 55785 indicates end-of-directory; otherwise, an error.

55786 Routines to deal with this problem more directly were proposed:

```

55787 int derror (dirp)
55788 DIR *dirp;

55789 void clearderr (dirp)
55790 DIR *dirp;

```

55791 The first would indicate whether an error had occurred, and the second would clear the error  
 55792 indication. The simpler method involving *errno* was adopted instead by requiring that *readdir()*  
 55793 not change *errno* when end-of-directory is encountered.

55794 An error or signal indicating that a directory has changed while open was considered but  
 55795 rejected.

55796 The thread-safe version of the directory reading function returns values in a user-supplied buffer  
 55797 instead of possibly using a static data area that may be overwritten by each call. Either the  
 55798 {NAME\_MAX} compile-time constant or the corresponding *pathconf()* option can be used to  
 55799 determine the maximum sizes of returned pathnames.

#### 55800 FUTURE DIRECTIONS

55801 None.

#### 55802 SEE ALSO

55803 *closedir()*, *dirfd()*, *exec*, *fdopendir()*, *fstatat()*, *rewinddir()*, *symlink()*

55804 XBD `<dirent.h>`, `<sys/types.h>`

#### 55805 CHANGE HISTORY

55806 First released in Issue 2.

#### 55807 Issue 5

55808 Large File Summit extensions are added.

55809 The *readdir\_r()* function is included for alignment with the POSIX Threads Extension.

55810 A note indicating that the *readdir()* function need not be reentrant is added to the  
 55811 DESCRIPTION.

#### 55812 Issue 6

55813 The *readdir\_r()* function is marked as part of the Thread-Safe Functions option.

55814 The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir\_r()*.

55815 The Open Group Corrigendum U026/8 is applied, clarifying the wording of the successful  
 55816 return for the *readdir\_r()* function.

55817 The following new requirements on POSIX implementations derive from alignment with the  
 55818 Single UNIX Specification:

- 55819 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
 55820 required for conforming implementations of previous POSIX specifications, it was not  
 55821 required for UNIX applications.
- 55822 • A statement is added to the DESCRIPTION indicating the disposition of certain fields in  
 55823 **struct dirent** when an entry refers to a symbolic link.
- 55824 • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
 55825 files.
- 55826 • The [ENOENT] optional error condition is added.

55827 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
 55828 its avoidance of possibly using a static data area.

55829 The **restrict** keyword is added to the *readdir\_r()* prototype for alignment with the  
 55830 ISO/IEC 9899:1999 standard.

55831 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/50 is applied, replacing the EXAMPLES  
 55832 section with a new example.

#### 55833 Issue 7

55834 Austin Group Interpretation 1003.1-2001 #059 is applied, updating the ERRORS section.

55835 Austin Group Interpretation 1003.1-2001 #156 is applied.

55836 The *readdir\_r()* function is moved from the Thread-Safe Functions option to the Base.

**readdir()**

- 55837 Changes are made related to support for finegrained timestamps.
- 55838 The value of the *d\_ino* member is no longer unspecified for symbolic links.
- 55839 SD5-XSH-ERN-193 is applied.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

55840 **NAME**

55841 readlink, readlinkat — read the contents of a symbolic link relative to a directory file descriptor

55842 **SYNOPSIS**

```
55843 #include <unistd.h>
55844 ssize_t readlink(const char *restrict path, char *restrict buf,
55845                 size_t bufsize);
55846 ssize_t readlinkat(int fd, const char *restrict path,
55847                  char *restrict buf, size_t bufsize);
```

55848 **DESCRIPTION**

55849 The *readlink()* function shall place the contents of the symbolic link referred to by *path* in the  
 55850 buffer *buf* which has size *bufsize*. If the number of bytes in the symbolic link is less than *bufsize*,  
 55851 the contents of the remainder of *buf* are unspecified. If the *buf* argument is not large enough to  
 55852 contain the link content, the first *bufsize* bytes shall be placed in *buf*.

55853 If the value of *bufsize* is greater than {SSIZE\_MAX}, the result is implementation-defined.

55854 Upon successful completion, *readlink()* shall mark for update the last data access timestamp of  
 55855 the symbolic link.

55856 The *readlinkat()* function shall be equivalent to the *readlink()* function except in the case where  
 55857 *path* specifies a relative path. In this case the symbolic link whose content is read is relative to the  
 55858 directory associated with the file descriptor *fd* instead of the current working directory. If the file  
 55859 descriptor was opened without O\_SEARCH, the function shall check whether directory searches  
 55860 are permitted using the current permissions of the directory underlying the file descriptor. If the  
 55861 file descriptor was opened with O\_SEARCH, the function shall not perform the check.

55862 If *readlinkat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 55863 directory is used and the behavior shall be identical to a call to *readlink()*.

55864 **RETURN VALUE**

55865 Upon successful completion, *readlink()* shall return the count of bytes placed in the buffer.  
 55866 Otherwise, it shall return a value of -1, leave the buffer unchanged, and set *errno* to indicate the  
 55867 error.

55868 Upon successful completion, the *readlinkat()* function shall return 0. Otherwise, it shall return -1  
 55869 and set *errno* to indicate the error.

55870 **ERRORS**

55871 These functions shall fail if:

55872 [EACCES] Search permission is denied for a component of the path prefix of *path*.

55873 [EINVAL] The *path* argument names a file that is not a symbolic link.

55874 [EIO] An I/O error occurred while reading from the file system.

55875 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 55876 argument.

55877 [ENAMETOOLONG] The length of a component of a pathname is longer than {NAME\_MAX}.

55879 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

55880 [ENOTDIR] A component of the path prefix is not a directory, or the *path* argument  
 55881 contains at least one non-*<slash>* character and ends with one or more trailing  
 55882 *<slash>* characters and the last pathname component names an existing file  
 55883 that is neither a directory nor a symbolic link to a directory.

**readlink()**

- 55884 The *readlinkat()* function shall fail if:
- 55885 [EACCES] *fd* was not opened with O\_SEARCH and the permissions of the directory  
55886 underlying *fd* do not permit directory searches.
- 55887 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
55888 neither AT\_FDCWD nor a valid file descriptor open for reading or searching.
- 55889 These functions may fail if:
- 55890 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
55891 resolution of the *path* argument.
- 55892 [ENAMETOOLONG]  
55893 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
55894 symbolic link produced an intermediate result with a length that exceeds  
55895 {PATH\_MAX}.
- 55896 The *readlinkat()* function may fail if:
- 55897 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT\_FDCWD nor a  
55898 file descriptor associated with a directory.

55899 **EXAMPLES**55900 **Reading the Name of a Symbolic Link**

55901 The following example shows how to read the name of a symbolic link named **/modules/pass1**.

```
55902 #include <unistd.h>
55903 char buf[1024];
55904 ssize_t len;
55905 ...
55906 if ((len = readlink("/modules/pass1", buf, sizeof(buf)-1)) != -1)
55907     buf[len] = '\0';
```

55908 **APPLICATION USAGE**

55909 Conforming applications should not assume that the returned contents of the symbolic link are  
55910 null-terminated.

55911 **RATIONALE**

55912 Since POSIX.1-2008 does not require any association of file times with symbolic links, there is no  
55913 requirement that file times be updated by *readlink()*. The type associated with *bufsiz* is a **size\_t**  
55914 in order to be consistent with both the ISO C standard and the definition of *read()*. The behavior  
55915 specified for *readlink()* when *bufsiz* is zero represents historical practice. For this case, the  
55916 standard developers considered a change whereby *readlink()* would return the number of non-  
55917 null bytes contained in the symbolic link with the buffer *buf* remaining unchanged; however,  
55918 since the **stat** structure member *st\_size* value can be used to determine the size of buffer  
55919 necessary to contain the contents of the symbolic link as returned by *readlink()*, this proposal  
55920 was rejected, and the historical practice retained.

55921 The purpose of the *readlinkat()* function is to read the content of symbolic links in directories  
55922 other than the current working directory without exposure to race conditions. Any part of the  
55923 path of a file could be changed in parallel to a call to *readlink()*, resulting in unspecified behavior.  
55924 By opening a file descriptor for the target directory and using the *readlinkat()* function it can be  
55925 guaranteed that the symbolic link read is located relative to the desired directory.

55926 **FUTURE DIRECTIONS**

55927 None.

55928 **SEE ALSO**55929 *fstatat()*, *symlink()*55930 XBD <*unistd.h*>55931 **CHANGE HISTORY**

55932 First released in Issue 4, Version 2.

55933 **Issue 5**

55934 Moved from X/OPEN UNIX extension to BASE.

55935 **Issue 6**55936 The return type is changed to **ssize\_t**, to align with the IEEE P1003.1a draft standard.55937 The following new requirements on POSIX implementations derive from alignment with the  
55938 Single UNIX Specification:

- 55939 • This function is made mandatory.
- 55940 • In this function it is possible for the return value to exceed the range of the type **ssize\_t**  
55941 (since **size\_t** has a larger range of positive values than **ssize\_t**). A sentence restricting the  
55942 size of the **size\_t** object is added to the description to resolve this conflict.

55943 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 55944 • The FUTURE DIRECTIONS section is changed to None.

55945 The following changes were made to align with the IEEE P1003.1a draft standard:

- 55946 • The [ELOOP] optional error condition is added.

55947 The **restrict** keyword is added to the *readlink()* prototype for alignment with the  
55948 ISO/IEC 9899: 1999 standard.55949 **Issue 7**

55950 Austin Group Interpretation 1003.1-2001 #143 is applied.

55951 SD5-XSH-ERN-189 is applied, updating the ERRORS section.

55952 The *readlinkat()* function is added from The Open Group Technical Standard, 2006, Extended  
55953 API Set Part 2.

55954 The [EACCES] error is removed from the “may fail” error conditions.

55955 Changes are made to allow a directory to be opened for searching.

55956 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
55957 pathname exists but is not a directory or a symbolic link to a directory.

**readv()**55958 **NAME**

55959 readv — read a vector

55960 **SYNOPSIS**

```
55961 xSI #include <sys/uio.h>
55962      ssize_t readv(int fildes, const struct iovec *iov, int iovcnt);
```

55963 **DESCRIPTION**

55964 The *readv()* function shall be equivalent to *read()*, except as described below. The *readv()*  
 55965 function shall place the input data into the *iovcnt* buffers specified by the members of the *iov*  
 55966 array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*−1]. The *iovcnt* argument is valid if greater than 0 and less than  
 55967 or equal to {IOV\_MAX}.

55968 Each *iovec* entry specifies the base address and length of an area in memory where data should  
 55969 be placed. The *readv()* function shall always fill an area completely before proceeding to the  
 55970 next.

55971 Upon successful completion, *readv()* shall mark for update the last data access timestamp of the  
 55972 file.

55973 **RETURN VALUE**55974 Refer to *read()*.55975 **ERRORS**55976 Refer to *read()*.55977 In addition, the *readv()* function shall fail if:55978 [EINVAL] The sum of the *iov\_len* values in the *iov* array overflowed an **ssize\_t**.55979 The *readv()* function may fail if:55980 [EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV\_MAX}.55981 **EXAMPLES**55982 **Reading Data into an Array**

55983 The following example reads data from the file associated with the file descriptor *fd* into the  
 55984 buffers specified by members of the *iov* array.

```
55985 #include <sys/types.h>
55986 #include <sys/uio.h>
55987 #include <unistd.h>
55988 ...
55989 ssize_t bytes_read;
55990 int fd;
55991 char buf0[20];
55992 char buf1[30];
55993 char buf2[40];
55994 int iovcnt;
55995 struct iovec iov[3];

55996 iov[0].iov_base = buf0;
55997 iov[0].iov_len = sizeof(buf0);
55998 iov[1].iov_base = buf1;
55999 iov[1].iov_len = sizeof(buf1);
56000 iov[2].iov_base = buf2;
```

```
56001     iov[2].iov_len = sizeof(buf2);
56002     ...
56003     iovcnt = sizeof(iov) / sizeof(struct iovec);
56004     bytes_read = readv(fd, iov, iovcnt);
56005     ...
```

56006 **APPLICATION USAGE**  
56007 None.

56008 **RATIONALE**  
56009 Refer to *read()*.

56010 **FUTURE DIRECTIONS**  
56011 None.

56012 **SEE ALSO**  
56013 *read()*, *writew()*  
56014 XBD <sys/uio.h>

56015 **CHANGE HISTORY**  
56016 First released in Issue 4, Version 2.

56017 **Issue 6**  
56018 Split out from the *read()* reference page.

56019 **Issue 7**  
56020 Changes are made related to support for finegrained timestamps.

**realloc()**56021 **NAME**56022            **realloc** — memory reallocator56023 **SYNOPSIS**

56024            #include &lt;stdlib.h&gt;

56025            void \*realloc(void \*ptr, size\_t size);

56026 **DESCRIPTION**

56027 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 56028            conflict between the requirements described here and the ISO C standard is unintentional. This  
 56029            volume of POSIX.1-2008 defers to the ISO C standard.

56030            The *realloc()* function shall change the size of the memory object pointed to by *ptr* to the size  
 56031            specified by *size*. The contents of the object shall remain unchanged up to the lesser of the new  
 56032            and old sizes. If the new size of the memory object would require movement of the object, the  
 56033            space for the previous instantiation of the object is freed. If the new size is larger, the contents of  
 56034            the newly allocated portion of the object are unspecified. If *size* is 0 and *ptr* is not a null pointer,  
 56035            the object pointed to is freed. If the space cannot be allocated, the object shall remain unchanged.

56036            If *ptr* is a null pointer, *realloc()* shall be equivalent to *malloc()* for the specified size.

56037            If *ptr* does not match a pointer returned earlier by *calloc()*, *malloc()*, or *realloc()* or if the space has  
 56038            previously been deallocated by a call to *free()* or *realloc()*, the behavior is undefined.

56039            The order and contiguity of storage allocated by successive calls to *realloc()* is unspecified. The  
 56040            pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to  
 56041            a pointer to any type of object and then used to access such an object in the space allocated (until  
 56042            the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object  
 56043            disjoint from any other object. The pointer returned shall point to the start (lowest byte address)  
 56044            of the allocated space. If the space cannot be allocated, a null pointer shall be returned.

56045 **RETURN VALUE**

56046            Upon successful completion with a size not equal to 0, *realloc()* shall return a pointer to the  
 56047            (possibly moved) allocated space. If *size* is 0, either a null pointer or a unique pointer that can be  
 56048            successfully passed to *free()* shall be returned. If there is not enough available memory, *realloc()*  
 56049 CX        shall return a null pointer and set *errno* to [ENOMEM].

56050 **ERRORS**

56051            The *realloc()* function shall fail if:

56052 CX        [ENOMEM]   Insufficient memory is available.

56053 **EXAMPLES**

56054            None.

56055 **APPLICATION USAGE**

56056            None.

56057 **RATIONALE**

56058            None.

56059 **FUTURE DIRECTIONS**

56060            None.

56061 **SEE ALSO**

56062            *calloc()*, *free()*, *malloc()*

56063            XBD <stdlib.h>

56064 **CHANGE HISTORY**

56065 First released in Issue 1. Derived from Issue 1 of the SVID.

56066 **Issue 6**

56067 Extensions beyond the ISO C standard are marked.

56068 The following new requirements on POSIX implementations derive from alignment with the  
56069 Single UNIX Specification:

- 56070 • In the RETURN VALUE section, if there is not enough available memory, the setting of  
56071 *errno* to [ENOMEM] is added.
- 56072 • The [ENOMEM] error condition is added.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**realpath()**56073 **NAME**56074 `realpath` — resolve a pathname56075 **SYNOPSIS**

```
56076 XSI #include <stdlib.h>
56077 char *realpath(const char *restrict file_name,
56078               char *restrict resolved_name);
```

56079 **DESCRIPTION**

56080 The `realpath()` function shall derive, from the pathname pointed to by `file_name`, an absolute  
 56081 pathname that resolves to the same directory entry, whose resolution does not involve '.',  
 56082 '..', or symbolic links. If `resolved_name` is a null pointer, the generated pathname shall be  
 56083 stored as a null-terminated string in a buffer allocated as if by a call to `malloc()`. Otherwise, if  
 56084 `{PATH_MAX}` is defined as a constant in the `<limits.h>` header, then the generated pathname  
 56085 shall be stored as a null-terminated string, up to a maximum of `{PATH_MAX}` bytes, in the  
 56086 buffer pointed to by `resolved_name`.

56087 If `resolved_name` is not a null pointer and `{PATH_MAX}` is not defined as a constant in the  
 56088 `<limits.h>` header, the behavior is undefined.

56089 **RETURN VALUE**

56090 Upon successful completion, `realpath()` shall return a pointer to the buffer containing the  
 56091 resolved name. Otherwise, `realpath()` shall return a null pointer and set `errno` to indicate the  
 56092 error.

56093 If the `resolved_name` argument is a null pointer, the pointer returned by `realpath()` can be passed  
 56094 to `free()`.

56095 If the `resolved_name` argument is not a null pointer and the `realpath()` function fails, the contents  
 56096 of the buffer pointed to by `resolved_name` are undefined.

56097 **ERRORS**

56098 The `realpath()` function shall fail if:

56099 [EACCES] Read or search permission was denied for a component of `file_name`.

56100 [EINVAL] The `file_name` argument is a null pointer.

56101 [EIO] An error occurred while reading from the file system.

56102 [ELOOP] A loop exists in symbolic links encountered during resolution of the `file_name`  
 56103 argument.

56104 [ENAMETOOLONG]

56105 The length of a component of a pathname is longer than `{NAME_MAX}`.

56106 [ENOENT] A component of `file_name` does not name an existing file or `file_name` points to  
 56107 an empty string.

56108 [ENOTDIR] A component of the path prefix is not a directory, or the `file_name` argument  
 56109 contains at least one non-`<slash>` character and ends with one or more trailing  
 56110 `<slash>` characters and the last pathname component names an existing file  
 56111 that is neither a directory nor a symbolic link to a directory.

56112 The `realpath()` function may fail if:

56113 [ELOOP] More than `{SYMLOOP_MAX}` symbolic links were encountered during  
 56114 resolution of the `file_name` argument.

- 56115 [ENAMETOOLONG]  
 56116 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 56117 symbolic link produced an intermediate result with a length that exceeds  
 56118 {PATH\_MAX}.
- 56119 [ENOMEM] Insufficient storage space is available.

56120 **EXAMPLES**56121 **Generating an Absolute Pathname**

56122 The following example generates an absolute pathname for the file identified by the *symlinkpath*  
 56123 argument. The generated pathname is stored in the buffer pointed to by *actualpath*.

```
56124 #include <stdlib.h>
56125 ...
56126 char *symlinkpath = "/tmp/symlink/file";
56127 char *actualpath;

56128 actualpath = realpath(symlinkpath, NULL);
56129 if (actualpath != NULL)
56130 {
56131     ... use actualpath ...
56132     free(actualpath);
56133 }
56134 else
56135 {
56136     ... handle error ...
56137 }
```

56138 **APPLICATION USAGE**

56139 For functions that allocate memory as if by *malloc()*, the application should release such memory  
 56140 when it is no longer required by a call to *free()*. For *realpath()*, this is the return value.

56141 **RATIONALE**

56142 Since *realpath()* has no *length* argument, if {PATH\_MAX} is not defined as a constant in  
 56143 <limits.h>, applications have no way of determining how large a buffer they need to allocate for  
 56144 it to be safe to pass to *realpath()*. A {PATH\_MAX} value obtained from a prior *pathconf()* call is  
 56145 out-of-date by the time *realpath()* is called. Hence the only reliable way to use *realpath()* when  
 56146 {PATH\_MAX} is not defined in <limits.h> is to pass a null pointer for *resolved\_name* so that  
 56147 *realpath()* will allocate a buffer of the necessary size.

56148 **FUTURE DIRECTIONS**

56149 None.

56150 **SEE ALSO**

56151 *fpathconf()*, *free()*, *getcwd()*, *sysconf()*

56152 XBD <limits.h>, <stdlib.h>

56153 **CHANGE HISTORY**

56154 First released in Issue 4, Version 2.

56155 **Issue 5**

56156 Moved from X/OPEN UNIX extension to BASE.

**realpath()**56157 **Issue 6**

56158 The **restrict** keyword is added to the *realpath()* prototype for alignment with the  
56159 ISO/IEC 9899: 1999 standard.

56160 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
56161 [ELOOP] error condition is added.

56162 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/51 is applied, adding new text to the  
56163 DESCRIPTION for the case when *resolved\_name* is a null pointer, changing the [EINVAL] error  
56164 text, adding text to the RATIONALE, and adding text to FUTURE DIRECTIONS.

56165 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/110 is applied, updating the ERRORS  
56166 section to refer to the *file\_name* argument, rather than a nonexistent *path* argument.

56167 **Issue 7**

56168 Austin Group Interpretation 1003.1-2001 #143 is applied.

56169 This function is updated for passing a null pointer to *realpath()* for the *resolved\_name* argument.

56170 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by  
56171 *malloc()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

56172 **NAME**

56173           recv — receive a message from a connected socket

56174 **SYNOPSIS**

56175           #include &lt;sys/socket.h&gt;

56176           ssize\_t recv(int socket, void \*buffer, size\_t length, int flags);

56177 **DESCRIPTION**

56178           The *recv()* function shall receive a message from a connection-mode or connectionless-mode  
 56179           socket. It is normally used with connected sockets because it does not permit the application to  
 56180           retrieve the source address of received data.

56181           The *recv()* function takes the following arguments:56182           *socket*           Specifies the socket file descriptor.56183           *buffer*           Points to a buffer where the message should be stored.56184           *length*           Specifies the length in bytes of the buffer pointed to by the *buffer* argument.56185           *flags*           Specifies the type of message reception. Values of this argument are formed by  
 56186           logically OR'ing zero or more of the following values:56187           MSG\_PEEK           Peeks at an incoming message. The data is treated as unread and  
 56188           the next *recv()* or similar function shall still return this data.56189           MSG\_OOB           Requests out-of-band data. The significance and semantics of  
 56190           out-of-band data are protocol-specific.56191           MSG\_WAITALL       On SOCK\_STREAM sockets this requests that the function block  
 56192           until the full amount of data can be returned. The function may  
 56193           return the smaller amount of data if the socket is a message-  
 56194           based socket, if a signal is caught, if the connection is terminated,  
 56195           if MSG\_PEEK was specified, or if an error is pending for the  
 56196           socket.

56197           The *recv()* function shall return the length of the message written to the buffer pointed to by the  
 56198           *buffer* argument. For message-based sockets, such as SOCK\_DGRAM and SOCK\_SEQPACKET,  
 56199           the entire message shall be read in a single operation. If a message is too long to fit in the  
 56200           supplied buffer, and MSG\_PEEK is not set in the *flags* argument, the excess bytes shall be  
 56201           discarded. For stream-based sockets, such as SOCK\_STREAM, message boundaries shall be  
 56202           ignored. In this case, data shall be returned to the user as soon as it becomes available, and no  
 56203           data shall be discarded.

56204           If the MSG\_WAITALL flag is not set, data shall be returned only up to the end of the first  
 56205           message.56206           If no messages are available at the socket and O\_NONBLOCK is not set on the socket's file  
 56207           descriptor, *recv()* shall block until a message arrives. If no messages are available at the socket  
 56208           and O\_NONBLOCK is set on the socket's file descriptor, *recv()* shall fail and set *errno* to  
 56209           [EAGAIN] or [EWOULDBLOCK].56210 **RETURN VALUE**56211           Upon successful completion, *recv()* shall return the length of the message in bytes. If no  
 56212           messages are available to be received and the peer has performed an orderly shutdown, *recv()*  
 56213           shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

**recv()**56214 **ERRORS**56215 The *recv()* function shall fail if:

56216 [EAGAIN] or [EWOULDBLOCK]

56217 The socket's file descriptor is marked O\_NONBLOCK and no data is waiting  
56218 to be received; or MSG\_OOB is set and no out-of-band data is available and  
56219 either the socket's file descriptor is marked O\_NONBLOCK or the socket does  
56220 not support blocking to await out-of-band data.56221 [EBADF] The *socket* argument is not a valid file descriptor.

56222 [ECONNRESET] A connection was forcibly closed by a peer.

56223 [EINTR] The *recv()* function was interrupted by a signal that was caught, before any  
56224 data was available.

56225 [EINVAL] The MSG\_OOB flag is set and no out-of-band data is available.

56226 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

56227 [ENOTSOCK] The *socket* argument does not refer to a socket.

56228 [EOPNOTSUPP] The specified flags are not supported for this socket type or protocol.

56229 [ETIMEDOUT] The connection timed out during connection establishment, or due to a  
56230 transmission timeout on active connection.56231 The *recv()* function may fail if:

56232 [EIO] An I/O error occurred while reading from or writing to the file system.

56233 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

56234 [ENOMEM] Insufficient memory was available to fulfill the request.

56235 **EXAMPLES**

56236 None.

56237 **APPLICATION USAGE**56238 The *recv()* function is equivalent to *recvfrom()* with a zero *address\_len* argument, and to *read()* if  
56239 no flags are used.56240 The *select()* and *poll()* functions can be used to determine when data is available to be received.56241 **RATIONALE**

56242 None.

56243 **FUTURE DIRECTIONS**

56244 None.

56245 **SEE ALSO**56246 *poll()*, *pselect()*, *read()*, *recvmsg()*, *recvfrom()*, *send()*, *sendmsg()*, *sendto()*, *shutdown()*, *socket()*,  
56247 *write()*

56248 XBD &lt;sys/socket.h&gt;

56249 **CHANGE HISTORY**

56250 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

56251 **NAME**

56252 recvfrom — receive a message from a socket

56253 **SYNOPSIS**

56254 #include &lt;sys/socket.h&gt;

```
56255 ssize_t recvfrom(int socket, void *restrict buffer, size_t length,
56256                 int flags, struct sockaddr *restrict address,
56257                 socklen_t *restrict address_len);
```

56258 **DESCRIPTION**

56259 The *recvfrom()* function shall receive a message from a connection-mode or connectionless-mode  
 56260 socket. It is normally used with connectionless-mode sockets because it permits the application  
 56261 to retrieve the source address of received data.

56262 The *recvfrom()* function takes the following arguments:

56263	<i>socket</i>	Specifies the socket file descriptor.
56264	<i>buffer</i>	Points to the buffer where the message should be stored.
56265	<i>length</i>	Specifies the length in bytes of the buffer pointed to by the <i>buffer</i> argument.
56266	<i>flags</i>	Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:
56268	MSG_PEEK	Peeks at an incoming message. The data is treated as unread and the next <i>recvfrom()</i> or similar function shall still return this data.
56269		
56271	MSG_OOB	Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.
56272		
56273	MSG_WAITALL	On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket.
56274		
56275		
56276		
56277		
56278		
56279	<i>address</i>	A null pointer, or points to a <b>sockaddr</b> structure in which the sending address is to be stored. The length and format of the address depend on the address family of the socket.
56280		
56281		
56282	<i>address_len</i>	Specifies the length of the <b>sockaddr</b> structure pointed to by the <i>address</i> argument.
56283		

56284 The *recvfrom()* function shall return the length of the message written to the buffer pointed to by  
 56285 RS the *buffer* argument. For message-based sockets, such as SOCK\_RAW, SOCK\_DGRAM, and  
 56286 SOCK\_SEQPACKET, the entire message shall be read in a single operation. If a message is too  
 56287 long to fit in the supplied buffer, and MSG\_PEEK is not set in the *flags* argument, the excess  
 56288 bytes shall be discarded. For stream-based sockets, such as SOCK\_STREAM, message  
 56289 boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes  
 56290 available, and no data shall be discarded.

56291 If the MSG\_WAITALL flag is not set, data shall be returned only up to the end of the first  
 56292 message.

56293 Not all protocols provide the source address for messages. If the *address* argument is not a null  
 56294 pointer and the protocol provides the source address of messages, the source address of the

**recvfrom()**

56295 received message shall be stored in the **sockaddr** structure pointed to by the *address* argument,  
 56296 and the length of this address shall be stored in the object pointed to by the *address\_len*  
 56297 argument.

56298 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,  
 56299 the stored address shall be truncated.

56300 If the *address* argument is not a null pointer and the protocol does not provide the source address  
 56301 of messages, the value stored in the object pointed to by *address* is unspecified.

56302 If no messages are available at the socket and O\_NONBLOCK is not set on the socket's file  
 56303 descriptor, *recvfrom()* shall block until a message arrives. If no messages are available at the  
 56304 socket and O\_NONBLOCK is set on the socket's file descriptor, *recvfrom()* shall fail and set *errno*  
 56305 to [EAGAIN] or [EWOULDBLOCK].

**RETURN VALUE**

56306 Upon successful completion, *recvfrom()* shall return the length of the message in bytes. If no  
 56307 messages are available to be received and the peer has performed an orderly shutdown,  
 56308 *recvfrom()* shall return 0. Otherwise, the function shall return -1 and set *errno* to indicate the  
 56309 error.  
 56310

**ERRORS**

56311 The *recvfrom()* function shall fail if:

56312 [EAGAIN] or [EWOULDBLOCK]

56313 The socket's file descriptor is marked O\_NONBLOCK and no data is waiting  
 56314 to be received; or MSG\_OOB is set and no out-of-band data is available and  
 56315 either the socket's file descriptor is marked O\_NONBLOCK or the socket does  
 56316 not support blocking to await out-of-band data.  
 56317

56318 [EBADF] The *socket* argument is not a valid file descriptor.

56319 [ECONNRESET] A connection was forcibly closed by a peer.

56320 [EINTR] A signal interrupted *recvfrom()* before any data was available.

56321 [EINVAL] The MSG\_OOB flag is set and no out-of-band data is available.

56322 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

56323 [ENOTSOCK] The *socket* argument does not refer to a socket.

56324 [EOPNOTSUPP] The specified flags are not supported for this socket type.

56325 [ETIMEDOUT] The connection timed out during connection establishment, or due to a  
 56326 transmission timeout on active connection.

56327 The *recvfrom()* function may fail if:

56328 [EIO] An I/O error occurred while reading from or writing to the file system.

56329 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

56330 [ENOMEM] Insufficient memory was available to fulfill the request.

56331 **EXAMPLES**

56332 None.

56333 **APPLICATION USAGE**56334 The *select()* and *poll()* functions can be used to determine when data is available to be received.56335 **RATIONALE**

56336 None.

56337 **FUTURE DIRECTIONS**

56338 None.

56339 **SEE ALSO**56340 *poll()*, *pselect()*, *read()*, *recv()*, *recvmsg()*, *send()*, *sendmsg()*, *sendto()*, *shutdown()*, *socket()*, *write()*56341 XBD <[sys/socket.h](#)>56342 **CHANGE HISTORY**

56343 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**recvmsg()**56344 **NAME**56345 `recvmsg` — receive a message from a socket56346 **SYNOPSIS**56347 `#include <sys/socket.h>`56348 `ssize_t recvmsg(int socket, struct msghdr *message, int flags);`56349 **DESCRIPTION**56350 The `recvmsg()` function shall receive a message from a connection-mode or connectionless-mode  
56351 socket. It is normally used with connectionless-mode sockets because it permits the application  
56352 to retrieve the source address of received data.56353 The `recvmsg()` function takes the following arguments:

56354	<i>socket</i>	Specifies the socket file descriptor.
56355	<i>message</i>	Points to a <b>msghdr</b> structure, containing both the buffer to store the source address and the buffers for the incoming message. The length and format of the address depend on the address family of the socket. The <i>msg_flags</i> member is ignored on input, but may contain meaningful values on output.
56356		
56357		
56358		
56359	<i>flags</i>	Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:
56360		
56361	MSG_OOB	Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.
56362		
56363	MSG_PEEK	Peeks at the incoming message.
56364	MSG_WAITALL	On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket.
56365		
56366		
56367		
56368		
56369		

56370 The `recvmsg()` function shall receive messages from unconnected or connected sockets and shall  
56371 return the length of the message.56372 The `recvmsg()` function shall return the total length of the message. For message-based sockets,  
56373 such as SOCK\_DGRAM and SOCK\_SEQPACKET, the entire message shall be read in a single  
56374 operation. If a message is too long to fit in the supplied buffers, and MSG\_PEEK is not set in the  
56375 *flags* argument, the excess bytes shall be discarded, and MSG\_TRUNC shall be set in the  
56376 *msg\_flags* member of the **msghdr** structure. For stream-based sockets, such as SOCK\_STREAM,  
56377 message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it  
56378 becomes available, and no data shall be discarded.56379 If the MSG\_WAITALL flag is not set, data shall be returned only up to the end of the first  
56380 message.56381 If no messages are available at the socket and O\_NONBLOCK is not set on the socket's file  
56382 descriptor, `recvmsg()` shall block until a message arrives. If no messages are available at the  
56383 socket and O\_NONBLOCK is set on the socket's file descriptor, the `recvmsg()` function shall fail  
56384 and set *errno* to [EAGAIN] or [EWOULDBLOCK].56385 In the **msghdr** structure, the *msg\_name* and *msg\_namelen* members specify the source address if  
56386 the socket is unconnected. If the socket is connected, the *msg\_name* and *msg\_namelen* members  
56387 shall be ignored. The *msg\_name* member may be a null pointer if no names are desired or  
56388 required. The *msg\_iov* and *msg\_iovlen* fields are used to specify where the received data shall be

56389 stored. *msg\_iov* points to an array of **iovec** structures; *msg\_iovlen* shall be set to the dimension of  
 56390 this array. In each **iovec** structure, the *iov\_base* field specifies a storage area and the *iov\_len* field  
 56391 gives its size in bytes. Each storage area indicated by *msg\_iov* is filled with received data in turn  
 56392 until all of the received data is stored or all of the areas have been filled.

56393 Upon successful completion, the *msg\_flags* member of the message header shall be the bitwise-  
 56394 inclusive OR of all of the following flags that indicate conditions detected for the received  
 56395 message:

56396 MSG\_EOR End-of-record was received (if supported by the protocol).

56397 MSG\_OOB Out-of-band data was received.

56398 MSG\_TRUNC Normal data was truncated.

56399 MSG\_CTRUNC Control data was truncated.

#### 56400 RETURN VALUE

56401 Upon successful completion, *recvmsg()* shall return the length of the message in bytes. If no  
 56402 messages are available to be received and the peer has performed an orderly shutdown,  
 56403 *recvmsg()* shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

#### 56404 ERRORS

56405 The *recvmsg()* function shall fail if:

56406 [EAGAIN] or [EWOULDBLOCK]

56407 The socket's file descriptor is marked O\_NONBLOCK and no data is waiting  
 56408 to be received; or MSG\_OOB is set and no out-of-band data is available and  
 56409 either the socket's file descriptor is marked O\_NONBLOCK or the socket does  
 56410 not support blocking to await out-of-band data.

56411 [EBADF] The *socket* argument is not a valid open file descriptor.

56412 [ECONNRESET] A connection was forcibly closed by a peer.

56413 [EINTR] This function was interrupted by a signal before any data was available.

56414 [EINVAL] The sum of the *iov\_len* values overflows a **ssize\_t**, or the MSG\_OOB flag is set  
 56415 and no out-of-band data is available.

56416 [EMSGSIZE] The *msg\_iovlen* member of the **msghdr** structure pointed to by *message* is less  
 56417 than or equal to 0, or is greater than {IOV\_MAX}.

56418 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

56419 [ENOTSOCK] The *socket* argument does not refer to a socket.

56420 [EOPNOTSUPP] The specified flags are not supported for this socket type.

56421 [ETIMEDOUT] The connection timed out during connection establishment, or due to a  
 56422 transmission timeout on active connection.

56423 The *recvmsg()* function may fail if:

56424 [EIO] An I/O error occurred while reading from or writing to the file system.

56425 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

56426 [ENOMEM] Insufficient memory was available to fulfill the request.

## 56440 NAME

56441 regcomp, regerror, regex, regfree — regular expression matching

## 56442 SYNOPSIS

```
56443 #include <regex.h>
56444 int regcomp(regex_t *restrict preg, const char *restrict pattern,
56445             int cflags);
56446 size_t regerror(int errcode, const regex_t *restrict preg,
56447               char *restrict errbuf, size_t errbuf_size);
56448 int regex(const regex_t *restrict preg, const char *restrict string,
56449           size_t nmatch, regmatch_t pmatch[restrict], int eflags);
56450 void regfree(regex_t *preg);
```

## 56451 DESCRIPTION

56452 These functions interpret *basic* and *extended* regular expressions as described in XBD [Chapter 9](#)  
 56453 (on page 181).

56454 The **regex\_t** structure is defined in **<regex.h>** and contains at least the following member:

Member Type	Member Name	Description
size_t	re_nsub	Number of parenthesized subexpressions.

56458 The **regmatch\_t** structure is defined in **<regex.h>** and contains at least the following members:

Member Type	Member Name	Description
regoff_t	rm_so	Byte offset from start of <i>string</i> to start of substring.
regoff_t	rm_eo	Byte offset from start of <i>string</i> of the first character after the end of substring.

56464 The *regcomp()* function shall compile the regular expression contained in the string pointed to by  
 56465 the *pattern* argument and place the results in the structure pointed to by *preg*. The *cflags*  
 56466 argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in  
 56467 the **<regex.h>** header:

- 56468 REG\_EXTENDED Use Extended Regular Expressions.
- 56469 REG\_ICASE Ignore case in match (see XBD [Chapter 9](#), on page 181).
- 56470 REG\_NOSUB Report only success/fail in *regex()*.
- 56471 REG\_NEWLINE Change the handling of <newline> characters, as described in the text.

56472 The default regular expression type for *pattern* is a Basic Regular Expression. The application can  
 56473 specify Extended Regular Expressions using the REG\_EXTENDED *cflags* flag.

56474 If the REG\_NOSUB flag was not set in *cflags*, then *regcomp()* shall set *re\_nsub* to the number of  
 56475 parenthesized subexpressions (delimited by "\(\)" in basic regular expressions or "()" in  
 56476 extended regular expressions) found in *pattern*.

56477 The *regex()* function compares the null-terminated string specified by *string* with the compiled  
 56478 regular expression *preg* initialized by a previous call to *regcomp()*. If it finds a match, *regex()*  
 56479 shall return 0; otherwise, it shall return non-zero indicating either no match or an error. The  
 56480 *eflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are  
 56481 defined in the **<regex.h>** header:

## regcomp()

- 56482 REG\_NOTBOL The first character of the string pointed to by *string* is not the beginning of  
56483 the line. Therefore, the <circumflex> character ('^'), when taken as a  
56484 special character, shall not match the beginning of *string*.
- 56485 REG\_NOTEOL The last character of the string pointed to by *string* is not the end of the  
56486 line. Therefore, the <dollar-sign> ('\$'), when taken as a special character,  
56487 shall not match the end of *string*.
- 56488 If *nmatch* is 0 or REG\_NOSUB was set in the *cflags* argument to *regcomp()*, then *regexec()* shall  
56489 ignore the *pmatch* argument. Otherwise, the application shall ensure that the *pmatch* argument  
56490 points to an array with at least *nmatch* elements, and *regexec()* shall fill in the elements of that  
56491 array with offsets of the substrings of *string* that correspond to the parenthesized subexpressions  
56492 of *pattern*: *pmatch[i].rm\_so* shall be the byte offset of the beginning and *pmatch[i].rm\_eo* shall be  
56493 one greater than the byte offset of the end of substring *i*. (Subexpression *i* begins at the *i*th  
56494 matched open parenthesis, counting from 1.) Offsets in *pmatch[0]* identify the substring that  
56495 corresponds to the entire regular expression. Unused elements of *pmatch* up to *pmatch[nmatch-1]*  
56496 shall be filled with -1. If there are more than *nmatch* subexpressions in *pattern* (*pattern* itself  
56497 counts as a subexpression), then *regexec()* shall still do the match, but shall record only the first  
56498 *nmatch* substrings.
- 56499 When matching a basic or extended regular expression, any given parenthesized subexpression  
56500 of *pattern* might participate in the match of several different substrings of *string*, or it might not  
56501 match any substring even though the pattern as a whole did match. The following rules shall be  
56502 used to determine which substrings to report in *pmatch* when matching regular expressions:
- 56503 1. If subexpression *i* in a regular expression is not contained within another subexpression,  
56504 and it participated in the match several times, then the byte offsets in *pmatch[i]* shall  
56505 delimit the last such match.
  - 56506 2. If subexpression *i* is not contained within another subexpression, and it did not  
56507 participate in an otherwise successful match, the byte offsets in *pmatch[i]* shall be -1. A  
56508 subexpression does not participate in the match when:
    - 56509 ' \* ' or "\{\}" appears immediately after the subexpression in a basic regular  
56510 expression, or ' \* ', ' ? ', or "{ }" appears immediately after the subexpression in  
56511 an extended regular expression, and the subexpression did not match (matched 0  
56512 times)
- 56513 or:
- 56514 ' | ' is used in an extended regular expression to select this subexpression or  
56515 another, and the other subexpression matched.
- 56516 3. If subexpression *i* is contained within another subexpression *j*, and *i* is not contained  
56517 within any other subexpression that is contained within *j*, and a match of subexpression *j*  
56518 is reported in *pmatch[j]*, then the match or non-match of subexpression *i* reported in  
56519 *pmatch[i]* shall be as described in 1. and 2. above, but within the substring reported in  
56520 *pmatch[j]* rather than the whole string. The offsets in *pmatch[i]* are still relative to the start  
56521 of *string*.
  - 56522 4. If subexpression *i* is contained in subexpression *j*, and the byte offsets in *pmatch[j]* are -1,  
56523 then the pointers in *pmatch[i]* shall also be -1.
  - 56524 5. If subexpression *i* matched a zero-length string, then both byte offsets in *pmatch[i]* shall be  
56525 the byte offset of the character or null terminator immediately following the zero-length  
56526 string.

56527 If, when *regexec()* is called, the locale is different from when the regular expression was  
56528 compiled, the result is undefined.

56529 If REG\_NEWLINE is not set in *cflags*, then a <newline> in *pattern* or *string* shall be treated as an  
56530 ordinary character. If REG\_NEWLINE is set, then <newline> shall be treated as an ordinary  
56531 character except as follows:

- 56532 1. A <newline> in *string* shall not be matched by a <period> outside a bracket expression or  
56533 by any form of a non-matching list (see XBD Chapter 9, on page 181).
- 56534 2. A <circumflex> (' ^ ') in *pattern*, when used to specify expression anchoring (see XBD  
56535 Section 9.3.8, on page 187), shall match the zero-length string immediately after a  
56536 <newline> in *string*, regardless of the setting of REG\_NOTBOL.
- 56537 3. A <dollar-sign> (' \$ ') in *pattern*, when used to specify expression anchoring, shall match  
56538 the zero-length string immediately before a <newline> in *string*, regardless of the setting  
56539 of REG\_NOTEOL.

56540 The *regfree()* function frees any memory allocated by *regcomp()* associated with *preg*.

56541 The following constants are defined as error return values:

56542	REG_BADBR	Content of "\{\}" invalid: not a number, number too large, more than 56543 two numbers, first larger than second.
56544	REG_BADPAT	Invalid regular expression.
56545	REG_BADRPT	'?', '*', or '+' not preceded by valid regular expression.
56546	REG_EBRACE	"\{\}" imbalance.
56547	REG_EBRACK	"[]" imbalance.
56548	REG_ECOLLATE	Invalid collating element referenced.
56549	REG_ECTYPE	Invalid character class type referenced.
56550	REG_EESCAPE	Trailing <backslash> character in pattern.
56551	REG_EPAREN	"(\)" or "()" imbalance.
56552	REG_ERANGE	Invalid endpoint in range expression.
56553	REG_ESPACE	Out of memory.
56554	REG_ESUBREG	Number in "\digit" invalid or in error.
56555	REG_NOMATCH	<i>regexec()</i> failed to match.

56556 If more than one error occurs in processing a function call, any one of the possible constants may  
56557 be returned, as the order of detection is unspecified.

56558 The *regerror()* function provides a mapping from error codes returned by *regcomp()* and  
56559 *regexec()* to unspecified printable strings. It generates a string corresponding to the value of the  
56560 *errcode* argument, which the application shall ensure is the last non-zero value returned by  
56561 *regcomp()* or *regexec()* with the given value of *preg*. If *errcode* is not such a value, the content of  
56562 the generated string is unspecified.

56563 If *preg* is a null pointer, but *errcode* is a value returned by a previous call to *regexec()* or *regcomp()*,  
56564 the *regerror()* still generates an error string corresponding to the value of *errcode*, but it might not  
56565 be as detailed under some implementations.

56566 If the *errbuf\_size* argument is not 0, *regerror()* shall place the generated string into the buffer of

**regcomp()**

56567 size *errbuf\_size* bytes pointed to by *errbuf*. If the string (including the terminating null) cannot fit  
56568 in the buffer, *regerror()* shall truncate the string and null-terminate the result.

56569 If *errbuf\_size* is 0, *regerror()* shall ignore the *errbuf* argument, and return the size of the buffer  
56570 needed to hold the generated string.

56571 If the *preg* argument to *regexexec()* or *regfree()* is not a compiled regular expression returned by  
56572 *regcomp()*, the result is undefined. A *preg* is no longer treated as a compiled regular expression  
56573 after it is given to *regfree()*.

**RETURN VALUE**

56574 Upon successful completion, the *regcomp()* function shall return 0. Otherwise, it shall return an  
56575 integer value indicating an error as described in **<regex.h>**, and the content of *preg* is undefined.  
56576 If a code is returned, the interpretation shall be as given in **<regex.h>**.  
56577

56578 If *regcomp()* detects an invalid RE, it may return REG\_BADPAT, or it may return one of the error  
56579 codes that more precisely describes the error.

56580 Upon successful completion, the *regexexec()* function shall return 0. Otherwise, it shall return  
56581 REG\_NOMATCH to indicate no match.

56582 Upon successful completion, the *regerror()* function shall return the number of bytes needed to  
56583 hold the entire generated string, including the null termination. If the return value is greater  
56584 than *errbuf\_size*, the string returned in the buffer pointed to by *errbuf* has been truncated.

56585 The *regfree()* function shall not return a value.

**ERRORS**

56586 No errors are defined.  
56587

**EXAMPLES**

```
56588 #include <regex.h>
56589
56590 /*
56591  * Match string against the extended regular expression in
56592  * pattern, treating errors as no match.
56593  *
56594  * Return 1 for match, 0 for no match.
56595  */
56596
56597 int
56598 match(const char *string, char *pattern)
56599 {
56600     int status;
56601     regex_t re;
56602
56603     if (regcomp(&re, pattern, REG_EXTENDED|REG_NOSUB) != 0) {
56604         return(0); /* Report error. */
56605     }
56606     status = regexexec(&re, string, (size_t) 0, NULL, 0);
56607     regfree(&re);
56608     if (status != 0) {
56609         return(0); /* Report error. */
56610     }
56611     return(1);
56612 }
```

56611 The following demonstrates how the REG\_NOTBOL flag could be used with *regexexec()* to find all

56612 substrings in a line that match a pattern supplied by a user. (For simplicity of the example, very  
56613 little error checking is done.)

```
56614 (void) regcomp (&re, pattern, 0);
56615 /* This call to regexec() finds the first match on the line. */
56616 error = regexec (&re, &buffer[0], 1, &pm, 0);
56617 while (error == 0) { /* While matches found. */
56618     /* Substring found between pm.rm_so and pm.rm_eo. */
56619     /* This call to regexec() finds the next match. */
56620     error = regexec (&re, buffer + pm.rm_eo, 1, &pm, REG_NOTBOL);
56621 }
```

#### 56622 APPLICATION USAGE

56623 An application could use:

```
56624 regerror(code, preg, (char *)NULL, (size_t)0)
```

56625 to find out how big a buffer is needed for the generated string, *malloc()* a buffer to hold the  
56626 string, and then call *regerror()* again to get the string. Alternatively, it could allocate a fixed,  
56627 static buffer that is big enough to hold most strings, and then use *malloc()* to allocate a larger  
56628 buffer if it finds that this is too small.

56629 To match a pattern as described in XCU Section 2.13 (on page 2332), use the *fnmatch()* function.

#### 56630 RATIONALE

56631 The *regexec()* function must fill in all *nmatch* elements of *pmatch*, where *nmatch* and *pmatch* are  
56632 supplied by the application, even if some elements of *pmatch* do not correspond to  
56633 subexpressions in *pattern*. The application developer should note that there is probably no  
56634 reason for using a value of *nmatch* that is larger than *preg->re\_nsub+1*.

56635 The REG\_NEWLINE flag supports a use of RE matching that is needed in some applications like  
56636 text editors. In such applications, the user supplies an RE asking the application to find a line  
56637 that matches the given expression. An anchor in such an RE anchors at the beginning or end of  
56638 any line. Such an application can pass a sequence of <newline>-separated lines to *regexec()* as a  
56639 single long string and specify REG\_NEWLINE to *regcomp()* to get the desired behavior. The  
56640 application must ensure that there are no explicit <newline> characters in *pattern* if it wants to  
56641 ensure that any match occurs entirely within a single line.

56642 The REG\_NEWLINE flag affects the behavior of *regexec()*, but it is in the *cflags* parameter to  
56643 *regcomp()* to allow flexibility of implementation. Some implementations will want to generate  
56644 the same compiled RE in *regcomp()* regardless of the setting of REG\_NEWLINE and have  
56645 *regexec()* handle anchors differently based on the setting of the flag. Other implementations will  
56646 generate different compiled REs based on the REG\_NEWLINE.

56647 The REG\_ICASE flag supports the operations taken by the *grep -i* option and the historical  
56648 implementations of *ex* and *vi*. Including this flag will make it easier for application code to be  
56649 written that does the same thing as these utilities.

56650 The substrings reported in *pmatch[]* are defined using offsets from the start of the string rather  
56651 than pointers. This allows type-safe access to both constant and non-constant strings.

56652 The type **regoff\_t** is used for the elements of *pmatch[]* to ensure that the application can  
56653 represent large arrays in memory (important for an application conforming to the Shell and  
56654 Utilities volume of POSIX.1-2008).

56655 The 1992 edition of this standard required **regoff\_t** to be at least as wide as **off\_t**, to facilitate  
56656 future extensions in which the string to be searched is taken from a file. However, these future  
56657 extensions have not appeared. The requirement rules out popular implementations with 32-bit

**regcomp()**

- 56658 **regoff\_t** and 64-bit **off\_t**, so it has been removed.
- 56659 The standard developers rejected the inclusion of a *regsub()* function that would be used to do  
56660 substitutions for a matched RE. While such a routine would be useful to some applications, its  
56661 utility would be much more limited than the matching function described here. Both RE parsing  
56662 and substitution are possible to implement without support other than that required by the  
56663 ISO C standard, but matching is much more complex than substituting. The only difficult part of  
56664 substitution, given the information supplied by *regexexec()*, is finding the next character in a string  
56665 when there can be multi-byte characters. That is a much larger issue, and one that needs a more  
56666 general solution.
- 56667 The *errno* variable has not been used for error returns to avoid filling the *errno* name space for  
56668 this feature.
- 56669 The interface is defined so that the matched substrings *rm\_sp* and *rm\_ep* are in a separate  
56670 **regmatch\_t** structure instead of in **regex\_t**. This allows a single compiled RE to be used  
56671 simultaneously in several contexts; in *main()* and a signal handler, perhaps, or in multiple  
56672 threads of lightweight processes. (The *preg* argument to *regexexec()* is declared with type **const**, so  
56673 the implementation is not permitted to use the structure to store intermediate results.) It also  
56674 allows an application to request an arbitrary number of substrings from an RE. The number of  
56675 subexpressions in the RE is reported in *re\_nsub* in *preg*. With this change to *regexexec()*,  
56676 consideration was given to dropping the REG\_NOSUB flag since the user can now specify this  
56677 with a zero *nmatch* argument to *regexexec()*. However, keeping REG\_NOSUB allows an  
56678 implementation to use a different (perhaps more efficient) algorithm if it knows in *regcomp()* that  
56679 no subexpressions need be reported. The implementation is only required to fill in *pmatch* if  
56680 *nmatch* is not zero and if REG\_NOSUB is not specified. Note that the **size\_t** type, as defined in  
56681 the ISO C standard, is unsigned, so the description of *regexexec()* does not need to address  
56682 negative values of *nmatch*.
- 56683 REG\_NOTBOL was added to allow an application to do repeated searches for the same pattern  
56684 in a line. If the pattern contains a <circumflex> character that should match the beginning of a  
56685 line, then the pattern should only match when matched against the beginning of the line.  
56686 Without the REG\_NOTBOL flag, the application could rewrite the expression for subsequent  
56687 matches, but in the general case this would require parsing the expression. The need for  
56688 REG\_NOTEOL is not as clear; it was added for symmetry.
- 56689 The addition of the *regerror()* function addresses the historical need for conforming application  
56690 programs to have access to error information more than "Function failed to compile/match your  
56691 RE for unknown reasons".
- 56692 This interface provides for two different methods of dealing with error conditions. The specific  
56693 error codes (REG\_EBRACE, for example), defined in <**regex.h**>, allow an application to recover  
56694 from an error if it is so able. Many applications, especially those that use patterns supplied by a  
56695 user, will not try to deal with specific error cases, but will just use *regerror()* to obtain a human-  
56696 readable error message to present to the user.
- 56697 The *regerror()* function uses a scheme similar to *confstr()* to deal with the problem of allocating  
56698 memory to hold the generated string. The scheme used by *sterror()* in the ISO C standard was  
56699 considered unacceptable since it creates difficulties for multi-threaded applications.
- 56700 The *preg* argument is provided to *regerror()* to allow an implementation to generate a more  
56701 descriptive message than would be possible with *errcode* alone. An implementation might, for  
56702 example, save the character offset of the offending character of the pattern in a field of *preg*, and  
56703 then include that in the generated message string. The implementation may also ignore *preg*.
- 56704 A REG\_FILENAME flag was considered, but omitted. This flag caused *regexexec()* to match

56705 patterns as described in XCU Section 2.13 (on page 2332) instead of REs. This service is now  
56706 provided by the *fnmatch()* function.

56707 Notice that there is a difference in philosophy between the ISO POSIX-2:1993 standard and  
56708 POSIX.1-2008 in how to handle a “bad” regular expression. The ISO POSIX-2:1993 standard says  
56709 that many bad constructs “produce undefined results”, or that “the interpretation is undefined”.  
56710 POSIX.1-2008, however, says that the interpretation of such REs is unspecified. The term  
56711 “undefined” means that the action by the application is an error, of similar severity to passing a  
56712 bad pointer to a function.

56713 The *regcomp()* and *regexec()* functions are required to accept any null-terminated string as the  
56714 *pattern* argument. If the meaning of the string is “undefined”, the behavior of the function is  
56715 “unspecified”. POSIX.1-2008 does not specify how the functions will interpret the pattern; they  
56716 might return error codes, or they might do pattern matching in some completely unexpected  
56717 way, but they should not do something like abort the process.

#### 56718 FUTURE DIRECTIONS

56719 None.

56722 XBD Chapter 9 (on page 181), `<regex.h>`, `<sys/types.h>`

56723 XCU Section 2.13 (on page 2332)

#### 56724 CHANGE HISTORY

56725 First released in Issue 4. Derived from the ISO POSIX-2 standard.

#### 56726 Issue 5

56727 Moved from POSIX2 C-language Binding to BASE.

#### 56728 Issue 6

56729 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

56730 The following new requirements on POSIX implementations derive from alignment with the  
56731 Single UNIX Specification:

- 56732 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
56733 required for conforming implementations of previous POSIX specifications, it was not  
56734 required for UNIX applications.

56735 The normative text is updated to avoid use of the term “must” for application requirements.

56736 The `REG_ENOSYS` constant is removed.

56737 The `restrict` keyword is added to the *regcomp()*, *regerror()*, and *regexec()* prototypes for  
56738 alignment with the ISO/IEC 9899:1999 standard.

#### 56739 Issue 7

56740 Austin Group Interpretation 1003.1-2001 #134 is applied, clarifying that if more than one error  
56741 occurs in processing a function call, any one of the possible constants may be returned.

56742 SD5-XBD-ERN-60 is applied.

**remainder()**56743 **NAME**

56744 remainder, remainderf, remainderl — remainder function

56745 **SYNOPSIS**

56746 #include &lt;math.h&gt;

56747 double remainder(double x, double y);

56748 float remainderf(float x, float y);

56749 long double remainderl(long double x, long double y);

56750 **DESCRIPTION**56751 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
56752 conflict between the requirements described here and the ISO C standard is unintentional. This  
56753 volume of POSIX.1-2008 defers to the ISO C standard.56754 These functions shall return the floating-point remainder  $r=x-ny$  when  $y$  is non-zero. The value  
56755  $n$  is the integral value nearest the exact value  $x/y$ . When  $|n-x/y| = 1/2$ , the value  $n$  is chosen to  
56756 be even.56757 The behavior of *remainder()* shall be independent of the rounding mode.56758 **RETURN VALUE**56759 Upon successful completion, these functions shall return the floating-point remainder  $r=x-ny$   
56760 when  $y$  is non-zero.56761 On systems that do not support the IEC 60559 Floating-Point option, if  $y$  is zero, it is  
56762 implementation-defined whether a domain error occurs or zero is returned.56763 MX If  $x$  or  $y$  is NaN, a NaN shall be returned.56764 If  $x$  is infinite or  $y$  is 0 and the other is non-NaN, a domain error shall occur, and either a NaN (if  
56765 supported), or an implementation-defined value shall be returned.56766 **ERRORS**

56767 These functions shall fail if:

56768 MX **Domain Error** The  $x$  argument is  $\pm\text{Inf}$ , or the  $y$  argument is  $\pm 0$  and the other argument is non-  
56769 NaN.56770 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
56771 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
56772 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
56773 shall be raised.

56774 These functions may fail if:

56775 **Domain Error** The  $y$  argument is zero.56776 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
56777 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
56778 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
56779 shall be raised.

56780 **EXAMPLES**

56781 None.

56782 **APPLICATION USAGE**56783 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
56784 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.56785 **RATIONALE**

56786 None.

56787 **FUTURE DIRECTIONS**

56788 None.

56789 **SEE ALSO**56790 *abs()*, *div()*, *feclearexcept()*, *fetestexcept()*, *ldiv()*

56791 XBD Section 4.19 (on page 116), &lt;math.h&gt;

56792 **CHANGE HISTORY**

56793 First released in Issue 4, Version 2.

56794 **Issue 5**

56795 Moved from X/OPEN UNIX extension to BASE.

56796 **Issue 6**56797 The *remainder()* function is no longer marked as an extension.56798 The *remainderf()* and *remainderl()* functions are added for alignment with the ISO/IEC 9899:1999  
56799 standard.56800 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
56801 revised to align with the ISO/IEC 9899:1999 standard.56802 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
56803 marked.56804 **Issue 7**

56805 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #55 (SD5-XSH-ERN-82) is applied.

**remove()**56806 **NAME**56807 `remove` — remove a file56808 **SYNOPSIS**56809 `#include <stdio.h>`56810 `int remove(const char *path);`56811 **DESCRIPTION**56812 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
56813 conflict between the requirements described here and the ISO C standard is unintentional. This  
56814 volume of POSIX.1-2008 defers to the ISO C standard.56815 The `remove()` function shall cause the file named by the pathname pointed to by `path` to be no  
56816 longer accessible by that name. A subsequent attempt to open that file using that name shall fail,  
56817 unless it is created anew.56818 CX If `path` does not name a directory, `remove(path)` shall be equivalent to `unlink(path)`.56819 If `path` names a directory, `remove(path)` shall be equivalent to `rmdir(path)`.56820 **RETURN VALUE**56821 CX Refer to `rmdir()` or `unlink()`.56822 **ERRORS**56823 CX Refer to `rmdir()` or `unlink()`.56824 **EXAMPLES**56825 **Removing Access to a File**56826 The following example shows how to remove access to a file named `/home/cnd/old_mods`.56827 `#include <stdio.h>`  
56828 `int status;`  
56829 `...`  
56830 `status = remove("/home/cnd/old_mods");`56831 **APPLICATION USAGE**

56832 None.

56833 **RATIONALE**

56834 None.

56835 **FUTURE DIRECTIONS**

56836 None.

56837 **SEE ALSO**56838 `rmdir()`, `unlink()`56839 XBD `<stdio.h>`56840 **CHANGE HISTORY**56841 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ISO C  
56842 standard.56843 **Issue 6**

56844 Extensions beyond the ISO C standard are marked.

56845 The following new requirements on POSIX implementations derive from alignment with the  
56846 Single UNIX Specification:

- 56847
- 56848 • The DESCRIPTION, RETURN VALUE, and ERRORS sections are updated so that if *path* is  
56849 not a directory, *remove()* is equivalent to *unlink()*, and if it is a directory, it is equivalent to  
*rmdir()*.

**remque()***System Interfaces*56850 **NAME**

56851 remque — remove an element from a queue

56852 **SYNOPSIS**56853 XSI `#include <search.h>`56854 `void remque(void *element);`56855 **DESCRIPTION**56856 Refer to *insque()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

56857 **NAME**

56858 remquo, remquof, remquol — remainder functions

56859 **SYNOPSIS**

56860 #include &lt;math.h&gt;

56861 double remquo(double x, double y, int \*quo);

56862 float remquof(float x, float y, int \*quo);

56863 long double remquol(long double x, long double y, int \*quo);

56864 **DESCRIPTION**

56865 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 56866 conflict between the requirements described here and the ISO C standard is unintentional. This  
 56867 volume of POSIX.1-2008 defers to the ISO C standard.

56868 The *remquo()*, *remquof()*, and *remquol()* functions shall compute the same remainder as the  
 56869 *remainder()*, *remainderf()*, and *remainderl()* functions, respectively. In the object pointed to by *quo*,  
 56870 they store a value whose sign is the sign of  $x/y$  and whose magnitude is congruent modulo  $2^n$   
 56871 to the magnitude of the integral quotient of  $x/y$ , where  $n$  is an implementation-defined integer  
 56872 greater than or equal to 3. If  $y$  is zero, the value stored in the object pointed to by *quo* is  
 56873 unspecified.

56874 An application wishing to check for error situations should set *errno* to zero and call  
 56875 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 56876 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 56877 zero, an error has occurred.

56878 **RETURN VALUE**56879 These functions shall return  $x \text{ REM } y$ .

56880 On systems that do not support the IEC 60559 Floating-Point option, if  $y$  is zero, it is  
 56881 implementation-defined whether a domain error occurs or zero is returned.

56882 MX If  $x$  or  $y$  is NaN, a NaN shall be returned.

56883 If  $x$  is  $\pm\text{Inf}$  or  $y$  is zero and the other argument is non-NaN, a domain error shall occur, and either  
 56884 a NaN (if supported), or an implementation-defined value shall be returned.

56885 **ERRORS**

56886 These functions shall fail if:

56887 MX **Domain Error** The  $x$  argument is  $\pm\text{Inf}$ , or the  $y$  argument is  $\pm 0$  and the other argument is non-  
 56888 NaN.

56889 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 56890 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 56891 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 56892 shall be raised.

56893 These functions may fail if:

56894 **Domain Error** The  $y$  argument is zero.

56895 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 56896 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 56897 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 56898 shall be raised.

**remquo()**56899 **EXAMPLES**

56900 None.

56901 **APPLICATION USAGE**56902 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
56903 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.56904 **RATIONALE**56905 These functions are intended for implementing argument reductions which can exploit a few  
56906 low-order bits of the quotient. Note that *x* may be so large in magnitude relative to *y* that an  
56907 exact representation of the quotient is not practical.56908 **FUTURE DIRECTIONS**

56909 None.

56910 **SEE ALSO**56911 *feclearexcept()*, *fetestexcept()*, *remainder()*

56912 XBD Section 4.19 (on page 116), &lt;math.h&gt;

56913 **CHANGE HISTORY**

56914 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

56915 **Issue 7**

56916 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #56 (SD5-XSH-ERN-83) is applied.

56917 **NAME**

56918 rename, renameat — rename file relative to directory file descriptor

56919 **SYNOPSIS**

56920 #include &lt;stdio.h&gt;

56921 int rename(const char \*old, const char \*new);

56922 CX int renameat(int oldfd, const char \*old, int newfd,  
56923 const char \*new);56924 **DESCRIPTION**56925 CX For *rename()*: The functionality described on this reference page is aligned with the ISO C  
56926 standard. Any conflict between the requirements described here and the ISO C standard is  
56927 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.56928 The *rename()* function shall change the name of a file. The *old* argument points to the pathname  
56929 CX of the file to be renamed. The *new* argument points to the new pathname of the file. If the *new*  
56930 argument does not resolve to an existing directory entry for a file of type directory and the *new*  
56931 argument contains at least one non-*</i>slash*>* character and ends with one or more trailing  
56932 *</i>slash*>* characters after all symbolic links have been processed, *rename()* shall fail.**56933 If either the *old* or *new* argument names a symbolic link, *rename()* shall operate on the symbolic  
56934 link itself, and shall not resolve the last component of the argument. If the *old* argument and the  
56935 *new* argument resolve to either the same existing directory entry or different directory entries for  
56936 the same existing file, *rename()* shall return successfully and perform no other action.56937 If the *old* argument points to the pathname of a file that is not a directory, the *new* argument shall  
56938 not point to the pathname of a directory. If the link named by the *new* argument exists, it shall be  
56939 removed and *old* renamed to *new*. In this case, a link named *new* shall remain visible to other  
56940 processes throughout the renaming operation and refer either to the file referred to by *new* or *old*  
56941 before the operation began. Write access permission is required for both the directory containing  
56942 *old* and the directory containing *new*.56943 If the *old* argument points to the pathname of a directory, the *new* argument shall not point to the  
56944 pathname of a file that is not a directory. If the directory named by the *new* argument exists, it  
56945 shall be removed and *old* renamed to *new*. In this case, a link named *new* shall exist throughout  
56946 the renaming operation and shall refer either to the directory referred to by *new* or *old* before the  
56947 operation began. If *new* names an existing directory, it shall be required to be an empty directory.56948 If either *pathname* argument refers to a path whose final component is either dot or dot-dot,  
56949 *rename()* shall fail.56950 If the *old* argument points to a pathname of a symbolic link, the symbolic link shall be renamed.  
56951 If the *new* argument points to a pathname of a symbolic link, the symbolic link shall be removed.56952 The *old* pathname shall not name an ancestor directory of the *new* pathname. Write access  
56953 permission is required for the directory containing *old* and the directory containing *new*. If the  
56954 *old* argument points to the pathname of a directory, write access permission may be required for  
56955 the directory named by *old*, and, if it exists, the directory named by *new*.56956 If the link named by the *new* argument exists and the file's link count becomes 0 when it is  
56957 removed and no process has the file open, the space occupied by the file shall be freed and the  
56958 file shall no longer be accessible. If one or more processes have the file open when the last link is  
56959 removed, the link shall be removed before *rename()* returns, but the removal of the file contents  
56960 shall be postponed until all references to the file are closed.56961 Upon successful completion, *rename()* shall mark for update the last data modification and last

**rename()**

56962 file status change timestamps of the parent directory of each file.

56963 If the *rename()* function fails for any reason other than [EIO], any file named by *new* shall be  
56964 unaffected.

56965 The *renameat()* function shall be equivalent to the *rename()* function except in the case where  
56966 either *old* or *new* specifies a relative path. If *old* is a relative path, the file to be renamed is located  
56967 relative to the directory associated with the file descriptor *oldfd* instead of the current working  
56968 directory. If *new* is a relative path, the same happens only relative to the directory associated  
56969 with *newfd*. If the file descriptor was opened without O\_SEARCH, the function shall check  
56970 whether directory searches are permitted using the current permissions of the directory  
56971 underlying the file descriptor. If the file descriptor was opened with O\_SEARCH, the function  
56972 shall not perform the check.

56973 If *renameat()* is passed the special value AT\_FDCWD in the *oldfd* or *newfd* parameter, the current  
56974 working directory shall be used in the determination of the file for the respective *path* parameter.

56975 **RETURN VALUE**

56976 CX Upon successful completion, the *rename()* function shall return 0. Otherwise, it shall return -1,  
56977 *errno* shall be set to indicate the error, and neither the file named by *old* nor the file named by  
56978 *new* shall be changed or created.

56979 CX Upon successful completion, the *renameat()* function shall return 0. Otherwise, it shall return -1  
56980 and set *errno* to indicate the error.

56981 **ERRORS**

56982 CX The *rename()* and *renameat()* functions shall fail if:

56983 CX [EACCES] A component of either path prefix denies search permission; or one of the  
56984 directories containing *old* or *new* denies write permissions; or, write  
56985 permission is required and is denied for a directory pointed to by the *old* or  
56986 *new* arguments.

56987 CX [EBUSY] The directory named by *old* or *new* is currently in use by the system or another  
56988 process, and the implementation considers this an error.

56989 CX [EEXIST] or [ENOTEMPTY]  
56990 The link named by *new* is a directory that is not an empty directory.

56991 CX [EINVAL] The *old* pathname names an ancestor directory of the *new* pathname, or either  
56992 *pathname* argument contains a final component that is dot or dot-dot.

56993 CX [EIO] A physical I/O error has occurred.

56994 CX [EISDIR] The *new* argument points to a directory and the *old* argument points to a file  
56995 that is not a directory.

56996 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
56997 argument.

56998 CX [EMLINK] The file named by *old* is a directory, and the link count of the parent directory  
56999 of *new* would exceed {LINK\_MAX}.

57000 CX [ENAMETOOLONG]  
57001 The length of a component of a pathname is longer than {NAME\_MAX}.

57002 CX [ENOENT] The link named by *old* does not name an existing file, a component of the path  
57003 prefix of *new* does not exist, or either *old* or *new* points to an empty string.

