is a file of type directory and *source\_file* is not a file of  
 97326 type directory, or it is a file not of type directory and *source\_file* is a file of type directory,  
 97327 *mv* shall write a diagnostic message to standard error, do nothing more with the current  
 97328 *source\_file*, and go on to any remaining *source\_files*. If the destination path exists and was  
 97329 created by a previous step, it is unspecified whether this will be treated as an error or the  
 97330 destination path will be overwritten.
- 97331 5. If the destination path exists, *mv* shall attempt to remove it. If this fails for any reason, *mv*  
 97332 shall write a diagnostic message to standard error, do nothing more with the current  
 97333 *source\_file*, and go on to any remaining *source\_files*.
- 97334 6. The file hierarchy rooted in *source\_file* shall be duplicated as a file hierarchy rooted in the  
 97335 destination path. If *source\_file* or any of the files below it in the hierarchy are symbolic  
 97336 links, the links themselves shall be duplicated, including their contents, rather than any  
 97337 files to which they refer. The following characteristics of each file in the file hierarchy  
 97338 shall be duplicated:
- 97339 • The time of last data modification and time of last access
  - 97340 • The user ID and group ID
  - 97341 • The file mode
- 97342 If the user ID, group ID, or file mode of a regular file cannot be duplicated, the file mode  
 97343 bits S\_ISUID and S\_ISGID shall not be duplicated.
- 97344 When files are duplicated to another file system, the implementation may require that the  
 97345 process invoking *mv* has read access to each file being duplicated.
- 97346 If files being duplicated to another file system have hard links to other files, it is  
 97347 unspecified whether the files copied to the new file system have the hard links preserved  
 97348 or separate copies are created for the linked files.
- 97349 If the duplication of the file hierarchy fails for any reason, *mv* shall write a diagnostic  
 97350 message to standard error, do nothing more with the current *source\_file*, and go on to any  
 97351 remaining *source\_files*.
- 97352 If the duplication of the file characteristics fails for any reason, *mv* shall write a diagnostic  
 97353 message to standard error, but this failure shall not cause *mv* to modify its exit status.
- 97354 7. The file hierarchy rooted in *source\_file* shall be removed. If this fails for any reason, *mv*  
 97355 shall write a diagnostic message to the standard error, do nothing more with the current  
 97356 *source\_file*, and go on to any remaining *source\_files*.

**OPTIONS**

- 97357 The *mv* utility shall conform to XBD Section 12.2 (on page 215).
- 97358
- 97359 The following options shall be supported:
- 97360 **-f** Do not prompt for confirmation if the destination path exists. Any previous  
 97361 occurrence of the **-i** option is ignored.
- 97362 **-i** Prompt for confirmation if the destination path exists. Any previous occurrence of  
 97363 the **-f** option is ignored.
- 97364 Specifying more than one of the **-f** or **-i** options shall not be considered an error. The last option

97365 specified shall determine the behavior of *mv*.

#### 97366 OPERANDS

97367 The following operands shall be supported:

97368 *source\_file* A pathname of a file or directory to be moved.

97369 *target\_file* A new pathname for the file or directory being moved.

97370 *target\_dir* A pathname of an existing directory into which to move the input files.

#### 97371 STDIN

97372 The standard input shall be used to read an input line in response to each prompt specified in  
97373 the STDERR section. Otherwise, the standard input shall not be used.

#### 97374 INPUT FILES

97375 The input files specified by each *source\_file* operand can be of any file type.

#### 97376 ENVIRONMENT VARIABLES

97377 The following environment variables shall affect the execution of *mv*:

97378 *LANG* Provide a default value for the internationalization variables that are unset or null.  
97379 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
97380 variables used to determine the values of locale categories.)

97381 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
97382 internationalization variables.

97383 *LC\_COLLATE*

97384 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
97385 character collating elements used in the extended regular expression defined for  
97386 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

97387 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
97388 characters (for example, single-byte as opposed to multi-byte characters in  
97389 arguments and input files), the behavior of character classes used in the extended  
97390 regular expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES*  
97391 category.

97392 *LC\_MESSAGES*

97393 Determine the locale used to process affirmative responses, and the locale used to  
97394 affect the format and contents of diagnostic messages and prompts written to  
97395 standard error.

97396 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 97397 ASYNCHRONOUS EVENTS

97398 Default.

#### 97399 STDOUT

97400 Not used.

#### 97401 STDERR

97402 Prompts shall be written to the standard error under the conditions specified in the  
97403 DESCRIPTION section. The prompts shall contain the destination pathname, but their format is  
97404 otherwise unspecified. Otherwise, the standard error shall be used only for diagnostic  
97405 messages.

97406 **OUTPUT FILES**

97407 The output files may be of any file type.

97408 **EXTENDED DESCRIPTION**

97409 None.

97410 **EXIT STATUS**

97411 The following exit values shall be returned:

97412 0 All input files were moved successfully.

97413 &gt;0 An error occurred.

97414 **CONSEQUENCES OF ERRORS**

97415 If the copying or removal of *source\_file* is prematurely terminated by a signal or error, *mv* may  
 97416 leave a partial copy of *source\_file* at the source or destination. The *mv* utility shall not modify  
 97417 both *source\_file* and the destination path simultaneously; termination at any point shall leave  
 97418 either *source\_file* or the destination path complete.

97419 **APPLICATION USAGE**

97420 Some implementations mark for update the last file status change timestamp of renamed files  
 97421 and some do not. Applications which make use of the last file status change timestamp may  
 97422 behave differently with respect to renamed files unless they are designed to allow for either  
 97423 behavior.

97424 The specification ensures that *mv a a* will not alter the contents of file *a*, and allows the  
 97425 implementation to issue an error that a file cannot be moved onto itself. Likewise, when *a* and *b*  
 97426 are hard links to the same file, *mv a b* will not alter *b*, but if a diagnostic is not issued, then it is  
 97427 unspecified whether *a* is left untouched (as it would be by the *rename()* function) or unlinked  
 97428 (reducing the link count of *b*).

97429 **EXAMPLES**

97430 If the current directory contains only files *a* (of any type defined by the System Interfaces  
 97431 volume of POSIX.1-2008), *b* (also of any type), and a directory *c*:

97432 `mv a b c`97433 `mv c d`97434 results with the original files *a* and *b* residing in the directory *d* in the current directory.97435 **RATIONALE**

97436 Early proposals diverged from the SVID and BSD historical practice in that they required that  
 97437 when the destination path exists, the `-f` option is not specified, and input is not a terminal, *mv*  
 97438 fails. This was done for compatibility with *cp*. The current text returns to historical practice. It  
 97439 should be noted that this is consistent with the *rename()* function defined in the System  
 97440 Interfaces volume of POSIX.1-2008, which does not require write permission on the target.

97441 For absolute clarity, paragraph (1), describing the behavior of *mv* when prompting for  
 97442 confirmation, should be interpreted in the following manner:

```
97443 if (exists AND (NOT f_option) AND
97444     ((not_writable AND input_is_terminal) OR i_option))
```

97445 The `-i` option exists on BSD systems, giving applications and users a way to avoid accidentally  
 97446 unlinking files when moving others. When the standard input is not a terminal, the 4.3 BSD *mv*  
 97447 deletes all existing destination paths without prompting, even when `-i` is specified; this is  
 97448 inconsistent with the behavior of the 4.3 BSD *cp* utility, which always generates an error when  
 97449 the file is unwritable and the standard input is not a terminal. The standard developers decided  
 97450 that use of `-i` is a request for interaction, so when the destination path exists, the utility takes

97451 instructions from whatever responds to standard input.

97452 The *rename()* function is able to move directories within the same file system. Some historical  
97453 versions of *mv* have been able to move directories, but not to a different file system. The  
97454 standard developers considered that this was an annoying inconsistency, so this volume of  
97455 POSIX.1-2008 requires directories to be able to be moved even across file systems. There is no **-R**  
97456 option to confirm that moving a directory is actually intended, since such an option was not  
97457 required for moving directories in historical practice. Requiring the application to specify it  
97458 sometimes, depending on the destination, seemed just as inconsistent. The semantics of the  
97459 *rename()* function were preserved as much as possible. For example, *mv* is not permitted to  
97460 “rename” files to or from directories, even though they might be empty and removable.

97461 Historic implementations of *mv* did not exit with a non-zero exit status if they were unable to  
97462 duplicate any file characteristics when moving a file across file systems, nor did they write a  
97463 diagnostic message for the user. The former behavior has been preserved to prevent scripts from  
97464 breaking; a diagnostic message is now required, however, so that users are alerted that the file  
97465 characteristics have changed.

97466 The exact format of the interactive prompts is unspecified. Only the general nature of the  
97467 contents of prompts are specified because implementations may desire more descriptive  
97468 prompts than those used on historical implementations. Therefore, an application not using the  
97469 **-f** option or using the **-i** option relies on the system to provide the most suitable dialog directly  
97470 with the user, based on the behavior specified.

97471 When *mv* is dealing with a single file system and *source\_file* is a symbolic link, the link itself is  
97472 moved as a consequence of the dependence on the *rename()* functionality, per the  
97473 DESCRIPTION. Across file systems, this has to be made explicit.

#### 97474 FUTURE DIRECTIONS

97475 None.

#### 97476 SEE ALSO

#### 97480 CHANGE HISTORY

97481 First released in Issue 2.

#### 97482 Issue 6

97483 The *mv* utility is changed to describe processing of symbolic links as specified in the  
97484 IEEE P1003.2b draft standard.

97485 The APPLICATION USAGE section is added.

#### 97486 Issue 7

97487 Austin Group Interpretation 1003.1-2001 #016 is applied.

97488 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
97489 *LC\_MESSAGES* environment variable.

97490 Austin Group Interpretations 1003.1-2001 #164, #168, and #169 are applied.

97491 SD5-XCU-ERN-13 is applied, making an editorial correction to the SYNOPSIS.

97492 SD5-XCU-ERN-51 is applied to the DESCRIPTION, defining the behavior for when files are  
97493 being duplicated to another file system while having hard links.

97494

Changes are made related to support for finegrained timestamps.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

97495 **NAME**

97496 newgrp — change to a new group

97497 **SYNOPSIS**97498 newgrp [-1] [*group*]97499 **DESCRIPTION**

97500 The *newgrp* utility shall create a new shell execution environment with a new real and effective  
 97501 group identification. Of the attributes listed in Section 2.12 (on page 2331), the new shell  
 97502 execution environment shall retain the working directory, file creation mask, and exported  
 97503 variables from the previous environment (that is, open files, traps, unexported variables, alias  
 97504 definitions, shell functions, and *set* options may be lost). All other aspects of the process  
 97505 environment that are preserved by the *exec* family of functions defined in the System Interfaces  
 97506 volume of POSIX.1-2008 shall also be preserved by *newgrp*; whether other aspects are preserved  
 97507 is unspecified.

97508 A failure to assign the new group identifications (for example, for security or password-related  
 97509 reasons) shall not prevent the new shell execution environment from being created.

97510 The *newgrp* utility shall affect the supplemental groups for the process as follows:

- 97511 • On systems where the effective group ID is normally in the supplementary group list (or  
 97512 whenever the old effective group ID actually is in the supplementary group list):
  - 97513 — If the new effective group ID is also in the supplementary group list, *newgrp* shall  
 97514 change the effective group ID.
  - 97515 — If the new effective group ID is not in the supplementary group list, *newgrp* shall add  
 97516 the new effective group ID to the list, if there is room to add it.
- 97517 • On systems where the effective group ID is not normally in the supplementary group list  
 97518 (or whenever the old effective group ID is not in the supplementary group list):
  - 97519 — If the new effective group ID is in the supplementary group list, *newgrp* shall delete  
 97520 it.
  - 97521 — If the old effective group ID is not in the supplementary list, *newgrp* shall add it if  
 97522 there is room.

97523 **Note:** The System Interfaces volume of POSIX.1-2008 does not specify whether the effective group ID  
 97524 of a process is included in its supplementary group list.

97525 With no operands, *newgrp* shall change the effective group back to the groups identified in the  
 97526 user's user entry, and shall set the list of supplementary groups to that set in the user's group  
 97527 database entries.

97528 If the first argument is '-', the results are unspecified.

97529 If a password is required for the specified group, and the user is not listed as a member of that  
 97530 group in the group database, the user shall be prompted to enter the correct password for that  
 97531 group. If the user is listed as a member of that group, no password shall be requested. If no  
 97532 password is required for the specified group, it is implementation-defined whether users not  
 97533 listed as members of that group can change to that group. Whether or not a password is  
 97534 required, implementation-defined system accounting or security mechanisms may impose  
 97535 additional authorization restrictions that may cause *newgrp* to write a diagnostic message and  
 97536 suppress the changing of the group identification.

**newgrp**

Utilities

97537 **OPTIONS**

97538 The *newgrp* utility shall conform to XBD Section 12.2 (on page 215), except for the unspecified  
 97539 usage of ' - ' .

97540 The following option shall be supported:

97541 **-l** (The letter ell.) Change the environment to what would be expected if the user  
 97542 actually logged in again.

97543 **OPERANDS**

97544 The following operand shall be supported:

97545 *group* A group name from the group database or a non-negative numeric group ID.  
 97546 Specifies the group ID to which the real and effective group IDs shall be set. If  
 97547 *group* is a non-negative numeric string and exists in the group database as a group  
 97548 name (see *getgrnam()*), the numeric group ID associated with that group name  
 97549 shall be used as the group ID.

97550 **STDIN**

97551 Not used.

97552 **INPUT FILES**

97553 The file */dev/tty* shall be used to read a single line of text for password checking, when one is  
 97554 required.

97555 **ENVIRONMENT VARIABLES**

97556 The following environment variables shall affect the execution of *newgrp*:

97557 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 97558 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 97559 variables used to determine the values of locale categories.)

97560 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 97561 internationalization variables.

97562 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 97563 characters (for example, single-byte as opposed to multi-byte characters in  
 97564 arguments).

97565 *LC\_MESSAGES*

97566 Determine the locale that should be used to affect the format and contents of  
 97567 diagnostic messages written to standard error.

97568 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

97569 **ASYNCHRONOUS EVENTS**

97570 Default.

97571 **STDOUT**

97572 Not used.

97573 **STDERR**

97574 The standard error shall be used for diagnostic messages and a prompt string for a password, if  
 97575 one is required. Diagnostic messages may be written in cases where the exit status is not  
 97576 available. See the EXIT STATUS section.

97577 **OUTPUT FILES**

97578 None.

97579 **EXTENDED DESCRIPTION**

97580 None.

97581 **EXIT STATUS**

97582 If *newgrp* succeeds in creating a new shell execution environment, whether or not the group  
 97583 identification was changed successfully, the exit status shall be the exit status of the shell.  
 97584 Otherwise, the following exit value shall be returned:

97585 &gt;0 An error occurred.

97586 **CONSEQUENCES OF ERRORS**

97587 The invoking shell may terminate.

97588 **APPLICATION USAGE**

97589 There is no convenient way to enter a password into the group database. Use of group  
 97590 passwords is not encouraged, because by their very nature they encourage poor security  
 97591 practices. Group passwords may disappear in the future.

97592 A common implementation of *newgrp* is that the current shell uses *exec* to overlay itself with  
 97593 *newgrp*, which in turn overlays itself with a new shell after changing group. On some  
 97594 implementations, however, this may not occur and *newgrp* may be invoked as a subprocess.

97595 The *newgrp* command is intended only for use from an interactive terminal. It does not offer a  
 97596 useful interface for the support of applications.

97597 The exit status of *newgrp* is generally inapplicable. If *newgrp* is used in a script, in most cases it  
 97598 successfully invokes a new shell and the rest of the original shell script is bypassed when the  
 97599 new shell exits. Used interactively, *newgrp* displays diagnostic messages to indicate problems.  
 97600 But usage such as:

```
97601 newgrp foo
97602 echo $?
```

97603 is not useful because the new shell might not have access to any status *newgrp* may have  
 97604 generated (and most historical systems do not provide this status). A zero status echoed here  
 97605 does not necessarily indicate that the user has changed to the new group successfully. Following  
 97606 *newgrp* with the *id* command provides a portable means of determining whether the group  
 97607 change was successful or not.

97608 **EXAMPLES**

97609 None.

97610 **RATIONALE**

97611 Most historical implementations use one of the *exec* functions to implement the behavior of  
 97612 *newgrp*. Errors detected before the *exec* leave the environment unchanged, while errors detected  
 97613 after the *exec* leave the user in a changed environment. While it would be useful to have *newgrp*  
 97614 issue a diagnostic message to tell the user that the environment changed, it would be  
 97615 inappropriate to require this change to some historical implementations.

97616 The password mechanism is allowed in the group database, but how this would be  
 97617 implemented is not specified.

97618 The *newgrp* utility was retained in this volume of POSIX.1-2008, even given the existence of the  
 97619 multiple group permissions feature in the System Interfaces volume of POSIX.1-2008, for several  
 97620 reasons. First, in some implementations, the group ownership of a newly created file is  
 97621 determined by the group of the directory in which the file is created, as allowed by the System

**newgrp**

Utilities

- 97622 Interfaces volume of POSIX.1-2008; on other implementations, the group ownership of a newly  
97623 created file is determined by the effective group ID. On implementations of the latter type,  
97624 *newgrp* allows files to be created with a specific group ownership. Finally, many  
97625 implementations use the real group ID in accounting, and on such systems, *newgrp* allows the  
97626 accounting identity of the user to be changed.
- 97627 **FUTURE DIRECTIONS**
- 97628 None.
- 97629 **SEE ALSO**
- 97630 [Chapter 2](#) (on page 2297), *sh*
- 97631 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)
- 97632 XSH *exec*, *getgrnam()*
- 97633 **CHANGE HISTORY**
- 97634 First released in Issue 2.
- 97635 **Issue 6**
- 97636 This utility is marked as part of the User Portability Utilities option.
- 97637 The obsolescent SYNOPSIS is removed.
- 97638 The text describing supplemental groups is no longer conditional on {NGROUPS\_MAX} being  
97639 greater than 1. This is because {NGROUPS\_MAX} now has a minimum value of 8. This is a FIPS  
97640 requirement.
- 97641 **Issue 7**
- 97642 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
97643 argument is '-'.  
97644 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 97645 The *newgrp* utility is moved from the User Portability Utilities option to the Base. User  
97646 Portability Utilities is now an option for interactive utilities.

97647 **NAME**

97648 nice — invoke a utility with an altered nice value

97649 **SYNOPSIS**97650 nice [-n *increment*] *utility* [*argument...*]97651 **DESCRIPTION**

97652 The *nice* utility shall invoke a utility, requesting that it be run with a different nice value (see  
 97653 XBD Section 3.239, on page 71). With no options, the executed utility shall be run with a nice  
 97654 value that is some implementation-defined quantity greater than or equal to the nice value of the  
 97655 current process. If the user lacks appropriate privileges to affect the nice value in the requested  
 97656 manner, the *nice* utility shall not affect the nice value; in this case, a warning message may be  
 97657 written to standard error, but this shall not prevent the invocation of *utility* or affect the exit  
 97658 status.

97659 **OPTIONS**97660 The *nice* utility shall conform to XBD Section 12.2 (on page 215).

97661 The following option is supported:

97662 **-n *increment*** A positive or negative decimal integer which shall have the same effect on the  
 97663 execution of the utility as if the utility had called the *nice()* function with the  
 97664 numeric value of the *increment* option-argument.

97665 **OPERANDS**

97666 The following operands shall be supported:

97667 *utility* The name of a utility that is to be invoked. If the *utility* operand names any of the  
 97668 special built-in utilities in Section 2.14 (on page 2334), the results are undefined.

97669 *argument* Any string to be supplied as an argument when invoking the utility named by the  
 97670 *utility* operand.

97671 **STDIN**

97672 Not used.

97673 **INPUT FILES**

97674 None.

97675 **ENVIRONMENT VARIABLES**97676 The following environment variables shall affect the execution of *nice*:

97677 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 97678 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 97679 variables used to determine the values of locale categories.)

97680 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 97681 internationalization variables.

97682 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 97683 characters (for example, single-byte as opposed to multi-byte characters in  
 97684 arguments).

97685 **LC\_MESSAGES**

97686 Determine the locale that should be used to affect the format and contents of  
 97687 diagnostic messages written to standard error.

97688 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

97732 any other reason.

97733 **EXAMPLES**

97734 None.

97735 **RATIONALE**

97736 The 4.3 BSD version of *nice* does not check whether *increment* is a valid decimal integer. The  
 97737 command *nice -x utility*, for example, would be treated the same as the command *nice -1*  
 97738 *utility*. If the user does not have appropriate privileges, this results in a “permission denied”  
 97739 error. This is considered a bug.

97740 When a user without appropriate privileges gives a negative *increment*, System V treats it like  
 97741 the command *nice -0 utility*, while 4.3 BSD writes a “permission denied” message and does not  
 97742 run the utility. The standard specifies the System V behavior together with an optional BSD-style  
 97743 “permission denied” message.

97744 The C shell has a built-in version of *nice* that has a different interface from the one described in  
 97745 this volume of POSIX.1-2008.

97746 The term “utility” is used, rather than “command”, to highlight the fact that shell compound  
 97747 commands, pipelines, and so on, cannot be used. Special built-ins also cannot be used.  
 97748 However, “utility” includes user application programs and shell scripts, not just utilities defined  
 97749 in this volume of POSIX.1-2008.

97750 Historical implementations of *nice* provide a nice value range of 40 or 41 discrete steps, with the  
 97751 default nice value being the midpoint of that range. By default, they raise the nice value of the  
 97752 executed utility by 10.

97753 Some historical documentation states that the *increment* value must be within a fixed range. This  
 97754 is misleading; the valid *increment* values on any invocation are determined by the current  
 97755 process nice value, which is not always the default.

97756 The definition of nice value is not intended to suggest that all processes in a system have  
 97757 priorities that are comparable. Scheduling policy extensions such as the realtime priorities in the  
 97758 System Interfaces volume of POSIX.1-2008 make the notion of a single underlying priority for all  
 97759 scheduling policies problematic. Some implementations may implement the *nice*-related features  
 97760 to affect all processes on the system, others to affect just the general time-sharing activities  
 97761 implied by this volume of POSIX.1-2008, and others may have no effect at all. Because of the use  
 97762 of “implementation-defined” in *nice* and *renice*, a wide range of implementation strategies are  
 97763 possible.

97764 Earlier versions of this standard allowed a *-increment* option. This form is no longer specified by  
 97765 POSIX.1-2008 but may be present in some implementations.

97766 **FUTURE DIRECTIONS**

97767 None.

97768 **SEE ALSO**

97769 Chapter 2 (on page 2297), *renice*

97770 XBD Section 3.239 (on page 71), Chapter 8 (on page 173), Section 12.2 (on page 215)

97771 XSH *nice()*

97772 **CHANGE HISTORY**

97773 First released in Issue 4.

**nice***Utilities*97774 **Issue 6**

97775 This utility is marked as part of the User Portability Utilities option.

97776 The obsolescent SYNOPSIS is removed.

97777 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/18 is applied, deleting a paragraph of  
97778 RATIONALE that referred to text no longer in the standard.

97779 **Issue 7**

97780 Austin Group Interpretation 1003.1-2001 #027 is applied.

97781 SD5-XCU-ERN-32 and SD5-XCU-ERN-33 are applied, updating the DESCRIPTION,  
97782 APPLICATION USAGE, and RATIONALE sections.

97783 The *nice* utility is moved from the User Portability Utilities option to the Base. User Portability  
97784 Utilities is now an option for interactive utilities.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

97785 **NAME**

97786 nl — line numbering filter

97787 **SYNOPSIS**

```
97788 xSI nl [-p] [-b type] [-d delim] [-f type] [-h type] [-i incr] [-l num]
97789 [-n format] [-s sep] [-v startnum] [-w width] [file]
```

97790 **DESCRIPTION**

97791 The *nl* utility shall read lines from the named *file* or the standard input if no *file* is named and  
 97792 shall reproduce the lines to standard output. Lines shall be numbered on the left. Additional  
 97793 functionality may be provided in accordance with the command options in effect.

97794 The *nl* utility views the text it reads in terms of logical pages. Line numbering shall be reset at  
 97795 the start of each logical page. A logical page consists of a header, a body, and a footer section.  
 97796 Empty sections are valid. Different line numbering options are independently available for  
 97797 header, body, and footer (for example, no numbering of header and footer lines while  
 97798 numbering blank lines only in the body).

97799 The starts of logical page sections shall be signaled by input lines containing nothing but the  
 97800 following delimiter characters:

Line	Start of
\: \: \:	Header
\: \:	Body
\:	Footer

97805 Unless otherwise specified, *nl* shall assume the text being read is in a single logical page body.

97806 **OPTIONS**

97807 The *nl* utility shall conform to XBD Section 12.2 (on page 215). Only one file can be named.

97808 The following options shall be supported:

97809 **-b *type*** Specify which logical page body lines shall be numbered. Recognized *types* and  
 97810 their meaning are:

97811 **a** Number all lines.

97812 **t** Number only non-empty lines.

97813 **n** No line numbering.

97814 **pstring** Number only lines that contain the basic regular expression specified in  
 97815 *string*.

97816 The default *type* for logical page body shall be **t** (text lines numbered).

97817 **-d *delim*** Specify the delimiter characters that indicate the start of a logical page section.  
 97818 These can be changed from the default characters "\:" to two user-specified  
 97819 characters. If only one character is entered, the second character shall remain the  
 97820 default character ' : ' .

97821 **-f *type*** Specify the same as **b *type*** except for footer. The default for logical page footer shall  
 97822 be **n** (no lines numbered).

97823 **-h *type*** Specify the same as **b *type*** except for header. The default *type* for logical page  
 97824 header shall be **n** (no lines numbered).

97825	<b>-i</b> <i>incr</i>	Specify the increment value used to number logical page lines. The default shall be 1.
97826		
97827	<b>-l</b> <i>num</i>	Specify the number of blank lines to be considered as one. For example, <b>-l 2</b> results in only the second adjacent blank line being numbered (if the appropriate <b>-h a</b> , <b>-b a</b> , or <b>-f a</b> option is set). The default shall be 1.
97828		
97829		
97830	<b>-n</b> <i>format</i>	Specify the line numbering format. Recognized values are: <b>ln</b> , left justified, leading zeros suppressed; <b>rn</b> , right justified, leading zeros suppressed; <b>rz</b> , right justified, leading zeros kept. The default <i>format</i> shall be <b>rn</b> (right justified).
97831		
97832		
97833	<b>-p</b>	Specify that numbering should not be restarted at logical page delimiters.
97834	<b>-s</b> <i>sep</i>	Specify the characters used in separating the line number and the corresponding text line. The default <i>sep</i> shall be a <tab>.
97835		
97836	<b>-v</b> <i>startnum</i>	Specify the initial value used to number logical page lines. The default shall be 1.
97837	<b>-w</b> <i>width</i>	Specify the number of characters to be used for the line number. The default <i>width</i> shall be 6.
97838		
97839	<b>OPERANDS</b>	
97840		The following operand shall be supported:
97841	<i>file</i>	A pathname of a text file to be line-numbered.
97842	<b>STDIN</b>	
97843		The standard input shall be used if no <i>file</i> operand is specified, and shall be used if the <i>file</i> operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise, the standard input shall not be used. See the INPUT FILES section.
97844		
97845		
97846	<b>INPUT FILES</b>	
97847		The input file shall be a text file.
97848	<b>ENVIRONMENT VARIABLES</b>	
97849		The following environment variables shall affect the execution of <i>nl</i> :
97850	<i>LANG</i>	Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)
97851		
97852		
97853	<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
97854		
97855	<i>LC_COLLATE</i>	Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements within regular expressions.
97856		
97857		
97858	<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files), the behavior of character classes within regular expressions, and for deciding which characters are in character class <b>graph</b> (for the <b>-b t</b> , <b>-f t</b> , and <b>-h t</b> options).
97859		
97860		
97861		
97862		
97863	<i>LC_MESSAGES</i>	Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
97864		
97865		

97866 `NLSPATH` Determine the location of message catalogs for the processing of `LC_MESSAGES`.

#### 97867 **ASYNCHRONOUS EVENTS**

97868 Default.

#### 97869 **STDOUT**

97870 The standard output shall be a text file in the following format:

97871 `"%s%s%s", <line number>, <separator>, <input line>`

97872 where `<line number>` is one of the following numeric formats:

97873 `%6d` When the `rn` format is used (the default; see `-n`).

97874 `%06d` When the `rz` format is used.

97875 `%-6d` When the `ln` format is used.

97876 `<empty>` When line numbers are suppressed for a portion of the page; the `<separator>` is also suppressed.

97878 In the preceding list, the number 6 is the default width; the `-w` option can change this value.

#### 97879 **STDERR**

97880 The standard error shall be used only for diagnostic messages.

#### 97881 **OUTPUT FILES**

97882 None.

#### 97883 **EXTENDED DESCRIPTION**

97884 None.

#### 97885 **EXIT STATUS**

97886 The following exit values shall be returned:

97887 0 Successful completion.

97888 >0 An error occurred.

#### 97889 **CONSEQUENCES OF ERRORS**

97890 Default.

#### 97891 **APPLICATION USAGE**

97892 In using the `-d delim` option, care should be taken to escape characters that have special meaning to the command interpreter.

#### 97894 **EXAMPLES**

97895 The command:

97896 `nl -v 10 -i 10 -d \!+ file1`

97897 numbers `file1` starting at line number 10 with an increment of 10. The logical page delimiter is `"!+"`. Note that the `'!'` has to be escaped when using `cs`h as a command interpreter because of its history substitution syntax. For `ksh` and `sh` the escape is not necessary, but does not do any harm.