57004	CX	[ENOSPC]	The directory that would contain <i>new</i> cannot be extended.
57005	CX	[ENOTDIR]	A component of either path prefix is not a directory; or the <i>old</i> argument names a directory and the <i>new</i> argument names a non-directory file; or the <i>old</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory; or the <i>new</i> argument names a non-existent file, contains at least one non- <code>&lt;slash&gt;</code> character, and ends with one or more trailing <code>&lt;slash&gt;</code> characters.
57006			
57007			
57008			
57009			
57010			
57011			
57012	XSI	[EPERM] or [EACCES]	The <code>S_ISVTX</code> flag is set on the directory containing the file referred to by <i>old</i> and the process does not satisfy the criteria specified in XBD Section 4.2 (on page 107) with respect to <i>old</i> ; or <i>new</i> refers to an existing file, the <code>S_ISVTX</code> flag is set on the directory containing this file, and the process does not satisfy the criteria specified in XBD Section 4.2 with respect to this file.
57013			
57014			
57015			
57016			
57017			
57018	CX	[EROFS]	The requested operation requires writing in a directory on a read-only file system.
57019			
57020	CX	[EXDEV]	The links named by <i>new</i> and <i>old</i> are on different file systems and the implementation does not support links between file systems.
57021			
57022	CX		In addition, the <code>renameat()</code> function shall fail if:
57023		[EACCES]	<i>oldfd</i> or <i>newfd</i> was not opened with <code>O_SEARCH</code> and the permissions of the directory underlying <i>oldfd</i> or <i>newfd</i> respectively do not permit directory searches.
57024			
57025			
57026		[EBADF]	The <i>old</i> argument does not specify an absolute path and the <i>oldfd</i> argument is neither <code>AT_FDCWD</code> nor a valid file descriptor open for reading or searching, or the <i>new</i> argument does not specify an absolute path and the <i>newfd</i> argument is neither <code>AT_FDCWD</code> nor a valid file descriptor open for reading or searching.
57027			
57028			
57029			
57030			
57031	CX		The <code>rename()</code> and <code>renameat()</code> functions may fail if:
57032	OB XSR	[EBUSY]	The file named by the <i>old</i> or <i>new</i> arguments is a named STREAM.
57033	CX	[ELOOP]	More than <code>{SYMLOOP_MAX}</code> symbolic links were encountered during resolution of the <i>path</i> argument.
57034			
57035	CX	[ENAMETOOLONG]	The length of a pathname exceeds <code>{PATH_MAX}</code> , or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds <code>{PATH_MAX}</code> .
57036			
57037			
57038			
57039	CX	[ETXTBSY]	The file to be renamed is a pure procedure (shared text) file that is being executed.
57040			
57041	CX		The <code>renameat()</code> function may fail if:
57042		[ENOTDIR]	The <i>old</i> argument is not an absolute path and <i>oldfd</i> is neither <code>AT_FDCWD</code> nor a file descriptor associated with a directory, or the <i>new</i> argument is not an absolute path and <i>newfd</i> is neither <code>AT_FDCWD</code> nor a file descriptor associated with a directory.
57043			
57044			
57045			

**rename()**57046 **EXAMPLES**57047 **Renaming a File**

57048 The following example shows how to rename a file named `/home/cnd/mod1` to  
 57049 `/home/cnd/mod2`.

```
57050 #include <stdio.h>
57051 int status;
57052 ...
57053 status = rename("/home/cnd/mod1", "/home/cnd/mod2");
```

57054 **APPLICATION USAGE**

57055 Some implementations mark for update the last file status change timestamp of renamed files  
 57056 and some do not. Applications which make use of the last file status change timestamp may  
 57057 behave differently with respect to renamed files unless they are designed to allow for either  
 57058 behavior.

57059 **RATIONALE**

57060 This *rename()* function is equivalent for regular files to that defined by the ISO C standard. Its  
 57061 inclusion here expands that definition to include actions on directories and specifies behavior  
 57062 when the *new* parameter names a file that already exists. That specification requires that the  
 57063 action of the function be atomic.

57064 One of the reasons for introducing this function was to have a means of renaming directories  
 57065 while permitting implementations to prohibit the use of *link()* and *unlink()* with directories,  
 57066 thus constraining links to directories to those made by *mkdir()*.

57067 The specification that if *old* and *new* refer to the same file is intended to guarantee that:

```
57068 rename("x", "x");
```

57069 does not remove the file.

57070 Renaming dot or dot-dot is prohibited in order to prevent cyclical file system paths.

57071 See also the descriptions of [ENOTEMPTY] and [ENAMETOOLONG] in *rmdir()* and [EBUSY] in  
 57072 *unlink()*. For a discussion of [EXDEV], see *link()*.

57073 The purpose of the *renameat()* function is to rename files in directories other than the current  
 57074 working directory without exposure to race conditions. Any part of the path of a file could be  
 57075 changed in parallel to a call to *rename()*, resulting in unspecified behavior. By opening file  
 57076 descriptors for the source and target directories and using the *renameat()* function it can be  
 57077 guaranteed that that renamed file is located correctly and the resulting file is in the desired  
 57078 directory.

57079 **FUTURE DIRECTIONS**

57080 None.

57081 **SEE ALSO**

57082 *link()*, *rmdir()*, *symlink()*, *unlink()*

57083 XBD Section 4.2 (on page 107), `<stdio.h>`

57084 **CHANGE HISTORY**

57085 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

57086 **Issue 5**

57087 The [EBUSY] error is added to the optional part of the ERRORS section.

57088 **Issue 6**

57089 Extensions beyond the ISO C standard are marked.

57090 The following new requirements on POSIX implementations derive from alignment with the  
57091 Single UNIX Specification:

- 57092 • The [EIO] mandatory error condition is added.
- 57093 • The [ELOOP] mandatory error condition is added.
- 57094 • A second [ENAMETOOLONG] is added as an optional error condition.
- 57095 • The [ETXTBSY] optional error condition is added.

57096 The following changes were made to align with the IEEE P1003.1a draft standard:

- 57097 • Details are added regarding the treatment of symbolic links.
- 57098 • The [ELOOP] optional error condition is added.

57099 The normative text is updated to avoid use of the term “must” for application requirements.

57100 **Issue 7**

57101 Austin Group Interpretation 1003.1-2001 #016 is applied, changing the definition of the  
57102 [ENOTDIR] error.

57103 Austin Group Interpretation 1003.1-2001 #076 is applied, clarifying the behavior if the final  
57104 component of a path is either dot or dot-dot, and adding the associated [EINVAL] error case.

57105 Austin Group Interpretation 1003.1-2001 #143 is applied.

57106 Austin Group Interpretation 1003.1-2001 #145 is applied, clarifying that the [ENOENT] error  
57107 condition also applies to the case in which a component of *new* does not exist.

57108 Austin Group Interpretations 1003.1-2001 #174 and #181 are applied.

57109 The *renameat()* function is added from The Open Group Technical Standard, 2006, Extended API  
57110 Set Part 2.

57111 Changes are made related to support for finegrained timestamps.

57112 Changes are made to allow a directory to be opened for searching.

**rewind()**57113 **NAME**57114 `rewind` — reset the file position indicator in a stream57115 **SYNOPSIS**57116 `#include <stdio.h>`57117 `void rewind(FILE *stream);`57118 **DESCRIPTION**57119 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
57120 conflict between the requirements described here and the ISO C standard is unintentional. This  
57121 volume of POSIX.1-2008 defers to the ISO C standard.

57122 The call:

57123 `rewind(stream)`

57124 shall be equivalent to:

57125 `(void) fseek(stream, 0L, SEEK_SET)`57126 except that `rewind()` shall also clear the error indicator.57127 CX Since `rewind()` does not return a value, an application wishing to detect errors should clear `errno`,  
57128 then call `rewind()`, and if `errno` is non-zero, assume an error has occurred.57129 **RETURN VALUE**57130 The `rewind()` function shall not return a value.57131 **ERRORS**57132 CX Refer to `fseek()` with the exception of [EINVAL] which does not apply.57133 **EXAMPLES**

57134 None.

57135 **APPLICATION USAGE**

57136 None.

57137 **RATIONALE**

57138 None.

57139 **FUTURE DIRECTIONS**

57140 None.

57141 **SEE ALSO**57142 `fseek()`57143 XBD `<stdio.h>`57144 **CHANGE HISTORY**

57145 First released in Issue 1. Derived from Issue 1 of the SVID.

57146 **Issue 6**

57147 Extensions beyond the ISO C standard are marked.

57148 **NAME**

57149            rewinddir — reset the position of a directory stream to the beginning of a directory

57150 **SYNOPSIS**

57151            #include &lt;dirent.h&gt;

57152            void rewinddir(DIR \*dirp);

57153 **DESCRIPTION**

57154            The *rewinddir()* function shall reset the position of the directory stream to which *dirp* refers to the beginning of the directory. It shall also cause the directory stream to refer to the current state of the corresponding directory, as a call to *opendir()* would have done. If *dirp* does not refer to a directory stream, the effect is undefined.

57158            After a call to the *fork()* function, either the parent or child (but not both) may continue processing the directory stream using *readdir()*, *rewinddir()*, or *seekdir()*. If both the parent and child processes use these functions, the result is undefined.

57161 **RETURN VALUE**57162            The *rewinddir()* function shall not return a value.57163 **ERRORS**

57164            No errors are defined.

57165 **EXAMPLES**

57166            None.

57167 **APPLICATION USAGE**

57168            The *rewinddir()* function should be used in conjunction with *opendir()*, *readdir()*, and *closedir()* to examine the contents of the directory. This method is recommended for portability.

57170 **RATIONALE**

57171            None.

57172 **FUTURE DIRECTIONS**

57173            None.

57174 **SEE ALSO**57175            *closedir()*, *fdopendir()*, *readdir()*

57176            XBD &lt;dirent.h&gt;, &lt;sys/types.h&gt;

57177 **CHANGE HISTORY**

57178            First released in Issue 2.

57179 **Issue 6**

57180            In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

57181            The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 57183            • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

**rint()**57186 **NAME**

57187 rint, rintf, rintl — round-to-nearest integral value

57188 **SYNOPSIS**

```
57189 #include <math.h>
57190 double rint(double x);
57191 float rintf(float x);
57192 long double rintl(long double x);
```

57193 **DESCRIPTION**

57194 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 57195 conflict between the requirements described here and the ISO C standard is unintentional. This  
 57196 volume of POSIX.1-2008 defers to the ISO C standard.

57197 These functions shall return the integral value (represented as a **double**) nearest  $x$  in the  
 57198 direction of the current rounding mode. The current rounding mode is implementation-defined.

57199 If the current rounding mode rounds toward negative infinity, then *rint()* shall be equivalent to  
 57200 *floor()*. If the current rounding mode rounds toward positive infinity, then *rint()* shall be  
 57201 equivalent to *ceil()*.

57202 These functions differ from the *nearbyint()*, *nearbyintf()*, and *nearbyintl()* functions only in that  
 57203 they may raise the inexact floating-point exception if the result differs in value from the  
 57204 argument.

57205 An application wishing to check for error situations should set *errno* to zero and call  
 57206 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 57207 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 57208 zero, an error has occurred.

57209 **RETURN VALUE**

57210 Upon successful completion, these functions shall return the integer (represented as a double  
 57211 precision number) nearest  $x$  in the direction of the current rounding mode.

57212 MX If  $x$  is NaN, a NaN shall be returned.

57213 If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.

57214 XSI If the correct value would cause overflow, a range error shall occur and *rint()*, *rintf()*, and *rintl()*  
 57215 shall return the value of the macro  $\pm \text{HUGE\_VAL}$ ,  $\pm \text{HUGE\_VALF}$ , and  $\pm \text{HUGE\_VALL}$  (with the  
 57216 same sign as  $x$ ), respectively.

57217 **ERRORS**

57218 These functions shall fail if:

57219 XSI **Range Error** The result would cause an overflow.

57220 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 57221 then *errno* shall be set to [ERANGE]. If the integer expression  
 57222 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 57223 floating-point exception shall be raised.

57224 **EXAMPLES**

57225 None.

57226 **APPLICATION USAGE**57227 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
57228 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.57229 **RATIONALE**

57230 None.

57231 **FUTURE DIRECTIONS**

57232 None.

57233 **SEE ALSO**57234 *abs()*, *ceil()*, *feclearexcept()*, *fetetestexcept()*, *floor()*, *isnan()*, *nearbyint()*

57235 XBD Section 4.19 (on page 116), &lt;math.h&gt;

57236 **CHANGE HISTORY**

57237 First released in Issue 4, Version 2.

57238 **Issue 5**

57239 Moved from X/OPEN UNIX extension to BASE.

57240 **Issue 6**

57241 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 57242 • The *rintf()* and *rintl()* functions are added.
- 57243 • The *rint()* function is no longer marked as an extension.
- 57244 • The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
57245 revised to align with the ISO/IEC 9899:1999 standard.
- 57246 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard  
57247 are marked.

**rmdir()**57248 **NAME**57249 `rmdir` — remove a directory57250 **SYNOPSIS**

```
57251 #include <unistd.h>
57252 int rmdir(const char *path);
```

57253 **DESCRIPTION**

57254 The `rmdir()` function shall remove a directory whose name is given by *path*. The directory shall  
 57255 be removed only if it is an empty directory.

57256 If the directory is the root directory or the current working directory of any process, it is  
 57257 unspecified whether the function succeeds, or whether it shall fail and set *errno* to [EBUSY].

57258 If *path* names a symbolic link, then `rmdir()` shall fail and set *errno* to [ENOTDIR].

57259 If the *path* argument refers to a path whose final component is either dot or dot-dot, `rmdir()` shall  
 57260 fail.

57261 If the directory's link count becomes 0 and no process has the directory open, the space occupied  
 57262 by the directory shall be freed and the directory shall no longer be accessible. If one or more  
 57263 processes have the directory open when the last link is removed, the dot and dot-dot entries, if  
 57264 present, shall be removed before `rmdir()` returns and no new entries may be created in the  
 57265 directory, but the directory shall not be removed until all references to the directory are closed.

57266 If the directory is not an empty directory, `rmdir()` shall fail and set *errno* to [EEXIST] or  
 57267 [ENOTEMPTY].

57268 Upon successful completion, `rmdir()` shall mark for update the last data modification and last  
 57269 file status change timestamps of the parent directory.

57270 **RETURN VALUE**

57271 Upon successful completion, the function `rmdir()` shall return 0. Otherwise, -1 shall be returned,  
 57272 and *errno* set to indicate the error. If -1 is returned, the named directory shall not be changed.

57273 **ERRORS**

57274 The `rmdir()` function shall fail if:

57275 [EACCES] Search permission is denied on a component of the path prefix, or write  
 57276 permission is denied on the parent directory of the directory to be removed.

57277 [EBUSY] The directory to be removed is currently in use by the system or some process  
 57278 and the implementation considers this to be an error.

57279 [EEXIST] or [ENOTEMPTY]

57280 The *path* argument names a directory that is not an empty directory, or there  
 57281 are hard links to the directory other than dot or a single entry in dot-dot.

57282 [EINVAL] The *path* argument contains a last component that is dot.

57283 [EIO] A physical I/O error has occurred.

57284 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 57285 argument.

57286 [ENAMETOOLONG]

57287 The length of a component of a pathname is longer than {NAME\_MAX}.

57288 [ENOENT] A component of *path* does not name an existing file, or the *path* argument  
 57289 names a nonexistent directory or points to an empty string.

- 57290 [ENOTDIR] A component of *path* is not a directory.
- 57291 XSI [EPERM] or [EACCES]  
 57292 The S\_ISVTX flag is set on the directory containing the file referred to by the  
 57293 *path* argument and the process does not satisfy the criteria specified in XBD  
 57294 Section 4.2 (on page 107).
- 57295 [EROFS] The directory entry to be removed resides on a read-only file system.
- 57296 The *rmdir()* function may fail if:
- 57297 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 57298 resolution of the *path* argument.
- 57299 [ENAMETOOLONG]  
 57300 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 57301 symbolic link produced an intermediate result with a length that exceeds  
 57302 {PATH\_MAX}.

57303 **EXAMPLES**57304 **Removing a Directory**

57305 The following example shows how to remove a directory named `/home/cnd/mod1`.

```
57306 #include <unistd.h>
57307 int status;
57308 ...
57309 status = rmdir("/home/cnd/mod1");
```

57310 **APPLICATION USAGE**

57311 None.

57312 **RATIONALE**

57313 The *rmdir()* and *rename()* functions originated in 4.2 BSD, and they used [ENOTEMPTY] for the  
 57314 condition when the directory to be removed does not exist or *new* already exists. When the 1984  
 57315 /usr/group standard was published, it contained [EEXIST] instead. When these functions were  
 57316 adopted into System V, the 1984 /usr/group standard was used as a reference. Therefore,  
 57317 several existing applications and implementations support/use both forms, and no agreement  
 57318 could be reached on either value. All implementations are required to supply both [EEXIST] and  
 57319 [ENOTEMPTY] in `<errno.h>` with distinct values, so that applications can use both values in C-  
 57320 language `case` statements.

57321 The meaning of deleting *pathname/dot* is unclear, because the name of the file (directory) in the  
 57322 parent directory to be removed is not clear, particularly in the presence of multiple links to a  
 57323 directory.

57324 The POSIX.1-1990 standard was silent with regard to the behavior of *rmdir()* when there are  
 57325 multiple hard links to the directory being removed. The requirement to set *errno* to [EEXIST] or  
 57326 [ENOTEMPTY] clarifies the behavior in this case.

57327 If the current working directory of the process is being removed, that should be an allowed  
 57328 error.

57329 Virtually all existing implementations detect [ENOTEMPTY] or the case of dot-dot. The text in  
 57330 Section 2.3 (on page 477) about returning any one of the possible errors permits that behavior to  
 57331 continue. The [ELOOP] error may be returned if more than {SYMLOOP\_MAX} symbolic links  
 57332 are encountered during resolution of the *path* argument.

**rmdir()**57333 **FUTURE DIRECTIONS**

57334 None.

57335 **SEE ALSO**57336 [Section 2.3](#) (on page 477), *mkdir()*, *remove()*, *rename()*, *unlink()*57337 XBD [Section 4.2](#) (on page 107), `<unistd.h>`57338 **CHANGE HISTORY**

57339 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

57340 **Issue 6**57341 The following new requirements on POSIX implementations derive from alignment with the  
57342 Single UNIX Specification:

- 57343 • The DESCRIPTION is updated to indicate the results of naming a symbolic link in *path*.
- 57344 • The [EIO] mandatory error condition is added.
- 57345 • The [ELOOP] mandatory error condition is added.
- 57346 • A second [ENAMETOOLONG] is added as an optional error condition.

57347 The following changes were made to align with the IEEE P1003.1a draft standard:

- 57348 • The [ELOOP] optional error condition is added.

57349 **Issue 7**

57350 Austin Group Interpretation 1003.1-2001 #143 is applied.

57351 Austin Group Interpretation 1003.1-2001 #181 is applied, updating the requirements for  
57352 operations when the S\_ISVTX bit is set.

57353 Changes are made related to support for finegrained timestamps.

57354 **NAME**

57355 round, roundf, roundl — round to the nearest integer value in a floating-point format

57356 **SYNOPSIS**

```
57357 #include <math.h>
57358 double round(double x);
57359 float roundf(float x);
57360 long double roundl(long double x);
```

57361 **DESCRIPTION**

57362 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 57363 conflict between the requirements described here and the ISO C standard is unintentional. This  
 57364 volume of POSIX.1-2008 defers to the ISO C standard.

57365 These functions shall round their argument to the nearest integer value in floating-point format,  
 57366 rounding halfway cases away from zero, regardless of the current rounding direction.

57367 An application wishing to check for error situations should set *errno* to zero and call  
 57368 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 57369 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 57370 zero, an error has occurred.

57371 **RETURN VALUE**

57372 Upon successful completion, these functions shall return the rounded integer value.

57373 MX If *x* is NaN, a NaN shall be returned.57374 If *x* is  $\pm 0$  or  $\pm \text{Inf}$ , *x* shall be returned.

57375 XSI If the correct value would cause overflow, a range error shall occur and *round*(*x*), *roundf*(*x*), and  
 57376 *roundl*(*x*) shall return the value of the macro  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$   
 57377 (with the same sign as *x*), respectively.

57378 **ERRORS**

57379 These functions may fail if:

57380 XSI **Range Error** The result overflows.

57381 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 57382 then *errno* shall be set to [ERANGE]. If the integer expression  
 57383 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 57384 floating-point exception shall be raised.

57385 **EXAMPLES**

57386 None.

57387 **APPLICATION USAGE**

57388 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 57389 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

57390 **RATIONALE**

57391 None.

57392 **FUTURE DIRECTIONS**

57393 None.

**round()***System Interfaces*57394 **SEE ALSO**57395 *feclearexcept()*, *fetestexcept()*57396 XBD Section 4.19 (on page 116), [<math.h>](#)57397 **CHANGE HISTORY**

57399 **NAME**

57400 scalbn, scalblnf, scalblnl, scalbn, scalbnf, scalbnl — compute exponent using FLT\_RADIX

57401 **SYNOPSIS**

```
57402 #include <math.h>
57403 double scalbn(double x, long n);
57404 float scalblnf(float x, long n);
57405 long double scalblnl(long double x, long n);
57406 double scalbn(double x, int n);
57407 float scalbnf(float x, int n);
57408 long double scalbnl(long double x, int n);
```

57409 **DESCRIPTION**

57410 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 57411 conflict between the requirements described here and the ISO C standard is unintentional. This  
 57412 volume of POSIX.1-2008 defers to the ISO C standard.

57413 These functions shall compute  $x * FLT\_RADIX^n$  efficiently, not normally by computing  
 57414  $FLT\_RADIX^n$  explicitly.

57415 An application wishing to check for error situations should set *errno* to zero and call  
 57416 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 57417 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 57418 zero, an error has occurred.

57419 **RETURN VALUE**

57420 Upon successful completion, these functions shall return  $x * FLT\_RADIX^n$ .

57421 If the result would cause overflow, a range error shall occur and these functions shall return  
 57422  $\pm HUGE\_VAL$ ,  $\pm HUGE\_VALF$ , and  $\pm HUGE\_VALL$  (according to the sign of *x*) as appropriate for  
 57423 the return type of the function.

57424 If the correct value would cause underflow, and is not representable, a range error may occur,  
 57425 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.

57426 **MX** If *x* is NaN, a NaN shall be returned.

57427 If *x* is  $\pm 0$  or  $\pm Inf$ , *x* shall be returned.

57428 If *n* is 0, *x* shall be returned.

57429 If the correct value would cause underflow, and is representable, a range error may occur and  
 57430 the correct value shall be returned.

57431 **ERRORS**

57432 These functions shall fail if:

57433 **Range Error** The result overflows.

57434 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 57435 then *errno* shall be set to [ERANGE]. If the integer expression  
 57436 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 57437 floating-point exception shall be raised.

57438 These functions may fail if:

57439 **Range Error** The result underflows.

57440 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 57441 then *errno* shall be set to [ERANGE]. If the integer expression

**scalbln()**

57442 *(math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
57443 floating-point exception shall be raised.

**EXAMPLES**

57444 None.

**APPLICATION USAGE**

57447 On error, the expressions *(math\_errhandling* & MATH\_ERRNO) and *(math\_errhandling* &  
57448 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**RATIONALE**

57450 These functions are named so as to avoid conflicting with the historical definition of the *scalb()*  
57451 function from the Single UNIX Specification. The difference is that the *scalb()* function has a  
57452 second argument of **double** instead of **int**. The *scalb()* function is not part of the ISO C standard.  
57453 The three functions whose second type is **long** are provided because the factor required to scale  
57454 from the smallest positive floating-point value to the largest finite one, on many  
57455 implementations, is too large to represent in the minimum-width **int** format.

**FUTURE DIRECTIONS**

57456 None.

**SEE ALSO**

57507 *sched\_setscheduler()*.57508 XBD `<sched.h>`57509 **CHANGE HISTORY**

57510 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

57511 **Issue 6**

57512 These functions are marked as part of the Process Scheduling option.

57513 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
57514 implementation does not support the Process Scheduling option.57515 The [ESRCH] error condition has been removed since these functions do not take a *pid*  
57516 argument.57517 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/52 is applied, changing the PS margin  
57518 code in the SYNOPSIS to PS|TPS.

**sched\_getparam()**57519 **NAME**57520 sched\_getparam — get scheduling parameters (**REALTIME**)57521 **SYNOPSIS**

```
57522 PS #include <sched.h>
57523 int sched_getparam(pid_t pid, struct sched_param *param);
```

57524 **DESCRIPTION**

57525 The *sched\_getparam()* function shall return the scheduling parameters of a process specified by  
57526 *pid* in the **sched\_param** structure pointed to by *param*.

57527 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
57528 parameters for the process whose process ID is equal to *pid* shall be returned.

57529 If *pid* is zero, the scheduling parameters for the calling process shall be returned. The behavior of  
57530 the *sched\_getparam()* function is unspecified if the value of *pid* is negative.

57531 **RETURN VALUE**

57532 Upon successful completion, the *sched\_getparam()* function shall return zero. If the call to  
57533 *sched\_getparam()* is unsuccessful, the function shall return a value of -1 and set *errno* to indicate  
57534 the error.

57535 **ERRORS**

57536 The *sched\_getparam()* function shall fail if:

57537 [EPERM] The requesting process does not have permission to obtain the scheduling  
57538 parameters of the specified process.

57539 [ESRCH] No process can be found corresponding to that specified by *pid*.

57540 **EXAMPLES**

57541 None.

57542 **APPLICATION USAGE**

57543 None.

57544 **RATIONALE**

57545 None.

57550 XBD <**sched.h**>

57551 **CHANGE HISTORY**

57552 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

57553 **Issue 6**

57554 The *sched\_getparam()* function is marked as part of the Process Scheduling option.

57555 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
57556 implementation does not support the Process Scheduling option.

57557 **NAME**57558 sched\_getscheduler — get scheduling policy (**REALTIME**)57559 **SYNOPSIS**

```
57560 PS #include <sched.h>
57561 int sched_getscheduler(pid_t pid);
```

57562 **DESCRIPTION**

57563 The *sched\_getscheduler()* function shall return the scheduling policy of the process specified by  
 57564 *pid*. If the value of *pid* is negative, the behavior of the *sched\_getscheduler()* function is  
 57565 unspecified.

57566 The values that can be returned by *sched\_getscheduler()* are defined in the `<sched.h>` header.

57567 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
 57568 policy shall be returned for the process whose process ID is equal to *pid*.

57569 If *pid* is zero, the scheduling policy shall be returned for the calling process.

57570 **RETURN VALUE**

57571 Upon successful completion, the *sched\_getscheduler()* function shall return the scheduling policy  
 57572 of the specified process. If unsuccessful, the function shall return `-1` and set *errno* to indicate the  
 57573 error.

57574 **ERRORS**

57575 The *sched\_getscheduler()* function shall fail if:

- |       |         |  |
|-------|---------|--|
| 57576 | [EPERM] | The requesting process does not have permission to determine the scheduling policy of the specified process. |
| 57577 |         |  |
| 57578 | [ESRCH] | No process can be found corresponding to that specified by <i>pid</i> .                                      |

57590 **CHANGE HISTORY**

57591 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

57592 **Issue 6**

57593 The *sched\_getscheduler()* function is marked as part of the Process Scheduling option.

57594 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 57595 implementation does not support the Process Scheduling option.

**sched\_rr\_get\_interval()**

System Interfaces

57596 **NAME**57597 sched\_rr\_get\_interval — get execution time limits (**REALTIME**)57598 **SYNOPSIS**

```
57599 PS|TPS #include <sched.h>
57600 int sched_rr_get_interval(pid_t pid, struct timespec *interval);
```

57601 **DESCRIPTION**

57602 The *sched\_rr\_get\_interval()* function shall update the **timespec** structure referenced by the  
 57603 *interval* argument to contain the current execution time limit (that is, time quantum) for the  
 57604 process specified by *pid*. If *pid* is zero, the current execution time limit for the calling process  
 57605 shall be returned.

57606 **RETURN VALUE**

57607 If successful, the *sched\_rr\_get\_interval()* function shall return zero. Otherwise, it shall return a  
 57608 value of  $-1$  and set *errno* to indicate the error.

57609 **ERRORS**

57610 The *sched\_rr\_get\_interval()* function shall fail if:

57611 [ESRCH] No process can be found corresponding to that specified by *pid*.

57612 **EXAMPLES**

57613 None.

57614 **APPLICATION USAGE**

57615 None.

57623 XBD [<sched.h>](#)

57624 **CHANGE HISTORY**

57625 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

57626 **Issue 6**

57627 The *sched\_rr\_get\_interval()* function is marked as part of the Process Scheduling option.

57628 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 57629 implementation does not support the Process Scheduling option.

57630 IEEE Std 1003.1-2001/Cor 1-2002, XSH/TC1/D6/53 is applied, changing the PS margin code in  
 57631 the SYNOPSIS to PS|TPS.

57632 **NAME**57633 sched\_setparam — set scheduling parameters (**REALTIME**)57634 **SYNOPSIS**

```
57635 PS #include <sched.h>
57636 int sched_setparam(pid_t pid, const struct sched_param *param);
```

57637 **DESCRIPTION**

57638 The *sched\_setparam()* function shall set the scheduling parameters of the process specified by *pid*  
 57639 to the values specified by the **sched\_param** structure pointed to by *param*. The value of the  
 57640 *sched\_priority* member in the **sched\_param** structure shall be any integer within the inclusive  
 57641 priority range for the current scheduling policy of the process specified by *pid*. Higher  
 57642 numerical values for the priority represent higher priorities. If the value of *pid* is negative, the  
 57643 behavior of the *sched\_setparam()* function is unspecified.

57644 If a process specified by *pid* exists, and if the calling process has permission, the scheduling  
 57645 parameters shall be set for the process whose process ID is equal to *pid*.

57646 If *pid* is zero, the scheduling parameters shall be set for the calling process.

57647 The conditions under which one process has permission to change the scheduling parameters of  
 57648 another process are implementation-defined.

57649 Implementations may require the requesting process to have appropriate privileges to set its  
 57650 own scheduling parameters or those of another process.

57651 See [Scheduling Policies](#) (on page 501) for a description on how this function affects the  
 57652 scheduling of the threads within the target process.

57653 SS If the current scheduling policy for the target process is not SCHED\_FIFO, SCHED\_RR, or  
 57654 SCHED\_SPORADIC, the result is implementation-defined; this case includes the  
 57655 SCHED\_OTHER policy.

57656 SS The specified *sched\_ss\_repl\_period* shall be greater than or equal to the specified  
 57657 *sched\_ss\_init\_budget* for the function to succeed; if it is not, then the function shall fail.

57658 The value of *sched\_ss\_max\_repl* shall be within the inclusive range [1, {SS\_REPL\_MAX}] for the  
 57659 function to succeed; if not, the function shall fail. It is unspecified whether the  
 57660 *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values are stored as provided by this function or are  
 57661 rounded to align with the resolution of the clock being used.

57662 This function is not atomic with respect to other threads in the process. Threads may continue to  
 57663 execute while this function call is in the process of changing the scheduling policy for the  
 57664 underlying kernel-scheduled entities used by the process contention scope threads.

57665 **RETURN VALUE**

57666 If successful, the *sched\_setparam()* function shall return zero.

57667 If the call to *sched\_setparam()* is unsuccessful, the priority shall remain unchanged, and the  
 57668 function shall return a value of  $-1$  and set *errno* to indicate the error.

57669 **ERRORS**

57670 The *sched\_setparam()* function shall fail if:

57671 [EINVAL] One or more of the requested scheduling parameters is outside the range  
 57672 defined for the scheduling policy of the specified *pid*.

**sched\_setparam()**

57704		

57705 **NAME**57706 sched\_setscheduler — set scheduling policy and parameters (**REALTIME**)57707 **SYNOPSIS**

```
57708 PS #include <sched.h>
57709
57709 int sched_setscheduler(pid_t pid, int policy,
57710 const struct sched_param *param);
```

57711 **DESCRIPTION**

57712 The `sched_setscheduler()` function shall set the scheduling policy and scheduling parameters of  
 57713 the process specified by `pid` to `policy` and the parameters specified in the `sched_param` structure  
 57714 pointed to by `param`, respectively. The value of the `sched_priority` member in the `sched_param`  
 57715 structure shall be any integer within the inclusive priority range for the scheduling policy  
 57716 specified by `policy`. If the value of `pid` is negative, the behavior of the `sched_setscheduler()`  
 57717 function is unspecified.

57718 The possible values for the `policy` parameter are defined in the `<sched.h>` header.

57719 If a process specified by `pid` exists, and if the calling process has permission, the scheduling  
 57720 policy and scheduling parameters shall be set for the process whose process ID is equal to `pid`.

57721 If `pid` is zero, the scheduling policy and scheduling parameters shall be set for the calling  
 57722 process.

57723 The conditions under which one process has appropriate privileges to change the scheduling  
 57724 parameters of another process are implementation-defined.

57725 Implementations may require that the requesting process have permission to set its own  
 57726 scheduling parameters or those of another process. Additionally, implementation-defined  
 57727 restrictions may apply as to the appropriate privileges required to set the scheduling policy of  
 57728 the process, or the scheduling policy of another process, to a particular value.

57729 The `sched_setscheduler()` function shall be considered successful if it succeeds in setting the  
 57730 scheduling policy and scheduling parameters of the process specified by `pid` to the values  
 57731 specified by `policy` and the structure pointed to by `param`, respectively.

57732 See [Scheduling Policies](#) (on page 501) for a description on how this function affects the  
 57733 scheduling of the threads within the target process.

57734 SS If the current scheduling policy for the target process is not `SCHED_FIFO`, `SCHED_RR`, or  
 57735 `SCHED_SPORADIC`, the result is implementation-defined; this case includes the  
 57736 `SCHED_OTHER` policy.

57737 SS The specified `sched_ss_repl_period` shall be greater than or equal to the specified  
 57738 `sched_ss_init_budget` for the function to succeed; if it is not, then the function shall fail.

57739 The value of `sched_ss_max_repl` shall be within the inclusive range `[1, {SS_REPL_MAX}]` for the  
 57740 function to succeed; if not, the function shall fail. It is unspecified whether the  
 57741 `sched_ss_repl_period` and `sched_ss_init_budget` values are stored as provided by this function or are  
 57742 rounded to align with the resolution of the clock being used.

57743 This function is not atomic with respect to other threads in the process. Threads may continue to  
 57744 execute while this function call is in the process of changing the scheduling policy and  
 57745 associated scheduling parameters for the underlying kernel-scheduled entities used by the  
 57746 process contention scope threads.

**sched\_setscheduler()**

System Interfaces

57747 **RETURN VALUE**

57748 Upon successful completion, the function shall return the former scheduling policy of the  
 57749 specified process. If the *sched\_setscheduler()* function fails to complete successfully, the policy  
 57750 and scheduling parameters shall remain unchanged, and the function shall return a value of -1  
 57751 and set *errno* to indicate the error.

57752 **ERRORS**

57753 The *sched\_setscheduler()* function shall fail if:

57754 [EINVAL] The value of the *policy* parameter is invalid, or one or more of the parameters  
 57755 contained in *param* is outside the valid range for the specified scheduling  
 57756 policy.

57757 [EPERM] The requesting process does not have permission to set either or both of the  
 57758 scheduling parameters or the scheduling policy of the specified process.

57759 [ESRCH] No process can be found corresponding to that specified by *pid*.

57760 **EXAMPLES**

57761 None.

57762 **APPLICATION USAGE**

57763 None.

57764 **RATIONALE**

57765 None.

57769 [Scheduling Policies](#) (on page 501), [sched\\_getparam\(\)](#), [sched\\_getscheduler\(\)](#), [sched\\_setparam\(\)](#)

57770 XBD [<sched.h>](#)

57771 **CHANGE HISTORY**

57772 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

57773 **Issue 6**

57774 The *sched\_setscheduler()* function is marked as part of the Process Scheduling option.

57775 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 57776 implementation does not support the Process Scheduling option.

57777 The following new requirements on POSIX implementations derive from alignment with the  
 57778 Single UNIX Specification:

- 57779 • In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is  
 57780 added.

- 57781 • Sections describing two-level scheduling and atomicity of the function are added.

57782 The SCHED\_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

57783 **Issue 7**

57784 Austin Group Interpretation 1003.1-2001 #061 is applied, updating the DESCRIPTION.

57785 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements  
 57786 for the *sched\_ss\_repl\_period* and *sched\_ss\_init\_budget* values.

57787 **NAME**

57788 sched\_yield — yield the processor

57789 **SYNOPSIS**

57790 #include &lt;sched.h&gt;

57791 int sched\_yield(void);

57792 **DESCRIPTION**57793 The *sched\_yield()* function shall force the running thread to relinquish the processor until it again  
57794 becomes the head of its thread list. It takes no arguments.57795 **RETURN VALUE**57796 The *sched\_yield()* function shall return 0 if it completes successfully; otherwise, it shall return a  
57797 value of -1 and set *errno* to indicate the error.57798 **ERRORS**

57799 No errors are defined.

57800 **EXAMPLES**

57801 None.

57802 **APPLICATION USAGE**57803 The conceptual model for scheduling semantics in POSIX.1-2008 defines a set of thread lists. This  
57804 set of thread lists is always present regardless of the scheduling options supported by the  
57805 system. On a system where the Process Scheduling option is not supported, portable  
57806 applications should not make any assumptions regarding whether threads from other processes  
57807 will be on the same thread list.57808 **RATIONALE**

57809 None.

57810 **FUTURE DIRECTIONS**

57811 None.

57812 **SEE ALSO**

57813 XBD &lt;sched.h&gt;

57814 **CHANGE HISTORY**57815 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
57816 POSIX Threads Extension.57817 **Issue 6**57818 The *sched\_yield()* function is now marked as part of the Process Scheduling and Threads options.57819 **Issue 7**

57820 SD5-XSH-ERN-120 is applied, adding APPLICATION USAGE.

57821 The *sched\_yield()* function is moved to the Base.

**seed48()***System Interfaces*57822 **NAME**

57823 seed48 — seed a uniformly distributed pseudo-random non-negative long integer generator

57824 **SYNOPSIS**

```
57825 XSI #include <stdlib.h>  
57826 unsigned short *seed48(unsigned short seed16v[3]);
```

57827 **DESCRIPTION**57828 Refer to *drand48()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

57829 **NAME**

57830 seekdir — set the position of a directory stream

57831 **SYNOPSIS**

```
57832 XSI #include <dirent.h>
57833 void seekdir(DIR *dirp, long loc);
```

57834 **DESCRIPTION**

57835 The *seekdir()* function shall set the position of the next *readdir()* operation on the directory  
 57836 stream specified by *dirp* to the position specified by *loc*. The value of *loc* should have been  
 57837 returned from an earlier call to *telldir()* using the same directory stream. The new position  
 57838 reverts to the one associated with the directory stream when *telldir()* was performed.

57839 If the value of *loc* was not obtained from an earlier call to *telldir()*, or if a call to *rewinddir()*  
 57840 occurred between the call to *telldir()* and the call to *seekdir()*, the results of subsequent calls to  
 57841 *readdir()* are unspecified.

57842 **RETURN VALUE**57843 The *seekdir()* function shall not return a value.57844 **ERRORS**

57845 No errors are defined.

57846 **EXAMPLES**

57847 None.

57848 **APPLICATION USAGE**

57849 None.

57850 **RATIONALE**

57851 The original standard developers perceived that there were restrictions on the use of the  
 57852 *seekdir()* and *telldir()* functions related to implementation details, and for that reason these  
 57853 functions need not be supported on all POSIX-conforming systems. They are required on  
 57854 implementations supporting the XSI option.

57855 One of the perceived problems of implementation is that returning to a given point in a directory  
 57856 is quite difficult to describe formally, in spite of its intuitive appeal, when systems that use B-  
 57857 trees, hashing functions, or other similar mechanisms to order their directories are considered.  
 57858 The definition of *seekdir()* and *telldir()* does not specify whether, when using these interfaces, a  
 57859 given directory entry will be seen at all, or more than once.

57860 On systems not supporting these functions, their capability can sometimes be accomplished by  
 57861 saving a filename found by *readdir()* and later using *rewinddir()* and a loop on *readdir()* to  
 57862 relocate the position from which the filename was saved.

57863 **FUTURE DIRECTIONS**

57864 None.

57865 **SEE ALSO**57866 *fdopendir()*, *readdir()*, *telldir()*57867 XBD *<dirent.h>*, *<sys/types.h>*57868 **CHANGE HISTORY**

57869 First released in Issue 2.

**seekdir()**57870 **Issue 6**

57871 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

57872 **Issue 7**

57873 SD5-XSH-ERN-200 is applied, updating the DESCRIPTION to note that the value of *loc* should  
57874 have been returned from an earlier call to *telldir()* using the same directory stream.

*System Interfaces***select()**57875 **NAME**57876 `select` — synchronous I/O multiplexing57877 **SYNOPSIS**57878 `#include <sys/select.h>`

```
57879 int select(int nfds, fd_set *restrict readfds,  
57880           fd_set *restrict writefds, fd_set *restrict errorfds,  
57881           struct timeval *restrict timeout);
```

57882 **DESCRIPTION**57883 Refer to *pselect()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**sem\_close()**57884 **NAME**57885 `sem_close` — close a named semaphore57886 **SYNOPSIS**57887 `#include <semaphore.h>`  
57888 `int sem_close(sem_t *sem);`57889 **DESCRIPTION**57890 The `sem_close()` function shall indicate that the calling process is finished using the named  
57891 semaphore indicated by `sem`. The effects of calling `sem_close()` for an unnamed semaphore (one  
57892 created by `sem_init()`) are undefined. The `sem_close()` function shall deallocate (that is, make  
57893 available for reuse by a subsequent `sem_open()` by this process) any system resources allocated  
57894 by the system for use by this process for this semaphore. The effect of subsequent use of the  
57895 semaphore indicated by `sem` by this process is undefined. If the semaphore has not been  
57896 removed with a successful call to `sem_unlink()`, then `sem_close()` has no effect on the state of the  
57897 semaphore. If the `sem_unlink()` function has been successfully invoked for `name` after the most  
57898 recent call to `sem_open()` with `O_CREAT` for this semaphore, then when all processes that have  
57899 opened the semaphore close it, the semaphore is no longer accessible.57900 **RETURN VALUE**57901 Upon successful completion, a value of zero shall be returned. Otherwise, a value of `-1` shall be  
57902 returned and `errno` set to indicate the error.57903 **ERRORS**57904 The `sem_close()` function may fail if:57905 `[EINVAL]` The `sem` argument is not a valid semaphore descriptor.57906 **EXAMPLES**

57907 None.

57908 **APPLICATION USAGE**57909 The `sem_close()` function is part of the Semaphores option and need not be available on all  
57910 implementations.57911 **RATIONALE**

57912 None.

57913 **FUTURE DIRECTIONS**

57914 None.

57915 **SEE ALSO**57916 `semctl()`, `semget()`, `semop()`, `sem_init()`, `sem_open()`, `sem_unlink()`57917 XBD `<semaphore.h>`57918 **CHANGE HISTORY**

57919 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

57920 **Issue 6**57921 The `sem_close()` function is marked as part of the Semaphores option.57922 The `[ENOSYS]` error condition has been removed as stubs need not be provided if an  
57923 implementation does not support the Semaphores option.57924 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/113 is applied, updating the ERRORS  
57925 section so that the `[EINVAL]` error becomes optional.

57926 **Issue 7**  
57927

The *sem\_close()* function is moved from the Semaphores option to the Base.

**sem\_destroy()**57928 **NAME**57929 `sem_destroy` — destroy an unnamed semaphore57930 **SYNOPSIS**57931 `#include <semaphore.h>`  
57932 `int sem_destroy(sem_t *sem);`57933 **DESCRIPTION**57934 The `sem_destroy()` function shall destroy the unnamed semaphore indicated by `sem`. Only a  
57935 semaphore that was created using `sem_init()` may be destroyed using `sem_destroy()`; the effect of  
57936 calling `sem_destroy()` with a named semaphore is undefined. The effect of subsequent use of the  
57937 semaphore `sem` is undefined until `sem` is reinitialized by another call to `sem_init()`.57938 It is safe to destroy an initialized semaphore upon which no threads are currently blocked. The  
57939 effect of destroying a semaphore upon which other threads are currently blocked is undefined.57940 **RETURN VALUE**57941 Upon successful completion, a value of zero shall be returned. Otherwise, a value of `-1` shall be  
57942 returned and `errno` set to indicate the error.57943 **ERRORS**57944 The `sem_destroy()` function may fail if:

- 57945 [EINVAL] The
- `sem`
- argument is not a valid semaphore.
- 
- 57946 [EBUSY] There are currently processes blocked on the semaphore.

57947 **EXAMPLES**

57948 None.

57949 **APPLICATION USAGE**57950 The `sem_destroy()` function is part of the Semaphores option and need not be available on all  
57951 implementations.57952 **RATIONALE**

57953 None.

57954 **FUTURE DIRECTIONS**

57955 None.

57956 **SEE ALSO**57957 `semctl()`, `semget()`, `semop()`, `sem_init()`, `sem_open()`57958 XBD `<semaphore.h>`57959 **CHANGE HISTORY**

57960 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

57961 **Issue 6**57962 The `sem_destroy()` function is marked as part of the Semaphores option.57963 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
57964 implementation does not support the Semaphores option.57965 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/114 is applied, updating the ERRORS  
57966 section so that the [EINVAL] error becomes optional.

**sem\_getvalue()**57969 **NAME**57970 `sem_getvalue` — get the value of a semaphore57971 **SYNOPSIS**57972 `#include <semaphore.h>`  
57973 `int sem_getvalue(sem_t *restrict sem, int *restrict sval);`57974 **DESCRIPTION**57975 The `sem_getvalue()` function shall update the location referenced by the `sval` argument to have  
57976 the value of the semaphore referenced by `sem` without affecting the state of the semaphore. The  
57977 updated value represents an actual semaphore value that occurred at some unspecified time  
57978 during the call, but it need not be the actual value of the semaphore when it is returned to the  
57979 calling process.57980 If `sem` is locked, then the object to which `sval` points shall either be set to zero or to a negative  
57981 number whose absolute value represents the number of processes waiting for the semaphore at  
57982 some unspecified time during the call.57983 **RETURN VALUE**57984 Upon successful completion, the `sem_getvalue()` function shall return a value of zero. Otherwise,  
57985 it shall return a value of `-1` and set `errno` to indicate the error.57986 **ERRORS**57987 The `sem_getvalue()` function may fail if:57988 [EINVAL] The `sem` argument does not refer to a valid semaphore.57989 **EXAMPLES**

57990 None.

57991 **APPLICATION USAGE**57992 The `sem_getvalue()` function is part of the Semaphores option and need not be available on all  
57993 implementations.57994 **RATIONALE**

**sem\_init()**58016 **NAME**58017 `sem_init` — initialize an unnamed semaphore58018 **SYNOPSIS**

```
58019 #include <semaphore.h>
58020 int sem_init(sem_t *sem, int pshared, unsigned value);
```

58021 **DESCRIPTION**

58022 The `sem_init()` function shall initialize the unnamed semaphore referred to by `sem`. The value of  
 58023 the initialized semaphore shall be `value`. Following a successful call to `sem_init()`, the semaphore  
 58024 may be used in subsequent calls to `sem_wait()`, `sem_timedwait()`, `sem_trywait()`, `sem_post()`, and  
 58025 `sem_destroy()`. This semaphore shall remain usable until the semaphore is destroyed.

58026 If the `pshared` argument has a non-zero value, then the semaphore is shared between processes;  
 58027 in this case, any process that can access the semaphore `sem` can use `sem` for performing  
 58028 `sem_wait()`, `sem_timedwait()`, `sem_trywait()`, `sem_post()`, and `sem_destroy()` operations.

58029 Only `sem` itself may be used for performing synchronization. The result of referring to copies of  
 58030 `sem` in calls to `sem_wait()`, `sem_timedwait()`, `sem_trywait()`, `sem_post()`, and `sem_destroy()` is  
 58031 undefined.

58032 If the `pshared` argument is zero, then the semaphore is shared between threads of the process; any  
 58033 thread in this process can use `sem` for performing `sem_wait()`, `sem_timedwait()`, `sem_trywait()`,  
 58034 `sem_post()`, and `sem_destroy()` operations. The use of the semaphore by threads other than those  
 58035 created in the same process is undefined.

58036 Attempting to initialize an already initialized semaphore results in undefined behavior.

58037 **RETURN VALUE**

58038 Upon successful completion, the `sem_init()` function shall initialize the semaphore in `sem` and  
 58039 return 0. Otherwise, it shall return -1 and set `errno` to indicate the error.

58040 **ERRORS**

58041 The `sem_init()` function shall fail if:

- |       |          |   |
|-------|----------|---|
| 58042 | [EINVAL] | The <code>value</code> argument exceeds {SEM_VALUE_MAX}.  |
| 58043 | [ENOSPC] | A resource required to initialize the semaphore has been exhausted, or the<br>58044 limit on semaphores ({SEM_NSEMS_MAX}) has been reached. |
| 58045 | [EPERM]  | The process lacks appropriate privileges to initialize the semaphore.   |

58046 **EXAMPLES**

58047 None.

58048 **APPLICATION USAGE**

58049 The `sem_init()` function is part of the Semaphores option and need not be available on all  
 58050 implementations.

58051 **RATIONALE**

58052 None.

58053 **FUTURE DIRECTIONS**

58054 None.

58058 **CHANGE HISTORY**

58059 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

58060 **Issue 6**

58061 The *sem\_init()* function is marked as part of the Semaphores option.

58062 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
58063 implementation does not support the Semaphores option.

58064 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std  
58065 1003.1d-1999.

58066 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/116 is applied, updating the  
58067 DESCRIPTION to add the *sem\_timedwait()* function for alignment with IEEE Std 1003.1d-1999.

58068 **Issue 7**

58069 SD5-XSH-ERN-176 is applied.

58070 The *sem\_init()* function is moved from the Semaphores option to the Base.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**sem\_open()**58071 **NAME**58072 `sem_open` — initialize and open a named semaphore58073 **SYNOPSIS**58074 `#include <semaphore.h>`  
58075 `sem_t *sem_open(const char *name, int oflag, ...);`58076 **DESCRIPTION**58077 The `sem_open()` function shall establish a connection between a named semaphore and a process.  
58078 Following a call to `sem_open()` with semaphore name `name`, the process may reference the  
58079 semaphore associated with `name` using the address returned from the call. This semaphore may  
58080 be used in subsequent calls to `sem_wait()`, `sem_timedwait()`, `sem_trywait()`, `sem_post()`, and  
58081 `sem_close()`. The semaphore remains usable by this process until the semaphore is closed by a  
58082 successful call to `sem_close()`, `_exit()`, or one of the `exec` functions.58083 The `oflag` argument controls whether the semaphore is created or merely accessed by the call to  
58084 `sem_open()`. The following flag bits may be set in `oflag`:58085 **O\_CREAT** This flag is used to create a semaphore if it does not already exist. If **O\_CREAT** is  
58086 set and the semaphore already exists, then **O\_CREAT** has no effect, except as noted  
58087 under **O\_EXCL**. Otherwise, `sem_open()` creates a named semaphore. The **O\_CREAT**  
58088 flag requires a third and a fourth argument: `mode`, which is of type **mode\_t**, and  
58089 `value`, which is of type **unsigned**. The semaphore is created with an initial value of  
58090 `value`. Valid initial values for semaphores are less than or equal to  
58091 `{SEM_VALUE_MAX}`.58092 The user ID of the semaphore shall be set to the effective user ID of the process.  
58093 The group ID of the semaphore shall be set to the effective group ID of the process;  
58094 however, if the `name` argument is visible in the file system, the group ID may be set  
58095 to the group ID of the containing directory. The permission bits of the semaphore  
58096 are set to the value of the `mode` argument except those set in the file mode creation  
58097 mask of the process. When bits in `mode` other than the file permission bits are  
58098 specified, the effect is unspecified.58099 After the semaphore named `name` has been created by `sem_open()` with the  
58100 **O\_CREAT** flag, other processes can connect to the semaphore by calling  
58101 `sem_open()` with the same value of `name`.58102 **O\_EXCL** If **O\_EXCL** and **O\_CREAT** are set, `sem_open()` fails if the semaphore `name` exists.  
58103 The check for the existence of the semaphore and the creation of the semaphore if it  
58104 does not exist are atomic with respect to other processes executing `sem_open()` with  
58105 **O\_EXCL** and **O\_CREAT** set. If **O\_EXCL** is set and **O\_CREAT** is not set, the effect is  
58106 undefined.58107 If flags other than **O\_CREAT** and **O\_EXCL** are specified in the `oflag` parameter, the  
58108 effect is unspecified.58109 The `name` argument points to a string naming a semaphore object. It is unspecified whether the  
58110 name appears in the file system and is visible to functions that take pathnames as arguments.  
58111 The `name` argument conforms to the construction rules for a pathname, except that the  
58112 interpretation of `<slash>` characters other than the leading `<slash>` character in `name` is  
58113 implementation-defined, and that the length limits for the `name` argument are implementation-  
58114 defined and need not be the same as the pathname limits `{PATH_MAX}` and `{NAME_MAX}`. If  
58115 `name` begins with the `<slash>` character, then processes calling `sem_open()` with the same value of  
58116 `name` shall refer to the same semaphore object, as long as that name has not been removed. If  
58117 `name` does not begin with the `<slash>` character, the effect is implementation-defined.

58118 If a process makes multiple successful calls to *sem\_open()* with the same value for *name*, the same  
 58119 semaphore address shall be returned for each such successful call, provided that there have been  
 58120 no calls to *sem\_unlink()* for this semaphore, and at least one previous successful *sem\_open()* call  
 58121 for this semaphore has not been matched with a *sem\_close()* call.

58122 References to copies of the semaphore produce undefined results.

#### 58123 RETURN VALUE

58124 Upon successful completion, the *sem\_open()* function shall return the address of the semaphore.  
 58125 Otherwise, it shall return a value of SEM\_FAILED and set *errno* to indicate the error. The symbol  
 58126 SEM\_FAILED is defined in the **<semaphore.h>** header. No successful return from *sem\_open()*  
 58127 shall return the value SEM\_FAILED.

#### 58128 ERRORS

58129 If any of the following conditions occur, the *sem\_open()* function shall return SEM\_FAILED and  
 58130 set *errno* to the corresponding value:

58131 [EACCES] The named semaphore exists and the permissions specified by *oflag* are  
 58132 denied, or the named semaphore does not exist and permission to create the  
 58133 named semaphore is denied.

58134 [EEXIST] O\_CREAT and O\_EXCL are set and the named semaphore already exists.

58135 [EINTR] The *sem\_open()* operation was interrupted by a signal.

58136 [EINVAL] The *sem\_open()* operation is not supported for the given name, or O\_CREAT  
 58137 was specified in *oflag* and *value* was greater than {SEM\_VALUE\_MAX}.

58138 [EMFILE] Too many semaphore descriptors or file descriptors are currently in use by this  
 58139 process.

58140 [ENFILE] Too many semaphores are currently open in the system.

58141 [ENOENT] O\_CREAT is not set and the named semaphore does not exist.

58142 [ENOMEM] There is insufficient memory for the creation of the new named semaphore.

58143 [ENOSPC] There is insufficient space on a storage device for the creation of the new  
 58144 named semaphore.

58145 If any of the following conditions occur, the *sem\_open()* function may return SEM\_FAILED and  
 58146 set *errno* to the corresponding value:

58147 [ENAMETOOLONG]

58148 The length of the *name* argument exceeds {\_POSIX\_PATH\_MAX} on systems  
 58149 XSI that do not support the XSI option or exceeds {\_XOPEN\_PATH\_MAX} on XSI  
 58150 systems, or has a pathname component that is longer than  
 58151 XSI {\_POSIX\_NAME\_MAX} on systems that do not support the XSI option or  
 58152 longer than {\_XOPEN\_NAME\_MAX} on XSI systems.

**sem\_open()**58153 **EXAMPLES**

58154 None.

58155 **APPLICATION USAGE**58156 The *sem\_open()* function is part of the Semaphores option and need not be available on all  
58157 implementations.58158 **RATIONALE**58159 Early drafts required an error return value of `-1` with the type `sem_t *` for the *sem\_open()*  
58160 function, which is not guaranteed to be portable across implementations. The revised text  
58161 provides the symbolic error code `SEM_FAILED` to eliminate the type conflict.58162 **FUTURE DIRECTIONS**58163 A future version might require the *sem\_open()* and *sem\_unlink()* functions to have semantics  
58164 similar to normal file system operations.58165 **SEE ALSO**58166 *semctl()*, *semget()*, *semop()*, *sem\_close()*, *sem\_post()*, *sem\_timedwait()*, *sem\_trywait()*, *sem\_unlink()*58167 XBD `<semaphore.h>`58168 **CHANGE HISTORY**

58169 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

58170 **Issue 6**58171 The *sem\_open()* function is marked as part of the Semaphores option.58172 The `[ENOSYS]` error condition has been removed as stubs need not be provided if an  
58173 implementation does not support the Semaphores option.58174 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std  
58175 1003.1d-1999.58176 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/117 is applied, updating the  
58177 DESCRIPTION to add the *sem\_timedwait()* function for alignment with IEEE Std 1003.1d-1999.58178 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/118 is applied, updating the  
58179 DESCRIPTION to describe the conditions to return the same semaphore address on a call to  
58180 *sem\_open()*. The words "and at least one previous successful *sem\_open()* call for this semaphore  
58181 has not been matched with a *sem\_close()* call" are added.58182 **Issue 7**58183 Austin Group Interpretation 1003.1-2001 #066 is applied, updating the `[ENOSPC]` error case and  
58184 adding the `[ENOMEM]` error case.58185 Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and  
58186 adding `[ENAMETOOLONG]` as a "may fail" error.

58187 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

58188 SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the  
58189 user ID and group ID of the semaphore.58190 The *sem\_open()* function is moved from the Semaphores option to the Base.

58191 **NAME**

58192 sem\_post — unlock a semaphore

58193 **SYNOPSIS**

```
58194 #include <semaphore.h>
58195 int sem_post(sem_t *sem);
```

58196 **DESCRIPTION**

58197 The *sem\_post()* function shall unlock the semaphore referenced by *sem* by performing a  
58198 semaphore unlock operation on that semaphore.

58199 If the semaphore value resulting from this operation is positive, then no threads were blocked  
58200 waiting for the semaphore to become unlocked; the semaphore value is simply incremented.

58201 If the value of the semaphore resulting from this operation is zero, then one of the threads  
58202 blocked waiting for the semaphore shall be allowed to return successfully from its call to  
58203 *sem\_wait()*. If the Process Scheduling option is supported, the thread to be unblocked shall be  
58204 chosen in a manner appropriate to the scheduling policies and parameters in effect for the  
58205 blocked threads. In the case of the schedulers SCHED\_FIFO and SCHED\_RR, the highest  
58206 priority waiting thread shall be unblocked, and if there is more than one highest priority thread  
58207 blocked waiting for the semaphore, then the highest priority thread that has been waiting the  
58208 longest shall be unblocked. If the Process Scheduling option is not defined, the choice of a thread  
58209 to unblock is unspecified.

58210 SS If the Process Sporadic Server option is supported, and the scheduling policy is  
58211 SCHED\_SPORADIC, the semantics are as per SCHED\_FIFO above.

58212 The *sem\_post()* function shall be async-signal-safe and may be invoked from a signal-catching  
58213 function.

58214 **RETURN VALUE**

58215 If successful, the *sem\_post()* function shall return zero; otherwise, the function shall return  $-1$   
58216 and set *errno* to indicate the error.

58217 **ERRORS**

58218 The *sem\_post()* function may fail if:

58219 [EINVAL] The *sem* argument does not refer to a valid semaphore.

58220 **EXAMPLES**

58221 See *sem\_timedwait()*.

58222 **APPLICATION USAGE**

58223 The *sem\_post()* function is part of the Semaphores option and need not be available on all  
58224 implementations.

58225 **RATIONALE**

58226 None.

58227 **FUTURE DIRECTIONS**

58228 None.

58229 **SEE ALSO**

58230 *semctl()*, *semget()*, *semop()*, *sem\_timedwait()*, *sem\_trywait()*

**sem\_post()****CHANGE HISTORY**

58232 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

58234 The *sem\_post()* function is marked as part of the Semaphores option.

58236 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
58237 implementation does not support the Semaphores option.

58238 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std  
58239 1003.1d-1999.

58240 SCHED\_SPORADIC is added to the list of scheduling policies for which the thread that is to be  
58241 unblocked is specified for alignment with IEEE Std 1003.1d-1999.

58242 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/119 is applied, updating the ERRORS  
58243 section so that the [EINVAL] error becomes optional.

**Issue 7**

58244 Austin Group Interpretation 1003.1-2001 #156 is applied.

58246 The *sem\_post()* function is moved from the Semaphores option to the Base.

58247 **NAME**58248 `sem_timedwait` — lock a semaphore58249 **SYNOPSIS**

```
58250 #include <semaphore.h>
58251 #include <time.h>

58252 int sem_timedwait(sem_t *restrict sem,
58253                  const struct timespec *restrict abstime);
```

58254 **DESCRIPTION**

58255 The `sem_timedwait()` function shall lock the semaphore referenced by `sem` as in the `sem_wait()`  
 58256 function. However, if the semaphore cannot be locked without waiting for another process or  
 58257 thread to unlock the semaphore by performing a `sem_post()` function, this wait shall be  
 58258 terminated when the specified timeout expires.

58259 The timeout shall expire when the absolute time specified by `abstime` passes, as measured by the  
 58260 clock on which timeouts are based (that is, when the value of that clock equals or exceeds  
 58261 `abstime`), or if the absolute time specified by `abstime` has already been passed at the time of the  
 58262 call.

58263 The timeout shall be based on the `CLOCK_REALTIME` clock. The resolution of the timeout shall  
 58264 be the resolution of the clock on which it is based. The `timespec` data type is defined as a  
 58265 structure in the `<time.h>` header.

58266 Under no circumstance shall the function fail with a timeout if the semaphore can be locked  
 58267 immediately. The validity of the `abstime` need not be checked if the semaphore can be locked  
 58268 immediately.

58269 **RETURN VALUE**

58270 The `sem_timedwait()` function shall return zero if the calling process successfully performed the  
 58271 semaphore lock operation on the semaphore designated by `sem`. If the call was unsuccessful, the  
 58272 state of the semaphore shall be unchanged, and the function shall return a value of `-1` and set  
 58273 `errno` to indicate the error.

58274 **ERRORS**

58275 The `sem_timedwait()` function shall fail if:

58276 [EINVAL] The process or thread would have blocked, and the `abstime` parameter  
 58277 specified a nanoseconds field value less than zero or greater than or equal to  
 58278 1 000 million.

58279 [ETIMEDOUT] The semaphore could not be locked before the specified timeout expired.

58280 The `sem_timedwait()` function may fail if:

58281 [EDEADLK] A deadlock condition was detected.

58282 [EINTR] A signal interrupted this function.

58283 [EINVAL] The `sem` argument does not refer to a valid semaphore.

**sem\_timedwait()****EXAMPLES**

The program shown below operates on an unnamed semaphore. The program expects two command-line arguments. The first argument specifies a seconds value that is used to set an alarm timer to generate a SIGALRM signal. This handler performs a `sem_post(3)` to increment the semaphore that is being waited on in `main()` using `sem_timedwait()`. The second command-line argument specifies the length of the timeout, in seconds, for `sem_timedwait()`.

```

58290 #include <unistd.h>
58291 #include <stdio.h>
58292 #include <stdlib.h>
58293 #include <semaphore.h>
58294 #include <time.h>
58295 #include <assert.h>
58296 #include <errno.h>
58297 #include <signal.h>

58298 sem_t sem;

58299 static void
58300 handler(int sig)
58301 {
58302     write(STDOUT_FILENO, "sem_post() from handler\n", 24);
58303     if (sem_post(&sem) == -1) {
58304         write(STDERR_FILENO, "sem_post() failed\n", 18);
58305         _exit(EXIT_FAILURE);
58306     }
58307 }

58308 int
58309 main(int argc, char *argv[])
58310 {
58311     struct sigaction sa;
58312     struct timespec ts;
58313     int s;

58314     if (argc != 3) {
58315         fprintf(stderr, "Usage: %s <alarm-secs> <wait-secs>\n",
58316             argv[0]);
58317         exit(EXIT_FAILURE);
58318     }

58319     if (sem_init(&sem, 0, 0) == -1) {
58320         perror("sem_init");
58321         exit(EXIT_FAILURE);
58322     }

58323     /* Establish SIGALRM handler; set alarm timer using argv[1] */

58324     sa.sa_handler = handler;
58325     sigemptyset(&sa.sa_mask);
58326     sa.sa_flags = 0;
58327     if (sigaction(SIGALRM, &sa, NULL) == -1) {
58328         perror("sigaction");
58329         exit(EXIT_FAILURE);
58330     }

```

```

58331     alarm(atoi(argv[1]));
58332     /* Calculate relative interval as current time plus
58333        number of seconds given argv[2] */
58334     if (clock_gettime(CLOCK_REALTIME, &ts) == -1) {
58335         perror("clock_gettime");
58336         exit(EXIT_FAILURE);
58337     }
58338     ts.tv_sec += atoi(argv[2]);
58339     printf("main() about to call sem_timedwait()\n");
58340     while ((s = sem_timedwait(&sem, &ts)) == -1 && errno == EINTR)
58341         continue; /* Restart if interrupted by handler */
58342     /* Check what happened */
58343     if (s == -1) {
58344         if (errno == ETIMEDOUT)
58345             printf("sem_timedwait() timed out\n");
58346         else
58347             perror("sem_timedwait");
58348     } else
58349         printf("sem_timedwait() succeeded\n");
58350     exit((s == 0) ? EXIT_SUCCESS : EXIT_FAILURE);
58351 }

```

**APPLICATION USAGE**

Applications using these functions may be subject to priority inversion, as discussed in XBD Section 3.285 (on page 79).

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/120 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

**Issue 7**

The `sem_timedwait()` function is moved from the Semaphores option to the Base.

Functionality relating to the Timers option is moved to the Base.

An example is added.

**sem\_trywait()**58370 **NAME**

58371 sem\_trywait, sem\_wait — lock a semaphore

58372 **SYNOPSIS**

```
58373 #include <semaphore.h>
58374 int sem_trywait(sem_t *sem);
58375 int sem_wait(sem_t *sem);
```

58376 **DESCRIPTION**

58377 The *sem\_trywait()* function shall lock the semaphore referenced by *sem* only if the semaphore is  
 58378 currently not locked; that is, if the semaphore value is currently positive. Otherwise, it shall not  
 58379 lock the semaphore.

58380 The *sem\_wait()* function shall lock the semaphore referenced by *sem* by performing a semaphore  
 58381 lock operation on that semaphore. If the semaphore value is currently zero, then the calling  
 58382 thread shall not return from the call to *sem\_wait()* until it either locks the semaphore or the call is  
 58383 interrupted by a signal.

58384 Upon successful return, the state of the semaphore shall be locked and shall remain locked until  
 58385 the *sem\_post()* function is executed and returns successfully.

58386 The *sem\_wait()* function is interruptible by the delivery of a signal.

58387 **RETURN VALUE**

58388 The *sem\_trywait()* and *sem\_wait()* functions shall return zero if the calling process successfully  
 58389 performed the semaphore lock operation on the semaphore designated by *sem*. If the call was  
 58390 unsuccessful, the state of the semaphore shall be unchanged, and the function shall return a  
 58391 value of  $-1$  and set *errno* to indicate the error.

58392 **ERRORS**

58393 The *sem\_trywait()* function shall fail if:

58394 [EAGAIN] The semaphore was already locked, so it cannot be immediately locked by the  
 58395 *sem\_trywait()* operation.

58396 The *sem\_trywait()* and *sem\_wait()* functions may fail if:

58397 [EDEADLK] A deadlock condition was detected.

58398 [EINTR] A signal interrupted this function.

58399 [EINVAL] The *sem* argument does not refer to a valid semaphore.

58400 **EXAMPLES**

58401 None.

58402 **APPLICATION USAGE**

58403 Applications using these functions may be subject to priority inversion, as discussed in XBD  
 58404 Section 3.285 (on page 79).

58405 The *sem\_trywait()* and *sem\_wait()* functions are part of the Semaphores option and need not be  
 58406 provided on all implementations.

58407 **RATIONALE**

58408 None.

58409 **FUTURE DIRECTIONS**

58410 None.

58411 **SEE ALSO**58412 *semctl()*, *semget()*, *semop()*, *sem\_post()*, *sem\_timedwait()*

58413 XBD Section 3.285 (on page 79), Section 4.11 (on page 110), &lt;semaphore.h&gt;

58414 **CHANGE HISTORY**

58415 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

58416 **Issue 6**58417 The *sem\_trywait()* and *sem\_wait()* functions are marked as part of the Semaphores option.58418 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
58419 implementation does not support the Semaphores option.58420 The *sem\_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std  
58421 1003.1d-1999.58422 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/121 is applied, updating the ERRORS  
58423 section so that the [EINVAL] error becomes optional.58424 **Issue 7**58425 SD5-XSH-ERN-54 is applied, removing the *sem\_wait()* function from the “shall fail” error cases.58426 The *sem\_trywait()* and *sem\_wait()* functions are moved from the Semaphores option to the Base.

**sem\_unlink()**58427 **NAME**58428 `sem_unlink` — remove a named semaphore58429 **SYNOPSIS**58430 `#include <semaphore.h>`  
58431 `int sem_unlink(const char *name);`58432 **DESCRIPTION**58433 The `sem_unlink()` function shall remove the semaphore named by the string *name*. If the  
58434 semaphore named by *name* is currently referenced by other processes, then `sem_unlink()` shall  
58435 have no effect on the state of the semaphore. If one or more processes have the semaphore open  
58436 when `sem_unlink()` is called, destruction of the semaphore is postponed until all references to the  
58437 semaphore have been destroyed by calls to `sem_close()`, `_exit()`, or `exec`. Calls to `sem_open()` to  
58438 recreate or reconnect to the semaphore refer to a new semaphore after `sem_unlink()` is called. The  
58439 `sem_unlink()` call shall not block until all references have been destroyed; it shall return  
58440 immediately.58441 **RETURN VALUE**58442 Upon successful completion, the `sem_unlink()` function shall return a value of 0. Otherwise, the  
58443 semaphore shall not be changed and the function shall return a value of `-1` and set `errno` to  
58444 indicate the error.58445 **ERRORS**58446 The `sem_unlink()` function shall fail if:

58447 [EACCES] Permission is denied to unlink the named semaphore.

58448 [ENOENT] The named semaphore does not exist.

58449 The `sem_unlink()` function may fail if:

58450 [ENAMETOOLONG]

58451 The length of the *name* argument exceeds `{_POSIX_PATH_MAX}` on systems  
58452 XSI that do not support the XSI option or exceeds `{_XOPEN_PATH_MAX}` on XSI  
58453 systems, or has a pathname component that is longer than  
58454 XSI `{_POSIX_NAME_MAX}` on systems that do not support the XSI option or  
58455 longer than `{_XOPEN_NAME_MAX}` on XSI systems. A call to `sem_unlink()`  
58456 with a *name* argument that contains the same semaphore name as was  
58457 previously used in a successful `sem_open()` call shall not give an  
58458 [ENAMETOOLONG] error.58459 **EXAMPLES**

58460 None.

58461 **APPLICATION USAGE**58462 The `sem_unlink()` function is part of the Semaphores option and need not be available on all  
58463 implementations.58464 **RATIONALE**

58465 None.

58466 **FUTURE DIRECTIONS**58467 A future version might require the `sem_open()` and `sem_unlink()` functions to have semantics  
58468 similar to normal file system operations.

58469 **SEE ALSO**58470 *semctl()*, *semget()*, *semop()*, *sem\_close()*, *sem\_open()*58471 XBD <[semaphore.h](#)>58472 **CHANGE HISTORY**

58473 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

58474 **Issue 6**58475 The *sem\_unlink()* function is marked as part of the Semaphores option.58476 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
58477 implementation does not support the Semaphores option.58478 **Issue 7**58479 Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a  
58480 “shall fail” to a “may fail” error.

58481 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

58482 The *sem\_unlink()* function is moved from the Semaphores option to the Base.

58490 **NAME**

58491 semctl — XSI semaphore control operations

58492 **SYNOPSIS**

```
58493 XSI #include <sys/sem.h>
58494 int semctl(int semid, int semnum, int cmd, ...);
```

58495 **DESCRIPTION**

58496 The *semctl()* function operates on XSI semaphores (see XBD Section 4.16, on page 113). It is  
 58497 unspecified whether this function interoperates with the realtime interprocess communication  
 58498 facilities defined in Section 2.8 (on page 497).

58499 The *semctl()* function provides a variety of semaphore control operations as specified by *cmd*.  
 58500 The fourth argument is optional and depends upon the operation requested. If required, it is of  
 58501 type **union semun**, which the application shall explicitly declare:

```
58502 union semun {
58503     int val;
58504     struct semid_ds *buf;
58505     unsigned short *array;
58506 } arg;
```

58507 The following semaphore control operations as specified by *cmd* are executed with respect to the  
 58508 semaphore specified by *semid* and *semnum*. The level of permission required for each operation  
 58509 is shown with each command; see Section 2.7 (on page 496). The symbolic names for the values  
 58510 of *cmd* are defined in the `<sys/sem.h>` header:

58511	GETVAL	Return the value of <i>semval</i> ; see <code>&lt;sys/sem.h&gt;</code> . Requires read permission.
58512	SETVAL	Set the value of <i>semval</i> to <i>arg.val</i> , where <i>arg</i> is the value of the fourth argument to <i>semctl()</i> . When this command is successfully executed, the <i>semadj</i> value corresponding to the specified semaphore in all processes is cleared. Requires alter permission; see Section 2.7 (on page 496).
58513		
58514		
58515		
58516	GETPID	Return the value of <i>sempid</i> . Requires read permission.
58517	GETNCNT	Return the value of <i>semncnt</i> . Requires read permission.
58518	GETZCNT	Return the value of <i>semzcnt</i> . Requires read permission.

58519 The following values of *cmd* operate on each *semval* in the set of semaphores:

58520	GETALL	Return the value of <i>semval</i> for each semaphore in the semaphore set and place into the array pointed to by <i>arg.array</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . Requires read permission.
58521		
58522		
58523	SETALL	Set the value of <i>semval</i> for each semaphore in the semaphore set according to the array pointed to by <i>arg.array</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . When this command is successfully executed, the <i>semadj</i> values corresponding to each specified semaphore in all processes are cleared. Requires alter permission.
58524		
58525		
58526		
58527		

58528 The following values of *cmd* are also available:

58529	IPC_STAT	Place the current value of each member of the <b>semid_ds</b> data structure associated with <i>semid</i> into the structure pointed to by <i>arg.buf</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . The contents of this structure are defined in <code>&lt;sys/sem.h&gt;</code> . Requires read permission.
58530		
58531		
58532		

**semctl()**

58533	IPC_SET	Set the value of the following members of the <b>semid_ds</b> data structure associated with <i>semid</i> to the corresponding value found in the structure pointed to by <i>arg.buf</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> :
58534		
58535		
58536		<i>sem_perm.uid</i>
58537		<i>sem_perm.gid</i>
58538		<i>sem_perm.mode</i>
58539		The mode bits specified in <a href="#">Section 2.7.1</a> (on page 496) are copied into the corresponding bits of the <i>sem_perm.mode</i> associated with <i>semid</i> . The stored values of any other bits are unspecified.
58540		
58541		
58542		This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of <i>sem_perm.cuid</i> or <i>sem_perm.uid</i> in the <b>semid_ds</b> data structure associated with <i>semid</i> .
58543		
58544		
58545		
58546	IPC_RMID	Remove the semaphore identifier specified by <i>semid</i> from the system and destroy the set of semaphores and <b>semid_ds</b> data structure associated with it. This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of <i>sem_perm.cuid</i> or <i>sem_perm.uid</i> in the <b>semid_ds</b> data structure associated with <i>semid</i> .
58547		
58548		
58549		
58550		
58551		
58552	<b>RETURN VALUE</b>	
58553		If successful, the value returned by <i>semctl()</i> depends on <i>cmd</i> as follows:
58554	GETVAL	The value of <i>semval</i> .
58555	GETPID	The value of <i>sempid</i> .
58556	GETNCNT	The value of <i>semncnt</i> .
58557	GETZCNT	The value of <i>semzcnt</i> .
58558	All others	0.
58559		Otherwise, <i>semctl()</i> shall return $-1$ and set <i>errno</i> to indicate the error.
58560	<b>ERRORS</b>	
58561		The <i>semctl()</i> function shall fail if:
58562	[EACCES]	Operation permission is denied to the calling process; see <a href="#">Section 2.7</a> (on page 496).
58563		
58564	[EINVAL]	The value of <i>semid</i> is not a valid semaphore identifier, or the value of <i>semnum</i> is less than 0 or greater than or equal to <i>sem_nsems</i> , or the value of <i>cmd</i> is not a valid command.
58565		
58566		
58567	[EPERM]	The argument <i>cmd</i> is equal to IPC_RMID or IPC_SET and the effective user ID of the calling process is not equal to that of a process with appropriate privileges and it is not equal to the value of <i>sem_perm.cuid</i> or <i>sem_perm.uid</i> in the data structure associated with <i>semid</i> .
58568		
58569		
58570		
58571	[ERANGE]	The argument <i>cmd</i> is equal to SETVAL or SETALL and the value to which <i>semval</i> is to be set is greater than the system-imposed maximum.
58572		

58573 **EXAMPLES**

58574 None.

58575 **APPLICATION USAGE**

58576 The fourth parameter in the SYNOPSIS section is now specified as ". . ." in order to avoid a  
 58577 clash with the ISO C standard when referring to the union *semun* (as defined in Issue 3) and for  
 58578 backwards-compatibility.

58579 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
 58580 Application developers who need to use IPC should design their applications so that modules  
 58581 using the IPC routines described in Section 2.7 (on page 496) can be easily modified to use the  
 58582 alternative interfaces.

58583 **RATIONALE**

58584 None.

58585 **FUTURE DIRECTIONS**

58586 None.

58587 **SEE ALSO**

58590 XBD Section 4.16 (on page 113), [<sys/sem.h>](#)58591 **CHANGE HISTORY**

58592 First released in Issue 2. Derived from Issue 2 of the SVID.

58593 **Issue 5**

58594 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
 58595 DIRECTIONS to the APPLICATION USAGE section.

**semget()**58596 **NAME**58597 `semget` — get set of XSI semaphores58598 **SYNOPSIS**

```
58599 XSI #include <sys/sem.h>
58600 int semget(key_t key, int nsems, int semflg);
```

58601 **DESCRIPTION**

58602 The `semget()` function operates on XSI semaphores (see XBD Section 4.16, on page 113). It is  
 58603 unspecified whether this function interoperates with the realtime interprocess communication  
 58604 facilities defined in Section 2.8 (on page 497).

58605 The `semget()` function shall return the semaphore identifier associated with `key`.

58606 A semaphore identifier with its associated `semid_ds` data structure and its associated set of  
 58607 `nsems` semaphores (see `<sys/sem.h>`) is created for `key` if one of the following is true:

- 58608 • The argument `key` is equal to `IPC_PRIVATE`.
- 58609 • The argument `key` does not already have a semaphore identifier associated with it and  
 58610 (`semflg & IPC_CREAT`) is non-zero.

58611 Upon creation, the `semid_ds` data structure associated with the new semaphore identifier is  
 58612 initialized as follows:

- 58613 • In the operation permissions structure `sem_perm.cuid`, `sem_perm.uid`, `sem_perm.cgid`, and  
 58614 `sem_perm.gid` shall be set equal to the effective user ID and effective group ID, respectively,  
 58615 of the calling process.
- 58616 • The low-order 9 bits of `sem_perm.mode` shall be set equal to the low-order 9 bits of `semflg`.
- 58617 • The variable `sem_nsems` shall be set equal to the value of `nsems`.
- 58618 • The variable `sem_otime` shall be set equal to 0 and `sem_ctime` shall be set equal to the current  
 58619 time.
- 58620 • The data structure associated with each semaphore in the set need not be initialized. The  
 58621 `semctl()` function with the command `SETVAL` or `SETALL` can be used to initialize each  
 58622 semaphore.

58623 **RETURN VALUE**

58624 Upon successful completion, `semget()` shall return a non-negative integer, namely a semaphore  
 58625 identifier; otherwise, it shall return `-1` and set `errno` to indicate the error.

58626 **ERRORS**

58627 The `semget()` function shall fail if:

- |       |          |   |
|-------|----------|---|
| 58628 | [EACCES] | A semaphore identifier exists for <code>key</code> , but operation permission as specified by the low-order 9 bits of <code>semflg</code> would not be granted; see Section 2.7 (on page 496).  |
| 58629 |          |   |
| 58630 |          |   |
| 58631 | [EEXIST] | A semaphore identifier exists for the argument <code>key</code> but <code>((semflg &amp; IPC_CREAT) &amp;&amp; (semflg &amp; IPC_EXCL))</code> is non-zero.   |
| 58632 |          |   |
| 58633 | [EINVAL] | The value of <code>nsems</code> is either less than or equal to 0 or greater than the system-imposed limit, or a semaphore identifier exists for the argument <code>key</code> , but the number of semaphores in the set associated with it is less than <code>nsems</code> and <code>nsems</code> is not equal to 0. |
| 58634 |          |   |
| 58635 |          |   |
| 58636 |          |   |

58637	[ENOENT]	A semaphore identifier does not exist for the argument <i>key</i> and ( <i>semflg</i> &IPC_CREAT) is equal to 0.
58638		
58639	[ENOSPC]	A semaphore identifier is to be created but the system-imposed limit on the maximum number of allowed semaphores system-wide would be exceeded.
58640		

58641 **EXAMPLES**58642 **Creating a Semaphore Identifier**

58643 The following example gets a unique semaphore key using the *ftok()* function, then gets a  
 58644 semaphore ID associated with that key using the *semget()* function (the first call also tests to  
 58645 make sure the semaphore exists). If the semaphore does not exist, the program creates it, as  
 58646 shown by the second call to *semget()*. In creating the semaphore for the queuing process, the  
 58647 program attempts to create one semaphore with read/write permission for all. It also uses the  
 58648 IPC\_EXCL flag, which forces *semget()* to fail if the semaphore already exists.

58649 After creating the semaphore, the program uses a call to *semop()* to initialize it to the values in  
 58650 the *sbuf* array. The number of processes that can execute concurrently without queuing is  
 58651 initially set to 2. The final call to *semget()* creates a semaphore identifier that can be used later in  
 58652 the program.

```

58653 #include <sys/types.h>
58654 #include <stdio.h>
58655 #include <sys/ipc.h>
58656 #include <sys/sem.h>
58657 #include <sys/stat.h>
58658 #include <errno.h>
58659 #include <unistd.h>
58660 #include <stdlib.h>
58661 #include <pwd.h>
58662 #include <fcntl.h>
58663 #include <limits.h>
58664 ...
58665 key_t semkey;
58666 int semid, pfd, fw;
58667 struct sembuf sbuf;
58668 char *lgn;
58669 char filename[PATH_MAX+1];
58670 struct stat outstat;
58671 struct passwd *pw;
58672 ...
58673 /* Get unique key for semaphore. */
58674 if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
58675     perror("IPC error: ftok"); exit(1);
58676 }
58677
58678 /* Get semaphore ID associated with this key. */
58679 if ((semid = semget(semkey, 0, 0)) == -1) {
58680     /* Semaphore does not exist - Create. */
58681     if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
58682         S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
58683     {
58684         /* Initialize the semaphore. */

```

**semget()**

```

58684         sbuf.sem_num = 0;
58685         sbuf.sem_op = 2; /* This is the number of runs
58686                        without queuing. */
58687         sbuf.sem_flg = 0;
58688         if (semop(semid, &sbuf, 1) == -1) {
58689             perror("IPC error: semop"); exit(1);
58690         }
58691     }
58692     else if (errno == EEXIST) {
58693         if ((semid = semget(semkey, 0, 0)) == -1) {
58694             perror("IPC error 1: semget"); exit(1);
58695         }
58696     }
58697     else {
58698         perror("IPC error 2: semget"); exit(1);
58699     }
58700 }
58701 ...

```

**58702 APPLICATION USAGE**

58703 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
58704 Application developers who need to use IPC should design their applications so that modules  
58705 using the IPC routines described in [Section 2.7](#) (on page 496) can be easily modified to use the  
58706 alternative interfaces.

**58715 CHANGE HISTORY**

58716 First released in Issue 2. Derived from Issue 2 of the SVID.

**58717 Issue 5**

58718 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
58719 DIRECTIONS to a new APPLICATION USAGE section.

**58720 Issue 6**

58721 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/122 is applied, updating the  
58722 DESCRIPTION from "each semaphore in the set shall not be initialized" to "each semaphore in  
58723 the set need not be initialized".

58724 **NAME**

58725 semop — XSI semaphore operations

58726 **SYNOPSIS**

```
58727 XSI #include <sys/sem.h>
58728 int semop(int semid, struct sembuf *sops, size_t nsops);
```

58729 **DESCRIPTION**

58730 The *semop()* function operates on XSI semaphores (see XBD Section 4.16, on page 113). It is  
 58731 unspecified whether this function interoperates with the realtime interprocess communication  
 58732 facilities defined in Section 2.8 (on page 497).

58733 The *semop()* function shall perform atomically a user-defined array of semaphore operations in  
 58734 array order on the set of semaphores associated with the semaphore identifier specified by the  
 58735 argument *semid*.

58736 The argument *sops* is a pointer to a user-defined array of semaphore operation structures. The  
 58737 implementation shall not modify elements of this array unless the application uses  
 58738 implementation-defined extensions.

58739 The argument *nsops* is the number of such structures in the array.

58740 Each structure, **sembuf**, includes the following members:

Member Type	Member Name	Description
short	<i>sem_num</i>	Semaphore number.
short	<i>sem_op</i>	Semaphore operation.
short	<i>sem_flg</i>	Operation flags.

58745 Each semaphore operation specified by *sem\_op* is performed on the corresponding semaphore  
 58746 specified by *semid* and *sem\_num*.

58747 The variable *sem\_op* specifies one of three semaphore operations:

- 58748 1. If *sem\_op* is a negative integer and the calling process has alter permission, one of the  
 58749 following shall occur:
  - 58750 • If *semval* (see <sys/sem.h>) is greater than or equal to the absolute value of *sem\_op*,  
 58751 the absolute value of *sem\_op* is subtracted from *semval*. Also, if (*sem\_flg*  
 58752 &SEM\_UNDO) is non-zero, the absolute value of *sem\_op* shall be added to the  
 58753 *semadj* value of the calling process for the specified semaphore.
  - 58754 • If *semval* is less than the absolute value of *sem\_op* and (*sem\_flg* &IPC\_NOWAIT) is  
 58755 non-zero, *semop()* shall return immediately.
  - 58756 • If *semval* is less than the absolute value of *sem\_op* and (*sem\_flg* &IPC\_NOWAIT) is 0,  
 58757 *semop()* shall increment the *semncnt* associated with the specified semaphore and  
 58758 suspend execution of the calling thread until one of the following conditions occurs:
    - 58759 — The value of *semval* becomes greater than or equal to the absolute value of  
 58760 *sem\_op*. When this occurs, the value of *semncnt* associated with the specified  
 58761 semaphore shall be decremented, the absolute value of *sem\_op* shall be  
 58762 subtracted from *semval* and, if (*sem\_flg* &SEM\_UNDO) is non-zero, the  
 58763 absolute value of *sem\_op* shall be added to the *semadj* value of the calling  
 58764 process for the specified semaphore.

**semop()**

- 58765 — The *semid* for which the calling thread is awaiting action is removed from the  
58766 system. When this occurs, *errno* shall be set equal to [EIDRM] and  $-1$  shall be  
58767 returned.
- 58768 — The calling thread receives a signal that is to be caught. When this occurs, the  
58769 value of *semncnt* associated with the specified semaphore shall be  
58770 decremented, and the calling thread shall resume execution in the manner  
58771 prescribed in *sigaction()*.
- 58772 2. If *sem\_op* is a positive integer and the calling process has alter permission, the value of  
58773 *sem\_op* shall be added to *semval* and, if (*sem\_flg* & SEM\_UNDO) is non-zero, the value of  
58774 *sem\_op* shall be subtracted from the *semadj* value of the calling process for the specified  
58775 semaphore.
- 58776 3. If *sem\_op* is 0 and the calling process has read permission, one of the following shall occur:
- 58777 • If *semval* is 0, *semop()* shall return immediately.
  - 58778 • If *semval* is non-zero and (*sem\_flg* & IPC\_NOWAIT) is non-zero, *semop()* shall return  
58779 immediately.
  - 58780 • If *semval* is non-zero and (*sem\_flg* & IPC\_NOWAIT) is 0, *semop()* shall increment the  
58781 *semzcnt* associated with the specified semaphore and suspend execution of the  
58782 calling thread until one of the following occurs:
    - 58783 — The value of *semval* becomes 0, at which time the value of *semzcnt* associated  
58784 with the specified semaphore shall be decremented.
    - 58785 — The *semid* for which the calling thread is awaiting action is removed from the  
58786 system. When this occurs, *errno* shall be set equal to [EIDRM] and  $-1$  shall be  
58787 returned.
    - 58788 — The calling thread receives a signal that is to be caught. When this occurs, the  
58789 value of *semzcnt* associated with the specified semaphore shall be  
58790 decremented, and the calling thread shall resume execution in the manner  
58791 prescribed in *sigaction()*.
- 58792 Upon successful completion, the value of *sempid* for each semaphore specified in the array  
58793 pointed to by *sops* shall be set equal to the process ID of the calling process.

**RETURN VALUE**

58794 Upon successful completion, *semop()* shall return 0; otherwise, it shall return  $-1$  and set *errno* to  
58795 indicate the error.  
58796

**ERRORS**

58797 The *semop()* function shall fail if:  
58798

- |       |          |   |
|-------|----------|---|
| 58799 | [E2BIG]  | The value of <i>nsops</i> is greater than the system-imposed maximum.   |
| 58800 | [EACCES] | Operation permission is denied to the calling process; see <a href="#">Section 2.7</a> (on page 496).                                     |
| 58801 |          |   |
| 58802 | [EAGAIN] | The operation would result in suspension of the calling process but ( <i>sem_flg</i> & IPC_NOWAIT) is non-zero.                           |
| 58803 |          |   |
| 58804 | [EFBIG]  | The value of <i>sem_num</i> is less than 0 or greater than or equal to the number of semaphores in the set associated with <i>semid</i> . |
| 58805 |          |   |

58806	[EIDRM]	The semaphore identifier <i>semid</i> is removed from the system.
58807	[EINTR]	The <i>semop()</i> function was interrupted by a signal.
58808	[EINVAL]	The value of <i>semid</i> is not a valid semaphore identifier, or the number of individual semaphores for which the calling process requests a SEM_UNDO would exceed the system-imposed limit.
58809		
58810		
58811	[ENOSPC]	The limit on the number of individual processes requesting a SEM_UNDO would be exceeded.
58812		
58813	[ERANGE]	An operation would cause a <i>semval</i> to overflow the system-imposed limit, or an operation would cause a <i>semadj</i> value to overflow the system-imposed limit.
58814		
58815		

58816 **EXAMPLES**58817 **Setting Values in Semaphores**

58818 The following example sets the values of the two semaphores associated with the *semid* identifier  
58819 to the values contained in the *sb* array.

```
58820 #include <sys/sem.h>
58821 ...
58822 int semid;
58823 struct sembuf sb[2];
58824 int nsops = 2;
58825 int result;

58826 /* Adjust value of semaphore in the semaphore array semid. */
58827 sb[0].sem_num = 0;
58828 sb[0].sem_op = -1;
58829 sb[0].sem_flg = SEM_UNDO | IPC_NOWAIT;
58830 sb[1].sem_num = 1;
58831 sb[1].sem_op = 1;
58832 sb[1].sem_flg = 0;

58833 result = semop(semid, sb, nsops);
```

58834 **Creating a Semaphore Identifier**

58835 The following example gets a unique semaphore key using the *ftok()* function, then gets a  
58836 semaphore ID associated with that key using the *semget()* function (the first call also tests to  
58837 make sure the semaphore exists). If the semaphore does not exist, the program creates it, as  
58838 shown by the second call to *semget()*. In creating the semaphore for the queuing process, the  
58839 program attempts to create one semaphore with read/write permission for all. It also uses the  
58840 IPC\_EXCL flag, which forces *semget()* to fail if the semaphore already exists.

58841 After creating the semaphore, the program uses a call to *semop()* to initialize it to the values in  
58842 the *sbuf* array. The number of processes that can execute concurrently without queuing is  
58843 initially set to 2. The final call to *semget()* creates a semaphore identifier that can be used later in  
58844 the program.

58845 The final call to *semop()* acquires the semaphore and waits until it is free; the SEM\_UNDO  
58846 option releases the semaphore when the process exits, waiting until there are less than two  
58847 processes running concurrently.

## semop()

```

58848     #include <sys/types.h>
58849     #include <stdio.h>
58850     #include <sys/ipc.h>
58851     #include <sys/sem.h>
58852     #include <sys/stat.h>
58853     #include <errno.h>
58854     #include <unistd.h>
58855     #include <stdlib.h>
58856     #include <pwd.h>
58857     #include <fcntl.h>
58858     #include <limits.h>
58859     ...
58860     key_t semkey;
58861     int semid, pfd, fv;
58862     struct sembuf sbuf;
58863     char *lgn;
58864     char filename[PATH_MAX+1];
58865     struct stat outstat;
58866     struct passwd *pw;
58867     ...
58868     /* Get unique key for semaphore. */
58869     if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
58870         perror("IPC error: ftok"); exit(1);
58871     }
58872     /* Get semaphore ID associated with this key. */
58873     if ((semid = semget(semkey, 0, 0)) == -1) {
58874         /* Semaphore does not exist - Create. */
58875         if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
58876             S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
58877         {
58878             /* Initialize the semaphore. */
58879             sbuf.sem_num = 0;
58880             sbuf.sem_op = 2; /* This is the number of runs without queuing. */
58881             sbuf.sem_flg = 0;
58882             if (semop(semid, &sbuf, 1) == -1) {
58883                 perror("IPC error: semop"); exit(1);
58884             }
58885         }
58886         else if (errno == EEXIST) {
58887             if ((semid = semget(semkey, 0, 0)) == -1) {
58888                 perror("IPC error 1: semget"); exit(1);
58889             }
58890         }
58891         else {
58892             perror("IPC error 2: semget"); exit(1);
58893         }
58894     }
58895     ...
58896     sbuf.sem_num = 0;
58897     sbuf.sem_op = -1;
58898     sbuf.sem_flg = SEM_UNDO;

```

```

58899     if (semop(semid, &sbuf, 1) == -1) {
58900         perror("IPC Error: semop"); exit(1);
58901     }

```

**58902 APPLICATION USAGE**

58903 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
 58904 Application developers who need to use IPC should design their applications so that modules  
 58905 using the IPC routines described in [Section 2.7](#) (on page 496) can be easily modified to use the  
 58906 alternative interfaces.

**58916 CHANGE HISTORY**

58917 First released in Issue 2. Derived from Issue 2 of the SVID.

**58918 Issue 5**

58919 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
 58920 DIRECTIONS to a new APPLICATION USAGE section.

**58921 Issue 7**

58922 SD5-XSH-ERN-171 is applied, updating the DESCRIPTION to clarify the order in which the  
 58923 operations in *sops* will be performed when there are multiple operations.

**send()**58924 **NAME**58925 `send` — send a message on a socket58926 **SYNOPSIS**58927 `#include <sys/socket.h>`58928 `ssize_t send(int socket, const void *buffer, size_t length, int flags);`58929 **DESCRIPTION**

58930 The `send()` function shall initiate transmission of a message from the specified socket to its peer.  
 58931 The `send()` function shall send a message only when the socket is connected. If the socket is a  
 58932 connectionless-mode socket, the message shall be sent to the pre-specified peer address.

58933 The `send()` function takes the following arguments:

58934	<i>socket</i>	Specifies the socket file descriptor.
58935	<i>buffer</i>	Points to the buffer containing the message to send.
58936	<i>length</i>	Specifies the length of the message in bytes.
58937	<i>flags</i>	Specifies the type of message transmission. Values of this argument are formed by logically OR'ing zero or more of the following flags:
58939	MSG_EOR	Terminates a record (if supported by the protocol).
58940	MSG_OOB	Sends out-of-band data on sockets that support out-of-band communications. The significance and semantics of out-of-band data are protocol-specific.
58941		
58942		
58943	MSG_NOSIGNAL	Requests not to send the SIGPIPE signal if an attempt to send is made on a stream-oriented socket that is no longer connected. The [EPIPE] error shall still be returned.
58944		
58945		
58946		

58947 The length of the message to be sent is specified by the *length* argument. If the message is too  
 58948 long to pass through the underlying protocol, `send()` shall fail and no data shall be transmitted.

58949 Successful completion of a call to `send()` does not guarantee delivery of the message. A return  
 58950 value of `-1` indicates only locally-detected errors.

58951 If space is not available at the sending socket to hold the message to be transmitted, and the  
 58952 socket file descriptor does not have `O_NONBLOCK` set, `send()` shall block until space is  
 58953 available. If space is not available at the sending socket to hold the message to be transmitted,  
 58954 and the socket file descriptor does have `O_NONBLOCK` set, `send()` shall fail. The `select()` and  
 58955 `poll()` functions can be used to determine when it is possible to send more data.

58956 The socket in use may require the process to have appropriate privileges to use the `send()`  
 58957 function.

58958 **RETURN VALUE**

58959 Upon successful completion, `send()` shall return the number of bytes sent. Otherwise, `-1` shall be  
 58960 returned and `errno` set to indicate the error.

58961 **ERRORS**58962 The `send()` function shall fail if:

58963 [EAGAIN] or [EWOULDBLOCK]

58964 The socket's file descriptor is marked `O_NONBLOCK` and the requested  
 58965 operation would block.

58966	[EBADF]	The <i>socket</i> argument is not a valid file descriptor.
58967	[ECONNRESET]	A connection was forcibly closed by a peer.
58968	[EDESTADDRREQ]	
58969		The socket is not connection-mode and no peer address is set.
58970	[EINTR]	A signal interrupted <i>send()</i> before any data was transmitted.
58971	[EMSGSIZE]	The message is too large to be sent all at once, as the socket requires.
58972	[ENOTCONN]	The socket is not connected.
58973	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
58974	[EOPNOTSUPP]	The <i>socket</i> argument is associated with a socket that does not support one or more of the values set in <i>flags</i> .
58975		
58976	[EPIPE]	The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type SOCK_STREAM or SOCK_SEQPACKET and the MSG_NOSIGNAL flag is not set, the SIGPIPE signal is generated to the calling thread.
58977

**send()**

- 59005 The MSG\_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.
- 59006
- 59007 The [EPIPE] error is modified.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

59008 **NAME**

59009 sendmsg — send a message on a socket using a message structure

59010 **SYNOPSIS**

59011 #include &lt;sys/socket.h&gt;

59012 ssize\_t sendmsg(int *socket*, const struct msghdr \**message*, int *flags*);59013 **DESCRIPTION**

59014 The *sendmsg()* function shall send a message through a connection-mode or connectionless-mode socket. If the socket is a connectionless-mode socket, the message shall be sent to the address specified by **msghdr** if no pre-specified peer address has been set. If a peer address has been pre-specified, either the message shall be sent to the address specified in **msghdr** (overriding the pre-specified peer address), or the function shall return  $-1$  and set *errno* to [EISCONN]. If the socket is connection-mode, the destination address in **msghdr** shall be ignored.

59021 The *sendmsg()* function takes the following arguments:59022 *socket* Specifies the socket file descriptor.

59023 *message* Points to a **msghdr** structure, containing both the destination address and the buffers for the outgoing message. The length and format of the address depend on the address family of the socket. The *msg\_flags* member is ignored.

59026 *flags* Specifies the type of message transmission. The application may specify 0 or the following flag:

59028 MSG\_EOR Terminates a record (if supported by the protocol).

59029 MSG\_OOB Sends out-of-band data on sockets that support out-of-bound data. The significance and semantics of out-of-band data are protocol-specific.

59032 MSG\_NOSIGNAL Requests not to send the SIGPIPE signal if an attempt to send is made on a stream-oriented socket that is no longer connected. The [EPIPE] error shall still be returned.

59036 The *msg\_iov* and *msg\_iovlen* fields of *message* specify zero or more buffers containing the data to be sent. *msg\_iov* points to an array of **iovec** structures; *msg\_iovlen* shall be set to the dimension of this array. In each **iovec** structure, the *iov\_base* field specifies a storage area and the *iov\_len* field gives its size in bytes. Some of these sizes can be zero. The data from each storage area indicated by *msg\_iov* is sent in turn.

59041 Successful completion of a call to *sendmsg()* does not guarantee delivery of the message. A return value of  $-1$  indicates only locally-detected errors.

59043 If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does not have O\_NONBLOCK set, the *sendmsg()* function shall block until space is available. If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does have O\_NONBLOCK set, the *sendmsg()* function shall fail.

59048 If the socket protocol supports broadcast and the specified address is a broadcast address for the socket protocol, *sendmsg()* shall fail if the SO\_BROADCAST option is not set for the socket.

59050 The socket in use may require the process to have appropriate privileges to use the *sendmsg()* function.

**sendmsg()**59052 **RETURN VALUE**

59053 Upon successful completion, *sendmsg()* shall return the number of bytes sent. Otherwise, -1  
 59054 shall be returned and *errno* set to indicate the error.

59055 **ERRORS**

59056 The *sendmsg()* function shall fail if:

59057 [EAGAIN] or [EWOULDBLOCK]

59058 The socket's file descriptor is marked O\_NONBLOCK and the requested  
 59059 operation would block.

59060 [EAFNOSUPPORT]

59061 Addresses in the specified address family cannot be used with this socket.

59062 [EBADF] The *socket* argument is not a valid file descriptor.

59063 [ECONNRESET] A connection was forcibly closed by a peer.

59064 [EINTR] A signal interrupted *sendmsg()* before any data was transmitted.

59065 [EINVAL] The sum of the *iov\_len* values overflows an **ssize\_t**.

59066 [EMSGSIZE] The message is too large to be sent all at once (as the socket requires), or the  
 59067 *msg\_iovlen* member of the **msghdr** structure pointed to by *message* is less than  
 59068 or equal to 0 or is greater than {IOV\_MAX}.

59069 [ENOTCONN] The socket is connection-mode but is not connected.

59070 [ENOTSOCK] The *socket* argument does not refer to a socket.

59071 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or  
 59072 more of the values set in *flags*.

59073 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is  
 59074 no longer connected. In the latter case, and if the socket is of type  
 59075 SOCK\_STREAM or SOCK\_SEQPACKET and the MSG\_NOSIGNAL flag is not  
 59076 set, the SIGPIPE signal is generated to the calling thread.

59077 If the address family of the socket is AF\_UNIX, then *sendmsg()* shall fail if:

59078 [EIO] An I/O error occurred while reading from or writing to the file system.

59079 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname  
 59080 in the socket address.

59081 [ENAMETOOLONG]

59082 The length of a component of a pathname is longer than {NAME\_MAX}.

59083 [ENOENT]

59084 A component of the pathname does not name an existing file or the path name  
 59084 is an empty string.

59085 [ENOTDIR]

59086 A component of the path prefix of the pathname in the socket address is not a  
 59087 directory, or the pathname in the socket address contains at least one  
 59088 non-*<slash>* character and ends with one or more trailing *<slash>* characters  
 59089 and the last pathname component names an existing file that is neither a  
 59089 directory nor a symbolic link to a directory.

59090 The *sendmsg()* function may fail if:

59091 [EACCES]

59092 Search permission is denied for a component of the path prefix; or write access  
 59092 to the named socket is denied.

59093	[EDESTADDRREQ]	
59094		The socket is not connection-mode and does not have its peer address set, and
59095		no destination address was specified.
59096	[EHOSTUNREACH]	
59097		The destination host cannot be reached (probably because the host is down or
59098		a remote router cannot reach it).
59099	[EIO]	An I/O error occurred while reading from or writing to the file system.
59100	[EISCONN]	A destination address was specified and the socket is already connected.
59101	[ENETDOWN]	The local network interface used to reach the destination is down.
59102	[ENETUNREACH]	
59103		No route to the network is present.
59104	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.
59105	[ENOMEM]	Insufficient memory was available to fulfill the request.
59106		If the address family of the socket is AF_UNIX, then <i>sendmsg()</i> may fail if:
59107	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during
59108		resolution of the pathname in the socket address.
59109	[ENAMETOOLONG]	
59110		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
59111		symbolic link produced an intermediate result with a length that exceeds
59112		{PATH_MAX}.

**59113 EXAMPLES**

59114 Done.

**59115 APPLICATION USAGE**

59116 The *select()* and *poll()* functions can be used to determine when it is possible to send more data.

**59117 RATIONALE**

59118 None.

**59119 FUTURE DIRECTIONS**

59120 None.

**59121 SEE ALSO**

**59125 CHANGE HISTORY**

59126 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

59127 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
59128 [ELOOP] error condition is added.

**59129 Issue 7**

59130 Austin Group Interpretation 1003.1-2001 #073 is applied, updating the DESCRIPTION.

59131 Austin Group Interpretation 1003.1-2001 #143 is applied.

59132 The MSG\_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended  
59133 API Set Part 2.

**sendmsg()**

59134

The [EPIPE] error is modified.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

59135 **NAME**59136 `sendto` — send a message on a socket59137 **SYNOPSIS**59138 `#include <sys/socket.h>`

```
59139     ssize_t sendto(int socket, const void *message, size_t length,
59140                   int flags, const struct sockaddr *dest_addr,
59141                   socklen_t dest_len);
```

59142 **DESCRIPTION**

59143 The `sendto()` function shall send a message through a connection-mode or connectionless-mode  
 59144 socket.

59145 If the socket is a connectionless-mode socket, the message shall be sent to the address specified  
 59146 by `dest_addr` if no pre-specified peer address has been set. If a peer address has been pre-  
 59147 specified, either the message shall be sent to the address specified by `dest_addr` (overriding the  
 59148 pre-specified peer address), or the function shall return `-1` and set `errno` to `[EISCONN]`.

59149 If the socket is connection-mode, `dest_addr` shall be ignored.

59150 The `sendto()` function takes the following arguments:

59151 `socket` Specifies the socket file descriptor.

59152 `message` Points to a buffer containing the message to be sent.

59153 `length` Specifies the size of the message in bytes.

59154 `flags` Specifies the type of message transmission. Values of this argument are  
 59155 formed by logically OR'ing zero or more of the following flags:

59156 `MSG_EOR` Terminates a record (if supported by the protocol).

59157 `MSG_OOB` Sends out-of-band data on sockets that support out-of-  
 59158 band data. The significance and semantics of out-of-  
 59159 band data are protocol-specific.

59160 `MSG_NOSIGNAL` Requests not to send the SIGPIPE signal if an attempt to  
 59161 send is made on a stream-oriented socket that is no  
 59162 longer connected. The `[EPIPE]` error shall still be  
 59163 returned.

59164 `dest_addr` Points to a `sockaddr` structure containing the destination address. The length  
 59165 and format of the address depend on the address family of the socket.

59166 `dest_len` Specifies the length of the `sockaddr` structure pointed to by the `dest_addr`  
 59167 argument.

59168 If the socket protocol supports broadcast and the specified address is a broadcast address for the  
 59169 socket protocol, `sendto()` shall fail if the `SO_BROADCAST` option is not set for the socket.

59170 The `dest_addr` argument specifies the address of the target.

59171 The `length` argument specifies the length of the message.

59172 Successful completion of a call to `sendto()` does not guarantee delivery of the message. A return  
 59173 value of `-1` indicates only locally-detected errors.

59174 If space is not available at the sending socket to hold the message to be transmitted and the  
 59175 socket file descriptor does not have `O_NONBLOCK` set, `sendto()` shall block until space is  
 59176 available. If space is not available at the sending socket to hold the message to be transmitted

**sendto()**

- 59177 and the socket file descriptor does have O\_NONBLOCK set, *sendto()* shall fail.
- 59178 The socket in use may require the process to have appropriate privileges to use the *sendto()*  
59179 function.
- 59180 **RETURN VALUE**
- 59181 Upon successful completion, *sendto()* shall return the number of bytes sent. Otherwise, -1 shall  
59182 be returned and *errno* set to indicate the error.
- 59183 **ERRORS**
- 59184 The *sendto()* function shall fail if:
- 59185 [EAFNOSUPPORT]  
59186 Addresses in the specified address family cannot be used with this socket.
- 59187 [EAGAIN] or [EWOULDBLOCK]  
59188 The socket's file descriptor is marked O\_NONBLOCK and the requested  
59189 operation would block.
- 59190 [EBADF] The *socket* argument is not a valid file descriptor.
- 59191 [ECONNRESET] A connection was forcibly closed by a peer.
- 59192 [EINTR] A signal interrupted *sendto()* before any data was transmitted.
- 59193 [EMSGSIZE] The message is too large to be sent all at once, as the socket requires.
- 59194 [ENOTCONN] The socket is connection-mode but is not connected.
- 59195 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 59196 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or  
59197 more of the values set in *flags*.
- 59198 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is  
59199 no longer connected. In the latter case, and if the socket is of type  
59200 SOCK\_STREAM or SOCK\_SEQPACKET and the MSG\_NOSIGNAL flag is not  
59201 set, the SIGPIPE signal is generated to the calling thread.
- 59202 If the address family of the socket is AF\_UNIX, then *sendto()* shall fail if:
- 59203 [EIO] An I/O error occurred while reading from or writing to the file system.
- 59204 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname  
59205 in the socket address.
- 59206 [ENAMETOOLONG]  
59207 The length of a component of a pathname is longer than {NAME\_MAX}.
- 59208 [ENOENT] A component of the pathname does not name an existing file or the pathname  
59209 is an empty string.
- 59210 [ENOTDIR] A component of the path prefix of the pathname in the socket address is not a  
59211 directory, or the pathname in the socket address contains at least one  
59212 non-`<slash>` character and ends with one or more trailing `<slash>` characters  
59213 and the last pathname component names an existing file that is neither a  
59214 directory nor a symbolic link to a directory.

- 59215 The *sendto()* function may fail if:
- 59216 [EACCES] Search permission is denied for a component of the path prefix; or write access  
59217 to the named socket is denied.
- 59218 [EDESTADDRREQ]  
59219 The socket is not connection-mode and does not have its peer address set, and  
59220 no destination address was specified.
- 59221 [EHOSTUNREACH]  
59222 The destination host cannot be reached (probably because the host is down or  
59223 a remote router cannot reach it).
- 59224 [EINVAL] The *dest\_len* argument is not a valid length for the address family.
- 59225 [EIO] An I/O error occurred while reading from or writing to the file system.
- 59226 [EISCONN] A destination address was specified and the socket is already connected.
- 59227 [ENETDOWN] The local network interface used to reach the destination is down.
- 59228 [ENETUNREACH]  
59229 No route to the network is present.
- 59230 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 59231 [ENOMEM] Insufficient memory was available to fulfill the request.
- 59232 If the address family of the socket is AF\_UNIX, then *sendto()* may fail if:
- 59233 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
59234 resolution of the pathname in the socket address.
- 59235 [ENAMETOOLONG]  
59236 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
59237 symbolic link produced an intermediate result with a length that exceeds  
59238 {PATH\_MAX}.
- 59239 **EXAMPLES**  
59240 None.
- 59241 **APPLICATION USAGE**  
59242 The *select()* and *poll()* functions can be used to determine when it is possible to send more data.
- 59243 **RATIONALE**  
59244 None.
- 59245 **FUTURE DIRECTIONS**  
59246 None.
- 59247 **SEE ALSO**  
59248 *getsockopt()*, *poll()*, *pselect()*, *recv()*, *recvfrom()*, *recvmsg()*, *send()*, *sendmsg()*, *setsockopt()*,

**sendto()***System Interfaces*59255 **Issue 7**

59256 Austin Group Interpretations 1003.1-2001 #035 and #073 are applied, updating the [EISCONN]  
59257 error and the DESCRIPTION.

59258 Austin Group Interpretation 1003.1-2001 #143 is applied, clarifying the [ENAMETOOLONG]  
59259 error condition.

59260 The MSG\_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended  
59261 API Set Part 2.

59262 The [EPIPE] error is modified.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

59263 **NAME**

59264 setbuf — assign buffering to a stream

59265 **SYNOPSIS**

59266 #include &lt;stdio.h&gt;

59267 void setbuf(FILE \*restrict stream, char \*restrict buf);

59268 **DESCRIPTION**

59269 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 59270 conflict between the requirements described here and the ISO C standard is unintentional. This  
 59271 volume of POSIX.1-2008 defers to the ISO C standard.

59272 Except that it returns no value, the function call:

59273 setbuf(stream, buf)

59274 shall be equivalent to:

59275 setvbuf(stream, buf, \_IOFBF, BUFSIZ)

59276 if *buf* is not a null pointer, or to:

59277 setvbuf(stream, buf, \_IONBF, BUFSIZ)

59278 if *buf* is a null pointer.59279 **RETURN VALUE**59280 The *setbuf()* function shall not return a value.59281 **ERRORS**

59282 No errors are defined.

59283 **EXAMPLES**

59284 None.

59285 **APPLICATION USAGE**

59286 A common source of error is allocating buffer space as an “automatic” variable in a code block,  
 59287 and then failing to close the stream in the same block.

59288 With *setbuf()*, allocating a buffer of BUFSIZ bytes does not necessarily imply that all of BUFSIZ  
 59289 bytes are used for the buffer area.

59290 **RATIONALE**

59291 None.

59292 **FUTURE DIRECTIONS**

59293 None.

59294 **SEE ALSO**59295 *fcntl()*, *setvbuf()*

59296 XBD &lt;stdio.h&gt;

59297 **CHANGE HISTORY**

59298 First released in Issue 1. Derived from Issue 1 of the SVID.

59299 **Issue 6**59300 The prototype for *setbuf()* is updated for alignment with the ISO/IEC 9899:1999 standard.

**setegid()**59301 **NAME**

59302           setegid — set the effective group ID

59303 **SYNOPSIS**

59304           #include &lt;unistd.h&gt;

59305           int setegid(gid\_t gid);

59306 **DESCRIPTION**59307           If *gid* is equal to the real group ID or the saved set-group-ID, or if the process has appropriate  
59308 privileges, *setegid()* shall set the effective group ID of the calling process to *gid*; the real group  
59309 ID, saved set-group-ID, and any supplementary group IDs shall remain unchanged.59310           The *setegid()* function shall not affect the supplementary group list in any way.59311 **RETURN VALUE**59312           Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
59313 indicate the error.59314 **ERRORS**59315           The *setegid()* function shall fail if:59316           [EINVAL]           The value of the *gid* argument is invalid and is not supported by the  
59317 implementation.59318           [EPERM]           The process does not have appropriate privileges and *gid* does not match the  
59319 real group ID or the saved set-group-ID.59320 **EXAMPLES**

59321           None.

59322 **APPLICATION USAGE**

59323           None.

59324 **RATIONALE**59325           Refer to the RATIONALE section in *setuid()*.59326 **FUTURE DIRECTIONS**

59327           None.

59328 **SEE ALSO**59329           *exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *seteuid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*

59330           XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

59331 **CHANGE HISTORY**

59332           First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

59333 **NAME**

59334            setenv — add or change environment variable

59335 **SYNOPSIS**

```
59336 CX       #include <stdlib.h>
59337       int setenv(const char *envname, const char *envval, int overwrite);
```

59338 **DESCRIPTION**

59339       The *setenv()* function shall update or add a variable in the environment of the calling process.  
 59340       The *envname* argument points to a string containing the name of an environment variable to be  
 59341       added or altered. The environment variable shall be set to the value to which *envval* points. The  
 59342       function shall fail if *envname* points to a string which contains an '=' character. If the  
 59343       environment variable named by *envname* already exists and the value of *overwrite* is non-zero,  
 59344       the function shall return success and the environment shall be updated. If the environment  
 59345       variable named by *envname* already exists and the value of *overwrite* is zero, the function shall  
 59346       return success and the environment shall remain unchanged.

59347       If the application modifies *environ* or the pointers to which it points, the behavior of *setenv()* is  
 59348       undefined. The *setenv()* function shall update the list of pointers to which *environ* points.

59349       The strings described by *envname* and *envval* are copied by this function.

59350       The *setenv()* function need not be thread-safe.

59351 **RETURN VALUE**

59352       Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to  
 59353       indicate the error, and the environment shall be unchanged.

59354 **ERRORS**

59355       The *setenv()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 59356 | [EINVAL] | The <i>name</i> argument is a null pointer, points to an empty string, or points to a string containing an '=' character. |
| 59357 |          |   |
| 59358 | [ENOMEM] | Insufficient memory was available to add a variable or its value to the environment.                                      |
| 59359 |          |   |

59360 **EXAMPLES**

59361       None.

59362 **APPLICATION USAGE**

59363       See *exec()* for restrictions on changing the environment in multi-threaded applications.

59364 **RATIONALE**

59365       Unanticipated results may occur if *setenv()* changes the external variable *environ*. In particular, if  
 59366       the optional *envp* argument to *main()* is present, it is not changed, and thus may point to an  
 59367       obsolete copy of the environment (as may any other copy of *environ*). However, other than the  
 59368       aforementioned restriction, the standard developers intended that the traditional method of  
 59369       walking through the environment by way of the *environ* pointer must be supported.

59370       It was decided that *setenv()* should be required by this version because it addresses a piece of  
 59371       missing functionality, and does not impose a significant burden on the implementor.

59372       There was considerable debate as to whether the System V *putenv()* function or the BSD *setenv()*  
 59373       function should be required as a mandatory function. The *setenv()* function was chosen because  
 59374       it permitted the implementation of the *unsetenv()* function to delete environmental variables,  
 59375       without specifying an additional interface. The *putenv()* function is available as part of the XSI  
 59376       option.

**setenv()**

59377 The standard developers considered requiring that *setenv()* indicate an error when a call to it  
59378 would result in exceeding {ARG\_MAX}. The requirement was rejected since the condition might  
59379 be temporary, with the application eventually reducing the environment size. The ultimate  
59380 success or failure depends on the size at the time of a call to *exec*, which returns an indication of  
59381 this error condition.

**59382 FUTURE DIRECTIONS**

59383 None.

**59387 CHANGE HISTORY**

59388 First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

59389 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/55 is applied, adding references to *exec* in  
59390 the APPLICATION USAGE and SEE ALSO sections.

**59391 Issue 7**

59392 Austin Group Interpretation 1003.1-2001 #156 is applied.

59393 **NAME**

59394        seteuid — set effective user ID

59395 **SYNOPSIS**

```
59396        #include <unistd.h>
59397        int seteuid(uid_t uid);
```

59398 **DESCRIPTION**

59399        If *uid* is equal to the real user ID or the saved set-user-ID, or if the process has appropriate  
 59400        privileges, *seteuid()* shall set the effective user ID of the calling process to *uid*; the real user ID  
 59401        and saved set-user-ID shall remain unchanged.

59402        The *seteuid()* function shall not affect the supplementary group list in any way.

59403 **RETURN VALUE**

59404        Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
 59405        indicate the error.

59406 **ERRORS**

59407        The *seteuid()* function shall fail if:

59408        [EINVAL]        The value of the *uid* argument is invalid and is not supported by the  
 59409        implementation.

59410        [EPERM]        The process does not have appropriate privileges and *uid* does not match the  
 59411        real user ID or the saved set-user-ID.

59412 **EXAMPLES**

59413        None.

59414 **APPLICATION USAGE**

59415        None.

59416 **RATIONALE**

59417        Refer to the RATIONALE section in *setuid()*.

59460 **CHANGE HISTORY**

59461 First released in Issue 1. Derived from Issue 1 of the SVID.

59462 **Issue 6**

59463 In the SYNOPSIS, the optional include of the &lt;sys/types.h&gt; header is removed.

59464 The following new requirements on POSIX implementations derive from alignment with the  
59465 Single UNIX Specification:

- 59466
- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
59467 required for conforming implementations of previous POSIX specifications, it was not  
59468 required for UNIX applications.

- 59469 • Functionality associated with `_POSIX_SAVED_IDS` is now mandated. This is a FIPS  
59470 requirement.

59471 The following changes were made to align with the IEEE P1003.1a draft standard:

- 59472 • The effects of `setgid()` in processes without appropriate privileges are changed.  
59473 • A requirement that the supplementary group list is not affected is added.

**setitimer()***System Interfaces*59488 **NAME**

59489 setitimer — set the value of an interval timer

59490 **SYNOPSIS**

59491 OB XSI #include &lt;sys/time.h&gt;

59492 int setitimer(int *which*, const struct itimerval \*restrict *value*,  
59493 struct itimerval \*restrict *ovalue*);59494 **DESCRIPTION**59495 Refer to *getitimer()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

59496 **NAME**

59497 setjmp — set jump point for a non-local goto

59498 **SYNOPSIS**

```
59499 #include <setjmp.h>
59500 int setjmp(jmp_buf env);
```

59501 **DESCRIPTION**

59502 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 59503 conflict between the requirements described here and the ISO C standard is unintentional. This  
 59504 volume of POSIX.1-2008 defers to the ISO C standard.

59505 A call to *setjmp()* shall save the calling environment in its *env* argument for later use by  
 59506 *longjmp()*.

59507 It is unspecified whether *setjmp()* is a macro or a function. If a macro definition is suppressed in  
 59508 order to access an actual function, or a program defines an external identifier with the name  
 59509 *setjmp*, the behavior is undefined.

59510 An application shall ensure that an invocation of *setjmp()* appears in one of the following  
 59511 contexts only:

- 59512 • The entire controlling expression of a selection or iteration statement
- 59513 • One operand of a relational or equality operator with the other operand an integral  
 59514 constant expression, with the resulting expression being the entire controlling expression  
 59515 of a selection or iteration statement
- 59516 • The operand of a unary '!' operator with the resulting expression being the entire  
 59517 controlling expression of a selection or iteration
- 59518 • The entire expression of an expression statement (possibly cast to **void**)

59519 If the invocation appears in any other context, the behavior is undefined.

59520 **RETURN VALUE**

59521 If the return is from a direct invocation, *setjmp()* shall return 0. If the return is from a call to  
 59522 *longjmp()*, *setjmp()* shall return a non-zero value.

59523 **ERRORS**

59524 No errors are defined.

59525 **EXAMPLES**

59526 None.

59527 **APPLICATION USAGE**

59528 In general, *sigsetjmp()* is more useful in dealing with errors and interrupts encountered in a low-  
 59529 level subroutine of a program.

59530 **RATIONALE**

59531 None.

59532 **FUTURE DIRECTIONS**

59533 None.

59534 **SEE ALSO**

59535 *longjmp()*, *sigsetjmp()*

59536 XBD <setjmp.h>

## setjmp()

### 59537 **CHANGE HISTORY**

59538 First released in Issue 1. Derived from Issue 1 of the SVID.

### 59539 **Issue 6**

59540 The normative text is updated to avoid use of the term “must” for application requirements.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

59541 **NAME**59542 setkey — set encoding key (**CRYPT**)59543 **SYNOPSIS**

```
59544 XSI #include <stdlib.h>
59545 void setkey(const char *key);
```

59546 **DESCRIPTION**

59547 The *setkey()* function provides access to an implementation-defined encoding algorithm. The  
 59548 argument of *setkey()* is an array of length 64 bytes containing only the bytes with numerical  
 59549 value of 0 and 1. If this string is divided into groups of 8, the low-order bit in each group is  
 59550 ignored; this gives a 56-bit key which is used by the algorithm. This is the key that shall be used  
 59551 with the algorithm to encode a string *block* passed to *encrypt()*.

59552 The *setkey()* function shall not change the setting of *errno* if successful. An application wishing to  
 59553 check for error situations should set *errno* to 0 before calling *setkey()*. If *errno* is non-zero on  
 59554 return, an error has occurred.

59555 The *setkey()* function need not be thread-safe.

59556 **RETURN VALUE**

59557 No values are returned.

59558 **ERRORS**59559 The *setkey()* function shall fail if:

59560 [ENOSYS] The functionality is not supported on this implementation.

59561 **EXAMPLES**

59562 None.

59563 **APPLICATION USAGE**

59564 Decoding need not be implemented in all environments. This is related to government  
 59565 restrictions in some countries on encryption and decryption routines. Historical practice has  
 59566 been to ship a different version of the encryption library without the decryption feature in the  
 59567 routines supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

59568 **RATIONALE**

59569 None.

59570 **FUTURE DIRECTIONS**

59571 None.

59572 **SEE ALSO**59573 *crypt()*, *encrypt()*

59574 XBD &lt;stdlib.h&gt;

59575 **CHANGE HISTORY**

59576 First released in Issue 1. Derived from Issue 1 of the SVID.

59577 **Issue 5**59578 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.59579 **Issue 7**

59580 Austin Group Interpretation 1003.1-2001 #156 is applied.

## setlocale()

## 59581 NAME

59582 setlocale — set program locale

## 59583 SYNOPSIS

59584 #include &lt;locale.h&gt;

59585 char \*setlocale(int *category*, const char \**locale*);

## 59586 DESCRIPTION

59587 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 59588 conflict between the requirements described here and the ISO C standard is unintentional. This  
 59589 volume of POSIX.1-2008 defers to the ISO C standard.

59590 The *setlocale()* function selects the appropriate piece of the locale of the process, as specified by  
 59591 the *category* and *locale* arguments, and may be used to change or query the entire locale of the  
 59592 process or portions thereof. The value *LC\_ALL* for *category* names the entire locale of the process;  
 59593 other values for *category* name only a part of the locale of the process:

59594 *LC\_COLLATE* Affects the behavior of regular expressions and the collation functions.

59595 *LC\_CTYPE* Affects the behavior of regular expressions, character classification, character  
 59596 conversion functions, and wide-character functions.

59597 CX *LC\_MESSAGES* Affects what strings are expected by commands and utilities as affirmative or  
 59598 negative responses.

59599 XSI It also affects what strings are given by commands and utilities as affirmative  
 59600 or negative responses, and the content of messages.

59601 *LC\_MONETARY* Affects the behavior of functions that handle monetary values.

59602 *LC\_NUMERIC* Affects the behavior of functions that handle numeric values.

59603 *LC\_TIME* Affects the behavior of the time conversion functions.

59604 The *locale* argument is a pointer to a character string containing the required setting of *category*.  
 59605 The contents of this string are implementation-defined. In addition, the following preset values  
 59606 of *locale* are defined for all settings of *category*:

59607 CX "POSIX" Specifies the minimal environment for C-language translation called the  
 59608 POSIX locale. If *setlocale()* is not invoked, the POSIX locale is the default at  
 59609 entry to *main()*.

59610 "C" Equivalent to "POSIX".

59611 CX "" Specifies an implementation-defined native environment. The determination  
 59612 of the name of the new locale for the specified category depends on the value  
 59613 of the associated environment variables, *LC\_\** and *LANG*; see XBD Chapter 7  
 59614 (on page 135) and Chapter 8 (on page 173).

59615 A null pointer Used to direct *setlocale()* to query the current internationalized environment  
 59616 and return the name of the locale.

59617 CX Setting all of the categories of the locale of the process is similar to successively setting each  
 59618 individual category of the locale of the process, except that all error checking is done before any  
 59619 actions are performed. To set all the categories of the locale of the process, *setlocale()* is invoked  
 59620 as:

```
59621 setlocale(LC_ALL, "");
```

59622 In this case, *setlocale()* shall first verify that the values of all the environment variables it needs  
 59623 according to the precedence rules (described in XBD Chapter 8, on page 173) indicate supported

59624 locales. If the value of any of these environment variable searches yields a locale that is not  
 59625 supported (and non-null), *setlocale()* shall return a null pointer and the locale of the process shall  
 59626 not be changed. If all environment variables name supported locales, *setlocale()* shall proceed as  
 59627 if it had been called for each category, using the appropriate value from the associated  
 59628 environment variable or from the implementation-defined default if there is no such value.

59629 The locale state is common to all threads within a process.

#### 59630 RETURN VALUE

59631 Upon successful completion, *setlocale()* shall return the string associated with the specified  
 59632 category for the new locale. Otherwise, *setlocale()* shall return a null pointer and the locale of the  
 59633 process is not changed.

59634 A null pointer for *locale* causes *setlocale()* to return a pointer to the string associated with the  
 59635 category for the current locale of the process. The locale of the process shall not be changed.

59636 The string returned by *setlocale()* is such that a subsequent call with that string and its associated  
 59637 category shall restore that part of the locale of the process. The application shall not modify the  
 59638 string returned which may be overwritten by a subsequent call to *setlocale()*.

#### 59639 ERRORS

59640 No errors are defined.

#### 59641 EXAMPLES

59642 None.

#### 59643 APPLICATION USAGE

59644 The following code illustrates how a program can initialize the international environment for  
 59645 one language, while selectively modifying the locale of the process such that regular expressions  
 59646 and string operations can be applied to text recorded in a different language:

```
59647 setlocale(LC_ALL, "De");
59648 setlocale(LC_COLLATE, "FrédicT");
```

59649 Internationalized programs must call *setlocale()* to initiate a specific language operation. This can  
 59650 be done by calling *setlocale()* as follows:

```
59651 setlocale(LC_ALL, "");
```

59652 Changing the setting of *LC\_MESSAGES* has no effect on catalogs that have already been opened  
 59653 by calls to *catopen()*.

#### 59654 RATIONALE

59655 The ISO C standard defines a collection of functions to support internationalization. One of the  
 59656 most significant aspects of these functions is a facility to set and query the *international*  
 59657 *environment*. The international environment is a repository of information that affects the  
 59658 behavior of certain functionality, namely:

- 59659 1. Character handling
- 59660 2. Collating
- 59661 3. Date/time formatting
- 59662 4. Numeric editing
- 59663 5. Monetary formatting
- 59664 6. Messaging

59665 The *setlocale()* function provides the application developer with the ability to set all or portions,

**setlocale()**

59666 called *categories*, of the international environment. These categories correspond to the areas of  
 59667 functionality mentioned above. The syntax for *setlocale()* is as follows:

```
59668 char *setlocale(int category, const char *locale);
```

59669 where *category* is the name of one of following categories, namely:

```
59670     LC_COLLATE
59671     LC_CTYPE
59672     LC_MESSAGES
59673     LC_MONETARY
59674     LC_NUMERIC
59675     LC_TIME
```

59676 In addition, a special value called *LC\_ALL* directs *setlocale()* to set all categories.

59677 There are two primary uses of *setlocale()*:

- 59678 1. Querying the international environment to find out what it is set to
- 59679 2. Setting the international environment, or *locale*, to a specific value

59680 The behavior of *setlocale()* in these two areas is described below. Since it is difficult to describe  
 59681 the behavior in words, examples are used to illustrate the behavior of specific uses.

59682 To query the international environment, *setlocale()* is invoked with a specific category and the  
 59683 null pointer as the locale. The null pointer is a special directive to *setlocale()* that tells it to query  
 59684 rather than set the international environment. The following syntax is used to query the name of  
 59685 the international environment:

```
59686 setlocale({LC_ALL, LC_COLLATE, LC_CTYPE, LC_MESSAGES, LC_MONETARY, \
59687          LC_NUMERIC, LC_TIME}, (char *) NULL);
```

59688 The *setlocale()* function shall return the string corresponding to the current international  
 59689 environment. This value may be used by a subsequent call to *setlocale()* to reset the international  
 59690 environment to this value. However, it should be noted that the return value from *setlocale()*  
 59691 may be a pointer to a static area within the function and is not guaranteed to remain unchanged  
 59692 (that is, it may be modified by a subsequent call to *setlocale()*). Therefore, if the purpose of  
 59693 calling *setlocale()* is to save the value of the current international environment so it can be  
 59694 changed and reset later, the return value should be copied to an array of **char** in the calling  
 59695 program.

59696 There are three ways to set the international environment with *setlocale()*:

59697 *setlocale(category, string)*

59698 This usage sets a specific *category* in the international environment to a specific value  
 59699 corresponding to the value of the *string*. A specific example is provided below:

```
59700 setlocale(LC_ALL, "fr_FR.ISO-8859-1");
```

59701 In this example, all categories of the international environment are set to the locale  
 59702 corresponding to the string "fr\_FR.ISO-8859-1", or to the French language as spoken in  
 59703 France using the ISO/IEC 8859-1:1998 standard codeset.

59704 If the string does not correspond to a valid locale, *setlocale()* shall return a null pointer and  
 59705 the international environment is not changed. Otherwise, *setlocale()* shall return the name of  
 59706 the locale just set.

- 59707 *setlocale(category, "C")*  
 59708 The ISO C standard states that one locale must exist on all conforming implementations.  
 59709 The name of the locale is C and corresponds to a minimal international environment needed  
 59710 to support the C programming language.
- 59711 *setlocale(category, "")*  
 59712 This sets a specific category to an implementation-defined default. This corresponds to the  
 59713 value of the environment variables.
- 59714 **FUTURE DIRECTIONS**  
 59715 None.

 59725 First released in Issue 3.
- 59726 **Issue 5**  
 59727 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.
- 59728 **Issue 6**  
 59729 Extensions beyond the ISO C standard are marked.  
 59730 The normative text is updated to avoid use of the term “must” for application requirements.  
 59731 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/124 is applied, updating the  
 59732 DESCRIPTION to clarify the behavior of:  
 59733 `setlocale(LC_ALL, "");`
- 59734 **Issue 7**  
 59735 Functionality relating to the Threads option is moved to the Base.

**setlogmask()***System Interfaces*59736 **NAME**

59737 setlogmask — set the log priority mask

59738 **SYNOPSIS**

```
59739 xSI #include <syslog.h>  
59740 int setlogmask(int maskpri);
```

59741 **DESCRIPTION**59742 Refer to *closelog()*.

*System Interfaces***setnetent()**59743 **NAME**

59744 setnetent — network database function

59745 **SYNOPSIS**

59746 #include &lt;netdb.h&gt;

59747 void setnetent(int stayopen);

59748 **DESCRIPTION**59749 Refer to *endnetent()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**setpgid()**59750 **NAME**

59751 setpgid — set process group ID for job control

59752 **SYNOPSIS**

59753 #include &lt;unistd.h&gt;

59754 int setpgid(pid\_t pid, pid\_t pgid);

59755 **DESCRIPTION**59756 The *setpgid()* function shall either join an existing process group or create a new process group  
59757 within the session of the calling process.

59758 The process group ID of a session leader shall not change.

59759 Upon successful completion, the process group ID of the process with a process ID that matches  
59760 *pid* shall be set to *pgid*.59761 As a special case, if *pid* is 0, the process ID of the calling process shall be used. Also, if *pgid* is 0,  
59762 the process ID of the indicated process shall be used.59763 **RETURN VALUE**59764 Upon successful completion, *setpgid()* shall return 0; otherwise, -1 shall be returned and *errno*  
59765 shall be set to indicate the error.59766 **ERRORS**59767 The *setpgid()* function shall fail if:59768 [EACCES] The value of the *pid* argument matches the process ID of a child process of the  
59769 calling process and the child process has successfully executed one of the *exec*  
59770 functions.59771 [EINVAL] The value of the *pgid* argument is less than 0, or is not a value supported by  
59772 the implementation.59773 [EPERM] The process indicated by the *pid* argument is a session leader.59774 [EPERM] The value of the *pid* argument matches the process ID of a child process of the  
59775 calling process and the child process is not in the same session as the calling  
59776 process.59777 [EPERM] The value of the *pgid* argument is valid but does not match the process ID of  
59778 the process indicated by the *pid* argument and there is no process with a  
59779 process group ID that matches the value of the *pgid* argument in the same  
59780 session as the calling process.59781 [ESRCH] The value of the *pid* argument does not match the process ID of the calling  
59782 process or of a child process of the calling process.59783 **EXAMPLES**

59784 None.

59785 **APPLICATION USAGE**

59786 None.

59787 **RATIONALE**59788 The *setpgid()* function shall group processes together for the purpose of signaling, placement in  
59789 foreground or background, and other job control actions.59790 The *setpgid()* function is similar to the *setpgrp()* function of 4.2 BSD, except that 4.2 BSD allowed  
59791 the specified new process group to assume any value. This presents certain security problems  
59792 and is more flexible than necessary to support job control.

59793 To provide tighter security, *setpgid()* only allows the calling process to join a process group  
59794 already in use inside its session or create a new process group whose process group ID was  
59795 equal to its process ID.

59796 When a job control shell spawns a new job, the processes in the job must be placed into a new  
59797 process group via *setpgid()*. There are two timing constraints involved in this action:

59798 1. The new process must be placed in the new process group before the appropriate  
59799 program is launched via one of the *exec* functions.

59800 2. The new process must be placed in the new process group before the shell can correctly  
59801 send signals to the new process group.

59802 To address these constraints, the following actions are performed. The new processes call  
59803 *setpgid()* to alter their own process groups after *fork()* but before *exec*. This satisfies the first  
59804 constraint. Under 4.3 BSD, the second constraint is satisfied by the synchronization property of  
59805 *vfork()*; that is, the shell is suspended until the child has completed the *exec*, thus ensuring that  
59806 the child has completed the *setpgid()*. A new version of *fork()* with this same synchronization  
59807 property was considered, but it was decided instead to merely allow the parent shell process to  
59808 adjust the process group of its child processes via *setpgid()*. Both timing constraints are now  
59809 satisfied by having both the parent shell and the child attempt to adjust the process group of the  
59810 child process; it does not matter which succeeds first.

59811 Since it would be confusing to an application to have its process group change after it began  
59812 executing (that is, after *exec*), and because the child process would already have adjusted its  
59813 process group before this, the [EACCES] error was added to disallow this.

59814 One non-obvious use of *setpgid()* is to allow a job control shell to return itself to its original  
59815 process group (the one in effect when the job control shell was executed). A job control shell  
59816 does this before returning control back to its parent when it is terminating or suspending itself as  
59817 a way of restoring its job control "state" back to what its parent would expect. (Note that the  
59818 original process group of the job control shell typically matches the process group of its parent,  
59819 but this is not necessarily always the case.)

#### 59820 FUTURE DIRECTIONS

59821 None.

#### 59822 SEE ALSO

59823 *exec*, *getpgrp()*, *setsid()*, *tcsetpgrp()*

59824 XBD [<sys/types.h>](#), [<unistd.h>](#)

#### 59825 CHANGE HISTORY

59826 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 59827 Issue 6

59828 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

59829 The following new requirements on POSIX implementations derive from alignment with the  
59830 Single UNIX Specification:

59831 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
59832 required for conforming implementations of previous POSIX specifications, it was not  
59833 required for UNIX applications.

59834 • The *setpgid()* function is mandatory since `_POSIX_JOB_CONTROL` is required to be  
59835 defined in this version. This is a FIPS requirement.

**setpgid()**

59836 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/56 is applied, changing the wording in  
59837 the DESCRIPTION from “the process group ID of the indicated process shall be used” to “the  
59838 process ID of the indicated process shall be used”. This change reverts the wording to as in the  
59839 ISO POSIX-1: 1996 standard; it appeared to be an unintentional change.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

59840 **NAME**

59841 setpgrp — set the process group ID

59842 **SYNOPSIS**

```
59843 OB XSI #include <unistd.h>
59844 pid_t setpgrp(void);
```

59845 **DESCRIPTION**

59846 If the calling process is not already a session leader, *setpgrp()* sets the process group ID of the  
 59847 calling process to the process ID of the calling process. If *setpgrp()* creates a new session, then the  
 59848 new session has no controlling terminal.