#### 97901 **RATIONALE**

97902 None.

97903 **FUTURE DIRECTIONS**

97904 None.

97905 **SEE ALSO**97906 *pr*97907 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)97908 **CHANGE HISTORY**

97909 First released in Issue 2.

97910 **Issue 5**97911 The option [*-f type*] is added to the SYNOPSIS. The option descriptions are presented in  
97912 alphabetic order. The description of *-bt* is changed to “Number only non-empty lines”.97913 **Issue 6**97914 The obsolescent behavior allowing the options to be intermingled with the optional *file* operand  
97915 is removed.97916 **Issue 7**

97917 Austin Group Interpretation 1003.1-2001 #092 is applied.

97918 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

97919 **NAME**97920 nm — write the name list of an object file (**DEVELOPMENT**)97921 **SYNOPSIS**

```
97922 SD nm [-APv] [-g|-u] [-t format] file...
97923 XSI nm [-APv] [-efox] [-g|-u] [-t format] file...
```

97924 **DESCRIPTION**

97925 The *nm* utility shall display symbolic information appearing in the object file, executable file, or  
 97926 object-file library named by *file*. If no symbolic information is available for a valid input file, the  
 97927 *nm* utility shall report that fact, but not consider it an error condition.

97928 XSI The default base used when numeric values are written is unspecified. On XSI-conformant  
 97929 systems, it shall be decimal.

97930 **OPTIONS**97931 The *nm* utility shall conform to XBD Section 12.2 (on page 215).

97932 The following options shall be supported:

97933 **-A** Write the full pathname or library name of an object on each line.97934 XSI **-e** Write only external (global) and static symbol information.

97935 XSI **-f** Produce full output. Write redundant symbols (*.text*, *.data*, and *.bss*), normally  
 97936 suppressed.

97937 **-g** Write only external (global) symbol information.97938 XSI **-o** Write numeric values in octal (equivalent to **-t o**).97939 **-P** Write information in a portable output format, as specified in the STDOUT section.

97940 **-t *format*** Write each numeric value in the specified format. The format shall be dependent  
 97941 on the single character used as the *format* option-argument:

97942 XSI d The offset is written in decimal (default).

97943 o The offset is written in octal.

97944 x The offset is written in hexadecimal.

97945 **-u** Write only undefined symbols.97946 **-v** Sort output by value instead of alphabetically.97947 XSI **-x** Write numeric values in hexadecimal (equivalent to **-t x**).97948 **OPERANDS**

97949 The following operand shall be supported:

97950 *file* A pathname of an object file, executable file, or object-file library.97951 **STDIN**

97952 See the INPUT FILES section.

97953 **INPUT FILES**

97954 The input file shall be an object file, an object-file library whose format is the same as those  
 97955 produced by the *ar* utility for link editing, or an executable file. The *nm* utility may accept  
 97956 additional implementation-defined object library formats for the input file.

97957 **ENVIRONMENT VARIABLES**97958 The following environment variables shall affect the execution of *nm*:

97959 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 97960 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 97961 variables used to determine the values of locale categories.)

97962 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 97963 internationalization variables.

97964 *LC\_COLLATE*  
 97965 Determine the locale for character collation information for the symbol-name and  
 97966 symbol-value collation sequences.

97967 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 97968 characters (for example, single-byte as opposed to multi-byte characters in  
 97969 arguments).

97970 *LC\_MESSAGES*  
 97971 Determine the locale that should be used to affect the format and contents of  
 97972 diagnostic messages written to standard error.

97973 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

97974 **ASYNCHRONOUS EVENTS**

97975 Default.

97976 **STDOUT**

97977 If symbolic information is present in the input files, then for each file or for each member of an  
 97978 archive, the *nm* utility shall write the following information to standard output. By default, the  
 97979 format is unspecified, but the output shall be sorted alphabetically by symbol name:

- 97980 • Library or object name, if *-A* is specified
- 97981 • Symbol name
- 97982 • Symbol type, which shall either be one of the following single characters or an  
 97983 implementation-defined type represented by a single character:
  - 97984 A Global absolute symbol.
  - 97985 a Local absolute symbol.
  - 97986 B Global "bss" (that is, uninitialized data space) symbol.
  - 97987 b Local bss symbol.
  - 97988 D Global data symbol.
  - 97989 d Local data symbol.
  - 97990 T Global text symbol.
  - 97991 t Local text symbol.
  - 97992 U Undefined symbol.
- 97993 • Value of the symbol
- 97994 • The size associated with the symbol, if applicable

97995 This information may be supplemented by additional information specific to the  
 97996 implementation.

97997 If the **-P** option is specified, the previous information shall be displayed using the following  
 97998 portable format. The three versions differ depending on whether **-t d**, **-t o**, or **-t x** was specified,  
 97999 respectively:

98000 "%s%s %s %d %d\n", <library/object name>, <name>, <type>,  
 98001 <value>, <size>

98002 "%s%s %s %o %o\n", <library/object name>, <name>, <type>,  
 98003 <value>, <size>

98004 "%s%s %s %x %x\n", <library/object name>, <name>, <type>,  
 98005 <value>, <size>

98006 where <library/object name> shall be formatted as follows:

- 98007 • If **-A** is not specified, <library/object name> shall be an empty string.
- 98008 • If **-A** is specified and the corresponding *file* operand does not name a library:  
 98009 "%s: ", <file>
- 98010 • If **-A** is specified and the corresponding *file* operand names a library. In this case,  
 98011 <object file> shall name the object file in the library containing the symbol being described:  
 98012 "%s[%s]: ", <file>, <object file>

98013 If **-A** is not specified, then if more than one *file* operand is specified or if only one *file* operand is  
 98014 specified and it names a library, *nm* shall write a line identifying the object containing the  
 98015 following symbols before the lines containing those symbols, in the form:

- 98016 • If the corresponding *file* operand does not name a library:  
 98017 "%s:\n", <file>
- 98018 • If the corresponding *file* operand names a library; in this case, <object file> shall be the  
 98019 name of the file in the library containing the following symbols:  
 98020 "%s[%s]:\n", <file>, <object file>

98021 If **-P** is specified, but **-t** is not, the format shall be as if **-t x** had been specified.

#### 98022 **STDERR**

98023 The standard error shall be used only for diagnostic messages.

#### 98024 **OUTPUT FILES**

98025 None.

#### 98026 **EXTENDED DESCRIPTION**

98027 None.

#### 98028 **EXIT STATUS**

98029 The following exit values shall be returned:

- 98030 0 Successful completion.
- 98031 >0 An error occurred.

#### 98032 **CONSEQUENCES OF ERRORS**

98033 Default.

98034 **APPLICATION USAGE**

98035 Mechanisms for dynamic linking make this utility less meaningful when applied to an  
 98036 executable file because a dynamically linked executable may omit numerous library routines  
 98037 that would be found in a statically linked executable.

98038 **EXAMPLES**

98039 None.

98040 **RATIONALE**

98041 Historical implementations of *nm* have used different bases for numeric output and supplied  
 98042 different default types of symbols that were reported. The *-t format* option, similar to that used  
 98043 in *od* and *strings*, can be used to specify the numeric base; *-g* and *-u* can be used to restrict the  
 98044 amount of output or the types of symbols included in the output.

98045 The compromise of using *-t format versus* using *-d*, *-o*, and other similar options was necessary  
 98046 because of differences in the meaning of *-o* between implementations. The *-o* option from BSD  
 98047 has been provided here as *-A* to avoid confusion with the *-o* from System V (which has been  
 98048 provided here as *-t* and as *-o* on XSI-conformant systems).

98049 The option list was significantly reduced from that provided by historical implementations.

98050 The *nm* description is a subset of both the System V and BSD *nm* utilities with no specified  
 98051 default output.

98052 It was recognized that mechanisms for dynamic linking make this utility less meaningful when  
 98053 applied to an executable file (because a dynamically linked executable file may omit numerous  
 98054 library routines that would be found in a statically linked executable file), but the value of *nm*  
 98055 during software development was judged to outweigh other limitations.

98056 The default output format of *nm* is not specified because of differences in historical  
 98057 implementations. The *-P* option was added to allow some type of portable output format. After  
 98058 a comparison of the different formats used in SunOS, BSD, SVR3, and SVR4, it was decided to  
 98059 create one that did not match the current format of any of these four systems. The format  
 98060 devised is easy to parse by humans, easy to parse in shell scripts, and does not need to vary  
 98061 depending on locale (because no English descriptions are included). All of the systems currently  
 98062 have the information available to use this format.

98063 The format given in *nm* STDOUT uses <space> characters between the fields, which may be any  
 98064 number of <blank> characters required to align the columns. The single-character types were  
 98065 selected to match historical practice, and the requirement that implementation additions also be  
 98066 single characters made parsing the information easier for shell scripts.

98067 **FUTURE DIRECTIONS**

98068 None.

98069 **SEE ALSO**

98070 *ar*, *c99*

98071 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

98072 **CHANGE HISTORY**

98073 First released in Issue 2.

98074 **Issue 6**

98075 This utility is marked as supported when both the User Portability Utilities option and the  
 98076 Software Development Utilities option are supported.

98077 **Issue 7**

98078 The *nm* utility is removed from the User Portability Utilities option. User Portability Utilities is  
98079 now an option for interactive utilities.

98080 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**nohup**

Utilities

98081 **NAME**

98082           nohup — invoke a utility immune to hangups

98083 **SYNOPSIS**98084           nohup *utility* [*argument...*]98085 **DESCRIPTION**

98086           The *nohup* utility shall invoke the utility named by the *utility* operand with arguments supplied  
 98087           as the *argument* operands. At the time the named *utility* is invoked, the SIGHUP signal shall be  
 98088           set to be ignored.

98089           If standard input is associated with a terminal, the *nohup* utility may redirect standard input  
 98090           from an unspecified file.

98091           If the standard output is a terminal, all output written by the named *utility* to its standard output  
 98092           shall be appended to the end of the file **nohup.out** in the current directory. If **nohup.out** cannot  
 98093           be created or opened for appending, the output shall be appended to the end of the file  
 98094           **nohup.out** in the directory specified by the *HOME* environment variable. If neither file can be  
 98095           created or opened for appending, *utility* shall not be invoked. If a file is created, the file's  
 98096           permission bits shall be set to S\_IRUSR | S\_IWUSR.

98097           If standard error is a terminal and standard output is open but is not a terminal, all output  
 98098           written by the named utility to its standard error shall be redirected to the same open file  
 98099           description as the standard output. If standard error is a terminal and standard output either is a  
 98100           terminal or is closed, the same output shall instead be appended to the end of the **nohup.out** file  
 98101           as described above.

98102 **OPTIONS**

98103           None.

98104 **OPERANDS**

98105           The following operands shall be supported:

98106           *utility*           The name of a utility that is to be invoked. If the *utility* operand names any of the  
 98107           special built-in utilities in Section 2.14 (on page 2334), the results are undefined.

98108           *argument*       Any string to be supplied as an argument when invoking the utility named by the  
 98109           *utility* operand.

98110 **STDIN**

98111           Not used.

98112 **INPUT FILES**

98113           None.

98114 **ENVIRONMENT VARIABLES**98115           The following environment variables shall affect the execution of *nohup*:

98116           *HOME*           Determine the pathname of the user's home directory: if the output file **nohup.out**  
 98117           cannot be created in the current directory, the *nohup* utility shall use the directory  
 98118           named by *HOME* to create the file.

98119           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 98120           (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 98121           variables used to determine the values of locale categories.)

98122           *LC\_ALL*           If set to a non-empty string value, override the values of all the other  
 98123           internationalization variables.

- 98124 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 98125 characters (for example, single-byte as opposed to multi-byte characters in  
 98126 arguments).
- 98127 *LC\_MESSAGES*  
 98128 Determine the locale that should be used to affect the format and contents of  
 98129 diagnostic messages written to standard error.
- 98130 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 98131 *PATH* Determine the search path that is used to locate the utility to be invoked. See XBD  
 98132 Chapter 8 (on page 173).
- 98133 **ASYNCHRONOUS EVENTS**  
 98134 The *nohup* utility shall take the standard action for all signals except that *SIGHUP* shall be  
 98135 ignored.
- 98136 **STDOUT**  
 98137 If the standard output is not a terminal, the standard output of *nohup* shall be the standard  
 98138 output generated by the execution of the *utility* specified by the operands. Otherwise, nothing  
 98139 shall be written to the standard output.
- 98140 **STDERR**  
 98141 If the standard output is a terminal, a message shall be written to the standard error, indicating  
 98142 the name of the file to which the output is being appended. The name of the file shall be either  
 98143 **nohup.out** or **\$HOME/nohup.out**.
- 98144 **OUTPUT FILES**  
 98145 Output written by the named utility is appended to the file **nohup.out** (or **\$HOME/nohup.out**),  
 98146 if the conditions hold as described in the **DESCRIPTION**.
- 98147 **EXTENDED DESCRIPTION**  
 98148 None.
- 98149 **EXIT STATUS**  
 98150 The following exit values shall be returned:
- 98151 126 The utility specified by *utility* was found but could not be invoked.
- 98152 127 An error occurred in the *nohup* utility or the utility specified by *utility* could not be  
 98153 found.
- 98154 Otherwise, the exit status of *nohup* shall be that of the utility specified by the *utility* operand.
- 98155 **CONSEQUENCES OF ERRORS**  
 98156 Default.
- 98157 **APPLICATION USAGE**  
 98158 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
 98159 an error occurs so that applications can distinguish “failure to find a utility” from “invoked  
 98160 utility exited with an error indication”. The value 127 was chosen because it is not commonly  
 98161 used for other meanings; most utilities use small values for “normal error conditions” and the  
 98162 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
 98163 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
 98164 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
 98165 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
 98166 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
 98167 any other reason.

**nohup**

Utilities

98168 **EXAMPLES**

98169 It is frequently desirable to apply *nohup* to pipelines or lists of commands. This can be done by  
 98170 placing pipelines and command lists in a single file; this file can then be invoked as a utility, and  
 98171 the *nohup* applies to everything in the file.

98172 Alternatively, the following command can be used to apply *nohup* to a complex command:

```
98173 nohup sh -c 'complex-command-line' </dev/null
```

98174 **RATIONALE**

98175 The 4.3 BSD version ignores SIGTERM and SIGHUP, and if **./nohup.out** cannot be used, it fails  
 98176 instead of trying to use **\$HOME/nohup.out**.

98177 The *cs* utility has a built-in version of *nohup* that acts differently from the *nohup* defined in this  
 98178 volume of POSIX.1-2008.

98179 The term *utility* is used, rather than *command*, to highlight the fact that shell compound  
 98180 commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility*  
 98181 includes user application programs and shell scripts, not just the standard utilities.

98182 Historical versions of the *nohup* utility use default file creation semantics. Some more recent  
 98183 versions use the permissions specified here as an added security precaution.

98184 Some historical implementations ignore SIGQUIT in addition to SIGHUP; others ignore  
 98185 SIGTERM. An early proposal allowed, but did not require, SIGQUIT to be ignored. Several  
 98186 reviewers objected that *nohup* should only modify the handling of SIGHUP as required by this  
 98187 volume of POSIX.1-2008.

98188 Historical versions of *nohup* did not affect standard input, but that causes problems in the  
 98189 common scenario where the user logs into a system, types the command:

```
98190 nohup make &
```

98191 at the prompt, and then logs out. If standard input is not affected by *nohup*, the login session  
 98192 may not terminate for quite some time, since standard input remains open until *make* exits. To  
 98193 avoid this problem, POSIX.1-2008 allows implementations to redirect standard input if it is a  
 98194 terminal. Since the behavior is implementation-defined, portable applications that may run into  
 98195 the problem should redirect standard input themselves. For example, instead of:

```
98196 nohup make &
```

98197 an application can invoke:

```
98198 nohup make </dev/null &
```

98199 **FUTURE DIRECTIONS**

98200 None.

## od

## 98209 NAME

98210 od — dump files in various formats

## 98211 SYNOPSIS

98212 od [-v] [-A *address\_base*] [-j *skip*] [-N *count*] [-t *type\_string*]...  
 98213 [*file*...]

98214 XSI od [-bcdosx] [*file*] [[+] *offset* [.][b]]

## 98215 DESCRIPTION

98216 The *od* utility shall write the contents of its input files to standard output in a user-specified  
 98217 format.

## 98218 OPTIONS

98219 The *od* utility shall conform to XBD Section 12.2 (on page 215), except that the order of  
 98220 XSI presentation of the **-t** options and the **-bcdosx** options is significant.

98221 The following options shall be supported:

98222 **-A *address\_base***

98223 Specify the input offset base. See the EXTENDED DESCRIPTION section. The  
 98224 application shall ensure that the *address\_base* option-argument is a character. The  
 98225 characters 'd', 'o', and 'x' specify that the offset base shall be written in  
 98226 decimal, octal, or hexadecimal, respectively. The character 'n' specifies that the  
 98227 offset shall not be written.

98228 XSI **-b** Interpret bytes in octal. This shall be equivalent to **-t o1**.

98229 XSI **-c** Interpret bytes as characters specified by the current setting of the *LC\_CTYPE*  
 98230 category. Certain non-graphic characters appear as C escapes: "NUL=\0",  
 98231 "BS=\b", "FF=\f", "NL=\n", "CR=\r", "HT=\t"; others appear as 3-digit octal  
 98232 numbers.

98233 XSI **-d** Interpret *words* (two-byte units) in unsigned decimal. This shall be equivalent to  
 98234 **-t u2**.

98235 **-j *skip*** Jump over *skip* bytes from the beginning of the input. The *od* utility shall read or  
 98236 seek past the first *skip* bytes in the concatenated input files. If the combined input is  
 98237 not at least *skip* bytes long, the *od* utility shall write a diagnostic message to  
 98238 standard error and exit with a non-zero exit status.

98239 By default, the *skip* option-argument shall be interpreted as a decimal number.  
 98240 With a leading 0x or 0X, the offset shall be interpreted as a hexadecimal number;  
 98241 otherwise, with a leading '0', the offset shall be interpreted as an octal number.  
 98242 Appending the character 'b', 'k', or 'm' to offset shall cause it to be interpreted  
 98243 as a multiple of 512, 1024, or 1048576 bytes, respectively. If the *skip* number is  
 98244 hexadecimal, any appended 'b' shall be considered to be the final hexadecimal  
 98245 digit.

98246 **-N *count*** Format no more than *count* bytes of input. By default, *count* shall be interpreted as  
 98247 a decimal number. With a leading 0x or 0X, *count* shall be interpreted as a  
 98248 hexadecimal number; otherwise, with a leading '0', it shall be interpreted as an  
 98249 octal number. If *count* bytes of input (after successfully skipping, if **-j *skip***  
 98250 is specified) are not available, it shall not be considered an error; the *od* utility shall  
 98251 format the input that is available.

98252	XSI	<b>-o</b>	Interpret <i>words</i> (two-byte units) in octal. This shall be equivalent to <b>-t o2</b> .
98253	XSI	<b>-s</b>	Interpret <i>words</i> (two-byte units) in signed decimal. This shall be equivalent to
98254		<b>-t d2</b> .	
98255		<b>-t type_string</b>	
98256			Specify one or more output types. See the EXTENDED DESCRIPTION section. The
98257			application shall ensure that the <i>type_string</i> option-argument is a string specifying
98258			the types to be used when writing the input data. The string shall consist of the
98259			type specification characters <i>a</i> , <i>c</i> , <i>d</i> , <i>f</i> , <i>o</i> , <i>u</i> , and <i>x</i> , specifying named character,
98260			character, signed decimal, floating point, octal, unsigned decimal, and
98261			hexadecimal, respectively. The type specification characters <i>d</i> , <i>f</i> , <i>o</i> , <i>u</i> , and <i>x</i> can be
98262			followed by an optional unsigned decimal integer that specifies the number of
98263			bytes to be transformed by each instance of the output type. The type specification
98264			character <i>f</i> can be followed by an optional <i>F</i> , <i>D</i> , or <i>L</i> indicating that the conversion
98265			should be applied to an item of type <b>float</b> , <b>double</b> , or <b>long double</b> , respectively.
98266			The type specification characters <i>d</i> , <i>o</i> , <i>u</i> , and <i>x</i> can be followed by an optional <i>C</i> , <i>S</i> ,
98267			<i>I</i> , or <i>L</i> indicating that the conversion should be applied to an item of type <b>char</b> ,
98268			<b>short</b> , <b>int</b> , or <b>long</b> , respectively. Multiple types can be concatenated within the
98269			same <i>type_string</i> and multiple <b>-t</b> options can be specified. Output lines shall be
98270			written for each type specified in the order in which the type specification
98271			characters are specified.
98272		<b>-v</b>	Write all input data. Without the <b>-v</b> option, any number of groups of output lines,
98273			which would be identical to the immediately preceding group of output lines
98274			(except for the byte offsets), shall be replaced with a line containing only an
98275			<asterisk> (' * ').
98276	XSI	<b>-x</b>	Interpret <i>words</i> (two-byte units) in hexadecimal. This shall be equivalent to <b>-t x2</b> .
98277	XSI		Multiple types can be specified by using multiple <b>-bcdostx</b> options. Output lines are written for
98278			each type specified in the order in which the types are specified.
98279		<b>OPERANDS</b>	
98280			The following operands shall be supported:
98281		<i>file</i>	A path name of a file to be read. If no <i>file</i> operands are specified, the standard input
98282			shall be used.
98283			If there are no more than two operands, none of the <b>-A</b> , <b>-j</b> , <b>-N</b> , <b>-t</b> , or <b>-v</b> options is
98284			specified, and either of the following is true: the first character of the last operand
98285			is a <plus-sign> (' + '), or there are two operands and the first character of the last
98286	XSI		operand is numeric; the last operand shall be interpreted as an offset operand on
98287			XSI-conformant systems. Under these conditions, the results are unspecified on
98288			systems that are not XSI-conformant systems.
98289	XSI	<b>[+]<i>offset</i>[.][b]</b>	The <i>offset</i> operand specifies the offset in the file where dumping is to commence.
98290			This operand is normally interpreted as octal bytes. If '.' is appended, the offset
98291			shall be interpreted in decimal. If 'b' is appended, the offset shall be interpreted
98292			in units of 512 bytes.
98293		<b>STDIN</b>	
98294			The standard input shall be used if no <i>file</i> operands are specified, and shall be used if a <i>file</i>
98295			operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,
98296			the standard input shall not be used. See the INPUT FILES section.

98297 **INPUT FILES**

98298 The input files can be any file type.

98299 **ENVIRONMENT VARIABLES**98300 The following environment variables shall affect the execution of *od*:

98301 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 98302 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 98303 variables used to determine the values of locale categories.)

98304 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 98305 internationalization variables.

98306 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 98307 characters (for example, single-byte as opposed to multi-byte characters in  
 98308 arguments and input files).

98309 *LC\_MESSAGES*

98310 Determine the locale that should be used to affect the format and contents of  
 98311 diagnostic messages written to standard error.

98312 *LC\_NUMERIC*

98313 Determine the locale for selecting the radix character used when writing floating-  
 98314 point formatted output.

98315 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

98316 **ASYNCHRONOUS EVENTS**

98317 Default.

98318 **STDOUT**

98319 See the EXTENDED DESCRIPTION section.

98320 **STDERR**

98321 The standard error shall be used only for diagnostic messages.

98322 **OUTPUT FILES**

98323 None.

98324 **EXTENDED DESCRIPTION**

98325 The *od* utility shall copy sequentially each input file to standard output, transforming the input  
 98326 XSI data according to the output types specified by the *-t* option or the *-bcdox* options. If no  
 98327 output type is specified, the default output shall be as if *-t oS* had been specified.

98328 The number of bytes transformed by the output type specifier *c* may be variable depending on  
 98329 the *LC\_CTYPE* category.

98330 The default number of bytes transformed by output type specifiers *d*, *f*, *o*, *u*, and *x* corresponds  
 98331 to the various C-language types as follows. If the *c99* compiler is present on the system, these  
 98332 specifiers shall correspond to the sizes used by default in that compiler. Otherwise, these sizes  
 98333 may vary among systems that conform to POSIX.1-2008.

- 98334 • For the type specifier characters *d*, *o*, *u*, and *x*, the default number of bytes shall
- 98335 correspond to the size of the underlying implementation's basic integer type. For these
- 98336 specifier characters, the implementation shall support values of the optional number of
- 98337 bytes to be converted corresponding to the number of bytes in the C-language types **char**,
- 98338 **short**, **int**, and **long**. These numbers can also be specified by an application as the
- 98339 characters '*C*', '*S*', '*I*', and '*L*', respectively. The implementation shall also support
- 98340 the values 1, 2, 4, and 8, even if it provides no C-Language types of those sizes. The

98341 implementation shall support the decimal value corresponding to the C-language type  
 98342 **long long**. The byte order used when interpreting numeric values is implementation-  
 98343 defined, but shall correspond to the order in which a constant of the corresponding type is  
 98344 stored in memory on the system.

98345 • For the type specifier character  $\mathfrak{f}$ , the default number of bytes shall correspond to the  
 98346 number of bytes in the underlying implementation's basic double precision floating-point  
 98347 data type. The implementation shall support values of the optional number of bytes to be  
 98348 converted corresponding to the number of bytes in the C-language types **float**, **double**,  
 98349 and **long double**. These numbers can also be specified by an application as the characters  
 98350 'F', 'D', and 'L', respectively.

98351 The type specifier character  $\mathfrak{a}$  specifies that bytes shall be interpreted as named characters from  
 98352 the International Reference Version (IRV) of the ISO/IEC 646:1991 standard. Only the least  
 98353 significant seven bits of each byte shall be used for this type specification. Bytes with the values  
 98354 listed in the following table shall be written using the corresponding names for those characters.

98355 **Table 4-13** Named Characters in *od*

Value	Name	Value	Name	Value	Name	Value	Name
\000	nul	\001	soh	\002	stx	\003	etx
\004	eot	\005	enq	\006	ack	\007	bel
\010	bs	\011	ht	\012	If or nl*	\013	vt
\014	ff	\015	cr	\016	so	\017	si
\020	dle	\021	dc1	\022	dc2	\023	dc3
\024	dc4	\025	nak	\026	syn	\027	etb
\030	can	\031	em	\032	sub	\033	esc
\034	fs	\035	gs	\036	rs	\037	us
\040	sp	\177	del				

98366 **Note:** The "\012" value may be written either as If or nl.

98367 The type specifier character  $\mathfrak{c}$  specifies that bytes shall be interpreted as characters specified by  
 98368 the current setting of the *LC\_CTYPE* locale category. Characters listed in the table in XBD  
 98369 Chapter 5 (on page 121) ('\ ', '\a', '\b', '\f', '\n', '\r', '\t', '\v') shall be written as  
 98370 the corresponding escape sequences, except that <backslash> shall be written as a single  
 98371 <backslash> and a NUL shall be written as '\0'. Other non-printable characters shall be  
 98372 written as one three-digit octal number for each byte in the character. Printable multi-byte  
 98373 characters shall be written in the area corresponding to the first byte of the character; the two-  
 98374 character sequence "\*\*\*" shall be written in the area corresponding to each remaining byte in the  
 98375 character, as an indication that the character is continued. When either the *-j skip* or *-N count*  
 98376 option is specified along with the  $\mathfrak{c}$  type specifier, and this results in an attempt to start or finish  
 98377 in the middle of a multi-byte character, the result is implementation-defined.

98378 The input data shall be manipulated in blocks, where a block is defined as a multiple of the least  
 98379 common multiple of the number of bytes transformed by the specified output types. If the least  
 98380 common multiple is greater than 16, the results are unspecified. Each input block shall be  
 98381 written as transformed by each output type, one per written line, in the order that the output  
 98382 types were specified. If the input block size is larger than the number of bytes transformed by  
 98383 the output type, the output type shall sequentially transform the parts of the input block, and  
 98384 the output from each of the transformations shall be separated by one or more <blank>  
 98385 characters.

98386 If, as a result of the specification of the *-N* option or end-of-file being reached on the last input  
 98387 file, input data only partially satisfies an output type, the input shall be extended sufficiently

98388 with null bytes to write the last byte of the input.

98389 Unless **-A n** is specified, the first output line produced for each input block shall be preceded by  
 98390 the input offset, cumulative across input files, of the next byte to be written. The format of the  
 98391 input offset is unspecified; however, it shall not contain any <blank> characters, shall start at the  
 98392 first character of the output line, and shall be followed by one or more <blank> characters. In  
 98393 addition, the offset of the byte following the last byte written shall be written after all the input  
 98394 data has been processed, but shall not be followed by any <blank> characters.

98395 If no **-A** option is specified, the input offset base is unspecified.

#### 98396 EXIT STATUS

98397 The following exit values shall be returned:

98398 0 All input files were processed successfully.

98399 >0 An error occurred.

#### 98400 CONSEQUENCES OF ERRORS

98401 Default.

#### 98402 APPLICATION USAGE

98403 XSI-conformant applications are warned not to use filenames starting with '+' or a first  
 98404 operand starting with a numeric character so that the old functionality can be maintained by  
 98405 implementations, unless they specify one of the **-A**, **-j** or **-N** options. To guarantee that one of  
 98406 these filenames is always interpreted as a filename, an application could always specify the  
 98407 address base format with the **-A** option.

#### 98408 EXAMPLES

98409 If a file containing 128 bytes with decimal values zero to 127, in increasing order, is supplied as  
 98410 standard input to the command:

98411 `od -A d -t a`

98412 on an implementation using an input block size of 16 bytes, the standard output, independent of  
 98413 the current locale setting, would be similar to:

```

98414 00000000 nul soh stx etx eot enq ack bel bs ht nl vt ff cr so si
98415 00000016 dle dc1 dc2 dc3 dc4 nak syn etb can em sub esc fs gs rs us
98416 00000032 sp ! " # $ % & ' ( ) * + , - . /
98417 00000048 0 1 2 3 4 5 6 7 8 9 : ; < = > ?
98418 00000064 @ A B C D E F G H I J K L M N O
98419 00000080 P Q R S T U V W X Y Z [ \ ] ^ _
98420 00000096 ` a b c d e f g h i j k l m n o
98421 00000112 p q r s t u v w x y z { | } ~ del
98422 00000128
  
```

98423 Note that this volume of POSIX.1-2008 allows **nl** or **lf** to be used as the name for the  
 98424 ISO/IEC 646:1991 standard IRV character with decimal value 10. The IRV names this character  
 98425 **lf** (line feed), but traditional implementations have referred to this character as newline (**nl**) and  
 98426 the POSIX locale character set symbolic name for the corresponding character is a <newline>.

98427 The command:

98428 `od -A o -t o2x2x -N 18`

98429 on a system with 32-bit words and an implementation using an input block size of 16 bytes  
 98430 could write 18 bytes in approximately the following format:

98431 0000000 032056 031440 041123 042040 052516 044530 020043 031464

```

98432          342e  3320  4253  4420  554e  4958  2023  3334
98433          342e3320      42534420      554e4958      20233334
98434 0000020 032472
98435          353a
98436          353a0000
98437 0000022

```

98438 The command:

```
98439 od -A d -t f -t o4 -t x4 -N 24 -j 0x15
```

98440 on a system with 64-bit doubles (for example, IEEE Std 754-1985 double precision floating-point  
98441 format) would skip 21 bytes of input data and then write 24 bytes in approximately the  
98442 following format:

```

98443 0000000 1.0000000000000000e+00 1.5735000000000000e+01
98444 07774000000 0000000000 10013674121 35341217270
98445 3ff00000 00000000 402f3851 eb851eb8
98446 0000016 1.4066823000000000e+02
98447 10030312542 04370303230
98448 40619562 23e18698
98449 0000024

```

#### 98450 RATIONALE

98451 The *od* utility went through several names in early proposals, including *hd*, *xd*, and most recently  
98452 *hexdump*. There were several objections to all of these based on the following reasons:

- 98453 • The *hd* and *xd* names conflicted with historical utilities that behaved differently.
- 98454 • The *hexdump* description was much more complex than needed for a simple dump utility.
- 98455 • The *od* utility has been available on all historical implementations and there was no need to  
98456 create a new name for a utility so similar to the historical *od* utility.

98457 The original reasons for not standardizing historical *od* were also fairly widespread. Those  
98458 reasons are given below along with rationale explaining why the standard developers believe  
98459 that this version does not suffer from the indicated problem:

- 98460 • The BSD and System V versions of *od* have diverged, and the intersection of features  
98461 provided by both does not meet the needs of the user community. In fact, the System V  
98462 version only provides a mechanism for dumping octal bytes and **shorts**, signed and  
98463 unsigned decimal **shorts**, hexadecimal **shorts**, and ASCII characters. BSD added the ability  
98464 to dump **floats**, **doubles**, named ASCII characters, and octal, signed decimal, unsigned  
98465 decimal, and hexadecimal **longs**. The version presented here provides more normalized  
98466 forms for dumping bytes, **shorts**, **ints**, and **longs** in octal, signed decimal, unsigned  
98467 decimal, and hexadecimal; **float**, **double**, and **long double**; and named ASCII as well as  
98468 current locale characters.
- 98469 • It would not be possible to come up with a compatible superset of the BSD and System V  
98470 flags that met the requirements of the standard developers. The historical default *od* output  
98471 is the specified default output of this utility. None of the option letters chosen for this  
98472 version of *od* conflict with any of the options to historical versions of *od*.
- 98473 • On systems with different sizes for **short**, **int**, and **long**, there was no way to ask for dumps  
98474 of **ints**, even in the BSD version. Because of the way options are named, the name space  
98475 could not be extended to solve these problems. This is why the **-t** option was added (with  
98476 type specifiers more closely matched to the *printf()* formats used in the rest of this volume  
98477 of POSIX.1-2008) and the optional field sizes were added to the *d*, *f*, *o*, *u*, and *x* type

98478 specifiers. It is also one of the reasons why the historical practice was not mandated as a  
 98479 required obsolescent form of *od*. (Although the old versions of *od* are not listed as an  
 98480 obsolescent form, implementations are urged to continue to recognize the older forms for  
 98481 several more years.) The *a*, *c*, *f*, *o*, and *x* types match the meaning of the corresponding  
 98482 format characters in the historical implementations of *od* except for the default sizes of the  
 98483 fields converted. The *d* format is signed in this volume of POSIX.1-2008 to match the  
 98484 *printf()* notation. (Historical versions of *od* used *d* as a synonym for *u* in this version. The  
 98485 System V implementation uses *s* for signed decimal; BSD uses *i* for signed decimal and *s*  
 98486 for null-terminated strings.) Other than *d* and *u*, all of the type specifiers match format  
 98487 characters in the historical BSD version of *od*.

98488 The sizes of the C-language types **char**, **short**, **int**, **long**, **float**, **double**, and **long double** are  
 98489 used even though it is recognized that there may be zero or more than one compiler for the  
 98490 C language on an implementation and that they may use different sizes for some of these  
 98491 types. (For example, one compiler might use 2 bytes **shorts**, 2 bytes **ints**, and 4 bytes **longs**,  
 98492 while another compiler (or an option to the same compiler) uses 2 bytes **shorts**, 4 bytes  
 98493 **ints**, and 4 bytes **longs**.) Nonetheless, there has to be a basic size known by the  
 98494 implementation for these types, corresponding to the values reported by invocations of the  
 98495 *getconf* utility when called with *system\_var* operands {UCHAR\_MAX}, {USHORT\_MAX},  
 98496 {UINT\_MAX}, and {ULONG\_MAX} for the types **char**, **short**, **int**, and **long**, respectively.  
 98497 There are similar constants required by the ISO C standard, but not required by the System  
 98498 Interfaces volume of POSIX.1-2008 or this volume of POSIX.1-2008. They are  
 98499 {FLT\_MANT\_DIG}, {DBL\_MANT\_DIG}, and {LDBL\_MANT\_DIG} for the types **float**,  
 98500 **double**, and **long double**, respectively. If the optional *c99* utility is provided by the  
 98501 implementation and used as specified by this volume of POSIX.1-2008, these are the sizes  
 98502 that would be provided. If an option is used that specifies different sizes for these types,  
 98503 there is no guarantee that the *od* utility is able to interpret binary data output by such a  
 98504 program correctly.

98505 This volume of POSIX.1-2008 requires that the numeric values of these lengths be  
 98506 recognized by the *od* utility and that symbolic forms also be recognized. Thus, a  
 98507 conforming application can always look at an array of **unsigned long** data elements using  
 98508 *od -t uL*.

- 98509 • The method of specifying the format for the address field based on specifying a starting  
 98510 offset in a file unnecessarily tied the two together. The *-A* option now specifies the address  
 98511 base and the *-S* option specifies a starting offset.
- 98512 • It would be difficult to break the dependence on US ASCII to achieve an internationalized  
 98513 utility. It does not seem to be any harder for *od* to dump characters in the current locale  
 98514 than it is for the *ed* or *sed* *l* commands. The *c* type specifier does this without difficulty and  
 98515 is completely compatible with the historical implementations of the *c* format character  
 98516 when the current locale uses a superset of the ISO/IEC 646:1991 standard as a codeset. The  
 98517 *a* type specifier (from the BSD *a* format character) was left as a portable means to dump  
 98518 ASCII (or more correctly ISO/IEC 646:1991 standard (IRV)) so that headers produced by  
 98519 *pax* could be deciphered even on systems that do not use the ISO/IEC 646:1991 standard  
 98520 as a subset of their base codeset.

98521 The use of "\*" as an indication of continuation of a multi-byte character in *c* specifier output  
 98522 was chosen based on seeing an implementation that uses this method. The continuation bytes  
 98523 have to be marked in a way that is not ambiguous with another single-byte or multi-byte  
 98524 character.

98525 An early proposal used *-S* and *-n*, respectively, for the *-j* and *-N* options eventually selected.  
 98526 These were changed to avoid conflicts with historical implementations.

98527 The original standard specified `-t o2` as the default when no output type was given. This was  
 98528 changed to `-t oS` (the length of a **short**) to accommodate a supercomputer implementation that  
 98529 historically used 64 bits as its default (and that defined shorts as 64 bits). This change should not  
 98530 affect conforming applications. The requirement to support lengths of 1, 2, and 4 was added at  
 98531 the same time to address an historical implementation that had no two-byte data types in its C  
 98532 compiler.

98533 The use of a basic integer data type is intended to allow the implementation to choose a word  
 98534 size commonly used by applications on that architecture.

98535 Earlier versions of this standard allowed for implementations with bytes other than eight bits,  
 98536 but this has been modified in this version.

#### 98537 FUTURE DIRECTIONS

98538 All option and operand interfaces marked XSI may be removed in a future version.

#### 98539 SEE ALSO

98540 *c99*, *sed*

98541 XBD [Chapter 5](#) (on page 121), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 98542 CHANGE HISTORY

98543 First released in Issue 2.

#### 98544 Issue 5

98545 In the description of the `-c` option, the phrase “This is equivalent to `-t c.`” is deleted.

98546 The FUTURE DIRECTIONS section is modified.

#### 98547 Issue 6

98548 The *od* utility is changed to remove the assumption that **short** was a two-byte entity, as per the  
 98549 revisions in the IEEE P1003.2b draft standard.

98550 The normative text is reworded to avoid use of the term “must” for application requirements.

98551 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/33 is applied, correcting the examples  
 98552 which used an undefined `-n` option, which should have been `-N`.

98553 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/19 is applied, removing text describing  
 98554 behavior on systems with bytes consisting of more than eight bits.

#### 98555 Issue 7

98556 Austin Group Interpretation 1003.1-2001 #092 is applied.

98557 SD5-XCU-ERN-37 is applied, updating the OPERANDS section.

98558 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**paste**

Utilities

98559 **NAME**98560 `paste` — merge corresponding or subsequent lines of files98561 **SYNOPSIS**98562 `paste [-s] [-d list] file...`98563 **DESCRIPTION**98564 The *paste* utility shall concatenate the corresponding lines of the given input files, and write the  
98565 resulting lines to standard output.98566 The default operation of *paste* shall concatenate the corresponding lines of the input files. The  
98567 <newline> of every line except the line from the last input file shall be replaced with a <tab>.98568 If an end-of-file condition is detected on one or more input files, but not all input files, *paste* shall  
98569 behave as though empty lines were read from the files on which end-of-file was detected, unless  
98570 the `-s` option is specified.98571 **OPTIONS**98572 The *paste* utility shall conform to XBD Section 12.2 (on page 215).

98573 The following options shall be supported:

98574 `-d list` Unless a <backslash> character appears in *list*, each character in *list* is an element  
98575 specifying a delimiter character. If a <backslash> character appears in *list*, the  
98576 <backslash> character and one or more characters following it are an element  
98577 specifying a delimiter character as described below. These elements specify one or  
98578 more delimiters to use, instead of the default <tab>, to replace the <newline> of  
98579 the input lines. The elements in *list* shall be used circularly; that is, when the list is  
98580 exhausted the first element from the list is reused. When the `-s` option is specified:

- 98581
- The last <newline> in a file shall not be modified.
  - The delimiter shall be reset to the first element of *list* after each *file* operand is processed.

98584 When the `-s` option is not specified:

- 98585
- The <newline> characters in the file specified by the last *file* operand shall not be modified.
  - The delimiter shall be reset to the first element of *list* each time a line is processed from each file.

98589 If a <backslash> character appears in *list*, it and the character following it shall be  
98590 used to represent the following delimiter characters:98591 `\n` <newline>.98592 `\t` <tab>.98593 `\\` <backslash> character.98594 `\0` Empty string (not a null character). If '`\0`' is immediately followed by the  
98595 character '`x`', the character '`X`', or any character defined by the `LC_CTYPE`  
98596 **digit** keyword (see XBD Chapter 7, on page 135), the results are unspecified.

98597 If any other characters follow the &lt;backslash&gt;, the results are unspecified.

98598 `-s` Concatenate all of the lines of each separate input file in command line order. The  
98599 <newline> of every line except the last line in each input file shall be replaced with  
98600 the <tab>, unless otherwise specified by the `-d` option.

98601 **OPERANDS**

98602 The following operand shall be supported:

98603 *file* A pathname of an input file. If '-' is specified for one or more of the *files*, the  
 98604 standard input shall be used; the standard input shall be read one line at a time,  
 98605 circularly, for each instance of '-'. Implementations shall support pasting of at  
 98606 least 12 *file* operands.

98607 **STDIN**98608 The standard input shall be used only if one or more *file* operands is '-'. See the INPUT FILES  
98609 section.98610 **INPUT FILES**

98611 The input files shall be text files, except that line lengths shall be unlimited.

98612 **ENVIRONMENT VARIABLES**98613 The following environment variables shall affect the execution of *paste*:

98614 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 98615 (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
 98616 used to determine the values of locale categories.)

98617 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 98618 internationalization variables.

98619 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 98620 characters (for example, single-byte as opposed to multi-byte characters in  
 98621 arguments and input files).

98622 *LC\_MESSAGES*98623 Determine the locale that should be used to affect the format and contents of  
98624 diagnostic messages written to standard error.98625 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.98626 **ASYNCHRONOUS EVENTS**

98627 Default.

98628 **STDOUT**98629 Concatenated lines of input files shall be separated by the <tab> (or other characters under the  
98630 control of the -d option) and terminated by a <newline>.98631 **STDERR**

98632 The standard error shall be used only for diagnostic messages.

98633 **OUTPUT FILES**

98634 None.

98635 **EXTENDED DESCRIPTION**

98636 None.

98637 **EXIT STATUS**

98638 The following exit values shall be returned:

98639 0 Successful completion.

98640 &gt;0 An error occurred.

98641 **CONSEQUENCES OF ERRORS**

98642 If one or more input files cannot be opened when the `-s` option is not specified, a diagnostic  
 98643 message shall be written to standard error, but no output is written to standard output. If the `-s`  
 98644 option is specified, the *paste* utility shall provide the default behavior described in Section 1.4 (on  
 98645 page 2288).

98646 **APPLICATION USAGE**

98647 When the escape sequences of the *list* option-argument are used in a shell script, they must be  
 98648 quoted; otherwise, the shell treats the <backslash> as a special character.

98649 Conforming applications should only use the specific <backslash>-escaped delimiters presented  
 98650 in this volume of POSIX.1-2008. Historical implementations treat '`\x`', where '`x`' is not in this  
 98651 list, as '`x`', but future implementations are free to expand this list to recognize other common  
 98652 escapes similar to those accepted by *printf* and other standard utilities.

98653 Most of the standard utilities work on text files. The *cut* utility can be used to turn files with  
 98654 arbitrary line lengths into a set of text files containing the same data. The *paste* utility can be used  
 98655 to create (or recreate) files with arbitrary line lengths. For example, if *file* contains long lines:

```
98656 cut -b 1-500 -n file > file1
98657 cut -b 501- -n file > file2
```

98658 creates **file1** (a text file) with lines no longer than 500 bytes (plus the <newline>) and **file2** that  
 98659 contains the remainder of the data from *file*. Note that **file2** is not a text file if there are lines in  
 98660 *file* that are longer than 500 + {LINE\_MAX} bytes. The original file can be recreated from **file1**  
 98661 and **file2** using the command:

```
98662 paste -d "\0" file1 file2 > file
```

98663 The commands:

```
98664 paste -d "\0" ...
98665 paste -d "" ...
```

98666 are not necessarily equivalent; the latter is not specified by this volume of POSIX.1-2008 and  
 98667 may result in an error. The construct '`\0`' is used to mean "no separator" because historical  
 98668 versions of *paste* did not follow the syntax guidelines, and the command:

```
98669 paste -d "" ...
```

98670 could not be handled properly by *getopt*().

98671 **EXAMPLES**

98672 1. Write out a directory in four columns:

```
98673 ls | paste - - - -
```

98674 2. Combine pairs of lines from a file into single lines:

```
98675 paste -s -d "\t\n" file
```

98676 **RATIONALE**

98677 None.

98678 **FUTURE DIRECTIONS**

98679 None.

**patch**

Utilities

98689 **NAME**

98690 patch — apply changes to files

98691 **SYNOPSIS**98692 patch [-blNR] [-c|-e|-n|-u] [-d *dir*] [-D *define*] [-i *patchfile*]  
98693 [-o *outfile*] [-p *num*] [-r *rejectfile*] [*file*]98694 **DESCRIPTION**98695 The *patch* utility shall read a source (patch) file containing any of four forms of difference (diff)  
98696 listings produced by the *diff* utility (normal, copied context, unified context, or in the style of *ed*)  
98697 and apply those differences to a file. By default, *patch* shall read from the standard input.98698 The *patch* utility shall attempt to determine the type of the *diff* listing, unless overruled by a *-c*,  
98699 *-e*, *-n*, or *-u* option.98700 If the patch file contains more than one patch, *patch* shall attempt to apply each of them as if they  
98701 came from separate patch files. (In this case, the application shall ensure that the name of the  
98702 patch file is determinable for each *diff* listing.)98703 **OPTIONS**98704 The *patch* utility shall conform to XBD Section 12.2 (on page 215).

98705 The following options shall be supported:

- 98706 **-b** Save a copy of the original contents of each modified file, before the differences are  
98707 applied, in a file of the same name with the suffix **.orig** appended to it. If the file  
98708 already exists, it shall be overwritten; if multiple patches are applied to the same  
98709 file, the **.orig** file shall be written only for the first patch. When the *-o outfile* option  
98710 is also specified, *file.orig* shall not be created but, if *outfile* already exists, *outfile.orig*  
98711 shall be created.
- 98712 **-c** Interpret the patch file as a copied context difference (the output of the utility *diff*  
98713 when the *-c* or *-C* options are specified).
- 98714 **-d dir** Change the current directory to *dir* before processing as described in the  
98715 EXTENDED DESCRIPTION section.
- 98716 **-D define** Mark changes with one of the following C preprocessor constructs:  
98717 `#ifdef define`  
98718 `...`  
98719 `#endif`  
98720 `#ifndef define`  
98721 `...`  
98722 `#endif`  
98723 optionally combined with the C preprocessor construct **#else**. If the patched file is  
98724 processed with the C preprocessor, where the macro *define* is defined, the output  
98725 shall contain the changes from the patch file; otherwise, the output shall not  
98726 contain the patches specified in the patch file.
- 98727 **-e** Interpret the patch file as an *ed* script, rather than a *diff* script.
- 98728 **-i patchfile** Read the patch information from the file named by the pathname *patchfile*, rather  
98729 than the standard input.
- 98730 **-l** (The letter ell.) Cause any sequence of <blank> characters in the difference script to  
98731 match any sequence of <blank> characters in the input file. Other characters shall  
98732 be matched exactly.

**patch**

- 98778 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.
- 98779 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
98780 characters (for example, single-byte as opposed to multi-byte characters in  
98781 arguments and input files), and the behavior of character classes used in the  
98782 extended regular expression defined for the **yesexpr** locale keyword in the  
98783 *LC\_MESSAGES* category.
- 98784 *LC\_MESSAGES*  
98785 Determine the locale used to process affirmative responses, and the locale used to  
98786 affect the format and contents of diagnostic messages and prompts written to  
98787 standard error.
- 98788 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 98789 *LC\_TIME* Determine the locale for recognizing the format of file timestamps written by the  
98790 *diff* utility in a context-difference input file.
- 98791 **ASYNCHRONOUS EVENTS**
- 98792 Default.
- 98793 **STDOUT**
- 98794 Not used.
- 98795 **STDERR**
- 98796 The standard error shall be used for diagnostic and informational messages.
- 98797 **OUTPUT FILES**
- 98798 The output of the *patch* utility, the save files (**.orig** suffixes), and the reject files (**.rej** suffixes) shall  
98799 be text files.
- 98800 **EXTENDED DESCRIPTION**
- 98801 A patch file may contain patching instructions for more than one file; filenames shall be  
98802 determined as specified in [Filename Determination](#) (on page 2997). When the **-b** option is  
98803 specified, for each patched file, the original shall be saved in a file of the same name with the  
98804 suffix **.orig** appended to it.
- 98805 For each patched file, a reject file may also be created as noted in [Patch Application](#) (on page  
98806 2997). In the absence of a **-r** option, the name of this file shall be formed by appending the suffix  
98807 **.rej** to the original filename.
- 98808 **Patch File Format**
- 98809 The patch file shall contain zero or more lines of header information followed by one or more  
98810 patches. Each patch shall contain zero or more lines of filename identification in the format  
98811 produced by the **-c**, **-C**, **-u**, or **-U** options of the *diff* utility, and one or more sets of *diff* output,  
98812 which are customarily called *hunks*.
- 98813 The *patch* utility shall recognize the following expression in the header information:
- 98814 **Index:** *pathname*  
98815 The file to be patched is named *pathname*.
- 98816 If all lines (including headers) within a patch begin with the same leading sequence of <blank>  
98817 characters, the *patch* utility shall remove this sequence before proceeding. Within each patch, if  
98818 the type of difference is common context, the *patch* utility shall recognize the following  
98819 expressions:

98820       \*\*\* *filename timestamp*  
98821       The patches arose from *filename*.

98822       --- *filename timestamp*  
98823       The patches should be applied to *filename*.

98824       If the type of difference is unified context, the *patch* utility shall recognize the following  
98825       expressions:

98826       --- *filename timestamp*  
98827       The patches arose from *filename*.

98828       +++ *filename timestamp*  
98829       The patches should be applied to *filename*.

98830       Each hunk within a patch shall be the *diff* output to change a line range within the original file.  
98831       The line numbers for successive hunks within a patch shall occur in ascending order.

### 98832       Filename Determination

98833       If no *file* operand is specified, *patch* shall perform the following steps to determine the filename  
98834       to use:

- 98835       1. If the type of *diff* is context, the *patch* utility shall delete pathname components (as  
98836       specified by the **-p** option) from the filename on the line beginning with "\*\*\*" (if copied  
98837       context) or "---" (if unified context), then test for the existence of this file relative to the  
98838       current directory (or the directory specified with the **-d** option). If the file exists, the *patch*  
98839       utility shall use this filename.
- 98840       2. If the type of *diff* is context, the *patch* utility shall delete the pathname components (as  
98841       specified by the **-p** option) from the filename on the line beginning with "---" (if copied  
98842       context) or "+++" (if unified context), then test for the existence of this file relative to the  
98843       current directory (or the directory specified with the **-d** option). If the file exists, the *patch*  
98844       utility shall use this filename.
- 98845       3. If the header information contains a line beginning with the string **Index:**, the *patch* utility  
98846       shall delete pathname components (as specified by the **-p** option) from this line, then test  
98847       for the existence of this file relative to the current directory (or the directory specified  
98848       with the **-d** option). If the file exists, the *patch* utility shall use this filename.
- 98849       4. If an **SCCS** directory exists in the current directory, *patch* shall attempt to perform a *get -e*  
98850       *SCCS/s.filename* command to retrieve an editable version of the file. If the file exists, the  
98851       *patch* utility shall use this filename.
- 98852       5. The *patch* utility shall write a prompt to standard output and request a filename  
98853       interactively from the controlling terminal (for example, **/dev/tty**).

### 98854       Patch Application

98855       If the **-c**, **-e**, **-n**, or **-u** option is present, the *patch* utility shall interpret information within each  
98856       hunk as a copied context difference, an *ed* difference, a normal difference, or a unified context  
98857       difference, respectively. In the absence of any of these options, the *patch* utility shall determine  
98858       the type of difference based on the format of information within the hunk.

98859       For each hunk, the *patch* utility shall begin to search for the place to apply the patch at the line  
98860       number at the beginning of the hunk, plus or minus any offset used in applying the previous  
98861       hunk. If lines matching the hunk context are not found, *patch* shall scan both forwards and  
98862       backwards at least 1 000 bytes for a set of lines that match the hunk context.

**patch**

98863 If no such place is found and it is a context difference, then another scan shall take place,  
 98864 ignoring the first and last line of context. If that fails, the first two and last two lines of context  
 98865 shall be ignored and another scan shall be made. Implementations may search more extensively  
 98866 for installation locations.

98867 If no location can be found, the *patch* utility shall append the hunk to the reject file. A rejected  
 98868 hunk that is a copied context difference, an *ed* difference, or a normal difference shall be written  
 98869 in copied-context-difference format regardless of the format of the patch file. It is  
 98870 implementation-defined whether a rejected hunk that is a unified context difference is written in  
 98871 copied-context-difference format or in unified-context-difference format. If the input was a  
 98872 normal or *ed*-style difference, the reject file may contain differences with zero lines of context.  
 98873 The line numbers on the hunks in the reject file may be different from the line numbers in the  
 98874 patch file since they shall reflect the approximate locations for the failed hunks in the new file  
 98875 rather than the old one.

98876 If the type of patch is an *ed* diff, the implementation may accomplish the patching by invoking  
 98877 the *ed* utility.

**EXIT STATUS**

98879 The following exit values shall be returned:

- 98880 0 Successful completion.
- 98881 1 One or more lines were written to a reject file.
- 98882 >1 An error occurred.

**CONSEQUENCES OF ERRORS**

98884 Patches that cannot be correctly placed in the file shall be written to a reject file.

**APPLICATION USAGE**

98886 The **-R** option does not work with *ed* scripts because there is too little information to reconstruct  
 98887 the reverse operation.

98888 The **-p** option makes it possible to customize a patch file to local user directory structures  
 98889 without manually editing the patch file. For example, if the filename in the patch file was:

98890 `/curds/whey/src/blurfl/blurfl.c`

98891 Setting **-p 0** gives the entire pathname unmodified; **-p 1** gives:

98892 `curds/whey/src/blurfl/blurfl.c`

98893 without the leading <slash>, **-p 4** gives:

98894 `blurfl/blurfl.c`

98895 and not specifying **-p** at all gives:

98896 `blurfl.c` .

**EXAMPLES**

98898 None.

**RATIONALE**

98900 Some of the functionality in historical *patch* implementations was not specified. The following  
 98901 documents those features present in historical implementations that have not been specified.

98902 A deleted piece of functionality was the '+' pseudo-option allowing an additional set of options  
 98903 and a patch file operand to be given. This was seen as being insufficiently useful to standardize.

98904 In historical implementations, if the string "Prereq:" appeared in the header, the *patch* utility

98905 would search for the corresponding version information (the string specified in the header,  
98906 delimited by <blank> characters or the beginning or end of a line or the file) anywhere in the  
98907 original file. This was deleted as too simplistic and insufficiently trustworthy a mechanism to  
98908 standardize. For example, if:

98909 Prereq: 1.2

98910 were in the header, the presence of a delimited 1.2 anywhere in the file would satisfy the  
98911 prerequisite.

98912 The following options were dropped from historical implementations of *patch* as insufficiently  
98913 useful to standardize:

98914 **-b** The **-b** option historically provided a method for changing the name extension of  
98915 the backup file from the default **.orig**. This option has been modified and retained  
98916 in this volume of POSIX.1-2008.

98917 **-F** The **-F** option specified the number of lines of a context diff to ignore when  
98918 searching for a place to install a patch.

98919 **-f** The **-f** option historically caused *patch* not to request additional information from  
98920 the user.

98921 **-r** The **-r** option historically provided a method of overriding the extension of the  
98922 reject file from the default **.rej**.

98923 **-s** The **-s** option historically caused *patch* to work silently unless an error occurred.

98924 **-x** The **-x** option historically set internal debugging flags.

98925 In some file system implementations, the saving of a **.orig** file may produce unwanted results. In  
98926 the case of 12, 13, or 14-character filenames (on file systems supporting 14-character maximum  
98927 filenames), the **.orig** file overwrites the new file. The reject file may also exceed this filename  
98928 limit. It was suggested, due to some historical practice, that a <tilde> ('~') suffix be used  
98929 instead of **.orig** and some other character instead of the **.rej** suffix. This was rejected because it is  
98930 not obvious to the user which file is which. The suffixes **.orig** and **.rej** are clearer and more  
98931 understandable.

98932 The **-b** option has the opposite sense in some historical implementations—do not save the **.orig**  
98933 file. The default case here is not to save the files, making *patch* behave more consistently with the  
98934 other standard utilities.

98935 The **-w** option in early proposals was changed to **-l** to match historical practice.

98936 The **-N** option was included because without it, a non-interactive application cannot reject  
98937 previously applied patches. For example, if a user is piping the output of *diff* into the *patch*  
98938 utility, and the user only wants to patch a file to a newer version non-interactively, the **-N** option  
98939 is required.

98940 Changes to the **-l** option description were proposed to allow matching across <newline>  
98941 characters in addition to just <blank> characters. Since this is not historical practice, and since  
98942 some ambiguities could result, it is suggested that future developments in this area utilize  
98943 another option letter, such as **-L**.

98944 The **-u** option of GNU *patch* has been added, along with support for unified context formats.

**patch**98945 **FUTURE DIRECTIONS**

98946 None.

98947 **SEE ALSO**98948 *diff, ed*98949 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)98950 **CHANGE HISTORY**

98951 First released in Issue 4.

98952 **Issue 5**

98953 The FUTURE DIRECTIONS section is added.

98954 **Issue 6**

98955 This utility is marked as part of the User Portability Utilities option.

98956 The description of the **-D** option and the steps in [Filename Determination](#) (on page 2997) are changed to match historical practice as defined in the IEEE P1003.2b draft standard.