59849 The *setpgrp()* function has no effect when the calling process is a session leader.

59850 **RETURN VALUE**

59851 Upon completion, *setpgrp()* shall return the process group ID.

59852 **ERRORS**

59853 No errors are defined.

59854 **EXAMPLES**

59855 None.

59856 **APPLICATION USAGE**

59857 It is unspecified whether this function behaves as *setpgid(0,0)* or *setsid()* unless the process is  
 59858 already a session leader. Therefore, applications are encouraged to use *setpgid()* or *setsid()* as  
 59859 appropriate.

59860 **RATIONALE**

59861 None.

59862 **FUTURE DIRECTIONS**

59863 The *setpgrp()* function may be removed in a future version.

59864 **SEE ALSO**

59865 *exec*, *fork()*, *getpid()*, *getsid()*, *kill()*, *setpgid()*, *setsid()*

59866 XBD <unistd.h>

59867 **CHANGE HISTORY**

59868 First released in Issue 4, Version 2.

59869 **Issue 5**

59870 Moved from X/OPEN UNIX extension to BASE.

59871 **Issue 7**

59872 The *setpgrp()* function is marked obsolescent.

**setpriority()**

System Interfaces

59873 **NAME**

59874           setpriority — set the nice value

59875 **SYNOPSIS**

```
59876 XSI       #include <sys/resource.h>  
59877           int setpriority(int which, id_t who, int nice);
```

59878 **DESCRIPTION**59879           Refer to *getpriority()*.

**setpwent()**59887 **NAME**

59888           setpwent — user database function

59889 **SYNOPSIS**

59890 XSI       #include &lt;pwd.h&gt;

59891       void setpwent(void);

59892 **DESCRIPTION**59893       Refer to *endpwent()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

59894 **NAME**

59895 setregid — set real and effective group IDs

59896 **SYNOPSIS**

```
59897 XSI #include <unistd.h>
59898 int setregid(gid_t rgid, gid_t egid);
```

59899 **DESCRIPTION**59900 The *setregid()* function shall set the real and effective group IDs of the calling process.59901 If *rgid* is  $-1$ , the real group ID shall not be changed; if *egid* is  $-1$ , the effective group ID shall not  
59902 be changed.

59903 The real and effective group IDs may be set to different values in the same call.

59904 Only a process with appropriate privileges can set the real group ID and the effective group ID  
59905 to any valid value.59906 A non-privileged process can set either the real group ID to the saved set-group-ID from one of  
59907 the *exec* family of functions, or the effective group ID to the saved set-group-ID or the real group  
59908 ID.59909 If the real group ID is being set (*rgid* is not  $-1$ ), or the effective group ID is being set to a value  
59910 not equal to the real group ID, then the saved set-group-ID of the current process shall be set  
59911 equal to the new effective group ID.

59912 Any supplementary group IDs of the calling process remain unchanged.

59913 **RETURN VALUE**59914 Upon successful completion, 0 shall be returned. Otherwise,  $-1$  shall be returned and *errno* set to  
59915 indicate the error, and neither of the group IDs are changed.59916 **ERRORS**59917 The *setregid()* function shall fail if:59918 [EINVAL] The value of the *rgid* or *egid* argument is invalid or out-of-range.59919 [EPERM] The process does not have appropriate privileges and a change other than  
59920 changing the real group ID to the saved set-group-ID, or changing the  
59921 effective group ID to the real group ID or the saved set-group-ID, was  
59922 requested.59923 **EXAMPLES**

59924 None.

59925 **APPLICATION USAGE**59926 If a non-privileged set-group-ID process sets its effective group ID to its real group ID, it can  
59927 only set its effective group ID back to the previous value if *rgid* was  $-1$  in the *setregid()* call, since  
59928 the saved-group-ID is not changed in that case. If *rgid* was equal to the real group ID in the  
59929 *setregid()* call, then the saved set-group-ID will also have been changed to the real user ID.59930 **RATIONALE**59931 Earlier versions of this standard did not specify whether the saved set-group-ID was affected by  
59932 *setregid()* calls. This version specifies common existing practice that constitutes an important  
59933 security feature. The ability to set both the effective group ID and saved set-group-ID to be the  
59934 same as the real group ID means that any security weakness in code that is executed after that  
59935 point cannot result in malicious code being executed with the previous effective group ID.  
59936 Privileged applications could already do this using just *setgid()*, but for non-privileged

**setregid()**

59937 applications the only standard method available is to use this feature of *setregid()*.

**59938 FUTURE DIRECTIONS**

59939 None.

**59940 SEE ALSO**

59941 *exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setreuid()*, *setuid()*

59942 XBD <[unistd.h](#)>

**59943 CHANGE HISTORY**

59944 First released in Issue 4, Version 2.

**59945 Issue 5**

59946 Moved from X/OPEN UNIX extension to BASE.

59947 The DESCRIPTION is updated to indicate that the saved set-group-ID can be set by any of the *exec* family of functions, not just *execve()*.

**59949 Issue 7**

59950 SD5-XSH-ERN-177 is applied, adding the ability to set both the effective group ID and saved set-group-ID to be the same as the real group ID.

59951

59952 **NAME**

59953 setreuid — set real and effective user IDs

59954 **SYNOPSIS**

```
59955 XSI #include <unistd.h>
59956 int setreuid(uid_t ruid, uid_t euid);
```

59957 **DESCRIPTION**

59958 The *setreuid()* function shall set the real and effective user IDs of the current process to the  
 59959 values specified by the *ruid* and *euid* arguments. If *ruid* or *euid* is  $-1$ , the corresponding effective  
 59960 or real user ID of the current process shall be left unchanged.

59961 A process with appropriate privileges can set either ID to any value. An unprivileged process  
 59962 can only set the effective user ID if the *euid* argument is equal to either the real, effective, or  
 59963 saved user ID of the process.

59964 If the real user ID is being set (*ruid* is not  $-1$ ), or the effective user ID is being set to a value not  
 59965 equal to the real user ID, then the saved set-user-ID of the current process shall be set equal to  
 59966 the new effective user ID.

59967 It is unspecified whether a process without appropriate privileges is permitted to change the real  
 59968 user ID to match the current effective user ID or saved set-user-ID of the process.

59969 **RETURN VALUE**

59970 Upon successful completion, 0 shall be returned. Otherwise,  $-1$  shall be returned and *errno* set to  
 59971 indicate the error.

59972 **ERRORS**

59973 The *setreuid()* function shall fail if:

- |       |          |  |
|-------|----------|--|
| 59974 | [EINVAL] | The value of the <i>ruid</i> or <i>euid</i> argument is invalid or out-of-range.   |
| 59975 | [EPERM]  | The current process does not have appropriate privileges, and either an attempt was made to change the effective user ID to a value other than the real user ID or the saved set-user-ID or an attempt was made to change the real user ID to a value not permitted by the implementation. |

59979 **EXAMPLES**59980 **Setting the Effective User ID to the Real User ID**

59981 The following example sets the effective user ID of the calling process to the real user ID, so that  
 59982 files created later will be owned by the current user. It also sets the saved set-user-ID to the real  
 59983 user ID, so any future attempt to set the effective user ID back to its previous value will fail.

```
59984 #include <unistd.h>
59985 #include <sys/types.h>
59986 ...
59987 setreuid(getuid(), getuid());
59988 ...
```

59989 **APPLICATION USAGE**

59990 None.

**setreuid()**59991 **RATIONALE**

59992 Earlier versions of this standard did not specify whether the saved set-user-ID was affected by  
59993 *setreuid()* calls. This version specifies common existing practice that constitutes an important  
59994 security feature. The ability to set both the effective user ID and saved set-user-ID to be the same  
59995 as the real user ID means that any security weakness in code that is executed after that point  
59996 cannot result in malicious code being executed with the previous effective user ID. Privileged  
59997 applications could already do this using just *setuid()*, but for non-privileged applications the  
59998 only standard method available is to use this feature of *setreuid()*.

59999 **FUTURE DIRECTIONS**

60000 None.

60001 **SEE ALSO**

60002 *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setregid()*, *setuid()*

60003 XBD <[unistd.h](#)>

60004 **CHANGE HISTORY**

60005 First released in Issue 4, Version 2.

60006 **Issue 5**

60007 Moved from X/OPEN UNIX extension to BASE.

60008 **Issue 7**

60009 SD5-XSH-ERN-177 is applied, adding the ability to set both the effective user ID and the saved  
60010 set-user-ID to be the same as the real user ID.

60011 **NAME**

60012 setrlimit — control maximum resource consumption

60013 **SYNOPSIS**

```
60014 XSI #include <sys/resource.h>  
60015 int setrlimit(int resource, const struct rlimit *rlp);
```

60016 **DESCRIPTION**60017 Refer to *getrlimit()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**setservent()**

60018 **NAME**  
60019       setservent — network services database functions

60020 **SYNOPSIS**  
60021       #include <netdb.h>  
60022       void setservent(int *stayopen*);

60023 **DESCRIPTION**  
60024       Refer to *endservent()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

60025 **NAME**

60026 setsid — create session and set process group ID

60027 **SYNOPSIS**

60028 #include &lt;unistd.h&gt;

60029 pid\_t setsid(void);

60030 **DESCRIPTION**

60031 The *setsid()* function shall create a new session, if the calling process is not a process group leader. Upon return the calling process shall be the session leader of this new session, shall be the process group leader of a new process group, and shall have no controlling terminal. The process group ID of the calling process shall be set equal to the process ID of the calling process. The calling process shall be the only process in the new process group and the only process in the new session.

60037 **RETURN VALUE**

60038 Upon successful completion, *setsid()* shall return the value of the new process group ID of the calling process. Otherwise, it shall return (**pid\_t**)-1 and set *errno* to indicate the error.

60040 **ERRORS**60041 The *setsid()* function shall fail if:

60042 [EPERM] The calling process is already a process group leader, or the process group ID of a process other than the calling process matches the process ID of the calling process.

60045 **EXAMPLES**

60046 None.

60047 **APPLICATION USAGE**

60048 None.

60049 **RATIONALE**

60050 The *setsid()* function is similar to the *setpgrp()* function of System V. System V, without job control, groups processes into process groups and creates new process groups via *setpgrp()*; only one process group may be part of a login session.

60053 Job control allows multiple process groups within a login session. In order to limit job control actions so that they can only affect processes in the same login session, this volume of POSIX.1-2008 adds the concept of a session that is created via *setsid()*. The *setsid()* function also creates the initial process group contained in the session. Additional process groups can be created via the *setpgid()* function. A System V process group would correspond to a POSIX System Interfaces session containing a single POSIX process group. Note that this function requires that the calling process not be a process group leader. The usual way to ensure this is true is to create a new process with *fork()* and have it call *setsid()*. The *fork()* function guarantees that the process ID of the new process does not match any existing process group ID.

60062 **FUTURE DIRECTIONS**

60063 None.

60064 **SEE ALSO**60065 *getsid()*, *setpgid()*, *setpgrp()*

60066 XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

**setsid()**60067 **CHANGE HISTORY**

60068 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

60069 **Issue 6**

60070 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

60071 The following new requirements on POSIX implementations derive from alignment with the  
60072 Single UNIX Specification:

- 60073 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>`  
60074 was required for conforming implementations of previous POSIX specifications, it was not  
60075 required for UNIX applications.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

60076 **NAME**

60077 setsockopt — set the socket options

60078 **SYNOPSIS**

60079 #include &lt;sys/socket.h&gt;

```
60080 int setsockopt(int socket, int level, int option_name,
60081               const void *option_value, socklen_t option_len);
```

60082 **DESCRIPTION**

60083 The *setsockopt()* function shall set the option specified by the *option\_name* argument, at the  
 60084 protocol level specified by the *level* argument, to the value pointed to by the *option\_value*  
 60085 argument for the socket associated with the file descriptor specified by the *socket* argument.

60086 The *level* argument specifies the protocol level at which the option resides. To set options at the  
 60087 socket level, specify the *level* argument as SOL\_SOCKET. To set options at other levels, supply  
 60088 the appropriate *level* identifier for the protocol controlling the option. For example, to indicate  
 60089 that an option is interpreted by the TCP (Transport Control Protocol), set *level* to IPPROTO\_TCP  
 60090 as defined in the <netinet/in.h> header.

60091 The *option\_name* argument specifies a single option to set. It can be one of the socket-level  
 60092 options defined in <sys/socket.h> and described in Section 2.10.16 (on page 522). If *setsockopt()*  
 60093 is called with *option\_name* equal to SO\_ACCEPTCONN, SO\_ERROR, or SO\_TYPE, the behavior  
 60094 is unspecified.

60095 **RETURN VALUE**

60096 Upon successful completion, *setsockopt()* shall return 0. Otherwise, -1 shall be returned and  
 60097 *errno* set to indicate the error.

60098 **ERRORS**

60099 The *setsockopt()* function shall fail if:

60100 [EBADF] The *socket* argument is not a valid file descriptor.

60101 [EDOM] The send and receive timeout values are too big to fit into the timeout fields in  
 60102 the socket structure.

60103 [EINVAL] The specified option is invalid at the specified socket level or the socket has  
 60104 been shut down.

60105 [EISCONN] The socket is already connected, and a specified option cannot be set while the  
 60106 socket is connected.

60107 [ENOPROTOPT]

60108 The option is not supported by the protocol.

60109 [ENOTSOCK] The *socket* argument does not refer to a socket.

60110 The *setsockopt()* function may fail if:

60111 [ENOMEM] There was insufficient memory available for the operation to complete.

60112 [ENOBUFS] Insufficient resources are available in the system to complete the call.

**setsockopt()**60113 **EXAMPLES**

60114 None.

60115 **APPLICATION USAGE**

60116 The *setsockopt()* function provides an application program with the means to control socket  
60117 behavior. An application program can use *setsockopt()* to allocate buffer space, control timeouts,  
60118 or permit socket data broadcasts. The `<sys/socket.h>` header defines the socket-level options  
60119 available to *setsockopt()*.

60120 Options may exist at multiple protocol levels. The SO\_ options are always present at the  
60121 uppermost socket level.

60122 **RATIONALE**

60123 None.

60124 **FUTURE DIRECTIONS**

60125 None.

60126 **SEE ALSO**60127 [Section 2.10](#) (on page 517), *bind()*, *endprotoent()*, *getsockopt()*, *socket()*60128 XBD `<netinet/in.h>`, `<sys/socket.h>`60129 **CHANGE HISTORY**

60130 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

60131 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/125 is applied, updating the SO\_LINGER  
60132 option in the DESCRIPTION to refer to the calling thread rather than the process.

60133 **Issue 7**

60134 Austin Group Interpretation 1003.1-2001 #158 is applied, removing text relating to socket options  
60135 that is now in [Section 2.10.16](#) (on page 522).

*System Interfaces***setstate()**60136 **NAME**60137        **setstate** — switch pseudo-random number generator state arrays60138 **SYNOPSIS**

```
60139 XSI        #include <stdlib.h>  
60140        char *setstate(char *state);
```

60141 **DESCRIPTION**60142        Refer to *initstate()*.

**setuid()**60143 **NAME**

60144        setuid — set user ID

60145 **SYNOPSIS**

```
60146        #include <unistd.h>
60147        int setuid(uid_t uid);
```

60148 **DESCRIPTION**

60149        If the process has appropriate privileges, *setuid()* shall set the real user ID, effective user ID, and  
 60150        the saved set-user-ID of the calling process to *uid*.

60151        If the process does not have appropriate privileges, but *uid* is equal to the real user ID or the  
 60152        saved set-user-ID, *setuid()* shall set the effective user ID to *uid*; the real user ID and saved set-  
 60153        user-ID shall remain unchanged.

60154        The *setuid()* function shall not affect the supplementary group list in any way.

60155 **RETURN VALUE**

60156        Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 60157        indicate the error.

60158 **ERRORS**

60159        The *setuid()* function shall fail, return -1, and set *errno* to the corresponding value if one or more  
 60160        of the following are true:

60161        [EINVAL]        The value of the *uid* argument is invalid and not supported by the  
 60162        implementation.

60163        [EPERM]        The process does not have appropriate privileges and *uid* does not match the  
 60164        real user ID or the saved set-user-ID.

60165 **EXAMPLES**

60166        None.

60167 **APPLICATION USAGE**

60168        None.

60169 **RATIONALE**

60170        The various behaviors of the *setuid()* and *setgid()* functions when called by non-privileged  
 60171        processes reflect the behavior of different historical implementations. For portability, it is  
 60172        recommended that new non-privileged applications use the *setuid()* and *setgid()* functions  
 60173        instead.

60174        The saved set-user-ID capability allows a program to regain the effective user ID established at  
 60175        the last *exec* call. Similarly, the saved set-group-ID capability allows a program to regain the  
 60176        effective group ID established at the last *exec* call. These capabilities are derived from System V.  
 60177        Without them, a program might have to run as superuser in order to perform the same  
 60178        functions, because superuser can write on the user's files. This is a problem because such a  
 60179        program can write on any user's files, and so must be carefully written to emulate the  
 60180        permissions of the calling process properly. In System V, these capabilities have traditionally  
 60181        been implemented only via the *setuid()* and *setgid()* functions for non-privileged processes. The  
 60182        fact that the behavior of those functions was different for privileged processes made them  
 60183        difficult to use. The POSIX.1-1990 standard defined the *setuid()* function to behave differently  
 60184        for privileged and unprivileged users. When the caller had appropriate privileges, the function  
 60185        set the real user ID, effective user ID, and saved set-user ID of the calling process on  
 60186        implementations that supported it. When the caller did not have appropriate privileges, the  
 60187        function set only the effective user ID, subject to permission checks. The former use is generally  
 60188        needed for utilities like *login* and *su*, which are not conforming applications and thus outside the

60189 scope of POSIX.1-2008. These utilities wish to change the user ID irrevocably to a new value,  
60190 generally that of an unprivileged user. The latter use is needed for conforming applications that  
60191 are installed with the set-user-ID bit and need to perform operations using the real user ID.

60192 POSIX.1-2008 augments the latter functionality with a mandatory feature named  
60193 `_POSIX_SAVED_IDS`. This feature permits a set-user-ID application to switch its effective user  
60194 ID back and forth between the values of its *exec*-time real user ID and effective user ID.  
60195 Unfortunately, the POSIX.1-1990 standard did not permit a conforming application using this  
60196 feature to work properly when it happened to be executed with (implementation-defined)  
60197 appropriate privileges. Furthermore, the application did not even have a means to tell whether it  
60198 had this privilege. Since the saved set-user-ID feature is quite desirable for applications, as  
60199 evidenced by the fact that NIST required it in FIPS 151-2, it has been mandated by POSIX.1-2008.  
60200 However, there are implementors who have been reluctant to support it given the limitation  
60201 described above.

60202 The 4.3BSD system handles the problem by supporting separate functions: *setuid()* (which  
60203 always sets both the real and effective user IDs, like *setuid()* in POSIX.1-2008 for privileged  
60204 users), and *seteuid()* (which always sets just the effective user ID, like *setuid()* in POSIX.1-2008  
60205 for non-privileged users). This separation of functionality into distinct functions seems desirable.  
60206 4.3BSD does not support the saved set-user-ID feature. It supports similar functionality of  
60207 switching the effective user ID back and forth via *setreuid()*, which permits reversing the real  
60208 and effective user IDs. This model seems less desirable than the saved set-user-ID because the  
60209 real user ID changes as a side-effect. The current 4.4BSD includes saved effective IDs and uses  
60210 them for *seteuid()* and *setegid()* as described above. The *setreuid()* and *setregid()* functions will be  
60211 deprecated or removed.

60212 The solution here is:

- 60213 • Require that all implementations support the functionality of the saved set-user-ID, which  
60214 is set by the *exec* functions and by privileged calls to *setuid()*.
- 60215 • Add the *seteuid()* and *setegid()* functions as portable alternatives to *setuid()* and *setgid()* for  
60216 non-privileged and privileged processes.

60217 Historical systems have provided two mechanisms for a set-user-ID process to change its  
60218 effective user ID to be the same as its real user ID in such a way that it could return to the  
60219 original effective user ID: the use of the *setuid()* function in the presence of a saved set-user-ID,  
60220 or the use of the BSD *setreuid()* function, which was able to swap the real and effective user IDs.  
60221 The changes included in POSIX.1-2008 provide a new mechanism using *seteuid()* in conjunction  
60222 with a saved set-user-ID. Thus, all implementations with the new *seteuid()* mechanism will have  
60223 a saved set-user-ID for each process, and most of the behavior controlled by  
60224 `_POSIX_SAVED_IDS` has been changed to agree with the case where the option was defined.  
60225 The *kill()* function is an exception. Implementors of the new *seteuid()* mechanism will generally  
60226 be required to maintain compatibility with the older mechanisms previously supported by their  
60227 systems. However, compatibility with this use of *setreuid()* and with the `_POSIX_SAVED_IDS`  
60228 behavior of *kill()* is unfortunately complicated. If an implementation with a saved set-user-ID  
60229 allows a process to use *setreuid()* to swap its real and effective user IDs, but were to leave the  
60230 saved set-user-ID unmodified, the process would then have an effective user ID equal to the  
60231 original real user ID, and both real and saved set-user-ID would be equal to the original effective  
60232 user ID. In that state, the real user would be unable to kill the process, even though the effective  
60233 user ID of the process matches that of the real user, if the *kill()* behavior of `_POSIX_SAVED_IDS`  
60234 was used. This is obviously not acceptable. The alternative choice, which is used in at least one  
60235 implementation, is to change the saved set-user-ID to the effective user ID during most calls to  
60236 *setreuid()*. The standard developers considered that alternative to be less correct than the  
60237 retention of the old behavior of *kill()* in such systems. Current conforming applications shall

**setuid()**

60238 accommodate either behavior from *kill()*, and there appears to be no strong reason for *kill()* to  
 60239 check the saved set-user-ID rather than the effective user ID.

60244 XBD [<sys/types.h>](#), [<unistd.h>](#)

60245 **CHANGE HISTORY**

60246 First released in Issue 1. Derived from Issue 1 of the SVID.

60247 **Issue 6**

60248 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

60249 The following new requirements on POSIX implementations derive from alignment with the  
 60250 Single UNIX Specification:

- 60251 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
 60252 required for conforming implementations of previous POSIX specifications, it was not  
 60253 required for UNIX applications.
- 60254 • The functionality associated with `_POSIX_SAVED_IDS` is now mandatory. This is a FIPS  
 60255 requirement.

60256 The following changes were made to align with the IEEE P1003.1a draft standard:

- 60257 • The effects of *setuid()* in processes without appropriate privileges are changed.
- 60258 • A requirement that the supplementary group list is not affected is added.

*System Interfaces***setutxent()**60259 **NAME**

60260 setutxent — reset the user accounting database to the first entry

60261 **SYNOPSIS**

```
60262 XSI #include <utmpx.h>  
60263 void setutxent(void);
```

60264 **DESCRIPTION**60265 Refer to *endutxent()*.

**setvbuf()**60266 **NAME**60267 `setvbuf` — assign buffering to a stream60268 **SYNOPSIS**60269 `#include <stdio.h>`60270 `int setvbuf(FILE *restrict stream, char *restrict buf, int type,`  
60271 `size_t size);`60272 **DESCRIPTION**60273 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
60274 conflict between the requirements described here and the ISO C standard is unintentional. This  
60275 volume of POSIX.1-2008 defers to the ISO C standard.60276 The `setvbuf()` function may be used after the stream pointed to by `stream` is associated with an  
60277 open file but before any other operation (other than an unsuccessful call to `setvbuf()`) is  
60278 performed on the stream. The argument `type` determines how `stream` shall be buffered, as  
60279 follows:

- 60280
- `{_IOFBF}` shall cause input/output to be fully buffered.
  - 60281 • `{_IOLBF}` shall cause input/output to be line buffered.
  - 60282 • `{_IONBF}` shall cause input/output to be unbuffered.

60283 If `buf` is not a null pointer, the array it points to may be used instead of a buffer allocated by  
60284 `setvbuf()` and the argument `size` specifies the size of the array; otherwise, `size` may determine the  
60285 size of a buffer allocated by the `setvbuf()` function. The contents of the array at any time are  
60286 unspecified.60287 For information about streams, see [Section 2.5](#) (on page 490).60288 **RETURN VALUE**60289 Upon successful completion, `setvbuf()` shall return 0. Otherwise, it shall return a non-zero value  
60290 **CX** if an invalid value is given for `type` or if the request cannot be honored, and may set `errno` to  
60291 indicate the error.60292 **ERRORS**60293 The `setvbuf()` function may fail if:60294 **CX** `[EBADF]` The file descriptor underlying `stream` is not valid.60295 **EXAMPLES**

60296 None.

60297 **APPLICATION USAGE**60298 A common source of error is allocating buffer space as an “automatic” variable in a code block,  
60299 and then failing to close the stream in the same block.60300 With `setvbuf()`, allocating a buffer of `size` bytes does not necessarily imply that all of `size` bytes are  
60301 used for the buffer area.60302 Applications should note that many implementations only provide line buffering on input from  
60303 terminal devices.60304 **RATIONALE**

60305 None.

60306 **FUTURE DIRECTIONS**

60307 None.

60308 **SEE ALSO**60309 [Section 2.5](#) (on page 490), [fopen\(\)](#), [setbuf\(\)](#)60310 XBD [<stdio.h>](#)60311 **CHANGE HISTORY**

60312 First released in Issue 1. Derived from Issue 1 of the SVID.

60313 **Issue 6**

60314 Extensions beyond the ISO C standard are marked.

60315 The *setvbuf()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**shm\_open()**60316 **NAME**60317 shm\_open — open a shared memory object (**REALTIME**)60318 **SYNOPSIS**

```
60319 SHM #include <sys/mman.h>
60320 int shm_open(const char *name, int oflag, mode_t mode);
```

60321 **DESCRIPTION**

60322 The *shm\_open()* function shall establish a connection between a shared memory object and a file  
 60323 descriptor. It shall create an open file description that refers to the shared memory object and a  
 60324 file descriptor that refers to that open file description. The file descriptor is used by other  
 60325 functions to refer to that shared memory object. The *name* argument points to a string naming a  
 60326 shared memory object. It is unspecified whether the name appears in the file system and is  
 60327 visible to other functions that take pathnames as arguments. The *name* argument conforms to the  
 60328 construction rules for a pathname, except that the interpretation of <slash> characters other than  
 60329 the leading <slash> character in *name* is implementation-defined, and that the length limits for  
 60330 the *name* argument are implementation-defined and need not be the same as the pathname limits  
 60331 {PATH\_MAX} and {NAME\_MAX}. If *name* begins with the <slash> character, then processes  
 60332 calling *shm\_open()* with the same value of *name* refer to the same shared memory object, as long  
 60333 as that name has not been removed. If *name* does not begin with the <slash> character, the effect  
 60334 is implementation-defined.

60335 If successful, *shm\_open()* shall return a file descriptor for the shared memory object that is the  
 60336 lowest numbered file descriptor not currently open for that process. The open file description is  
 60337 new, and therefore the file descriptor does not share it with any other processes. It is unspecified  
 60338 whether the file offset is set. The FD\_CLOEXEC file descriptor flag associated with the new file  
 60339 descriptor is set.

60340 The file status flags and file access modes of the open file description are according to the value  
 60341 of *oflag*. The *oflag* argument is the bitwise-inclusive OR of the following flags defined in the  
 60342 <fcntl.h> header. Applications specify exactly one of the first two values (access modes) below  
 60343 in the value of *oflag*:

60344 O\_RDONLY Open for read access only.

60345 O\_RDWR Open for read or write access.

60346 Any combination of the remaining flags may be specified in the value of *oflag*:

60347 O\_CREAT If the shared memory object exists, this flag has no effect, except as noted  
 60348 under O\_EXCL below. Otherwise, the shared memory object is created. The  
 60349 user ID of the shared memory object shall be set to the effective user ID of the  
 60350 process. The group ID of the shared memory object shall be set to the effective  
 60351 group ID of the process; however, if the *name* argument is visible in the file  
 60352 system, the group ID may be set to the group ID of the containing directory.  
 60353 The permission bits of the shared memory object shall be set to the value of  
 60354 the *mode* argument except those set in the file mode creation mask of the  
 60355 process. When bits in *mode* other than the file permission bits are set, the effect  
 60356 is unspecified. The *mode* argument does not affect whether the shared memory  
 60357 object is opened for reading, for writing, or for both. The shared memory  
 60358 object has a size of zero.

60359 O\_EXCL If O\_EXCL and O\_CREAT are set, *shm\_open()* fails if the shared memory  
 60360 object exists. The check for the existence of the shared memory object and the  
 60361 creation of the object if it does not exist is atomic with respect to other

60362		processes executing <i>shm_open()</i> naming the same shared memory object with
60363		<code>O_EXCL</code> and <code>O_CREAT</code> set. If <code>O_EXCL</code> is set and <code>O_CREAT</code> is not set, the
60364		result is undefined.
60365	<code>O_TRUNC</code>	If the shared memory object exists, and it is successfully opened <code>O_RDWR</code> , the
60366		object shall be truncated to zero length and the mode and owner shall be
60367		unchanged by this function call. The result of using <code>O_TRUNC</code> with
60368		<code>O_RDONLY</code> is undefined.
60369		When a shared memory object is created, the state of the shared memory object, including all
60370		data associated with the shared memory object, persists until the shared memory object is
60371		unlinked and all other references are gone. It is unspecified whether the name and shared
60372		memory object state remain valid after a system reboot.
60373	<b>RETURN VALUE</b>	
60374		Upon successful completion, the <i>shm_open()</i> function shall return a non-negative integer
60375		representing the lowest numbered unused file descriptor. Otherwise, it shall return <code>-1</code> and set
60376		<i>errno</i> to indicate the error.
60377	<b>ERRORS</b>	
60378		The <i>shm_open()</i> function shall fail if:
60379	<code>[EACCES]</code>	The shared memory object exists and the permissions specified by <i>oflag</i> are
60380		denied, or the shared memory object does not exist and permission to create
60381		the shared memory object is denied, or <code>O_TRUNC</code> is specified and write
60382		permission is denied.
60383	<code>[EEXIST]</code>	<code>O_CREAT</code> and <code>O_EXCL</code> are set and the named shared memory object already
60384		exists.
60385	<code>[EINTR]</code>	The <i>shm_open()</i> operation was interrupted by a signal.
60386	<code>[EINVAL]</code>	The <i>shm_open()</i> operation is not supported for the given name.
60387	<code>[EMFILE]</code>	All file descriptors available to the process are currently open.
60388	<code>[ENFILE]</code>	Too many shared memory objects are currently open in the system.
60389	<code>[ENOENT]</code>	<code>O_CREAT</code> is not set and the named shared memory object does not exist.
60390	<code>[ENOSPC]</code>	There is insufficient space for the creation of the new shared memory object.
60391		The <i>shm_open()</i> function may fail if:
60392	<code>[ENAMETOOLONG]</code>	
60393		The length of the <i>name</i> argument exceeds <code>{_POSIX_PATH_MAX}</code> on systems
60394	XSI	that do not support the XSI option or exceeds <code>{_XOPEN_PATH_MAX}</code> on XSI
60395		systems, or has a pathname component that is longer than
60396	XSI	<code>{_POSIX_NAME_MAX}</code> on systems that do not support the XSI option or
60397		longer than <code>{_XOPEN_NAME_MAX}</code> on XSI systems.

**shm\_open()**60398 **EXAMPLES**60399 **Creating and Mapping a Shared Memory Object**

60400 The following code segment demonstrates the use of *shm\_open()* to create a shared memory  
60401 object which is then sized using *ftruncate()* before being mapped into the process address space  
60402 using *mmap()*:

```
60403 #include <unistd.h>
60404 #include <sys/mman.h>
60405 ...
60406 #define MAX_LEN 10000
60407 struct region {          /* Defines "structure" of shared memory */
60408     int len;
60409     char buf[MAX_LEN];
60410 };
60411 struct region *rptr;
60412 int fd;
60413 /* Create shared memory object and set its size */
60414 fd = shm_open("/myregion", O_CREAT | O_RDWR, S_IRUSR | S_IWUSR);
60415 if (fd == -1)
60416     /* Handle error */;
60417 if (ftruncate(fd, sizeof(struct region)) == -1)
60418     /* Handle error */;
60419 /* Map shared memory object */
60420 rptr = mmap(NULL, sizeof(struct region),
60421             PROT_READ | PROT_WRITE, MAP_SHARED, fd, 0);
60422 if (rptr == MAP_FAILED)
60423     /* Handle error */;
60424 /* Now we can refer to mapped region using fields of rptr;
60425    for example, rptr->len */
60426 ...
```

60427 **APPLICATION USAGE**

60428 None.

60429 **RATIONALE**

60430 When the Memory Mapped Files option is supported, the normal *open()* call is used to obtain a  
60431 descriptor to a file to be mapped according to existing practice with *mmap()*. When the Shared  
60432 Memory Objects option is supported, the *shm\_open()* function shall obtain a descriptor to the  
60433 shared memory object to be mapped.

60434 There is ample precedent for having a file descriptor represent several types of objects. In the  
60435 POSIX.1-1990 standard, a file descriptor can represent a file, a pipe, a FIFO, a tty, or a directory.  
60436 Many implementations simply have an operations vector, which is indexed by the file descriptor  
60437 type and does very different operations. Note that in some cases the file descriptor passed to  
60438 generic operations on file descriptors is returned by *open()* or *creat()* and in some cases returned  
60439 by alternate functions, such as *pipe()*. The latter technique is used by *shm\_open()*.

60440 Note that such shared memory objects can actually be implemented as mapped files. In both  
60441 cases, the size can be set after the open using *ftruncate()*. The *shm\_open()* function itself does not

60442 create a shared object of a specified size because this would duplicate an extant function that set  
60443 the size of an object referenced by a file descriptor.

60444 On implementations where memory objects are implemented using the existing file system, the  
60445 *shm\_open()* function may be implemented using a macro that invokes *open()*, and the  
60446 *shm\_unlink()* function may be implemented using a macro that invokes *unlink()*.

60447 For implementations without a permanent file system, the definition of the name of the memory  
60448 objects is allowed not to survive a system reboot. Note that this allows systems with a  
60449 permanent file system to implement memory objects as data structures internal to the  
60450 implementation as well.

60451 On implementations that choose to implement memory objects using memory directly, a  
60452 *shm\_open()* followed by an *ftruncate()* and *close()* can be used to preallocate a shared memory  
60453 area and to set the size of that preallocation. This may be necessary for systems without virtual  
60454 memory hardware support in order to ensure that the memory is contiguous.

60455 The set of valid open flags to *shm\_open()* was restricted to O\_RDONLY, O\_RDWR, O\_CREAT,  
60456 and O\_TRUNC because these could be easily implemented on most memory mapping systems.  
60457 This volume of POSIX.1-2008 is silent on the results if the implementation cannot supply the  
60458 requested file access because of implementation-defined reasons, including hardware ones.

60459 The error conditions [EACCES] and [ENOTSUP] are provided to inform the application that the  
60460 implementation cannot complete a request.

60461 [EACCES] indicates for implementation-defined reasons, probably hardware-related, that the  
60462 implementation cannot comply with a requested mode because it conflicts with another  
60463 requested mode. An example might be that an application desires to open a memory object two  
60464 times, mapping different areas with different access modes. If the implementation cannot map a  
60465 single area into a process space in two places, which would be required if different access modes  
60466 were required for the two areas, then the implementation may inform the application at the time  
60467 of the second open.

60468 [ENOTSUP] indicates for implementation-defined reasons, probably hardware-related, that the  
60469 implementation cannot comply with a requested mode at all. An example would be that the  
60470 hardware of the implementation cannot support write-only shared memory areas.

60471 On all implementations, it may be desirable to restrict the location of the memory objects to  
60472 specific file systems for performance (such as a RAM disk) or implementation-defined reasons  
60473 (shared memory supported directly only on certain file systems). The *shm\_open()* function may  
60474 be used to enforce these restrictions. There are a number of methods available to the application  
60475 to determine an appropriate name of the file or the location of an appropriate directory. One way  
60476 is from the environment via *getenv()*. Another would be from a configuration file.

60477 This volume of POSIX.1-2008 specifies that memory objects have initial contents of zero when  
60478 created. This is consistent with current behavior for both files and newly allocated memory. For  
60479 those implementations that use physical memory, it would be possible that such  
60480 implementations could simply use available memory and give it to the process uninitialized.  
60481 This, however, is not consistent with standard behavior for the uninitialized data area, the stack,  
60482 and of course, files. Finally, it is highly desirable to set the allocated memory to zero for security  
60483 reasons. Thus, initializing memory objects to zero is required.

#### 60484 FUTURE DIRECTIONS

60485 A future version might require the *shm\_open()* and *shm\_unlink()* functions to have semantics  
60486 similar to normal file system operations.

**shm\_open()**60487 **SEE ALSO**60488 *close()*, *dup()*, *exec*, *fcntl()*, *mmap()*, *shmat()*, *shmctl()*, *shmdt()*, *shm\_unlink()*, *umask()*

60489 XBD &lt;fcntl.h&gt;, &lt;sys/mman.h&gt;

60490 **CHANGE HISTORY**

60491 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

60492 **Issue 6**60493 The *shm\_open()* function is marked as part of the Shared Memory Objects option.60494 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
60495 implementation does not support the Shared Memory Objects option.60496 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/126 is applied, adding the example to the  
60497 EXAMPLES section.60498 **Issue 7**60499 Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and  
60500 changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error.

60501 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

60502 SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the  
60503 user ID and group ID of the shared memory object.

60504 **NAME**60505 shm\_unlink — remove a shared memory object (**REALTIME**)60506 **SYNOPSIS**

```
60507 SHM #include <sys/mman.h>
60508 int shm_unlink(const char *name);
```

60509 **DESCRIPTION**

60510 The *shm\_unlink()* function shall remove the name of the shared memory object named by the  
60511 string pointed to by *name*.

60512 If one or more references to the shared memory object exist when the object is unlinked, the  
60513 name shall be removed before *shm\_unlink()* returns, but the removal of the memory object  
60514 contents shall be postponed until all open and map references to the shared memory object have  
60515 been removed.

60516 Even if the object continues to exist after the last *shm\_unlink()*, reuse of the name shall  
60517 subsequently cause *shm\_open()* to behave as if no shared memory object of this name exists (that  
60518 is, *shm\_open()* will fail if O\_CREAT is not set, or will create a new shared memory object if  
60519 O\_CREAT is set).

60520 **RETURN VALUE**

60521 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be  
60522 returned and *errno* set to indicate the error. If -1 is returned, the named shared memory object  
60523 shall not be changed by this function call.

60524 **ERRORS**

60525 The *shm\_unlink()* function shall fail if:

60526 [EACCES] Permission is denied to unlink the named shared memory object.

60527 [ENOENT] The named shared memory object does not exist.

60528 The *shm\_unlink()* function may fail if:

60529 [ENAMETOOLONG]

60530 The length of the *name* argument exceeds {\_POSIX\_PATH\_MAX} on systems  
60531 XSI that do not support the XSI option or exceeds {\_XOPEN\_PATH\_MAX} on XSI  
60532 systems, or has a pathname component that is longer than  
60533 XSI {\_POSIX\_NAME\_MAX} on systems that do not support the XSI option or  
60534 longer than {\_XOPEN\_NAME\_MAX} on XSI systems. A call to *shm\_unlink()*  
60535 with a *name* argument that contains the same shared memory object name as  
60536 was previously used in a successful *shm\_open()* call shall not give an  
60537 [ENAMETOOLONG] error.

60538 **EXAMPLES**

60539 None.

60540 **APPLICATION USAGE**

60541 Names of memory objects that were allocated with *open()* are deleted with *unlink()* in the usual  
60542 fashion. Names of memory objects that were allocated with *shm\_open()* are deleted with  
60543 *shm\_unlink()*. Note that the actual memory object is not destroyed until the last close and  
60544 unmap on it have occurred if it was already in use.

**shm\_unlink()**60545 **RATIONALE**

60546 None.

60547 **FUTURE DIRECTIONS**60548 A future version might require the *shm\_open()* and *shm\_unlink()* functions to have semantics  
60549 similar to normal file system operations.60550 **SEE ALSO**60551 *close()*, *mmap()*, *munmap()*, *shmat()*, *shmctl()*, *shmdt()*, *shm\_open()*60552 XBD <[sys/mman.h](#)>60553 **CHANGE HISTORY**

60554 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

60555 **Issue 6**60556 The *shm\_unlink()* function is marked as part of the Shared Memory Objects option.60557 In the DESCRIPTION, text is added to clarify that reusing the same name after a *shm\_unlink()*  
60558 will not attach to the old shared memory object.60559 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
60560 implementation does not support the Shared Memory Objects option.60561 **Issue 7**60562 Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a  
60563 “shall fail” to a “may fail” error.

60564 Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

60565 **NAME**

60566 shmat — XSI shared memory attach operation

60567 **SYNOPSIS**

```
60568 XSI #include <sys/shm.h>
60569 void *shmat(int shmid, const void *shmaddr, int shmflg);
```

60570 **DESCRIPTION**

60571 The *shmat()* function operates on XSI shared memory (see XBD Section 3.340, on page 88). It is  
 60572 unspecified whether this function interoperates with the realtime interprocess communication  
 60573 facilities defined in Section 2.8 (on page 497).

60574 The *shmat()* function attaches the shared memory segment associated with the shared memory  
 60575 identifier specified by *shmid* to the address space of the calling process. The segment is attached  
 60576 at the address specified by one of the following criteria:

- 60577 • If *shmaddr* is a null pointer, the segment is attached at the first available address as selected  
 60578 by the system.
- 60579 • If *shmaddr* is not a null pointer and (*shmflg* &SHM\_RND) is non-zero, the segment is  
 60580 attached at the address given by (*shmaddr* - ((*uintptr\_t*)*shmaddr* %SHMLBA)). The character  
 60581 ' % ' is the C-language remainder operator.
- 60582 • If *shmaddr* is not a null pointer and (*shmflg* &SHM\_RND) is 0, the segment is attached at  
 60583 the address given by *shmaddr*.
- 60584 • The segment is attached for reading if (*shmflg* &SHM\_RDONLY) is non-zero and the  
 60585 calling process has read permission; otherwise, if it is 0 and the calling process has read  
 60586 and write permission, the segment is attached for reading and writing.

60587 **RETURN VALUE**

60588 Upon successful completion, *shmat()* shall increment the value of *shm\_nattch* in the data  
 60589 structure associated with the shared memory ID of the attached shared memory segment and  
 60590 return the segment's start address.

60591 Otherwise, the shared memory segment shall not be attached, *shmat()* shall return -1, and *errno*  
 60592 shall be set to indicate the error.

60593 **ERRORS**

60594 The *shmat()* function shall fail if:

- |   |          |  |
|---|----------|--|
| 60595<br>60596                            | [EACCES] | Operation permission is denied to the calling process; see Section 2.7 (on page 496).  |
| 60597<br>60598<br>60599<br>60600<br>60601 | [EINVAL] | The value of <i>shmid</i> is not a valid shared memory identifier, the <i>shmaddr</i> is not a null pointer, and the value of ( <i>shmaddr</i> - (( <i>uintptr_t</i> ) <i>shmaddr</i> %SHMLBA)) is an illegal address for attaching shared memory; or the <i>shmaddr</i> is not a null pointer, ( <i>shmflg</i> &SHM_RND) is 0, and the value of <i>shmaddr</i> is an illegal address for attaching shared memory. |
| 60602<br>60603                            | [EMFILE] | The number of shared memory segments attached to the calling process would exceed the system-imposed limit.  |
| 60604<br>60605                            | [ENOMEM] | The available data space is not large enough to accommodate the shared memory segment.   |

60626 DIRECTIONS to a new APPLICATION USAGE section.

60627 **Issue 6**

60628 The Open Group Corrigendum U021/13 is applied.

60629 **NAME**

60630 shmctl — XSI shared memory control operations

60631 **SYNOPSIS**

```
60632 XSI #include <sys/shm.h>
60633 int shmctl(int shmid, int cmd, struct shm_ds *buf);
```

60634 **DESCRIPTION**

60635 The *shmctl()* function operates on XSI shared memory (see XBD Section 3.340, on page 88). It is  
 60636 unspecified whether this function interoperates with the realtime interprocess communication  
 60637 facilities defined in Section 2.8 (on page 497).

60638 The *shmctl()* function provides a variety of shared memory control operations as specified by  
 60639 *cmd*. The following values for *cmd* are available:

60640 **IPC\_STAT** Place the current value of each member of the **shm\_ds** data structure  
 60641 associated with *shmid* into the structure pointed to by *buf*. The contents of the  
 60642 structure are defined in **<sys/shm.h>**.

60643 **IPC\_SET** Set the value of the following members of the **shm\_ds** data structure  
 60644 associated with *shmid* to the corresponding value found in the structure  
 60645 pointed to by *buf*:

60646 shm\_perm.uid  
 60647 shm\_perm.gid  
 60648 shm\_perm.mode Low-order nine bits.

60649 IPC\_SET can only be executed by a process that has an effective user ID equal  
 60650 to either that of a process with appropriate privileges or to the value of  
 60651 *shm\_perm.cuid* or *shm\_perm.uid* in the **shm\_ds** data structure associated with  
 60652 *shmid*.

60653 **IPC\_RMID** Remove the shared memory identifier specified by *shmid* from the system and  
 60654 destroy the shared memory segment and **shm\_ds** data structure associated  
 60655 with it. IPC\_RMID can only be executed by a process that has an effective user  
 60656 ID equal to either that of a process with appropriate privileges or to the value  
 60657 of *shm\_perm.cuid* or *shm\_perm.uid* in the **shm\_ds** data structure associated  
 60658 with *shmid*.

60659 **RETURN VALUE**

60660 Upon successful completion, *shmctl()* shall return 0; otherwise, it shall return -1 and set *errno* to  
 60661 indicate the error.

60662 **ERRORS**

60663 The *shmctl()* function shall fail if:

60664 [EACCES] The argument *cmd* is equal to IPC\_STAT and the calling process does not have  
 60665 read permission; see Section 2.7 (on page 496).

60666 [EINVAL] The value of *shmid* is not a valid shared memory identifier, or the value of *cmd*  
 60667 is not a valid command.

60668 [EPERM] The argument *cmd* is equal to IPC\_RMID or IPC\_SET and the effective user ID  
 60669 of the calling process is not equal to that of a process with appropriate  
 60670 privileges and it is not equal to the value of *shm\_perm.cuid* or *shm\_perm.uid* in  
 60671 the data structure associated with *shmid*.

**shmctl()**

60672 The *shmctl()* function may fail if:

60673 [EOVERFLOW] The *cmd* argument is `IPC_STAT` and the *gid* or *uid* value is too large to be  
60674 stored in the structure pointed to by the *buf* argument.

**EXAMPLES**

60675 None.  
60676

**APPLICATION USAGE**

60677 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
60678 Application developers who need to use IPC should design their applications so that modules  
60679 using the IPC routines described in [Section 2.7](#) (on page 496) can be easily modified to use the  
60680 alternative interfaces.

60696 **NAME**

60697 shmdt — XSI shared memory detach operation

60698 **SYNOPSIS**

```
60699 XSI #include <sys/shm.h>
60700 int shmdt(const void *shmaddr);
```

60701 **DESCRIPTION**

60702 The *shmdt()* function operates on XSI shared memory (see XBD Section 3.340, on page 88). It is  
 60703 unspecified whether this function interoperates with the realtime interprocess communication  
 60704 facilities defined in Section 2.8 (on page 497).

60705 The *shmdt()* function detaches the shared memory segment located at the address specified by  
 60706 *shmaddr* from the address space of the calling process.

60707 **RETURN VALUE**

60708 Upon successful completion, *shmdt()* shall decrement the value of *shm\_nattch* in the data  
 60709 structure associated with the shared memory ID of the attached shared memory segment and  
 60710 return 0.

60711 Otherwise, the shared memory segment shall not be detached, *shmdt()* shall return -1, and *errno*  
 60712 shall be set to indicate the error.

60713 **ERRORS**

60714 The *shmdt()* function shall fail if:

60715	[EINVAL]	The value of <i>shmaddr</i> is not the data segment start address of a shared memory segment.

60738 **NAME**

60739 shmget — get an XSI shared memory segment

60740 **SYNOPSIS**

```
60741 XSI #include <sys/shm.h>
60742 int shmget(key_t key, size_t size, int shmflg);
```

60743 **DESCRIPTION**

60744 The *shmget()* function operates on XSI shared memory (see XBD [Section 3.340](#), on page 88). It is  
 60745 unspecified whether this function interoperates with the realtime interprocess communication  
 60746 facilities defined in [Section 2.8](#) (on page 497).

60747 The *shmget()* function shall return the shared memory identifier associated with *key*.

60748 A shared memory identifier, associated data structure, and shared memory segment of at least  
 60749 *size* bytes (see [<sys/shm.h>](#)) are created for *key* if one of the following is true:

- 60750 • The argument *key* is equal to `IPC_PRIVATE`.
- 60751 • The argument *key* does not already have a shared memory identifier associated with it and  
 60752 (*shmflg* & `IPC_CREAT`) is non-zero.

60753 Upon creation, the data structure associated with the new shared memory identifier shall be  
 60754 initialized as follows:

- 60755 • The values of *shm\_perm.cuid*, *shm\_perm.uid*, *shm\_perm.cgid*, and *shm\_perm.gid* are set equal  
 60756 to the effective user ID and effective group ID, respectively, of the calling process.
- 60757 • The low-order nine bits of *shm\_perm.mode* are set equal to the low-order nine bits of *shmflg*.
- 60758 • The value of *shm\_segsz* is set equal to the value of *size*.
- 60759 • The values of *shm\_lpid*, *shm\_nattch*, *shm\_atime*, and *shm\_dtime* are set equal to 0.
- 60760 • The value of *shm\_ctime* is set equal to the current time.

60761 When the shared memory segment is created, it shall be initialized with all zero values.

60762 **RETURN VALUE**

60763 Upon successful completion, *shmget()* shall return a non-negative integer, namely a shared  
 60764 memory identifier; otherwise, it shall return `-1` and set *errno* to indicate the error.

60765 **ERRORS**

60766 The *shmget()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 60767 | [EACCES] | A shared memory identifier exists for <i>key</i> but operation permission as specified by the low-order nine bits of <i>shmflg</i> would not be granted; see <a href="#">Section 2.7</a> (on page 496). |
| 60768 |          |   |
| 60769 |          |   |
| 60770 | [EEXIST] | A shared memory identifier exists for the argument <i>key</i> but ( <i>shmflg</i> & <code>IPC_CREAT</code> ) && ( <i>shmflg</i> & <code>IPC_EXCL</code> ) is non-zero.                                  |
| 60771 |          |   |
| 60772 | [EINVAL] | A shared memory segment is to be created and the value of <i>size</i> is less than the system-imposed minimum or greater than the system-imposed maximum.   |
| 60773 |          |   |
| 60774 | [EINVAL] | No shared memory segment is to be created and a shared memory segment exists for <i>key</i> but the size of the segment associated with it is less than <i>size</i> and <i>size</i> is not 0.           |
| 60775 |          |   |
| 60776 |          |   |

**shmget()**

60777	[ENOENT]	A shared memory identifier does not exist for the argument <i>key</i> and ( <i>shmflg</i> &IPC_CREAT) is 0.
60778		
60779	[ENOMEM]	A shared memory identifier and associated shared memory segment shall be created, but the amount of available physical memory is not sufficient to fill the request.
60780		
60781		
60782	[ENOSPC]	A shared memory identifier is to be created, but the system-imposed limit on the maximum number of allowed shared memory identifiers system-wide would be exceeded.
60783		
60784		

**EXAMPLES**

60785  
60786 None.

**APPLICATION USAGE**

60787 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.  
60788 Application developers who need to use IPC should design their applications so that modules  
60789 using the IPC routines described in Section 2.7 (on page 496) can be easily modified to use the  
60790 alternative interfaces.

**CHANGE HISTORY**

60800 First released in Issue 2. Derived from Issue 2 of the SVID.

**Issue 5**

60802 Moved from SHARED MEMORY to BASE.

60804 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE  
60805 DIRECTIONS to a new APPLICATION USAGE section.

60806 **NAME**

60807 shutdown — shut down socket send and receive operations

60808 **SYNOPSIS**

```
60809 #include <sys/socket.h>
60810 int shutdown(int socket, int how);
```

60811 **DESCRIPTION**

60812 The *shutdown()* function shall cause all or part of a full-duplex connection on the socket  
 60813 associated with the file descriptor *socket* to be shut down.

60814 The *shutdown()* function takes the following arguments:

60815	<i>socket</i>	Specifies the file descriptor of the socket.
60816	<i>how</i>	Specifies the type of shutdown. The values are as follows:
60817	SHUT_RD	Disables further receive operations.
60818	SHUT_WR	Disables further send operations.
60819	SHUT_RDWR	Disables further send and receive operations.

60820 The *shutdown()* function disables subsequent send and/or receive operations on a socket,  
 60821 depending on the value of the *how* argument.

60822 **RETURN VALUE**

60823 Upon successful completion, *shutdown()* shall return 0; otherwise, -1 shall be returned and *errno*  
 60824 set to indicate the error.

60825 **ERRORS**

60826 The *shutdown()* function shall fail if:

60827	[EBADF]	The <i>socket</i> argument is not a valid file descriptor.
60828	[EINVAL]	The <i>how</i> argument is invalid.
60829	[ENOTCONN]	The socket is not connected.
60830	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.

60831 The *shutdown()* function may fail if:

60832	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.

60847 **NAME**

60848 sigaction — examine and change a signal action

60849 **SYNOPSIS**

```
60850 CX #include <signal.h>
60851 int sigaction(int sig, const struct sigaction *restrict act,
60852 struct sigaction *restrict oact);
```

60853 **DESCRIPTION**

60854 The *sigaction()* function allows the calling process to examine and/or specify the action to be  
 60855 associated with a specific signal. The argument *sig* specifies the signal; acceptable values are  
 60856 defined in **<signal.h>**.

60857 The structure **sigaction**, used to describe an action to be taken, is defined in the **<signal.h>**  
 60858 header to include at least the following members:

Member Type	Member Name	Description
<b>void(*) (int)</b>	<i>sa_handler</i>	Pointer to a signal-catching function or one of the macros SIG_IGN or SIG_DFL.
<b>sigset_t</b>	<i>sa_mask</i>	Additional set of signals to be blocked during execution of signal-catching function.
<b>int</b>	<i>sa_flags</i>	Special flags to affect behavior of signal.
<b>void(*) (int, siginfo_t *, void *)</b>	<i>sa_sigaction</i>	Pointer to a signal-catching function.

60868 The storage occupied by *sa\_handler* and *sa\_sigaction* may overlap, and a conforming application  
 60869 shall not use both simultaneously.

60870 If the argument *act* is not a null pointer, it points to a structure specifying the action to be  
 60871 associated with the specified signal. If the argument *oact* is not a null pointer, the action  
 60872 previously associated with the signal is stored in the location pointed to by the argument *oact*. If  
 60873 the argument *act* is a null pointer, signal handling is unchanged; thus, the call can be used to  
 60874 enquire about the current handling of a given signal. The SIGKILL and SIGSTOP signals shall  
 60875 not be added to the signal mask using this mechanism; this restriction shall be enforced by the  
 60876 system without causing an error to be indicated.

60877 If the SA\_SIGINFO flag (see below) is cleared in the *sa\_flags* field of the **sigaction** structure, the  
 60878 *sa\_handler* field identifies the action to be associated with the specified signal. If the  
 60879 SA\_SIGINFO flag is set in the *sa\_flags* field, the *sa\_sigaction* field specifies a signal-catching  
 60880 function.

60881 The *sa\_flags* field can be used to modify the behavior of the specified signal.

60882 The following flags, defined in the **<signal.h>** header, can be set in *sa\_flags*:

60883 XSI SA\_NOCLDSTOP Do not generate SIGCHLD when children stop or stopped children  
 60884 continue.

60885 If *sig* is SIGCHLD and the SA\_NOCLDSTOP flag is not set in *sa\_flags*, and  
 60886 the implementation supports the SIGCHLD signal, then a SIGCHLD  
 60887 signal shall be generated for the calling process whenever any of its child  
 60888 XSI processes stop and a SIGCHLD signal may be generated for the calling  
 60889 process whenever any of its stopped child processes are continued. If *sig*  
 60890 is SIGCHLD and the SA\_NOCLDSTOP flag is set in *sa\_flags*, then the  
 60891 implementation shall not generate a SIGCHLD signal in this way.

**sigaction()**

60892	XSI	<b>SA_ONSTACK</b>	If set and an alternate signal stack has been declared with <i>sigaltstack()</i> , the signal shall be delivered to the calling process on that stack. Otherwise, the signal shall be delivered on the current stack.
60893			
60894			
60895		<b>SA_RESETHAND</b>	If set, the disposition of the signal shall be reset to SIG_DFL and the SA_SIGINFO flag shall be cleared on entry to the signal handler.
60896			
60897			<b>Note:</b> SIGILL and SIGTRAP cannot be automatically reset when delivered.
60898			the system silently enforces this restriction.
60899			Otherwise, the disposition of the signal shall not be modified on entry to the signal handler.
60900			
60901			In addition, if this flag is set, <i>sigaction()</i> may behave as if the SA_NODEFER flag were also set.
60902			
60903		<b>SA_RESTART</b>	This flag affects the behavior of interruptible functions; that is, those specified to fail with <i>errno</i> set to [EINTR]. If set, and a function specified as interruptible is interrupted by this signal, the function shall restart and shall not fail with [EINTR] unless otherwise specified. If an interruptible function which uses a timeout is restarted, the duration of the timeout following the restart is set to an unspecified value that does not exceed the original timeout value. If the flag is not set, interruptible functions interrupted by this signal shall fail with <i>errno</i> set to [EINTR].
60904			
60905			
60906			
60907			
60908			
60909			
60910			
60911		<b>SA_SIGINFO</b>	If cleared and the signal is caught, the signal-catching function shall be entered as:
60912			
60913			<pre>void func(int signo);</pre>
60914			where <i>signo</i> is the only argument to the signal-catching function. In this case, the application shall use the <i>sa_handler</i> member to describe the signal-catching function and the application shall not modify the <i>sa_sigaction</i> member.
60915			
60916			
60917			
60918			If SA_SIGINFO is set and the signal is caught, the signal-catching function shall be entered as:
60919			
60920			<pre>void func(int signo, siginfo_t *info, void *context);</pre>
60921			where two additional arguments are passed to the signal-catching function. The second argument shall point to an object of type <b>siginfo_t</b> explaining the reason why the signal was generated; the third argument can be cast to a pointer to an object of type <b>ucontext_t</b> to refer to the receiving thread's context that was interrupted when the signal was delivered. In this case, the application shall use the <i>sa_sigaction</i> member to describe the signal-catching function and the application shall not modify the <i>sa_handler</i> member.
60922			
60923			
60924			
60925			
60926			
60927			
60928			
60929			The <i>si_signo</i> member contains the system-generated signal number.
60930	XSI		The <i>si_errno</i> member may contain implementation-defined additional error information; if non-zero, it contains an error number identifying the condition that caused the signal to be generated.
60931			
60932			
60933			The <i>si_code</i> member contains a code identifying the cause of the signal, as described in Section 2.4.3 (on page 486).
60934			

60935 SA\_NOCLDWAIT If set, and *sig* equals SIGCHLD, child processes of the calling processes  
60936 shall not be transformed into zombie processes when they terminate. If  
60937 the calling process subsequently waits for its children, and the process has  
60938 no unwaited-for children that were transformed into zombie processes, it  
60939 shall block until all of its children terminate, and *wait()*, *waitid()*, and  
60940 *waitpid()* shall fail and set *errno* to [ECHILD]. Otherwise, terminating  
60941 child processes shall be transformed into zombie processes, unless  
60942 SIGCHLD is set to SIG\_IGN.

60943 SA\_NODEFER If set and *sig* is caught, *sig* shall not be added to the thread's signal mask  
60944 on entry to the signal handler unless it is included in *sa\_mask*. Otherwise,  
60945 *sig* shall always be added to the thread's signal mask on entry to the  
60946 signal handler.

60947 When a signal is caught by a signal-catching function installed by *sigaction()*, a new signal mask  
60948 is calculated and installed for the duration of the signal-catching function (or until a call to either  
60949 *sigprocmask()* or *sigsuspend()* is made). This mask is formed by taking the union of the current  
60950 signal mask and the value of the *sa\_mask* for the signal being delivered, and unless  
60951 SA\_NODEFER or SA\_RESETHAND is set, then including the signal being delivered. If and  
60952 when the user's signal handler returns normally, the original signal mask is restored.

60953 Once an action is installed for a specific signal, it shall remain installed until another action is  
60954 explicitly requested (by another call to *sigaction()*), until the SA\_RESETHAND flag causes  
60955 resetting of the handler, or until one of the *exec* functions is called.

60956 If the previous action for *sig* had been established by *signal()*, the values of the fields returned in  
60957 the structure pointed to by *oact* are unspecified, and in particular *oact->sa\_handler* is not  
60958 necessarily the same value passed to *signal()*. However, if a pointer to the same structure or a  
60959 copy thereof is passed to a subsequent call to *sigaction()* via the *act* argument, handling of the  
60960 signal shall be as if the original call to *signal()* were repeated.

60961 If *sigaction()* fails, no new signal handler is installed.

60962 It is unspecified whether an attempt to set the action for a signal that cannot be caught or  
60963 ignored to SIG\_DFL is ignored or causes an error to be returned with *errno* set to [EINVAL].

60964 If SA\_SIGINFO is not set in *sa\_flags*, then the disposition of subsequent occurrences of *sig* when  
60965 it is already pending is implementation-defined; the signal-catching function shall be invoked  
60966 with a single argument. If SA\_SIGINFO is set in *sa\_flags*, then subsequent occurrences of *sig*  
60967 generated by *sigqueue()* or as a result of any signal-generating function that supports the  
60968 specification of an application-defined value (when *sig* is already pending) shall be queued in  
60969 FIFO order until delivered or accepted; the signal-catching function shall be invoked with three  
60970 arguments. The application specified value is passed to the signal-catching function as the  
60971 *si\_value* member of the **siginfo\_t** structure.

60972 The result of the use of *sigaction()* and a *sigwait()* function concurrently within a process on the  
60973 same signal is unspecified.

60974 **RETURN VALUE**

60975 Upon successful completion, *sigaction()* shall return 0; otherwise, -1 shall be returned, *errno* shall  
60976 be set to indicate the error, and no new signal-catching function shall be installed.

**sigaction()**60977 **ERRORS**60978 The *sigaction()* function shall fail if:60979 [EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a  
60980 signal that cannot be caught or ignore a signal that cannot be ignored.60981 [ENOTSUP] The SA\_SIGINFO bit flag is set in the *sa\_flags* field of the **sigaction** structure.60982 The *sigaction()* function may fail if:60983 [EINVAL] An attempt was made to set the action to SIG\_DFL for a signal that cannot be  
60984 caught or ignored (or both).60985 In addition, the *sigaction()* function may fail if the SA\_SIGINFO flag is set in the *sa\_flags* field of  
60986 the **sigaction** structure for a signal not in the range SIGRTMIN to SIGRTMAX.60987 **EXAMPLES**60988 **Establishing a Signal Handler**60989 The following example demonstrates the use of *sigaction()* to establish a handler for the SIGINT  
60990 signal.

```

60991 #include <signal.h>
60992 static void handler(int signum)
60993 {
60994     /* Take appropriate actions for signal delivery */
60995 }
60996 int main()
60997 {
60998     struct sigaction sa;
60999     sa.sa_handler = handler;
61000     sigemptyset(&sa.sa_mask);
61001     sa.sa_flags = SA_RESTART; /* Restart functions if
61002                             interrupted by handler */
61003     if (sigaction(SIGINT, &sa, NULL) == -1)
61004         /* Handle error */;
61005     /* Further code */
61006 }

```

61007 **APPLICATION USAGE**

61008 The *sigaction()* function supersedes the *signal()* function, and should be used in preference. In  
61009 particular, *sigaction()* and *signal()* should not be used in the same process to control the same  
61010 signal. The behavior of async-signal-safe functions, as defined in their respective  
61011 DESCRIPTION sections, is as specified by this volume of POSIX.1-2008, regardless of invocation  
61012 from a signal-catching function. This is the only intended meaning of the statement that async-  
61013 signal-safe functions may be used in signal-catching functions without restrictions. Applications  
61014 must still consider all effects of such functions on such things as data structures, files, and  
61015 process state. In particular, application developers need to consider the restrictions on  
61016 interactions when interrupting *sleep()* and interactions among multiple handles for a file  
61017 description. The fact that any specific function is listed as async-signal-safe does not necessarily  
61018 mean that invocation of that function from a signal-catching function is recommended.

61019 In order to prevent errors arising from interrupting non-async-signal-safe function calls,  
61020 applications should protect calls to these functions either by blocking the appropriate signals or

61021 through the use of some programmatic semaphore (see *semget()*, *sem\_init()*, *sem\_open()*, and so  
 61022 on). Note in particular that even the “safe” functions may modify *errno*; the signal-catching  
 61023 function, if not executing as an independent thread, should save and restore its value in order to  
 61024 avoid the possibility that delivery of a signal in between an error return from a function that sets  
 61025 *errno* and the subsequent examination of *errno* could result in the signal-catching function  
 61026 changing the value of *errno*. Naturally, the same principles apply to the async-signal-safety of  
 61027 application routines and asynchronous data access. Note that *longjmp()* and *siglongjmp()* are not  
 61028 in the list of async-signal-safe functions. This is because the code executing after *longjmp()* and  
 61029 *siglongjmp()* can call any unsafe functions with the same danger as calling those unsafe  
 61030 functions directly from the signal handler. Applications that use *longjmp()* and *siglongjmp()* from  
 61031 within signal handlers require rigorous protection in order to be portable. Many of the other  
 61032 functions that are excluded from the list are traditionally implemented using either *malloc()* or  
 61033 *free()* functions or the standard I/O library, both of which traditionally use data structures in a  
 61034 non-async-signal-safe manner. Since any combination of different functions using a common  
 61035 data structure can cause async-signal-safety problems, this volume of POSIX.1-2008 does not  
 61036 define the behavior when any unsafe function is called in a signal handler that interrupts an  
 61037 unsafe function.

61038 If the signal occurs other than as the result of calling *abort()*, *kill()*, or *raise()*, the behavior is  
 61039 undefined if the signal handler calls any function in the standard library other than one of the  
 61040 functions listed in the table of async-signal-safe functions in Section 2.4.3 (on page 486), or refers  
 61041 to any object other than *errno* with static storage duration other than by assigning a value to a  
 61042 static storage duration variable of type **volatile sig\_atomic\_t**. Unless all signal handlers have  
 61043 *errno* set on return as it was on entry, the value of *errno* is unspecified.

61044 Usually, the signal is executed on the stack that was in effect before the signal was delivered. An  
 61045 alternate stack may be specified to receive a subset of the signals being caught.

61046 When the signal handler returns, the receiving thread resumes execution at the point it was  
 61047 interrupted unless the signal handler makes other arrangements. If *longjmp()* or *\_longjmp()* is  
 61048 used to leave the signal handler, then the signal mask must be explicitly restored.

61049 This volume of POSIX.1-2008 defines the third argument of a signal handling function when  
 61050 SA\_SIGINFO is set as a **void \*** instead of a **ucontext\_t \***, but without requiring type checking.  
 61051 New applications should explicitly cast the third argument of the signal handling function to  
 61052 **ucontext\_t \***.

61053 The BSD optional four argument signal handling function is not supported by this volume of  
 61054 POSIX.1-2008. The BSD declaration would be:

```
61055 void handler(int sig, int code, struct sigcontext *scp,  
61056             char *addr);
```

61057 where *sig* is the signal number, *code* is additional information on certain signals, *scp* is a pointer  
 61058 to the **sigcontext** structure, and *addr* is additional address information. Much the same  
 61059 information is available in the objects pointed to by the second argument of the signal handler  
 61060 specified when SA\_SIGINFO is set.

61061 Since the *sigaction()* function is allowed but not required to set SA\_NODEFER when the  
 61062 application sets the SA\_RESETHAND flag, applications which depend on the SA\_RESETHAND  
 61063 functionality for the newly installed signal handler must always explicitly set SA\_NODEFER  
 61064 when they set SA\_RESETHAND in order to be portable.

**sigaction()**61065 **RATIONALE**

61066 Although this volume of POSIX.1-2008 requires that signals that cannot be ignored shall not be  
 61067 added to the signal mask when a signal-catching function is entered, there is no explicit  
 61068 requirement that subsequent calls to *sigaction()* reflect this in the information returned in the *oact*  
 61069 argument. In other words, if SIGKILL is included in the *sa\_mask* field of *act*, it is unspecified  
 61070 whether or not a subsequent call to *sigaction()* returns with SIGKILL included in the *sa\_mask*  
 61071 field of *oact*.

61072 The SA\_NOCLDSTOP flag, when supplied in the *act->sa\_flags* parameter, allows overloading  
 61073 SIGCHLD with the System V semantics that each SIGCLD signal indicates a single terminated  
 61074 child. Most conforming applications that catch SIGCHLD are expected to install signal-catching  
 61075 functions that repeatedly call the *waitpid()* function with the WNOHANG flag set, acting on  
 61076 each child for which status is returned, until *waitpid()* returns zero. If stopped children are not of  
 61077 interest, the use of the SA\_NOCLDSTOP flag can prevent the overhead from invoking the  
 61078 signal-catching routine when they stop.

61079 Some historical implementations also define other mechanisms for stopping processes, such as  
 61080 the *ptrace()* function. These implementations usually do not generate a SIGCHLD signal when  
 61081 processes stop due to this mechanism; however, that is beyond the scope of this volume of  
 61082 POSIX.1-2008.

61083 This volume of POSIX.1-2008 requires that calls to *sigaction()* that supply a NULL *act* argument  
 61084 succeed, even in the case of signals that cannot be caught or ignored (that is, SIGKILL or  
 61085 SIGSTOP). The System V *signal()* and BSD *sigvec()* functions return [EINVAL] in these cases  
 61086 and, in this respect, their behavior varies from *sigaction()*.