98958 The normative text is reworded to avoid use of the term “must” for application requirements.

98959 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/34 is applied, clarifying the way that the *patch* utility performs **ifdef** selection for the **-D** option.98961 **Issue 7**98962 The *patch* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

98964 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

98965 SD5-XCU-ERN-103 and SD5-XCU-ERN-120 are applied, adding the **-u** option.98966 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the *LC\_MESSAGES* and *LC\_CTYPE* environment variables and adding the *LC\_COLLATE* environment variable.

98969 **NAME**

98970 pathchk — check pathnames

98971 **SYNOPSIS**98972 pathchk [-p] [-P] *pathname*...98973 **DESCRIPTION**

98974 The *pathchk* utility shall check that one or more pathnames are valid (that is, they could be used  
 98975 to access or create a file without causing syntax errors) and portable (that is, no filename  
 98976 truncation results). More extensive portability checks are provided by the **-p** and **-P** options.

98977 By default, the *pathchk* utility shall check each component of each *pathname* operand based on the  
 98978 underlying file system. A diagnostic shall be written for each *pathname* operand that

- 98979 • Is longer than {PATH\_MAX} bytes (see **Pathname Variable Values** in XBD Chapter 13 (on  
 98980 page 219), <limits.h>)
- 98981 • Contains any component longer than {NAME\_MAX} bytes in its containing directory
- 98982 • Contains any component in a directory that is not searchable
- 98983 • Contains any character in any component that is not valid in its containing directory

98984 The format of the diagnostic message is not specified, but shall indicate the error detected and  
 98985 the corresponding *pathname* operand.

98986 It shall not be considered an error if one or more components of a *pathname* operand do not exist  
 98987 as long as a file matching the pathname specified by the missing components could be created  
 98988 that does not violate any of the checks specified above.

98989 **OPTIONS**98990 The *pathchk* utility shall conform to XBD Section 12.2 (on page 215).

98991 The following option shall be supported:

- 98992 **-p** Instead of performing checks based on the underlying file system, write a  
 98993 diagnostic for each *pathname* operand that:
- 98994 • Is longer than {\_POSIX\_PATH\_MAX} bytes (see **Minimum Values** in XBD  
 98995 Chapter 13 (on page 219), <limits.h>)
  - 98996 • Contains any component longer than {\_POSIX\_NAME\_MAX} bytes
  - 98997 • Contains any character in any component that is not in the portable filename  
 98998 character set
- 98999 **-P** Write a diagnostic for each *pathname* operand that:
- 99000 • Contains a component whose first character is the <hyphen> character
  - 99001 • Is empty

99002 **OPERANDS**

99003 The following operand shall be supported:

99004 *pathname* A pathname to be checked.99005 **STDIN**

99006 Not used.

**pathchk**

Utilities

99007 **INPUT FILES**

99008 None.

99009 **ENVIRONMENT VARIABLES**99010 The following environment variables shall affect the execution of *pathchk*:

99011 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 99012 (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
 99013 used to determine the values of locale categories.)

99014 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 99015 internationalization variables.

99016 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 99017 characters (for example, single-byte as opposed to multi-byte characters in  
 99018 arguments).

99019 *LC\_MESSAGES*

99020 Determine the locale that should be used to affect the format and contents of  
 99021 diagnostic messages written to standard error.

99022 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

99023 **ASYNCHRONOUS EVENTS**

99024 Default.

99025 **STDOUT**

99026 Not used.

99027 **STDERR**

99028 The standard error shall be used only for diagnostic messages.

99029 **OUTPUT FILES**

99030 None.

99031 **EXTENDED DESCRIPTION**

99032 None.

99033 **EXIT STATUS**

99034 The following exit values shall be returned:

99035 0 All *pathname* operands passed all of the checks.

99036 &gt;0 An error occurred.

99037 **CONSEQUENCES OF ERRORS**

99038 Default.

99039 **APPLICATION USAGE**

99040 The *test* utility can be used to determine whether a given pathname names an existing file; it  
 99041 does not, however, give any indication of whether or not any component of the pathname was  
 99042 truncated in a directory where the *\_POSIX\_NO\_TRUNC* feature is not in effect. The *pathchk*  
 99043 utility does not check for file existence; it performs checks to determine whether a pathname  
 99044 does exist or could be created with no pathname component truncation.

99045 The *noclobber* option in the shell (see the *set* special built-in) can be used to atomically create a  
 99046 file. As with all file creation semantics in the System Interfaces volume of POSIX.1-2008, it  
 99047 guarantees atomic creation, but still depends on applications to agree on conventions and  
 99048 cooperate on the use of files after they have been created.

99049 To verify that a pathname meets the requirements of filename portability, applications should

99050 use both the `-p` and `-P` options together.

#### 99051 EXAMPLES

99052 To verify that all pathnames in an imported data interchange archive are legitimate and  
99053 unambiguous on the current system:

```
99054 # This example assumes that no pathnames in the archive
99055 # contain <newline> characters.
99056 pax -f archive | sed -e 's/[^[[:alnum:]]/\\&/g' | xargs pathchk --
99057 if [ $? -eq 0 ]
99058 then
99059     pax -r -f archive
99060 else
99061     echo Investigate problems before importing files.
99062     exit 1
99063 fi
```

99064 To verify that all files in the current directory hierarchy could be moved to any system  
99065 conforming to the System Interfaces volume of POSIX.1-2008 that also supports the `pax` utility:

```
99066 find . -exec pathchk -p -P {} +
99067 if [ $? -eq 0 ]
99068 then
99069     pax -w -f ../archive .
99070 else
99071     echo Portable archive cannot be created.
99072     exit 1
99073 fi
```

99074 To verify that a user-supplied pathname names a readable file and that the application can create  
99075 a file extending the given path without truncation and without overwriting any existing file:

```
99076 case $- in
99077     *C*)   reset="";;
99078     *)     reset="set +C"
99079           set -C;
99080 esac
99081 test -r "$path" && pathchk "$path.out" &&
99082 rm "$path.out" > "$path.out"
99083 if [ $? -ne 0 ]; then
99084     printf "%s: %s not found or %s.out fails \
99085 creation checks.\n" $0 "$path" "$path"
99086     $reset      # Reset the noclobber option in case a trap
99087                # on EXIT depends on it.
99088     exit 1
99089 fi
99090 $reset
99091 PROCESSING < "$path" > "$path.out"
```

99092 The following assumptions are made in this example:

- 99093 1. **PROCESSING** represents the code that is used by the application to use `$path` once it is  
99094 verified that `$path.out` works as intended.

## pathchk

- 99095 2. The state of the *noclobber* option is unknown when this code is invoked and should be set  
 99096 on exit to the state it was in when this code was invoked. (The **reset** variable is used in  
 99097 this example to restore the initial state.)
- 99098 3. Note the usage of:
- 99099 `rm "$path.out" > "$path.out"`
- 99100 a. The *pathchk* command has already verified, at this point, that **\$path.out** is not  
 99101 truncated.
- 99102 b. With the *noclobber* option set, the shell verifies that **\$path.out** does not already exist  
 99103 before invoking *rm*.
- 99104 c. If the shell succeeded in creating **\$path.out**, *rm* removes it so that the application  
 99105 can create the file again in the **PROCESSING** step.
- 99106 d. If the **PROCESSING** step wants the file to exist already when it is invoked, the:  
 99107 `rm "$path.out" > "$path.out"`  
 99108 should be replaced with:  
 99109 `> "$path.out"`  
 99110 which verifies that the file did not already exist, but leaves **\$path.out** in place for  
 99111 use by **PROCESSING**.

## RATIONALE

99112 The *pathchk* utility was new for the ISO POSIX-2:1993 standard. It, along with the *set*  
 99113 `-C(noclobber)` option added to the shell, replaces the *mktemp*, *validfnam*, and *create* utilities that  
 99114 appeared in early proposals. All of these utilities were attempts to solve several common  
 99115 problems:  
 99116

- 99117 • Verify the validity (for several different definitions of “valid”) of a pathname supplied by a  
 99118 user, generated by an application, or imported from an external source.
- 99119 • Atomically create a file
- 99120 • Perform various string handling functions to generate a temporary filename.

99121 The *create* utility, included in an early proposal, provided checking and atomic creation in a  
 99122 single invocation of the utility; these are orthogonal issues and need not be grouped into a single  
 99123 utility. Note that the *noclobber* option also provides a way of creating a lock for process  
 99124 synchronization; since it provides an atomic *create*, there is no race between a test for existence  
 99125 and the following creation if it did not exist.

99126 Having a function like *tmpnam()* in the ISO C standard is important in many high-level  
 99127 languages. The shell programming language, however, has built-in string manipulation  
 99128 facilities, making it very easy to construct temporary filenames. The names needed obviously  
 99129 depend on the application, but are frequently of a form similar to:

99130 `$TMPDIR/application_abbreviation$$ .suffix`

99131 In cases where there is likely to be contention for a given suffix, a simple shell **for** or **while** loop  
 99132 can be used with the shell *noclobber* option to create a file without risk of collisions, as long as  
 99133 applications trying to use the same filename name space are cooperating on the use of files after  
 99134 they have been created.

99135 For historical purposes, `-p` does not check for the use of the <hyphen> character as the first  
 99136 character in a component of the pathname, or for an empty *pathname* operand.

99137 **FUTURE DIRECTIONS**

99138 None.

**pax**

Utilities

99147 **NAME**

99148 pax — portable archive interchange

99149 **SYNOPSIS**99150 pax [-dv] [-c|-n] [-H|-L] [-o options] [-f archive] [-s replstr]...  
99151 [pattern...]99152 pax -r[-c|-n] [-dikuv] [-H|-L] [-f archive] [-o options]... [-p string]...  
99153 [-s replstr]... [pattern...]99154 pax -w [-dituvX] [-H|-L] [-b blocksize] [[-a] [-f archive]] [-o options]...  
99155 [-s replstr]... [-x format] [file...]99156 pax -r -w [-diklntuvX] [-H|-L] [-o options]... [-p string]...  
99157 [-s replstr]... [file...] directory99158 **DESCRIPTION**99159 The *pax* utility shall read, write, and write lists of the members of archive files and copy  
99160 directory hierarchies. A variety of archive formats shall be supported; see the *-x format* option.99161 The action to be taken depends on the presence of the *-r* and *-w* options. The four combinations  
99162 of *-r* and *-w* are referred to as the four modes of operation: **list**, **read**, **write**, and **copy** modes,  
99163 corresponding respectively to the four forms shown in the SYNOPSIS section.99164 **list** In **list** mode (when neither *-r* nor *-w* are specified), *pax* shall write the names of  
99165 the members of the archive file read from the standard input, with pathnames  
99166 matching the specified patterns, to standard output. If a named file is of type  
99167 directory, the file hierarchy rooted at that file shall be listed as well.99168 **read** In **read** mode (when *-r* is specified, but *-w* is not), *pax* shall extract the members of  
99169 the archive file read from the standard input, with pathnames matching the  
99170 specified patterns. If an extracted file is of type directory, the file hierarchy rooted  
99171 at that file shall be extracted as well. The extracted files shall be created performing  
99172 pathname resolution with the directory in which *pax* was invoked as the current  
99173 working directory.99174 If an attempt is made to extract a directory when the directory already exists, this  
99175 shall not be considered an error. If an attempt is made to extract a FIFO when the  
99176 FIFO already exists, this shall not be considered an error.99177 The ownership, access, and modification times, and file mode of the restored files  
99178 are discussed under the *-p* option.99179 **write** In **write** mode (when *-w* is specified, but *-r* is not), *pax* shall write the contents of  
99180 the *file* operands to the standard output in an archive format. If no *file* operands are  
99181 specified, a list of files to copy, one per line, shall be read from the standard input  
99182 and each entry in this list shall be processed as if it had been a *file* operand on the  
99183 command line. A file of type directory shall include all of the files in the file  
99184 hierarchy rooted at the file.99185 **copy** In **copy** mode (when both *-r* and *-w* are specified), *pax* shall copy the *file* operands  
99186 to the destination directory.99187 If no *file* operands are specified, a list of files to copy, one per line, shall be read  
99188 from the standard input. A file of type directory shall include all of the files in the  
99189 file hierarchy rooted at the file.99190 The effect of the **copy** shall be as if the copied files were written to a *pax* format  
99191 archive file and then subsequently extracted, except that there may be hard links

99192 between the original and the copied files. If the destination directory is a  
 99193 subdirectory of one of the files to be copied, the results are unspecified. If the  
 99194 destination directory is a file of a type not defined by the System Interfaces volume  
 99195 of POSIX.1-2008, the results are implementation-defined; otherwise, it shall be an  
 99196 error for the file named by the *directory* operand not to exist, not be writable by the  
 99197 user, or not be a file of type directory.

99198 In **read** or **copy** modes, if intermediate directories are necessary to extract an archive member,  
 99199 *pax* shall perform actions equivalent to the *mkdir()* function defined in the System Interfaces  
 99200 volume of POSIX.1-2008, called with the following arguments:

- 99201 • The intermediate directory used as the *path* argument
- 99202 • The value of the bitwise-inclusive OR of S\_IRWXU, S\_IRWXG, and S\_IRWXO as the *mode*  
 99203 argument

99204 If any specified *pattern* or *file* operands are not matched by at least one file or archive member,  
 99205 *pax* shall write a diagnostic message to standard error for each one that did not match and exit  
 99206 with a non-zero exit status.

99207 The archive formats described in the EXTENDED DESCRIPTION section shall be automatically  
 99208 detected on input. The default output archive format shall be implementation-defined.

99209 A single archive can span multiple files. The *pax* utility shall determine, in an implementation-  
 99210 defined manner, what file to read or write as the next file.

99211 If the selected archive format supports the specification of linked files, it shall be an error if these  
 99212 files cannot be linked when the archive is extracted. For archive formats that do not store file  
 99213 contents with each name that causes a hard link, if the file that contains the data is not extracted  
 99214 during this *pax* session, either the data shall be restored from the original file, or a diagnostic  
 99215 message shall be displayed with the name of a file that can be used to extract the data. In  
 99216 traversing directories, *pax* shall detect infinite loops; that is, entering a previously visited  
 99217 directory that is an ancestor of the last file visited. When it detects an infinite loop, *pax* shall  
 99218 write a diagnostic message to standard error and shall terminate.

## 99219 OPTIONS

99220 The *pax* utility shall conform to XBD Section 12.2 (on page 215), except that the order of  
 99221 presentation of the **-o**, **-p**, and **-s** options is significant.

99222 The following options shall be supported:

- 99223 **-r** Read an archive file from standard input.
- 99224 **-w** Write files to the standard output in the specified archive format.
- 99225 **-a** Append files to the end of the archive. It is implementation-defined which devices  
 99226 on the system support appending. Additional file formats unspecified by this  
 99227 volume of POSIX.1-2008 may impose restrictions on appending.
- 99228 **-b** *blocksize* Block the output at a positive decimal integer number of bytes per write to the  
 99229 archive file. Devices and archive formats may impose restrictions on blocking.  
 99230 Blocking shall be automatically determined on input. Conforming applications  
 99231 shall not specify a *blocksize* value larger than 32 256. Default blocking when  
 99232 creating archives depends on the archive format. (See the **-x** option below.)
- 99233 **-c** Match all file or archive members except those specified by the *pattern* or *file*  
 99234 operands.

## pax

## Utilities

99235	-d	Cause files of type directory being copied or archived or archive members of type directory being extracted or listed to match only the file or archive member itself and not the file hierarchy rooted at the file.
99236		
99237		
99238	-f <i>archive</i>	Specify the pathname of the input or output archive, overriding the default standard input (in <b>list</b> or <b>read</b> modes) or standard output ( <b>write</b> mode).
99239		
99240	-H	If a symbolic link referencing a file of type directory is specified on the command line, <i>pax</i> shall archive the file hierarchy rooted in the file referenced by the link, using the name of the link as the root of the file hierarchy. Otherwise, if a symbolic link referencing a file of any other file type which <i>pax</i> can normally archive is specified on the command line, then <i>pax</i> shall archive the file referenced by the link, using the name of the link. The default behavior, when neither -H or -L are specified, shall be to archive the symbolic link itself.
99241		
99242		
99243		
99244		
99245		
99246		
99247	-i	Interactively rename files or archive members. For each archive member matching a <i>pattern</i> operand or file matching a <i>file</i> operand, a prompt shall be written to the file <b>/dev/tty</b> . The prompt shall contain the name of the file or archive member, but the format is otherwise unspecified. A line shall then be read from <b>/dev/tty</b> . If this line is blank, the file or archive member shall be skipped. If this line consists of a single period, the file or archive member shall be processed with no modification to its name. Otherwise, its name shall be replaced with the contents of the line. The <i>pax</i> utility shall immediately exit with a non-zero exit status if end-of-file is encountered when reading a response or if <b>/dev/tty</b> cannot be opened for reading and writing.
99248		
99249		
99250		
99251		
99252		
99253		
99254		
99255		
99256		
99257	-k	The results of extracting a hard link to a file that has been renamed during extraction are unspecified.
99258		
99259	-l	(The letter ell.) In <b>copy</b> mode, hard links shall be made between the source and destination file hierarchies whenever possible. If specified in conjunction with -H or -L, when a symbolic link is encountered, the hard link created in the destination file hierarchy shall be to the file referenced by the symbolic link. If specified when neither -H nor -L is specified, when a symbolic link is encountered, the implementation shall create a hard link to the symbolic link in the source file hierarchy or copy the symbolic link to the destination.
99260		
99261		
99262		
99263		
99264		
99265		
99266		
99267	-L	If a symbolic link referencing a file of type directory is specified on the command line or encountered during the traversal of a file hierarchy, <i>pax</i> shall archive the file hierarchy rooted in the file referenced by the link, using the name of the link as the root of the file hierarchy. Otherwise, if a symbolic link referencing a file of any other file type which <i>pax</i> can normally archive is specified on the command line or encountered during the traversal of a file hierarchy, <i>pax</i> shall archive the file referenced by the link, using the name of the link. The default behavior, when neither -H or -L are specified, shall be to archive the symbolic link itself.
99268		
99269		
99270		
99271		
99272		
99273		
99274		
99275	-n	Select the first archive member that matches each <i>pattern</i> operand. No more than one archive member shall be matched for each pattern (although members of type directory shall still match the file hierarchy rooted at that file).
99276		
99277		
99278	-o <i>options</i>	Provide information to the implementation to modify the algorithm for extracting or writing files. The value of <i>options</i> shall consist of one or more <comma>-separated keywords of the form:
99279		
99280		
99281		<i>keyword</i> [[:]= <i>value</i> ] [, <i>keyword</i> [[:]= <i>value</i> ], ...]

99282 Some keywords apply only to certain file formats, as indicated with each  
 99283 description. Use of keywords that are inapplicable to the file format being  
 99284 processed produces undefined results.

99285 Keywords in the *options* argument shall be a string that would be a valid portable  
 99286 filename as described in XBD Section 3.276 (on page 77).

99287 **Note:** Keywords are not expected to be filenames, merely to follow the same character  
 99288 composition rules as portable filenames.

99289 Keywords can be preceded with white space. The *value* field shall consist of zero or  
 99290 more characters; within *value*, the application shall precede any literal <comma>  
 99291 with a <backslash>, which shall be ignored, but preserves the <comma> as part of  
 99292 *value*. A <comma> as the final character, or a <comma> followed solely by white  
 99293 space as the final characters, in *options* shall be ignored. Multiple **-o** options can be  
 99294 specified; if keywords given to these multiple **-o** options conflict, the keywords  
 99295 and values appearing later in command line sequence shall take precedence and  
 99296 the earlier shall be silently ignored. The following keyword values of *options* shall  
 99297 be supported for the file formats as indicated:

99298 **delete=pattern**

99299 (Applicable only to the **-x pax** format.) When used in **write** or **copy** mode, *pax*  
 99300 shall omit from extended header records that it produces any keywords  
 99301 matching the string pattern. When used in **read** or **list** mode, *pax* shall ignore  
 99302 any keywords matching the string pattern in the extended header records. In  
 99303 both cases, matching shall be performed using the pattern matching notation  
 99304 described in Section 2.13.1 (on page 2332) and Section 2.13.2 (on page 2332).  
 99305 For example:

99306 **-o delete=security.\***

99307 would suppress security-related information. See *pax Extended Header* (on  
 99308 page 3019) for extended header record keyword usage.

99309 When multiple **-o delete=pattern** options are specified, the patterns shall be  
 99310 additive; all keywords matching the specified string patterns shall be omitted  
 99311 from extended header records that *pax* produces.

99312 **exthdr.name=string**

99313 (Applicable only to the **-x pax** format.) This keyword allows user control over  
 99314 the name that is written into the **ustar** header blocks for the extended header  
 99315 produced under the circumstances described in *pax Header Block* (on page  
 99316 3019). The name shall be the contents of *string*, after the following character  
 99317 substitutions have been made:

<i>string</i> Includes:	Replaced by:
%d	The directory name of the file, equivalent to the result of the <i>dirname</i> utility on the translated pathname.
%f	The filename of the file, equivalent to the result of the <i>basename</i> utility on the translated pathname.
%p	The process ID of the <i>pax</i> process.
%%	A ' % ' character.

99326 Any other ' % ' characters in *string* produce undefined results.

99327 If no **-o exthdr.name=string** is specified, *pax* shall use the following default

99328 value:  
 99329 %d/PaxHeaders.%p/%f

**globexthdr.name=string**

(Applicable only to the **-x pax** format.) When used in **write** or **copy** mode with the appropriate options, *pax* shall create global extended header records with **ustar** header blocks that will be treated as regular files by previous versions of *pax*. This keyword allows user control over the name that is written into the **ustar** header blocks for global extended header records. The name shall be the contents of *string*, after the following character substitutions have been made:

<i>string</i> Includes:	Replaced by:
%n	An integer that represents the sequence number of the global extended header record in the archive, starting at 1.
%p	The process ID of the <i>pax</i> process.
%%	A ' % ' character.

Any other ' % ' characters in *string* produce undefined results.

If no **-o globexthdr.name=string** is specified, *pax* shall use the following default value:

\$TMPDIR/GlobalHead.%p.%n

where \$TMPDIR represents the value of the *TMPDIR* environment variable. If *TMPDIR* is not set, *pax* shall use **/tmp**.

**invalid=action**

(Applicable only to the **-x pax** format.) This keyword allows user control over the action *pax* takes upon encountering values in an extended header record that, in **read** or **copy** mode, are invalid in the destination hierarchy or, in **list** mode, cannot be written in the codeset and current locale of the implementation. The following are invalid values that shall be recognized by *pax*:

- In **read** or **copy** mode, a filename or link name that contains character encodings invalid in the destination hierarchy. (For example, the name may contain embedded NULs.)
- In **read** or **copy** mode, a filename or link name that is longer than the maximum allowed in the destination hierarchy (for either a pathname component or the entire pathname).
- In **list** mode, any character string value (filename, link name, user name, and so on) that cannot be written in the codeset and current locale of the implementation.

The following mutually-exclusive values of the *action* argument are supported:

**binary** In **write** mode, *pax* shall generate a **hdrcharset=BINARY** extended header record for each file with a filename, link name, group name, owner name, or any other field in an extended header record that cannot be translated to the UTF-8 codeset, allowing the archive to contain the files with unencoded extended header record values. In **read** or **copy** mode, *pax* shall

- 99373 use the values specified in the header without translation,  
 99374 regardless of whether this may overwrite an existing file with a  
 99375 valid name. In **list** mode, *pax* shall behave identically to the  
 99376 **bypass** action.
- 99377 **bypass** In **read** or **copy** mode, *pax* shall bypass the file, causing no  
 99378 change to the destination hierarchy. In **list** mode, *pax* shall write  
 99379 all requested valid values for the file, but its method for writing  
 99380 invalid values is unspecified.
- 99381 **rename** In **read** or **copy** mode, *pax* shall act as if the **-i** option were in  
 99382 effect for each file with invalid filename or link name values,  
 99383 allowing the user to provide a replacement name interactively.  
 99384 In **list** mode, *pax* shall behave identically to the **bypass** action.
- 99385 **UTF-8** When used in **read**, **copy**, or **list** mode and a filename, link  
 99386 name, owner name, or any other field in an extended header  
 99387 record cannot be translated from the **pax** UTF-8 codeset format  
 99388 to the codeset and current locale of the implementation, *pax* shall  
 99389 use the actual UTF-8 encoding for the name. If a **hdrcharset**  
 99390 extended header record is in effect for this file, the character set  
 99391 specified by that record shall be used instead of UTF-8. If a  
 99392 **hdrcharset=BINARY** extended header record is in effect for this  
 99393 file, no translation shall be performed.
- 99394 **write** In **read** or **copy** mode, *pax* shall write the file, translating the  
 99395 name, regardless of whether this may overwrite an existing file  
 99396 with a valid name. In **list** mode, *pax* shall behave identically to  
 99397 the **bypass** action.
- 99398 If no **-o invalid=option** is specified, *pax* shall act as if **-o invalid=bypass** were  
 99399 specified. Any overwriting of existing files that may be allowed by the  
 99400 **-o invalid=** actions shall be subject to permission (**-p**) and modification time  
 99401 (**-u**) restrictions, and shall be suppressed if the **-k** option is also specified.
- 99402 **linkdata**  
 99403 (Applicable only to the **-x pax** format.) In **write** mode, *pax* shall write the  
 99404 contents of a file to the archive even when that file is merely a hard link to a  
 99405 file whose contents have already been written to the archive.
- 99406 **listopt=format**  
 99407 This keyword specifies the output format of the table of contents produced  
 99408 when the **-v** option is specified in **list** mode. See [List Mode Format](#)  
 99409 [Specifications](#) (on page 3014). To avoid ambiguity, the **listopt=format** shall be  
 99410 the only or final **keyword=value** pair in a **-o** option-argument; all characters  
 99411 in the remainder of the option-argument shall be considered part of the format  
 99412 string. When multiple **-olistopt=format** options are specified, the format  
 99413 strings shall be considered a single, concatenated string, evaluated in  
 99414 command line order.
- 99415 **times**  
 99416 (Applicable only to the **-x pax** format.) When used in **write** or **copy** mode, *pax*  
 99417 shall include **atime** and **mtime** extended header records for each file. See [pax](#)  
 99418 [Extended Header File Times](#) (on page 3023).
- 99419 In addition to these keywords, if the **-x pax** format is specified, any of the

99420 keywords and values defined in [pax Extended Header](#) (on page 3019), including  
 99421 implementation extensions, can be used in `-o` option-arguments, in either of two  
 99422 modes:

99423 **keyword=***value*

99424 When used in **write** or **copy** mode, these keyword/value pairs shall be  
 99425 included at the beginning of the archive as **typeflag g** global extended header  
 99426 records. When used in **read** or **list** mode, these keyword/value pairs shall act  
 99427 as if they had been at the beginning of the archive as **typeflag g** global  
 99428 extended header records.

99429 **keyword:=***value*

99430 When used in **write** or **copy** mode, these keyword/value pairs shall be  
 99431 included as records at the beginning of a **typeflag x** extended header for each  
 99432 file. (This shall be equivalent to the `<equals-sign>` form except that it creates  
 99433 no **typeflag g** global extended header records.) When used in **read** or **list**  
 99434 mode, these keyword/value pairs shall act as if they were included as records  
 99435 at the end of each extended header; thus, they shall override any global or file-  
 99436 specific extended header record keywords of the same names. For example, in  
 99437 the command:

```
99438 pax -r -o "  
99439 gname:=mygroup,  
99440 " <archive
```

99441 the group name will be forced to a new value for all files read from the  
 99442 archive.

99443 The precedence of `-o` keywords over various fields in the archive is described in  
 99444 [pax Extended Header Keyword Precedence](#) (on page 3022).

99445 **-p** *string* Specify one or more file characteristic options (privileges). The *string* option-  
 99446 argument shall be a string specifying file characteristics to be retained or discarded  
 99447 on extraction. The string shall consist of the specification characters *a*, *e*, *m*, *o*, and  
 99448 *p*. Other implementation-defined characters can be included. Multiple  
 99449 characteristics can be concatenated within the same string and multiple `-p` options  
 99450 can be specified. The meaning of the specification characters are as follows:

99451 *a* Do not preserve file access times.

99452 *e* Preserve the user ID, group ID, file mode bits (see [XBD Section 3.169](#), on page  
 99453 60), access time, modification time, and any other implementation-defined file  
 99454 characteristics.

99455 *m* Do not preserve file modification times.

99456 *o* Preserve the user ID and group ID.

99457 *p* Preserve the file mode bits. Other implementation-defined file mode attributes  
 99458 may be preserved.

99459 In the preceding list, “preserve” indicates that an attribute stored in the archive  
 99460 shall be given to the extracted file, subject to the permissions of the invoking  
 99461 process. The access and modification times of the file shall be preserved unless  
 99462 otherwise specified with the `-p` option or not stored in the archive. All attributes  
 99463 that are not preserved shall be determined as part of the normal file creation action  
 99464 (see [Section 1.1.1.4](#), on page 2280).