61087 This volume of POSIX.1-2008 requires that *sigaction()* properly save and restore a signal action  
 61088 set up by the ISO C standard *signal()* function. However, there is no guarantee that the reverse is  
 61089 true, nor could there be given the greater amount of information conveyed by the **sigaction**  
 61090 structure. Because of this, applications should avoid using both functions for the same signal in  
 61091 the same process. Since this cannot always be avoided in case of general-purpose library  
 61092 routines, they should always be implemented with *sigaction()*.

61093 It was intended that the *signal()* function should be implementable as a library routine using  
 61094 *sigaction()*.

61095 The POSIX Realtime Extension extends the *sigaction()* function as specified by the POSIX.1-1990  
 61096 standard to allow the application to request on a per-signal basis via an additional signal action  
 61097 flag that the extra parameters, including the application-defined signal value, if any, be passed to  
 61098 the signal-catching function.

61099 **FUTURE DIRECTIONS**

61100 None.

61105 XBD <**signal.h**>

61106 **CHANGE HISTORY**

61107 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

61108 **Issue 5**

61109 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and POSIX  
61110 Threads Extension.

61111 In the DESCRIPTION, the second argument to *func* when SA\_SIGINFO is set is no longer  
61112 permitted to be NULL, and the description of permitted **siginfo\_t** contents is expanded by  
61113 reference to **<signal.h>**.

61114 Since the X/OPEN UNIX Extension functionality is now folded into the BASE, the [ENOTSUP]  
61115 error is deleted.

61116 **Issue 6**

61117 The Open Group Corrigendum U028/7 is applied. In the paragraph entitled “Signal Effects on  
61118 Other Functions”, a reference to *sigpending()* is added.

61119 In the DESCRIPTION, the text “Signal Generation and Delivery”, “Signal Actions”, and “Signal  
61120 Effects on Other Functions” are moved to a separate section of this volume of POSIX.1-2008.

61121 Text describing functionality from the Realtime Signals Extension option is marked.

61122 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 61123 • The [ENOTSUP] error condition is added.

61124 The normative text is updated to avoid use of the term “must” for application requirements.

61125 The **restrict** keyword is added to the *sigaction()* prototype for alignment with the  
61126 ISO/IEC 9899: 1999 standard.

61127 References to the *wait3()* function are removed.

61128 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an  
61129 extension over the ISO C standard.

61130 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/57 is applied, changing text in the table  
61131 describing the **sigaction** structure.

61132 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/127 is applied, removing text from the  
61133 DESCRIPTION duplicated later in the same section.

61134 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/128 is applied, updating the  
61135 DESCRIPTION and APPLICATION USAGE sections. Changes are made to refer to the thread  
61136 rather than the process.

61137 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/129 is applied, adding the example to the  
61138 EXAMPLES section.

61139 **Issue 7**

61140 Austin Group Interpretation 1003.1-2001 #004 is applied.

61141 Austin Group Interpretations 1003.1-2001 #065 and #084 are applied, clarifying the role of the  
61142 SA\_NODEFER flag with respect to the signal mask, and clarifying the SA\_RESTART flag for  
61143 interrupted functions which use timeouts.

61144 Austin Group Interpretation 1003.1-2001 #156 is applied.

61145 SD5-XSH-ERN-167 is applied, updating the APPLICATION USAGE section.

61146 SD5-XSH-ERN-172 is applied, updating the DESCRIPTION to make optional the requirement  
61147 that when the SA\_RESETHAND flag is set, *sigaction()* shall behave as if the SA\_NODEFER flag  
61148 were also set.

**sigaction()**

- 61149            Functionality relating to the Realtime Signals Extension option is moved to the Base.
- 61150            The description of the *si\_code* member is replaced with a reference to [Section 2.4.3](#) (on page 486).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

61151 **NAME**

61152 sigaddset — add a signal to a signal set

61153 **SYNOPSIS**

```
61154 CX #include <signal.h>
61155 int sigaddset(sigset_t *set, int signo);
```

61156 **DESCRIPTION**

61157 The *sigaddset()* function adds the individual signal specified by the *signo* to the signal set pointed  
61158 to by *set*.

61159 Applications shall call either *sigemptyset()* or *sigfillset()* at least once for each object of type  
61160 **sigset\_t** prior to any other use of that object. If such an object is not initialized in this way, but is  
61161 nonetheless supplied as an argument to any of *pthread\_sigmask()*, *sigaction()*, *sigaddset()*,  
61162 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or  
61163 *sigwaitinfo()*, the results are undefined.

61164 **RETURN VALUE**

61165 Upon successful completion, *sigaddset()* shall return 0; otherwise, it shall return -1 and set *errno*  
61166 to indicate the error.

61167 **ERRORS**

61168 The *sigaddset()* function may fail if:

61169 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

61170 **EXAMPLES**

61171 None.

61172 **APPLICATION USAGE**

61173 None.

61174 **RATIONALE**

61175 None.

61176 **FUTURE DIRECTIONS**

61181 XBD <signal.h>

61182 **CHANGE HISTORY**

61183 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

61184 **Issue 5**

61185 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
61186 previous issues.

61187 **Issue 6**

61188 The normative text is updated to avoid use of the term “must” for application requirements.

61189 The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an  
61190 extension over the ISO C standard.

**sigaltstack()**61191 **NAME**

61192 sigaltstack — set and get signal alternate stack context

61193 **SYNOPSIS**

```
61194 XSI #include <signal.h>
61195 int sigaltstack(const stack_t *restrict ss, stack_t *restrict oss);
```

61196 **DESCRIPTION**

61197 The *sigaltstack()* function allows a process to define and examine the state of an alternate stack  
 61198 for signal handlers for the current thread. Signals that have been explicitly declared to execute  
 61199 on the alternate stack shall be delivered on the alternate stack.

61200 If *ss* is not a null pointer, it points to a **stack\_t** structure that specifies the alternate signal stack  
 61201 that shall take effect upon return from *sigaltstack()*. The *ss\_flags* member specifies the new stack  
 61202 state. If it is set to *SS\_DISABLE*, the stack is disabled and *ss\_sp* and *ss\_size* are ignored.  
 61203 Otherwise, the stack shall be enabled, and the *ss\_sp* and *ss\_size* members specify the new address  
 61204 and size of the stack.

61205 The range of addresses starting at *ss\_sp* up to but not including *ss\_sp+ss\_size* is available to the  
 61206 implementation for use as the stack. This function makes no assumptions regarding which end  
 61207 is the stack base and in which direction the stack grows as items are pushed.

61208 If *oss* is not a null pointer, upon successful completion it shall point to a **stack\_t** structure that  
 61209 specifies the alternate signal stack that was in effect prior to the call to *sigaltstack()*. The *ss\_sp*  
 61210 and *ss\_size* members specify the address and size of that stack. The *ss\_flags* member specifies the  
 61211 stack's state, and may contain one of the following values:

61212 **SS\_ONSTACK** The process is currently executing on the alternate signal stack. Attempts to  
 61213 modify the alternate signal stack while the process is executing on it fail. This  
 61214 flag shall not be modified by processes.

61215 **SS\_DISABLE** The alternate signal stack is currently disabled.

61216 The value *SIGSTKSZ* is a system default specifying the number of bytes that would be used to  
 61217 cover the usual case when manually allocating an alternate stack area. The value *MINSIGSTKSZ*  
 61218 is defined to be the minimum stack size for a signal handler. In computing an alternate stack  
 61219 size, a program should add that amount to its stack requirements to allow for the system  
 61220 implementation overhead. The constants *SS\_ONSTACK*, *SS\_DISABLE*, *SIGSTKSZ*, and  
 61221 *MINSIGSTKSZ* are defined in **<signal.h>**.

61222 After a successful call to one of the *exec* functions, there are no alternate signal stacks in the new  
 61223 process image.

61224 In some implementations, a signal (whether or not indicated to execute on the alternate stack)  
 61225 shall always execute on the alternate stack if it is delivered while another signal is being caught  
 61226 using the alternate stack.

61227 Use of this function by library threads that are not bound to kernel-scheduled entities results in  
 61228 undefined behavior.

61229 **RETURN VALUE**

61230 Upon successful completion, *sigaltstack()* shall return 0; otherwise, it shall return -1 and set *errno*  
 61231 to indicate the error.

61232 **ERRORS**61233 The *sigaltstack()* function shall fail if:61234 [EINVAL] The *ss* argument is not a null pointer, and the *ss\_flags* member pointed to by *ss*  
61235 contains flags other than *SS\_DISABLE*.61236 [ENOMEM] The size of the alternate stack area is less than *MINSIGSTKSZ*.

61237 [EPERM] An attempt was made to modify an active stack.

61238 **EXAMPLES**61239 **Allocating Memory for an Alternate Stack**

61240 The following example illustrates a method for allocating memory for an alternate stack.

```

61241 #include <signal.h>
61242 ...
61243 if ((sigstk.ss_sp = malloc(SIGSTKSZ)) == NULL)
61244     /* Error return. */
61245     sigstk.ss_size = SIGSTKSZ;
61246     sigstk.ss_flags = 0;
61247     if (sigaltstack(&sigstk, (stack_t *)0) < 0)
61248         perror("sigaltstack");

```

61249 **APPLICATION USAGE**61250 On some implementations, stack space is automatically extended as needed. On those  
61251 implementations, automatic extension is typically not available for an alternate stack. If the stack  
61252 overflows, the behavior is undefined.61253 **RATIONALE**

61254 None.

61255 **FUTURE DIRECTIONS**

61256 None.

61257 **SEE ALSO**61258 [Section 2.4](#) (on page 484), *exec*, *sigaction()*, *sigsetjmp()*61259 XBD [<signal.h>](#)61260 **CHANGE HISTORY**

61261 First released in Issue 4, Version 2.

61262 **Issue 5**

61263 Moved from X/OPEN UNIX extension to BASE.

61264 The last sentence of the DESCRIPTION was included as an APPLICATION USAGE note in  
61265 previous issues.61266 **Issue 6**

61267 The normative text is updated to avoid use of the term “must” for application requirements.

61268 The **restrict** keyword is added to the *sigaltstack()* prototype for alignment with the  
61269 ISO/IEC 9899:1999 standard.61270 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/58 is applied, updating the first sentence  
61271 to include “for the current thread”.

**sigdelset()**61272 **NAME**

61273 sigdelset — delete a signal from a signal set

61274 **SYNOPSIS**

```
61275 CX #include <signal.h>
61276 int sigdelset(sigset_t *set, int signo);
```

61277 **DESCRIPTION**

61278 The *sigdelset()* function deletes the individual signal specified by *signo* from the signal set  
 61279 pointed to by *set*.

61280 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type  
 61281 **sigset\_t** prior to any other use of that object. If such an object is not initialized in this way, but is  
 61282 nonetheless supplied as an argument to any of *pthread\_sigmask()*, *sigaction()*, *sigaddset()*,  
 61283 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or  
 61284 *sigwaitinfo()*, the results are undefined.

61285 **RETURN VALUE**

61286 Upon successful completion, *sigdelset()* shall return 0; otherwise, it shall return -1 and set *errno*  
 61287 to indicate the error.

61288 **ERRORS**

61289 The *sigdelset()* function may fail if:

61290 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal  
 61291 number.

61292 **EXAMPLES**

61293 None.

61303 XBD [<signal.h>](#)

61304 **CHANGE HISTORY**

61305 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

61306 **Issue 5**

61307 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
 61308 previous issues.

61309 **Issue 6**

61310 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an  
 61311 extension over the ISO C standard.

61312 **NAME**

61313 sigemptyset — initialize and empty a signal set

61314 **SYNOPSIS**

```
61315 CX #include <signal.h>
61316 int sigemptyset(sigset_t *set);
```

61317 **DESCRIPTION**

61318 The *sigemptyset()* function initializes the signal set pointed to by *set*, such that all signals defined  
 61319 in POSIX.1-2008 are excluded.

61320 **RETURN VALUE**

61321 Upon successful completion, *sigemptyset()* shall return 0; otherwise, it shall return -1 and set  
 61322 *errno* to indicate the error.

61323 **ERRORS**

61324 No errors are defined.

61325 **EXAMPLES**

61326 None.

61327 **APPLICATION USAGE**

61328 None.

61329 **RATIONALE**

61330 The implementation of the *sigemptyset()* (or *sigfillset()*) function could quite trivially clear (or set)  
 61331 all the bits in the signal set. Alternatively, it would be reasonable to initialize part of the  
 61332 structure, such as a version field, to permit binary-compatibility between releases where the size  
 61333 of the set varies. For such reasons, either *sigemptyset()* or *sigfillset()* must be called prior to any  
 61334 other use of the signal set, even if such use is read-only (for example, as an argument to  
 61335 *sigpending()*). This function is not intended for dynamic allocation.

61336 The *sigfillset()* and *sigemptyset()* functions require that the resulting signal set include (or  
 61337 exclude) all the signals defined in this volume of POSIX.1-2008. Although it is outside the scope  
 61338 of this volume of POSIX.1-2008 to place this requirement on signals that are implemented as  
 61339 extensions, it is recommended that implementation-defined signals also be affected by these  
 61340 functions. However, there may be a good reason for a particular signal not to be affected. For  
 61341 example, blocking or ignoring an implementation-defined signal may have undesirable side-  
 61342 effects, whereas the default action for that signal is harmless. In such a case, it would be  
 61343 preferable for such a signal to be excluded from the signal set returned by *sigfillset()*.

61344 In early proposals there was no distinction between invalid and unsupported signals (the names  
 61345 of optional signals that were not supported by an implementation were not defined by that  
 61346 implementation). The [EINVAL] error was thus specified as a required error for invalid signals.  
 61347 With that distinction, it is not necessary to require implementations of these functions to  
 61348 determine whether an optional signal is actually supported, as that could have a significant  
 61349 performance impact for little value. The error could have been required for invalid signals and  
 61350 optional for unsupported signals, but this seemed unnecessarily complex. Thus, the error is  
 61351 optional in both cases.

61352 **FUTURE DIRECTIONS**

61353 None.

**sigemptyset()**

61387 XBD <signal.h>

61388 **CHANGE HISTORY**

61389 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

61390 **Issue 6**

61391 The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an  
 61392 extension over the ISO C standard.

**sighold()**61393 **NAME**

61394 sighold, sigignore, sigpause, sigrelse, sigset — signal management

61395 **SYNOPSIS**

```

61396 OB XSI #include <signal.h>
61397 int sighold(int sig);
61398 int sigignore(int sig);
61399 int sigpause(int sig);
61400 int sigrelse(int sig);
61401 void (*sigset(int sig, void (*disp)(int)))(int);

```

61402 **DESCRIPTION**

61403 Use of any of these functions is unspecified in a multi-threaded process.

61404 The *sighold()*, *sigignore()*, *sigpause()*, *sigrelse()*, and *sigset()* functions provide simplified signal management.  
61405

61406 The *sigset()* function shall modify signal dispositions. The *sig* argument specifies the signal, which may be any signal except SIGKILL and SIGSTOP. The *disp* argument specifies the signal's disposition, which may be SIG\_DFL, SIG\_IGN, or the address of a signal handler. If *sigset()* is used, and *disp* is the address of a signal handler, the system shall add *sig* to the signal mask of the calling process before executing the signal handler; when the signal handler returns, the system shall restore the signal mask of the calling process to its state prior to the delivery of the signal. In addition, if *sigset()* is used, and *disp* is equal to SIG\_HOLD, *sig* shall be added to the signal mask of the calling process and *sig*'s disposition shall remain unchanged. If *sigset()* is used, and *disp* is not equal to SIG\_HOLD, *sig* shall be removed from the signal mask of the calling process.

61416 The *sighold()* function shall add *sig* to the signal mask of the calling process.61417 The *sigrelse()* function shall remove *sig* from the signal mask of the calling process.61418 The *sigignore()* function shall set the disposition of *sig* to SIG\_IGN.61419 The *sigpause()* function shall remove *sig* from the signal mask of the calling process and suspend the calling process until a signal is received. The *sigpause()* function shall restore the signal mask of the process to its original state before returning.  
61421

61422 If the action for the SIGCHLD signal is set to SIG\_IGN, child processes of the calling processes shall not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited-for children that were transformed into zombie processes, it shall block until all of its children terminate, and *wait()*, *waitid()*, and *waitpid()* shall fail and set *errno* to [ECHILD].

61427 **RETURN VALUE**61428 Upon successful completion, *sigset()* shall return SIG\_HOLD if the signal had been blocked and the signal's previous disposition if it had not been blocked. Otherwise, SIG\_ERR shall be returned and *errno* set to indicate the error.  
61429  
6143061431 The *sigpause()* function shall suspend execution of the thread until a signal is received, whereupon it shall return -1 and set *errno* to [EINTR].  
6143261433 For all other functions, upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.  
61434

**61435 ERRORS**

61436 These functions shall fail if:

61437 [EINVAL] The *sig* argument is an illegal signal number.

61438 The *sigset()* and *sigignore()* functions shall fail if:

61439 [EINVAL] An attempt is made to catch a signal that cannot be caught, or to ignore a  
61440 signal that cannot be ignored.

**61441 EXAMPLES**

61442 None.

**61443 APPLICATION USAGE**

61444 The *sigaction()* function provides a more comprehensive and reliable mechanism for controlling  
61445 signals; new applications should use the *sigaction()* function instead of the obsolescent *sigset()*  
61446 function.

61447 The *sighold()* function, in conjunction with *sigrelse()* or *sigpause()*, may be used to establish  
61448 critical regions of code that require the delivery of a signal to be temporarily deferred. For  
61449 broader portability, the *pthread\_sigmask()* or *sigprocmask()* functions should be used instead of  
61450 the obsolescent *sighold()* and *sigrelse()* functions.

61451 For broader portability, the *sigsuspend()* function should be used instead of the obsolescent  
61452 *sigpause()* function.

**61453 RATIONALE**

61454 Each of these historic functions has a direct analog in the other functions which are required to  
61455 be per-thread and thread-safe (aside from *sigprocmask()*, which is replaced by *pthread\_sigmask()*).  
61456 The *sigset()* function can be implemented as a simple wrapper for *sigaction()*. The *sighold()*  
61457 function is equivalent to *sigprocmask()* or *pthread\_sigmask()* with SIG\_BLOCK set. The *sigignore()*  
61458 function is equivalent to *sigaction()* with SIG\_IGN set. The *sigpause()* function is equivalent to  
61459 *sigsuspend()*. The *sigrelse()* function is equivalent to *sigprocmask()* or *pthread\_sigmask()* with  
61460 SIG\_UNBLOCK set.

**61461 FUTURE DIRECTIONS**

61462 These functions may be removed in a future version.

**61463 SEE ALSO**

61464 Section 2.4 (on page 484), *exec*, *pause()*, *pthread\_sigmask()*, *sigaction()*, *signal()*, *sigsuspend()*,  
61465 *wait()*, *waitid()*.

**61467 CHANGE HISTORY**

61468 First released in Issue 4, Version 2.

**61469 Issue 5**

61470 Moved from X/OPEN UNIX extension to BASE.

61471 The DESCRIPTION is updated to indicate that the *sigpause()* function restores the signal mask of  
61472 the process to its original state before returning.

61473 The RETURN VALUE section is updated to indicate that the *sigpause()* function suspends  
61474 execution of the process until a signal is received, whereupon it returns -1 and sets *errno* to  
61475 [EINTR].

**sighold()**61476 **Issue 6**

61477 The normative text is updated to avoid use of the term “must” for application requirements.

61478 References to the *wait3()* function are removed.

61479 The XSI functions are split out into their own reference page.

61480 **Issue 7**

61481 SD5-XSH-ERN-113 and SD5-XSH-ERN-42 are applied, marking these functions obsolescent and  
61482 updating the APPLICATION USAGE and RATIONALE sections.

61483 **NAME**61484 `siginterrupt` — allow signals to interrupt functions61485 **SYNOPSIS**

```
61486 OB XSI #include <signal.h>
61487 int siginterrupt(int sig, int flag);
```

61488 **DESCRIPTION**

61489 The `siginterrupt()` function shall change the restart behavior when a function is interrupted by  
 61490 the specified signal. The function `siginterrupt(sig, flag)` has an effect as if implemented as:

```
61491 int siginterrupt(int sig, int flag) {
61492     int ret;
61493     struct sigaction act;
61494
61495     (void) sigaction(sig, NULL, &act);
61496     if (flag)
61497         act.sa_flags &= ~SA_RESTART;
61498     else
61499         act.sa_flags |= SA_RESTART;
61500     ret = sigaction(sig, &act, NULL);
61501     return ret;
61502 }
```

61502 **RETURN VALUE**

61503 Upon successful completion, `siginterrupt()` shall return 0; otherwise, -1 shall be returned and  
 61504 `errno` set to indicate the error.

61505 **ERRORS**

61506 The `siginterrupt()` function shall fail if:

61507 [EINVAL] The `sig` argument is not a valid signal number.

61508 **EXAMPLES**

61509 None.

61510 **APPLICATION USAGE**

61511 The `siginterrupt()` function supports programs written to historical system interfaces.  
 61512 Applications should use the `sigaction()` with the SA\_RESTART flag instead of the obsolescent  
 61513 `siginterrupt()` function.

61514 **RATIONALE**

61515 None.

61516 **FUTURE DIRECTIONS**

61517 None.

61525 **Issue 6**61526 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/59 is applied, correcting the declaration in  
61527 the sample implementation given in the DESCRIPTION.61528 **Issue 7**61529 The *siginterrupt()* function is marked obsolescent.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

61530 **NAME**

61531 sigismember — test for a signal in a signal set

61532 **SYNOPSIS**

```
61533 CX #include <signal.h>
61534 int sigismember(const sigset_t *set, int signo);
```

61535 **DESCRIPTION**

61536 The *sigismember()* function shall test whether the signal specified by *signo* is a member of the set  
 61537 pointed to by *set*.

61538 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type  
 61539 **sigset\_t** prior to any other use of that object. If such an object is not initialized in this way, but is  
 61540 nonetheless supplied as an argument to any of *pthread\_sigmask()*, *sigaction()*, *sigaddset()*,  
 61541 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or  
 61542 *sigwaitinfo()*, the results are undefined.

61543 **RETURN VALUE**

61544 Upon successful completion, *sigismember()* shall return 1 if the specified signal is a member of  
 61545 the specified set, or 0 if it is not. Otherwise, it shall return -1 and set *errno* to indicate the error.

61546 **ERRORS**

61547 The *sigismember()* function may fail if:

61548 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal  
 61549 number.

61550 **EXAMPLES**

61551 None.

61552 **APPLICATION USAGE**

61553 None.

61554 **RATIONALE**

61555 None.

61556 **FUTURE DIRECTIONS**

61557 None.

61558 **SEE ALSO**

61559 Section 2.4 (on page 484), *pthread\_sigmask()*, *sigaction()*, *sigaddset()*, *sigdelset()*, *sigfillset()*,

61561 XBD <signal.h>

61562 **CHANGE HISTORY**

61563 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

61564 **Issue 5**

61565 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
 61566 previous issues.

61567 **Issue 6**

61568 The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an  
 61569 extension over the ISO C standard.

**siglongjmp()**61570 **NAME**

61571 siglongjmp — non-local goto with signal handling

61572 **SYNOPSIS**

```
61573 CX #include <setjmp.h>
61574 void siglongjmp(sigjmp_buf env, int val);
```

61575 **DESCRIPTION**61576 The *siglongjmp()* function shall be equivalent to the *longjmp()* function, except as follows:

- 61577 • References to *setjmp()* shall be equivalent to *sigsetjmp()*.
- 61578 • The *siglongjmp()* function shall restore the saved signal mask if and only if the *env*
- 61579 argument was initialized by a call to *sigsetjmp()* with a non-zero *savemask* argument.

61580 **RETURN VALUE**

61581 After *siglongjmp()* is completed, program execution shall continue as if the corresponding

61582 invocation of *sigsetjmp()* had just returned the value specified by *val*. The *siglongjmp()* function

61583 shall not cause *sigsetjmp()* to return 0; if *val* is 0, *sigsetjmp()* shall return the value 1.

61584 **ERRORS**

61585 No errors are defined.

61586 **EXAMPLES**

61587 None.

61588 **APPLICATION USAGE**

61589 The distinction between *setjmp()* or *longjmp()* and *sigsetjmp()* or *siglongjmp()* is only significant

61590 for programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

61591 **RATIONALE**

61592 None.

61593 **FUTURE DIRECTIONS**

61594 None.

61595 **SEE ALSO**61596 *longjmp()*, *pthread\_sigmask()*, *setjmp()*, *sigsetjmp()*, *sigsuspend()*61597 XBD **<setjmp.h>**61598 **CHANGE HISTORY**

61599 First released in Issue 3. Included for alignment with the ISO POSIX-1 standard.

61600 **Issue 5**

61601 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

61602 **Issue 6**61603 The DESCRIPTION is rewritten in terms of *longjmp()*.

61604 The SYNOPSIS is marked CX since the presence of this function in the **<setjmp.h>** header is an

61605 extension over the ISO C standard.

61606 **NAME**61607 `signal` — signal management61608 **SYNOPSIS**61609 `#include <signal.h>`61610 `void (*signal(int sig, void (*func)(int)))(int);`61611 **DESCRIPTION**

61612 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 61613 conflict between the requirements described here and the ISO C standard is unintentional. This  
 61614 volume of POSIX.1-2008 defers to the ISO C standard.

61615 Use of this function is unspecified in a multi-threaded process.

61616 The `signal()` function chooses one of three ways in which receipt of the signal number `sig` is to be  
 61617 subsequently handled. If the value of `func` is `SIG_DFL`, default handling for that signal shall  
 61618 occur. If the value of `func` is `SIG_IGN`, the signal shall be ignored. Otherwise, the application  
 61619 shall ensure that `func` points to a function to be called when that signal occurs. An invocation of  
 61620 such a function because of a signal, or (recursively) of any further functions called by that  
 61621 invocation (other than functions in the standard library), is called a “signal handler”.

61622 When a signal occurs, and `func` points to a function, it is implementation-defined whether the  
 61623 equivalent of a:

61624 `signal(sig, SIG_DFL);`

61625 is executed or the implementation prevents some implementation-defined set of signals (at least  
 61626 including `sig`) from occurring until the current signal handling has completed. (If the value of `sig`  
 61627 is `SIGILL`, the implementation may alternatively define that no action is taken.) Next the  
 61628 equivalent of:

61629 `(*func)(sig);`

61630 is executed. If and when the function returns, if the value of `sig` was `SIGFPE`, `SIGILL`, or  
 61631 `SIGSEGV` or any other implementation-defined value corresponding to a computational  
 61632 exception, the behavior is undefined. Otherwise, the program shall resume execution at the  
 61633 CX point it was interrupted. If the signal occurs as the result of calling the `abort()`, `raise()`, `kill()`,  
 61634 `pthread_kill()`, or `sigqueue()` function, the signal handler shall not call the `raise()` function.

61635 CX If the signal occurs other than as the result of calling `abort()`, `raise()`, `kill()`, `pthread_kill()`, or  
 61636 `sigqueue()`, the behavior is undefined if the signal handler refers to any object with static storage  
 61637 duration other than by assigning a value to an object declared as volatile `sig_atomic_t`, or if the  
 61638 signal handler calls any function in the standard library other than one of the functions listed in  
 61639 Section 2.4 (on page 484). Furthermore, if such a call fails, the value of `errno` is unspecified.

61640 At program start-up, the equivalent of:

61641 `signal(sig, SIG_IGN);`

61642 is executed for some signals, and the equivalent of:

61643 `signal(sig, SIG_DFL);`

61644 CX is executed for all other signals (see `exec`).

61645 **RETURN VALUE**

61646 If the request can be honored, `signal()` shall return the value of `func` for the most recent call to  
 61647 `signal()` for the specified signal `sig`. Otherwise, `SIG_ERR` shall be returned and a positive value  
 61648 shall be stored in `errno`.

**signal()**61649 **ERRORS**61650 The *signal()* function shall fail if:61651 CX [EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a  
61652 signal that cannot be caught or ignore a signal that cannot be ignored.61653 The *signal()* function may fail if:61654 CX [EINVAL] An attempt was made to set the action to SIG\_DFL for a signal that cannot be  
61655 caught or ignored (or both).61656 **EXAMPLES**

61657 None.

61658 **APPLICATION USAGE**61659 The *sigaction()* function provides a more comprehensive and reliable mechanism for controlling  
61660 signals; new applications should use *sigaction()* rather than *signal()*.61661 **RATIONALE**

61662 None.

61663 **FUTURE DIRECTIONS**

61664 None.

61665 **SEE ALSO**61666 Section 2.4 (on page 484), *exec*, *pause()*, *sigaction()*, *sigsuspend()*, *waitid()*61667 XBD <[signal.h](#)>61668 **CHANGE HISTORY**

61669 First released in Issue 1. Derived from Issue 1 of the SVID.

61670 **Issue 5**

61671 Moved from X/OPEN UNIX extension to BASE.

61672 The DESCRIPTION is updated to indicate that the *sigpause()* function restores the signal mask of  
61673 the process to its original state before returning.61674 The RETURN VALUE section is updated to indicate that the *sigpause()* function suspends  
61675 execution of the process until a signal is received, whereupon it returns -1 and sets *errno* to  
61676 [EINTR].61677 **Issue 6**

61678 Extensions beyond the ISO C standard are marked.

61679 The normative text is updated to avoid use of the term “must” for application requirements.

61680 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

61681 References to the *wait3()* function are removed.61682 The *sighold()*, *sigignore()*, *sigelse()*, and *sigset()* functions are split out onto their own reference  
61683 page.

61684 **NAME**

61685 signbit — test sign

61686 **SYNOPSIS**

61687 #include &lt;math.h&gt;

61688 int signbit(real-floating x);

61689 **DESCRIPTION**

61690 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 61691 conflict between the requirements described here and the ISO C standard is unintentional. This  
 61692 volume of POSIX.1-2008 defers to the ISO C standard.

61693 The *signbit()* macro shall determine whether the sign of its argument value is negative. NaNs,  
 61694 zeros, and infinities have a sign bit.

61695 **RETURN VALUE**

61696 The *signbit()* macro shall return a non-zero value if and only if the sign of its argument value is  
 61697 negative.

61698 **ERRORS**

61699 No errors are defined.

61763 int sigprocmask(int how, const sigset_t *restrict set,
61764 sigset_t *restrict oset);
```

61765 **DESCRIPTION**61766 Refer to [pthread\\_sigmask\(\)](#).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**sigqueue()**61767 **NAME**

61768 sigqueue — queue a signal to a process

61769 **SYNOPSIS**

```
61770 CX #include <signal.h>
61771 int sigqueue(pid_t pid, int signo, const union sigval value);
```

61772 **DESCRIPTION**

61773 The *sigqueue()* function shall cause the signal specified by *signo* to be sent with the value  
 61774 specified by *value* to the process specified by *pid*. If *signo* is zero (the null signal), error checking  
 61775 is performed but no signal is actually sent. The null signal can be used to check the validity of  
 61776 *pid*.

61777 The conditions required for a process to have permission to queue a signal to another process are  
 61778 the same as for the *kill()* function.

61779 The *sigqueue()* function shall return immediately. If SA\_SIGINFO is set for *signo* and if the  
 61780 resources were available to queue the signal, the signal shall be queued and sent to the receiving  
 61781 process. If SA\_SIGINFO is not set for *signo*, then *signo* shall be sent at least once to the receiving  
 61782 process; it is unspecified whether *value* shall be sent to the receiving process as a result of this  
 61783 call.

61784 If the value of *pid* causes *signo* to be generated for the sending process, and if *signo* is not blocked  
 61785 for the calling thread and if no other thread has *signo* unblocked or is waiting in a *sigwait()*  
 61786 function for *signo*, either *signo* or at least the pending, unblocked signal shall be delivered to the  
 61787 calling thread before the *sigqueue()* function returns. Should any multiple pending signals in the  
 61788 range SIGRTMIN to SIGRTMAX be selected for delivery, it shall be the lowest numbered one.  
 61789 The selection order between realtime and non-realtime signals, or between multiple pending  
 61790 non-realtime signals, is unspecified.

61791 **RETURN VALUE**

61792 Upon successful completion, the specified signal shall have been queued, and the *sigqueue()*  
 61793 function shall return a value of zero. Otherwise, the function shall return a value of -1 and set  
 61794 *errno* to indicate the error.

61795 **ERRORS**

61796 The *sigqueue()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 61797 | [EAGAIN] | No resources are available to queue the signal. The process has already queued {SIGQUEUE_MAX} signals that are still pending at the receiver(s), or a system-wide resource limit has been exceeded. |
| 61798 |          |   |
| 61799 |          |   |
| 61800 | [EINVAL] | The value of the <i>signo</i> argument is an invalid or unsupported signal number.  |
| 61801 | [EPERM]  | The process does not have appropriate privileges to send the signal to the receiving process.   |
| 61802 |          |   |
| 61803 | [ESRCH]  | The process <i>pid</i> does not exist.  |

61804 **EXAMPLES**

61805 None.

61806 **APPLICATION USAGE**

61807 None.

61808 **RATIONALE**

61809 The *sigqueue()* function allows an application to queue a realtime signal to itself or to another  
 61810 process, specifying the application-defined value. This is common practice in realtime  
 61811 applications on existing realtime systems. It was felt that specifying another function in the  
 61812 *sig...* name space already carved out for signals was preferable to extending the interface to  
 61813 *kill()*.

61814 Such a function became necessary when the put/get event function of the message queues was  
 61815 removed. It should be noted that the *sigqueue()* function implies reduced performance in a  
 61816 security-conscious implementation as the access permissions between the sender and receiver  
 61817 have to be checked on each send when the *pid* is resolved into a target process. Such access  
 61818 checks were necessary only at message queue open in the previous interface.

61819 The standard developers required that *sigqueue()* have the same semantics with respect to the  
 61820 null signal as *kill()*, and that the same permission checking be used. But because of the difficulty  
 61821 of implementing the “broadcast” semantic of *kill()* (for example, to process groups) and the  
 61822 interaction with resource allocation, this semantic was not adopted. The *sigqueue()* function  
 61823 queues a signal to a single process specified by the *pid* argument.

61824 The *sigqueue()* function can fail if the system has insufficient resources to queue the signal. An  
 61825 explicit limit on the number of queued signals that a process could send was introduced. While  
 61826 the limit is “per-sender”, this volume of POSIX.1-2008 does not specify that the resources be part  
 61827 of the state of the sender. This would require either that the sender be maintained after exit until  
 61828 all signals that it had sent to other processes were handled or that all such signals that had not  
 61829 yet been acted upon be removed from the queue(s) of the receivers. This volume of  
 61830 POSIX.1-2008 does not preclude this behavior, but an implementation that allocated queuing  
 61831 resources from a system-wide pool (with per-sender limits) and that leaves queued signals  
 61832 pending after the sender exits is also permitted.

61833 **FUTURE DIRECTIONS**

61834 None.

61835 **SEE ALSO**61836 [Section 2.8.1](#) (on page 497)61837 XBD [<signal.h>](#)61838 **CHANGE HISTORY**

61839 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
 61840 POSIX Threads Extension.

61841 **Issue 6**61842 The *sigqueue()* function is marked as part of the Realtime Signals Extension option.

61843 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 61844 implementation does not support the Realtime Signals Extension option.

61845 **Issue 7**61846 The *sigqueue()* function is moved from the Realtime Signals Extension option to the Base.

**sigrelse()**61847 **NAME**

61848 sigrelse, sigset — signal management

61849 **SYNOPSIS**

```
61850 OB XSI #include <signal.h>
61851 int sigrelse(int sig);
61852 void (*sigset(int sig, void (*disp)(int)))(int);
```

61853 **DESCRIPTION**61854 Refer to *sighold()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

61855 **NAME**

61856 sigsetjmp — set jump point for a non-local goto

61857 **SYNOPSIS**

```
61858 CX #include <setjmp.h>
61859 int sigsetjmp(sigjmp_buf env, int savemask);
```

61860 **DESCRIPTION**61861 The *sigsetjmp()* function shall be equivalent to the *setjmp()* function, except as follows:

- 61862 • References to *setjmp()* are equivalent to *sigsetjmp()*.
- 61863 • References to *longjmp()* are equivalent to *siglongjmp()*.
- 61864 • If the value of the *savemask* argument is not 0, *sigsetjmp()* shall also save the current signal mask of the calling thread as part of the calling environment.

61866 **RETURN VALUE**

61867 If the return is from a successful direct invocation, *sigsetjmp()* shall return 0. If the return is from  
 61868 a call to *siglongjmp()*, *sigsetjmp()* shall return a non-zero value.

61869 **ERRORS**

61870 No errors are defined.

61871 **EXAMPLES**

61872 None.

61873 **APPLICATION USAGE**

61874 The distinction between *setjmp()/longjmp()* and *sigsetjmp()/siglongjmp()* is only significant for  
 61875 programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

61876 Note that since this function is defined in terms of *setjmp()*, if *savemask* is zero, it is unspecified  
 61877 whether the signal mask is saved.

61878 **RATIONALE**

61879 The ISO C standard specifies various restrictions on the usage of the *setjmp()* macro in order to  
 61880 permit implementors to recognize the name in the compiler and not implement an actual  
 61881 function. These same restrictions apply to the *sigsetjmp()* macro.

61882 There are processors that cannot easily support these calls, but this was not considered a  
 61883 sufficient reason to exclude them.

61884 4.2 BSD, 4.3 BSD, and XSI-conformant systems provide functions named *\_setjmp()* and  
 61885 *\_longjmp()* that, together with *setjmp()* and *longjmp()*, provide the same functionality as  
 61886 *sigsetjmp()* and *siglongjmp()*. On those systems, *setjmp()* and *longjmp()* save and restore signal  
 61887 masks, while *\_setjmp()* and *\_longjmp()* do not. On System V Release 3 and in corresponding  
 61888 issues of the SVID, *setjmp()* and *longjmp()* are explicitly defined not to save and restore signal  
 61889 masks. In order to permit existing practice in both cases, the relation of *setjmp()* and *longjmp()* to  
 61890 signal masks is not specified, and a new set of functions is defined instead.

61891 The *longjmp()* and *siglongjmp()* functions operate as in the previous issue provided the matching  
 61892 *setjmp()* or *sigsetjmp()* has been performed in the same thread. Non-local jumps into contexts  
 61893 saved by other threads would be at best a questionable practice and were not considered worthy  
 61894 of standardization.

**sigsetjmp()**61895 **FUTURE DIRECTIONS**

61896 None.

61897 **SEE ALSO**61898 *pthread\_sigmask()*, *siglongjmp()*, *signal()*, *sigsuspend()*61899 XBD **<setjmp.h>**61900 **CHANGE HISTORY**

61902 **Issue 5**

61903 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

61904 **Issue 6**61905 The DESCRIPTION is reworded in terms of *setjmp()*.61906 The SYNOPSIS is marked CX since the presence of this function in the **<setjmp.h>** header is an extension over the ISO C standard.

61907

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

61908 **NAME**

61909 sigsuspend — wait for a signal

61910 **SYNOPSIS**

```
61911 CX #include <signal.h>
61912 int sigsuspend(const sigset_t *sigmask);
```

61913 **DESCRIPTION**

61914 The *sigsuspend()* function shall replace the current signal mask of the calling thread with the set  
 61915 of signals pointed to by *sigmask* and then suspend the thread until delivery of a signal whose  
 61916 action is either to execute a signal-catching function or to terminate the process. This shall not  
 61917 cause any other signals that may have been pending on the process to become pending on the  
 61918 thread.

61919 If the action is to terminate the process then *sigsuspend()* shall never return. If the action is to  
 61920 execute a signal-catching function, then *sigsuspend()* shall return after the signal-catching  
 61921 function returns, with the signal mask restored to the set that existed prior to the *sigsuspend()*  
 61922 call.

61923 It is not possible to block signals that cannot be ignored. This is enforced by the system without  
 61924 causing an error to be indicated.

61925 **RETURN VALUE**

61926 Since *sigsuspend()* suspends thread execution indefinitely, there is no successful completion  
 61927 return value. If a return occurs,  $-1$  shall be returned and *errno* set to indicate the error.

61928 **ERRORS**

61929 The *sigsuspend()* function shall fail if:

61930 [EINTR] A signal is caught by the calling process and control is returned from the  
 61931 signal-catching function.

61932 **EXAMPLES**

61933 None.

61934 **APPLICATION USAGE**

61935 Normally, at the beginning of a critical code section, a specified set of signals is blocked using  
 61936 the *sigprocmask()* function. When the thread has completed the critical section and needs to wait  
 61937 for the previously blocked signal(s), it pauses by calling *sigsuspend()* with the mask that was  
 61938 returned by the *sigprocmask()* call.

61939 **RATIONALE**

61940 Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers  
 61941 can install an additional cancellation handler which resets the signal mask to the expected value.

```
61942 void cleanup(void *arg)
61943 {
61944     sigset_t *ss = (sigset_t *) arg;
61945     pthread_sigmask(SIG_SETMASK, ss, NULL);
61946 }
61947 int call_sigsuspend(const sigset_t *mask)
61948 {
61949     sigset_t oldmask;
61950     int result;
61951     pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
61952     pthread_cleanup_push(cleanup, &oldmask);
```

**sigsuspend()**

```
61953         result = sigsuspend(sigmask);
61954         pthread_cleanup_pop(0);
61955         return result;
61956     }
```

**61957 FUTURE DIRECTIONS**

61958 None.

**61962 CHANGE HISTORY**

61963 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**61964 Issue 5**

61965 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

**61966 Issue 6**

61967 The text in the RETURN VALUE section has been changed from “suspends process execution”  
61968 to “suspends thread execution”. This reflects IEEE PASC Interpretation 1003.1c #40.

61969 Text in the APPLICATION USAGE section has been replaced.

61970 The SYNOPSIS is marked CX since the presence of this function in the [<signal.h>](#) header is an  
61971 extension over the ISO C standard.

**61972 Issue 7**

61973 SD5-XSH-ERN-122 is applied, adding the example code in the RATIONALE.

61974 **NAME**

61975 sigtimedwait, sigwaitinfo — wait for queued signals

61976 **SYNOPSIS**

```

61977 CX #include <signal.h>
61978
61978 int sigtimedwait(const sigset_t *restrict set,
61979                 siginfo_t *restrict info,
61980                 const struct timespec *restrict timeout);
61981 int sigwaitinfo(const sigset_t *restrict set,
61982                 siginfo_t *restrict info);

```

61983 **DESCRIPTION**

61984 The *sigtimedwait()* function shall be equivalent to *sigwaitinfo()* except that if none of the signals  
61985 specified by *set* are pending, *sigtimedwait()* shall wait for the time interval specified in the  
61986 **timespec** structure referenced by *timeout*. If the **timespec** structure pointed to by *timeout* is zero-  
61987 valued and if none of the signals specified by *set* are pending, then *sigtimedwait()* shall return  
61988 immediately with an error. If *timeout* is the null pointer, the behavior is unspecified. If the  
61989 Monotonic Clock option is supported, the CLOCK\_MONOTONIC clock shall be used to  
61990 measure the time interval specified by the *timeout* argument.

61991 The *sigwaitinfo()* function selects the pending signal from the set specified by *set*. Should any of  
61992 multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it shall be the  
61993 lowest numbered one. The selection order between realtime and non-realtime signals, or  
61994 between multiple pending non-realtime signals, is unspecified. If no signal in *set* is pending at  
61995 the time of the call, the calling thread shall be suspended until one or more signals in *set* become  
61996 pending or until it is interrupted by an unblocked, caught signal.

61997 The *sigwaitinfo()* function shall be equivalent to the *sigwait()* function if the *info* argument is  
61998 NULL. If the *info* argument is non-NULL, the *sigwaitinfo()* function shall be equivalent to  
61999 *sigwait()*, except that the selected signal number shall be stored in the *si\_signo* member, and the  
62000 cause of the signal shall be stored in the *si\_code* member. If any value is queued to the selected  
62001 signal, the first such queued value shall be dequeued and, if the *info* argument is non-NULL, the  
62002 value shall be stored in the *si\_value* member of *info*. The system resource used to queue the  
62003 signal shall be released and returned to the system for other use. If no value is queued, the  
62004 content of the *si\_value* member is undefined. If no further signals are queued for the selected  
62005 signal, the pending indication for that signal shall be reset.

62006 **RETURN VALUE**

62007 Upon successful completion (that is, one of the signals specified by *set* is pending or is  
62008 generated) *sigwaitinfo()* and *sigtimedwait()* shall return the selected signal number. Otherwise,  
62009 the function shall return a value of -1 and set *errno* to indicate the error.

62010 **ERRORS**

62011 The *sigtimedwait()* function shall fail if:

62012 [EAGAIN] No signal specified by *set* was generated within the specified timeout period.

62013 The *sigtimedwait()* and *sigwaitinfo()* functions may fail if:

62014 [EINTR] The wait was interrupted by an unblocked, caught signal. It shall be  
62015 documented in system documentation whether this error causes these  
62016 functions to fail.

**sigtimedwait()**

62017 The *sigtimedwait()* function may also fail if:  
 62018 [EINVAL] The *timeout* argument specified a *tv\_nsec* value less than zero or greater than  
 62019 or equal to 1 000 million.  
 62020 An implementation should only check for this error if no signal is pending in *set* and it is  
 62021 necessary to wait.

**EXAMPLES**

62022 None.  
 62023

**APPLICATION USAGE**

62024 The *sigtimedwait()* function times out and returns an [EAGAIN] error. Application developers  
 62025 should note that this is inconsistent with other functions such as *pthread\_cond\_timedwait()* that  
 62026 return [ETIMEDOUT].  
 62027

**RATIONALE**

62028 Existing programming practice on realtime systems uses the ability to pause waiting for a  
 62029 selected set of events and handle the first event that occurs in-line instead of in a signal-handling  
 62030 function. This allows applications to be written in an event-directed style similar to a state  
 62031 machine. This style of programming is useful for largescale transaction processing in which the  
 62032 overall throughput of an application and the ability to clearly track states are more important  
 62033 than the ability to minimize the response time of individual event handling.  
 62034

62035 It is possible to construct a signal-waiting macro function out of the realtime signal function  
 62036 mechanism defined in this volume of POSIX.1-2008. However, such a macro has to include the  
 62037 definition of a generalized handler for all signals to be waited on. A significant portion of the  
 62038 overhead of handler processing can be avoided if the signal-waiting function is provided by the  
 62039 kernel. This volume of POSIX.1-2008 therefore provides two signal-waiting functions—one that  
 62040 waits indefinitely and one with a timeout—as part of the overall realtime signal function  
 62041 specification.

62042 The specification of a function with a timeout allows an application to be written that can be  
 62043 broken out of a wait after a set period of time if no event has occurred. It was argued that setting  
 62044 a timer event before the wait and recognizing the timer event in the wait would also implement  
 62045 the same functionality, but at a lower performance level. Because of the performance  
 62046 degradation associated with the user-level specification of a timer event and the subsequent  
 62047 cancellation of that timer event after the wait completes for a valid event, and the complexity  
 62048 associated with handling potential race conditions associated with the user-level method, the  
 62049 separate function has been included.

62050 Note that the semantics of the *sigwaitinfo()* function are nearly identical to that of the *sigwait()*  
 62051 function defined by this volume of POSIX.1-2008. The only difference is that *sigwaitinfo()* returns  
 62052 the queued signal value in the *value* argument. The return of the queued value is required so that  
 62053 applications can differentiate between multiple events queued to the same signal number.

62054 The two distinct functions are being maintained because some implementations may choose to  
 62055 implement the POSIX Threads Extension functions and not implement the queued signals  
 62056 extensions. Note, though, that *sigwaitinfo()* does not return the queued value if the *value*  
 62057 argument is NULL, so the POSIX Threads Extension *sigwait()* function can be implemented as a  
 62058 macro on *sigwaitinfo()*.

62059 The *sigtimedwait()* function was separated from the *sigwaitinfo()* function to address concerns  
 62060 regarding the overloading of the *timeout* pointer to indicate indefinite wait (no timeout), timed  
 62061 wait, and immediate return, and concerns regarding consistency with other functions where the  
 62062 conditional and timed waits were separate functions from the pure blocking function. The  
 62063 semantics of *sigtimedwait()* are specified such that *sigwaitinfo()* could be implemented as a macro

62064 with a null pointer for *timeout*.

62065 The *sigwait* functions provide a synchronous mechanism for threads to wait for asynchronously-  
62066 generated signals. One important question was how many threads that are suspended in a call  
62067 to a *sigwait*() function for a signal should return from the call when the signal is sent. Four  
62068 choices were considered:

- 62069 1. Return an error for multiple simultaneous calls to *sigwait* functions for the same signal.
- 62070 2. One or more threads return.
- 62071 3. All waiting threads return.
- 62072 4. Exactly one thread returns.

62073 Prohibiting multiple calls to *sigwait*() for the same signal was felt to be overly restrictive. The  
62074 “one or more” behavior made implementation of conforming packages easy at the expense of  
62075 forcing POSIX threads clients to protect against multiple simultaneous calls to *sigwait*() in  
62076 application code in order to achieve predictable behavior. There was concern that the “all  
62077 waiting threads” behavior would result in “signal broadcast storms”, consuming excessive CPU  
62078 resources by replicating the signals in the general case. Furthermore, no convincing examples  
62079 could be presented that delivery to all was either simpler or more powerful than delivery to one.

62080 Thus, the consensus was that exactly one thread that was suspended in a call to a *sigwait*  
62081 function for a signal should return when that signal occurs. This is not an onerous restriction as:

- 62082 • A multi-way signal wait can be built from the single-way wait.
- 62083 • Signals should only be handled by application-level code, as library routines cannot guess  
62084 what the application wants to do with signals generated for the entire process.
- 62085 • Applications can thus arrange for a single thread to wait for any given signal and call any  
62086 needed routines upon its arrival.

62087 In an application that is using signals for interprocess communication, signal processing is  
62088 typically done in one place. Alternatively, if the signal is being caught so that process cleanup  
62089 can be done, the signal handler thread can call separate process cleanup routines for each  
62090 portion of the application. Since the application main line started each portion of the application,  
62091 it is at the right abstraction level to tell each portion of the application to clean up.

62092 Certainly, there exist programming styles where it is logical to consider waiting for a single  
62093 signal in multiple threads. A simple *sigwait\_multiple*() routine can be constructed to achieve this  
62094 goal. A possible implementation would be to have each *sigwait\_multiple*() caller registered as  
62095 having expressed interest in a set of signals. The caller then waits on a thread-specific condition  
62096 variable. A single server thread calls a *sigwait*() function on the union of all registered signals.  
62097 When the *sigwait*() function returns, the appropriate state is set and condition variables are  
62098 broadcast. New *sigwait\_multiple*() callers may cause the pending *sigwait*() call to be canceled  
62099 and reissued in order to update the set of signals being waited for.

#### 62100 FUTURE DIRECTIONS

62101 None.

**sigtimedwait()**62106 **CHANGE HISTORY**

62107 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
62108 POSIX Threads Extension.

62109 **Issue 6**

62110 These functions are marked as part of the Realtime Signals Extension option.

62111 The Open Group Corrigendum U035/3 is applied. The SYNOPSIS of the *sigwaitinfo()* function  
62112 has been corrected so that the second argument is of type **siginfo\_t** \*.

62113 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
62114 implementation does not support the Realtime Signals Extension option.

62115 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the  
62116 CLOCK\_MONOTONIC clock, if supported, is used to measure timeout intervals.

62117 The **restrict** keyword is added to the *sigtimedwait()* and *sigwaitinfo()* prototypes for alignment  
62118 with the ISO/IEC 9899:1999 standard.

62119 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/130 is applied, restoring wording in the  
62120 RETURN VALUE section to that in the original base document ("An implementation should  
62121 only check for this error if no signal is pending in *set* and it is necessary to wait").

62122 **Issue 7**

62123 The *sigtimedwait()* and *sigwaitinfo()* functions are moved from the Realtime Signals Extension  
62124 option to the Base.

62125 **NAME**

62126 sigwait — wait for queued signals

62127 **SYNOPSIS**

```
62128 CX #include <signal.h>
62129 int sigwait(const sigset_t *restrict set, int *restrict sig);
```

62130 **DESCRIPTION**

62131 The *sigwait()* function shall select a pending signal from *set*, atomically clear it from the system's  
 62132 set of pending signals, and return that signal number in the location referenced by *sig*. If prior to  
 62133 the call to *sigwait()* there are multiple pending instances of a single signal number, it is  
 62134 implementation-defined whether upon successful return there are any remaining pending  
 62135 signals for that signal number. If the implementation supports queued signals and there are  
 62136 multiple signals queued for the signal number selected, the first such queued signal shall cause a  
 62137 return from *sigwait()* and the remainder shall remain queued. If no signal in *set* is pending at the  
 62138 time of the call, the thread shall be suspended until one or more becomes pending. The signals  
 62139 defined by *set* shall have been blocked at the time of the call to *sigwait()*; otherwise, the behavior  
 62140 is undefined. The effect of *sigwait()* on the signal actions for the signals in *set* is unspecified.

62141 If more than one thread is using *sigwait()* to wait for the same signal, no more than one of these  
 62142 threads shall return from *sigwait()* with the signal number. If more than a single thread is  
 62143 blocked in *sigwait()* for a signal when that signal is generated for the process, it is unspecified  
 62144 which of the waiting threads returns from *sigwait()*. If the signal is generated for a specific  
 62145 thread, as by *pthread\_kill()*, only that thread shall return.

62146 Should any of the multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it  
 62147 shall be the lowest numbered one. The selection order between realtime and non-realtime  
 62148 signals, or between multiple pending non-realtime signals, is unspecified.

62149 **RETURN VALUE**

62150 Upon successful completion, *sigwait()* shall store the signal number of the received signal at the  
 62151 location referenced by *sig* and return zero. Otherwise, an error number shall be returned to  
 62152 indicate the error.

62153 **ERRORS**

62154 The *sigwait()* function may fail if:

62155 [EINVAL] The *set* argument contains an invalid or unsupported signal number.

62156 **EXAMPLES**

62157 None.

62158 **APPLICATION USAGE**

62159 None.

62160 **RATIONALE**

62161 To provide a convenient way for a thread to wait for a signal, this volume of POSIX.1-2008  
 62162 provides the *sigwait()* function. For most cases where a thread has to wait for a signal, the  
 62163 *sigwait()* function should be quite convenient, efficient, and adequate.

62164 However, requests were made for a lower-level primitive than *sigwait()* and for semaphores that  
 62165 could be used by threads. After some consideration, threads were allowed to use semaphores  
 62166 and *sem\_post()* was defined to be async-signal and async-cancel-safe.

62167 In summary, when it is necessary for code run in response to an asynchronous signal to notify a  
 62168 thread, *sigwait()* should be used to handle the signal. Alternatively, if the implementation  
 62169 provides semaphores, they also can be used, either following *sigwait()* or from within a signal

**sigwait()**

62170 handling routine previously registered with *sigaction()*.

**62171 FUTURE DIRECTIONS**

62172 None.

**62177 CHANGE HISTORY**

62178 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the  
62179 POSIX Threads Extension.

**62180 Issue 6**

62181 The **restrict** keyword is added to the *sigwait()* prototype for alignment with the  
62182 ISO/IEC 9899:1999 standard.

62183 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/131 is applied, updating the  
62184 DESCRIPTION to state that if more than a single thread is blocked in *sigwait()*, it is unspecified  
62185 which of the waiting threads returns, and that if a signal is generated for a specific thread only  
62186 that thread shall return.

**62187 Issue 7**

62188 Functionality relating to the Realtime Signals Extension option is moved to the Base.

*System Interfaces***sigwaitinfo()**62189 **NAME**

62190 sigwaitinfo — wait for queued signals

62191 **SYNOPSIS**62192 `#include <signal.h>`62193 `int sigwaitinfo(const sigset_t *restrict set, siginfo_t *restrict info);`62194 **DESCRIPTION**62195 Refer to *sigtimedwait()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**sin()**62196 **NAME**62197 `sin, sinf, sinl` — sine function62198 **SYNOPSIS**

```
62199     #include <math.h>
62200     double sin(double x);
62201     float sinf(float x);
62202     long double sinl(long double x);
```

62203 **DESCRIPTION**

62204 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 62205 conflict between the requirements described here and the ISO C standard is unintentional. This  
 62206 volume of POSIX.1-2008 defers to the ISO C standard.

62207 These functions shall compute the sine of their argument *x*, measured in radians.

62208 An application wishing to check for error situations should set *errno* to zero and call  
 62209 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 62210 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 62211 zero, an error has occurred.

62212 **RETURN VALUE**

62213 Upon successful completion, these functions shall return the sine of *x*.

62214 **MX** If *x* is NaN, a NaN shall be returned.

62215 If *x* is  $\pm 0$ , *x* shall be returned.

62216 If *x* is subnormal, a range error may occur and *x* should be returned.

62217 If *x* is  $\pm\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 62218 defined value shall be returned.

62219 **ERRORS**

62220 These functions shall fail if:

62221 **MX** **Domain Error** The *x* argument is  $\pm\text{Inf}$ .

62222 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 62223 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 62224 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 62225 shall be raised.

62226 These functions may fail if:

62227 **MX** **Range Error** The value of *x* is subnormal

62228 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 62229 then *errno* shall be set to [ERANGE]. If the integer expression  
 62230 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 62231 floating-point exception shall be raised.

62232 **EXAMPLES**62233 **Taking the Sine of a 45-Degree Angle**

```

62234 #include <math.h>
62235 ...
62236 double radians = 45.0 * M_PI / 180;
62237 double result;
62238 ...
62239 result = sin(radians);

```

62240 **APPLICATION USAGE**

62241 These functions may lose accuracy when their argument is near a multiple of  $\pi$  or is far from 0.0.

62242 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
62243 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

62244 **RATIONALE**

62245 None.

62246 **FUTURE DIRECTIONS**

62251 **CHANGE HISTORY**

62252 First released in Issue 1. Derived from Issue 1 of the SVID.

62253 **Issue 5**

62254 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes  
62255 in previous issues.

62256 **Issue 6**

62257 The *sinf()* and *sinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

62258 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
62259 revised to align with the ISO/IEC 9899:1999 standard.

62260 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
62261 marked.

**sinh()**62262 **NAME**62263 `sinh, sinhf, sinhl` — hyperbolic sine functions62264 **SYNOPSIS**

```
62265 #include <math.h>
62266 double sinh(double x);
62267 float sinhf(float x);
62268 long double sinhl(long double x);
```

62269 **DESCRIPTION**

62270 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 62271 conflict between the requirements described here and the ISO C standard is unintentional. This  
 62272 volume of POSIX.1-2008 defers to the ISO C standard.

62273 These functions shall compute the hyperbolic sine of their argument *x*.

62274 An application wishing to check for error situations should set *errno* to zero and call  
 62275 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 62276 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 62277 zero, an error has occurred.

62278 **RETURN VALUE**

62279 Upon successful completion, these functions shall return the hyperbolic sine of *x*.

62280 If the result would cause an overflow, a range error shall occur and  $\pm$ HUGE\_VAL,  
 62281  $\pm$ HUGE\_VALF, and  $\pm$ HUGE\_VALL (with the same sign as *x*) shall be returned as appropriate for  
 62282 the type of the function.

62283 MX If *x* is NaN, a NaN shall be returned.

62284 If *x* is  $\pm 0$  or  $\pm$ Inf, *x* shall be returned.

62285 If *x* is subnormal, a range error may occur and *x* should be returned.

62286 **ERRORS**

62287 These functions shall fail if:

62288 Range Error The result would cause an overflow.

62289 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 62290 then *errno* shall be set to [ERANGE]. If the integer expression  
 62291 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 62292 floating-point exception shall be raised.

62293 These functions may fail if:

62294 MX Range Error The value *x* is subnormal.

62295 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 62296 then *errno* shall be set to [ERANGE]. If the integer expression  
 62297 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 62298 floating-point exception shall be raised.

62299 **EXAMPLES**

62300 None.

62301 **APPLICATION USAGE**62302 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
62303 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.62304 **RATIONALE**

62315 text was previously published in the APPLICATION USAGE section.62316 **Issue 6**62317 The *sinhf()* and *sinhl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.62318 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
62319 revised to align with the ISO/IEC 9899:1999 standard.62320 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
62321 marked.

**sinl()**62322 **NAME**

62323           sinl — sine function

62324 **SYNOPSIS**

62325           #include &lt;math.h&gt;

62326           long double sinl(long double x);

62327 **DESCRIPTION**62328           Refer to *sin()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

62329 **NAME**

62330 sleep — suspend execution for an interval of time

62331 **SYNOPSIS**

62332 #include &lt;unistd.h&gt;

62333 unsigned sleep(unsigned seconds);

62334 **DESCRIPTION**

62335 The *sleep()* function shall cause the calling thread to be suspended from execution until either  
 62336 the number of realtime seconds specified by the argument *seconds* has elapsed or a signal is  
 62337 delivered to the calling thread and its action is to invoke a signal-catching function or to  
 62338 terminate the process. The suspension time may be longer than requested due to the scheduling  
 62339 of other activity by the system.

62340 If a SIGALRM signal is generated for the calling process during execution of *sleep()* and if the  
 62341 SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether *sleep()*  
 62342 returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also  
 62343 unspecified whether it remains pending after *sleep()* returns or it is discarded.

62344 If a SIGALRM signal is generated for the calling process during execution of *sleep()*, except as a  
 62345 result of a prior call to *alarm()*, and if the SIGALRM signal is not being ignored or blocked from  
 62346 delivery, it is unspecified whether that signal has any effect other than causing *sleep()* to return.

62347 If a signal-catching function interrupts *sleep()* and examines or changes either the time a  
 62348 SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or  
 62349 whether the SIGALRM signal is blocked from delivery, the results are unspecified.

62350 If a signal-catching function interrupts *sleep()* and calls *siglongjmp()* or *longjmp()* to restore an  
 62351 environment saved prior to the *sleep()* call, the action associated with the SIGALRM signal and  
 62352 the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also  
 62353 unspecified whether the SIGALRM signal is blocked, unless the signal mask of the process is  
 62354 restored as part of the environment.

62355 XSI Interactions between *sleep()* and *setitimer()* are unspecified.

62356 **RETURN VALUE**

62357 If *sleep()* returns because the requested time has elapsed, the value returned shall be 0. If *sleep()*  
 62358 returns due to delivery of a signal, the return value shall be the “unslept” amount (the requested  
 62359 time minus the time actually slept) in seconds.

62360 **ERRORS**

62361 No errors are defined.

62362 **EXAMPLES**

62363 None.

62364 **APPLICATION USAGE**

62365 None.

62366 **RATIONALE**

62367 There are two general approaches to the implementation of the *sleep()* function. One is to use the  
 62368 *alarm()* function to schedule a SIGALRM signal and then suspend the calling thread waiting for  
 62369 that signal. The other is to implement an independent facility. This volume of POSIX.1-2008  
 62370 permits either approach.

62371 In order to comply with the requirement that no primitive shall change a process attribute unless  
 62372 explicitly described by this volume of POSIX.1-2008, an implementation using SIGALRM must  
 62373 carefully take into account any SIGALRM signal scheduled by previous *alarm()* calls, the action

**sleep()**

62374 previously established for SIGALRM, and whether SIGALRM was blocked. If a SIGALRM has  
 62375 been scheduled before the *sleep()* would ordinarily complete, the *sleep()* must be shortened to  
 62376 that time and a SIGALRM generated (possibly simulated by direct invocation of the signal-  
 62377 catching function) before *sleep()* returns. If a SIGALRM has been scheduled after the *sleep()*  
 62378 would ordinarily complete, it must be rescheduled for the same time before *sleep()* returns. The  
 62379 action and blocking for SIGALRM must be saved and restored.

62380 Historical implementations often implement the SIGALRM-based version using *alarm()* and  
 62381 *pause()*. One such implementation is prone to infinite hangups, as described in *pause()*.  
 62382 Another such implementation uses the C-language *setjmp()* and *longjmp()* functions to avoid  
 62383 that window. That implementation introduces a different problem: when the SIGALRM signal  
 62384 interrupts a signal-catching function installed by the user to catch a different signal, the  
 62385 *longjmp()* aborts that signal-catching function. An implementation based on *sigprocmask()*,  
 62386 *alarm()*, and *sigsuspend()* can avoid these problems.

62387 Despite all reasonable care, there are several very subtle, but detectable and unavoidable,  
 62388 differences between the two types of implementations. These are the cases mentioned in this  
 62389 volume of POSIX.1-2008 where some other activity relating to SIGALRM takes place, and the  
 62390 results are stated to be unspecified. All of these cases are sufficiently unusual as not to be of  
 62391 concern to most applications.

62392 See also the discussion of the term *realtime* in *alarm()*.

62393 Since *sleep()* can be implemented using *alarm()*, the discussion about alarms occurring early  
 62394 under *alarm()* applies to *sleep()* as well.

62395 Application developers should note that the type of the argument *seconds* and the return value of  
 62396 *sleep()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces Application  
 62397 cannot pass a value greater than the minimum guaranteed value for {UINT\_MAX}, which the  
 62398 ISO C standard sets as 65 535, and any application passing a larger value is restricting its  
 62399 portability. A different type was considered, but historical implementations, including those  
 62400 with a 16-bit **int** type, consistently use either **unsigned** or **int**.

62401 Scheduling delays may cause the process to return from the *sleep()* function significantly after  
 62402 the requested time. In such cases, the return value should be set to zero, since the formula  
 62403 (requested time minus the time actually spent) yields a negative number and *sleep()* returns an  
 62404 **unsigned**.

**FUTURE DIRECTIONS**

62405 None.

**socketmark()**62425 **NAME**

62426 socketmark — determine whether a socket is at the out-of-band mark

62427 **SYNOPSIS**

```
62428 #include <sys/socket.h>
62429 int socketmark(int s);
```

62430 **DESCRIPTION**

62431 The *socketmark()* function shall determine whether the socket specified by the descriptor *s* is at  
 62432 the out-of-band data mark (see [Section 2.10.12](#), on page 520). If the protocol for the socket  
 62433 supports out-of-band data by marking the stream with an out-of-band data mark, the  
 62434 *socketmark()* function shall return 1 when all data preceding the mark has been read and the out-  
 62435 of-band data mark is the first element in the receive queue. The *socketmark()* function shall not  
 62436 remove the mark from the stream.

62437 **RETURN VALUE**

62438 Upon successful completion, the *socketmark()* function shall return a value indicating whether  
 62439 the socket is at an out-of-band data mark. If the protocol has marked the data stream and all data  
 62440 preceding the mark has been read, the return value shall be 1; if there is no mark, or if data  
 62441 precedes the mark in the receive queue, the *socketmark()* function shall return 0. Otherwise, it  
 62442 shall return a value of -1 and set *errno* to indicate the error.

62443 **ERRORS**62444 The *socketmark()* function shall fail if:

- 62445 [EBADF] The *s* argument is not a valid file descriptor.  
 62446 [ENOTTY] The file associated with the *s* argument is not a socket.

62447 **EXAMPLES**

62448 None.

62449 **APPLICATION USAGE**

62450 The use of this function between receive operations allows an application to determine which  
 62451 received data precedes the out-of-band data and which follows the out-of-band data.

62452 There is an inherent race condition in the use of this function. On an empty receive queue, the  
 62453 current read of the location might well be at the “mark”, but the system has no way of knowing  
 62454 that the next data segment that will arrive from the network will carry the mark, and  
 62455 *socketmark()* will return false, and the next read operation will silently consume the mark.

62456 Hence, this function can only be used reliably when the application already knows that the out-  
 62457 of-band data has been seen by the system or that it is known that there is data waiting to be read  
 62458 at the socket (via SIGURG or *select()*). See [Section 2.10.11](#) (on page 520), [Section 2.10.12](#) (on page  
 62459 520), [Section 2.10.14](#) (on page 521), and *pselect()* for details.

62460 **RATIONALE**

62461 The *socketmark()* function replaces the historical SIOCATMARK command to *ioctl()* which  
 62462 implemented the same functionality on many implementations. Using a wrapper function  
 62463 follows the adopted conventions to avoid specifying commands to the *ioctl()* function, other  
 62464 than those now included to support XSI STREAMS. The *socketmark()* function could be  
 62465 implemented as follows:

```
62466 #include <sys/ioctl.h>
62467 int socketmark(int s)
62468 {
62469     int val;
```

```
62470         if (ioctl(s, SIOCATMARK, &val) == -1)
62471             return(-1);
62472         return(val);
62473     }
```

62474 The use of [ENOTTY] to indicate an incorrect descriptor type matches the historical behavior of  
62475 SIOCATMARK.

62476 **FUTURE DIRECTIONS**

62477 None.

62478 **SEE ALSO**

62479 [Section 2.10.12](#) (on page 520), [pselect\(\)](#), [recv\(\)](#), [recvmsg\(\)](#)

62481 **CHANGE HISTORY**

62482 First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

62483 **Issue 7**

62484 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**socket()**62485 **NAME**62486 `socket` — create an endpoint for communication62487 **SYNOPSIS**

```
62488 #include <sys/socket.h>
62489 int socket(int domain, int type, int protocol);
```

62490 **DESCRIPTION**

62491 The `socket()` function shall create an unbound socket in a communications domain, and return a  
 62492 file descriptor that can be used in later function calls that operate on sockets.

62493 The `socket()` function takes the following arguments:

62494	<i>domain</i>	Specifies the communications domain in which a socket is to be created.
62495	<i>type</i>	Specifies the type of socket to be created.
62496	<i>protocol</i>	Specifies a particular protocol to be used with the socket. Specifying a <i>protocol</i> 62497 of 0 causes <code>socket()</code> to use an unspecified default protocol appropriate for the 62498 requested socket type.

62499 The *domain* argument specifies the address family used in the communications domain. The  
 62500 address families supported by the system are implementation-defined.

62501 Symbolic constants that can be used for the domain argument are defined in the `<sys/socket.h>`  
 62502 header.

62503 The *type* argument specifies the socket type, which determines the semantics of communication  
 62504 over the socket. The following socket types are defined; implementations may specify additional  
 62505 socket types:

62506 `SOCK_STREAM` Provides sequenced, reliable, bidirectional, connection-mode byte streams,  
 62507 and may provide a transmission mechanism for out-of-band data.

62508 `SOCK_DGRAM` Provides datagrams, which are connectionless-mode, unreliable messages of  
 62509 fixed maximum length.

62510 `SOCK_SEQPACKET`

62511 Provides sequenced, reliable, bidirectional, connection-mode transmission  
 62512 paths for records. A record can be sent using one or more output operations  
 62513 and received using one or more input operations, but a single operation never  
 62514 transfers part of more than one record. Record boundaries are visible to the  
 62515 receiver via the `MSG_EOR` flag.

62516 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address  
 62517 family. If the *protocol* argument is zero, the default protocol for this address family and type shall  
 62518 be used. The protocols supported by the system are implementation-defined.

62519 The process may need to have appropriate privileges to use the `socket()` function or to create  
 62520 some sockets.

62521 **RETURN VALUE**

62522 Upon successful completion, `socket()` shall return a non-negative integer, the socket file  
 62523 descriptor. Otherwise, a value of `-1` shall be returned and `errno` set to indicate the error.

**62524 ERRORS**

62525 The *socket()* function shall fail if:

62526 [EAFNOSUPPORT]

62527 The implementation does not support the specified address family.

62528 [EMFILE] All file descriptors available to the process are currently open.

62529 [ENFILE] No more file descriptors are available for the system.

62530 [EPROTONOSUPPORT]

62531 The protocol is not supported by the address family, or the protocol is not supported by the implementation.

62533 [EPROTOTYPE] The socket type is not supported by the protocol.

62534 The *socket()* function may fail if:

62535 [EACCES] The process does not have appropriate privileges.

62536 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

62537 [ENOMEM] Insufficient memory was available to fulfill the request.

**62538 EXAMPLES**

62539 None.

**62540 APPLICATION USAGE**

62541 The documentation for specific address families specifies which protocols each address family supports. The documentation for specific protocols specifies which socket types each protocol supports.

62544 The application can determine whether an address family is supported by trying to create a socket with *domain* set to the protocol in question.

**62546 RATIONALE**

62547 None.

**62548 FUTURE DIRECTIONS**

**62554 CHANGE HISTORY**

62555 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

**socketpair()**62556 **NAME**

62557 socketpair — create a pair of connected sockets

62558 **SYNOPSIS**

```
62559 #include <sys/socket.h>
62560 int socketpair(int domain, int type, int protocol,
62561               int socket_vector[2]);
```

62562 **DESCRIPTION**

62563 The *socketpair()* function shall create an unbound pair of connected sockets in a specified *domain*,  
 62564 of a specified *type*, under the protocol optionally specified by the *protocol* argument. The two  
 62565 sockets shall be identical. The file descriptors used in referencing the created sockets shall be  
 62566 returned in *socket\_vector*[0] and *socket\_vector*[1].

62567 The *socketpair()* function takes the following arguments:

62568	<i>domain</i>	Specifies the communications domain in which the sockets are to be created.
62569	<i>type</i>	Specifies the type of sockets to be created.
62570	<i>protocol</i>	Specifies a particular protocol to be used with the sockets. Specifying a 62571 <i>protocol</i> of 0 causes <i>socketpair()</i> to use an unspecified default protocol 62572 appropriate for the requested socket type.
62573	<i>socket_vector</i>	Specifies a 2-integer array to hold the file descriptors of the created socket pair.

62574 The *type* argument specifies the socket type, which determines the semantics of communications  
 62575 over the socket. The following socket types are defined; implementations may specify additional  
 62576 socket types:

62577	SOCK_STREAM	Provides sequenced, reliable, bidirectional, connection-mode byte 62578 streams, and may provide a transmission mechanism for out-of-band 62579 data.
62580	SOCK_DGRAM	Provides datagrams, which are connectionless-mode, unreliable messages 62581 of fixed maximum length.
62582	SOCK_SEQPACKET	Provides sequenced, reliable, bidirectional, connection-mode transmission 62583 paths for records. A record can be sent using one or more output 62584 operations and received using one or more input operations, but a single 62585 operation never transfers part of more than one record. Record 62586 boundaries are visible to the receiver via the MSG_EOR flag.

62587 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address  
 62588 family. If the *protocol* argument is zero, the default protocol for this address family and type shall  
 62589 be used. The protocols supported by the system are implementation-defined.

62590 The process may need to have appropriate privileges to use the *socketpair()* function or to create  
 62591 some sockets.

62592 **RETURN VALUE**

62593 Upon successful completion, this function shall return 0; otherwise, -1 shall be returned and  
 62594 *errno* set to indicate the error.

62595 **ERRORS**

62596 The *socketpair()* function shall fail if:

62597	[EAFNOSUPPORT]	
62598		The implementation does not support the specified address family.

62599	[EMFILE]	All, or all but one, of the file descriptors available to the process are currently open.
62600		
62601	[ENFILE]	No more file descriptors are available for the system.
62602	[EOPNOTSUPP]	The specified protocol does not permit creation of socket pairs.
62603	[EPROTONOSUPPORT]	
62604		The protocol is not supported by the address family, or the protocol is not supported by the implementation.
62605		
62606	[EPROTOTYPE]	The socket type is not supported by the protocol.
62607		The <i>socketpair()</i> function may fail if:
62608	[EACCES]	The process does not have appropriate privileges.
62609	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.
62610	[ENOMEM]	Insufficient memory was available to fulfill the request.
62611	<b>EXAMPLES</b>	
62612		None.
62613	<b>APPLICATION USAGE</b>	
62614		The documentation for specific address families specifies which protocols each address family supports. The documentation for specific protocols specifies which socket types each protocol supports.
62615		
62616		
62617		The <i>socketpair()</i> function is used primarily with UNIX domain sockets and need not be supported for other domains.
62618		
62619	<b>RATIONALE</b>	
62620		None.
62621	<b>FUTURE DIRECTIONS</b>	
62622		None.
62623	<b>SEE ALSO</b>	
62624		<a href="#">socket()</a>
62625		XBD <a href="#">&lt;sys/socket.h&gt;</a>
62626	<b>CHANGE HISTORY</b>	
62627		First released in Issue 6. Derived from the XNS, Issue 5.2 specification.
62628	<b>Issue 7</b>	
62629		The description of the [EMFILE] error condition is aligned with the <i>pipe()</i> function.

**sprintf()***System Interfaces*62630 **NAME**62631 `printf` — print formatted output62632 **SYNOPSIS**62633 `#include <stdio.h>`62634 `int sprintf(char *restrict s, const char *restrict format, ...);`62635 **DESCRIPTION**62636 Refer to *fprintf()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

62637 **NAME**

62638 sqrt, sqrtf, sqrtl — square root function

62639 **SYNOPSIS**

```
62640 #include <math.h>
62641 double sqrt(double x);
62642 float sqrtf(float x);
62643 long double sqrtl(long double x);
```

62644 **DESCRIPTION**

62645 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 62646 conflict between the requirements described here and the ISO C standard is unintentional. This  
 62647 volume of POSIX.1-2008 defers to the ISO C standard.

62648 These functions shall compute the square root of their argument  $x$ ,  $\sqrt{x}$ .

62649 An application wishing to check for error situations should set *errno* to zero and call  
 62650 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 62651 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 62652 zero, an error has occurred.

62653 **RETURN VALUE**

62654 Upon successful completion, these functions shall return the square root of  $x$ .

62655 MX For finite values of  $x < -0$ , a domain error shall occur, and either a NaN (if supported), or an  
 62656 implementation-defined value shall be returned.

62657 MX If  $x$  is NaN, a NaN shall be returned.

62658 If  $x$  is  $\pm 0$  or  $+\text{Inf}$ ,  $x$  shall be returned.

62659 If  $x$  is  $-\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 62660 defined value shall be returned.

62661 **ERRORS**

62662 These functions shall fail if:

62663 MX Domain Error The finite value of  $x$  is  $< -0$ , or  $x$  is  $-\text{Inf}$ .

62664 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 62665 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 62666 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 62667 shall be raised.

62668 **EXAMPLES**62669 **Taking the Square Root of 9.0**

```
62670 #include <math.h>
62671 ...
62672 double x = 9.0;
62673 double result;
62674 ...
62675 result = sqrt(x);
```

**sqrt()**62676 **APPLICATION USAGE**

62677 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
62678 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

62679 **RATIONALE**

62680 None.

62681 **FUTURE DIRECTIONS**

62682 None.

62683 **SEE ALSO**

62684 *feclearexcept()*, *fetestexcept()*, *isnan()*

62686 **CHANGE HISTORY**

62687 First released in Issue 1. Derived from Issue 1 of the SVID.

62688 **Issue 5**

62689 The DESCRIPTION is updated to indicate how an application should check for an error. This  
62690 text was previously published in the APPLICATION USAGE section.

62691 **Issue 6**

62692 The *sqrtf()* and *sqrtl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

62693 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
62694 revised to align with the ISO/IEC 9899:1999 standard.

62695 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
62696 marked.

62739 **NAME**

62740 stderr, stdin, stdout — standard I/O streams

62741 **SYNOPSIS**

62742 #include &lt;stdio.h&gt;

62743 extern FILE \*stderr, \*stdin, \*stdout;

62744 **DESCRIPTION**

62745 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 62746 conflict between the requirements described here and the ISO C standard is unintentional. This  
 62747 volume of POSIX.1-2008 defers to the ISO C standard.

62748 A file with associated buffering is called a *stream* and is declared to be a pointer to a defined type  
 62749 **FILE**. The *fopen()* function shall create certain descriptive data for a stream and return a pointer  
 62750 to designate the stream in all further transactions. Normally, there are three open streams with  
 62751 constant pointers declared in the <stdio.h> header and associated with the standard open files.

62752 At program start-up, three streams shall be predefined and need not be opened explicitly:  
 62753 *standard input* (for reading conventional input), *standard output* (for writing conventional output),  
 62754 and *standard error* (for writing diagnostic output). When opened, the standard error stream is not  
 62755 fully buffered; the standard input and standard output streams are fully buffered if and only if  
 62756 the stream can be determined not to refer to an interactive device.

62757 CX The following symbolic values in <unistd.h> define the file descriptors that shall be associated  
 62758 with the C-language *stdin*, *stdout*, and *stderr* when the application is started:

62759 STDIN\_FILENO Standard input value, *stdin*. Its value is 0.62760 STDOUT\_FILENO Standard output value, *stdout*. Its value is 1.62761 STDERR\_FILENO Standard error value, *stderr*. Its value is 2.62762 The *stderr* stream is expected to be open for reading and writing.62763 **RETURN VALUE**

62764 None.

62765 **ERRORS**

62766 No errors are defined.

62767 **EXAMPLES**

62768 None.

62769 **APPLICATION USAGE**

62770 None.

62771 **RATIONALE**

62772 None.

**62798 NAME**

62799 `strcasecmp`, `strcasecmp_l`, `strncasecmp`, `strncasecmp_l` — case-insensitive string comparisons

**62800 SYNOPSIS**

```
62801 #include <strings.h>
62802 int strcasecmp(const char *s1, const char *s2);
62803 int strcasecmp_l(const char *s1, const char *s2,
62804                 locale_t locale);
62805 int strncasecmp(const char *s1, const char *s2, size_t n);
62806 int strncasecmp_l(const char *s1, const char *s2,
62807                  size_t n, locale_t locale);
```

**62808 DESCRIPTION**

62809 The `strcasecmp()` and `strcasecmp_l()` functions shall compare, while ignoring differences in case,  
 62810 the string pointed to by `s1` to the string pointed to by `s2`. The `strncasecmp()` and `strncasecmp_l()`  
 62811 functions shall compare, while ignoring differences in case, not more than `n` bytes from the  
 62812 string pointed to by `s1` to the string pointed to by `s2`.

62813 The `strcasecmp()` and `strncasecmp()` functions use the current locale of the process to determine  
 62814 the case of the characters.

62815 The `strcasecmp_l()` and `strncasecmp_l()` functions use the locale represented by `locale` to determine  
 62816 the case of the characters.

62817 When the `LC_CTYPE` category of the current locale is from the POSIX locale, `strcasecmp()` and  
 62818 `strncasecmp()` shall behave as if the strings had been converted to lowercase and then a byte  
 62819 comparison performed. Otherwise, the results are unspecified.

**62820 RETURN VALUE**

62821 Upon completion, `strcasecmp()` and `strcasecmp_l()` shall return an integer greater than, equal to,  
 62822 or less than 0, if the string pointed to by `s1` is, ignoring case, greater than, equal to, or less than  
 62823 the string pointed to by `s2`, respectively.

62824 Upon successful completion, `strncasecmp()` and `strncasecmp_l()` shall return an integer greater  
 62825 than, equal to, or less than 0, if the possibly null-terminated array pointed to by `s1` is, ignoring  
 62826 case, greater than, equal to, or less than the possibly null-terminated array pointed to by `s2`,  
 62827 respectively.

**62828 ERRORS**

62829 The `strcasecmp_l()` and `strncasecmp_l()` functions may fail if:

62830 [EINVAL] `locale` is not a valid locale object handle.

**62831 EXAMPLES**

62832 None.

**62833 APPLICATION USAGE**

62834 None.

**62835 RATIONALE**

62836 None.

**62837 FUTURE DIRECTIONS**

62838 None.

**strcasemp()**62839 **SEE ALSO**62840 [wcscasemp\(\)](#)62841 XBD [<strings.h>](#)62842 **CHANGE HISTORY**

62843 First released in Issue 4, Version 2.

62844 **Issue 5**

62845 Moved from X/OPEN UNIX extension to BASE.

62846 **Issue 7**62847 The *strcasemp()* and *strncasemp()* functions are moved from the XSI option to the Base.62848 The *strcasemp\_l()* and *strncasemp\_l()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

62850 **NAME**

62851 strcat — concatenate two strings

62852 **SYNOPSIS**

62853 #include &lt;string.h&gt;

62854 char \*strcat(char \*restrict s1, const char \*restrict s2);

62855 **DESCRIPTION**

62856 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 62857 conflict between the requirements described here and the ISO C standard is unintentional. This  
 62858 volume of POSIX.1-2008 defers to the ISO C standard.

62859 The *strcat()* function shall append a copy of the string pointed to by *s2* (including the  
 62860 terminating NUL character) to the end of the string pointed to by *s1*. The initial byte of *s2*  
 62861 overwrites the NUL character at the end of *s1*. If copying takes place between objects that  
 62862 overlap, the behavior is undefined.

62863 **RETURN VALUE**62864 The *strcat()* function shall return *s1*; no return value is reserved to indicate an error.62865 **ERRORS**

62866 No errors are defined.

62867 **EXAMPLES**

62868 None.

62869 **APPLICATION USAGE**

62870 This version is aligned with the ISO C standard; this does not affect compatibility with XPG3  
 62871 applications. Reliable error detection by this function was never guaranteed.

62872 **RATIONALE**

62873 None.

62874 **FUTURE DIRECTIONS**

62875 None.

62876 **SEE ALSO**62877 [strncat\(\)](#)62878 XBD [<string.h>](#)62879 **CHANGE HISTORY**

62880 First released in Issue 1. Derived from Issue 1 of the SVID.

62881 **Issue 6**62882 The *strcat()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

**strchr()**62883 **NAME**

62884       strchr — string scanning operation

62885 **SYNOPSIS**

62886       #include &lt;string.h&gt;

62887       char \*strchr(const char \*s, int c);

62888 **DESCRIPTION**62889 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
62890 conflict between the requirements described here and the ISO C standard is unintentional. This  
62891 volume of POSIX.1-2008 defers to the ISO C standard.62892       The *strchr()* function shall locate the first occurrence of *c* (converted to a **char**) in the string  
62893 pointed to by *s*. The terminating NUL character is considered to be part of the string.62894 **RETURN VALUE**62895       Upon completion, *strchr()* shall return a pointer to the byte, or a null pointer if the byte was not  
62896 found.62897 **ERRORS**

62898       No errors are defined.

62899 **EXAMPLES**

62900       None.

62901 **APPLICATION USAGE**

62902       None.

62903 **RATIONALE**

62904       None.

62905 **FUTURE DIRECTIONS**

62906       None.

62907 **SEE ALSO**62908       [strchr\(\)](#)62909       XBD [<string.h>](#)62910 **CHANGE HISTORY**

62911       First released in Issue 1. Derived from Issue 1 of the SVID.

62912 **Issue 6**

62913       Extensions beyond the ISO C standard are marked.

62914 **NAME**

62915 strcmp — compare two strings

62916 **SYNOPSIS**

62917 #include &lt;string.h&gt;

62918 int strcmp(const char \*s1, const char \*s2);

62919 **DESCRIPTION**

62920 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 62921 conflict between the requirements described here and the ISO C standard is unintentional. This  
 62922 volume of POSIX.1-2008 defers to the ISO C standard.

62923 The *strcmp()* function shall compare the string pointed to by *s1* to the string pointed to by *s2*.

62924 The sign of a non-zero return value shall be determined by the sign of the difference between the  
 62925 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings  
 62926 being compared.

62927 **RETURN VALUE**

62928 Upon completion, *strcmp()* shall return an integer greater than, equal to, or less than 0, if the  
 62929 string pointed to by *s1* is greater than, equal to, or less than the string pointed to by *s2*,  
 62930 respectively.

62931 **ERRORS**

62932 No errors are defined.

62933 **EXAMPLES**62934 **Checking a Password Entry**

62935 The following example compares the information read from standard input to the value of the  
 62936 name of the user entry. If the *strcmp()* function returns 0 (indicating a match), a further check  
 62937 will be made to see if the user entered the proper old password. The *crypt()* function shall  
 62938 encrypt the old password entered by the user, using the value of the encrypted password in the  
 62939 **passwd** structure as the salt. If this value matches the value of the encrypted **passwd** in the  
 62940 structure, the entered password *oldpasswd* is the correct user's password. Finally, the program  
 62941 encrypts the new password so that it can store the information in the **passwd** structure.

```

62942 #include <string.h>
62943 #include <unistd.h>
62944 #include <stdio.h>
62945 ...
62946 int valid_change;
62947 struct passwd *p;
62948 char user[100];
62949 char oldpasswd[100];
62950 char newpasswd[100];
62951 char savepasswd[100];
62952 ...
62953 if (strcmp(p->pw_name, user) == 0) {
62954     if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
62955         strcpy(savepasswd, crypt(newpasswd, user));
62956         p->pw_passwd = savepasswd;
62957         valid_change = 1;
62958     }
62959     else {

```

**strcmp()**

```
62960         fprintf(stderr, "Old password is not valid\n");
62961     }
62962 }
62963 ...

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

62977 **NAME**62978 `strcoll, strcoll_l` — string comparison using collating information62979 **SYNOPSIS**

```
62980 #include <string.h>
62981 int strcoll(const char *s1, const char *s2);
62982 CX int strcoll_l(const char *s1, const char *s2,
62983 locale_t locale);
```

62984 **DESCRIPTION**

62985 CX For `strcoll()`: The functionality described on this reference page is aligned with the ISO C  
 62986 standard. Any conflict between the requirements described here and the ISO C standard is  
 62987 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

62988 CX The `strcoll()` and `strcoll_l()` functions shall compare the string pointed to by `s1` to the string  
 62989 pointed to by `s2`, both interpreted as appropriate to the `LC_COLLATE` category of the current  
 62990 locale, or of the locale represented by `locale`, respectively.

62991 CX The `strcoll()` and `strcoll_l()` functions shall not change the setting of `errno` if successful.

62992 Since no return value is reserved to indicate an error, an application wishing to check for error  
 62993 CX situations should set `errno` to 0, then call `strcoll()`, or `strcoll_l()` then check `errno`.

62994 **RETURN VALUE**

62995 Upon successful completion, `strcoll()` shall return an integer greater than, equal to, or less than 0,  
 62996 according to whether the string pointed to by `s1` is greater than, equal to, or less than the string  
 62997 CX pointed to by `s2` when both are interpreted as appropriate to the current locale. On error,  
 62998 `strcoll()` may set `errno`, but no return value is reserved to indicate an error.

62999 Upon successful completion, `strcoll_l()` shall return an integer greater than, equal to, or less than  
 63000 0, according to whether the string pointed to by `s1` is greater than, equal to, or less than the  
 63001 string pointed to by `s2` when both are interpreted as appropriate to the locale represented by  
 63002 `locale`. On error, `strcoll_l()` may set `errno`, but no return value is reserved to indicate an error.

63003 **ERRORS**

63004 These functions may fail if:

63005 CX [EINVAL] The `s1` or `s2` arguments contain characters outside the domain of the collating  
 63006 sequence.

63007 The `strcoll_l()` function may fail if:

63008 CX [EINVAL] `locale` is not a valid locale object handle.

63009 **EXAMPLES**63010 **Comparing Nodes**

63011 The following example uses an application-defined function, `node_compare()`, to compare two  
 63012 nodes based on an alphabetical ordering of the `string` field.

```
63013 #include <string.h>
63014 ...
63015 struct node { /* These are stored in the table. */
63016     char *string;
63017     int length;
63018 };
63019 ...
```

**strcoll()**

```

63020     int node_compare(const void *node1, const void *node2)
63021     {
63022         return strcoll(((const struct node *)node1)->string,
63023                       ((const struct node *)node2)->string);
63024     }
63025     ...

```

**63026 APPLICATION USAGE**

63027 The *strxfrm()* and *strcmp()* functions should be used for sorting large lists.

**63028 RATIONALE**

63029 None.

**63030 FUTURE DIRECTIONS**

63031 None.

**63032 SEE ALSO**

63033 *alphasort()*, *strcmp()*, *strxfrm()*

63034 XBD <*string.h*>

**63035 CHANGE HISTORY**

63036 First released in Issue 3.

**63037 Issue 5**

63038 The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.

**63039 Issue 6**

63040 Extensions beyond the ISO C standard are marked.

63041 The following new requirements on POSIX implementations derive from alignment with the  
 63042 Single UNIX Specification:

- 63043 • The [EINVAL] optional error condition is added.

63044 An example is added.

**63045 Issue 7**

63046 The *strcoll\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
 63047 Set Part 4.

63048 **NAME**

63049            strcpy, strcpy — copy a string and return a pointer to the end of the result

63050 **SYNOPSIS**

63051            #include &lt;string.h&gt;

63052 CX         char \*stpcpy(char \*restrict s1, const char \*restrict s2);

63053            char \*strcpy(char \*restrict s1, const char \*restrict s2);

63054 **DESCRIPTION**63055 CX         For *strcpy()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.63058 CX         The *stpcpy()* and *strcpy()* functions shall copy the string pointed to by *s2* (including the terminating NUL character) into the array pointed to by *s1*.

63060            If copying takes place between objects that overlap, the behavior is undefined.

63061 **RETURN VALUE**63062 CX         The *stpcpy()* function shall return a pointer to the terminating NUL character copied into the *s1* buffer.63064            The *strcpy()* function shall return *s1*.

63065            No return values are reserved to indicate an error.

63066 **ERRORS**

63067            No errors are defined.

63068 **EXAMPLES**63069            **Construction of a Multi-Part Message in a Single Buffer**

63070            #include &lt;string.h&gt;

63071            #include &lt;stdio.h&gt;

63072            int

63073            main (void)

63074            {

63075                 char buffer [10];

63076                 char \*name = buffer;

63077                 name = stpcpy (stpcpy (stpcpy (name, "ice"), "-"), "cream");

63078                 puts (buffer);

63079                 return 0;

63080            }

63081 **Initializing a String**63082            The following example copies the string "-----" into the *permstring* variable.

63083            #include &lt;string.h&gt;

63084            ...

63085            static char permstring[11];

63086            ...

63087            strcpy(permstring, "-----");

63088            ...

**strcpy()**63089 **Storing a Key and Data**

63090 The following example allocates space for a key using *malloc()* then uses *strcpy()* to place the  
 63091 key there. Then it allocates space for data using *malloc()*, and uses *strcpy()* to place data there.  
 63092 (The user-defined function *dbfree()* frees memory previously allocated to an array of type **struct**  
 63093 **element** \*.)

```

63094 #include <string.h>
63095 #include <stdlib.h>
63096 #include <stdio.h>
63097 ...
63098 /* Structure used to read data and store it. */
63099 struct element {
63100     char *key;
63101     char *data;
63102 };
63103
63104 struct element *tbl, *curtbl;
63105 char *key, *data;
63106 int count;
63107 ...
63108 void dbfree(struct element *, int);
63109 ...
63110 if ((curtbl->key = malloc(strlen(key) + 1)) == NULL) {
63111     perror("malloc"); dbfree(tbl, count); return NULL;
63112 }
63113 strcpy(curtbl->key, key);
63114
63115 if ((curtbl->data = malloc(strlen(data) + 1)) == NULL) {
63116     perror("malloc"); free(curtbl->key); dbfree(tbl, count); return NULL;
63117 }
63118 strcpy(curtbl->data, data);
63119 ...
  
```

63118 **APPLICATION USAGE**

63119 Character movement is performed differently in different implementations. Thus, overlapping  
 63120 moves may yield surprises.

63121 This version is aligned with the ISO C standard; this does not affect compatibility with XPG3  
 63122 applications. Reliable error detection by this function was never guaranteed.

63123 **RATIONALE**

63124 None.

63125 **FUTURE DIRECTIONS**

63126 None.

**strcspn()**63137 **NAME**63138 `strcspn` — get the length of a complementary substring63139 **SYNOPSIS**63140 `#include <string.h>`63141 `size_t strcspn(const char *s1, const char *s2);`63142 **DESCRIPTION**63143 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
63144 conflict between the requirements described here and the ISO C standard is unintentional. This  
63145 volume of POSIX.1-2008 defers to the ISO C standard.63146 The `strcspn()` function shall compute the length (in bytes) of the maximum initial segment of the  
63147 string pointed to by `s1` which consists entirely of bytes *not* from the string pointed to by `s2`.63148 **RETURN VALUE**63149 The `strcspn()` function shall return the length of the computed segment of the string pointed to  
63150 by `s1`; no return value is reserved to indicate an error.63151 **ERRORS**

63152 No errors are defined.

63153 **EXAMPLES**

63154 None.

63155 **APPLICATION USAGE**

63156 None.

63157 **RATIONALE**

63158 None.

63159 **FUTURE DIRECTIONS**

63160 None.

63161 **SEE ALSO**63162 [strspn\(\)](#)63163 XBD [<string.h>](#)63164 **CHANGE HISTORY**

63165 First released in Issue 1. Derived from Issue 1 of the SVID.

63166 **Issue 5**63167 The RETURN VALUE section is updated to indicate that `strcspn()` returns the length of `s1`, and  
63168 not `s1` itself as was previously stated.63169 **Issue 6**63170 The Open Group Corrigendum U030/1 is applied. The text of the RETURN VALUE section is  
63171 updated to indicate that the computed segment length is returned, not the `s1` length.

63172 **NAME**63173            *strdup*, *strndup* — duplicate a specific number of bytes from a string63174 **SYNOPSIS**

```
63175 CX      #include <string.h>
63176          char *strdup(const char *s);
63177          char *strndup(const char *s, size_t size);
```

63178 **DESCRIPTION**

63179            The *strdup*() function shall return a pointer to a new string, which is a duplicate of the string  
 63180            pointed to by *s*. The returned pointer can be passed to *free*(). A null pointer is returned if the  
 63181            new string cannot be created.

63182            The *strndup*() function shall be equivalent to the *strdup*() function, duplicating the provided *s* in  
 63183            a new block of memory allocated as if by using *malloc*(), with the exception being that *strndup*()  
 63184            copies at most *size* plus one bytes into the newly allocated memory, terminating the new string  
 63185            with a NUL character. If the length of *s* is larger than *size*, only *size* bytes shall be duplicated. If  
 63186            *size* is larger than the length of *s*, all bytes in *s* shall be copied into the new memory buffer,  
 63187            including the terminating NUL character. The newly created string shall always be properly  
 63188            terminated.

63189 **RETURN VALUE**

63190            The *strdup*() function shall return a pointer to a new string on success. Otherwise, it shall return  
 63191            a null pointer and set *errno* to indicate the error.

63192            Upon successful completion, the *strndup*() function shall return a pointer to the newly allocated  
 63193            memory containing the duplicated string. Otherwise, it shall return a null pointer and set *errno*  
 63194            to indicate the error.

63195 **ERRORS**

63196            These functions shall fail if:

63197            [ENOMEM]       Storage space available is insufficient.

63198 **EXAMPLES**

63199            None.

63200 **APPLICATION USAGE**

63201            For functions that allocate memory as if by *malloc*(), the application should release such memory  
 63202            when it is no longer required by a call to *free*(). For *strdup*() and *strndup*(), this is the return  
 63203            value.

63204 **RATIONALE**

63205            None.

63206 **FUTURE DIRECTIONS**

63207            None.

63208 **SEE ALSO**

63209            *free*(), *wcsdup*()

63210            XBD <string.h>

63211 **CHANGE HISTORY**

63212            First released in Issue 4, Version 2.

**strdup()**63213 **Issue 5**

63214 Moved from X/OPEN UNIX extension to BASE.

63215 **Issue 7**

63216 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOMEM]  
63217 error to become a “shall fail” error.

63218 The *strdup()* function is moved from the XSI option to the Base.

63219 The *strndup()* function is added from The Open Group Technical Standard, 2006, Extended API  
63220 Set Part 1.

63221 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by  
63222 *malloc()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

63223 **NAME**63224 `strerror, strerror_l, strerror_r` — get error message string63225 **SYNOPSIS**63226 `#include <string.h>`63227 `char *strerror(int errnum);`63228 CX `char *strerror_l(int errnum, locale_t locale);`63229 `int strerror_r(int errnum, char *strerrbuf, size_t buflen);`63230 **DESCRIPTION**63231 CX For `strerror()`: The functionality described on this reference page is aligned with the ISO C  
63232 standard. Any conflict between the requirements described here and the ISO C standard is  
63233 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.63234 The `strerror()` function shall map the error number in `errnum` to a locale-dependent error  
63235 message string and shall return a pointer to it. Typically, the values for `errnum` come from `errno`,  
63236 but `strerror()` shall map any value of type `int` to a message.63237 The string pointed to shall not be modified by the application. The string may be overwritten by  
63238 a subsequent call to `strerror()`.63239 CX The string may be overwritten by a subsequent call to `strerror_l()` in the same thread.63240 The contents of the error message strings returned by `strerror()` should be determined by the  
63241 setting of the `LC_MESSAGES` category in the current locale.63242 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
63243 `strerror()`.63244 CX The `strerror()` and `strerror_l()` functions shall not change the setting of `errno` if successful.63245 Since no return value is reserved to indicate an error, an application wishing to check for error  
63246 situations should set `errno` to 0, then call `strerror()`, then check `errno`.63247 The `strerror()` function need not be thread-safe.63248 The `strerror_l()` function shall map the error number in `errnum` to a locale-dependent error  
63249 message string in the locale represented by `locale` and shall return a pointer to it.63250 The `strerror_r()` function shall map the error number in `errnum` to a locale-dependent error  
63251 message string and shall return the string in the buffer pointed to by `strerrbuf`, with length  
63252 `buflen`.63253 CX If the value of `errnum` is a valid error number, the message string shall indicate what error  
63254 occurred; otherwise, if these functions complete successfully, the message string shall indicate  
63255 that an unknown error occurred.63256 **RETURN VALUE**63257 Upon completion, whether successful or not, `strerror()` shall return a pointer to the generated  
63258 CX message string. On error `errno` may be set, but no return value is reserved to indicate an error.63259 Upon successful completion, `strerror_l()` shall return a pointer to the generated message string. If  
63260 `errnum` is not a valid error number, `errno` may be set to [EINVAL], but a pointer to a message  
63261 string shall still be returned. If any other error occurs, `errno` shall be set to indicate the error and  
63262 a null pointer shall be returned.63263 Upon successful completion, `strerror_r()` shall return 0. Otherwise, an error number shall be  
63264 returned to indicate the error.

**strerror()**63265 **ERRORS**

63266 These functions may fail if:

63267 CX [EINVAL] The value of *errnum* is not a valid error number.63268 The *strerror\_l()* function may fail if:63269 CX [EINVAL] The *locale* argument is not a valid locale object handle.63270 The *strerror\_r()* function may fail if:63271 CX [ERANGE] Insufficient storage was supplied via *strrdbuf* and *buflen* to contain the  
63272 generated message string.63273 **EXAMPLES**

63274 None.

63275 **APPLICATION USAGE**63276 Historically in some implementations, calls to *perror()* would overwrite the string that the  
63277 pointer returned by *strerror()* points to. Such implementations did not conform to the ISO C  
63278 standard; however, application developers should be aware of this behavior if they wish their  
63279 applications to be portable to such implementations.63280 **RATIONALE**63281 The *strerror\_l()* function is required to be thread-safe, thereby eliminating the need for an  
63282 equivalent to the *strerror\_r()* function.63283 Earlier versions of this standard did not explicitly require that the error message strings returned  
63284 by *strerror()* and *strerror\_r()* provide any information about the error. This version of the  
63285 standard requires a meaningful message for any successful completion.63286 Since no return value is reserved to indicate a *strerror()* error, but all calls (whether successful or  
63287 not) must return a pointer to a message string, on error *strerror()* can return a pointer to an  
63288 empty string or a pointer to a meaningful string that can be printed.63289 Note that the [EINVAL] error condition is a may fail error. If an invalid error number is supplied  
63290 as the value of *errnum*, applications should be prepared to handle any of the following:63291 1. Error (with no meaningful message): *errno* is set to [EINVAL], the return value is a pointer  
63292 to an empty string.63293 2. Successful completion: *errno* is unchanged and the return value points to a string like  
63294 "unknown error" or "error number xxx" (where *xxx* is the value of *errnum*).63295 3. Combination of #1 and #2: *errno* is set to [EINVAL] and the return value points to a string  
63296 like "unknown error" or "error number xxx" (where *xxx* is the value of *errnum*).63297 Since applications frequently use the return value of *strerror()* as an argument to  
63298 functions like *fprintf()* (without checking the return value) and since applications have no  
63299 way to parse an error message string to determine whether *errnum* represents a valid  
63300 error number, implementations are encouraged to implement #3. Similarly,  
63301 implementations are encouraged to have *strerror\_r()* return [EINVAL] and put a string  
63302 like "unknown error" or "error number xxx" in the buffer pointed to by *strrdbuf*  
63303 when the value of *errnum* is not a valid error number.63304 **FUTURE DIRECTIONS**

63305 None.

63306 **SEE ALSO**63307 *perror()*63308 XBD `<string.h>`63309 **CHANGE HISTORY**

63310 First released in Issue 3.

63311 **Issue 5**63312 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.63313 A note indicating that the *strerror()* function need not be reentrant is added to the  
63314 DESCRIPTION.63315 **Issue 6**

63316 Extensions beyond the ISO C standard are marked.

63317 The following new requirements on POSIX implementations derive from alignment with the  
63318 Single UNIX Specification:

- 63319 • In the RETURN VALUE section, the fact that *errno* may be set is added.
- 63320 • The [EINVAL] optional error condition is added.

63321 The normative text is updated to avoid use of the term “must” for application requirements.

63322 The *strerror\_r()* function is added in response to IEEE PASC Interpretation 1003.1c #39.63323 The *strerror\_r()* function is marked as part of the Thread-Safe Functions option.63324 **Issue 7**

63325 Austin Group Interpretation 1003.1-2001 #072 is applied, updating the ERRORS section.

63326 Austin Group Interpretation 1003.1-2001 #156 is applied.

63327 Austin Group Interpretation 1003.1-2001 #187 is applied, clarifying the behavior when the  
63328 generated error message is an empty string.

63329 SD5-XSH-ERN-191 is applied, updating the APPLICATION USAGE section.

63330 The *strerror\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
63331 Set Part 4.63332 The *strerror\_r()* function is moved from the Thread-Safe Functions option to the Base.

**strfmon()**63333 **NAME**63334 `strfmon, strfmon_l` — convert monetary value to a string63335 **SYNOPSIS**

```
63336 #include <monetary.h>
63337
63337 ssize_t strfmon(char *restrict s, size_t maxsize,
63338               const char *restrict format, ...);
63339
63339 ssize_t strfmon_l(char *restrict s, size_t maxsize,
63340                 locale_t locale, const char *restrict format, ...);
```

63341 **DESCRIPTION**

63342 The `strfmon()` function shall place characters into the array pointed to by `s` as controlled by the  
 63343 string pointed to by `format`. No more than `maxsize` bytes are placed into the array.

63344 The format is a character string, beginning and ending in its initial state, if any, that contains two  
 63345 types of objects: *plain characters*, which are simply copied to the output stream, and *conversion*  
 63346 *specifications*, each of which shall result in the fetching of zero or more arguments which are  
 63347 converted and formatted. The results are undefined if there are insufficient arguments for the  
 63348 format. If the format is exhausted while arguments remain, the excess arguments are simply  
 63349 ignored.

63350 The application shall ensure that a conversion specification consists of the following sequence:

- 63351 • A '%' character
- 63352 • Optional flags
- 63353 • Optional field width
- 63354 • Optional left precision
- 63355 • Optional right precision
- 63356 • A required conversion specifier character that determines the conversion to be performed

63357 The `strfmon_l()` function shall be equivalent to the `strfmon()` function, except that the locale data  
 63358 used is from the locale represented by `locale`.

63359 **Flags**

63360 One or more of the following optional flags can be specified to control the conversion:

63361 `=f` An '=' followed by a single character `f` which is used as the numeric fill character. In  
 63362 order to work with precision or width counts, the fill character shall be a single byte  
 63363 character; if not, the behavior is undefined. The default numeric fill character is the  
 63364 <space>. This flag does not affect field width filling which always uses the <space>.  
 63365 This flag is ignored unless a left precision (see below) is specified.

63366 Do not format the currency amount with grouping characters. The default is to insert  
 63367 the grouping characters if defined for the current locale.

63368 + or ( Specify the style of representing positive and negative currency amounts. Only one of  
 63369 '+' or '(' may be specified. If '+' is specified, the locale's equivalent of '+' and '-'  
 63370 are used (for example, in many locales, the empty string if positive and '-' if  
 63371 negative). If '(' is specified, negative amounts are enclosed within parentheses. If  
 63372 neither flag is specified, the '+' style is used.

63373 ! Suppress the currency symbol from the output conversion.

63374 – Specify the alignment. If this flag is present the result of the conversion is left-justified  
 63375 (padded to the right) rather than right-justified. This flag shall be ignored unless a field  
 63376 width (see below) is specified.

#### 63377 Field Width

63378 *w* A decimal digit string *w* specifying a minimum field width in bytes in which the result  
 63379 of the conversion is right-justified (or left-justified if the flag '*-*' is specified). The  
 63380 default is 0.

#### 63381 Left Precision

63382 *#n* A '*#*' followed by a decimal digit string *n* specifying a maximum number of digits  
 63383 expected to be formatted to the left of the radix character. This option can be used to  
 63384 keep the formatted output from multiple calls to the *strfmon()* function aligned in the  
 63385 same columns. It can also be used to fill unused positions with a special character as in  
 63386 "*\$\*\*\*123.45*". This option causes an amount to be formatted as if it has the number  
 63387 of digits specified by *n*. If more than *n* digit positions are required, this conversion  
 63388 specification is ignored. Digit positions in excess of those actually required are filled  
 63389 with the numeric fill character (see the *=f* flag above).

63390 If grouping has not been suppressed with the '*^*' flag, and it is defined for the current  
 63391 locale, grouping separators are inserted before the fill characters (if any) are added.  
 63392 Grouping separators are not applied to fill characters even if the fill character is a digit.

63393 To ensure alignment, any characters appearing before or after the number in the  
 63394 formatted output such as currency or sign symbols are padded as necessary with  
 63395 *<space>* characters to make their positive and negative formats an equal length.

#### 63396 Right Precision

63397 *.p* A *<period>* followed by a decimal digit string *p* specifying the number of digits after  
 63398 the radix character. If the value of the right precision *p* is 0, no radix character appears.  
 63399 If a right precision is not included, a default specified by the current locale is used. The  
 63400 amount being formatted is rounded to the specified number of digits prior to  
 63401 formatting.

#### 63402 Conversion Specifier Characters

63403 The conversion specifier characters and their meanings are:

63404 *i* The **double** argument is formatted according to the locale's international currency  
 63405 format (for example, in the US: USD 1,234.56). If the argument is  $\pm\text{Inf}$  or NaN, the result  
 63406 of the conversion is unspecified.

63407 *n* The **double** argument is formatted according to the locale's national currency format  
 63408 (for example, in the US: \$1,234.56). If the argument is  $\pm\text{Inf}$  or NaN, the result of the  
 63409 conversion is unspecified.

63410 *%* Convert to a '*%*'; no argument is converted. The entire conversion specification shall  
 63411 be *%%*.

**strfmon()**63412 **Locale Information**

63413 The *LC\_MONETARY* category of the locale of the process affects the behavior of this function  
 63414 including the monetary radix character (which may be different from the numeric radix  
 63415 character affected by the *LC\_NUMERIC* category), the grouping separator, the currency symbols,  
 63416 and formats. The international currency symbol should be conformant with the ISO 4217:2001  
 63417 standard.

63418 If the value of *maxsize* is greater than {SSIZE\_MAX}, the result is implementation-defined.

63419 **RETURN VALUE**

63420 If the total number of resulting bytes including the terminating null byte is not more than  
 63421 *maxsize*, these functions shall return the number of bytes placed into the array pointed to by *s*,  
 63422 not including the terminating NUL character. Otherwise, -1 shall be returned, the contents of the  
 63423 array are unspecified, and *errno* shall be set to indicate the error.

63424 **ERRORS**

63425 These functions shall fail if:

63426 [E2BIG] Conversion stopped due to lack of space in the buffer.

63427 The *strfmon\_l()* function may fail if:

63428 [EINVAL] *locale* is not a valid locale object.

63429 **EXAMPLES**

63430 Given a locale for the US and the values 123.45, -123.45, and 3456.781, the following output  
 63431 might be produced. Square brackets (" [ ] ") are used in this example to delimit the output.

63432	%n	[\$123.45]	Default formatting
63433		[-\$123.45]	
63434		[\$3,456.78]	
63435	%11n	[ \$123.45]	Right align within an 11-character field
63436		[-\$123.45]	
63437		[ \$3,456.78]	
63438	##5n	[ \$ 123.45]	Aligned columns for values up to 99999
63439		[-\$ 123.45]	
63440		[ \$ 3,456.78]	
63441	=%*#5n	[ \$***123.45]	Specify a fill character
63442		[-\$***123.45]	
63443		[ \$*3,456.78]	
63444	=%0#5n	[ \$000123.45]	Fill characters do not use grouping
63445		[-\$000123.45]	even if the fill character is a digit
63446		[ \$03,456.78]	
63447	%^#5n	[ \$ 123.45]	Disable the grouping separator
63448		[-\$ 123.45]	
63449		[ \$ 3456.78]	
63450	%^#5.0n	[ \$ 123]	Round off to whole units
63451		[-\$ 123]	
63452		[ \$ 3457]	
63453	%^#5.4n	[ \$ 123.4500]	Increase the precision
63454		[-\$ 123.4500]	
63455		[ \$ 3456.7810]	

63456	% (#5n	[ \$ 123.45 ]	Use an alternative pos/neg style
63457		[ (\$ 123.45) ]	
63458		[ \$ 3,456.78 ]	
63459	%! (#5n	[ 123.45 ]	Disable the currency symbol
63460		[ ( 123.45) ]	
63461		[ 3,456.78 ]	
63462	%-14#5.4n	[ \$ 123.4500 ]	Left-justify the output
63463		[-\$ 123.4500 ]	
63464		[ \$ 3,456.7810 ]	
63465	%14#5.4n	[ \$ 123.4500 ]	Corresponding right-justified output
63466		[ -\$ 123.4500 ]	
63467		[ \$ 3,456.7810 ]	

63468 See also the EXAMPLES section in *fprintf()*.

#### 63469 APPLICATION USAGE

63470 None.

#### 63471 RATIONALE

63472 None.

#### 63473 FUTURE DIRECTIONS

63474 Lowercase conversion characters are reserved for future standards use and uppercase for  
63475 implementation-defined use.

#### 63476 SEE ALSO

63477 *fprintf()*, *localeconv()*

63478 XBD <monetary.h>

#### 63479 CHANGE HISTORY

63480 First released in Issue 4.

#### 63481 Issue 5

63482 Moved from ENHANCED I18N to BASE.

63483 The [ENOSYS] error is removed.

63484 Text is added to the DESCRIPTION warning about values of *maxsize* that are greater than  
63485 {SSIZE\_MAX}.

#### 63486 Issue 6

63487 The normative text is updated to avoid use of the term “must” for application requirements.

63488 The **restrict** keyword is added to the *strfmon()* prototype for alignment with the  
63489 ISO/IEC 9899:1999 standard.

63490 The EXAMPLES section is reworked, clarifying the output format.

#### 63491 Issue 7

63492 SD5-XSH-ERN-29 is applied, updating the examples for % (#5n and %! (#5n.

63493 SD5-XSH-ERN-233 is applied, changing the definition of the '+' or '(' flags to refer to  
63494 multiple locales.

63495 The *strfmon()* function is moved from the XSI option to the Base.

## strfmon()

63496  
63497

The *strfmon\_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

63498 **NAME**63499 `strftime, strftime_l` — convert date and time to a string63500 **SYNOPSIS**

```
63501 #include <time.h>
63502 size_t strftime(char *restrict s, size_t maxsize,
63503               const char *restrict format, const struct tm *restrict timeptr);
63504 CX size_t strftime_l(char *restrict s, size_t maxsize,
63505                  const char *restrict format, const struct tm *restrict timeptr,
63506                  locale_t locale);
```

63507 **DESCRIPTION**

63508 CX For `strftime()`: The functionality described on this reference page is aligned with the ISO C  
 63509 standard. Any conflict between the requirements described here and the ISO C standard is  
 63510 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

63511 The `strftime()` function shall place bytes into the array pointed to by `s` as controlled by the string  
 63512 pointed to by `format`. The format is a character string, beginning and ending in its initial shift  
 63513 state, if any. The format string consists of zero or more conversion specifications and ordinary  
 63514 characters.

63515 Each conversion specification is introduced by the `'%'` character after which the following  
 63516 appear in sequence:

- 63517 CX
- An optional flag:
    - 63518 0 The zero character (`'0'`), which specifies that the character used as the padding
    - 63519 character is `'0'`,
    - 63520 + The `<plus-sign>` character (`'+'`), which specifies that the character used as the
    - 63521 padding character is `'0'`, and that if and only if the field being produced consumes
    - 63522 more than four bytes to represent a year (for `%F`, `%G`, or `%Y`) or more than two bytes to
    - 63523 represent the year divided by 100 (for `%C`) then a leading `<plus-sign>` character shall
    - 63524 be included if the year being processed is greater than or equal to zero or a leading
    - 63525 minus-sign character (`'-'`) shall be included if the year is less than zero.

63526 The default padding character is unspecified.

- An optional minimum field width. If the converted value, including any leading `'+'` or  
 63527 `'-'` sign, has fewer bytes than the minimum field width and the padding character is not  
 63528 the NUL character, the output shall be padded on the left (after any leading `'+'` or `'-'`  
 63529 sign) with the padding character.
- An optional `E` or `O` modifier.
- A terminating conversion specifier character that indicates the type of conversion to be  
 63532 applied.

63534 CX The results are unspecified if more than one flag character is specified, a flag character is  
 63535 specified without a minimum field width; a minimum field width is specified without a flag  
 63536 character; a modifier is specified with a flag or with a minimum field width; or if a minimum  
 63537 field width is specified for any conversion specifier other than `C`, `F`, `G`, or `Y`.

63538 All ordinary characters (including the terminating NUL character) are copied unchanged into  
 63539 the array. If copying takes place between objects that overlap, the behavior is undefined. No  
 63540 more than `maxsize` bytes are placed into the array. Each conversion specifier is replaced by  
 63541 appropriate characters as described in the following list. The appropriate characters are

**strftime()**

- 63542 determined using the *LC\_TIME* category of the current locale and by the values of zero or more  
 63543 members of the broken-down time structure pointed to by *timeptr*, as specified in brackets in the  
 63544 description. If any of the specified values are outside the normal range, the characters stored are  
 63545 unspecified.
- 63546 CX The *strftime\_l()* function shall be equivalent to the *strftime()* function, except that the locale data  
 63547 used is from the locale represented by *locale*.
- 63548 Local timezone information is used as though *strftime()* called *tzset()*.
- 63549 The following conversion specifiers shall be supported:
- 63550 a Replaced by the locale's abbreviated weekday name. [*tm\_wday*]
- 63551 A Replaced by the locale's full weekday name. [*tm\_wday*]
- 63552 b Replaced by the locale's abbreviated month name. [*tm\_mon*]
- 63553 B Replaced by the locale's full month name. [*tm\_mon*]
- 63554 c Replaced by the locale's appropriate date and time representation. (See the Base  
 63555 Definitions volume of POSIX.1-2008, <**time.h**>.)
- 63556 C Replaced by the year divided by 100 and truncated to an integer, as a decimal number.  
 63557 [*tm\_year*]
- 63558 If a minimum field width is not specified, the number of characters placed into the  
 63559 array pointed to by *s* will be the number of digits in the year divided by 100 or two,  
 63560 CX whichever is greater. If a minimum field width is specified, the number of characters  
 63561 placed into the array pointed to by *s* will be the number of digits in the year divided by  
 63562 100 or the minimum field width, whichever is greater.
- 63563 d Replaced by the day of the month as a decimal number [01,31]. [*tm\_mday*]
- 63564 D Equivalent to %m/%d/%y. [*tm\_mon, tm\_mday, tm\_year*]
- 63565 e Replaced by the day of the month as a decimal number [1,31]; a single digit is preceded  
 63566 by a space. [*tm\_mday*]
- 63567 CX F Equivalent to %+4Y-%m-%d if no flag and no minimum field width are specified.  
 63568 [*tm\_year, tm\_mon, tm\_mday*]
- 63569 CX If a minimum field width of *x* is specified, the year shall be output as if by the *Y*  
 63570 specifier (described below) with whatever flag was given and a minimum field width  
 63571 of *x*-6. If *x* is less than 6, the behavior shall be as if *x* equalled 6.
- 63572 If the minimum field width is specified to be 10, and the year is four digits long, then  
 63573 the output string produced will match the ISO 8601:2004 standard subclause 4.1.2.2  
 63574 complete representation, extended format date representation of a specific day. If a +  
 63575 flag is specified, a minimum field width of *x* is specified, and *x*-7 bytes are sufficient to  
 63576 hold the digits of the year (not including any needed sign character), then the output  
 63577 will match the ISO 8601:2004 standard subclause 4.1.2.4 complete representation,  
 63578 expanded format date representation of a specific day.
- 63579 g Replaced by the last 2 digits of the week-based year (see below) as a decimal number  
 63580 [00,99]. [*tm\_year, tm\_wday, tm\_yday*]
- 63581 G Replaced by the week-based year (see below) as a decimal number (for example, 1977).  
 63582 [*tm\_year, tm\_wday, tm\_yday*]

63583	CX	If a minimum field width is specified, the number of characters placed into the array pointed to by <i>s</i> will be the number of digits and leading sign characters (if any) in the year, or the minimum field width, whichever is greater.
63584		
63585		
63586	h	Equivalent to %b. [ <i>tm_mon</i> ]
63587	H	Replaced by the hour (24-hour clock) as a decimal number [00,23]. [ <i>tm_hour</i> ]
63588	I	Replaced by the hour (12-hour clock) as a decimal number [01,12]. [ <i>tm_hour</i> ]
63589	j	Replaced by the day of the year as a decimal number [001,366]. [ <i>tm_yday</i> ]
63590	m	Replaced by the month as a decimal number [01,12]. [ <i>tm_mon</i> ]
63591	M	Replaced by the minute as a decimal number [00,59]. [ <i>tm_min</i> ]
63592	n	Replaced by a <newline>.
63593	p	Replaced by the locale's equivalent of either a.m. or p.m. [ <i>tm_hour</i> ]
63594	CX	Replaced by the time in a.m. and p.m. notation; in the POSIX locale this shall be equivalent to %I:%M:%S %p. [ <i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i> ]
63595		
63596	R	Replaced by the time in 24-hour notation (%H:%M). [ <i>tm_hour</i> , <i>tm_min</i> ]
63597	S	Replaced by the second as a decimal number [00,60]. [ <i>tm_sec</i> ]
63598	t	Replaced by a <tab>.
63599	T	Replaced by the time (%H:%M:%S). [ <i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i> ]
63600	u	Replaced by the weekday as a decimal number [1,7], with 1 representing Monday. [ <i>tm_wday</i> ]
63601		
63602	U	Replaced by the week number of the year as a decimal number [00,53]. The first Sunday of January is the first day of week 1; days in the new year before this are in week 0. [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]
63603		
63604		
63605	V	Replaced by the week number of the year (Monday as the first day of the week) as a decimal number [01,53]. If the week containing 1 January has four or more days in the new year, then it is considered week 1. Otherwise, it is the last week of the previous year, and the next week is week 1. Both January 4th and the first Thursday of January are always in week 1. [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]
63606		
63607		
63608		
63609		
63610	w	Replaced by the weekday as a decimal number [0,6], with 0 representing Sunday. [ <i>tm_wday</i> ]
63611		
63612	W	Replaced by the week number of the year as a decimal number [00,53]. The first Monday of January is the first day of week 1; days in the new year before this are in week 0. [ <i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i> ]
63613		
63614		
63615	x	Replaced by the locale's appropriate date representation. (See the Base Definitions volume of POSIX.1-2008, <time.h>.)
63616		
63617	X	Replaced by the locale's appropriate time representation. (See the Base Definitions volume of POSIX.1-2008, <time.h>.)
63618		
63619	y	Replaced by the last two digits of the year as a decimal number [00,99]. [ <i>tm_year</i> ]
63620	Y	Replaced by the year as a decimal number (for example, 1997). [ <i>tm_year</i> ]
63621	CX	If a minimum field width is specified, the number of characters placed into the array pointed to by <i>s</i> will be the number of digits and leading sign characters (if any) in the
63622		

**strftime()**

63623		year, or the minimum field width, whichever is greater.
63624	z	Replaced by the offset from UTC in the ISO 8601:2004 standard format (+hhmm or -hhmm), or by no characters if no timezone is determinable. For example, "-0430" means 4 hours 30 minutes behind UTC (west of Greenwich). If <i>tm_isdst</i> is zero, the standard time offset is used. If <i>tm_isdst</i> is greater than zero, the daylight savings time offset is used. If <i>tm_isdst</i> is negative, no characters are returned. [ <i>tm_isdst</i> ]
63625		
63626	CX	
63627		
63628		
63629	Z	Replaced by the timezone name or abbreviation, or by no bytes if no timezone information exists. [ <i>tm_isdst</i> ]
63630		
63631	%	Replaced by %.
63632		If a conversion specification does not correspond to any of the above, the behavior is undefined.
63633	CX	If a <b>struct tm</b> broken-down time structure is created by <i>localtime()</i> or <i>localtime_r()</i> , or modified by <i>mktime()</i> , and the value of <i>TZ</i> is subsequently modified, the results of the %Z and %z <i>strftime()</i> conversion specifiers are undefined, when <i>strftime()</i> is called with such a broken-down time structure.
63634		
63635		
63636		
63637		If a <b>struct tm</b> broken-down time structure is created or modified by <i>gmtime()</i> or <i>gmtime_r()</i> , it is unspecified whether the result of the %Z and %z conversion specifiers shall refer to UTC or the current local timezone, when <i>strftime()</i> is called with such a broken-down time structure.
63638		
63639		
63640		<b>Modified Conversion Specifiers</b>
63641		Some conversion specifiers can be modified by the E or O modifier characters to indicate that an alternative format or specification should be used rather than the one normally used by the unmodified conversion specifier. If the alternative format or specification does not exist for the current locale (see ERA in XBD Section 7.3.5, on page 158), the behavior shall be as if the unmodified conversion specification were used.
63642		
63643		
63644		
63645		
63646	%Ec	Replaced by the locale's alternative appropriate date and time representation.
63647	%EC	Replaced by the name of the base year (period) in the locale's alternative representation.
63648		
63649	%Ex	Replaced by the locale's alternative date representation.
63650	%EX	Replaced by the locale's alternative time representation.
63651	%Ey	Replaced by the offset from %EC (year only) in the locale's alternative representation.
63652	%EY	Replaced by the full alternative year representation.
63653	%Od	Replaced by the day of the month, using the locale's alternative numeric symbols, filled as needed with leading zeros if there is any alternative symbol for zero; otherwise, with leading <space> characters.
63654		
63655		
63656	%Oe	Replaced by the day of the month, using the locale's alternative numeric symbols, filled as needed with leading <space> characters.
63657		
63658	%OH	Replaced by the hour (24-hour clock) using the locale's alternative numeric symbols.
63659	%OI	Replaced by the hour (12-hour clock) using the locale's alternative numeric symbols.
63660	%Om	Replaced by the month using the locale's alternative numeric symbols.
63661	%OM	Replaced by the minutes using the locale's alternative numeric symbols.

63662	%OS	Replaced by the seconds using the locale's alternative numeric symbols.
63663	%Ou	Replaced by the weekday as a number in the locale's alternative representation (Monday=1).
63664		
63665	%OU	Replaced by the week number of the year (Sunday as the first day of the week, rules corresponding to %U) using the locale's alternative numeric symbols.
63666		
63667	%OV	Replaced by the week number of the year (Monday as the first day of the week, rules corresponding to %V) using the locale's alternative numeric symbols.
63668		
63669	%Ow	Replaced by the number of the weekday (Sunday=0) using the locale's alternative numeric symbols.
63670		
63671	%OW	Replaced by the week number of the year (Monday as the first day of the week) using the locale's alternative numeric symbols.
63672		
63673	%Oy	Replaced by the year (offset from %C) using the locale's alternative numeric symbols.
63674	%g, %G, and %V	give values according to the ISO 8601:2004 standard week-based year. In this system, weeks begin on a Monday and week 1 of the year is the week that includes January 4th, which is also the week that includes the first Thursday of the year, and is also the first week that contains at least four days in the year. If the first Monday of January is the 2nd, 3rd, or 4th, the preceding days are part of the last week of the preceding year; thus, for Saturday 2nd January 1999, %G is replaced by 1998 and %V is replaced by 53. If December 29th, 30th, or 31st is a Monday, it and any following days are part of week 1 of the following year. Thus, for Tuesday 30th December 1997, %G is replaced by 1998 and %V is replaced by 01.
63675		
63676		
63677		
63678		
63679		
63680		
63681		
63682		If a conversion specifier is not one of the above, the behavior is undefined.

**63683 RETURN VALUE**

63684 If the total number of resulting bytes including the terminating null byte is not more than  
 63685 *maxsize*, these functions shall return the number of bytes placed into the array pointed to by *s*,  
 63686 not including the terminating NUL character. Otherwise, 0 shall be returned and the contents of  
 63687 the array are unspecified.

**63688 ERRORS**

63689 The *strftime\_l()* function may fail if:

63690 CX [EINVAL] *locale* is not a valid locale object handle.

**63691 EXAMPLES****63692 Getting a Localized Date String**

63693 The following example first sets the locale to the user's default. The locale information will be  
 63694 used in the *nl\_langinfo()* and *strftime()* functions. The *nl\_langinfo()* function returns the localized  
 63695 date string which specifies how the date is laid out. The *strftime()* function takes this  
 63696 information and, using the **tm** structure for values, places the date and time information into  
 63697 *datestring*.

```
63698 #include <time.h>
63699 #include <locale.h>
63700 #include <langinfo.h>
63701 ...
63702 struct tm *tm;
63703 char datestring[256];
63704 ...
63705 setlocale (LC_ALL, "");
```

**strftime()**

```
63706     ...
63707     strftime (datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
63708     ...
```

**63709 APPLICATION USAGE**

63710 The range of values for %S is [00,60] rather than [00,59] to allow for the occasional leap second.

63711 Some of the conversion specifications are duplicates of others. They are included for  
63712 compatibility with *nl\_cxtime()* and *nl\_ascxtime()*, which were published in Issue 2.

63713 The %C, %F, %G, and %Y format specifiers in *strftime()* always print full values, but the *strptime()*  
63714 %C, %F, and %Y format specifiers only scan two digits (assumed to be the first two digits of a  
63715 four-digit year) for %C and four digits (assumed to be the entire (four-digit) year) for %F and %Y.  
63716 This mimics the behavior of *printf()* and *scanf()*; that is:

```
63717 printf("%2d", x = 1000);
```

63718 prints "1000", but:

```
63719 scanf("%2d", &x);
```

63720 when given "1000" as input will only store 10 in *x*). Applications using extended ranges of  
63721 years must be sure that the number of digits specified for scanning years with *strptime()* matches  
63722 the number of digits that will actually be present in the input stream. Historic implementations  
63723 of the %Y conversion specification (with no flags and no minimum field width) produced  
63724 different output formats. Some always produced at least four digits (with 0 fill for years from 0  
63725 through 999) while others only produced the number of digits present in the year (with no fill  
63726 and no padding). These two forms can be produced with the '0' flag and a minimum field  
63727 width options using the conversions specifications %04Y and %01Y, respectively.

63728 In the past, the C and POSIX standards specified that %F produced an ISO 8601:2004 standard  
63729 date format, but didn't specify which one. For years in the range [0001,9999], POSIX.1-2008  
63730 requires that the output produced match the ISO 8601:2004 standard complete representation  
63731 extended format (YYYY-MM-DD) and for years outside of this range produce output that  
63732 matches the ISO 8601:2004 standard expanded representation extended format  
63733 (<+/-><Underline>Y</Underline>YYYY-MM-DD). To fully meet ISO 8601:2004 standard  
63734 requirements, the producer and consumer must agree on a date format that has a specific  
63735 number of bytes reserved to hold the characters used to represent the years that is sufficiently  
63736 large to hold all values that will be shared. For example, the %+13F conversion specification will  
63737 produce output matching the format "<+/->YYYYYY-MM-DD" (a leading '+' or '-' sign; a six-  
63738 digit, 0-filled year; a '-' ; a two-digit, leading 0-filled month; another '-' ; and the two-digit,  
63739 leading 0-filled day within the month).

63740 Note that if the year being printed is greater than 9999, the resulting string from the unadorned  
63741 %F conversion specifications will not conform to the ISO 8601:2004 standard extended format,  
63742 complete representation for a date and will instead be an extended format, expanded  
63743 representation (presumably without the required agreement between the date's producer and  
63744 consumer).

63745 In the C locale, the E and O modifiers are ignored and the replacement strings for the following  
63746 specifiers are:

- |       |    |  |
|-------|----|--|
| 63747 | %a | The first three characters of %A.        |
| 63748 | %A | One of Sunday, Monday, . . . , Saturday. |

63749	%b	The first three characters of %B.
63750	%B	One of January, February, . . . , December.
63751	%c	Equivalent to %a %b %e %T %Y.
63752	%p	One of AM or PM.
63753	%r	Equivalent to %I:%M:%S %p.
63754	%x	Equivalent to %m/%d/%y.
63755	%X	Equivalent to %T.
63756	%Z	Implementation-defined.

#### 63757 RATIONALE

63758 The %Y conversion specification to *strptime()* was frequently assumed to be a four-digit year, but  
 63759 the ISO C standard does not specify that %Y is restricted to any subset of allowed values from the  
 63760 *tm\_year* field. Similarly, the %C conversion specification was assumed to be a two-digit field and  
 63761 the first part of the output from the %F conversion specification was assumed to be a four-digit  
 63762 field. With *tm\_year* being a signed 32 or more-bit **int** and with many current implementations  
 63763 supporting 64-bit **time\_t** types in one or more programming environments, these assumptions  
 63764 are clearly wrong.

63765 POSIX.1-2008 now allows the format specifications %0xC, %0xF, %0xG, and %0xY (where 'x' is  
 63766 a string of decimal digits used to specify printing and scanning of a string of x decimal digits)  
 63767 with leading zero fill characters. Allowing applications to set the field width enables them to  
 63768 agree on the number of digits to be printed and scanned in the ISO 8601:2004 standard  
 63769 expanded representation of a year (for %F, %G, and %Y) or all but the last two digits of the year  
 63770 (for %C). This is based on a feature in some versions of GNU **libc**'s *strptime()*. The GNU version  
 63771 allows specifying space, zero, or no-fill characters in *strptime()* format strings, but does not allow  
 63772 any flags to be specified in *strptime()* format strings. These implementations also allow these  
 63773 flags to be specified for any numeric field. POSIX.1-2008 only requires the zero fill flag ('0') and  
 63774 only requires that it be recognized when processing %C, %F, %G, and %Y specifications when a  
 63775 minimum field width is also specified. The '0' flag is the only flag needed to produce and scan  
 63776 the ISO 8601:2004 standard year fields using the extended format forms. POSIX.1-2008 also  
 63777 allows applications to specify the same flag and field width specifiers to be used in both  
 63778 *strptime()* and *strptime()* format strings for symmetry. Systems may provide other flag characters  
 63779 and may accept flags in conjunction with conversion specifiers other than %C, %F, %G, and %Y;  
 63780 but portable applications cannot depend on such extensions.

63781 POSIX.1-2008 now also allows the format specifications %+xC, %+xF, %+xG, and %+xY (where  
 63782 'x' is a string of decimal digits used to specify printing and scanning of a string of 'x' decimal  
 63783 digits) with leading zero fill characters and a leading '+' sign character if the year being  
 63784 converted is more than four digits or a minimum field width is specified that allows room for  
 63785 more than four digits for the year. This allows date providers and consumers to agree on a  
 63786 specific number of digits to represent a year as required by the ISO 8601:2004 standard  
 63787 expanded representation formats. The expanded representation formats all require the year to  
 63788 begin with a leading '+' or '-' sign. (All of these specifiers can also provide a leading '-'  
 63789 sign for negative years. Since negative years and the year 0 don't fit well with the Gregorian or  
 63790 Julian calendars, the normal ranges of dates start with year 1. The ISO C standard allows *tm\_year*  
 63791 to assume values corresponding to years before year 1, but the use of such years provided  
 63792 unspecified results.)

63793 Some earlier version of this standard specified that applications wanting to use *strptime()* to scan  
 63794 dates and times printed by *strptime()* should provide non-digit characters between fields to

**strftime()**

63795 separate years from months and days. It also supported %F to print and scan the ISO 8601:2004  
 63796 standard extended format, complete representation date for years 1 through 9999 (i.e., YYYY-  
 63797 MM-DD). However, many applications were written to print (using *strftime()*) and scan (using  
 63798 *strptime()*) dates written using the basic format complete representation (four-digit years) and  
 63799 truncated representation (two-digit years) specified by the ISO 8601:2004 standard  
 63800 representation of dates and times which do not have any separation characters between fields.  
 63801 The ISO 8601:2004 standard also specifies basic format expanded representation where the  
 63802 creator and consumer of these fields agree beforehand to represent years as leading zero-filled  
 63803 strings of an agreed length of more than four digits to represent a year (again with no separation  
 63804 characters when year, month, and day are all displayed). Applications producing and  
 63805 consuming expanded representations are encouraged to use the '+' flag and an appropriate  
 63806 maximum field width to scan the year including the leading sign. Note that even without the  
 63807 '+' flag, years less than zero may be represented with a leading minus-sign for %F, %G, and %Y  
 63808 conversion specifications. Using negative years results in unspecified behavior.

63809 If a format specification %+xF with the field width x greater than 11 is specified and the width is  
 63810 large enough to display the full year, the output string produced will match the ISO 8601:2004  
 63811 standard subclause 4.1.2.4 expanded representation, extended format date representation for a  
 63812 specific day. (For years in the range [1,99 999], %+12F is sufficient for an agreed five-digit year  
 63813 with a leading sign using the ISO 8601:2004 standard expanded representation, extended format  
 63814 for a specific day "<+/->YYYYY-MM-DD".) Note also that years less than 0 may produce a  
 63815 leading minus-sign ('-') when using %Y or %C whether or not the '0' or '+' flags are used.

63816 The difference between the '0' flag and the '+' flag is whether the leading '+' character will  
 63817 be provided for years >9999 as required for the ISO 8601:2004 standard extended representation  
 63818 format containing a year. For example:

Year	Conversion Specification	<i>strftime()</i> Output	<i>strptime()</i> Scan Back
1970	%Y	1970	1970
1970	%+4Y	1970	1970
27	%Y	27 or 0027	27
270	%Y	270 or 0270	270
270	%+4Y	0270	270
17	%C%y	0017	17
270	%C%y	0270	270
12345	%Y	12345	1234*
12345	%+4Y	+12345	123*
12345	%05%Y	12345	12345
270	%+5Y or %+3C%y	+0270	270
12345	%+5Y or %+3C%y1+12345	1234*	
12345	%06Y or %04C%y	012345	12345
12345	%+6Y or %+4C%y	+12345	12345
123456	%08Y or %06C%y	00123456	123456
123456	%+8Y or %+6C%y	+0123456	123456

63837 In the cases above marked with a \* in the *strptime()* scan back field, the implied or specified  
 63838 number of characters scanned by *strptime()* was less than the number of characters output by  
 63839 *strftime()* using the same format; so the remaining digits of the year were dropped when the  
 63840 output date produced by *strftime()* was scanned back in by *strptime()*.

63841 **FUTURE DIRECTIONS**

63842 None.

63843 **SEE ALSO**63844 *asctime()*, *clock()*, *ctime()*, *difftime()*, *getdate()*, *gmtime()*, *localtime()*, *mktime()*, *strptime()*, *time()*,  
63845 *tzset()*, *uselocale()*, *utime()*63846 XBD Section 7.3.5 (on page 158), [<time.h>](#)63847 **CHANGE HISTORY**

63848 First released in Issue 3.

63849 **Issue 5**63850 The description of %OV is changed to be consistent with %V and defines Monday as the first day  
63851 of the week.