- 99465 If neither the `e` nor the `o` specification character is specified, or the user ID and  
 99466 group ID are not preserved for any reason, *pax* shall not set the `S_ISUID` and  
 99467 `S_ISGID` bits of the file mode.
- 99468 If the preservation of any of these items fails for any reason, *pax* shall write a  
 99469 diagnostic message to standard error. Failure to preserve these items shall affect  
 99470 the final exit status, but shall not cause the extracted file to be deleted.
- 99471 If file characteristic letters in any of the *string* option-arguments are duplicated or  
 99472 conflict with each other, the ones given last shall take precedence. For example, if  
 99473 `-p_eme` is specified, file modification times are preserved.
- 99474 `-s replstr` Modify file or archive member names named by *pattern* or *file* operands according  
 99475 to the substitution expression *replstr*, using the syntax of the *ed* utility. The concepts  
 99476 of “address” and “line” are meaningless in the context of the *pax* utility, and shall  
 99477 not be supplied. The format shall be:
- 99478 `-s /old/new/ [gp]`
- 99479 where as in *ed*, *old* is a basic regular expression and *new* can contain an  
 99480 `<ampersand>`, `'\n'` (where *n* is a digit) back-references, or subexpression  
 99481 matching. The *old* string shall also be permitted to contain `<newline>` characters.
- 99482 Any non-null character can be used as a delimiter (`'/'` shown here). Multiple `-s`  
 99483 expressions can be specified; the expressions shall be applied in the order  
 99484 specified, terminating with the first successful substitution. The optional trailing  
 99485 `'g'` is as defined in the *ed* utility. The optional trailing `'p'` shall cause successful  
 99486 substitutions to be written to standard error. File or archive member names that  
 99487 substitute to the empty string shall be ignored when reading and writing archives.
- 99488 `-t` When reading files from the file system, and if the user has the permissions  
 99489 required by *utime()* to do so, set the access time of each file read to the access time  
 99490 that it had before being read by *pax*.
- 99491 `-u` Ignore files that are older (having a less recent file modification time) than a pre-  
 99492 existing file or archive member with the same name. In **read** mode, an archive  
 99493 member with the same name as a file in the file system shall be extracted if the  
 99494 archive member is newer than the file. In **write** mode, an archive file member with  
 99495 the same name as a file in the file system shall be superseded if the file is newer  
 99496 than the archive member. If `-a` is also specified, this is accomplished by appending  
 99497 to the archive; otherwise, it is unspecified whether this is accomplished by actual  
 99498 replacement in the archive or by appending to the archive. In **copy** mode, the file  
 99499 in the destination hierarchy shall be replaced by the file in the source hierarchy or  
 99500 by a link to the file in the source hierarchy if the file in the source hierarchy is  
 99501 newer.
- 99502 `-v` In **list** mode, produce a verbose table of contents (see the `STDOUT` section).  
 99503 Otherwise, write archive member pathnames to standard error (see the `STDERR`  
 99504 section).
- 99505 `-x format` Specify the output archive format. The *pax* utility shall support the following  
 99506 formats:
- 99507 **cpio** The **cpio** interchange format; see the EXTENDED DESCRIPTION  
 99508 section. The default *blocksize* for this format for character special  
 99509 archive files shall be 5120. Implementations shall support all  
 99510 *blocksize* values less than or equal to 32 256 that are multiples of 512.

- 99511            **pax**            The **pax** interchange format; see the EXTENDED DESCRIPTION  
99512 section. The default *blocksize* for this format for character special  
99513 archive files shall be 5120. Implementations shall support all  
99514 *blocksize* values less than or equal to 32 256 that are multiples of 512.
- 99515            **ustar**            The **tar** interchange format; see the EXTENDED DESCRIPTION  
99516 section. The default *blocksize* for this format for character special  
99517 archive files shall be 10 240. Implementations shall support all  
99518 *blocksize* values less than or equal to 32 256 that are multiples of 512.
- 99519            Implementation-defined formats shall specify a default block size as well as any  
99520 other block sizes supported for character special archive files.
- 99521            Any attempt to append to an archive file in a format different from the existing  
99522 archive format shall cause *pax* to exit immediately with a non-zero exit status.
- 99523            **-X**            When traversing the file hierarchy specified by a pathname, *pax* shall not descend  
99524 into directories that have a different device ID (*st\_dev*; see the System Interfaces  
99525 volume of POSIX.1-2008, *stat()*).
- 99526            Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered  
99527 an error and the last option specified shall determine the behavior of the utility.
- 99528            The options that operate on the names of files or archive members (**-c**, **-i**, **-n**, **-s**, **-u**, and **-v**)  
99529 shall interact as follows. In **read** mode, the archive members shall be selected based on the user-  
99530 specified *pattern* operands as modified by the **-c**, **-n**, and **-u** options. Then, any **-s** and **-i**  
99531 options shall modify, in that order, the names of the selected files. The **-v** option shall write  
99532 names resulting from these modifications.
- 99533            In **write** mode, the files shall be selected based on the user-specified pathnames as modified by  
99534 the **-n** and **-u** options. Then, any **-s** and **-i** options shall modify, in that order, the names of  
99535 these selected files. The **-v** option shall write names resulting from these modifications.
- 99536            If both the **-u** and **-n** options are specified, *pax* shall not consider a file selected unless it is  
99537 newer than the file to which it is compared.
- 99538            **List Mode Format Specifications**
- 99539            In **list** mode with the **-o listopt=format** option, the *format* argument shall be applied for each  
99540 selected file. The *pax* utility shall append a <newline> to the **listopt** output for each selected file.  
99541 The *format* argument shall be used as the *format* string described in XBD Chapter 5 (on page 121),  
99542 with the exceptions 1. through 5. defined in the EXTENDED DESCRIPTION section of *printf*,  
99543 plus the following exceptions:
- 99544            6. The sequence (*keyword*) can occur before a format conversion specifier. The conversion  
99545 argument is defined by the value of *keyword*. The implementation shall support the  
99546 following keywords:
- 99547            — Any of the Field Name entries in Table 4-14 (on page 3024) and Table 4-16 (on page  
99548 3027). The implementation may support the *cpio* keywords without the leading *c\_* in  
99549 addition to the form required by Table 4-16 (on page 3027).
- 99550            — Any keyword defined for the extended header in **pax Extended Header** (on page  
99551 3019).
- 99552            — Any keyword provided as an implementation-defined extension within the extended  
99553 header defined in **pax Extended Header** (on page 3019).
- 99554            For example, the sequence "%(charset)s" is the string value of the name of the character

- 99555 set in the extended header.
- 99556 The result of the keyword conversion argument shall be the value from the applicable  
99557 header field or extended header, without any trailing NULs.
- 99558 All keyword values used as conversion arguments shall be translated from the UTF-8  
99559 encoding (or alternative encoding specified by any **hdrcharset** extended header record) to  
99560 the character set appropriate for the local file system, user database, and so on, as  
99561 applicable.
- 99562 7. An additional conversion specifier character, **T**, shall be used to specify time formats. The **T**  
99563 conversion specifier character can be preceded by the sequence (*keyword=subformat*), where  
99564 *subformat* is a date format as defined by *date* operands. The default *keyword* shall be **mtime**  
99565 and the default subformat shall be:
- 99566 %b %e %H:%M %Y
- 99567 8. An additional conversion specifier character, **M**, shall be used to specify the file mode string  
99568 as defined in *ls* Standard Output. If (*keyword*) is omitted, the **mode** keyword shall be used.  
99569 For example, `%.1M` writes the single character corresponding to the *<entry type>* field of the  
99570 *ls -l* command.
- 99571 9. An additional conversion specifier character, **D**, shall be used to specify the device for block  
99572 or special files, if applicable, in an implementation-defined format. If not applicable, and  
99573 (*keyword*) is specified, then this conversion shall be equivalent to `%(keyword)u`. If not  
99574 applicable, and (*keyword*) is omitted, then this conversion shall be equivalent to `<space>`.
- 99575 10. An additional conversion specifier character, **F**, shall be used to specify a pathname. The **F**  
99576 conversion character can be preceded by a sequence of `<comma>`-separated keywords:
- 99577 (*keyword*[, *keyword*] ... )
- 99578 The values for all the keywords that are non-null shall be concatenated together, each  
99579 separated by a `'/'`. The default shall be (**path**) if the keyword **path** is defined; otherwise,  
99580 the default shall be (**prefix,name**).
- 99581 11. An additional conversion specifier character, **L**, shall be used to specify a symbolic link  
99582 expansion. If the current file is a symbolic link, then `%L` shall expand to:
- 99583 "%s -> %s", *<value of keyword>*, *<contents of link>*
- 99584 Otherwise, the `%L` conversion specification shall be the equivalent of `%F`.

**OPERANDS**

99585 The following operands shall be supported:

- 99586 *directory* The destination directory pathname for **copy** mode.
- 99587 *file* A pathname of a file to be copied or archived.
- 99588 *pattern* A pattern matching one or more pathnames of archive members. A pattern must  
99589 be given in the name-generating notation of the pattern matching notation in  
99590 [Section 2.13](#) (on page 2332), including the filename expansion rules in [Section](#)  
99591 [2.13.3](#) (on page 2333). The default, if no *pattern* is specified, is to select all members  
99592 in the archive.

**STDIN**

99594 In **write** mode, the standard input shall be used only if no *file* operands are specified. It shall be a  
99595 text file containing a list of pathnames, one per line, without leading or trailing `<blank>`  
99596 characters.

99598 In **list** and **read** modes, if **-f** is not specified, the standard input shall be an archive file.  
 99599 Otherwise, the standard input shall not be used.

#### 99600 INPUT FILES

99601 The input file named by the *archive* option-argument, or standard input when the archive is read  
 99602 from there, shall be a file formatted according to one of the specifications in the EXTENDED  
 99603 DESCRIPTION section or some other implementation-defined format.  
 99604 The file **/dev/tty** shall be used to write prompts and read responses.

#### 99605 ENVIRONMENT VARIABLES

99606 The following environment variables shall affect the execution of *pax*:

99607 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 99608 (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
 99609 used to determine the values of locale categories.)

99610 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 99611 internationalization variables.

#### 99612 LC\_COLLATE

99613 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 99614 character collating elements used in the pattern matching expressions for the  
 99615 *pattern* operand, the basic regular expression for the **-s** option, and the extended  
 99616 regular expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES*  
 99617 category.

99618 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 99619 characters (for example, single-byte as opposed to multi-byte characters in  
 99620 arguments and input files) and the behavior of character classes used in the extended  
 99621 regular expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES*  
 99622 category, and pattern matching.

#### 99623 LC\_MESSAGES

99624 Determine the locale used to process affirmative responses, and the locale used to  
 99625 affect the format and contents of diagnostic messages and prompts written to  
 99626 standard error.

99627 **LC\_TIME** Determine the format and contents of date and time strings when the **-v** option is  
 99628 specified.

99629 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

99630 **TMPDIR** Determine the pathname that provides part of the default global extended header  
 99631 record file, as described for the **-o globexthdr=** keyword in the OPTIONS section.

99632 **TZ** Determine the timezone used to calculate date and time strings when the **-v** option  
 99633 is specified. If *TZ* is unset or null, an unspecified default timezone shall be used.

#### 99634 ASYNCHRONOUS EVENTS

99635 Default.

#### 99636 STDOUT

99637 In **write** mode, if **-f** is not specified, the standard output shall be the archive formatted  
 99638 according to one of the specifications in the EXTENDED DESCRIPTION section, or some other  
 99639 implementation-defined format (see **-x format**).

99640 In **list** mode, when the **-olistopt=format** has been specified, the selected archive members shall  
 99641 be written to standard output using the format described under [List Mode Format Specifications](#)

99642 (on page 3014). In **list** mode without the **-olistopt=format** option, the table of contents of the  
 99643 selected archive members shall be written to standard output using the following format:

99644 "%s\n", <pathname>

99645 If the **-v** option is specified in **list** mode, the table of contents of the selected archive members  
 99646 shall be written to standard output using the following formats.

99647 For pathnames representing hard links to previous members of the archive:

99648 "%sΔ==Δ%s\n", <ls -l listing>, <linkname>

99649 For all other pathnames:

99650 "%s\n", <ls -l listing>

99651 where <ls -l listing> shall be the format specified by the *ls* utility with the **-l** option. When  
 99652 writing pathnames in this format, it is unspecified what is written for fields for which the  
 99653 underlying archive format does not have the correct information, although the correct number of  
 99654 <blank>-separated fields shall be written.

99655 In **list** mode, standard output shall not be buffered more than a line at a time.

#### 99656 STDERR

99657 If **-v** is specified in **read**, **write**, or **copy** modes, *pax* shall write the pathnames it processes to the  
 99658 standard error output using the following format:

99659 "%s\n", <pathname>

99660 These pathnames shall be written as soon as processing is begun on the file or archive member,  
 99661 and shall be flushed to standard error. The trailing <newline>, which shall not be buffered, is  
 99662 written when the file has been read or written.

99663 If the **-s** option is specified, and the replacement string has a trailing 'p', substitutions shall be  
 99664 written to standard error in the following format:

99665 "%sΔ>>Δ%s\n", <original pathname>, <new pathname>

99666 In all operating modes of *pax*, optional messages of unspecified format concerning the input  
 99667 archive format and volume number, the number of files, blocks, volumes, and media parts as  
 99668 well as other diagnostic messages may be written to standard error.

99669 In all formats, for both standard output and standard error, it is unspecified how non-printable  
 99670 characters in pathnames or link names are written.

99671 When using the **-xpax** archive format, if a filename, link name, group name, owner name, or any  
 99672 other field in an extended header record cannot be translated between the codeset in use for that  
 99673 extended header record and the character set of the current locale, *pax* shall write a diagnostic  
 99674 message to standard error, shall process the file as described for the **-o invalid=** option, and then  
 99675 shall continue processing with the next file.

#### 99676 OUTPUT FILES

99677 In **read** mode, the extracted output files shall be of the archived file type. In **copy** mode, the  
 99678 copied output files shall be the type of the file being copied. In either mode, existing files in the  
 99679 destination hierarchy shall be overwritten only when all permission (**-p**), modification time (**-u**),  
 99680 and invalid-value (**-oinvalid=**) tests allow it.

99681 In **write** mode, the output file named by the **-f** option-argument shall be a file formatted  
 99682 according to one of the specifications in the EXTENDED DESCRIPTION section, or some other  
 99683 implementation-defined format.

99684 **EXTENDED DESCRIPTION**

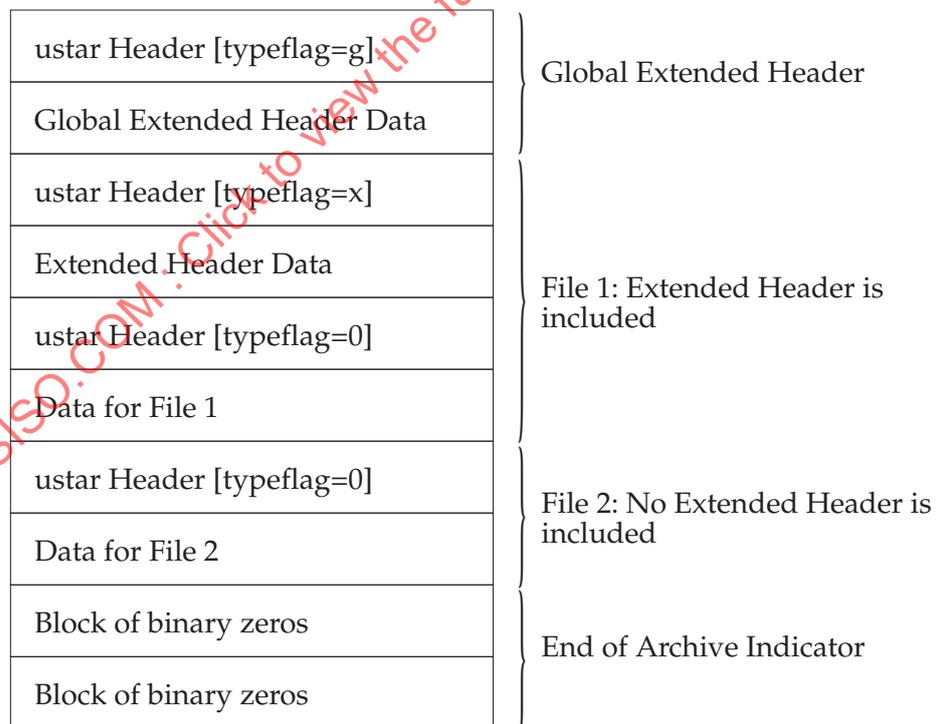

99685 **pax Interchange Format**

99686 A *pax* archive tape or file produced in the **-xpax** format shall contain a series of blocks. The  
 99687 physical layout of the archive shall be identical to the **ustar** format described in **ustar**  
 99688 **Interchange Format** (on page 3023). Each file archived shall be represented by the following  
 99689 sequence:

- 99690 • An optional header block with extended header records. This header block is of the form  
 99691 described in **pax Header Block** (on page 3019), with a *typeflag* value of **x** or **g**. The  
 99692 extended header records, described in **pax Extended Header** (on page 3019), shall be  
 99693 included as the data for this header block.
- 99694 • A header block that describes the file. Any fields in the preceding optional extended  
 99695 header shall override the associated fields in this header block for this file.
- 99696 • Zero or more blocks that contain the contents of the file.

99697 At the end of the archive file there shall be two 512-byte blocks filled with binary zeros,  
 99698 interpreted as an end-of-archive indicator.

99699 A schematic of an example archive with global extended header records and two actual files is  
 99700 shown in **Figure 4-1**. In the example, the second file in the archive has no extended header  
 99701 preceding it, presumably because it has no need for extended attributes.

**Figure 4-1** pax Format Archive Example

99702

99703 **pax Header Block**

99704 The **pax** header block shall be identical to the **ustar** header block described in **ustar Interchange**  
 99705 **Format** (on page 3023), except that two additional *typeflag* values are defined:

- 99706 x Represents extended header records for the following file in the archive (which shall have  
 99707 its own **ustar** header block). The format of these extended header records shall be as  
 99708 described in **pax Extended Header**.
- 99709 g Represents global extended header records for the following files in the archive. The format  
 99710 of these extended header records shall be as described in **pax Extended Header**. Each value  
 99711 shall affect all subsequent files that do not override that value in their own extended header  
 99712 record and until another global extended header record is reached that provides another  
 99713 value for the same field. The *typeflag* **g** global headers should not be used with interchange  
 99714 media that could suffer partial data loss in transporting the archive.

99715 For both of these types, the *size* field shall be the size of the extended header records in octets.  
 99716 The other fields in the header block are not meaningful to this version of the *pax* utility.  
 99717 However, if this archive is read by a *pax* utility conforming to the ISO POSIX-2:1993 standard,  
 99718 the header block fields are used to create a regular file that contains the extended header records  
 99719 as data. Therefore, header block field values should be selected to provide reasonable file access  
 99720 to this regular file.

99721 A further difference from the **ustar** header block is that data blocks for files of *typeflag* 1 (the digit  
 99722 one) (hard link) may be included, which means that the size field may be greater than zero.  
 99723 Archives created by *pax -o linkdata* shall include these data blocks with the hard links.

99724 **pax Extended Header**

99725 A **pax** extended header contains values that are inappropriate for the **ustar** header block because  
 99726 of limitations in that format: fields requiring a character encoding other than that described in  
 99727 the ISO/IEC 646:1991 standard, fields representing file attributes not described in the **ustar**  
 99728 header, and fields whose format or length do not fit the requirements of the **ustar** header. The  
 99729 values in an extended header add attributes to the following file (or files; see the description of  
 99730 the *typeflag* **g** header block) or override values in the following header block(s), as indicated in  
 99731 the following list of keywords.

99732 An extended header shall consist of one or more records, each constructed as follows:

99733 "%d %s=%s\n" <length>, <keyword>, <value>

99734 The extended header records shall be encoded according to the ISO/IEC 10646-1:2000 standard  
 99735 UTF-8 encoding. The <length> field, <blank>, <equals-sign>, and <newline> shown shall be  
 99736 limited to the portable character set, as encoded in UTF-8. The <keyword> fields can be any  
 99737 UTF-8 characters. The <length> field shall be the decimal length of the extended header record  
 99738 in octets, including the trailing <newline>. If there is a **hdrcharset** extended header in effect for  
 99739 a file, the *value* field for any **gname**, **linkpath**, **path**, and **uname** extended header records shall be  
 99740 encoded using the character set specified by the **hdrcharset** extended header record; otherwise,  
 99741 the *value* field shall be encoded using UTF-8. The *value* field for all other keywords specified by  
 99742 POSIX.1-2008 shall be encoded using UTF-8.

99743 The <keyword> field shall be one of the entries from the following list or a keyword provided as  
 99744 an implementation extension. Keywords consisting entirely of lowercase letters, digits, and  
 99745 periods are reserved for future standardization. A keyword shall not include an <equals-sign>.  
 99746 (In the following list, the notations "file(s)" or "block(s)" is used to acknowledge that a keyword  
 99747 affects the following single file after a *typeflag* **x** extended header, but possibly multiple files after  
 99748 *typeflag* **g**. Any requirements in the list for *pax* to include a record when in **write** or **copy** mode

**pax**

99749 shall apply only when such a record has not already been provided through the use of the **-o**  
 99750 option. When used in **copy** mode, *pax* shall behave as if an archive had been created with  
 99751 applicable extended header records and then extracted.)

99752 **atime** The file access time for the following file(s), equivalent to the value of the *st\_atime*  
 99753 member of the **stat** structure for a file, as described by the *stat()* function. The  
 99754 access time shall be restored if the process has appropriate privileges required to  
 99755 do so. The format of the *<value>* shall be as described in *pax Extended Header File*  
 99756 *Times* (on page 3023).

99757 **charset** The name of the character set used to encode the data in the following file(s). The  
 99758 entries in the following table are defined to refer to known standards; additional  
 99759 names may be agreed on between the originator and recipient.

<i>&lt;value&gt;</i>	Formal Standard
ISO-IRΔ646Δ1990	ISO/IEC 646: 1990
ISO-IRΔ8859Δ1Δ1998	ISO/IEC 8859-1: 1998
ISO-IRΔ8859Δ2Δ1999	ISO/IEC 8859-2: 1999
ISO-IRΔ8859Δ3Δ1999	ISO/IEC 8859-3: 1999
ISO-IRΔ8859Δ4Δ1998	ISO/IEC 8859-4: 1998
ISO-IRΔ8859Δ5Δ1999	ISO/IEC 8859-5: 1999
ISO-IRΔ8859Δ6Δ1999	ISO/IEC 8859-6: 1999
ISO-IRΔ8859Δ7Δ1987	ISO/IEC 8859-7: 1987
ISO-IRΔ8859Δ8Δ1999	ISO/IEC 8859-8: 1999
ISO-IRΔ8859Δ9Δ1999	ISO/IEC 8859-9: 1999
ISO-IRΔ8859Δ10Δ1998	ISO/IEC 8859-10: 1998
ISO-IRΔ8859Δ13Δ1998	ISO/IEC 8859-13: 1998
ISO-IRΔ8859Δ14Δ1998	ISO/IEC 8859-14: 1998
ISO-IRΔ8859Δ15Δ1999	ISO/IEC 8859-15: 1999
ISO-IRΔ10646Δ2000	ISO/IEC 10646: 2000
ISO-IRΔ10646Δ2000ΔUTF-8	ISO/IEC 10646, UTF-8 encoding
BINARY	None.

99778 The encoding is included in an extended header for information only; when *pax* is  
 99779 used as described in POSIX.1-2008, it shall not translate the file data into any other  
 99780 encoding. The **BINARY** entry indicates unencoded binary data.

99781 When used in **write** or **copy** mode, it is implementation-defined whether *pax*  
 99782 includes a **charset** extended header record for a file.

99783 **comment** A series of characters used as a comment. All characters in the *<value>* field shall  
 99784 be ignored by *pax*.

99785 **gid** The group ID of the group that owns the file, expressed as a decimal number using  
 99786 digits from the ISO/IEC 646: 1991 standard. This record shall override the *gid* field  
 99787 in the following header block(s). When used in **write** or **copy** mode, *pax* shall  
 99788 include a *gid* extended header record for each file whose group ID is greater than  
 99789 2 097 151 (octal 7777 777).

99790 **gname** The group of the file(s), formatted as a group name in the group database. This  
 99791 record shall override the *gid* and *gname* fields in the following header block(s), and  
 99792 any *gid* extended header record. When used in **read**, **copy**, or **list** mode, *pax* shall  
 99793 translate the name from the encoding in the header record to the character set  
 99794 appropriate for the group database on the receiving system. If any of the characters  
 99795 cannot be translated, and if neither the **-oinvalid=UTF-8** option nor the

99796 –**oinvalid=binary** option is specified, the results are implementation-defined.  
 99797 When used in **write** or **copy** mode, *pax* shall include a **gname** extended header  
 99798 record for each file whose group name cannot be represented entirely with the  
 99799 letters and digits of the portable character set.

99800 **hdrcharset** The name of the character set used to encode the value field of the **gname**,  
 99801 **linkpath**, **path**, and **uname** *pax* extended header records. The entries in the  
 99802 following table are defined to refer to known standards; additional names may be  
 99803 agreed between the originator and the recipient.

	<value>	Formal Standard
99804	ISO-IRΔ10646Δ2000ΔUTF-8	ISO/IEC 10646, UTF-8 encoding
99805	BINARY	None.
99806		

99807 If no **hdrcharset** extended header record is specified, the default character set used  
 99808 to encode all values in extended header records shall be the ISO/IEC 10646-1:2000  
 99809 standard UTF-8 encoding.

99810 The **BINARY** entry indicates that all values recorded in extended headers for  
 99811 affected files are unencoded binary data from the underlying system.

99812 **linkpath** The pathname of a link being created to another file, of any type, previously  
 99813 archived. This record shall override the *linkname* field in the following **ustar** header  
 99814 block(s). The following **ustar** header block shall determine the type of link created.  
 99815 If *typeflag* of the following header block is 1, it shall be a hard link. If *typeflag* is 2, it  
 99816 shall be a symbolic link and the **linkpath** value shall be the contents of the  
 99817 symbolic link. The *pax* utility shall translate the name of the link (contents of the  
 99818 symbolic link) from the encoding in the header to the character set appropriate for  
 99819 the local file system. When used in **write** or **copy** mode, *pax* shall include a  
 99820 **linkpath** extended header record for each link whose pathname cannot be  
 99821 represented entirely with the members of the portable character set other than  
 99822 NUL.

99823 **mtime** The file modification time of the following file(s), equivalent to the value of the  
 99824 *st\_mtime* member of the **stat** structure for a file, as described in the *stat()* function.  
 99825 This record shall override the *mtime* field in the following header block(s). The  
 99826 modification time shall be restored if the process has appropriate privileges  
 99827 required to do so. The format of the <value> shall be as described in [pax Extended](#)  
 99828 [Header File Times](#) (on page 3023).

99829 **path** The pathname of the following file(s). This record shall override the *name* and  
 99830 *prefix* fields in the following header block(s). The *pax* utility shall translate the  
 99831 pathname of the file from the encoding in the header to the character set  
 99832 appropriate for the local file system.

99833 When used in **write** or **copy** mode, *pax* shall include a *path* extended header record  
 99834 for each file whose pathname cannot be represented entirely with the members of  
 99835 the portable character set other than NUL.

99836 **realtime.any** The keywords prefixed by “realtime.” are reserved for future standardization.

99837 **security.any** The keywords prefixed by “security.” are reserved for future standardization.

99838 **size** The size of the file in octets, expressed as a decimal number using digits from the  
 99839 ISO/IEC 646:1991 standard. This record shall override the *size* field in the  
 99840 following header block(s). When used in **write** or **copy** mode, *pax* shall include a  
 99841 *size* extended header record for each file with a size value greater than 8 589 934 591

- 99842 (octal 77 777 777 777).
- 99843 **uid** The user ID of the file owner, expressed as a decimal number using digits from the  
99844 ISO/IEC 646:1991 standard. This record shall override the *uid* field in the  
99845 following header block(s). When used in **write** or **copy** mode, *pax* shall include a  
99846 *uid* extended header record for each file whose owner ID is greater than 2097151  
99847 (octal 7777777).
- 99848 **uname** The owner of the following file(s), formatted as a user name in the user database.  
99849 This record shall override the *uid* and *uname* fields in the following header block(s),  
99850 and any *uid* extended header record. When used in **read**, **copy**, or **list** mode, *pax*  
99851 shall translate the name from the encoding in the header record to the character set  
99852 appropriate for the user database on the receiving system. If any of the characters  
99853 cannot be translated, and if neither the **-oinvalid=UTF-8** option nor the  
99854 **-oinvalid=binary** option is specified, the results are implementation-defined.  
99855 When used in **write** or **copy** mode, *pax* shall include a **uname** extended header  
99856 record for each file whose user name cannot be represented entirely with the letters  
99857 and digits of the portable character set.
- 99858 If the *<value>* field is zero length, it shall delete any header block field, previously entered  
99859 extended header value, or global extended header value of the same name.
- 99860 If a keyword in an extended header record (or in a **-o** option-argument) overrides or deletes a  
99861 corresponding field in the **ustar** header block, *pax* shall ignore the contents of that header block  
99862 field.
- 99863 Unlike the **ustar** header block fields, NULs shall not delimit *<value>*s; all characters within the  
99864 *<value>* field shall be considered data for the field. None of the length limitations of the **ustar**  
99865 header block fields in Table 4-14 (on page 3024) shall apply to the extended header records.
- 99866 **pax Extended Header Keyword Precedence**
- 99867 This section describes the precedence in which the various header records and fields and  
99868 command line options are selected to apply to a file in the archive. When *pax* is used in **read** or  
99869 **list** modes, it shall determine a file attribute in the following sequence:
- 99870 1. If **-odelete=keyword-prefix** is used, the affected attributes shall be determined from step  
99871 7., if applicable, or ignored otherwise.
  - 99872 2. If **-okeyword:=** is used, the affected attributes shall be ignored.
  - 99873 3. If **-okeyword:=value** is used, the affected attribute shall be assigned the value.
  - 99874 4. If there is a *typeflag* **x** extended header record, the affected attribute shall be assigned the  
99875 *<value>*. When extended header records conflict, the last one given in the header shall  
99876 take precedence.
  - 99877 5. If **-okeyword=value** is used, the affected attribute shall be assigned the value.
  - 99878 6. If there is a *typeflag* **g** global extended header record, the affected attribute shall be  
99879 assigned the *<value>*. When global extended header records conflict, the last one given in  
99880 the global header shall take precedence.
  - 99881 7. Otherwise, the attribute shall be determined from the **ustar** header block.