63852 The description of %Oy is clarified.

63853 **Issue 6**

63854 Extensions beyond the ISO C standard are marked.

63855 The Open Group Corrigendum U033/8 is applied. The %V conversion specifier is changed from  
63856 “Otherwise, it is week 53 of the previous year, and the next week is week 1” to “Otherwise, it is  
63857 the last week of the previous year, and the next week is week 1”.63858 The following new requirements on POSIX implementations derive from alignment with the  
63859 Single UNIX Specification:

- 63860
- The %C, %D, %e, %h, %n, %r, %R, %t, and %T conversion specifiers are added.
  - The modified conversion specifiers are added for consistency with the ISO POSIX-2  
63861 standard *date* utility.

63863 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 63864
- The *strptime()* prototype is updated.
  - The DESCRIPTION is extensively revised.
  - The %z conversion specifier is added.

63867 An example is added.

63868 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/60 is applied.

63869 **Issue 7**

63870 Austin Group Interpretation 1003.1-2001 #163 is applied.

63871 The *strptime\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
63872 Set Part 4.

**strlen()**63873 **NAME**63874 `strlen, strlen` — get length of fixed size string63875 **SYNOPSIS**

```
63876 #include <string.h>
63877 size_t strlen(const char *s);
63878 CX size_t strlen(const char *s, size_t maxlen);
```

63879 **DESCRIPTION**

63880 CX For `strlen()`: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

63883 The `strlen()` function shall compute the number of bytes in the string to which `s` points, not including the terminating NUL character.

63885 CX The `strlen()` function shall compute the smaller of the number of bytes in the array to which `s` points, not including the terminating NUL character, or the value of the `maxlen` argument. The `strlen()` function shall never examine more than `maxlen` bytes of the array pointed to by `s`.

63888 **RETURN VALUE**

63889 The `strlen()` function shall return the length of `s`; no return value shall be reserved to indicate an error.

63891 CX The `strlen()` function shall return an integer containing the smaller of either the length of the string pointed to by `s` or `maxlen`.

63893 **ERRORS**

63894 No errors are defined.

63895 **EXAMPLES**63896 **Getting String Lengths**

63897 The following example sets the maximum length of `key` and `data` by using `strlen()` to get the lengths of those strings.

```
63899 #include <string.h>
63900 ...
63901 struct element {
63902     char *key;
63903     char *data;
63904 };
63905 ..
63906 char *key, *data;
63907 int len;

63908 *keylength = *datalength = 0;
63909 ...
63910 if ((len = strlen(key)) > *keylength)
63911     *keylength = len;
63912 if ((len = strlen(data)) > *datalength)
63913     *datalength = len;
63914 ...
```

64008 Extensions beyond the ISO C standard are marked.

64009 **NAME**64010 `stpncpy`, `strncpy` — copy fixed length string, returning a pointer to the array end64011 **SYNOPSIS**64012 `#include <string.h>`64013 CX `char *stpncpy(char *restrict s1, const char *restrict s2, size_t n);`  
64014 `char *strncpy(char *restrict s1, const char *restrict s2, size_t n);`64015 **DESCRIPTION**64016 CX For `strncpy()`: The functionality described on this reference page is aligned with the ISO C  
64017 standard. Any conflict between the requirements described here and the ISO C standard is  
64018 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.64019 CX The `stpncpy()` and `strncpy()` functions shall copy not more than *n* bytes (bytes that follow a NUL  
64020 character are not copied) from the array pointed to by *s2* to the array pointed to by *s1*.64021 If the array pointed to by *s2* is a string that is shorter than *n* bytes, NUL characters shall be  
64022 appended to the copy in the array pointed to by *s1*, until *n* bytes in all are written.

64023 If copying takes place between objects that overlap, the behavior is undefined.

64024 **RETURN VALUE**64025 CX If a NUL character is written to the destination, the `stpncpy()` function shall return the address of  
64026 the first such NUL character. Otherwise, it shall return `&s1[n]`.64027 The `strncpy()` function shall return *s1*.

64028 No return values are reserved to indicate an error.

64029 **ERRORS**

64030 No errors are defined.

64031 **EXAMPLES**

64032 None.

64033 **APPLICATION USAGE**64034 Applications must provide the space in *s1* for the *n* bytes to be transferred, as well as ensure that  
64035 the *s2* and *s1* arrays do not overlap.64036 Character movement is performed differently in different implementations. Thus, overlapping  
64037 moves may yield surprises.64038 If there is no NUL character byte in the first *n* bytes of the array pointed to by *s2*, the result is not  
64039 null-terminated.64040 **RATIONALE**

64041 None.

64042 **FUTURE DIRECTIONS**

64043 None.

64044 **SEE ALSO**64045 `strcpy()`, `wcsncpy()`64046 XBD `<string.h>`64047 **CHANGE HISTORY**

64048 First released in Issue 1. Derived from Issue 1 of the SVID.

**strncpy()**64049 **Issue 6**

64050 The *strncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

64051 **Issue 7**

64052 The *stpncpy()* function is added from The Open Group Technical Standard, 2006, Extended API  
64053 Set Part 1.

64095 **CHANGE HISTORY**

64096 First released in Issue 1. Derived from Issue 1 of the SVID.

**strptime()**64097 **NAME**64098 `strptime` — date and time conversion64099 **SYNOPSIS**

```
64100 XSI #include <time.h>
64101 char *strptime(const char *restrict buf, const char *restrict format,
64102 struct tm *restrict tm);
```

64103 **DESCRIPTION**

64104 The `strptime()` function shall convert the character string pointed to by `buf` to values which are  
 64105 stored in the `tm` structure pointed to by `tm`, using the format specified by `format`.

64106 The format is composed of zero or more directives. Each directive is composed of one of the  
 64107 following: one or more white-space characters (as specified by `isspace()`); an ordinary character  
 64108 (neither `' % '` nor a white-space character); or a conversion specification.

64109 Each conversion specification is introduced by the `' % '` character after which the following  
 64110 appear in sequence:

- 64111 • An optional flag, the zero character (`' 0 '`) or the `<plus-sign>` character (`' + '`), which is  
 64112 ignored.
- 64113 • An optional field width. If a field width is specified, it shall be interpreted as a string of  
 64114 decimal digits that will determine the maximum number of bytes converted for the  
 64115 conversion rather than the number of bytes specified below in the description of the  
 64116 conversion specifiers.
- 64117 • An optional `E` or `O` modifier.
- 64118 • A terminating conversion specifier character that indicates the type of conversion to be  
 64119 applied.

64120 The conversions are determined using the `LC_TIME` category of the current locale. The  
 64121 application shall ensure that there is white-space or other non-alphanumeric characters between  
 64122 any two conversion specifications unless all of the adjacent conversion specifications convert a  
 64123 known, fixed number of characters. In the following list, the maximum number of characters  
 64124 scanned (excluding the one matching the next directive) is as follows:

- 64125 • If a maximum field width is specified, then that number
- 64126 • Otherwise, the pattern "`{x}`" indicates that the maximum is `x`
- 64127 • Otherwise, the pattern "`[x,y]`" indicates that the value shall fall within the range given  
 64128 (both bounds being inclusive), and the maximum number of characters scanned shall be  
 64129 the maximum required to represent any value in the range without leading zeros and  
 64130 without a leading `<plus-sign>`

64131 The following conversion specifiers are supported.

64132 The results are unspecified if a modifier is specified with a flag or with a minimum field width,  
 64133 or if a field width is specified for any conversion specifier other than `C`, `E`, or `Y`.

- 64134 a The day of the week, using the locale's weekday names; either the abbreviated or full  
 64135 name may be specified.
- 64136 A Equivalent to `%a`.

64137	b	The month, using the locale's month names; either the abbreviated or full name may be specified.
64138		
64139	B	Equivalent to %b.
64140	c	Replaced by the locale's appropriate date and time representation.
64141	C	All but the last two digits of the year {2}; leading zeros shall be permitted but shall not be required. A leading '+' or '-' character shall be permitted before any leading zeros but shall not be required.
64142		
64143		
64144	d	The day of the month [01,31]; leading zeros shall be permitted but shall not be required.
64145	D	The date as %m/%d/%y.
64146	e	Equivalent to %d.
64147	h	Equivalent to %b.
64148	H	The hour (24-hour clock) [00,23]; leading zeros shall be permitted but shall not be required.
64149		
64150	I	The hour (12-hour clock) [01,12]; leading zeros shall be permitted but shall not be required.
64151		
64152	j	The day number of the year [001,366]; leading zeros shall be permitted but shall not be required.
64153		
64154	m	The month number [01,12]; leading zeros shall be permitted but shall not be required.
64155	M	The minute [00,59]; leading zeros shall be permitted but shall not be required.
64156	n	Any white space.
64157	p	The locale's equivalent of a.m. or p.m.
64158	r	12-hour clock time using the AM/PM notation if <code>t_fmt_ampm</code> is not an empty string in the <code>LC_TIME</code> portion of the current locale; in the POSIX locale, this shall be equivalent to %I:%M:%S %p.
64159		
64160		
64161	R	The time as %H:%M.
64162	S	The seconds [00,60]; leading zeros shall be permitted but shall not be required.
64163	t	Any white space.
64164	T	The time as %H:%M:%S.
64165	U	The week number of the year (Sunday as the first day of the week) as a decimal number [00,53]; leading zeros shall be permitted but shall not be required.
64166		
64167	w	The weekday as a decimal number [0,6], with 0 representing Sunday.
64168	W	The week number of the year (Monday as the first day of the week) as a decimal number [00,53]; leading zeros shall be permitted but shall not be required.
64169		
64170	x	The date, using the locale's date format.
64171	X	The time, using the locale's time format.
64172	y	The last two digits of the year. When <i>format</i> contains neither a C conversion specifier nor a Y conversion specifier, values in the range [69,99] shall refer to years 1969 to 1999 inclusive and values in the range [00,68] shall refer to years 2000 to 2068 inclusive; leading zeros shall be permitted but shall not be required. A leading '+' or '-'
64173		
64174		
64175		

**strptime()**

- 64176 character shall be permitted before any leading zeros but shall not be required.
- 64177 **Note:** It is expected that in a future version of this standard the default century inferred  
64178 from a 2-digit year will change. (This would apply to all commands accepting a  
64179 2-digit year as input.)
- 64180 **Y** The full year {4}; leading zeros shall be permitted but shall not be required. A leading  
64181 '+' or '-' character shall be permitted before any leading zeros but shall not be  
64182 required.
- 64183 **%** Replaced by %.

**64184 Modified Conversion Specifiers**

64185 Some conversion specifiers can be modified by the **E** and **O** modifier characters to indicate that  
64186 an alternative format or specification should be used rather than the one normally used by the  
64187 unmodified conversion specifier. If the alternative format or specification does not exist in the  
64188 current locale, the behavior shall be as if the unmodified conversion specification were used.

- 64189 **%Ec** The locale's alternative appropriate date and time representation.
- 64190 **%EC** The name of the base year (period) in the locale's alternative representation.
- 64191 **%Ex** The locale's alternative date representation.
- 64192 **%EX** The locale's alternative time representation.
- 64193 **%Ey** The offset from **%EC** (year only) in the locale's alternative representation.
- 64194 **%EY** The full alternative year representation.
- 64195 **%Od** The day of the month using the locale's alternative numeric symbols; leading zeros  
64196 shall be permitted but shall not be required.
- 64197 **%Oe** Equivalent to **%Od**.
- 64198 **%OH** The hour (24-hour clock) using the locale's alternative numeric symbols.
- 64199 **%OI** The hour (12-hour clock) using the locale's alternative numeric symbols.
- 64200 **%Om** The month using the locale's alternative numeric symbols.
- 64201 **%OM** The minutes using the locale's alternative numeric symbols.
- 64202 **%OS** The seconds using the locale's alternative numeric symbols.
- 64203 **%OU** The week number of the year (Sunday as the first day of the week) using the locale's  
64204 alternative numeric symbols.
- 64205 **%Ow** The number of the weekday (Sunday=0) using the locale's alternative numeric  
64206 symbols.
- 64207 **%OW** The week number of the year (Monday as the first day of the week) using the locale's  
64208 alternative numeric symbols.
- 64209 **%Oy** The year (offset from **%C**) using the locale's alternative numeric symbols.

64210 A conversion specification composed of white-space characters is executed by scanning input up  
64211 to the first character that is not white-space (which remains unscanned), or until no more  
64212 characters can be scanned.

64213 A conversion specification that is an ordinary character is executed by scanning the next  
64214 character from the buffer. If the character scanned from the buffer differs from the one  
64215 comprising the directive, the directive fails, and the differing and subsequent characters remain

64216 unscanned.

64217 A series of conversion specifications composed of %n, %t, white-space characters, or any  
64218 combination is executed by scanning up to the first character that is not white space (which  
64219 remains unscanned), or until no more characters can be scanned.

64220 Any other conversion specification is executed by scanning characters until a character matching  
64221 the next directive is scanned, or until no more characters can be scanned. These characters  
64222 except the one matching the next directive, are then compared to the locale values associated  
64223 with the conversion specifier. If a match is found, values for the appropriate **tm** structure  
64224 members are set to values corresponding to the locale information. Case is ignored when  
64225 matching items in *buf* such as month or weekday names. If no match is found, *strptime()* fails  
64226 and no more characters are scanned.

#### 64227 RETURN VALUE

64228 Upon successful completion, *strptime()* shall return a pointer to the character following the last  
64229 character parsed. Otherwise, a null pointer shall be returned.

#### 64230 ERRORS

64231 No errors are defined.

#### 64232 EXAMPLES

##### 64233 Convert a Data-Plus-Time String to Broken-Down Time and Then into Seconds

64234 The following example demonstrates the use of *strptime()* to convert a string into broken-down  
64235 time. The broken-down time is then converted into seconds since the Epoch using *mktime()*.

```
64236 #include <time.h>
64237 ...
64238 struct tm tm;
64239 time_t t;
64240 if (strptime("6 Dec 2004 12:33:45", "%d %b %Y %H:%M:%S", &tm) == NULL)
64241     /* Handle error */;
64242 printf("year: %d; month: %d; day: %d;\n",
64243        tm.tm_year, tm.tm_mon, tm.tm_mday);
64244 printf("hour: %d; minute: %d; second: %d\n",
64245        tm.tm_hour, tm.tm_min, tm.tm_sec);
64246 printf("week day: %d; year day: %d\n", tm.tm_wday, tm.tm_yday);
64247 tm.tm_isdst = -1; /* Not set by strptime(); tells mktime()
64248                  to determine whether daylight saving time
64249                  is in effect */
64250 t = mktime(&tm);
64251 if (t == -1)
64252     /* Handle error */;
64253 printf("seconds since the Epoch: %ld\n", (long) t);"
```

#### 64254 APPLICATION USAGE

64255 Several "equivalent to" formats and the special processing of white-space characters are  
64256 provided in order to ease the use of identical *format* strings for *strptime()* and *strptime()*.

64257 It should be noted that dates constructed by the *strptime()* function with the %Y or %C%y  
64258 conversion specifiers may have values larger than 9999. If the *strptime()* function is used to read  
64259 such values using %C%y or %Y, the year values will be truncated to four digits. Applications

**strptime()**

- 64260 should use `%+w%y` or `%+xY` with *w* and *x* set large enough to contain the full value of any years  
64261 that will be printed or scanned.
- 64262 See also the APPLICATION USAGE section in *strptime()*.
- 64263 It is unspecified whether multiple calls to *strptime()* using the same **tm** structure will update the  
64264 current contents of the structure or overwrite all contents of the structure. Conforming  
64265 applications should make a single call to *strptime()* with a format and all data needed to  
64266 completely specify the date and time being converted.
- 64267 **RATIONALE**
- 64268 See the RATIONALE section for *strptime()*.
- 64269 **FUTURE DIRECTIONS**
- 64270 None.
- 64271 **SEE ALSO**
- 64272 *fprintf()*, *fscanf()*, *strptime()*, *time()*
- 64273 XBD `<time.h>`
- 64274 **CHANGE HISTORY**
- 64275 First released in Issue 4.
- 64276 **Issue 5**
- 64277 Moved from ENHANCED I18N to BASE.
- 64278 The [ENOSYS] error is removed.
- 64279 The exact meaning of the `%y` and `%0y` specifiers is clarified in the DESCRIPTION.
- 64280 **Issue 6**
- 64281 The Open Group Corrigendum U033/5 is applied. The `%r` specifier description is reworded.
- 64282 The normative text is updated to avoid use of the term “must” for application requirements.
- 64283 The **restrict** keyword is added to the *strptime()* prototype for alignment with the  
64284 ISO/IEC 9899:1999 standard.
- 64285 The Open Group Corrigendum U047/2 is applied.
- 64286 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion  
64287 specification” for consistency with *strptime()*.
- 64288 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/133 is applied, adding the example to the  
64289 EXAMPLES section.
- 64290 **Issue 7**
- 64291 Austin Group Interpretation 1003.1-2001 #041 is applied, updating the DESCRIPTION and  
64292 APPLICATION USAGE sections.
- 64293 Austin Group Interpretation 1003.1-2001 #163 is applied.
- 64294 SD5-XSH-ERN-67 is applied, correcting the APPLICATION USAGE to remove the impression  
64295 that `%Y` is 4-digit years.

64296 **NAME**

64297           strrchr — string scanning operation

64298 **SYNOPSIS**

64299           #include &lt;string.h&gt;

64300           char \*strrchr(const char \*s, int c);

64301 **DESCRIPTION**

64302 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 64303 conflict between the requirements described here and the ISO C standard is unintentional. This  
 64304 volume of POSIX.1-2008 defers to the ISO C standard.

64305       The *strrchr()* function shall locate the last occurrence of *c* (converted to a **char**) in the string  
 64306 pointed to by *s*. The terminating NUL character is considered to be part of the string.

64307 **RETURN VALUE**

64308       Upon successful completion, *strrchr()* shall return a pointer to the byte or a null pointer if *c* does  
 64309 not occur in the string.

64310 **ERRORS**

64311       No errors are defined.

64312 **EXAMPLES**64313           **Finding the Base Name of a File**

64314       The following example uses *strrchr()* to get a pointer to the base name of a file. The *strrchr()*  
 64315 function searches backwards through the name of the file to find the last '/' character in *name*.  
 64316 This pointer (plus one) will point to the base name of the file.

```
64317       #include <string.h>
64318       ...
64319       const char *name;
64320       char *basename;
64321       ...
64322       basename = strrchr(name, '/') + 1;
64323       ...
```

64324 **APPLICATION USAGE**

64325       None.

64326 **RATIONALE**

64327       None.

64328 **FUTURE DIRECTIONS**

64329       None.

64330 **SEE ALSO**64331       [strchr\(\)](#)64332       XBD [<string.h>](#)64333 **CHANGE HISTORY**

64334       First released in Issue 1. Derived from Issue 1 of the SVID.

**strsignal()**64335 **NAME**

64336 strsignal — get name of signal

64337 **SYNOPSIS**

```
64338 CX #include <string.h>
64339 char *strsignal(int signum);
```

64340 **DESCRIPTION**

64341 The *strsignal()* function shall map the signal number in *signum* to an implementation-defined string and shall return a pointer to it. It shall use the same set of messages as the *psignal()* function.

64344 The string pointed to shall not be modified by the application, but may be overwritten by a subsequent call to *strsignal()* or *setlocale()*.

64346 The contents of the message strings returned by *strsignal()* should be determined by the setting of the *LC\_MESSAGES* category in the current locale.

64348 The implementation shall behave as if no function defined in this standard calls *strsignal()*.

64349 Since no return value is reserved to indicate an error, an application wishing to check for error situations should set *errno* to 0, then call *strsignal()*, then check *errno*.

64351 The *strsignal()* function need not be thread-safe.

64352 **RETURN VALUE**

64353 Upon successful completion, *strsignal()* shall return a pointer to a string. Otherwise, if *signum* is not a valid signal number, the return value is unspecified.

64355 **ERRORS**

64356 No errors are defined.

64357 **EXAMPLES**

64358 None.

64359 **APPLICATION USAGE**

64360 None.

64361 **RATIONALE**

64362 If *signum* is not a valid signal number, some implementations return NULL, while for others the *strsignal()* function returns a pointer to a string containing an unspecified message denoting an unknown signal. POSIX.1-2008 leaves this return value unspecified.

64365 **FUTURE DIRECTIONS**

64366 None.

64367 **SEE ALSO**

64368 *psiginfo()*, *setlocale()*

64369 XBD <string.h>

64370 **CHANGE HISTORY**

64371 First released in Issue 7.

64372 **NAME**

64373 strspn — get length of a substring

64374 **SYNOPSIS**

64375 #include &lt;string.h&gt;

64376 size\_t strspn(const char \*s1, const char \*s2);

64377 **DESCRIPTION**

64378 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 64379 conflict between the requirements described here and the ISO C standard is unintentional. This  
 64380 volume of POSIX.1-2008 defers to the ISO C standard.

64381 The *strspn()* function shall compute the length (in bytes) of the maximum initial segment of the  
 64382 string pointed to by *s1* which consists entirely of bytes from the string pointed to by *s2*.

64383 **RETURN VALUE**

64384 The *strspn()* function shall return the computed length; no return value is reserved to indicate an  
 64385 error.

64386 **ERRORS**

64387 No errors are defined.

64388 **EXAMPLES**

64389 None.

64390 **APPLICATION USAGE**

64391 None.

64392 **RATIONALE**

64393 None.

64394 **FUTURE DIRECTIONS**

## 64436 NAME

64437 strtod, strtodf, strtold — convert a string to a double-precision number

## 64438 SYNOPSIS

64439 #include &lt;stdlib.h&gt;

64440 double strtod(const char \*restrict *nptr*, char \*\*restrict *endptr*);64441 float strtodf(const char \*restrict *nptr*, char \*\*restrict *endptr*);64442 long double strtold(const char \*restrict *nptr*, char \*\*restrict *endptr*);

## 64443 DESCRIPTION

64444 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 64445 conflict between the requirements described here and the ISO C standard is unintentional. This  
 64446 volume of POSIX.1-2008 defers to the ISO C standard.

64447 These functions shall convert the initial portion of the string pointed to by *nptr* to **double**, **float**,  
 64448 and **long double** representation, respectively. First, they decompose the input string into three  
 64449 parts:

- 64450 1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
- 64451 2. A subject sequence interpreted as a floating-point constant or representing infinity or  
 64452 NaN
- 64453 3. A final string of one or more unrecognized characters, including the terminating NUL  
 64454 character of the input string

64455 Then they shall attempt to convert the subject sequence to a floating-point number, and return  
 64456 the result.

64457 The expected form of the subject sequence is an optional '+' or '-' sign, then one of the  
 64458 following:

- 64459 • A non-empty sequence of decimal digits optionally containing a radix character; then an  
 64460 optional exponent part consisting of the character 'e' or the character 'E', optionally  
 64461 followed by a '+' or '-' character, and then followed by one or more decimal digits
- 64462 • A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix  
 64463 character; then an optional binary exponent part consisting of the character 'p' or the  
 64464 character 'P', optionally followed by a '+' or '-' character, and then followed by one or  
 64465 more decimal digits
- 64466 • One of INF or INFINITY, ignoring case
- 64467 • One of NAN or NAN(*n-char-sequence<sub>opt</sub>*), ignoring case in the NAN part, where:

64468 *n-char-sequence*:

64469 digit

64470 nondigit

64471 *n-char-sequence* digit64472 *n-char-sequence* nondigit

64473 The subject sequence is defined as the longest initial subsequence of the input string, starting  
 64474 with the first non-white-space character, that is of the expected form. The subject sequence  
 64475 contains no characters if the input string is not of the expected form.

64476 If the subject sequence has the expected form for a floating-point number, the sequence of  
 64477 characters starting with the first digit or the decimal-point character (whichever occurs first)  
 64478 shall be interpreted as a floating constant of the C language, except that the radix character shall  
 64479 be used in place of a period, and that if neither an exponent part nor a radix character appears in

**strtod()**

64480 a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal  
 64481 floating-point number, an exponent part of the appropriate type with value zero is assumed to  
 64482 follow the last digit in the string. If the subject sequence begins with a minus-sign, the sequence  
 64483 shall be interpreted as negated. A character sequence INF or INFINITY shall be interpreted as an  
 64484 infinity, if representable in the return type, else as if it were a floating constant that is too large  
 64485 for the range of the return type. A character sequence NAN or NAN(*n-char-sequence<sub>opt</sub>*) shall be  
 64486 interpreted as a quiet NaN, if supported in the return type, else as if it were a subject sequence  
 64487 part that does not have the expected form; the meaning of the *n-char* sequences is  
 64488 implementation-defined. A pointer to the final string is stored in the object pointed to by *endptr*,  
 64489 provided that *endptr* is not a null pointer.

64490 If the subject sequence has the hexadecimal form and FLT\_RADIX is a power of 2, the value  
 64491 resulting from the conversion is correctly rounded.

64492 CX The radix character is defined in the locale of the process (category *LC\_NUMERIC*). In the  
 64493 POSIX locale, or in a locale where the radix character is not defined, the radix character shall  
 64494 default to a <period> ( ' . ' ).

64495 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be  
 64496 accepted.

64497 If the subject sequence is empty or does not have the expected form, no conversion shall be  
 64498 performed; the value of *str* is stored in the object pointed to by *endptr*, provided that *endptr* is not  
 64499 a null pointer.

64500 CX The *strtod()* function shall not change the setting of *errno* if successful.

64501 Since 0 is returned on error and is also a valid return on success, an application wishing to check  
 64502 for error situations should set *errno* to 0, then call *strtod()*, *strtof()*, or *strtold()*, then check *errno*.

**RETURN VALUE**

64504 Upon successful completion, these functions shall return the converted value. If no conversion  
 64505 could be performed, 0 shall be returned, and *errno* may be set to [EINVAL].

64506 If the correct value is outside the range of representable values, ±HUGE\_VAL, ±HUGE\_VALF, or  
 64507 ±HUGE\_VALL shall be returned (according to the sign of the value), and *errno* shall be set to  
 64508 [ERANGE].

64509 If the correct value would cause an underflow, a value whose magnitude is no greater than the  
 64510 smallest normalized positive number in the return type shall be returned and *errno* set to  
 64511 [ERANGE].

**ERRORS**

64512 These functions shall fail if:

64514 CX [ERANGE] The value to be returned would cause overflow or underflow.

64515 These functions may fail if:

64516 CX [EINVAL] No conversion could be performed.

64517 **EXAMPLES**

64518 None.

64519 **APPLICATION USAGE**

64520 If the subject sequence has the hexadecimal form and FLT\_RADIX is not a power of 2, and the  
 64521 result is not exactly representable, the result should be one of the two numbers in the  
 64522 appropriate internal format that are adjacent to the hexadecimal floating source value, with the  
 64523 extra stipulation that the error should have a correct sign for the current rounding direction.

64524 If the subject sequence has the decimal form and at most DECIMAL\_DIG (defined in <float.h>)  
 64525 significant digits, the result should be correctly rounded. If the subject sequence *D* has the  
 64526 decimal form and more than DECIMAL\_DIG significant digits, consider the two bounding,  
 64527 adjacent decimal strings *L* and *U*, both having DECIMAL\_DIG significant digits, such that the  
 64528 values of *L*, *D*, and *U* satisfy  $L \leq D \leq U$ . The result should be one of the (equal or adjacent)  
 64529 values that would be obtained by correctly rounding *L* and *U* according to the current rounding  
 64530 direction, with the extra stipulation that the error with respect to *D* should have a correct sign  
 64531 for the current rounding direction.

64532 The changes to *strtod()* introduced by the ISO/IEC 9899:1999 standard can alter the behavior of  
 64533 well-formed applications complying with the ISO/IEC 9899:1990 standard and thus earlier  
 64534 versions of this standard. One such example would be:

```

64535 int
64536 what_kind_of_number (char *s)
64537 {
64538     char *endp;
64539     double d;
64540     long l;
64541
64542     d = strtod(s, &endp);
64543     if (s != endp && *endp == '\0')
64544         printf("It's a float with value %g\n", d);
64545     else
64546     {
64547         l = strtol(s, &endp, 0);
64548         if (s != endp && *endp == '\0')
64549             printf("It's an integer with value %ld\n", l);
64550         else
64551             return 1;
64552     }
64553     return 0;
64554 }
```

64554 If the function is called with:

64555 `what_kind_of_number ("0x10")`

64556 an ISO/IEC 9899:1990 standard-compliant library will result in the function printing:

64557 `It's an integer with value 16`

64558 With the ISO/IEC 9899:1999 standard, the result is:

64559 `It's a float with value 16`

64560 The change in behavior is due to the inclusion of floating-point numbers in hexadecimal  
 64561 notation without requiring that either a decimal point or the binary exponent be present.

64563 None.

64564 **FUTURE DIRECTIONS**

64565 None.

64566 **SEE ALSO**64567 *fscanf()*, *isspace()*, *localeconv()*, *setlocale()*, *strtol()*64568 XBD Chapter 7 (on page 135), `<float.h>`, `<stdlib.h>`64569 **CHANGE HISTORY**

64570 First released in Issue 1. Derived from Issue 1 of the SVID.

64571 **Issue 5**64572 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.64573 **Issue 6**

64574 Extensions beyond the ISO C standard are marked.

64575 The following new requirements on POSIX implementations derive from alignment with the  
64576 Single UNIX Specification:

- 64577
- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
64578 added if no conversion could be performed.

64579 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 64580
- The *strtod()* function is updated.
  - The *strtodf()* and *strtold()* functions are added.
  - The DESCRIPTION is extensively revised.

64583 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

64584 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/61 is applied, correcting the second  
64585 paragraph in the RETURN VALUE section. This change clarifies the sign of the return value.64586 **Issue 7**

64587 Austin Group Interpretation 1003.1-2001 #015 is applied.

64588 **NAME**64589 `strtoimax, strtoumax` — convert string to integer type64590 **SYNOPSIS**64591 `#include <inttypes.h>`64592 `intmax_t strtoimax(const char *restrict nptr, char **restrict endptr,`  
64593 `int base);`64594 `uintmax_t strtoumax(const char *restrict nptr, char **restrict endptr,`  
64595 `int base);`64596 **DESCRIPTION**64597 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
64598 conflict between the requirements described here and the ISO C standard is unintentional. This  
64599 volume of POSIX.1-2008 defers to the ISO C standard.64600 These functions shall be equivalent to the `strtol()`, `strtoll()`, `strtoul()`, and `strtoull()` functions,  
64601 except that the initial portion of the string shall be converted to `intmax_t` and `uintmax_t`  
64602 representation, respectively.64603 **RETURN VALUE**

64604 These functions shall return the converted value, if any.

64605 If no conversion could be performed, zero shall be returned.

64606 If the correct value is outside the range of representable values, `{INTMAX_MAX}`,  
64607 `{INTMAX_MIN}`, or `{UINTMAX_MAX}` shall be returned (according to the return type and sign  
64608 of the value, if any), and `errno` shall be set to `[ERANGE]`.64609 **ERRORS**

64610 These functions shall fail if:

64611 `[ERANGE]` The value to be returned is not representable.

64612 These functions may fail if:

64613 `[EINVAL]` The value of `base` is not supported.64614 **EXAMPLES**

64622 **SEE ALSO**64623 `strtol()`, `strtoul()`64624 XBD `<inttypes.h>`64625 **CHANGE HISTORY**

64626 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**strtok()**64627 **NAME**64628 `strtok, strtok_r` — split string into tokens64629 **SYNOPSIS**

```
64630 #include <string.h>
64631 char *strtok(char *restrict s1, const char *restrict s2);
64632 CX char *strtok_r(char *restrict s, const char *restrict sep,
64633 char **restrict lasts);
```

64634 **DESCRIPTION**

64635 CX For `strtok()`: The functionality described on this reference page is aligned with the ISO C  
 64636 standard. Any conflict between the requirements described here and the ISO C standard is  
 64637 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

64638 A sequence of calls to `strtok()` breaks the string pointed to by `s1` into a sequence of tokens, each  
 64639 of which is delimited by a byte from the string pointed to by `s2`. The first call in the sequence  
 64640 has `s1` as its first argument, and is followed by calls with a null pointer as their first argument.  
 64641 The separator string pointed to by `s2` may be different from call to call.

64642 The first call in the sequence searches the string pointed to by `s1` for the first byte that is *not*  
 64643 contained in the current separator string pointed to by `s2`. If no such byte is found, then there  
 64644 are no tokens in the string pointed to by `s1` and `strtok()` shall return a null pointer. If such a byte  
 64645 is found, it is the start of the first token.

64646 The `strtok()` function then searches from there for a byte that *is* contained in the current separator  
 64647 string. If no such byte is found, the current token extends to the end of the string pointed to by  
 64648 `s1`, and subsequent searches for a token shall return a null pointer. If such a byte is found, it is  
 64649 overwritten by a NUL character, which terminates the current token. The `strtok()` function saves  
 64650 a pointer to the following byte, from which the next search for a token shall start.

64651 Each subsequent call, with a null pointer as the value of the first argument, starts searching from  
 64652 the saved pointer and behaves as described above.

64653 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
 64654 `strtok()`.

64655 CX The `strtok()` function need not be thread-safe.

64656 The `strtok_r()` function considers the null-terminated string `s` as a sequence of zero or more text  
 64657 tokens separated by spans of one or more characters from the separator string `sep`. The  
 64658 argument `lasts` points to a user-provided pointer which points to stored information necessary  
 64659 for `strtok_r()` to continue scanning the same string.

64660 In the first call to `strtok_r()`, `s` points to a null-terminated string, `sep` to a null-terminated string of  
 64661 separator characters, and the value pointed to by `lasts` is ignored. The `strtok_r()` function shall  
 64662 return a pointer to the first character of the first token, write a null character into `s` immediately  
 64663 following the returned token, and update the pointer to which `lasts` points.

64664 In subsequent calls, `s` is a null pointer and `lasts` shall be unchanged from the previous call so that  
 64665 subsequent calls shall move through the string `s`, returning successive tokens until no tokens  
 64666 remain. The separator string `sep` may be different from call to call. When no token remains in `s`, a  
 64667 null pointer shall be returned.

64668 **RETURN VALUE**

64669 Upon successful completion, *strtok()* shall return a pointer to the first byte of a token. Otherwise,  
64670 if there is no token, *strtok()* shall return a null pointer.

64671 CX The *strtok\_r()* function shall return a pointer to the token found, or a null pointer when no token  
64672 is found.

64673 **ERRORS**

64674 No errors are defined.

64675 **EXAMPLES**64676 **Searching for Word Separators**

64677 The following example searches for tokens separated by <space> characters.

```
64678 #include <string.h>
64679 ...
64680 char *token;
64681 char line[] = "LINE TO BE SEPARATED";
64682 char *search = " ";

64683 /* Token will point to "LINE". */
64684 token = strtok(line, search);

64685 /* Token will point to "TO". */
64686 token = strtok(NULL, search);
```

64687 **Breaking a Line**

64688 The following example uses *strtok()* to break a line into two character strings separated by any  
64689 combination of <space>, <tab>, or <newline> characters.

```
64690 #include <string.h>
64691 ...
64692 struct element {
64693     char *key;
64694     char *data;
64695 };
64696 ...
64697 char line[LINE_MAX];
64698 char *key, *data;
64699 ...
64700 key = strtok(line, " \n");
64701 data = strtok(NULL, " \n");
64702 ...
```

64703 **APPLICATION USAGE**

64704 The *strtok\_r()* function is thread-safe and stores its state in a user-supplied buffer instead of  
64705 possibly using a static data area that may be overwritten by an unrelated call from another  
64706 thread.

64707 **RATIONALE**

64708 The *strtok()* function searches for a separator string within a larger string. It returns a pointer to  
64709 the last substring between separator strings. This function uses static storage to keep track of  
64710 the current string position between calls. The new function, *strtok\_r()*, takes an additional  
64711 argument, *lasts*, to keep track of the current position in the string.

**strtok()**64712 **FUTURE DIRECTIONS**

64713 None.

64714 **SEE ALSO**64715 XBD [<string.h>](#)64716 **CHANGE HISTORY**

64717 First released in Issue 1. Derived from Issue 1 of the SVID.

64718 **Issue 5**64719 The *strtok\_r()* function is included for alignment with the POSIX Threads Extension.64720 A note indicating that the *strtok()* function need not be reentrant is added to the DESCRIPTION.64721 **Issue 6**

64722 Extensions beyond the ISO C standard are marked.

64723 The *strtok\_r()* function is marked as part of the Thread-Safe Functions option.

64724 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

64725 The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

64727 The **restrict** keyword is added to the *strtok()* and *strtok\_r()* prototypes for alignment with the ISO/IEC 9899: 1999 standard.64729 **Issue 7**

64730 Austin Group Interpretation 1003.1-2001 #156 is applied.

64731 SD5-XSH-ERN-235 is applied, correcting an example.

64732 The *strtok\_r()* function is moved from the Thread-Safe Functions option to the Base.

## 64733 NAME

64734 `strtol, strtoll` — convert a string to a long integer

## 64735 SYNOPSIS

64736 `#include <stdlib.h>`

```
64737 long strtol(const char *restrict str, char **restrict endptr, int base);
64738 long long strtoll(const char *restrict str, char **restrict endptr,
64739 int base)
```

## 64740 DESCRIPTION

64741 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 64742 conflict between the requirements described here and the ISO C standard is unintentional. This  
 64743 volume of POSIX.1-2008 defers to the ISO C standard.

64744 These functions shall convert the initial portion of the string pointed to by *str* to a type **long** and  
 64745 **long long** representation, respectively. First, they decompose the input string into three parts:

- 64746 1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
- 64747 2. A subject sequence interpreted as an integer represented in some radix determined by the  
 64748 value of *base*
- 64749 3. A final string of one or more unrecognized characters, including the terminating NUL  
 64750 character of the input string.

64751 Then they shall attempt to convert the subject sequence to an integer, and return the result.

64752 If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant,  
 64753 octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A  
 64754 decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An  
 64755 octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to  
 64756 '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the  
 64757 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

64758 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence  
 64759 of letters and digits representing an integer with the radix specified by *base*, optionally preceded  
 64760 by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the  
 64761 values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the  
 64762 value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and  
 64763 digits, following the sign if present.

64764 The subject sequence is defined as the longest initial subsequence of the input string, starting  
 64765 with the first non-white-space character that is of the expected form. The subject sequence shall  
 64766 contain no characters if the input string is empty or consists entirely of white-space characters,  
 64767 or if the first non-white-space character is other than a sign or a permissible letter or digit.

64768 If the subject sequence has the expected form and the value of *base* is 0, the sequence of  
 64769 characters starting with the first digit shall be interpreted as an integer constant. If the subject  
 64770 sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the  
 64771 base for conversion, ascribing to each letter its value as given above. If the subject sequence  
 64772 begins with a minus-sign, the value resulting from the conversion shall be negated. A pointer to  
 64773 the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null  
 64774 pointer.

64775 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be  
 64776 accepted.

64777 If the subject sequence is empty or does not have the expected form, no conversion is performed;

**strtol()**

64778 the value of *str* is stored in the object pointed to by *endptr*, provided that *endptr* is not a null  
 64779 pointer.

64780 CX The *strtol()* function shall not change the setting of *errno* if successful.

64781 Since 0, {LONG\_MIN} or {LLONG\_MIN}, and {LONG\_MAX} or {LLONG\_MAX} are returned  
 64782 on error and are also valid returns on success, an application wishing to check for error  
 64783 situations should set *errno* to 0, then call *strtol()* or *strtoll()*, then check *errno*.

**RETURN VALUE**

64785 Upon successful completion, these functions shall return the converted value, if any. If no  
 64786 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

64787 If the correct value is outside the range of representable values, {LONG\_MIN}, {LONG\_MAX},  
 64788 {LLONG\_MIN}, or {LLONG\_MAX} shall be returned (according to the sign of the value), and  
 64789 *errno* set to [ERANGE].

**ERRORS**

64790 These functions shall fail if:

64792 [ERANGE] The value to be returned is not representable.

64793 These functions may fail if:

64794 CX [EINVAL] The value of *base* is not supported.

**EXAMPLES**

64796 None.

**APPLICATION USAGE**

64798 None.

**RATIONALE**

64800 None.

**FUTURE DIRECTIONS**

64802 None.

**CHANGE HISTORY**

64807 First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

64809 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

**Issue 6**

64811 Extensions beyond the ISO C standard are marked.

64812 The following new requirements on POSIX implementations derive from alignment with the  
 64813 Single UNIX Specification:

- 64814 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
 64815 added if no conversion could be performed.

64816 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 64817 • The *strtol()* prototype is updated.
- 64818 • The *strtoll()* function is added.

64829        #include &lt;stdlib.h&gt;

64830        long long strtoll(const char \*restrict *str*, char \*\*restrict *endptr*,  
64831                    int *base*);64832 **DESCRIPTION**64833        Refer to *strtol()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**strtoul()**64834 **NAME**64835 `strtoul, strtoull` — convert a string to an unsigned long64836 **SYNOPSIS**64837 `#include <stdlib.h>`64838 `unsigned long strtoul(const char *restrict str,`  
64839 `char **restrict endptr, int base);`64840 `unsigned long long strtoull(const char *restrict str,`  
64841 `char **restrict endptr, int base);`64842 **DESCRIPTION**64843 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
64844 conflict between the requirements described here and the ISO C standard is unintentional. This  
64845 volume of POSIX.1-2008 defers to the ISO C standard.64846 These functions shall convert the initial portion of the string pointed to by *str* to a type **unsigned**  
64847 **long** and **unsigned long long** representation, respectively. First, they decompose the input string  
64848 into three parts:

- 64849
1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
  - 64850 2. A subject sequence interpreted as an integer represented in some radix determined by the  
64851 value of *base*
  - 64852 3. A final string of one or more unrecognized characters, including the terminating NUL  
64853 character of the input string

64854 Then they shall attempt to convert the subject sequence to an unsigned integer, and return the  
64855 result.64856 If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant,  
64857 octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A  
64858 decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An  
64859 octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to  
64860 '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the  
64861 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.64862 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence  
64863 of letters and digits representing an integer with the radix specified by *base*, optionally preceded  
64864 by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the  
64865 values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the  
64866 value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and  
64867 digits, following the sign if present.64868 The subject sequence is defined as the longest initial subsequence of the input string, starting  
64869 with the first non-white-space character that is of the expected form. The subject sequence shall  
64870 contain no characters if the input string is empty or consists entirely of white-space characters,  
64871 or if the first non-white-space character is other than a sign or a permissible letter or digit.64872 If the subject sequence has the expected form and the value of *base* is 0, the sequence of  
64873 characters starting with the first digit shall be interpreted as an integer constant. If the subject  
64874 sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the  
64875 base for conversion, ascribing to each letter its value as given above. If the subject sequence  
64876 begins with a minus-sign, the value resulting from the conversion shall be negated. A pointer to  
64877 the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null  
64878 pointer.

- 64879 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be  
64880 accepted.
- 64881 If the subject sequence is empty or does not have the expected form, no conversion shall be  
64882 performed; the value of *str* shall be stored in the object pointed to by *endptr*, provided that *endptr*  
64883 is not a null pointer.
- 64884 CX The *strtoul()* function shall not change the setting of *errno* if successful.
- 64885 Since 0, {ULONG\_MAX}, and {ULLONG\_MAX} are returned on error and are also valid returns  
64886 on success, an application wishing to check for error situations should set *errno* to 0, then call  
64887 *strtoul()* or *strtoull()*, then check *errno*.
- 64888 **RETURN VALUE**
- 64889 Upon successful completion, these functions shall return the converted value, if any. If no  
64890 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL]. If the  
64891 correct value is outside the range of representable values, {ULONG\_MAX} or {ULLONG\_MAX}  
64892 shall be returned and *errno* set to [ERANGE].
- 64893 **ERRORS**
- 64894 These functions shall fail if:
- 64895 CX [EINVAL] The value of *base* is not supported.
- 64896 [ERANGE] The value to be returned is not representable.
- 64897 These functions may fail if:
- 64898 CX [EINVAL] No conversion could be performed.
- 64899 **EXAMPLES**
- 64900 None.
- 64901 **APPLICATION USAGE**
- 64902 None.
- 64903 **RATIONALE**
- 64904 None.
- 64905 **FUTURE DIRECTIONS**
- 64906 None.
- 64907 **SEE ALSO**
- 64908 *fscanf()*, *isalpha()*, *strtod()*, *strtol()*

*System Interfaces***strtoumax()**64924 **NAME**64925        **strtoumax** — convert a string to an integer type64926 **SYNOPSIS**

64927        #include &lt;inttypes.h&gt;

64928        uintmax\_t strtoumax(const char \*restrict *nptr*, char \*\*restrict *endptr*,  
64929                            int *base*);64930 **DESCRIPTION**64931        Refer to *strtoimax()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**strxfrm()**64932 **NAME**64933 `strxfrm, strxfrm_l` — string transformation64934 **SYNOPSIS**64935 `#include <string.h>`64936 `size_t strxfrm(char *restrict s1, const char *restrict s2, size_t n);`64937 CX `size_t strxfrm_l(char *restrict s1, const char *restrict s2,`  
64938 `size_t n, locale_t locale);`64939 **DESCRIPTION**64940 CX For `strxfrm()`: The functionality described on this reference page is aligned with the ISO C  
64941 standard. Any conflict between the requirements described here and the ISO C standard is  
64942 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.64943 CX The `strxfrm()` and `strxfrm_l()` functions shall transform the string pointed to by `s2` and place the  
64944 resulting string into the array pointed to by `s1`. The transformation is such that if `strcmp()`  
64945 is applied to two transformed strings, it shall return a value greater than, equal to, or less than 0,  
64946 CX corresponding to the result of `strcoll()` or `strcoll_l()`, respectively, applied to the same two  
64947 CX original strings with the same locale. No more than `n` bytes are placed into the resulting array  
64948 pointed to by `s1`, including the terminating NUL character. If `n` is 0, `s1` is permitted to be a null  
64949 pointer. If copying takes place between objects that overlap, the behavior is undefined.64950 CX The `strxfrm()` and `strxfrm_l()` functions shall not change the setting of `errno` if successful.64951 Since no return value is reserved to indicate an error, an application wishing to check for error  
64952 CX situations should set `errno` to 0, then call `strxfrm()` or `strxfrm_l()`, then check `errno`.64953 **RETURN VALUE**64954 CX Upon successful completion, `strxfrm()` and `strxfrm_l()` shall return the length of the  
64955 transformed string (not including the terminating NUL character). If the value returned is `n` or  
64956 more, the contents of the array pointed to by `s1` are unspecified.64957 CX On error, `strxfrm()` and `strxfrm_l()` may set `errno` but no return value is reserved to indicate an  
64958 error.64959 **ERRORS**

64960 These functions may fail if:

64961 CX [EINVAL] The string pointed to by the `s2` argument contains characters outside the  
64962 domain of the collating sequence.64963 The `strxfrm_l()` function may fail if:64964 CX [EINVAL] `locale` is not a valid locale object.64965 **EXAMPLES**

64966 None.

64967 **APPLICATION USAGE**64968 The transformation function is such that two transformed strings can be ordered by `strcmp()` as  
64969 appropriate to collating sequence information in the locale of the process (category  
64970 `LC_COLLATE`).64971 The fact that when `n` is 0 `s1` is permitted to be a null pointer is useful to determine the size of the  
64972 `s1` array prior to making the transformation.

64973 **RATIONALE**

64974 None.

64975 **FUTURE DIRECTIONS**

64976 None.

64977 **SEE ALSO**64978 *strcmp()*, *strcoll()*64979 XBD `<string.h>`64980 **CHANGE HISTORY**

64981 First released in Issue 3. Included for alignment with the ISO C standard.

64982 **Issue 5**64983 The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.64984 **Issue 6**

64985 Extensions beyond the ISO C standard are marked.

64986 The following new requirements on POSIX implementations derive from alignment with the  
64987 Single UNIX Specification:

- 64988
- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
64989 added if no conversion could be performed.

64990 The *strxfrm()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.64991 **Issue 7**64992 The *strxfrm\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
64993 Set Part 4.

**swab()**64994 **NAME**64995 `swab` — swap bytes64996 **SYNOPSIS**

```
64997 XSI #include <unistd.h>
64998 void swab(const void *restrict src, void *restrict dest,
64999          ssize_t nbytes);
```

65000 **DESCRIPTION**

65001 The `swab()` function shall copy *nbytes* bytes, which are pointed to by *src*, to the object pointed to  
65002 by *dest*, exchanging adjacent bytes. The *nbytes* argument should be even. If *nbytes* is odd, `swab()`  
65003 copies and exchanges *nbytes*-1 bytes and the disposition of the last byte is unspecified. If  
65004 copying takes place between objects that overlap, the behavior is undefined. If *nbytes* is  
65005 negative, `swab()` does nothing.

65006 **RETURN VALUE**

65007 None.

65008 **ERRORS**

65009 No errors are defined.

65010 **EXAMPLES**

65011 None.

65012 **APPLICATION USAGE**

65013 None.

65014 **RATIONALE**

65015 None.

65016 **FUTURE DIRECTIONS**

65017 None.

65018 **SEE ALSO**

65019 XBD &lt;unistd.h&gt;

65020 **CHANGE HISTORY**

65021 First released in Issue 1. Derived from Issue 1 of the SVID.

65022 **Issue 6**

65023 The **restrict** keyword is added to the `swab()` prototype for alignment with the  
65024 ISO/IEC 9899:1999 standard.

65025 **NAME**

65026 swprintf — print formatted wide-character output

65027 **SYNOPSIS**

65028 #include &lt;stdio.h&gt;

65029 #include &lt;wchar.h&gt;

65030 int swprintf(wchar\_t \*restrict ws, size\_t n,

65031 const wchar\_t \*restrict format, ...);

65032 **DESCRIPTION**65033 Refer to *fwprintf()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**swscanf()**65034 **NAME**65035 `swscanf` — convert formatted wide-character input65036 **SYNOPSIS**65037 `#include <stdio.h>`65038 `#include <wchar.h>`65039 `int swscanf(const wchar_t *restrict ws,`  
65040 `const wchar_t *restrict format, ...);`65041 **DESCRIPTION**65042 Refer to *fwscanf()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

65043 **NAME**65044 `symlink, symlinkat` — make a symbolic link relative to directory file descriptor65045 **SYNOPSIS**65046 `#include <unistd.h>`65047 `int symlink(const char *path1, const char *path2);`65048 `int symlinkat(const char *path1, int fd, const char *path2);`65049 **DESCRIPTION**65050 The `symlink()` function shall create a symbolic link called `path2` that contains the string pointed to  
65051 by `path1` (`path2` is the name of the symbolic link created, `path1` is the string contained in the  
65052 symbolic link).65053 The string pointed to by `path1` shall be treated only as a character string and shall not be  
65054 validated as a pathname.65055 If the `symlink()` function fails for any reason other than [EIO], any file named by `path2` shall be  
65056 unaffected.65057 The symbolic link's user ID shall be set to the process' effective user ID. The symbolic link's  
65058 group ID shall be set to the group ID of the parent directory or to the effective group ID of the  
65059 process. Implementations shall provide a way to initialize the symbolic link's group ID to the  
65060 group ID of the parent directory. Implementations may, but need not, provide an  
65061 implementation-defined way to initialize the symbolic link's group ID to the effective group ID  
65062 of the calling process.65063 The values of the file mode bits for the created symbolic link are unspecified. All interfaces  
65064 specified by POSIX.1-2008 shall behave as if the contents of symbolic links can always be read,  
65065 except that the value of the file mode bits returned in the `st_mode` field of the `stat` structure is  
65066 unspecified.65067 Upon successful completion, `symlink()` shall mark for update the last data access, last data  
65068 modification, and last file status change timestamps of the symbolic link. Also, the last data  
65069 modification and last file status change timestamps of the directory that contains the new entry  
65070 shall be marked for update.65071 The `symlinkat()` function shall be equivalent to the `symlink()` function except in the case where  
65072 `path2` specifies a relative path. In this case the symbolic link is created relative to the directory  
65073 associated with the file descriptor `fd` instead of the current working directory. If the file  
65074 descriptor was opened without `O_SEARCH`, the function shall check whether directory searches  
65075 are permitted using the current permissions of the directory underlying the file descriptor. If the  
65076 file descriptor was opened with `O_SEARCH`, the function shall not perform the check.65077 If `symlinkat()` is passed the special value `AT_FDCWD` in the `fd` parameter, the current working  
65078 directory is used and the behavior shall be identical to a call to `symlink()`.65079 **RETURN VALUE**65080 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
65081 return -1 and set `errno` to indicate the error.65082 **ERRORS**

65083 These functions shall fail if:

65084 [EACCES] Write permission is denied in the directory where the symbolic link is being  
65085 created, or search permission is denied for a component of the path prefix of  
65086 `path2`.

## symlink()

65087	[EEXIST]	The <i>path2</i> argument names an existing file or symbolic link.
65088	[EIO]	An I/O error occurs while reading from or writing to the file system.
65089	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path2</i> argument.
65090		
65091	[ENAMETOOLONG]	
65092		The length of a component of the pathname specified by the <i>path2</i> argument is longer than {NAME_MAX} or the length of the <i>path1</i> argument is longer than {SYMLINK_MAX}.
65093		
65094		
65095	[ENOENT]	A component of <i>path2</i> does not name an existing file or <i>path2</i> is an empty string.
65096		
65097	[ENOSPC]	The directory in which the entry for the new symbolic link is being placed cannot be extended because no space is left on the file system containing the directory, or the new symbolic link cannot be created because no space is left on the file system which shall contain the link, or the file system is out of file-allocation resources.
65098		
65099		
65100		
65101		
65102	[ENOTDIR]	A component of the path prefix of <i>path2</i> is not a directory.
65103	[EROFS]	The new symbolic link would reside on a read-only file system.
65104		The <i>symlinkat()</i> function shall fail if:
65105	[EACCES]	<i>fd</i> was not opened with O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.
65106		
65107	[EBADF]	The <i>path2</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.
65108		
65109		These functions may fail if:
65110	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path2</i> argument.
65111		
65112	[ENAMETOOLONG]	
65113		The length of the <i>path2</i> argument exceeds {PATH_MAX} or pathname resolution of a symbolic link in the <i>path2</i> argument produced an intermediate result with a length that exceeds {PATH_MAX}.
65114		
65115		
65116		The <i>symlinkat()</i> function may fail if:
65117	[ENOTDIR]	The <i>path2</i> argument is not an absolute path and <i>fd</i> is neither AT_FDCWD nor a file descriptor associated with a directory.
65118		

**EXAMPLES**

None.

**APPLICATION USAGE**

Like a hard link, a symbolic link allows a file to have multiple logical names. The presence of a hard link guarantees the existence of a file, even after the original name has been removed. A symbolic link provides no such assurance; in fact, the file named by the *path1* argument need not exist when the link is created. A symbolic link can cross file system boundaries.

Normal permission checks are made on each component of the symbolic link pathname during its resolution.

65128 **RATIONALE**

65129 Since POSIX.1-2008 does not require any association of file times with symbolic links, there is no  
 65130 requirement that file times be updated by *symlink()*.

65131 The purpose of the *symlinkat()* function is to create symbolic links in directories other than the  
 65132 current working directory without exposure to race conditions. Any part of the path of a file  
 65133 could be changed in parallel to a call to *symlink()*, resulting in unspecified behavior. By opening  
 65134 a file descriptor for the target directory and using the *symlinkat()* function it can be guaranteed  
 65135 that the created symbolic link is located relative to the desired directory.

65136 **FUTURE DIRECTIONS**

65137 None.

65141 **CHANGE HISTORY**

65142 First released in Issue 4, Version 2.

65143 **Issue 5**

65144 Moved from X/OPEN UNIX extension to BASE.

65145 **Issue 6**

65146 The following changes were made to align with the IEEE P1003.1a draft standard:

- 65147 • The DESCRIPTION text is updated.
- 65148 • The [ELOOP] optional error condition is added.

65149 **Issue 7**

65150 Austin Group Interpretation 1003.1-2001 #143 is applied.

65151 The *symlinkat()* function is added from The Open Group Technical Standard, 2006, Extended  
 65152 API Set Part 2.

65153 Additions have been made describing how *symlink()* sets the user and group IDs and file mode  
 65154 of the symbolic link, and its effect on timestamps.

65155 Changes are made to allow a directory to be opened for searching.

**sync()**65156 **NAME**

65157 sync — schedule file system updates

65158 **SYNOPSIS**

```
65159 XSI #include <unistd.h>  
65160 void sync(void);
```

65161 **DESCRIPTION**65162 The *sync()* function shall cause all information in memory that updates file systems to be  
65163 scheduled for writing out to all file systems.65164 The writing, although scheduled, is not necessarily complete upon return from *sync()*.65165 **RETURN VALUE**65166 The *sync()* function shall not return a value.65167 **ERRORS**

65168 No errors are defined.

65169 **EXAMPLES**

65170 None.

65171 **APPLICATION USAGE**

65172 None.

65173 **RATIONALE**

65174 None.

65175 **FUTURE DIRECTIONS**

65176 None.

65177 **SEE ALSO**65178 [fsync\(\)](#)65179 XBD [<unistd.h>](#)65180 **CHANGE HISTORY**

65181 First released in Issue 4, Version 2.

65182 **Issue 5**

65183 Moved from X/OPEN UNIX extension to BASE.

65184 **NAME**

65185 sysconf — get configurable system variables

65186 **SYNOPSIS**

65187 #include &lt;unistd.h&gt;

65188 long sysconf(int name);

65189 **DESCRIPTION**

65190 The *sysconf()* function provides a method for the application to determine the current value of a  
 65191 configurable system limit or option (*variable*). The implementation shall support all of the  
 65192 variables listed in the following table and may support others.

65193 The *name* argument represents the system variable to be queried. The following table lists the  
 65194 minimal set of system variables from <limits.h> or <unistd.h> that can be returned by *sysconf()*,  
 65195 and the symbolic constants defined in <unistd.h> that are the corresponding values used for  
 65196 *name*.

Variable	Value of Name
{AIO_LISTIO_MAX}	_SC_AIO_LISTIO_MAX
{AIO_MAX}	_SC_AIO_MAX
{AIO_PRIO_DELTA_MAX}	_SC_AIO_PRIO_DELTA_MAX

65327	_XOPEN_VERSION	_SC_XOPEN_VERSION

**RETURN VALUE**

If *name* is an invalid value, *sysconf()* shall return  $-1$  and set *errno* to indicate the error. If the variable corresponding to *name* is described in **<limits.h>** as a maximum or minimum value and the variable has no limit, *sysconf()* shall return  $-1$  without changing the value of *errno*. Note that indefinite limits do not imply infinite limits; see **<limits.h>**.

Otherwise, *sysconf()* shall return the current variable value on the system. The value returned

**sysconf()**

65333 shall not be more restrictive than the corresponding value described to the application when it  
 65334 was compiled with the implementation's `<limits.h>` or `<unistd.h>`. The value shall not change  
 65335 XSI during the lifetime of the calling process, except that `sysconf(_SC_OPEN_MAX)` may return  
 65336 different values before and after a call to `setrlimit()` which changes the `RLIMIT_NOFILE` soft  
 65337 limit.

65338 If the variable corresponding to *name* is dependent on an unsupported option, the results are  
 65339 unspecified.

**ERRORS**

65340 The `sysconf()` function shall fail if:

65342 [EINVAL] The value of the *name* argument is invalid.

**EXAMPLES**

65343 None.  
 65344

**APPLICATION USAGE**

65345 As `-1` is a permissible return value in a successful situation, an application wishing to check for  
 65346 error situations should set `errno` to `0`, then call `sysconf()`, and, if it returns `-1`, check to see if `errno`  
 65347 is non-zero.  
 65348

65349 Application developers should check whether an option, such as `_POSIX_TRACE`, is supported  
 65350 prior to obtaining and using values for related variables, such as `_POSIX_TRACE_NAME_MAX`.

**RATIONALE**

65351 This functionality was added in response to requirements of application developers and of  
 65352 system vendors who deal with many international system configurations. It is closely related to  
 65353 `pathconf()` and `fpathconf()`.  
 65354

65355 Although a conforming application can run on all systems by never demanding more resources  
 65356 than the minimum values published in this volume of POSIX.1-2008, it is useful for that  
 65357 application to be able to use the actual value for the quantity of a resource available on any  
 65358 given system. To do this, the application makes use of the value of a symbolic constant in  
 65359 `<limits.h>` or `<unistd.h>`.

65360 However, once compiled, the application must still be able to cope if the amount of resource  
 65361 available is increased. To that end, an application may need a means of determining the quantity  
 65362 of a resource, or the presence of an option, at execution time.

65363 Two examples are offered:

65364 1. Applications may wish to act differently on systems with or without job control.  
 65365 Applications vendors who wish to distribute only a single binary package to all instances  
 65366 of a computer architecture would be forced to assume job control is never available if it  
 65367 were to rely solely on the `<unistd.h>` value published in this volume of POSIX.1-2008.

65368 2. International applications vendors occasionally require knowledge of the number of clock  
 65369 ticks per second. Without these facilities, they would be required to either distribute their  
 65370 applications partially in source form or to have 50 Hz and 60 Hz versions for the various  
 65371 countries in which they operate.

65372 It is the knowledge that many applications are actually distributed widely in executable form  
 65373 that leads to this facility. If limited to the most restrictive values in the headers, such applications  
 65374 would have to be prepared to accept the most limited environments offered by the smallest  
 65375 microcomputers. Although this is entirely portable, there was a consensus that they should be  
 65376 able to take advantage of the facilities offered by large systems, without the restrictions  
 65377 associated with source and object distributions.

65378 During the discussions of this feature, it was pointed out that it is almost always possible for an  
 65379 application to discern what a value might be at runtime by suitably testing the various functions  
 65380 themselves. And, in any event, it could always be written to adequately deal with error returns  
 65381 from the various functions. In the end, it was felt that this imposed an unreasonable level of  
 65382 complication and sophistication on the application developer.

65383 This runtime facility is not meant to provide ever-changing values that applications have to  
 65384 check multiple times. The values are seen as changing no more frequently than once per system  
 65385 initialization, such as by a system administrator or operator with an automatic configuration  
 65386 program. This volume of POSIX.1-2008 specifies that they shall not change within the lifetime of  
 65387 the process.

65388 Some values apply to the system overall and others vary at the file system or directory level. The  
 65389 latter are described in *fpathconf()*.

65390 Note that all values returned must be expressible as integers. String values were considered, but  
 65391 the additional flexibility of this approach was rejected due to its added complexity of  
 65392 implementation and use.

65393 Some values, such as {PATH\_MAX}, are sometimes so large that they must not be used to, say,  
 65394 allocate arrays. The *sysconf()* function returns a negative value to show that this symbolic  
 65395 constant is not even defined in this case.

65396 Similar to *pathconf()*, this permits the implementation not to have a limit. When one resource is  
 65397 infinite, returning an error indicating that some other resource limit has been reached is  
 65398 conforming behavior.

#### 65399 FUTURE DIRECTIONS

65400 None.

#### 65405 CHANGE HISTORY

65406 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

#### 65407 Issue 5

65408 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 65409 Threads Extension.

65410 The *XBS\_* variables and name values are added to the table of system variables in the  
 65411 DESCRIPTION. These are all marked EX.

#### 65412 Issue 6

65413 The symbol CLK\_TCK is obsolescent and removed. It is replaced with the phrase “clock ticks  
 65414 per second”.

65415 The symbol {PASS\_MAX} is removed.

65416 The following changes were made to align with the IEEE P1003.1a draft standard:

- 65417 • Table entries are added for the following variables: *\_SC\_REGEX*, *\_SC\_SHELL*,
- 65418 *\_SC\_REGEX\_VERSION*, *\_SC\_SYMLoop\_MAX*.

65419 The following *sysconf()* variables and their associated names are added for alignment with  
 65420 IEEE Std 1003.1d-1999:

## sysconf()

65421            \_POSIX\_ADVISORY\_INFO  
 65422            \_POSIX\_CPUTIME  
 65423            \_POSIX\_SPAWN  
 65424            \_POSIX\_SPORADIC\_SERVER  
 65425            \_POSIX\_THREAD\_CPUTIME  
 65426            \_POSIX\_THREAD\_SPORADIC\_SERVER  
 65427            \_POSIX\_TIMEOUTS

65428            The following changes are made to the DESCRIPTION for alignment with IEEE Std 1003.1j-2000:

- 65429            • A statement expressing the dependency of support for some system variables on
- 65430            implementation options is added.
- 65431            • The following system variables are added:

65432            \_POSIX\_BARRIERS  
 65433            \_POSIX\_CLOCK\_SELECTION  
 65434            \_POSIX\_MONOTONIC\_CLOCK  
 65435            \_POSIX\_READER\_WRITER\_LOCKS  
 65436            \_POSIX\_SPIN\_LOCKS  
 65437            \_POSIX\_TYPED\_MEMORY\_OBJECTS

65438            The following system variables are added for alignment with IEEE Std 1003.2d-1994:

65439            \_POSIX2\_PBS  
 65440            \_POSIX2\_PBS\_ACCOUNTING  
 65441            \_POSIX2\_PBS\_LOCATE  
 65442            \_POSIX2\_PBS\_MESSAGE  
 65443            \_POSIX2\_PBS\_TRACK

65444            The following *sysconf()* variables and their associated names are added for alignment with

65445            IEEE Std 1003.1q-2000:

65446            \_POSIX\_TRACE  
 65447            \_POSIX\_TRACE\_EVENT\_FILTER  
 65448            \_POSIX\_TRACE\_INHERIT  
 65449            \_POSIX\_TRACE\_LOG

65450            The macros associated with the *c89* programming models are marked LEGACY, and new

65451            equivalent macros associated with *c99* are introduced.

65452            IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/62 is applied, updating the

65453            DESCRIPTION to denote that the *\_PC\** and *\_SC\** symbols are now required to be supported. A

65454            corresponding change has been made in the Base Definitions volume of POSIX.1-2008. The

65455            deletion in the second paragraph removes some duplicated text. Additional symbols that were

65456            erroneously omitted from this reference page have been added.

65457            IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/63 is applied, making it clear in the

65458            RETURN VALUE section that the value returned for *sysconf(\_SC\_OPEN\_MAX)* may change if a

65459            call to *setrlimit()* adjusts the RLIMIT\_NOFILE soft limit.

65460            IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/134 is applied, updating the

65461            DESCRIPTION to remove an erroneous entry for *\_POSIX\_SYMLOOP\_MAX*. This corrects an

65462            error in IEEE Std 1003.1-2001/Cor 1-2002.

65463            IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/135 is applied, removing

65464        \_posix\_file\_locking,        \_posix\_multi\_process,        \_posix2\_c\_version,        and  
65465        \_xopen\_xcu\_version (and their associated \_SC\_\* variables) from the DESCRIPTION and  
65466        APPLICATION USAGE sections.

65467        IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/136 is applied, adding the following  
65468        constants (and their associated \_SC\_\* variables) to the DESCRIPTION:

65469                \_posix\_ss\_repl\_max  
65470                \_posix\_trace\_event\_name\_max  
65471                \_posix\_trace\_name\_max  
65472                \_posix\_trace\_sys\_max  
65473                \_posix\_trace\_user\_event\_max

65474        The RETURN VALUE and APPLICATION USAGE sections are updated to note that if variables  
65475        are dependent on unsupported options, the results are unspecified.

65476        IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/137 is applied, removing  
65477        \_REGEX\_VERSION and \_SC\_REGEX\_VERSION.

65478        **Issue 7**

65479        Austin Group Interpretation 1003.1-2001 #160 is applied.

65480        SD5-XSH-ERN-166 is applied, changing “Maximum size” to “Initial size” for the “Maximum  
65481        size of ...” entries in the table in the DESCRIPTION.

65482        The variables for the supported programming environments are updated to be V7 and the  
65483        LEGACY variables are removed.

65484        The following constants are added:

65485                \_posix\_thread\_robust\_prio\_inherit  
65486                \_posix\_thread\_robust\_prio\_protect

65487        The \_XOPEN\_UUCP variable and its associated \_SC\_XOPEN\_UUCP value is added to the table  
65488        of system variables.

**syslog()***System Interfaces*65489 **NAME**

65490 syslog — log a message

65491 **SYNOPSIS**65492 XSI `#include <syslog.h>`65493 `void syslog(int priority, const char *message, ... /* argument */);`65494 **DESCRIPTION**65495 Refer to *closelog()*.

65496 **NAME**

65497 system — issue a command

65498 **SYNOPSIS**

65499 #include &lt;stdlib.h&gt;

65500 int system(const char \*command);

65501 **DESCRIPTION**

65502 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 65503 conflict between the requirements described here and the ISO C standard is unintentional. This  
 65504 volume of POSIX.1-2008 defers to the ISO C standard.

65505 If *command* is a null pointer, the *system()* function shall determine whether the host environment  
 65506 has a command processor. If *command* is not a null pointer, the *system()* function shall pass the  
 65507 string pointed to by *command* to that command processor to be executed in an implementation-  
 65508 defined manner; this might then cause the program calling *system()* to behave in a non-  
 65509 conforming manner or to terminate.

65510 CX The *system()* function shall behave as if a child process were created using *fork()*, and the child  
 65511 process invoked the *sh* utility using *execl()* as follows:

65512 `execl(<shell path>, "sh", "-c", command, (char *)0);`

65513 where <shell path> is an unspecified pathname for the *sh* utility. It is unspecified whether the  
 65514 handlers registered with *pthread\_atfork()* are called as part of the creation of the child process.

65515 The *system()* function shall ignore the SIGINT and SIGQUIT signals, and shall block the  
 65516 SIGCHLD signal, while waiting for the command to terminate. If this might cause the  
 65517 application to miss a signal that would have killed it, then the application should examine the  
 65518 return value from *system()* and take whatever action is appropriate to the application if the  
 65519 command terminated due to receipt of a signal.