99882 **pax Extended Header File Times**

99883 The *pax* utility shall write an **mtime** record for each file in **write** or **copy** modes if the file's  
 99884 modification time cannot be represented exactly in the **ustar** header logical record described in  
 99885 **ustar Interchange Format**. This can occur if the time is out of **ustar** range, or if the file system of  
 99886 the underlying implementation supports non-integer time granularities and the time is not an  
 99887 integer. All of these time records shall be formatted as a decimal representation of the time in  
 99888 seconds since the Epoch. If a <period> ( ' . ' ) decimal point character is present, the digits to the  
 99889 right of the point shall represent the units of a subsecond timing granularity, where the first digit  
 99890 is tenths of a second and each subsequent digit is a tenth of the previous digit. In **read** or **copy**  
 99891 mode, the *pax* utility shall truncate the time of a file to the greatest value that is not greater than  
 99892 the input header file time. In **write** or **copy** mode, the *pax* utility shall output a time exactly if it  
 99893 can be represented exactly as a decimal number, and otherwise shall generate only enough digits  
 99894 so that the same time shall be recovered if the file is extracted on a system whose underlying  
 99895 implementation supports the same time granularity.

99896 **ustar Interchange Format**

99897 A **ustar** archive tape or file shall contain a series of logical records. Each logical record shall be a  
 99898 fixed-size logical record of 512 octets (see below). Although this format may be thought of as  
 99899 being stored on 9-track industry-standard 12.7 mm (0.5 in) magnetic tape, other types of  
 99900 transportable media are not excluded. Each file archived shall be represented by a header logical  
 99901 record that describes the file, followed by zero or more logical records that give the contents of  
 99902 the file. At the end of the archive file there shall be two 512-octet logical records filled with  
 99903 binary zeros, interpreted as an end-of-archive indicator.

99904 The logical records may be grouped for physical I/O operations, as described under the  
 99905 **-b** *blocksize* and **-x** **ustar** options. Each group of logical records may be written with a single  
 99906 operation equivalent to the *write()* function. On magnetic tape, the result of this write shall be a  
 99907 single tape physical block. The last physical block shall always be the full size, so logical records  
 99908 after the two zero logical records may contain undefined data.

99909 The header logical record shall be structured as shown in the following table. All lengths and  
 99910 offsets are in decimal.

99911

99931

99932

99933

99934

99935

All characters in the header logical record shall be represented in the coded character set of the ISO/IEC 646:1991 standard. For maximum portability between implementations, names should be selected from characters represented by the portable filename character set as octets with the most significant bit zero. If an implementation supports the use of characters outside of <slash> and the portable filename character set in names for files, users, and groups, one or more implementation-defined encodings of these characters shall be provided for interchange purposes.

99936

99937

99938

99939

99940

However, the *pax* utility shall never create filenames on the local system that cannot be accessed via the procedures described in POSIX.1-2008. If a filename is found on the medium that would create an invalid filename, it is implementation-defined whether the data from the file is stored on the file hierarchy and under what name it is stored. The *pax* utility may choose to ignore these files as long as it produces an error indicating that the file is being ignored.

99941

99942

Each field within the header logical record is contiguous; that is, there is no padding used. Each character on the archive medium shall be stored contiguously.

99943

99944

99945

99946

99947

99948

The fields *magic*, *uname*, and *gname* are character strings each terminated by a NUL character. The fields *name*, *linkname*, and *prefix* are NUL-terminated character strings except when all characters in the array contain non-NUL characters including the last character. The *version* field is two octets containing the characters "00" (zero-zero). The *typeflag* contains a single character. All other fields are leading zero-filled octal numbers using digits from the ISO/IEC 646:1991 standard IRV. Each numeric field is terminated by one or more <space> or NUL characters.

99949

99950

99951

99952

99953

99954

99955

The *name* and the *prefix* fields shall produce the pathname of the file. A new pathname shall be formed, if *prefix* is not an empty string (its first character is not NUL), by concatenating *prefix* (up to the first NUL character), a <slash> character, and *name*; otherwise, *name* is used alone. In either case, *name* is terminated at the first NUL character. If *prefix* begins with a NUL character, it shall be ignored. In this manner, pathnames of at most 256 characters can be supported. If a pathname does not fit in the space provided, *pax* shall notify the user of the error, and shall not store any part of the file—header or data—on the medium.

99956

99957

The *linkname* field, described below, shall not use the *prefix* to produce a pathname. As such, a *linkname* is limited to 100 characters. If the name does not fit in the space provided, *pax* shall

99958 notify the user of the error, and shall not attempt to store the link on the medium.

99959 The *mode* field provides 12 bits encoded in the ISO/IEC 646:1991 standard octal digit  
99960 representation. The encoded bits shall represent the following values:

99961 **Table 4-15** *ustar mode* Field

Bit Value	POSIX.1-2008 Bit	Description
04 000	S_ISUID	Set UID on execution.
02 000	S_ISGID	Set GID on execution.
01 000	<reserved>	Reserved for future standardization.
00 400	S_IRUSR	Read permission for file owner class.
00 200	S_IWUSR	Write permission for file owner class.
00 100	S_IXUSR	Execute/search permission for file owner class.
00 040	S_IRGRP	Read permission for file group class.
00 020	S_IWGRP	Write permission for file group class.
00 010	S_IXGRP	Execute/search permission for file group class.
00 004	S_IROTH	Read permission for file other class.
00 002	S_IWOTH	Write permission for file other class.
00 001	S_IXOTH	Execute/search permission for file other class.

99975 When appropriate privileges are required to set one of these mode bits, and the user restoring  
99976 the files from the archive does not have appropriate privileges, the mode bits for which the user  
99977 does not have appropriate privileges shall be ignored. Some of the mode bits in the archive  
99978 format are not mentioned elsewhere in this volume of POSIX.1-2008. If the implementation does  
99979 not support those bits, they may be ignored.

99980 The *uid* and *gid* fields are the user and group ID of the owner and group of the file, respectively.

99981 The *size* field is the size of the file in octets. If the *typeflag* field is set to specify a file to be of type  
99982 1 (a link) or 2 (a symbolic link), the *size* field shall be specified as zero. If the *typeflag* field is set to  
99983 specify a file of type 5 (directory), the *size* field shall be interpreted as described under the  
99984 definition of that record type. No data logical records are stored for types 1, 2, or 5. If the *typeflag*  
99985 field is set to 3 (character special file), 4 (block special file), or 6 (FIFO), the meaning of the *size*  
99986 field is unspecified by this volume of POSIX.1-2008, and no data logical records shall be stored  
99987 on the medium. Additionally, for type 6, the *size* field shall be ignored when reading. If the  
99988 *typeflag* field is set to any other value, the number of logical records written following the header  
99989 shall be  $(size+511)/512$ , ignoring any fraction in the result of the division.

99990 The *mtime* field shall be the modification time of the file at the time it was archived. It is the  
99991 ISO/IEC 646:1991 standard representation of the octal value of the modification time obtained  
99992 from the *stat()* function.

99993 The *chksum* field shall be the ISO/IEC 646:1991 standard IRV representation of the octal value of  
99994 the simple sum of all octets in the header logical record. Each octet in the header shall be treated  
99995 as an unsigned value. These values shall be added to an unsigned integer, initialized to zero, the  
99996 precision of which is not less than 17 bits. When calculating the checksum, the *chksum* field is  
99997 treated as if it were all <space> characters.

99998 The *typeflag* field specifies the type of file archived. If a particular implementation does not  
99999 recognize the type, or the user does not have appropriate privileges to create that type, the file  
100000 shall be extracted as if it were a regular file if the file type is defined to have a meaning for the  
100001 *size* field that could cause data logical records to be written on the medium (see the previous  
100002 description for *size*). If conversion to a regular file occurs, the *pax* utility shall produce an error  
100003 indicating that the conversion took place. All of the *typeflag* fields shall be coded in the

100004	ISO/IEC 646: 1991 standard IRV:
100005	0
100006	Represents a regular file. For backwards-compatibility, a <i>typeflag</i> value of binary zero (' \0 ') should be recognized as meaning a regular file when extracting files from the archive. Archives written with this version of the archive file format create regular files with a <i>typeflag</i> value of the ISO/IEC 646: 1991 standard IRV ' 0 '.
100007	
100008	
100009	1
100010	Represents a file linked to another file, of any type, previously archived. Such files are identified by having the same device and file serial numbers, and pathnames that refer to different directory entries. All such files shall be archived as linked files. The linked-to name is specified in the <i>linkname</i> field with a NUL-character terminator if it is less than 100 octets in length.
100011	
100012	
100013	
100014	2
100015	Represents a symbolic link. The contents of the symbolic link shall be stored in the <i>linkname</i> field.
100016	3, 4
100017	Represent character special files and block special files respectively. In this case the <i>devmajor</i> and <i>devminor</i> fields shall contain information defining the device, the format of which is unspecified by this volume of POSIX.1-2008. Implementations may map the device specifications to their own local specification or may ignore the entry.
100018	
100019	
100020	5
100021	Specifies a directory or subdirectory. On systems where disk allocation is performed on a directory basis, the <i>size</i> field shall contain the maximum number of octets (which may be rounded to the nearest disk block allocation unit) that the directory may hold. A <i>size</i> field of zero indicates no such limiting. Systems that do not support limiting in this manner should ignore the <i>size</i> field.
100022	
100023	
100024	
100025	6
100026	Specifies a FIFO special file. Note that the archiving of a FIFO file archives the existence of this file and not its contents.
100027	7
100028	Reserved to represent a file to which an implementation has associated some high-performance attribute. Implementations without such extensions should treat this file as a regular file (type 0).
100029	
100030	A–Z
100031	The letters ' A ' to ' Z ', inclusive, are reserved for custom implementations. All other values are reserved for future versions of this standard.
100032	It is unspecified whether files with pathnames that refer to the same directory entry are archived as linked files or as separate files. If they are archived as linked files, this means that attempting to extract both pathnames from the resulting archive will always cause an error (unless the <i>-u</i> option is used) because the link cannot be created.
100033	
100034	
100035	
100036	It is unspecified whether files with the same device and file serial numbers being appended to an archive are treated as linked files to members that were in the archive before the append.
100037	
100038	Attempts to archive a socket using <i>ustar</i> interchange format shall produce a diagnostic message. Handling of other file types is implementation-defined.
100039	
100040	The <i>magic</i> field is the specification that this archive was output in this archive format. If this field contains <i>ustar</i> (the five characters from the ISO/IEC 646: 1991 standard IRV shown followed by NUL), the <i>uname</i> and <i>gname</i> fields shall contain the ISO/IEC 646: 1991 standard IRV representation of the owner and group of the file, respectively (truncated to fit, if necessary).
100041	
100042	
100043	
100044	
100045	When the file is restored by a privileged, protection-preserving version of the utility, the user and group databases shall be scanned for these names. If found, the user and group IDs contained within these files shall be used rather than the values contained within the <i>uid</i> and <i>gid</i> fields.
100046	
100047	

100048 **cpio Interchange Format**

100049 The octet-oriented **cpio** archive format shall be a series of entries, each comprising a header that  
 100050 describes the file, the name of the file, and then the contents of the file.

100051 An archive may be recorded as a series of fixed-size blocks of octets. This blocking shall be used  
 100052 only to make physical I/O more efficient. The last group of blocks shall always be at the full  
 100053 size.

100054 For the octet-oriented **cpio** archive format, the individual entry information shall be in the order  
 100055 indicated and described by the following table; see also the **<cpio.h>** header.

100056 **Table 4-16** Octet-Oriented cpio Archive Entry

Header Field Name	Length (in Octets)	Interpreted as
<i>c_magic</i>	6	Octal number
<i>c_dev</i>	6	Octal number
<i>c_ino</i>	6	Octal number
<i>c_mode</i>	6	Octal number
<i>c_uid</i>	6	Octal number
<i>c_gid</i>	6	Octal number
<i>c_nlink</i>	6	Octal number
<i>c_rdev</i>	6	Octal number
<i>c_mtime</i>	11	Octal number
<i>c_namesize</i>	6	Octal number
<i>c_filesize</i>	11	Octal number
Filename Field Name	Length	Interpreted as
<i>c_name</i>	<i>c_namesize</i>	Pathname string
File Data Field Name	Length	Interpreted as
<i>c_filedata</i>	<i>c_filesize</i>	Data

100073 **cpio Header**

100074 For each file in the archive, a header as defined previously shall be written. The information in  
 100075 the header fields is written as streams of the ISO/IEC 646:1991 standard characters interpreted  
 100076 as octal numbers. The octal numbers shall be extended to the necessary length by appending the  
 100077 ISO/IEC 646:1991 standard IRV zeros at the most-significant-digit end of the number; the result  
 100078 is written to the most-significant digit of the stream of octets first. The fields shall be interpreted  
 100079 as follows:

100080 *c\_magic* Identify the archive as being a transportable archive by containing the identifying  
 100081 value "070707".

100082 *c\_dev, c\_ino* Contains values that uniquely identify the file within the archive (that is, no files  
 100083 contain the same pair of *c\_dev* and *c\_ino* values unless they are links to the same  
 100084 file). The values shall be determined in an unspecified manner.

100085 *c\_mode* Contains the file type and access permissions as defined in the following table.

100086

Table 4-17 Values for cpio c\_mode Field

100087

File Permissions Name	Value	Indicates
C_IRUSR	000 400	Read by owner
C_IWUSR	000 200	Write by owner
C_IXUSR	000 100	Execute by owner
C_IRGRP	000 040	Read by group
C_IWGRP	000 020	Write by group
C_IXGRP	000 010	Execute by group
C_IROTH	000 004	Read by others
C_IWOTH	000 002	Write by others
C_IXOTH	000 001	Execute by others
C_ISUID	004 000	Set <i>uid</i>
C_ISGID	002 000	Set <i>gid</i>
C_ISVTX	001 000	Reserved
File Type Name	Value	Indicates
C_ISDIR	040 000	Directory
C_ISFIFO	010 000	FIFO
C_ISREG	0100 000	Regular file
C_ISLNK	0120 000	Symbolic link
C_ISBLK	060 000	Block special file
C_ISCHR	020 000	Character special file
C_ISSOCK	0140 000	Socket
C_ISCTG	0110 000	Reserved

100088

100089

100090

100091

100092

100093

100094

100095

100096

100097

100098

100099

100100

100101

100102

100103

100104

100105

100106

100107

100108

100109

100110

100111

100112

100113

Directories, FIFOs, symbolic links, and regular files shall be supported on a system conforming to this volume of POSIX.1-2008; additional values defined previously are reserved for compatibility with existing systems. Additional file types may be supported; however, such files should not be written to archives intended to be transported to other systems.

100114

*c\_uid*

Contains the user ID of the owner.

100115

*c\_gid*

Contains the group ID of the group.

100116

*c\_nlink*

Contains a number greater than or equal to the number of links in the archive referencing the file. If the *-a* option is used to append to a *cpio* archive, then the *pax* utility need not account for the files in the existing part of the archive when calculating the *c\_nlink* values for the appended part of the archive, and need not alter the *c\_nlink* values in the existing part of the archive if additional files with the same *c\_dev* and *c\_ino* values are appended to the archive.

100117

100118

100119

100120

100121

100122

*c\_rdev*

Contains implementation-defined information for character or block special files.

100123

*c\_mtime*

Contains the latest time of modification of the file at the time the archive was created.

100124

100125

*c\_namesize*

Contains the length of the pathname, including the terminating NUL character.

100126

*c\_filesize*

Contains the length in octets of the data section following the header structure.

100127 **cpio Filename**

100128 The *c\_name* field shall contain the pathname of the file. The length of this field in octets is the  
100129 value of *c\_namesize*.

100130 If a filename is found on the medium that would create an invalid pathname, it is  
100131 implementation-defined whether the data from the file is stored on the file hierarchy and under  
100132 what name it is stored.

100133 All characters shall be represented in the ISO/IEC 646:1991 standard IRV. For maximum  
100134 portability between implementations, names should be selected from characters represented by  
100135 the portable filename character set as octets with the most significant bit zero. If an  
100136 implementation supports the use of characters outside the portable filename character set in  
100137 names for files, users, and groups, one or more implementation-defined encodings of these  
100138 characters shall be provided for interchange purposes. However, the *pax* utility shall never create  
100139 filenames on the local system that cannot be accessed via the procedures described previously in  
100140 this volume of POSIX.1-2008. If a filename is found on the medium that would create an invalid  
100141 filename, it is implementation-defined whether the data from the file is stored on the local file  
100142 system and under what name it is stored. The *pax* utility may choose to ignore these files as long  
100143 as it produces an error indicating that the file is being ignored.

100144 **cpio File Data**

100145 Following *c\_name*, there shall be *c\_filesize* octets of data. Interpretation of such data occurs in a  
100146 manner dependent on the file. For regular files, the data shall consist of the contents of the file.  
100147 For symbolic links, the data shall consist of the contents of the symbolic link. If *c\_filesize* is zero,  
100148 no data shall be contained in *c\_filedata*.

100149 When restoring from an archive:

- 100150 • If the user does not have appropriate privileges to create a file of the specified type, *pax*  
100151 shall ignore the entry and write an error message to standard error.
- 100152 • Only regular files and symbolic links have data to be restored. Presuming a regular file  
100153 meets any selection criteria that might be imposed on the format-reading utility by the  
100154 user, such data shall be restored.
- 100155 • If a user does not have appropriate privileges to set a particular mode flag, the flag shall be  
100156 ignored. Some of the mode flags in the archive format are not mentioned elsewhere in this  
100157 volume of POSIX.1-2008. If the implementation does not support those flags, they may be  
100158 ignored.

100159 **cpio Special Entries**

100160 FIFO special files, directories, and the trailer shall be recorded with *c\_filesize* equal to zero.  
100161 Symbolic links shall be recorded with *c\_filesize* equal to the length of the contents of the symbolic  
100162 link. For other special files, *c\_filesize* is unspecified by this volume of POSIX.1-2008. The header  
100163 for the next file entry in the archive shall be written directly after the last octet of the file entry  
100164 preceding it. A header denoting the filename **TRAILER!!!** shall indicate the end of the archive;  
100165 the contents of octets in the last block of the archive following such a header are undefined.

100166 **EXIT STATUS**

100167 The following exit values shall be returned:

- 100168 0 All files were processed successfully.

100169 >0 An error occurred.

#### 100170 CONSEQUENCES OF ERRORS

100171 If *pax* cannot create a file or a link when reading an archive or cannot find a file when writing an  
 100172 archive, or cannot preserve the user ID, group ID, or file mode when the **-p** option is specified, a  
 100173 diagnostic message shall be written to standard error and a non-zero exit status shall be  
 100174 returned, but processing shall continue. In the case where *pax* cannot create a link to a file, *pax*  
 100175 shall not, by default, create a second copy of the file.

100176 If the extraction of a file from an archive is prematurely terminated by a signal or error, *pax* may  
 100177 have only partially extracted the file or (if the **-n** option was not specified) may have extracted a  
 100178 file of the same name as that specified by the user, but which is not the file the user wanted.  
 100179 Additionally, the file modes of extracted directories may have additional bits from the S\_IRWXU  
 100180 mask set as well as incorrect modification and access times.

#### 100181 APPLICATION USAGE

100182 Caution is advised when using the **-a** option to append to a *cpio* format archive. If any of the  
 100183 files being appended happen to be given the same *c\_dev* and *c\_ino* values as a file in the existing  
 100184 part of the archive, then they may be treated as links to that file on extraction. Thus, it is risky to  
 100185 use **-a** with *cpio* format except when it is done on the same system that the original archive was  
 100186 created on, and with the same *pax* utility, and in the knowledge that there has been little or no  
 100187 file system activity since the original archive was created that could lead to any of the files  
 100188 appended being given the same *c\_dev* and *c\_ino* values as an unrelated file in the existing part of  
 100189 the archive. Also, when (intentionally) appending additional links to a file in the existing part of  
 100190 the archive, the *c\_nlink* values in the modified archive can be smaller than the number of links to  
 100191 the file in the archive, which may mean that the links are not preserved on extraction.

100192 The **-p** (privileges) option was invented to reconcile differences between historical *tar* and *cpio*  
 100193 implementations. In particular, the two utilities use **-m** in diametrically opposed ways. The **-p**  
 100194 option also provides a consistent means of extending the ways in which future file attributes can  
 100195 be addressed, such as for enhanced security systems or high-performance files. Although it may  
 100196 seem complex, there are really two modes that are most commonly used:

100197 **-p e** "Preserve everything". This would be used by the historical superuser, someone with  
 100198 all appropriate privileges, to preserve all aspects of the files as they are recorded in the  
 100199 archive. The *e* flag is the sum of *o* and *p*, and other implementation-defined attributes.

100200 **-p p** "Preserve" the file mode bits. This would be used by the user with regular privileges  
 100201 who wished to preserve aspects of the file other than the ownership. The file times are  
 100202 preserved by default, but two other flags are offered to disable these and use the time  
 100203 of extraction.

100204 The one pathname per line format of standard input precludes pathnames containing <newline>  
 100205 characters. Although such pathnames violate the portable filename guidelines, they may exist  
 100206 and their presence may inhibit usage of *pax* within shell scripts. This problem is inherited from  
 100207 historical archive programs. The problem can be avoided by listing filename arguments on the  
 100208 command line instead of on standard input.

100209 It is almost certain that appropriate privileges are required for *pax* to accomplish parts of this  
 100210 volume of POSIX.1-2008. Specifically, creating files of type block special or character special,  
 100211 restoring file access times unless the files are owned by the user (the **-t** option), or preserving file  
 100212 owner, group, and mode (the **-p** option) all probably require appropriate privileges.

100213 In **read** mode, implementations are permitted to overwrite files when the archive has multiple  
 100214 members with the same name. This may fail if permissions on the first version of the file do not  
 100215 permit it to be overwritten.

100216 The **cpio** and **ustar** formats can only support files up to 8 589 934 592 bytes ( $8 * 2^{30}$ ) in size.

100217 When archives containing binary header information are listed , the filenames printed may  
100218 cause strange behavior on some terminals.

#### 100219 EXAMPLES

100220 The following command:

```
100221 pax -w -f /dev/rmt/lm .
```

100222 copies the contents of the current directory to tape drive 1, medium density (assuming historical  
100223 System V device naming procedures—the historical BSD device name would be **/dev/rmt9**).

100224 The following commands:

```
100225 mkdir newdir
100226 pax -rw olddir newdir
```

100227 copy the *olddir* directory hierarchy to *newdir*.

```
100228 pax -r -s ',^//*usr//*,,' -f a.pax
```

100229 reads the archive **a.pax**, with all files rooted in **/usr** in the archive extracted relative to the current  
100230 directory.

100231 Using the option:

```
100232 -o listopt="%M %(atime)T %(size)D %(name)s"
```

100233 overrides the default output description in Standard Output and instead writes:

```
100234 -rw-rw--- Jan 12 15:53 2003 1492 /usr/foo/bar
```

100235 Using the options:

```
100236 -o listopt='%L\t%(size)D\n%.7' \
100237 -o listopt='(name)s\n%(atime)T\n%T'
```

100238 overrides the default output description in Standard Output and instead writes:

```
100239 /usr/foo/bar -> /tmp 1492
100240 /usr/fo
100241 Jan 12 15:53 1991
100242 Jan 31 15:53 2003
```

#### 100243 RATIONALE

100244 The *pax* utility was new for the ISO POSIX-2: 1993 standard. It represents a peaceful compromise  
100245 between advocates of the historical *tar* and *cpio* utilities.

100246 A fundamental difference between *cpio* and *tar* was in the way directories were treated. The *cpio*  
100247 utility did not treat directories differently from other files, and to select a directory and its  
100248 contents required that each file in the hierarchy be explicitly specified. For *tar*, a directory  
100249 matched every file in the file hierarchy it rooted.

100250 The *pax* utility offers both interfaces; by default, directories map into the file hierarchy they root.  
100251 The **-d** option causes *pax* to skip any file not explicitly referenced, as *cpio* historically did. The *tar*  
100252 **-style** behavior was chosen as the default because it was believed that this was the more  
100253 common usage and because *tar* is the more commonly available interface, as it was historically  
100254 provided on both System V and BSD implementations.

100255 The data interchange format specification in this volume of POSIX.1-2008 requires that processes  
100256 with “appropriate privileges” shall always restore the ownership and permissions of extracted

100257 files exactly as archived. If viewed from the historic equivalence between superuser and  
 100258 “appropriate privileges”, there are two problems with this requirement. First, users running as  
 100259 superusers may unknowingly set dangerous permissions on extracted files. Second, it is  
 100260 needlessly limiting, in that superusers cannot extract files and own them as superuser unless the  
 100261 archive was created by the superuser. (It should be noted that restoration of ownerships and  
 100262 permissions for the superuser, by default, is historical practice in *cpio*, but not in *tar*.) In order to  
 100263 avoid these two problems, the *pax* specification has an additional “privilege” mechanism, the **-p**  
 100264 option. Only a *pax* invocation with the privileges needed, and which has the **-p** option set using  
 100265 the **e** specification character, has appropriate privileges to restore full ownership and permission  
 100266 information.

100267 Note also that this volume of POSIX.1-2008 requires that the file ownership and access  
 100268 permissions shall be set, on extraction, in the same fashion as the *creat()* function when provided  
 100269 with the mode stored in the archive. This means that the file creation mask of the user is applied  
 100270 to the file permissions.

100271 Users should note that directories may be created by *pax* while extracting files with permissions  
 100272 that are different from those that existed at the time the archive was created. When extracting  
 100273 sensitive information into a directory hierarchy that no longer exists, users are encouraged to set  
 100274 their file creation mask appropriately to protect these files during extraction.

100275 The table of contents output is written to standard output to facilitate pipeline processing.

100276 An early proposal had hard links displaying for all pathnames. This was removed because it  
 100277 complicates the output of the case where **-v** is not specified and does not match historical *cpio*  
 100278 usage. The hard-link information is available in the **-v** display.

100279 The description of the **-l** option allows implementations to make hard links to symbolic links.  
 100280 POSIX.1-2008 does not specify any way to create a hard link to a symbolic link, but many  
 100281 implementations provide this capability as an extension. If there are hard links to symbolic links  
 100282 when an archive is created, the implementation is required to archive the hard link in the archive  
 100283 (unless **-H** or **-L** is specified). When in **read** mode and in **copy** mode, implementations  
 100284 supporting hard links to symbolic links should use them when appropriate.

100285 The archive formats inherited from the POSIX.1-1990 standard have certain restrictions that have  
 100286 been brought along from historical usage. For example, there are restrictions on the length of  
 100287 pathnames stored in the archive. When *pax* is used in **copy(-rw)** mode (copying directory  
 100288 hierarchies), the ability to use extensions from the **-xpax** format overcomes these restrictions.

100289 The default *blocksize* value of 5120 bytes for *cpio* was selected because it is one of the standard  
 100290 block-size values for *cpio*, set when the **-B** option is specified. (The other default block-size value  
 100291 for *cpio* is 512 bytes, and this was considered to be too small.) The default block value of 10240  
 100292 bytes for *tar* was selected because that is the standard block-size value for BSD *tar*. The  
 100293 maximum block size of 32256 bytes ( $2^{15}$ –512 bytes) is the largest multiple of 512 bytes that fits  
 100294 into a signed 16-bit tape controller transfer register. There are known limitations in some  
 100295 historical systems that would prevent larger blocks from being accepted. Historical values were  
 100296 chosen to improve compatibility with historical scripts using *dd* or similar utilities to manipulate  
 100297 archives. Also, default block sizes for any file type other than character special file has been  
 100298 deleted from this volume of POSIX.1-2008 as unimportant and not likely to affect the structure of  
 100299 the resulting archive.

100300 Implementations are permitted to modify the block-size value based on the archive format or the  
 100301 device to which the archive is being written. This is to provide implementations with the  
 100302 opportunity to take advantage of special types of devices, and it should not be used without a  
 100303 great deal of consideration as it almost certainly decreases archive portability.

- 100304 The intended use of the `-n` option was to permit extraction of one or more files from the archive  
 100305 without processing the entire archive. This was viewed by the standard developers as offering  
 100306 significant performance advantages over historical implementations. The `-n` option in early  
 100307 proposals had three effects; the first was to cause special characters in patterns to not be treated  
 100308 specially. The second was to cause only the first file that matched a pattern to be extracted. The  
 100309 third was to cause *pax* to write a diagnostic message to standard error when no file was found  
 100310 matching a specified pattern. Only the second behavior is retained by this volume of  
 100311 POSIX.1-2008, for many reasons. First, it is in general not acceptable for a single option to have  
 100312 multiple effects. Second, the ability to make pattern matching characters act as normal characters  
 100313 is useful for parts of *pax* other than file extraction. Third, a finer degree of control over the  
 100314 special characters is useful because users may wish to normalize only a single special character  
 100315 in a single filename. Fourth, given a more general escape mechanism, the previous behavior of  
 100316 the `-n` option can be easily obtained using the `-s` option or a *sed* script. Finally, writing a  
 100317 diagnostic message when a pattern specified by the user is unmatched by any file is useful  
 100318 behavior in all cases.
- 100319 In this version, the `-n` was removed from the **copy** mode synopsis of *pax*; it is inapplicable  
 100320 because there are no pattern operands specified in this mode.
- 100321 There is another method than *pax* for copying subtrees in POSIX.1-2008 described as part of the  
 100322 *cp* utility. Both methods are historical practice: *cp* provides a simpler, more intuitive interface,  
 100323 while *pax* offers a finer granularity of control. Each provides additional functionality to the  
 100324 other; in particular, *pax* maintains the hard-link structure of the hierarchy while *cp* does not. It is  
 100325 the intention of the standard developers that the results be similar (using appropriate option  
 100326 combinations in both utilities). The results are not required to be identical; there seemed  
 100327 insufficient gain to applications to balance the difficulty of implementations having to guarantee  
 100328 that the results would be exactly identical.
- 100329 A single archive may span more than one file. It is suggested that implementations provide  
 100330 informative messages to the user on standard error whenever the archive file is changed.
- 100331 The `-d` option (do not create intermediate directories not listed in the archive) found in early  
 100332 proposals was originally provided as a complement to the historic `-d` option of *cpio*. It has been  
 100333 deleted.
- 100334 The `-s` option in early proposals specified a subset of the substitution command from the *ed*  
 100335 utility. As there was no reason for only a subset to be supported, the `-s` option is now compatible  
 100336 with the current *ed* specification. Since the delimiter can be any non-null character, the following  
 100337 usage with single `<space>` characters is valid:
- ```
100338 pax -s " foo bar " ...
```
- 100339 The `-t` description is worded so as to note that this may cause the access time update caused by  
 100340 some other activity (which occurs while the file is being read) to be overwritten.
- 100341 The default behavior of *pax* with regard to file modification times is the same as historical  
 100342 implementations of *tar*. It is not the historical behavior of *cpio*.
- 100343 Because the `-i` option uses `/dev/tty`, utilities without a controlling terminal are not able to use  
 100344 this option.
- 100345 The `-y` option, found in early proposals, has been deleted because a line containing a single  
 100346 `<period>` for the `-i` option has equivalent functionality. The special lines for the `-i` option (a  
 100347 single `<period>` and the empty line) are historical practice in *cpio*.
- 100348 In early drafts, a `-echarmap` option was included to increase portability of files between systems  
 100349 using different coded character sets. This option was omitted because it was apparent that

100350 consensus could not be formed for it. In this version, the use of UTF-8 should be an adequate  
 100351 substitute.

100352 The ISO POSIX-2:1993 standard and ISO POSIX-1 standard requirements for *pax*, however,  
 100353 made it very difficult to create a single archive containing files created using extended characters  
 100354 provided by different locales. This version adds the **hdrcharset** keyword to make it possible to  
 100355 archive files in these cases without dropping files due to translation errors.

100356 Translating filenames and other attributes from a locale's encoding to UTF-8 and then back again  
 100357 can lose information, as the resulting filename might not be byte-for-byte equivalent to the  
 100358 original. To avoid this problem, users can specify the **-o hdrcharset=binary** option, which will  
 100359 cause the resulting archive to use binary format for all names and attributes. Such archives are  
 100360 not portable among hosts that use different native encodings (e.g., EBCDIC *versus* ASCII-based  
 100361 encodings), but they will allow interchange among the vast majority of POSIX file systems in  
 100362 practical use. Also, the **-o hdrcharset=binary** option will cause *pax* in **copy** mode to behave  
 100363 more like other standard utilities such as *cp*.

100364 If the values specified by the **-o exthdr.name=value**, **-o globexthdr.name=value**, or by  
 100365 **\$TMPDIR** (if **-o globexthdr.name** is not specified) require a character encoding other than that  
 100366 described in the ISO/IEC 646:1991 standard, a **path** extended header record will have to be  
 100367 created for the file. If a **hdrcharset** extended header record is active for such headers, it will  
 100368 determine the codeset used for the value field in these extended **path** header records. These **path**  
 100369 extended header records always need to be created when writing an archive even if  
 100370 **hdrcharset=binary** has been specified and would contain the same (binary) data that appears in  
 100371 the **ustar** header record prefix and *name* fields. (In other words, an extended header **path** record  
 100372 is always required to be generated if the *prefix* or *name* fields contain non-ASCII characters even  
 100373 when **hdrcharset=binary** is also in effect for that file.)

100374 The **-k** option was added to address international concerns about the dangers involved in the  
 100375 character set transformations of **-e** (if the target character set were different from the source, the  
 100376 filenames might be transformed into names matching existing files) and also was made more  
 100377 general to protect files transferred between file systems with different {NAME\_MAX} values  
 100378 (truncating a filename on a smaller system might also inadvertently overwrite existing files). As  
 100379 stated, it prevents any overwriting, even if the target file is older than the source. This version  
 100380 adds more granularity of options to solve this problem by introducing the **-o invalid=option**—  
 100381 specifically the **UTF-8** and **binary** actions. (Note that an existing file is still subject to overwriting  
 100382 in this case. The **-k** option closes that loophole.)

100383 Some of the file characteristics referenced in this volume of POSIX.1-2008 might not be  
 100384 supported by some archive formats. For example, neither the **tar** nor **cpio** formats contain the  
 100385 file access time. For this reason, the **e** specification character has been provided, intended to  
 100386 cause all file characteristics specified in the archive to be retained.

100387 It is required that extracted directories, by default, have their access and modification times and  
 100388 permissions set to the values specified in the archive. This has obvious problems in that the  
 100389 directories are almost certainly modified after being extracted and that directory permissions  
 100390 may not permit file creation. One possible solution is to create directories with the mode  
 100391 specified in the archive, as modified by the *umask* of the user, with sufficient permissions to  
 100392 allow file creation. After all files have been extracted, *pax* would then reset the access and  
 100393 modification times and permissions as necessary.

100394 The list-mode formatting description borrows heavily from the one defined by the *printf* utility.  
 100395 However, since there is no separate operand list to get conversion arguments, the format was  
 100396 extended to allow specifying the name of the conversion argument as part of the conversion  
 100397 specification.

100398 The T conversion specifier allows time fields to be displayed in any of the date formats. Unlike  
 100399 the *ls* utility, *pax* does not adjust the format when the date is less than six months in the past.  
 100400 This makes parsing the output more predictable.

100401 The D conversion specifier handles the ability to display the major/minor or file size, as with *ls*,  
 100402 by using `%-8 (size)D`.

100403 The L conversion specifier handles the *ls* display for symbolic links.

100404 Conversion specifiers were added to generate existing known types used for *ls*.

### 100405 **pax Interchange Format**

100406 The new POSIX data interchange format was developed primarily to satisfy international  
 100407 concerns that the **ustar** and **cpio** formats did not provide for file, user, and group names encoded  
 100408 in characters outside a subset of the ISO/IEC 646:1991 standard. The standard developers  
 100409 realized that this new POSIX data interchange format should be very extensible because there  
 100410 were other requirements they foresaw in the near future:

- 100411 • Support international character encodings and locale information
- 100412 • Support security information (ACLs, and so on)
- 100413 • Support future file types, such as realtime or contiguous files
- 100414 • Include data areas for implementation use
- 100415 • Support systems with words larger than 32 bits and timers with subsecond granularity

100416 The following were not goals for this format because these are better handled by separate  
 100417 utilities or are inappropriate for a portable format:

- 100418 • Encryption
- 100419 • Compression
- 100420 • Data translation between locales and codesets
- 100421 • *inode* storage

100422 The format chosen to support the goals is an extension of the **ustar** format. Of the two formats  
 100423 previously available, only the **ustar** format was selected for extensions because:

- 100424 • It was easier to extend in an upwards-compatible way. It offered version flags and header  
 100425 block type fields with room for future standardization. The **cpio** format, while possessing a  
 100426 more flexible file naming methodology, could not be extended without breaking some  
 100427 theoretical implementation or using a dummy filename that could be a legitimate filename.
- 100428 • Industry experience since the original “*tar wars*” fought in developing the ISO POSIX-1  
 100429 standard has clearly been in favor of the **ustar** format, which is generally the default  
 100430 output format selected for *pax* implementations on new systems.

100431 The new format was designed with one additional goal in mind: reasonable behavior when an  
 100432 older *tar* or *pax* utility happened to read an archive. Since the POSIX.1-1990 standard mandated  
 100433 that a “format-reading utility” had to treat unrecognized *typeflag* values as regular files, this  
 100434 allowed the format to include all the extended information in a pseudo-regular file that  
 100435 preceded each real file. An option is given that allows the archive creator to set up reasonable  
 100436 names for these files on the older systems. Also, the normative text suggests that reasonable file  
 100437 access values be used for this **ustar** header block. Making these header files inaccessible for  
 100438 convenient reading and deleting would not be reasonable. File permissions of 600 or 700 are  
 100439 suggested.

- 100440 The **ustar** *typeflag* field was used to accommodate the additional functionality of the new format  
 100441 rather than *magic* or *version* because the POSIX.1-1990 standard (and, by reference, the previous  
 100442 version of *pax*), mandated the behavior of the format-reading utility when it encountered an  
 100443 unknown *typeflag*, but was silent about the other two fields.
- 100444 Early proposals for the first version of this standard contained a proposed archive format that  
 100445 was based on compatibility with the standard for tape files (ISO 1001, similar to the format used  
 100446 historically on many mainframes and minicomputers). This format was overly complex and  
 100447 required considerable overhead in volume and header records. Furthermore, the standard  
 100448 developers felt that it would not be acceptable to the community of POSIX developers, so it was  
 100449 later changed to be a format more closely related to historical practice on POSIX systems.
- 100450 The prefix and name split of pathnames in **ustar** was replaced by the single path extended  
 100451 header record for simplicity.
- 100452 The concept of a global extended header (*typeflagg*) was controversial. If this were applied to an  
 100453 archive being recorded on magnetic tape, a few unreadable blocks at the beginning of the tape  
 100454 could be a serious problem; a utility attempting to extract as many files as possible from a  
 100455 damaged archive could lose a large percentage of file header information in this case. However,  
 100456 if the archive were on a reliable medium, such as a CD-ROM, the global extended header offers  
 100457 considerable potential size reductions by eliminating redundant information. Thus, the text  
 100458 warns against using the global method for unreliable media and provides a method for  
 100459 implanting global information in the extended header for each file, rather than in the *typeflag g*  
 100460 records.
- 100461 No facility for data translation or filtering on a per-file basis is included because the standard  
 100462 developers could not invent an interface that would allow this in an efficient manner. If a filter,  
 100463 such as encryption or compression, is to be applied to all the files, it is more efficient to apply the  
 100464 filter to the entire archive as a single file. The standard developers considered interfaces that  
 100465 would invoke a shell script for each file going into or out of the archive, but the system overhead  
 100466 in this approach was considered to be too high.
- 100467 One such approach would be to have **filter=** records that give a pathname for an executable.  
 100468 When the program is invoked, the file and archive would be open for standard input/output  
 100469 and all the header fields would be available as environment variables or command-line  
 100470 arguments. The standard developers did discuss such schemes, but they were omitted from  
 100471 POSIX.1-2008 due to concerns about excessive overhead. Also, the program itself would need to  
 100472 be in the archive if it were to be used portably.
- 100473 There is currently no portable means of identifying the character set(s) used for a file in the file  
 100474 system. Therefore, *pax* has not been given a mechanism to generate charset records  
 100475 automatically. The only portable means of doing this is for the user to write the archive using the  
 100476 **-ocharset=string** command line option. This assumes that all of the files in the archive use the  
 100477 same encoding. The “implementation-defined” text is included to allow for a system that can  
 100478 identify the encodings used for each of its files.
- 100479 The table of standards that accompanies the charset record description is acknowledged to be  
 100480 very limited. Only a limited number of character set standards is reasonable for maximal  
 100481 interchange. Any character set is, of course, possible by prior agreement. It was suggested that  
 100482 EBCDIC be listed, but it was omitted because it is not defined by a formal standard. Formal  
 100483 standards, and then only those with reasonably large followings, can be included here, simply as  
 100484 a matter of practicality. The *<value>*s represent names of officially registered character sets in the  
 100485 format required by the ISO 2375: 1985 standard.
- 100486 The normal *<comma>* or *<blank>*-separated list rules are not followed in the case of keyword  
 100487 options to allow ease of argument parsing for *getopts*.

- 100488 Further information on character encodings is in [pax Archive Character Set Encoding/Decoding](#)  
100489 (on page 3038).
- 100490 The standard developers have reserved keyword name space for vendor extensions. It is  
100491 suggested that the format to be used is:
- 100492 *VENDOR.keyword*
- 100493 where *VENDOR* is the name of the vendor or organization in all uppercase letters. It is further  
100494 suggested that the keyword following the <period> be named differently than any of the  
100495 standard keywords so that it could be used for future standardization, if appropriate, by  
100496 omitting the *VENDOR* prefix.
- 100497 The <length> field in the extended header record was included to make it simpler to step  
100498 through the records, even if a record contains an unknown format (to a particular *pax*) with  
100499 complex interactions of special characters. It also provides a minor integrity checkpoint within  
100500 the records to aid a program attempting to recover files from a damaged archive.
- 100501 There are no extended header versions of the *devmajor* and *devminor* fields because the  
100502 unspecified format **ustar** header field should be sufficient. If they are not, vendor-specific  
100503 extended keywords (such as *VENDOR.devmajor*) should be used.
- 100504 Device and *i*-number labeling of files was not adopted from *cpio*; files are interchanged strictly  
100505 on a symbolic name basis, as in **ustar**.
- 100506 Just as with the **ustar** format descriptions, the new format makes no special arrangements for  
100507 multi-volume archives. Each of the *pax* archive types is assumed to be inside a single POSIX file  
100508 and splitting that file over multiple volumes (diskettes, tape cartridges, and so on), processing  
100509 their labels, and mounting each in the proper sequence are considered to be implementation  
100510 details that cannot be described portably.
- 100511 The **pax** format is intended for interchange, not only for backup on a single (family of) systems.  
100512 It is not as densely packed as might be possible for backup:
- 100513 • It contains information as coded characters that could be coded in binary.
  - 100514 • It identifies extended records with name fields that could be omitted in favor of a fixed-  
100515 field layout.
  - 100516 • It translates names into a portable character set and identifies locale-related information,  
100517 both of which are probably unnecessary for backup.
- 100518 The requirements on restoring from an archive are slightly different from the historical wording,  
100519 allowing for non-monolithic privilege to bring forward as much as possible. In particular,  
100520 attributes such as “high performance file” might be broadly but not universally granted while  
100521 set-user-ID or *chown()* might be much more restricted. There is no implication in POSIX.1-2008  
100522 that the security information be honored after it is restored to the file hierarchy, in spite of what  
100523 might be improperly inferred by the silence on that topic. That is a topic for another standard.
- 100524 Links are recorded in the fashion described here because a link can be to any file type. It is  
100525 desirable in general to be able to restore part of an archive selectively and restore all of those files  
100526 completely. If the data is not associated with each link, it is not possible to do this. However, the  
100527 data associated with a file can be large, and when selective restoration is not needed, this can be  
100528 a significant burden. The archive is structured so that files that have no associated data can  
100529 always be restored by the name of any link name of any link, and the user may choose whether  
100530 data is recorded with each instance of a file that contains data. The format permits mixing of  
100531 both types of links in a single archive; this can be done for special needs, and *pax* is expected to  
100532 interpret such archives on input properly, despite the fact that there is no *pax* option that would

100533 force this mixed case on output. (When **-o linkdata** is used, the output must contain the  
100534 duplicate data, but the implementation is free to include it or omit it when **-o linkdata** is not  
100535 used.)

100536 The time values are included as extended header records for those implementations needing  
100537 more than the eleven octal digits allowed by the **ustar** format. Portable file timestamps cannot be  
100538 negative. If *pax* encounters a file with a negative timestamp in **copy** or **write** mode, it can reject  
100539 the file, substitute a non-negative timestamp, or generate a non-portable timestamp with a  
100540 leading '-'. Even though some implementations can support finer file-time granularities than  
100541 seconds, the normative text requires support only for seconds since the Epoch because the  
100542 ISO POSIX-1 standard states them that way. The **ustar** format includes only *mtime*; the new  
100543 format adds *atime* and *ctime* for symmetry. The *atime* access time restored to the file system will  
100544 be affected by the **-p a** and **-p e** options. The *ctime* creation time (actually *inode* modification  
100545 time) is described with appropriate privileges so that it can be ignored when writing to the file  
100546 system. POSIX does not provide a portable means to change file creation time. Nothing is  
100547 intended to prevent a non-portable implementation of *pax* from restoring the value.

100548 The *gid*, *size*, and *uid* extended header records were included to allow expansion beyond the  
100549 sizes specified in the regular *tar* header. New file system architectures are emerging that will  
100550 exhaust the 12-digit size field. There are probably not many systems requiring more than 8 digits  
100551 for user and group IDs, but the extended header values were included for completeness,  
100552 allowing overrides for all of the decimal values in the *tar* header.

100553 The standard developers intended to describe the effective results of *pax* with regard to file  
100554 ownerships and permissions; implementations are not restricted in timing or sequencing the  
100555 restoration of such, provided the results are as specified.

100556 Much of the text describing the extended headers refers to use in “**write** or **copy** modes”. The  
100557 **copy** mode references are due to the normative text: “The effect of the copy shall be as if the  
100558 copied files were written to an archive file and then subsequently extracted ...”. There is  
100559 certainly no way to test whether *pax* is actually generating the extended headers in **copy** mode,  
100560 but the effects must be as if it had.

#### 100561 **pax Archive Character Set Encoding/Decoding**

100562 There is a need to exchange archives of files between systems of different native codesets.  
100563 Filenames, group names, and user names must be preserved to the fullest extent possible when  
100564 an archive is read on the receiving platform. Translation of the contents of files is not within the  
100565 scope of the *pax* utility.

100566 There will also be the need to represent characters that are not available on the receiving  
100567 platform. These unsupported characters cannot be automatically folded to the local set of  
100568 characters due to the chance of collisions. This could result in overwriting previous extracted  
100569 files from the archive or pre-existing files on the system.

100570 For these reasons, the codeset used to represent characters within the extended header records of  
100571 the *pax* archive must be sufficiently rich to handle all commonly used character sets. The fields  
100572 requiring translation include, at a minimum, filenames, user names, group names, and link  
100573 pathnames. Implementations may wish to have localized extended keywords that use non-  
100574 portable characters.

100575 The standard developers considered the following options:

- 100576 • The archive creator specifies the well-defined name of the source codeset. The receiver  
100577 must then recognize the codeset name and perform the appropriate translations to the  
100578 destination codeset.

- 100579 • The archive creator includes within the archive the character mapping table for the source
- 100580 codeset used to encode extended header records. The receiver must then read the
- 100581 character mapping table and perform the appropriate translations to the destination
- 100582 codeset.
- 100583 • The archive creator translates the extended header records in the source codeset into a
- 100584 canonical form. The receiver must then perform the appropriate translations to the
- 100585 destination codeset.

100586 The approach that incorporates the name of the source codeset poses the problem of codeset  
 100587 name registration, and makes the archive useless to *pax* archive decoders that do not recognize  
 100588 that codeset.

100589 Because parts of an archive may be corrupted, the standard developers felt that including the  
 100590 character map of the source codeset was too fragile. The loss of this one key component could  
 100591 result in making the entire archive useless. (The difference between this and the global extended  
 100592 header decision was that the latter has a workaround—duplicating extended header records on  
 100593 unreliable media—but this would be too burdensome for large character set maps.)

100594 Both of the above approaches also put an undue burden on the *pax* archive receiver to handle the  
 100595 cross-product of all source and destination codesets.

100596 To simplify the translation from the source codeset to the canonical form and from the canonical  
 100597 form to the destination codeset, the standard developers decided that the internal representation  
 100598 should be a stateless encoding. A stateless encoding is one where each codepoint has the same  
 100599 meaning, without regard to the decoder being in a specific state. An example of a stateful  
 100600 encoding would be the Japanese Shift-JIS; an example of a stateless encoding would be the  
 100601 ISO/IEC 646: 1991 standard (equivalent to 7-bit ASCII).

100602 For these reasons, the standard developers decided to adopt a canonical format for the  
 100603 representation of file information strings. The obvious, well-endorsed candidate is the  
 100604 ISO/IEC 10646-1: 2000 standard (based in part on Unicode), which can be used to represent  
 100605 the characters of virtually all standardized character sets. The standard developers initially agreed  
 100606 upon using UCS2 (16-bit Unicode) as the internal representation. This repertoire of characters  
 100607 provides a sufficiently rich set to represent all commonly-used codesets.

100608 However, the standard developers found that the 16-bit Unicode representation had some  
 100609 problems. It forced the issue of standardizing byte ordering. The 2-byte length of each character  
 100610 made the extended header records twice as long for the case of strings coded entirely from  
 100611 historical 7-bit ASCII. For these reasons, the standard developers chose the UTF-8 defined in the  
 100612 ISO/IEC 10646-1: 2000 standard. This multi-byte representation encodes UCS2 or UCS4  
 100613 characters reliably and deterministically, eliminating the need for a canonical byte ordering. In  
 100614 addition, NUL octets and other characters possibly confusing to POSIX file systems do not  
 100615 appear, except to represent themselves. It was realized that certain national codesets take up  
 100616 more space after the encoding, due to their placement within the UCS range; it was felt that the  
 100617 usefulness of the encoding of the names outweighs the disadvantage of size increase for file,  
 100618 user, and group names.

100619 The encoding of UTF-8 is as follows:

| 100620 | UCS4 Hex Encoding   | UTF-8 Binary Encoding                        |
|--------|---------------------|----------------------------------------------|
| 100621 | 00000000–0000007F   | 0xxxxxxx                                     |
| 100622 | 00000080–000007FF   | 110xxxxx 10xxxxxx                            |
| 100623 | 00000800–0000FFFF   | 1110xxxx 10xxxxxx 10xxxxxx                   |
| 100624 | 00010000–001FFFFFFF | 11110xxx 10xxxxxx 10xxxxxx 10xxxxxx          |
| 100625 | 00200000–03FFFFFFF  | 111110xx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx |

100626 04000000-7FFFFFFF 1111110x 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx  
 100627 where each 'x' represents a bit value from the character being translated.

#### 100628 **ustar Interchange Format**

100629 The description of the **ustar** format reflects numerous enhancements over pre-1988 versions of  
 100630 the historical *tar* utility. The goal of these changes was not only to provide the functional  
 100631 enhancements desired, but also to retain compatibility between new and old versions. This  
 100632 compatibility has been retained. Archives written using the old archive format are compatible  
 100633 with the new format.

100634 Implementors should be aware that the previous file format did not include a mechanism to  
 100635 archive directory type files. For this reason, the convention of using a filename ending with  
 100636 <slash> was adopted to specify a directory on the archive.

100637 The total size of the *name* and *prefix* fields have been set to meet the minimum requirements for  
 100638 {PATH\_MAX}. If a pathname will fit within the *name* field, it is recommended that the pathname  
 100639 be stored there without the use of the *prefix* field. Although the *name* field is known to be too  
 100640 small to contain {PATH\_MAX} characters, the value was not changed in this version of the  
 100641 archive file format to retain backwards-compatibility, and instead the *prefix* was introduced.  
 100642 Also, because of the earlier version of the format, there is no way to remove the restriction on the  
 100643 *linkname* field being limited in size to just that of the *name* field.

100644 The *size* field is required to be meaningful in all implementation extensions, although it could be  
 100645 zero. This is required so that the data blocks can always be properly counted.

100646 It is suggested that if device special files need to be represented that cannot be represented in the  
 100647 standard format, that one of the extension types (A-Z) be used, and that the additional  
 100648 information for the special file be represented as data and be reflected in the *size* field.

100649 Attempting to restore a special file type, where it is converted to ordinary data and conflicts with  
 100650 an existing filename, need not be specially detected by the utility. If run as an ordinary user, *pax*  
 100651 should not be able to overwrite the entries in, for example, */dev* in any case (whether the file is  
 100652 converted to another type or not). If run as a privileged user, it should be able to do so, and it  
 100653 would be considered a bug if it did not. The same is true of ordinary data files and similarly  
 100654 named special files; it is impossible to anticipate the needs of the user (who could really intend  
 100655 to overwrite the file), so the behavior should be predictable (and thus regular) and rely on the  
 100656 protection system as required.

100657 The value 7 in the *typeflag* field is intended to define how contiguous files can be stored in a  
 100658 **ustar** archive. POSIX.1-2008 does not require the contiguous file extension, but does define a  
 100659 standard way of archiving such files so that all conforming systems can interpret these file types  
 100660 in a meaningful and consistent manner. On a system that does not support extended file types,  
 100661 the *pax* utility should do the best it can with the file and go on to the next.

100662 The file protection modes are those conventionally used by the *ls* utility. This is extended beyond  
 100663 the usage in the ISO POSIX-2 standard to support the "shared text" or "sticky" bit. It is intended  
 100664 that the conformance document should not document anything beyond the existence of and  
 100665 support of such a mode. Further extensions are expected to these bits, particularly with  
 100666 overloading the set-user-ID and set-group-ID flags.

100667 **cpio Interchange Format**

100668 The reference to appropriate privileges in the **cpio** format refers to an error on standard output;  
100669 the **ustar** format does not make comparable statements.

100670 The model for this format was the historical System V *cpio-c* data interchange format. This  
100671 model documents the portable version of the **cpio** format and not the binary version. It has the  
100672 flexibility to transfer data of any type described within POSIX.1-2008, yet is extensible to transfer  
100673 data types specific to extensions beyond POSIX.1-2008 (for example, contiguous files). Because it  
100674 describes existing practice, there is no question of maintaining upwards-compatibility.

100675 **cpio Header**

100676 There has been some concern that the size of the *c\_ino* field of the header is too small to handle  
100677 those systems that have very large *inode* numbers. However, the *c\_ino* field in the header is used  
100678 strictly as a hard-link resolution mechanism for archives. It is not necessarily the same value as  
100679 the *inode* number of the file in the location from which that file is extracted.

100680 The name *c\_magic* is based on historical usage.

100681 **cpio Filename**

100682 For most historical implementations of the *cpio* utility, {PATH\_MAX} octets can be used to  
100683 describe the pathname without the addition of any other header fields (the NUL character  
100684 would be included in this count). {PATH\_MAX} is the minimum value for pathname size,  
100685 documented as 256 bytes. However, an implementation may use *c\_namesize* to determine the  
100686 exact length of the pathname. With the current description of the **<cpio.h>** header, this  
100687 pathname size can be as large as a number that is described in six octal digits.

100688 Two values are documented under the *c\_mode* field values to provide for extensibility for known  
100689 file types:

100690 **0110 000** Reserved for contiguous files. The implementation may treat the rest of the  
100691 information for this archive like a regular file. If this file type is undefined, the  
100692 implementation may create the file as a regular file.

100693 This provides for extensibility of the **cpio** format while allowing for the ability to read old  
100694 archives. Files of an unknown type may be read as “regular files” on some implementations. On  
100695 a system that does not support extended file types, the *pax* utility should do the best it can with  
100696 the file and go on to the next.

100697 **FUTURE DIRECTIONS**

100698 None.

100699 **SEE ALSO**

100700 Chapter 2 (on page 2297), *cp*, *ed*, *getopts*, *ls*, *printf*

100702 (on page 215), **<cpio.h>**

100703 XSH *chown()*, *creat()*, *fstatat()*, *mkdir()*, *mkfifo()*, *utime()*, *write()*

100704 **CHANGE HISTORY**

100705 First released in Issue 4.

100706 **Issue 5**

100707 A note is added to the APPLICATION USAGE indicating that the **cpio** and **tar** formats can only  
 100708 support files up to 8 gigabytes in size.

100709 **Issue 6**

100710 The *pax* utility is aligned with the IEEE P1003.2b draft standard:

- 100711 • Support has been added for symbolic links in the options and interchange formats.
- 100712 • A new format has been devised, based on extensions to **ustar**.
- 100713 • References to the “extended” **tar** and **cpio** formats derived from the POSIX.1-1990  
 100714 standard have been changed to remove the “extended” adjective because this could cause  
 100715 confusion with the extended *tar* header added in this version. (All references to *tar* are  
 100716 actually to **ustar**.)

100717 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

100718 IEEE PASC Interpretation 1003.2 #168 is applied, clarifying that *mkdir()* and *mkfifo()* calls can  
 100719 ignore an [EEXIST] error when extracting an archive.

100720 IEEE PASC Interpretation 1003.2 #180 is applied, clarifying how extracted files are created when  
 100721 in **read** mode.

100722 IEEE PASC Interpretation 1003.2 #181 is applied, clarifying the description of the **-t** option.

100723 IEEE PASC Interpretation 1003.2 #195 is applied.

100724 IEEE PASC Interpretation 1003.2 #206 is applied, clarifying the handling of links for the **-H**, **-L**,  
 100725 and **-I** options.

100726 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/35 is applied, adding the process ID of  
 100727 the *pax* process into certain fields. This change provides a method for the implementation to  
 100728 ensure that different instances of *pax* extracting a file named */a/b/foo* will not collide when  
 100729 processing the extended header information associated with **foo**.

100730 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/36 is applied, changing **-x B** to **-x pax** in  
 100731 the OPTIONS section.

100732 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/20 is applied, updating the SYNOPSIS to  
 100733 be consistent with the normative text.

100734 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/21 is applied, updating the  
 100735 DESCRIPTION to describe the behavior when files to be linked are symbolic links and the  
 100736 system is not capable of making hard links to symbolic links.

100737 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/22 is applied, updating the OPTIONS  
 100738 section to describe the behavior for how multiple **-odelete=pattern** options are to be handled.

100739 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/23 is applied, updating the **write** option  
 100740 within the OPTIONS section.

100741 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/24 is applied, adding a paragraph into  
 100742 the OPTIONS section that states that specifying more than one of the mutually-exclusive options  
 100743 (**-H** and **-L**) is not considered an error and that the last option specified will determine the  
 100744 behavior of the utility.