65520 The *system()* function shall not affect the termination status of any child of the calling processes  
 65521 other than the process or processes it itself creates.

65522 The *system()* function shall not return until the child process has terminated.

65523 The *system()* function need not be thread-safe.

65524 **RETURN VALUE**

65525 If *command* is a null pointer, *system()* shall return non-zero to indicate that a command processor  
 65526 CX is available, or zero if none is available. The *system()* function shall always return non-zero  
 65527 when *command* is NULL.

65528 CX If *command* is not a null pointer, *system()* shall return the termination status of the command  
 65529 language interpreter in the format specified by *waitpid()*. The termination status shall be as  
 65530 defined for the *sh* utility; otherwise, the termination status is unspecified. If some error prevents  
 65531 the command language interpreter from executing after the child process is created, the return  
 65532 value from *system()* shall be as if the command language interpreter had terminated using  
 65533 *exit(127)* or *\_exit(127)*. If a child process cannot be created, or if the termination status for the  
 65534 command language interpreter cannot be obtained, *system()* shall return  $-1$  and set *errno* to  
 65535 indicate the error.

65536 **ERRORS**

65537 CX The *system()* function may set *errno* values as described by *fork()*.

**system()**

65538 In addition, *system()* may fail if:

65539 CX [ECHILD] The status of the child process created by *system()* is no longer available.

**EXAMPLES**

65541 None.

**APPLICATION USAGE**

65543 If the return value of *system()* is not  $-1$ , its value can be decoded through the use of the macros  
65544 described in `<sys/wait.h>`. For convenience, these macros are also provided in `<stdlib.h>`.

65545 Note that, while *system()* must ignore SIGINT and SIGQUIT and block SIGCHLD while waiting  
65546 for the child to terminate, the handling of signals in the executed command is as specified by  
65547 *fork()* and *exec*. For example, if SIGINT is being caught or is set to SIG\_DFL when *system()*  
65548 is called, then the child is started with SIGINT handling set to SIG\_DFL.

65549 Ignoring SIGINT and SIGQUIT in the parent process prevents coordination problems (two  
65550 processes reading from the same terminal, for example) when the executed command ignores or  
65551 catches one of the signals. It is also usually the correct action when the user has given a  
65552 command to the application to be executed synchronously (as in the '!' command in many  
65553 interactive applications). In either case, the signal should be delivered only to the child process,  
65554 not to the application itself. There is one situation where ignoring the signals might have less  
65555 than the desired effect. This is when the application uses *system()* to perform some task invisible  
65556 to the user. If the user typed the interrupt character ("C", for example) while *system()* is being  
65557 used in this way, one would expect the application to be killed, but only the executed command  
65558 is killed. Applications that use *system()* in this way should carefully check the return status from  
65559 *system()* to see if the executed command was successful, and should take appropriate action  
65560 when the command fails.

65561 Blocking SIGCHLD while waiting for the child to terminate prevents the application from  
65562 catching the signal and obtaining status from *system()*'s child process before *system()* can get the  
65563 status itself.

65564 The context in which the utility is ultimately executed may differ from that in which *system()*  
65565 was called. For example, file descriptors that have the FD\_CLOEXEC flag set are closed, and the  
65566 process ID and parent process ID are different. Also, if the executed utility changes its  
65567 environment variables or its current working directory, that change is not reflected in the caller's  
65568 context.

65569 There is no defined way for an application to find the specific path for the shell. However,  
65570 *confstr()* can provide a value for *PATH* that is guaranteed to find the *sh* utility.

65571 Using the *system()* function in more than one thread in a process or when the SIGCHLD signal is  
65572 being manipulated by more than one thread in a process may produce unexpected results.

**RATIONALE**

65573 The *system()* function should not be used by programs that have set user (or group) ID  
65574 privileges. The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used  
65575 instead. This prevents any unforeseen manipulation of the environment of the user that could  
65576 cause execution of commands not anticipated by the calling program.  
65577

65578 There are three levels of specification for the *system()* function. The ISO C standard gives the  
65579 most basic. It requires that the function exists, and defines a way for an application to query  
65580 whether a command language interpreter exists. It says nothing about the command language  
65581 or the environment in which the command is interpreted.

65582 POSIX.1-2008 places additional restrictions on *system()*. It requires that if there is a command  
65583 language interpreter, the environment must be as specified by *fork()* and *exec*. This ensures, for

65584 example, that *close-on-exec* works, that file locks are not inherited, and that the process ID is  
 65585 different. It also specifies the return value from *system()* when the command line can be run,  
 65586 thus giving the application some information about the command's completion status.

65587 Finally, POSIX.1-2008 requires the command to be interpreted as in the shell command language  
 65588 defined in the Shell and Utilities volume of POSIX.1-2008.

65589 Note that, *system(NULL)* is required to return non-zero, indicating that there is a command  
 65590 language interpreter. At first glance, this would seem to conflict with the ISO C standard which  
 65591 allows *system(NULL)* to return zero. There is no conflict, however. A system must have a  
 65592 command language interpreter, and is non-conforming if none is present. It is therefore  
 65593 permissible for the *system()* function on such a system to implement the behavior specified by  
 65594 the ISO C standard as long as it is understood that the implementation does not conform to  
 65595 POSIX.1-2008 if *system(NULL)* returns zero.

65596 It was explicitly decided that when *command* is NULL, *system()* should not be required to check  
 65597 to make sure that the command language interpreter actually exists with the correct mode, that  
 65598 there are enough processes to execute it, and so on. The call *system(NULL)* could, theoretically,  
 65599 check for such problems as too many existing child processes, and return zero. However, it  
 65600 would be inappropriate to return zero due to such a (presumably) transient condition. If some  
 65601 condition exists that is not under the control of this application and that would cause any  
 65602 *system()* call to fail, that system has been rendered non-conforming.

65603 Early drafts required, or allowed, *system()* to return with *errno* set to [EINTR] if it was  
 65604 interrupted with a signal. This error return was removed, and a requirement that *system()* not  
 65605 return until the child has terminated was added. This means that if a *waitpid()* call in *system()*  
 65606 exits with *errno* set to [EINTR], *system()* must reissue the *waitpid()*. This change was made for  
 65607 two reasons:

- 65608 1. There is no way for an application to clean up if *system()* returns [EINTR], short of calling  
 65609 *wait()*, and that could have the undesirable effect of returning the status of children other  
 65610 than the one started by *system()*.
- 65611 2. While it might require a change in some historical implementations, those  
 65612 implementations already have to be changed because they use *wait()* instead of *waitpid()*.

65613 Note that if the application is catching SIGCHLD signals, it will receive such a signal before a  
 65614 successful *system()* call returns.

65615 To conform to POSIX.1-2008, *system()* must use *waitpid()*, or some similar function, instead of  
 65616 *wait()*.

65617 The following code sample illustrates how *system()* might be implemented on an  
 65618 implementation conforming to POSIX.1-2008.

```
65619 #include <signal.h>
65620 int system(const char *cmd)
65621 {
65622     int stat;
65623     pid_t pid;
65624     struct sigaction sa, savintr, savequit;
65625     sigset_t saveblock;
65626     if (cmd == NULL)
65627         return(1);
65628     sa.sa_handler = SIG_IGN;
65629     sigemptyset(&sa.sa_mask);
65630     sa.sa_flags = 0;
```

**system()**

```

65631     sigemptyset(&saveintr.sa_mask);
65632     sigemptyset(&savequit.sa_mask);
65633     sigaction(SIGINT, &sa, &saveintr);
65634     sigaction(SIGQUIT, &sa, &savequit);
65635     sigaddset(&sa.sa_mask, SIGCHLD);
65636     sigprocmask(SIG_BLOCK, &sa.sa_mask, &saveblock);
65637     if ((pid = fork()) == 0) {
65638         sigaction(SIGINT, &saveintr, (struct sigaction *)0);
65639         sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
65640         sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
65641         execl("/bin/sh", "sh", "-c", cmd, (char *)0);
65642         _exit(127);
65643     }
65644     if (pid == -1) {
65645         stat = -1; /* errno comes from fork() */
65646     } else {
65647         while (waitpid(pid, &stat, 0) == -1) {
65648             if (errno != EINTR) {
65649                 stat = -1;
65650                 break;
65651             }
65652         }
65653     }
65654     sigaction(SIGINT, &saveintr, (struct sigaction *)0);
65655     sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
65656     sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
65657     return(stat);
65658 }

```

65659 Note that, while a particular implementation of *system()* (such as the one above) can assume a  
65660 particular path for the shell, such a path is not necessarily valid on another system. The above  
65661 example is not portable, and is not intended to be.

65662 One reviewer suggested that an implementation of *system()* might want to use an environment  
65663 variable such as *SHELL* to determine which command interpreter to use. The supposed  
65664 implementation would use the default command interpreter if the one specified by the  
65665 environment variable was not available. This would allow a user, when using an application that  
65666 prompts for command lines to be processed using *system()*, to specify a different command  
65667 interpreter. Such an implementation is discouraged. If the alternate command interpreter did not  
65668 follow the command line syntax specified in the Shell and Utilities volume of POSIX.1-2008, then  
65669 changing *SHELL* would render *system()* non-conforming. This would affect applications that  
65670 expected the specified behavior from *system()*, and since the Shell and Utilities volume of  
65671 POSIX.1-2008 does not mention that *SHELL* affects *system()*, the application would not know  
65672 that it needed to unset *SHELL*.

65673 **FUTURE DIRECTIONS**

65674 None.

**tan()**65688 **NAME**

65689 tan, tanf, tanl — tangent function

65690 **SYNOPSIS**

```
65691 #include <math.h>
65692 double tan(double x);
65693 float tanf(float x);
65694 long double tanl(long double x);
```

65695 **DESCRIPTION**

65696 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 65697 conflict between the requirements described here and the ISO C standard is unintentional. This  
 65698 volume of POSIX.1-2008 defers to the ISO C standard.

65699 These functions shall compute the tangent of their argument  $x$ , measured in radians.

65700 An application wishing to check for error situations should set *errno* to zero and call  
 65701 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 65702 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 65703 zero, an error has occurred.

65704 **RETURN VALUE**

65705 Upon successful completion, these functions shall return the tangent of  $x$ .

65706 If the correct value would cause underflow, and is not representable, a range error may occur,  
 65707 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

65708 MX If  $x$  is NaN, a NaN shall be returned.

65709 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

65710 If  $x$  is subnormal, a range error may occur and  $x$  should be returned.

65711 If  $x$  is  $\pm\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 65712 defined value shall be returned.

65713 If the correct value would cause underflow, and is representable, a range error may occur and  
 65714 the correct value shall be returned.

65715 XSI If the correct value would cause overflow, a range error shall occur and *tan()*, *tanf()*, and *tanl()*  
 65716 shall return  $\pm\text{HUGE\_VAL}$ ,  $\pm\text{HUGE\_VALF}$ , and  $\pm\text{HUGE\_VALL}$ , respectively, with the same sign  
 65717 as the correct value of the function.

65718 **ERRORS**

65719 These functions shall fail if:

65720 MX **Domain Error** The value of  $x$  is  $\pm\text{Inf}$ .

65721 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 65722 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 65723 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 65724 shall be raised.

65725 XSI **Range Error** The result overflows

65726 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 65727 then *errno* shall be set to [ERANGE]. If the integer expression  
 65728 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 65729 floating-point exception shall be raised.

65730 These functions may fail if:

65731 MX Range Error The result underflows, or the value of  $x$  is subnormal.

65732 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
65733 then *errno* shall be set to [ERANGE]. If the integer expression  
65734 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
65735 floating-point exception shall be raised.

## 65736 EXAMPLES

### 65737 Taking the Tangent of a 45-Degree Angle

```
65738 #include <math.h>
65739 ...
65740 double radians = 45.0 * M_PI / 180;
65741 double result;
65742 ...
65743 result = tan (radians);
```

## 65744 APPLICATION USAGE

65745 There are no known floating-point representations such that for a normal argument,  $\tan(x)$  is  
65746 either overflow or underflow.

65747 These functions may lose accuracy when their argument is near a multiple of  $\pi/2$  or is far from  
65748 0.0.

65749 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
65750 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

## 65751 RATIONALE

65752 None.

## 65758 CHANGE HISTORY

65759 First released in Issue 1. Derived from Issue 1 of the SVID.

### 65760 Issue 5

65761 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes  
65762 in previous issues.

### 65763 Issue 6

65764 The [tanf\(\)](#) and [tanl\(\)](#) functions are added for alignment with the ISO/IEC 9899:1999 standard.

65765 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
65766 revised to align with the ISO/IEC 9899:1999 standard.

65767 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
65768 marked.

65769 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/64 is applied, correcting the last  
65770 paragraph in the RETURN VALUE section.

**tanh()**65771 **NAME**

65772 tanh, tanhf, tanhl — hyperbolic tangent functions

65773 **SYNOPSIS**

```
65774 #include <math.h>
65775 double tanh(double x);
65776 float tanhf(float x);
65777 long double tanhl(long double x);
```

65778 **DESCRIPTION**

65779 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 65780 conflict between the requirements described here and the ISO C standard is unintentional. This  
 65781 volume of POSIX.1-2008 defers to the ISO C standard.

65782 These functions shall compute the hyperbolic tangent of their argument  $x$ .

65783 An application wishing to check for error situations should set *errno* to zero and call  
 65784 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 65785 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 65786 zero, an error has occurred.

65787 **RETURN VALUE**

65788 Upon successful completion, these functions shall return the hyperbolic tangent of  $x$ .

65789 MX If  $x$  is NaN, a NaN shall be returned.

65790 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

65791 If  $x$  is  $\pm\text{Inf}$ ,  $\pm 1$  shall be returned.

65792 If  $x$  is subnormal, a range error may occur and  $x$  should be returned.

65793 **ERRORS**

65794 These functions may fail if:

65795 MX Range Error The value of  $x$  is subnormal.

65796 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 65797 then *errno* shall be set to [ERANGE]. If the integer expression  
 65798 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 65799 floating-point exception shall be raised.

65800 **EXAMPLES**

65801 None.

65802 **APPLICATION USAGE**

65803 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 65804 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

65805 **RATIONALE**

65830 **NAME**

65831 tcdrain — wait for transmission of output

65832 **SYNOPSIS**

```
65833 #include <termios.h>
65834 int tcdrain(int fildev);
```

65835 **DESCRIPTION**

65836 The *tcdrain()* function shall block until all output written to the object referred to by *fildev* is  
 65837 transmitted. The *fildev* argument is an open file descriptor associated with a terminal.

65838 Any attempts to use *tcdrain()* from a process which is a member of a background process group  
 65839 on a *fildev* associated with its controlling terminal, shall cause the process group to be sent a  
 65840 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process  
 65841 shall be allowed to perform the operation, and no signal is sent.

65842 **RETURN VALUE**

65843 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 65844 indicate the error.

65845 **ERRORS**

65846 The *tcdrain()* function shall fail if:

- 65847 [EBADF] The *fildev* argument is not a valid file descriptor.
- 65848 [EINTR] A signal interrupted *tcdrain()*.
- 65849 [ENOTTY] The file associated with *fildev* is not a terminal.

65850 The *tcdrain()* function may fail if:

- 65851 [EIO] The process group of the writing process is orphaned, and the writing process  
 65852 is not ignoring or blocking SIGTTOU.

65853 **EXAMPLES**

65854 None.

65855 **APPLICATION USAGE**

65856 None.

65857 **RATIONALE**

65858 None.

65859 **FUTURE DIRECTIONS**

65860 None.

65872 **NAME**

65873 tcflow — suspend or restart the transmission or reception of data

65874 **SYNOPSIS**

```
65875 #include <termios.h>
65876 int tcflow(int fildev, int action);
```

65877 **DESCRIPTION**

65878 The *tcflow()* function shall suspend or restart transmission or reception of data on the object  
 65879 referred to by *fildev*, depending on the value of *action*. The *fildev* argument is an open file  
 65880 descriptor associated with a terminal.

- 65881 • If *action* is TCOOFF, output shall be suspended.
- 65882 • If *action* is TCOON, suspended output shall be restarted.
- 65883 • If *action* is TCIOFF and *fildev* refers to a terminal device, the system shall transmit a STOP  
 65884 character, which is intended to cause the terminal device to stop transmitting data to the  
 65885 system. If *fildev* is associated with a pseudo-terminal, the STOP character need not be  
 65886 transmitted.
- 65887 • If *action* is TCION and *fildev* refers to a terminal device, the system shall transmit a START  
 65888 character, which is intended to cause the terminal device to start transmitting data to the  
 65889 system. If *fildev* is associated with a pseudo-terminal, the START character need not be  
 65890 transmitted.

65891 The default on the opening of a terminal file is that neither its input nor its output are  
 65892 suspended.

65893 Attempts to use *tcflow()* from a process which is a member of a background process group on a  
 65894 *fildev* associated with its controlling terminal, shall cause the process group to be sent a  
 65895 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process  
 65896 shall be allowed to perform the operation, and no signal is sent.

65897 **RETURN VALUE**

65898 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 65899 indicate the error.

65900 **ERRORS**

65901 The *tcflow()* function shall fail if:

- 65902 [EBADF] The *fildev* argument is not a valid file descriptor.
- 65903 [EINVAL] The *action* argument is not a supported value.
- 65904 [ENOTTY] The file associated with *fildev* is not a terminal.

65905 The *tcflow()* function may fail if:

- 65906 [EIO] The process group of the writing process is orphaned, and the writing process  
 65907 is not ignoring or blocking SIGTTOU.

**tcfLOW()**65908 **EXAMPLES**

65909 None.

65910 **APPLICATION USAGE**

65911 None.

65912 **RATIONALE**

65913 None.

65914 **FUTURE DIRECTIONS**

65915 None.

65916 **SEE ALSO**65917 [tcsendbreak\(\)](#)65918 XBD [Chapter 11](#) (on page 199), [<termios.h>](#)65919 **CHANGE HISTORY**

65920 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

65921 **Issue 6**65922 The following new requirements on POSIX implementations derive from alignment with the  
65923 Single UNIX Specification:

- 65924
- The [EIO] error is added.

65925 **Issue 7**65926 SD5-XSH-ERN-190 is applied, clarifying in the DESCRIPTION the transmission of START and  
65927 STOP characters.

65928 **NAME**

65929 tcflush — flush non-transmitted output data, non-read input data, or both

65930 **SYNOPSIS**

65931 #include &lt;termios.h&gt;

65932 int tcflush(int *fildev*, int *queue\_selector*);65933 **DESCRIPTION**65934 Upon successful completion, *tcflush()* shall discard data written to the object referred to by *fildev*  
65935 (an open file descriptor associated with a terminal) but not transmitted, or data received but not  
65936 read, depending on the value of *queue\_selector*:

- 65937 • If *queue\_selector* is TCIFLUSH, it shall flush data received but not read.
- 65938 • If *queue\_selector* is TCOFLUSH, it shall flush data written but not transmitted.
- 65939 • If *queue\_selector* is TCIOFLUSH, it shall flush both data received but not read and data  
65940 written but not transmitted.

65941 Attempts to use *tcflush()* from a process which is a member of a background process group on a  
65942 *fildev* associated with its controlling terminal shall cause the process group to be sent a SIGTTOU  
65943 signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be  
65944 allowed to perform the operation, and no signal is sent.

65945 **RETURN VALUE**65946 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
65947 indicate the error.65948 **ERRORS**65949 The *tcflush()* function shall fail if:

- 65950 [EBADF] The *fildev* argument is not a valid file descriptor.
- 65951 [EINVAL] The *queue\_selector* argument is not a supported value.
- 65952 [ENOTTY] The file associated with *fildev* is not a terminal.

65953 The *tcflush()* function may fail if:

- 65954 [EIO] The process group of the writing process is orphaned, and the writing process  
65955 is not ignoring or blocking SIGTTOU.

65956 **EXAMPLES**

65957 None.

65958 **APPLICATION USAGE**

65959 None.

65960 **RATIONALE**

65961 None.

65962 **FUTURE DIRECTIONS**

65963 None.

65964 **SEE ALSO**65965 [tcdrain\(\)](#)65966 XBD Chapter 11 (on page 199), [<termios.h>](#)

**tcflush()**65967 **CHANGE HISTORY**

65968 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

65969 **Issue 6**

65970 The Open Group Corrigendum U035/1 is applied. In the ERRORS and APPLICATION USAGE  
65971 sections, references to *tcflow()* are replaced with *tcflush()*.

65972 The following new requirements on POSIX implementations derive from alignment with the  
65973 Single UNIX Specification:

- 65974 • In the DESCRIPTION, the final paragraph is no longer conditional on  
65975 `_POSIX_JOB_CONTROL`. This is a FIPS requirement.
- 65976 • The [EIO] error is added.

65977 **NAME**

65978 tcgetattr — get the parameters associated with the terminal

65979 **SYNOPSIS**

65980 #include &lt;termios.h&gt;

65981 int tcgetattr(int *fildev*, struct termios \**termios\_p*);65982 **DESCRIPTION**65983 The *tcgetattr()* function shall get the parameters associated with the terminal referred to by *fildev* and store them in the **termios** structure referenced by *termios\_p*. The *fildev* argument is an open file descriptor associated with a terminal.65986 The *termios\_p* argument is a pointer to a **termios** structure.65987 The *tcgetattr()* operation is allowed from any process.65988 If the terminal device supports different input and output baud rates, the baud rates stored in the **termios** structure returned by *tcgetattr()* shall reflect the actual baud rates, even if they are equal. If differing baud rates are not supported, the rate returned as the output baud rate shall be the actual baud rate. If the terminal device does not support split baud rates, the input baud rate stored in the **termios** structure shall be the output rate (as one of the symbolic values).65993 **RETURN VALUE**65994 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.65996 **ERRORS**65997 The *tcgetattr()* function shall fail if:65998 [EBADF] The *fildev* argument is not a valid file descriptor.65999 [ENOTTY] The file associated with *fildev* is not a terminal.66000 **EXAMPLES**

66001 None.

66002 **APPLICATION USAGE**

66003 None.

66004 **RATIONALE**66005 Care must be taken when changing the terminal attributes. Applications should always do a *tcgetattr()*, save the **termios** structure values returned, and then do a *tcsetattr()*, changing only the necessary fields. The application should use the values saved from the *tcgetattr()* to reset the terminal state whenever it is done with the terminal. This is necessary because terminal attributes apply to the underlying port and not to each individual open instance; that is, all processes that have used the terminal see the latest attribute changes.

66011 A program that uses these functions should be written to catch all signals and take other appropriate actions to ensure that when the program terminates, whether planned or not, the terminal device's state is restored to its original state.

66014 Existing practice dealing with error returns when only part of a request can be honored is based on calls to the *ioctl()* function. In historical BSD and System V implementations, the corresponding *ioctl()* returns zero if the requested actions were semantically correct, even if some of the requested changes could not be made. Many existing applications assume this behavior and would no longer work correctly if the return value were changed from zero to -1 in this case.

66020 Note that either specification has a problem. When zero is returned, it implies everything

**tcgetattr()**

66021 succeeded even if some of the changes were not made. When -1 is returned, it implies  
66022 everything failed even though some of the changes were made.

66023 Applications that need all of the requested changes made to work properly should follow  
66024 *tcsetattr()* with a call to *tcgetattr()* and compare the appropriate field values.

**66025 FUTURE DIRECTIONS**

66026 None.

**66027 SEE ALSO**

66028 [tcsetattr\(\)](#)

66029 XBD [Chapter 11](#) (on page 199), [<termios.h>](#)

**66030 CHANGE HISTORY**

66031 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**66032 Issue 6**

66033 In the DESCRIPTION, the rate returned as the input baud rate shall be the output rate.  
66034 Previously, the number zero was also allowed but was obsolescent.

66035 **NAME**

66036 tcgetpgrp — get the foreground process group ID

66037 **SYNOPSIS**

```
66038 #include <unistd.h>
66039 pid_t tcgetpgrp(int fildes);
```

66040 **DESCRIPTION**

66041 The *tcgetpgrp()* function shall return the value of the process group ID of the foreground process  
66042 group associated with the terminal.

66043 If there is no foreground process group, *tcgetpgrp()* shall return a value greater than 1 that does  
66044 not match the process group ID of any existing process group.

66045 The *tcgetpgrp()* function is allowed from a process that is a member of a background process  
66046 group; however, the information may be subsequently changed by a process that is a member of  
66047 a foreground process group.

66048 **RETURN VALUE**

66049 Upon successful completion, *tcgetpgrp()* shall return the value of the process group ID of the  
66050 foreground process associated with the terminal. Otherwise, -1 shall be returned and *errno* set to  
66051 indicate the error.

66052 **ERRORS**

66053 The *tcgetpgrp()* function shall fail if:

- |       |          |   |
|-------|----------|---|
| 66054 | [EBADF]  | The <i>fildes</i> argument is not a valid file descriptor.  |
| 66055 | [ENOTTY] | The calling process does not have a controlling terminal, or the file is not the<br>66056 controlling terminal. |

66057 **EXAMPLES**

66058 None.

66059 **APPLICATION USAGE**

66060 None.

66061 **RATIONALE**

66062 None.

66063 **FUTURE DIRECTIONS**

66064 None.

66065 **SEE ALSO**

66066 *setsid()*, *setpgid()*, *tcsetpgrp()*  
66067 XBD [<sys/types.h>](#), [<unistd.h>](#)

66068 **CHANGE HISTORY**

66069 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

66070 **Issue 6**

66071 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

66072 The following new requirements on POSIX implementations derive from alignment with the  
66073 Single UNIX Specification:

- 66074 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
66075 required for conforming implementations of previous POSIX specifications, it was not  
66076 required for UNIX applications.

## tcgetpgrp()

66077  
66078

- In the DESCRIPTION, text previously conditional on support for `_POSIX_JOB_CONTROL` is now mandatory. This is a FIPS requirement.

66079 **NAME**

66080 tcgetsid — get the process group ID for the session leader for the controlling terminal

66081 **SYNOPSIS**

66082 #include &lt;termios.h&gt;

66083 pid\_t tcgetsid(int *fildev*);66084 **DESCRIPTION**66085 The *tcgetsid()* function shall obtain the process group ID of the session for which the terminal  
66086 specified by *fildev* is the controlling terminal.66087 **RETURN VALUE**66088 Upon successful completion, *tcgetsid()* shall return the process group ID of the session  
66089 associated with the terminal. Otherwise, a value of (**pid\_t**)-1 shall be returned and *errno* set to  
66090 indicate the error.66091 **ERRORS**66092 The *tcgetsid()* function shall fail if:66093 [EBADF] The *fildev* argument is not a valid file descriptor.66094 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the  
66095 controlling terminal.66096 **EXAMPLES**

66097 None.

66098 **APPLICATION USAGE**

66099 None.

66100 **RATIONALE**

66101 None.

66102 **FUTURE DIRECTIONS**

66103 None.

66104 **SEE ALSO**

66105 XBD &lt;termios.h&gt;

66106 **CHANGE HISTORY**

66107 First released in Issue 4, Version 2.

66108 **Issue 5**

66109 Moved from X/OPEN UNIX extension to BASE.

66110 The [EACCES] error has been removed from the list of mandatory errors, and the description of  
66111 [ENOTTY] has been reworded.66112 **Issue 7**

66113 SD5-XSH-ERN-180 is applied, clarifying the RETURN VALUE section.

66114 The *tcgetsid()* function is moved from the XSI option to the Base.

**tcsendbreak()**66115 **NAME**66116 `tcsendbreak` — send a break for a specific duration66117 **SYNOPSIS**66118 `#include <termios.h>`66119 `int tcsendbreak(int fildev, int duration);`66120 **DESCRIPTION**

66121 If the terminal is using asynchronous serial data transmission, `tcsendbreak()` shall cause  
 66122 transmission of a continuous stream of zero-valued bits for a specific duration. If *duration* is 0, it  
 66123 shall cause transmission of zero-valued bits for at least 0.25 seconds, and not more than 0.5  
 66124 seconds. If *duration* is not 0, it shall send zero-valued bits for an implementation-defined period  
 66125 of time.

66126 The *fildev* argument is an open file descriptor associated with a terminal.

66127 If the terminal is not using asynchronous serial data transmission, it is implementation-defined  
 66128 whether `tcsendbreak()` sends data to generate a break condition or returns without taking any  
 66129 action.

66130 Attempts to use `tcsendbreak()` from a process which is a member of a background process group  
 66131 on a *fildev* associated with its controlling terminal shall cause the process group to be sent a  
 66132 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process  
 66133 shall be allowed to perform the operation, and no signal is sent.

66134 **RETURN VALUE**

66135 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 66136 indicate the error.

66137 **ERRORS**

66138 The `tcsendbreak()` function shall fail if:

66139 [EBADF] The *fildev* argument is not a valid file descriptor.

66140 [ENOTTY] The file associated with *fildev* is not a terminal.

66141 The `tcsendbreak()` function may fail if:

66142 [EIO] The process group of the writing process is orphaned, and the writing process  
 66143 is not ignoring or blocking SIGTTOU.

66144 **EXAMPLES**

66145 None.

66146 **APPLICATION USAGE**

66147 None.

66148 **RATIONALE**

66149 None.

66150 **FUTURE DIRECTIONS**

66151 None.

66152 **SEE ALSO**

66153 XBD [Chapter 11](#) (on page 199), `<termios.h>`

66154 **CHANGE HISTORY**

66155 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

66156 **Issue 6**

66157 The following new requirements on POSIX implementations derive from alignment with the  
66158 Single UNIX Specification:

- 66159 • In the DESCRIPTION, text previously conditional on `_POSIX_JOB_CONTROL` is now  
66160 mandated. This is a FIPS requirement.
- 66161 • The [EIO] error is added.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**tcsetattr()**66162 **NAME**

66163 tcsetattr — set the parameters associated with the terminal

66164 **SYNOPSIS**

```
66165 #include <termios.h>
66166 int tcsetattr(int fildev, int optional_actions,
66167               const struct termios *termios_p);
```

66168 **DESCRIPTION**

66169 The *tcsetattr()* function shall set the parameters associated with the terminal referred to by the  
 66170 open file descriptor *fildev* (an open file descriptor associated with a terminal) from the **termios**  
 66171 structure referenced by *termios\_p* as follows:

- 66172 • If *optional\_actions* is TCSANOW, the change shall occur immediately.
- 66173 • If *optional\_actions* is TCSADRAIN, the change shall occur after all output written to *fildev* is  
 66174 transmitted. This function should be used when changing parameters that affect output.
- 66175 • If *optional\_actions* is TCSAFLUSH, the change shall occur after all output written to *fildev* is  
 66176 transmitted, and all input so far received but not read shall be discarded before the change  
 66177 is made.

66178 If the output baud rate stored in the **termios** structure pointed to by *termios\_p* is the zero baud  
 66179 rate, B0, the modem control lines shall no longer be asserted. Normally, this shall disconnect the  
 66180 line.

66181 If the input baud rate stored in the **termios** structure pointed to by *termios\_p* is 0, the input baud  
 66182 rate given to the hardware is the same as the output baud rate stored in the **termios** structure.

66183 The *tcsetattr()* function shall return successfully if it was able to perform any of the requested  
 66184 actions, even if some of the requested actions could not be performed. It shall set all the  
 66185 attributes that the implementation supports as requested and leave all the attributes not  
 66186 supported by the implementation unchanged. If no part of the request can be honored, it shall  
 66187 return  $-1$  and set *errno* to [EINVAL]. If the input and output baud rates differ and are a  
 66188 combination that is not supported, neither baud rate shall be changed. A subsequent call to  
 66189 *tcgetattr()* shall return the actual state of the terminal device (reflecting both the changes made  
 66190 and not made in the previous *tcsetattr()* call). The *tcsetattr()* function shall not change the values  
 66191 found in the **termios** structure under any circumstances.

66192 The effect of *tcsetattr()* is undefined if the value of the **termios** structure pointed to by *termios\_p*  
 66193 was not derived from the result of a call to *tcgetattr()* on *fildev*; an application should modify  
 66194 only fields and flags defined by this volume of POSIX.1-2008 between the call to *tcgetattr()* and  
 66195 *tcsetattr()*, leaving all other fields and flags unmodified.

66196 No actions defined by this volume of POSIX.1-2008, other than a call to *tcsetattr()*, a close of the  
 66197 last file descriptor in the system associated with this terminal device, or an open of the first file  
 66198 descriptor in the system associated with this terminal device (using the O\_TTY\_INIT flag if it is  
 66199 non-zero and the device is not a pseudo-terminal), shall cause any of the terminal attributes  
 66200 defined by this volume of POSIX.1-2008 to change.

66201 If *tcsetattr()* is called from a process which is a member of a background process group on a *fildev*  
 66202 associated with its controlling terminal:

- 66203 • If the calling process is blocking or ignoring SIGTTOU signals, the operation completes  
 66204 normally and no signal is sent.

- 66205 • Otherwise, a SIGTTOU signal shall be sent to the process group.

**66206 RETURN VALUE**

66207 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
66208 indicate the error.

**66209 ERRORS**

66210 The *tcsetattr()* function shall fail if:

66211 [EBADF] The *fildev* argument is not a valid file descriptor.

66212 [EINTR] A signal interrupted *tcsetattr()*.

66213 [EINVAL] The *optional\_actions* argument is not a supported value, or an attempt was  
66214 made to change an attribute represented in the **termios** structure to an  
66215 unsupported value.

66216 [ENOTTY] The file associated with *fildev* is not a terminal.

66217 The *tcsetattr()* function may fail if:

66218 [EIO] The process group of the writing process is orphaned, and the writing process  
66219 is not ignoring or blocking SIGTTOU.

**66220 EXAMPLES**

66221 None.

**66222 APPLICATION USAGE**

66223 If trying to change baud rates, applications should call *tcsetattr()* then call *tcgetattr()* in order to  
66224 determine what baud rates were actually selected.

66225 In general, there are two reasons for an application to change the parameters associated with a  
66226 terminal device:

66227 1. The device already has working parameter settings but the application needs a different  
66228 behavior, such as non-canonical mode instead of canonical mode. The application sets (or  
66229 clears) only a few flags or *c\_cc[]* values. Typically, the terminal device in this case is either  
66230 the controlling terminal for the process or a pseudo-terminal.

66231 2. The device is a modem or similar piece of equipment connected by a serial line, and it  
66232 was not open before the application opened it. In this case, the application needs to  
66233 initialize all of the parameter settings "from scratch". However, since the **termios**  
66234 structure may include both standard and non-standard parameters, the application  
66235 cannot just initialize the whole structure in an arbitrary way (e.g., using *memset()*) as this  
66236 may cause some of the non-standard parameters to be set incorrectly, resulting in non-  
66237 conforming behavior of the terminal device. Conversely, the application cannot just set  
66238 the standard parameters, assuming that the non-standard parameters will already have  
66239 suitable values, as the device might previously have been used with non-conforming  
66240 parameter settings (and some implementations retain the settings from one use to the  
66241 next). The solution is to open the terminal device using the O\_TTY\_INIT flag to initialize  
66242 the terminal device to have conforming parameter settings, obtain those settings using  
66243 *tcgetattr()*, and then set all of the standard parameters to the desired settings.

**66244 RATIONALE**

66245 The *tcsetattr()* function can be interrupted in the following situations:

- 66246 • It is interrupted while waiting for output to drain.

**tcsetattr()**

66247 • It is called from a process in a background process group and SIGTTOU is caught.

66248 See also the RATIONALE section in *tcgetattr()*.

**FUTURE DIRECTIONS**

66250 Using an input baud rate of 0 to set the input rate equal to the output rate may not necessarily be supported in a future version of this volume of POSIX.1-2008.

66254 XBD Chapter 11 (on page 199), `<termios.h>`

**CHANGE HISTORY**

66256 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 6**

66257 The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

66260 • In the DESCRIPTION, text previously conditional on `_POSIX_JOB_CONTROL` is now mandated. This is a FIPS requirement.

66262 • The [EIO] error is added.

66263 In the DESCRIPTION, the text describing use of *tcsetattr()* from a process which is a member of a background process group is clarified.

**Issue 7**

66266 Austin Group Interpretation 1003.1-2001 #144 is applied.

66267 **NAME**

66268 tcsetpgrp — set the foreground process group ID

66269 **SYNOPSIS**

66270 #include &lt;unistd.h&gt;

66271 int tcsetpgrp(int *fildev*, pid\_t *pgid\_id*);66272 **DESCRIPTION**

66273 If the process has a controlling terminal, *tcsetpgrp()* shall set the foreground process group ID  
 66274 associated with the terminal to *pgid\_id*. The application shall ensure that the file associated with  
 66275 *fildev* is the controlling terminal of the calling process and the controlling terminal is currently  
 66276 associated with the session of the calling process. The application shall ensure that the value of  
 66277 *pgid\_id* matches a process group ID of a process in the same session as the calling process.

66278 Attempts to use *tcsetpgrp()* from a process which is a member of a background process group on  
 66279 a *fildev* associated with its controlling terminal shall cause the process group to be sent a  
 66280 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process  
 66281 shall be allowed to perform the operation, and no signal is sent.

66282 **RETURN VALUE**

66283 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
 66284 indicate the error.

66285 **ERRORS**66286 The *tcsetpgrp()* function shall fail if:66287 [EBADF] The *fildev* argument is not a valid file descriptor.66288 [EINVAL] This implementation does not support the value in the *pgid\_id* argument.

66289 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the  
 66290 controlling terminal, or the controlling terminal is no longer associated with  
 66291 the session of the calling process.

66292 [EPERM] The value of *pgid\_id* is a value supported by the implementation, but does not  
 66293 match the process group ID of a process in the same session as the calling  
 66294 process.

66295 **EXAMPLES**

66296 None.

66297 **APPLICATION USAGE**

66298 None.

66299 **RATIONALE**

66300 None.

66301 **FUTURE DIRECTIONS**

66302 None.

66303 **SEE ALSO**66304 *tcgetpgrp()*

66305 XBD &lt;sys/types.h&gt;, &lt;unistd.h&gt;

66306 **CHANGE HISTORY**

66307 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**tcsetpgrp()**66308 **Issue 6**

66309 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

66310 The following new requirements on POSIX implementations derive from alignment with the  
66311 Single UNIX Specification:

66312 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
66313 required for conforming implementations of previous POSIX specifications, it was not  
66314 required for UNIX applications.

66315 • In the DESCRIPTION and ERRORS sections, text previously conditional on  
66316 `_POSIX_JOB_CONTROL` is now mandated. This is a FIPS requirement.

66317 The normative text is updated to avoid use of the term “must” for application requirements.

66318 The Open Group Corrigendum U047/4 is applied.

66319 **NAME**

66320 tdelete, tfind, tsearch, twalk — manage a binary search tree

66321 **SYNOPSIS**

```

66322 XSI #include <search.h>
66323 void *tdelete(const void *restrict key, void **restrict rootp,
66324             int(*compar)(const void *, const void *));
66325 void *tfind(const void *key, void *const *rootp,
66326            int(*compar)(const void *, const void *));
66327 void *tsearch(const void *key, void **rootp,
66328              int (*compar)(const void *, const void *));
66329 void twalk(const void *root,
66330            void (*action)(const void *, VISIT, int));

```

66331 **DESCRIPTION**

66332 The *tdelete()*, *tfind()*, *tsearch()*, and *twalk()* functions manipulate binary search trees.  
66333 Comparisons are made with a user-supplied routine, the address of which is passed as the  
66334 *compar* argument. This routine is called with two arguments, which are the pointers to the  
66335 elements being compared. The application shall ensure that the user-supplied routine returns an  
66336 integer less than, equal to, or greater than 0, according to whether the first argument is to be  
66337 considered less than, equal to, or greater than the second argument. The comparison function  
66338 need not compare every byte, so arbitrary data may be contained in the elements in addition to  
66339 the values being compared.

66340 The *tsearch()* function shall build and access the tree. The *key* argument is a pointer to an element  
66341 to be accessed or stored. If there is a node in the tree whose element is equal to the value pointed  
66342 to by *key*, a pointer to this found node shall be returned. Otherwise, the value pointed to by *key*  
66343 shall be inserted (that is, a new node is created and the value of *key* is copied to this node), and a  
66344 pointer to this node returned. Only pointers are copied, so the application shall ensure that the  
66345 calling routine stores the data. The *rootp* argument points to a variable that points to the root  
66346 node of the tree. A null pointer value for the variable pointed to by *rootp* denotes an empty tree;  
66347 in this case, the variable shall be set to point to the node which shall be at the root of the new  
66348 tree.

66349 Like *tsearch()*, *tfind()* shall search for a node in the tree, returning a pointer to it if found.  
66350 However, if it is not found, *tfind()* shall return a null pointer. The arguments for *tfind()* are the  
66351 same as for *tsearch()*.

66352 The *tdelete()* function shall delete a node from a binary search tree. The arguments are the same  
66353 as for *tsearch()*. The variable pointed to by *rootp* shall be changed if the deleted node was the  
66354 root of the tree. The *tdelete()* function shall return a pointer to the parent of the deleted node, or  
66355 an unspecified non-null pointer if the deleted node was the root node, or a null pointer if the  
66356 node is not found.

66357 If *tsearch()* adds an element to a tree, or *tdelete()* successfully deletes an element from a tree, the  
66358 concurrent use of that tree in another thread, or use of pointers produced by a previous call to  
66359 *tfind()* or *tsearch()*, produces undefined results.

66360 The *twalk()* function shall traverse a binary search tree. The *root* argument is a pointer to the root  
66361 node of the tree to be traversed. (Any node in a tree may be used as the root for a walk below  
66362 that node.) The argument *action* is the name of a routine to be invoked at each node. This routine  
66363 is, in turn, called with three arguments. The first argument shall be the address of the node being  
66364 visited. The structure pointed to by this argument is unspecified and shall not be modified by  
66365 the application, but it shall be possible to cast a pointer-to-node into a pointer-to-pointer-to-

**tdelete()**

66366 element to access the element stored in the node. The second argument shall be a value from an  
66367 enumeration data type:

```
66368 typedef enum { preorder, postorder, endorder, leaf } VISIT;
```

66369 (defined in `<search.h>`), depending on whether this is the first, second, or third time that the  
66370 node is visited (during a depth-first, left-to-right traversal of the tree), or whether the node is a  
66371 leaf. The third argument shall be the level of the node in the tree, with the root being level 0.

66372 If the calling function alters the pointer to the root, the result is undefined.

66373 If the functions pointed to by *action* or *compar* (for any of these binary search functions) change  
66374 the tree, the results are undefined.

66375 These functions are thread-safe only as long as multiple threads do not access the same tree.

**RETURN VALUE**

66376 If the node is found, both *tsearch()* and *tfind()* shall return a pointer to it. If not, *tfind()* shall  
66377 return a null pointer, and *tsearch()* shall return a pointer to the inserted item.

66379 A null pointer shall be returned by *tsearch()* if there is not enough space available to create a new  
66380 node.

66381 A null pointer shall be returned by *tdelete()*, *tfind()*, and *tsearch()* if *rootp* is a null pointer on  
66382 entry.

66383 The *tdelete()* function shall return a pointer to the parent of the deleted node, or an unspecified  
66384 non-null pointer if the deleted node was the root node, or a null pointer if the node is not found.

66385 The *twalk()* function shall not return a value.

**ERRORS**

66386 No errors are defined.  
66387

**EXAMPLES**

66388 The following code reads in strings and stores structures containing a pointer to each string and  
66389 a count of its length. It then walks the tree, printing out the stored strings and their lengths in  
66390 alphabetical order.  
66391

```
66392 #include <search.h>
66393 #include <string.h>
66394 #include <stdio.h>
66395 #define STRSZ 10000
66396 #define NODSZ 500
66397 struct node { /* Pointers to these are stored in the tree. */
66398     char *string;
66399     int length;
66400 };
66401 char string_space[STRSZ]; /* Space to store strings. */
66402 struct node nodes[NODSZ]; /* Nodes to store. */
66403 void *root = NULL; /* This points to the root. */
66404 int main(int argc, char *argv[])
66405 {
66406     char *strptr = string_space;
66407     struct node *nodeptr = nodes;
66408     void print_node(const void *, VISIT, int);
```

```

66409         int    i = 0, node_compare(const void *, const void *);
66410         while (gets(strptr) != NULL && i++ < NODSZ) {
66411             /* Set node. */
66412             nodeptr->string = strptr;
66413             nodeptr->length = strlen(strptr);
66414             /* Put node into the tree. */
66415             (void) tsearch((void *)nodeptr, (void **)&root,
66416                 node_compare);
66417             /* Adjust pointers, so we do not overwrite tree. */
66418             strptr += nodeptr->length + 1;
66419             nodeptr++;
66420         }
66421         twalk(root, print_node);
66422         return 0;
66423     }
66424     /*
66425     * This routine compares two nodes, based on an
66426     * alphabetical ordering of the string field.
66427     */
66428     int
66429     node_compare(const void *node1, const void *node2)
66430     {
66431         return strcmp(((const struct node *) node1)->string,
66432             ((const struct node *) node2)->string);
66433     }
66434     /*
66435     * This routine prints out a node, the second time
66436     * twalk encounters it or if it is a leaf.
66437     */
66438     void
66439     print_node(const void *ptr, VISIT order, int level)
66440     {
66441         const struct node *p = *(const struct node **) ptr;
66442         if (order == postorder || order == leaf) {
66443             (void) printf("string = %s, length = %d\n",
66444                 p->string, p->length);
66445         }
66446     }

```

**APPLICATION USAGE**

The *root* argument to *twalk()* is one level of indirection less than the *rootp* arguments to *tdelete()* and *tsearch()*.

There are two nomenclatures used to refer to the order in which tree nodes are visited. The *tsearch()* function uses **preorder**, **postorder**, and **endorder** to refer respectively to visiting a node before any of its children, after its left child and before its right, and after both its children. The alternative nomenclature uses **preorder**, **inorder**, and **postorder** to refer to the same visits, which could result in some confusion over the meaning of **postorder**.

Since the return value of *tdelete()* is an unspecified non-null pointer in the case that the root of the tree has been deleted, applications should only use the return value of *tdelete()* as indication

**tdelete()**

66457 of success or failure and should not assume it can be dereferenced. Some implementations in this  
66458 case will return a pointer to the new root of the tree (or to an empty tree if the deleted root node  
66459 was the only node in the tree); other implementations return arbitrary non-null pointers.

**RATIONALE**

66460 None.  
66461

**FUTURE DIRECTIONS**

66462 None.

**CHANGE HISTORY**

66467 First released in Issue 1. Derived from Issue 1 of the SVID.  
66468

**Issue 5**

66469 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
66470 previous issues.  
66471

**Issue 6**

66472 The normative text is updated to avoid use of the term “must” for application requirements.  
66473

66474 The **restrict** keyword is added to the *tdelete()* prototype for alignment with the  
66475 ISO/IEC 9899:1999 standard.

**Issue 7**

66476 Austin Group Interpretation 1003.1-2001 #149 is applied, clarifying concurrent use of the tree in  
66477 another thread.  
66478

66479 Austin Group Interpretation 1003.1-2001 #151 is applied, clarifying behavior for *tdelete()* when  
66480 the deleted node is the root node.

66481 Austin Group Interpretation 1003.1-2001 #153 is applied.

66482 **NAME**

66483 telldir — current location of a named directory stream

66484 **SYNOPSIS**

```
66485 XSI #include <dirent.h>
66486 long telldir(DIR *dirp);
```

66487 **DESCRIPTION**

66488 The *telldir()* function shall obtain the current location associated with the directory stream  
 66489 specified by *dirp*.

66490 If the most recent operation on the directory stream was a *seekdir()*, the directory position  
 66491 returned from the *telldir()* shall be the same as that supplied as a *loc* argument for *seekdir()*.

66492 **RETURN VALUE**

66493 Upon successful completion, *telldir()* shall return the current location of the specified directory  
 66494 stream.

66495 **ERRORS**

66496 No errors are defined.

66497 **EXAMPLES**

66498 None.

66499 **APPLICATION USAGE**

66500 None.

66501 **RATIONALE**

66502 None.

66508 **CHANGE HISTORY**

66509 First released in Issue 2.

**tempnam()**66510 **NAME**

66511 tempnam — create a name for a temporary file

66512 **SYNOPSIS**

```
66513 OB XSI #include <stdio.h>
66514 char *tempnam(const char *dir, const char *pfx);
```

66515 **DESCRIPTION**66516 The *tempnam()* function shall generate a pathname that may be used for a temporary file.

66517 The *tempnam()* function allows the user to control the choice of a directory. The *dir* argument  
 66518 points to the name of the directory in which the file is to be created. If *dir* is a null pointer or  
 66519 points to a string which is not a name for an appropriate directory, the path prefix defined as  
 66520 P\_tmpdir in the **<stdio.h>** header shall be used. If that directory is not accessible, an  
 66521 implementation-defined directory may be used.

66522 Many applications prefer their temporary files to have certain initial letter sequences in their  
 66523 names. The *pfx* argument should be used for this. This argument may be a null pointer or point  
 66524 to a string of up to five bytes to be used as the beginning of the filename.

66525 Some implementations of *tempnam()* may use *tmpnam()* internally. On such implementations, if  
 66526 called more than {TMP\_MAX} times in a single process, the behavior is implementation-defined.

66527 **RETURN VALUE**

66528 Upon successful completion, *tempnam()* shall allocate space for a string, put the generated  
 66529 pathname in that space, and return a pointer to it. The pointer shall be suitable for use in a  
 66530 subsequent call to *free()*. Otherwise, it shall return a null pointer and set *errno* to indicate the  
 66531 error.

66532 **ERRORS**

66533 The *tempnam()* function shall fail if:

66534 [ENOMEM] Insufficient storage space is available.

66535 **EXAMPLES**66536 **Generating a Pathname**

66537 The following example generates a pathname for a temporary file in directory **/tmp**, with the  
 66538 prefix *file*. After the filename has been created, the call to *free()* deallocates the space used to  
 66539 store the filename.

```
66540 #include <stdio.h>
66541 #include <stdlib.h>
66542 .
66543 char *directory = "/tmp";
66544 char *fileprefix = "file";
66545 char *file;

66546 file = tempnam(directory, fileprefix);
66547 free(file);
```

66548 **APPLICATION USAGE**

66549 This function only creates pathnames. It is the application's responsibility to create and remove  
 66550 the files. Between the time a pathname is created and the file is opened, it is possible for some  
 66551 other process to create a file with the same name. Applications may find *tmpfile()* more useful.

66552 Applications should use the *tmpfile()*, *mkdtemp()*, or *mkstemp()* functions instead of the

66553 obsolescent *tempnam()* function.

66554 **RATIONALE**

66555 None.

66556 **FUTURE DIRECTIONS**

66557 The *tempnam()* function may be removed in a future version.

66558 **SEE ALSO**

66559 *fopen()*, *free()*, *open()*, *tmpfile()*, *tmpnam()*, *unlink()*

66560 XBD <stdio.h>

66561 **CHANGE HISTORY**

66562 First released in Issue 1. Derived from Issue 1 of the SVID.

66563 **Issue 5**

66564 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in  
66565 previous issues.

66566 **Issue 7**

66567 The *tempnam()* function is marked obsolescent.

**tfind()**66568 **NAME**

66569           tfind — search binary search tree

66570 **SYNOPSIS**

```
66571 XSI       #include <search.h>
66572       void *tfind(const void *key, void *const *rootp,
66573           int (*compar)(const void *, const void *));
```

66574 **DESCRIPTION**66575       Refer to *tdelete()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

66576 **NAME**

66577 tgamma, tgammaf, tgammal — compute gamma() function

66578 **SYNOPSIS**

```
66579 #include <math.h>
66580 double tgamma(double x);
66581 float tgammaf(float x);
66582 long double tgammal(long double x);
```

66583 **DESCRIPTION**

66584 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 66585 conflict between the requirements described here and the ISO C standard is unintentional. This  
 66586 volume of POSIX.1-2008 defers to the ISO C standard.

66587 These functions shall compute the *gamma()* function of *x*.

66588 An application wishing to check for error situations should set *errno* to zero and call  
 66589 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 66590 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 66591 zero, an error has occurred.

66592 **RETURN VALUE**

66593 Upon successful completion, these functions shall return *Gamma(x)*.

66594 CX If *x* is a negative integer, a domain error may occur and either a NaN (if supported) or an  
 66595 MX implementation-defined value shall be returned. On systems that support the IEC 60559  
 66596 Floating-Point option, a domain error shall occur and a NaN shall be returned.

66597 If *x* is  $\pm 0$ , *tgamma()*, *tgammaf()*, and *tgammal()* shall return  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, and  
 66598 MX  $\pm$ HUGE\_VALL, respectively. On systems that support the IEC 60559 Floating-Point option, a  
 66599 pole error shall occur;

66600 CX otherwise, a pole error may occur.

66601 If the correct value would cause overflow, a range error shall occur and *tgamma()*, *tgammaf()*,  
 66602 and *tgammal()* shall return  $\pm$ HUGE\_VAL,  $\pm$ HUGE\_VALF, or  $\pm$ HUGE\_VALL, respectively, with  
 66603 the same sign as the correct value of the function.

66604 MX If *x* is NaN, a NaN shall be returned.

66605 If *x* is +Inf, *x* shall be returned.

66606 If *x* is -Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-  
 66607 defined value shall be returned.

66608 **ERRORS**

66609 These functions shall fail if:

66610 MX **Domain Error** The value of *x* is a negative integer, or *x* is -Inf.

66611 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 66612 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 66613 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 66614 shall be raised.

66615 MX **Pole Error** The value of *x* is zero.

66616 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 66617 then *errno* shall be set to [ERANGE]. If the integer expression  
 66618 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 66619 floating-point exception shall be raised.

**tgamma()**

66620	Range Error	The value overflows.
66621		If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
66622		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
66623		( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the overflow
66624		floating-point exception shall be raised.
66625	These functions may fail if:	
66626	Domain Error	The value of <i>x</i> is a negative integer.
66627		If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
66628		then <i>errno</i> shall be set to [EDOM]. If the integer expression ( <i>math_errhandling</i>
66629		& MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
66630		shall be raised.
66631	Pole Error	The value of <i>x</i> is zero.
66632		If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero,
66633		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
66634		( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
66635		floating-point exception shall be raised.

66636 **EXAMPLES**

66637 None.

66638 **APPLICATION USAGE**66639 For IEEE Std 754-1985 **double**, overflow happens when  $0 < x < 1/\text{DBL\_MAX}$ , and  $171.7 < x$ .66640 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
66641 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.66642 **RATIONALE**66643 This function is named *tgamma()* in order to avoid conflicts with the historical *gamma()* and  
66644 *lgamma()* functions.66645 **FUTURE DIRECTIONS**66646 It is possible that the error response for a negative integer argument may be changed to a pole  
66647 error and a return value of  $\pm\text{Inf}$ .66648 **SEE ALSO**66649 [feclearexcept\(\)](#), [fetestexcept\(\)](#), [lgamma\(\)](#)66650 XBD Section 4.19 (on page 116), [<math.h>](#)66651 **CHANGE HISTORY**

66652 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

66653 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/65 is applied, correcting the third  
66654 paragraph in the RETURN VALUE section.66655 **Issue 7**

66656 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #52 (SD5-XSH-ERN-85) is applied.

66657 **NAME**66658 `time` — get time66659 **SYNOPSIS**

```
66660 #include <time.h>
66661 time_t time(time_t *tloc);
```

66662 **DESCRIPTION**

66663 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 66664 conflict between the requirements described here and the ISO C standard is unintentional. This  
 66665 volume of POSIX.1-2008 defers to the ISO C standard.

66666 CX The `time()` function shall return the value of time in seconds since the Epoch.

66667 The `tloc` argument points to an area where the return value is also stored. If `tloc` is a null pointer,  
 66668 no value is stored.

66669 **RETURN VALUE**

66670 Upon successful completion, `time()` shall return the value of time. Otherwise, `(time_t)-1` shall be  
 66671 returned.

66672 **ERRORS**

66673 No errors are defined.

66674 **EXAMPLES**66675 **Getting the Current Time**

66676 The following example uses the `time()` function to calculate the time elapsed, in seconds, since  
 66677 the Epoch, `localtime()` to convert that value to a broken-down time, and `asctime()` to convert the  
 66678 broken-down time values into a printable string.

```
66679 #include <stdio.h>
66680 #include <time.h>
66681 int main(void)
66682 {
66683     time_t result;
66684     result = time(NULL);
66685     printf("%s%ju secs since the Epoch\n",
66686           asctime(localtime(&result)),
66687           (uintmax_t)result);
66688     return(0);
66689 }
```

66690 This example writes the current time to `stdout` in a form like this:

```
66691 Wed Jun 26 10:32:15 1996
66692 835810335 secs since the Epoch
```

**time()**66693 **Timing an Event**

66694 The following example gets the current time, prints it out in the user's format, and prints the  
66695 number of minutes to an event being timed.

```
66696 #include <time.h>
66697 #include <stdio.h>
66698 ...
66699 time_t now;
66700 int minutes_to_event;
66701 ...
66702 time(&now);
66703 minutes_to_event = ...;
66704 printf("The time is ");
66705 puts(asctime(localtime(&now)));
66706 printf("There are %d minutes to the event.\n",
66707     minutes_to_event);
66708 ...
```

66709 **APPLICATION USAGE**

66710 None.

66711 **RATIONALE**

66712 The *time()* function returns a value in seconds (type **time\_t**) while *times()* returns a set of values  
66713 in clock ticks (type **clock\_t**). Some historical implementations, such as 4.3 BSD, have  
66714 mechanisms capable of returning more precise times (see below). A generalized timing scheme  
66715 to unify these various timing mechanisms has been proposed but not adopted.

66716 Implementations in which **time\_t** is a 32-bit signed integer (many historical implementations)  
66717 fail in the year 2038. POSIX.1-2008 does not address this problem. However, the use of the **time\_t**  
66718 type is mandated in order to ease the eventual fix.

66719 The use of the **<time.h>** header instead of **<sys/types.h>** allows compatibility with the ISO C  
66720 standard.

66721 Many historical implementations (including Version 7) and the 1984 /usr/group standard use  
66722 **long** instead of **time\_t**. This volume of POSIX.1-2008 uses the latter type in order to agree with  
66723 the ISO C standard.

66724 4.3 BSD includes *time()* only as an alternate function to the more flexible *gettimeofday()* function.

66725 **FUTURE DIRECTIONS**

66726 In a future version of this volume of POSIX.1-2008, **time\_t** is likely to be required to be capable  
66727 of representing times far in the future. Whether this will be mandated as a 64-bit type or a  
66728 requirement that a specific date in the future be representable (for example, 10000 AD) is not yet  
66729 determined. Systems purchased after the approval of this volume of POSIX.1-2008 should be  
66730 evaluated to determine whether their lifetime will extend past 2038.

66731 **SEE ALSO**

**timer\_create()**66740 **NAME**

66741 timer\_create — create a per-process timer

66742 **SYNOPSIS**

```

66743 CX #include <signal.h>
66744 #include <time.h>
66745 int timer_create(clockid_t clockid, struct sigevent *restrict evp,
66746 timer_t *restrict timerid);

```

66747 **DESCRIPTION**

66748 The *timer\_create()* function shall create a per-process timer using the specified clock, *clock\_id*, as  
 66749 the timing base. The *timer\_create()* function shall return, in the location referenced by *timerid*, a  
 66750 timer ID of type **timer\_t** used to identify the timer in timer requests. This timer ID shall be  
 66751 unique within the calling process until the timer is deleted. The particular clock, *clock\_id*, is  
 66752 defined in **<time.h>**. The timer whose ID is returned shall be in a disarmed state upon return  
 66753 from *timer\_create()*.

66754 The *evp* argument, if non-NULL, points to a **sigevent** structure. This structure, allocated by the  
 66755 application, defines the asynchronous notification to occur as specified in Section 2.4.1 (on page  
 66756 484) when the timer expires. If the *evp* argument is NULL, the effect is as if the *evp* argument  
 66757 pointed to a **sigevent** structure with the *sigev\_notify* member having the value SIGEV\_SIGNAL,  
 66758 the *sigev\_signo* having a default signal number, and the *sigev\_value* member having the value of  
 66759 the timer ID.

66760 Each implementation shall define a set of clocks that can be used as timing bases for per-process  
 66761 **MON** timers. All implementations shall support a *clock\_id* of CLOCK\_REALTIME. If the Monotonic  
 66762 Clock option is supported, implementations shall support a *clock\_id* of CLOCK\_MONOTONIC.

66763 Per-process timers shall not be inherited by a child process across a *fork()* and shall be disarmed  
 66764 and deleted by an *exec*.

66765 **CPT** If \_POSIX\_CPUTIME is defined, implementations shall support *clock\_id* values representing the  
 66766 CPU-time clock of the calling process.

66767 **TCT** If \_POSIX\_THREAD\_CPUTIME is defined, implementations shall support *clock\_id* values  
 66768 representing the CPU-time clock of the calling thread.

66769 **CPT|TCT** It is implementation-defined whether a *timer\_create()* function will succeed if the value defined  
 66770 by *clock\_id* corresponds to the CPU-time clock of a process or thread different from the process  
 66771 or thread invoking the function.

66772 **TSA** If *evp->sigev\_notify* is SIGEV\_THREAD and *sev->sigev\_notify\_attributes* is not NULL, if the  
 66773 attribute pointed to by *sev->sigev\_notify\_attributes* has a thread stack address specified by a call  
 66774 to *pthread\_attr\_setstack()*, the results are unspecified if the signal is generated more than once.

66775 **RETURN VALUE**

66776 If the call succeeds, *timer\_create()* shall return zero and update the location referenced by *timerid*  
 66777 to a **timer\_t**, which can be passed to the per-process timer calls. If an error occurs, the function  
 66778 shall return a value of -1 and set *errno* to indicate the error. The value of *timerid* is undefined if  
 66779 an error occurs.

66780 **ERRORS**66781 The *timer\_create()* function shall fail if:

66782 [EAGAIN] The system lacks sufficient signal queuing resources to honor the request.

66783	[EAGAIN]	The calling process has already created all of the timers it is allowed by this implementation.
66784		
66785	[EINVAL]	The specified clock ID is not defined.
66786	CPT TCT [ENOTSUP]	The implementation does not support the creation of a timer attached to the CPU-time clock that is specified by <i>clock_id</i> and associated with a process or thread different from the process or thread invoking <i>timer_create()</i> .
66787		
66788		

66789 **EXAMPLES**

66790 None.

66791 **APPLICATION USAGE**

66792 If a timer is created which has *evp->sigev\_sigev\_notify* set to SIGEV\_THREAD and the attribute  
 66793 pointed to by *evp->sigev\_notify\_attributes* has a thread stack address specified by a call to  
 66794 *pthread\_attr\_setstack()*, the memory dedicated as a thread stack cannot be recovered. The reason  
 66795 for this is that the threads created in response to a timer expiration are created detached, or in an  
 66796 unspecified way if the thread attribute's *detachstate* is PTHREAD\_CREATE\_JOINABLE. In  
 66797 neither case is it valid to call *pthread\_join()*, which makes it impossible to determine the lifetime  
 66798 of the created thread which thus means the stack memory cannot be reused.

66799 **RATIONALE**66800 **Periodic Timer Overrun and Resource Allocation**

66801 The specified timer facilities may deliver realtime signals (that is, queued signals) on  
 66802 implementations that support this option. Since realtime applications cannot afford to lose  
 66803 notifications of asynchronous events, like timer expirations or asynchronous I/O completions, it  
 66804 must be possible to ensure that sufficient resources exist to deliver the signal when the event  
 66805 occurs. In general, this is not a difficulty because there is a one-to-one correspondence between a  
 66806 request and a subsequent signal generation. If the request cannot allocate the signal delivery  
 66807 resources, it can fail the call with an [EAGAIN] error.

66808 Periodic timers are a special case. A single request can generate an unspecified number of  
 66809 signals. This is not a problem if the requesting process can service the signals as fast as they are  
 66810 generated, thus making the signal delivery resources available for delivery of subsequent  
 66811 periodic timer expiration signals. But, in general, this cannot be assured—processing of periodic  
 66812 timer signals may “overrun”; that is, subsequent periodic timer expirations may occur before the  
 66813 currently pending signal has been delivered.

66814 Also, for signals, according to the POSIX.1-1990 standard, if subsequent occurrences of a  
 66815 pending signal are generated, it is implementation-defined whether a signal is delivered for each  
 66816 occurrence. This is not adequate for some realtime applications. So a mechanism is required to  
 66817 allow applications to detect how many timer expirations were delayed without requiring an  
 66818 indefinite amount of system resources to store the delayed expirations.

66819 The specified facilities provide for an overrun count. The overrun count is defined as the  
 66820 number of extra timer expirations that occurred between the time a timer expiration signal is  
 66821 generated and the time the signal is delivered. The signal-catching function, if it is concerned  
 66822 with overruns, can retrieve this count on entry. With this method, a periodic timer only needs  
 66823 one “signal queuing resource” that can be allocated at the time of the *timer\_create()* function call.

66824 A function is defined to retrieve the overrun count so that an application need not allocate static  
 66825 storage to contain the count, and an implementation need not update this storage  
 66826 asynchronously on timer expirations. But, for some high-frequency periodic applications, the  
 66827 overhead of an additional system call on each timer expiration may be prohibitive. The  
 66828 functions, as defined, permit an implementation to maintain the overrun count in user space,

**timer\_create()**

66829 associated with the *timerid*. The *timer\_getoverrun()* function can then be implemented as a macro  
 66830 that uses the *timerid* argument (which may just be a pointer to a user space structure containing  
 66831 the counter) to locate the overrun count with no system call overhead. Other implementations,  
 66832 less concerned with this class of applications, can avoid the asynchronous update of user space  
 66833 by maintaining the count in a system structure at the cost of the extra system call to obtain it.

66834 **Timer Expiration Signal Parameters**

66835 The Realtime Signals Extension option supports an application-specific datum that is delivered  
 66836 to the extended signal handler. This value is explicitly specified by the application, along with  
 66837 the signal number to be delivered, in a **sigevent** structure. The type of the application-defined  
 66838 value can be either an integer constant or a pointer. This explicit specification of the value, as  
 66839 opposed to always sending the timer ID, was selected based on existing practice.

66840 It is common practice for realtime applications (on non-POSIX systems or realtime extended  
 66841 POSIX systems) to use the parameters of event handlers as the case label of a switch statement or  
 66842 as a pointer to an application-defined data structure. Since *timer\_ids* are dynamically allocated  
 66843 by the *timer\_create()* function, they can be used for neither of these functions without additional  
 66844 application overhead in the signal handler; for example, to search an array of saved timer IDs to  
 66845 associate the ID with a constant or application data structure.

66846 **FUTURE DIRECTIONS**

66847 None.

66848 **SEE ALSO**

66849 [clock\\_getres\(\)](#), [timer\\_delete\(\)](#), [timer\\_getoverrun\(\)](#)

66850 XBD [<signal.h>](#), [<time.h>](#)

66851 **CHANGE HISTORY**

66852 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

66853 **Issue 6**

66854 The *timer\_create()* function is marked as part of the Timers option.

66855 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 66856 implementation does not support the Timers option.

66857 CPU-time clocks are added for alignment with IEEE Std 1003.1d-1999.

66858 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding the  
 66859 requirement for the CLOCK\_MONOTONIC clock under the Monotonic Clock option.

66860 The **restrict** keyword is added to the *timer\_create()* prototype for alignment with the  
 66861 ISO/IEC 9899:1999 standard.

66862 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/138 is applied, updating the  
 66863 DESCRIPTION and APPLICATION USAGE sections to describe the case when a timer is created  
 66864 with the notification method set to SIGEV\_THREAD.

66865 **Issue 7**

66866 The *timer\_create()* function is moved from the Timers option to the Base.

66867 **NAME**

66868 timer\_delete — delete a per-process timer

66869 **SYNOPSIS**

```
66870 CX #include <time.h>
66871 int timer_delete(timer_t timerid);
```

66872 **DESCRIPTION**

66873 The *timer\_delete()* function deletes the specified timer, *timerid*, previously created by the  
 66874 *timer\_create()* function. If the timer is armed when *timer\_delete()* is called, the behavior shall be  
 66875 as if the timer is automatically disarmed before removal. The disposition of pending signals for  
 66876 the deleted timer is unspecified.

66877 **RETURN VALUE**

66878 If successful, the *timer\_delete()* function shall return a value of zero. Otherwise, the function shall  
 66879 return a value of  $-1$  and set *errno* to indicate the error.

66880 **ERRORS**

66881 The *timer\_delete()* function may fail if:

66882 [EINVAL] The timer ID specified by *timerid* is not a valid timer ID.

66883 **EXAMPLES**

66884 None.

66885 **APPLICATION USAGE**

66886 None.

66887 **RATIONALE**

66888 None.

66889 **FUTURE DIRECTIONS**

66890 None.

66891 **SEE ALSO**

66895 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

66896 **Issue 6**

66897 The *timer\_delete()* function is marked as part of the Timers option.

66898 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 66899 implementation does not support the Timers option.

66900 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/139 is applied, updating the ERRORS  
 66901 section so that the [EINVAL] error becomes optional.

66902 **Issue 7**

66903 The *timer\_delete()* function is moved from the Timers option to the Base.

**timer\_getoverrun()**66904 **NAME**

66905 timer\_getoverrun, timer\_gettime, timer\_settime — per-process timers

66906 **SYNOPSIS**

```

66907 CX #include <time.h>
66908
66908 int timer_getoverrun(timer_t timerid);
66909 int timer_gettime(timer_t timerid, struct itimerspec *value);
66910 int timer_settime(timer_t timerid, int flags,
66911     const struct itimerspec *restrict value,
66912     struct itimerspec *restrict ovalue);

```

66913 **DESCRIPTION**

66914 The *timer\_gettime()* function shall store the amount of time until the specified timer, *timerid*,  
 66915 expires and the reload value of the timer into the space pointed to by the *value* argument. The  
 66916 *it\_value* member of this structure shall contain the amount of time before the timer expires, or  
 66917 zero if the timer is disarmed. This value is returned as the interval until timer expiration