100745 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/25 is applied, removing the *ctime*  
 100746 paragraph within the EXTENDED DESCRIPTION. There is a contradiction in the definition of  
 100747 the *ctime* keyword for the *pax* extended header, in that the *st\_ctime* member of the **stat** structure  
 100748 does not refer to a file creation time. No field in the standard **stat** structure from **<sys/stat.h>**

- 100749 includes a file creation time.
- 100750 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/26 is applied, making it clear that *typeflag*
- 100751 1 (**ustar** Interchange Format) applies not only to files that are hard-linked, but also to files that
- 100752 are aliased via symbolic links.
- 100753 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/27 is applied, clarifying the *cpio c\_nlink*
- 100754 field.
- 100755 **Issue 7**
- 100756 Austin Group Interpretations 1003.1-2001 #011, #036, #086, and #109 are applied.
- 100757 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the
- 100758 *LC\_MESSAGES* environment variable.
- 100759 SD5-XCU-ERN-2 is applied, making *-c* and *-n* mutually-exclusive in the SYNOPSIS.
- 100760 SD5-XCU-ERN-3 is applied, revising the default behavior of *-H* and *-L*.
- 100761 SD5-XCU-ERN-5, SD5-XCU-ERN-6, SD5-XCU-ERN-7, SD5-XCU-ERN-60 are applied.
- 100762 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 100763 The *pax* utility is no longer allowed to create separate identical symbolic links when extracting
- 100764 linked symbolic links from an archive.

## 100765 NAME

100766 pr — print files

## 100767 SYNOPSIS

100768 pr [+page] [-column] [-adFmrt] [-e[char][gap]] [-h header] [-i[char][gap]]  
 100769 xSI [-l lines] [-n[char][width]] [-o offset] [-s[char]] [-w width] [-fp]  
 100770 [file...]

## 100771 DESCRIPTION

100772 The *pr* utility is a printing and pagination filter. If multiple input files are specified, each shall be  
 100773 read, formatted, and written to standard output. By default, the input shall be separated into  
 100774 66-line pages, each with:

- 100775 • A 5-line header that includes the page number, date, time, and the pathname of the file
- 100776 • A 5-line trailer consisting of blank lines

100777 If standard output is associated with a terminal, diagnostic messages shall be deferred until the  
 100778 *pr* utility has completed processing.

100779 When options specifying multi-column output are specified, output text columns shall be of  
 100780 equal width; input lines that do not fit into a text column shall be truncated. By default, text  
 100781 columns shall be separated with at least one <blank>.

## 100782 OPTIONS

100783 The *pr* utility shall conform to XBD Section 12.2 (on page 215), except that: the *page* option has a  
 100784 '+' delimiter; *page* and *column* can be multi-digit numbers; some of the option-arguments are  
 100785 optional; and some of the option-arguments cannot be specified as separate arguments from the  
 100786 preceding option letter. In particular, the *rs* option does not allow the option letter to be  
 100787 separated from its argument, and the options *-e*, *-i*, and *-n* require that both arguments, if  
 100788 present, not be separated from the option letter.

100789 The following options shall be supported. In the following option descriptions, *column*, *lines*,  
 100790 *offset*, *page*, and *width* are positive decimal integers; *gap* is a non-negative decimal integer.

100791 *+page* Begin output at page number *page* of the formatted input.

100792 *-column* Produce multi-column output that is arranged in *column* columns (the default shall  
 100793 be 1) and is written down each column in the order in which the text is received  
 100794 from the input file. This option should not be used with *-m*. The options *-e* and *-i*  
 100795 shall be assumed for multiple text-column output. Whether or not text columns are  
 100796 produced with identical vertical lengths is unspecified, but a text column shall  
 100797 never exceed the length of the page (see the *-l* option). When used with *-t*, use the  
 100798 minimum number of lines to write the output.

100799 *-a* Modify the effect of the *-column* option so that the columns are filled across the  
 100800 page in a round-robin order (for example, when *column* is 2, the first input line  
 100801 heads column 1, the second heads column 2, the third is the second line in column  
 100802 1, and so on).

100803 *-d* Produce output that is double-spaced; append an extra <newline> following every  
 100804 <newline> found in the input.

100805 *-e[char][gap]*

100806 Expand each input <tab> to the next greater column position specified by the  
 100807 formula  $n*gap+1$ , where *n* is an integer > 0. If *gap* is zero or is omitted, it shall  
 100808 default to 8. All <tab> characters in the input shall be expanded into the  
 100809 appropriate number of <space> characters. If any non-digit character, *char*, is  
 100810 specified, it shall be used as the input <tab>. If the first character of the *-e* option-

|        |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 100811 |     | argument is a digit, the entire option-argument shall be assumed to be <i>gap</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 100812 | XSI | <b>-f</b> Use a <form-feed> for new pages, instead of the default behavior that uses a sequence of <newline> characters. Pause before beginning the first page if the standard output is associated with a terminal.                                                                                                                                                                                                                                                                                                                                                              |

| 100827 |     | <b>-m</b> Merge files. Standard output shall be formatted so the <i>pr</i> utility writes one line from each file specified by a <i>file</i> operand, side by side into text columns of equal fixed widths, in terms of the number of column positions. Implementations shall support merging of at least nine <i>file</i> operands.                                                                                                                                                                                                                                              |

| 100831 |     | <b>-n[<i>char</i>][<i>width</i>]</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 100832 |     | Provide <i>width</i> -digit line numbering (default for <i>width</i> shall be 5). The number shall occupy the first <i>width</i> column positions of each text column of default output or each line of <b>-m</b> output. If <i>char</i> (any non-digit character) is given, it shall be appended to the line number to separate it from whatever follows (default for <i>char</i> is a <tab>).                                                                                                                                                                                   |
| 100833 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 100852 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 100853 |     | For single column output, input lines shall not be truncated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 100854 OPERANDS

100855 The following operand shall be supported:

100856 *file* A pathname of a file to be written. If no *file* operands are specified, or if a *file*  
100857 operand is ' - ', the standard input shall be used.

## 100858 STDIN

100859 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '  
100860 See the INPUT FILES section.

## 100861 INPUT FILES

100862 The input files shall be text files.

100863 The file */dev/tty* shall be used to read responses required by the *-p* option.

## 100864 ENVIRONMENT VARIABLES

100865 The following environment variables shall affect the execution of *pr*:

100866 *LANG* Provide a default value for the internationalization variables that are unset or null.  
100867 (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
100868 used to determine the values of locale categories.)

100869 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
100870 internationalization variables.

100871 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
100872 characters (for example, single-byte as opposed to multi-byte characters in  
100873 arguments and input files) and which characters are defined as printable (character  
100874 class **print**). Non-printable characters are still written to standard output, but are  
100875 not counted for the purpose for column-width and line-length calculations.

100876 *LC\_MESSAGES*

100877 Determine the locale that should be used to affect the format and contents of  
100878 diagnostic messages written to standard error.

100879 *LC\_TIME* Determine the format of the date and time for use in writing header lines.

100880 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

100881 *TZ* Determine the timezone used to calculate date and time strings written in header  
100882 lines. If *TZ* is unset or null, an unspecified default timezone shall be used.

## 100883 ASYNCHRONOUS EVENTS

100884 If *pr* receives an interrupt while writing to a terminal, it shall flush all accumulated error  
100885 messages to the screen before terminating.

## 100886 STDOUT

100887 The *pr* utility output shall be a paginated version of the original file (or files). This pagination  
100888 shall be accomplished using either *<form-feed>* characters or a sequence of *<newline>*  
100889 XSI characters, as controlled by the *-F* or *-f* option. Page headers shall be generated unless the *-t*  
100890 option is specified. The page headers shall be of the form:

100891 "\n\n%s %s Page %d\n\n\n", *<output of date>*, *<file>*, *<page number>*

100892 In the POSIX locale, the *<output of date>* field, representing the date and time of last modification  
100893 of the input file (or the current date and time if the input file is standard input), shall be  
100894 equivalent to the output of the following command as it would appear if executed at the given  
100895 time:

100896 date "+%b %e %H:%M %Y"

- 100897 without the trailing <newline>, if the page being written is from standard input. If the page  
 100898 being written is not from standard input, in the POSIX locale, the same format shall be used, but  
 100899 the time used shall be the modification time of the file corresponding to *file* instead of the current  
 100900 time. When the *LC\_TIME* locale category is not set to the POSIX locale, a different format and  
 100901 order of presentation of this field may be used.
- 100902 If the standard input is used instead of a *file* operand, the <*file*> field shall be replaced by a null  
 100903 string.
- 100904 If the **-h** option is specified, the <*file*> field shall be replaced by the *header* argument.
- 100905 **STDERR**
- 100906 The standard error shall be used for diagnostic messages and for alerting the terminal when **-p**  
 100907 is specified.
- 100908 **OUTPUT FILES**
- 100909 None.
- 100910 **EXTENDED DESCRIPTION**
- 100911 None.
- 100912 **EXIT STATUS**
- 100913 The following exit values shall be returned:
- 100914 0 Successful completion.
- 100915 >0 An error occurred.
- 100916 **CONSEQUENCES OF ERRORS**
- 100917 Default.
- 100918 **APPLICATION USAGE**
- 100919 A conforming application must protect its first operand, if it starts with a <plus-sign>, by  
 100920 preceding it with the "--" argument that denotes the end of the options. For example, *pr+x*  
 100921 could be interpreted as an invalid page number or a *file* operand.
- 100922 **EXAMPLES**
- 100923 1. Print a numbered list of all files in the current directory:
- 100924 `ls -a | pr -n -h "Files in $(pwd)."`
- 100925 2. Print **file1** and **file2** as a double-spaced, three-column listing headed by "file list":
- 100926 `pr -3d -h "file list" file1 file2`
- 100927 3. Write **file1** on **file2**, expanding tabs to columns 10, 19, 28, ...:
- 100928 `pr -e9 -t <file1 >file2`
- 100929 **RATIONALE**
- 100930 This utility is one of those that does not follow the Utility Syntax Guidelines because of its  
 100931 historical origins. The standard developers could have added new options that obeyed the  
 100932 guidelines (and marked the old options obsolescent) or devised an entirely new utility; there are  
 100933 examples of both actions in this volume of POSIX.1-2008. Because of its widespread use by  
 100934 historical applications, the standard developers decided to exempt this version of *pr* from many  
 100935 of the guidelines.
- 100936 Implementations are required to accept option-arguments to the **-h**, **-l**, **-o**, and **-w** options  
 100937 whether presented as part of the same argument or as a separate argument to *pr*, as suggested by  
 100938 the Utility Syntax Guidelines. The **-n** and **-s** options, however, are specified as in historical

- 100939 practice because they are frequently specified without their optional arguments. If a <blank>  
 100940 were allowed before the option-argument in these cases, a *file* operand could mistakenly be  
 100941 interpreted as an option-argument in historical applications.
- 100942 The text about the minimum number of lines in multi-column output was included to ensure  
 100943 that a best effort is made in balancing the length of the columns. There are known historical  
 100944 implementations in which, for example, 60-line files are listed by *pr -2* as one column of 56 lines  
 100945 and a second of 4. Although this is not a problem when a full page with headers and trailers is  
 100946 produced, it would be relatively useless when used with *-t*.
- 100947 Historical implementations of the *pr* utility have differed in the action taken for the *-f* option.  
 100948 BSD uses it as described here for the *-F* option; System V uses it to change trailing <newline>  
 100949 characters on each page to a <form-feed> and, if standard output is a TTY device, sends an  
 100950 <alert> to standard error and reads a line from */dev/tty* before the first page. There were strong  
 100951 arguments from both sides of this issue concerning historical practice and as a result the *-F*  
 100952 option was added. XSI-conformant systems support the System V historical actions for the *-f*  
 100953 option.
- 100954 The <*output of date*> field in the *-l* format is specified only for the POSIX locale. As noted, the  
 100955 format can be different in other locales. No mechanism for defining this is present in this volume  
 100956 of POSIX.1-2008, as the appropriate vehicle is a message catalog; that is, the format should be  
 100957 specified as a “message”.
- 100958 **FUTURE DIRECTIONS**
- 100959 None.
- 100960 **SEE ALSO**
- 100961 *expand*, *lp*
- 100962 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)
- 100963 **CHANGE HISTORY**
- 100964 First released in Issue 2.
- 100965 **Issue 6**
- 100966 The following new requirements on POSIX implementations derive from alignment with the  
 100967 Single UNIX Specification:
- 100968 • The *-p* option is added.
- 100969 The normative text is reworded to avoid use of the term “must” for application requirements.
- 100970 **Issue 7**
- 100971 PASC Interpretation 1003.2-92 #151 (SD5-XCU-ERN-44) is applied.
- 100972 Austin Group Interpretation 1003.1-2001 #093 is applied.
- 100973 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100974 **NAME**

100975 printf — write formatted output

100976 **SYNOPSIS**100977 printf *format* [*argument...*]100978 **DESCRIPTION**100979 The *printf* utility shall write formatted operands to the standard output. The *argument* operands  
100980 shall be formatted under control of the *format* operand.100981 **OPTIONS**

100982 None.

100983 **OPERANDS**

100984 The following operands shall be supported:

100985 *format* A string describing the format to use to write the remaining operands. See the  
100986 EXTENDED DESCRIPTION section.100987 *argument* The strings to be written to standard output, under the control of *format*. See the  
100988 EXTENDED DESCRIPTION section.100989 **STDIN**

100990 Not used.

100991 **INPUT FILES**

100992 None.

100993 **ENVIRONMENT VARIABLES**100994 The following environment variables shall affect the execution of *printf*:100995 *LANG* Provide a default value for the internationalization variables that are unset or null.  
100996 (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
100997 used to determine the values of locale categories.)100998 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
100999 internationalization variables.101000 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
101001 characters (for example, single-byte as opposed to multi-byte characters in  
101002 arguments).101003 *LC\_MESSAGES*  
101004 Determine the locale that should be used to affect the format and contents of  
101005 diagnostic messages written to standard error.101006 *LC\_NUMERIC*  
101007 Determine the locale for numeric formatting. It shall affect the format of numbers  
101008 written using the *e*, *E*, *f*, *g*, and *G* conversion specifier characters (if supported).101009 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.101010 **ASYNCHRONOUS EVENTS**

101011 Default.

101012 **STDOUT**

101013 See the EXTENDED DESCRIPTION section.

**printf**101014 **STDERR**

101015 The standard error shall be used only for diagnostic messages.

101016 **OUTPUT FILES**

101017 None.

101018 **EXTENDED DESCRIPTION**

101019 The *format* operand shall be used as the *format* string described in XBD Chapter 5 (on page 121)  
101020 with the following exceptions:

- 101021 1. A <space> in the format string, in any context other than a flag of a conversion  
101022 specification, shall be treated as an ordinary character that is copied to the output.
- 101023 2. A 'Δ' character in the format string shall be treated as a 'Δ' character, not as a <space>.
- 101024 3. In addition to the escape sequences shown in XBD Chapter 5 (on page 121) ('\\', '\a',  
101025 '\b', '\f', '\n', '\r', '\t', '\v'), "\ddd", where *ddd* is a one, two, or three-digit  
101026 octal number, shall be written as a byte with the numeric value specified by the octal  
101027 number.
- 101028 4. The implementation shall not precede or follow output from the *d* or *u* conversion  
101029 specifiers with <blank> characters not specified by the *format* operand.
- 101030 5. The implementation shall not precede output from the *o* conversion specifier with zeros  
101031 not specified by the *format* operand.
- 101032 6. The *a*, *A*, *e*, *E*, *f*, *F*, *g*, and *G* conversion specifiers need not be supported.
- 101033 7. An additional conversion specifier character, *b*, shall be supported as follows. The  
101034 argument shall be taken to be a string that may contain <backslash>-escape sequences.  
101035 The following <backslash>-escape sequences shall be supported:
  - 101036 — The escape sequences listed in XBD Chapter 5 (on page 121) ('\\', '\a', '\b',  
101037 '\f', '\n', '\r', '\t', '\v'), which shall be converted to the characters they  
101038 represent
  - 101039 — "\0ddd", where *ddd* is a zero, one, two, or three-digit octal number that shall be  
101040 converted to a byte with the numeric value specified by the octal number
  - 101041 — '\c', which shall not be written and shall cause *printf* to ignore any remaining  
101042 characters in the string operand containing it, any remaining string operands, and  
101043 any additional characters in the *format* operand
- 101044 The interpretation of a <backslash> followed by any other sequence of characters is  
101045 unspecified.
- 101046 Bytes from the converted string shall be written until the end of the string or the number  
101047 of bytes indicated by the precision specification is reached. If the precision is omitted, it  
101048 shall be taken to be infinite, so all bytes up to the end of the converted string shall be  
101049 written.
- 101050 8. For each conversion specification that consumes an argument, the next argument operand  
101051 shall be evaluated and converted to the appropriate type for the conversion as specified  
101052 below.
- 101053 9. The *format* operand shall be reused as often as necessary to satisfy the argument  
101054 operands. Any extra *c* or *s* conversion specifiers shall be evaluated as if a null string  
101055 argument were supplied; other extra conversion specifications shall be evaluated as if a  
101056 zero argument were supplied. If the *format* operand contains no conversion specifications  
101057 and *argument* operands are present, the results are unspecified.

- 101058 10. If a character sequence in the *format* operand begins with a '%' character, but does not  
101059 form a valid conversion specification, the behavior is unspecified.
- 101060 11. The argument to the *c* conversion specifier can be a string containing zero or more bytes.  
101061 If it contains one or more bytes, the first byte shall be written and any additional bytes  
101062 shall be ignored. If the argument is an empty string, it is unspecified whether nothing is  
101063 written or a null byte is written.

101064 The *argument* operands shall be treated as strings if the corresponding conversion specifier is *b*,  
101065 *c*, or *s*, and shall be evaluated as if by the *strtod()* function if the corresponding conversion  
101066 specifier is *a*, *A*, *e*, *E*, *f*, *F*, *g*, or *G*. Otherwise, they shall be evaluated as unsuffixed C integer  
101067 constants, as described by the ISO C standard, with the following extensions:

- 101068 • A leading <plus-sign> or minus-sign shall be allowed.
- 101069 • If the leading character is a single-quote or double-quote, the value shall be the numeric  
101070 value in the underlying codeset of the character following the single-quote or double-  
101071 quote.
- 101072 • Suffixed integer constants may be allowed.

101073 If an argument operand cannot be completely converted into an internal value appropriate to  
101074 the corresponding conversion specification, a diagnostic message shall be written to standard  
101075 error and the utility shall not exit with a zero exit status, but shall continue processing any  
101076 remaining operands and shall write the value accumulated at the time the error was detected to  
101077 standard output.

101078 It is not considered an error if an argument operand is not completely used for a *c* or *s*  
101079 conversion.

#### 101080 EXIT STATUS

101081 The following exit values shall be returned:

- 101082 0 Successful completion.
- 101083 >0 An error occurred.

#### 101084 CONSEQUENCES OF ERRORS

101085 Default.

#### 101086 APPLICATION USAGE

101087 The floating-point formatting conversion specifications of *printf()* are not required because all  
101088 arithmetic in the shell is integer arithmetic. The *awk* utility performs floating-point calculations  
101089 and provides its own **printf** function. The *bc* utility can perform arbitrary-precision floating-  
101090 point arithmetic, but does not provide extensive formatting capabilities. (This *printf* utility  
101091 cannot really be used to format *bc* output; it does not support arbitrary precision.)  
101092 Implementations are encouraged to support the floating-point conversions as an extension.

101093 Note that this *printf* utility, like the *printf()* function defined in the System Interfaces volume of  
101094 POSIX.1-2008 on which it is based, makes no special provision for dealing with multi-byte  
101095 characters when using the *%c* conversion specification or when a precision is specified in a *%b* or  
101096 *%s* conversion specification. Applications should be extremely cautious using either of these  
101097 features when there are multi-byte characters in the character set.

101098 No provision is made in this volume of POSIX.1-2008 which allows field widths and precisions  
101099 to be specified as '\*' since the '\*' can be replaced directly in the *format* operand using shell  
101100 variable substitution. Implementations can also provide this feature as an extension if they so  
101101 choose.

**printf**

101102 Hexadecimal character constants as defined in the ISO C standard are not recognized in the  
 101103 *format* operand because there is no consistent way to detect the end of the constant. Octal  
 101104 character constants are limited to, at most, three octal digits, but hexadecimal character constants  
 101105 are only terminated by a non-hex-digit character. In the ISO C standard, the "##" concatenation  
 101106 operator can be used to terminate a constant and follow it with a hexadecimal character to be  
 101107 written. In the shell, concatenation occurs before the *printf* utility has a chance to parse the end  
 101108 of the hexadecimal constant.

101109 The %b conversion specification is not part of the ISO C standard; it has been added here as a  
 101110 portable way to process <backslash>-escapes expanded in string operands as provided by the  
 101111 *echo* utility. See also the APPLICATION USAGE section of *echo* (on page 2615) for ways to use  
 101112 *printf* as a replacement for all of the traditional versions of the *echo* utility.

101113 If an argument cannot be parsed correctly for the corresponding conversion specification, the  
 101114 *printf* utility is required to report an error. Thus, overflow and extraneous characters at the end  
 101115 of an argument being used for a numeric conversion shall be reported as errors.

**EXAMPLES**

101116 To alert the user and then print and read a series of prompts:

```
101118 printf "\aPlease fill in the following: \nName: "
101119 read name
101120 printf "Phone number: "
101121 read phone
```

101122 To read out a list of right and wrong answers from a file, calculate the percentage correctly, and  
 101123 print them out. The numbers are right-justified and separated by a single <tab>. The percentage  
 101124 is written to one decimal place of accuracy:

```
101125 while read right wrong ; do
101126     percent=$(echo "scale=1; ($right*100)/($right+$wrong)" | bc)
101127     printf "%2d right\t%2d wrong\t(%s%%)\n" \
101128         $right $wrong $percent
101129 done < database_file
```

101130 The command:

```
101131 printf "%5d%4d\n" 1 21 321 4321 54321
```

101132 produces:

```
101133     1  21
101134    321 4321
101135   54321  0
```

101136 Note that the *format* operand is used three times to print all of the given strings and that a '0'  
 101137 was supplied by *printf* to satisfy the last %4d conversion specification.

101138 The *printf* utility is required to notify the user when conversion errors are detected while  
 101139 producing numeric output; thus, the following results would be expected on an implementation  
 101140 with 32-bit twos-complement integers when %d is specified as the *format* operand:

| Argument    | Standard Output | Diagnostic Output                                |
|-------------|-----------------|--------------------------------------------------|
| 5a          | 5               | <b>printf: "5a" not completely converted</b>     |
| 9999999999  | 2147483647      | <b>printf: "9999999999" arithmetic overflow</b>  |
| -9999999999 | -2147483648     | <b>printf: "-9999999999" arithmetic overflow</b> |
| ABC         | 0               | <b>printf: "ABC" expected numeric value</b>      |

The diagnostic message format is not specified, but these examples convey the type of information that should be reported. Note that the value shown on standard output is what would be expected as the return value from the `strtol()` function as defined in the System Interfaces volume of POSIX.1-2008. A similar correspondence exists between `%u` and `strtoul()` and `%e`, `%f`, and `%g` (if the implementation supports floating-point conversions) and `strtod()`.

In a locale using the ISO/IEC 646:1991 standard as the underlying codeset, the command:

```
printf "%d\n" 3 +3 -3 \'3 \' +3 "'-3"
```

produces:

3 Numeric value of constant 3

3 Numeric value of constant 3

-3 Numeric value of constant -3

51 Numeric value of the character '3' in the ISO/IEC 646:1991 standard codeset

43 Numeric value of the character '+' in the ISO/IEC 646:1991 standard codeset

45 Numeric value of the character '-' in the ISO/IEC 646:1991 standard codeset

Note that in a locale with multi-byte characters, the value of a character is intended to be the value of the equivalent of the `wchar_t` representation of the character as described in the System Interfaces volume of POSIX.1-2008.

#### RATIONALE

The `printf` utility was added to provide functionality that has historically been provided by `echo`. However, due to irreconcilable differences in the various versions of `echo` extant, the version has few special features, leaving those to this new `printf` utility, which is based on one in the Ninth Edition system.

The EXTENDED DESCRIPTION section almost exactly matches the `printf()` function in the ISO C standard, although it is described in terms of the file format notation in XBD Chapter 5 (on page 121).

Earlier versions of this standard specified that arguments for all conversions other than `b`, `c`, and `s` were evaluated in the same way (as C constants, but with stated exceptions). For implementations supporting the floating-point conversions it was not clear whether integer conversions need only accept integer constants and floating-point conversions need only accept floating-point constants, or whether both types of conversions should accept both types of constants. Also by not distinguishing between them, the requirement relating to a leading single-quote or double-quote applied to floating-point conversions even though this provided no useful functionality to applications that was not already available through the integer conversions. The current standard clarifies the situation by specifying that the arguments for floating-point conversions are evaluated as if by `strtod()`, and the arguments for integer conversions are evaluated as C integer constants, with the special treatment of leading single-quote and double-quote applying only to integer conversions.

101195 **NAME**101196            *prs* — print an SCCS file (**DEVELOPMENT**)101197 **SYNOPSIS**

```

101198 XSI        prs [-a] [-d dataspec] [-r[SID]] file...
101199            prs [-e|-l] -c cutoff [-d dataspec] file...
101200            prs [-e|-l] -r[SID] [-d dataspec] file...

```

101201 **DESCRIPTION**

101202            The *prs* utility shall write to standard output parts or all of an SCCS file in a user-supplied  
 101203            format.

101204 **OPTIONS**

101205            The *prs* utility shall conform to XBD [Section 12.2](#) (on page 215), except that the *-r* option has an  
 101206            optional option-argument. This optional option-argument cannot be presented as a separate  
 101207            argument. The following options shall be supported:

101208            *-d dataspec*    Specify the output data specification. The *dataspec* shall be a string consisting of  
 101209            SCCS file *data keywords* (see [Data Keywords](#), on page 3056) interspersed with  
 101210            optional user-supplied text.

101211            *-r[SID]*            Specify the SCCS identification string (*SID*) of a delta for which information is  
 101212            desired. If no *SID* option-argument is specified, the *SID* of the most recently  
 101213            created delta shall be assumed.

101214            *-e*                    Request information for all deltas created earlier than and including the delta  
 101215            designated via the *-r* option or the date-time given by the *-c* option.

101216            *-l*                    Request information for all deltas created later than and including the delta  
 101217            designated via the *-r* option or the date-time given by the *-c* option.

101218            *-c cutoff*            Indicate the *cutoff* date-time, in the form:

101219            *YY[MM[DD[HH[MM[SS]]]]]*

101220            For the *YY* component, values in the range [69,99] shall refer to years 1969 to 1999  
 101221            inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.

101222            **Note:**            It is expected that in a future version of this standard the default century inferred  
 101223            from a 2-digit year will change. (This would apply to all commands accepting a  
 101224            2-digit year as input.)

101225            No changes (deltas) to the SCCS file that were created after the specified *cutoff*  
 101226            date-time shall be included in the output. Units omitted from the date-time default  
 101227            to their maximum possible values; for example, *-c 7502* is equivalent to  
 101228            *-c 750228235959*.

101229            *-a*                    Request writing of information for both removed—that is, *delta type=R* (see  
 101230            *rmDEL*)—and existing—that is, *delta type=D*,—deltas. If the *-a* option is not  
 101231            specified, information for existing deltas only shall be provided.

101232 **OPERANDS**

101233            The following operand shall be supported:

101234            *file*                A pathname of an existing SCCS file or a directory. If *file* is a directory, the *prs*  
 101235            utility shall behave as though each file in the directory were specified as a named  
 101236            file, except that non-SCCS files (last component of the pathname does not begin  
 101237            with *s.*) and unreadable files shall be silently ignored.

- 101238 If exactly one *file* operand appears, and it is *'-'*, the standard input shall be read;  
 101239 each line of the standard input shall be taken to be the name of an SCCS file to be  
 101240 processed. Non-SCCS files and unreadable files shall be silently ignored.
- 101241 **STDIN**
- 101242 The standard input shall be a text file used only when the *file* operand is specified as *'-'*. Each  
 101243 line of the text file shall be interpreted as an SCCS pathname.
- 101244 **INPUT FILES**
- 101245 Any SCCS files displayed are files of an unspecified format.
- 101246 **ENVIRONMENT VARIABLES**
- 101247 The following environment variables shall affect the execution of *prs*:
- 101248 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 101249 (See XBD Section 8.2 (on page 174) the precedence of internationalization variables  
 101250 used to determine the values of locale categories.)
- 101251 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 101252 internationalization variables.
- 101253 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 101254 characters (for example, single-byte as opposed to multi-byte characters in  
 101255 arguments and input files).
- 101256 *LC\_MESSAGES*  
 101257 Determine the locale that should be used to affect the format and contents of  
 101258 diagnostic messages written to standard error.
- 101259 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 101260 **ASYNCHRONOUS EVENTS**
- 101261 Default.
- 101262 **STDOUT**
- 101263 The standard output shall be a text file whose format is dependent on the data keywords  
 101264 specified with the *-d* option.
- 101265 **Data Keywords**
- 101266 Data keywords specify which parts of an SCCS file shall be retrieved and output. All parts of an  
 101267 SCCS file have an associated data keyword. A data keyword may appear in a *dataspec* multiple  
 101268 times.
- 101269 The information written by *prs* shall consist of:
- 101270 1. The user-supplied text
- 101271 2. Appropriate values (extracted from the SCCS file) substituted for the recognized data  
 101272 keywords in the order of appearance in the *dataspec*
- 101273 The format of a data keyword value shall either be simple (*'S'*), in which keyword substitution  
 101274 is direct, or multi-line (*'M'*).
- 101275 User-supplied text shall be any text other than recognized data keywords. A <tab> shall be  
 101276 specified by *'\t'* and <newline> by *'\n'*. When the *-r* option is not specified, the default  
 101277 *dataspec* shall be:
- 101278 :PN: :\n\n
- 101279 and the following *dataspec* shall be used for each selected delta:
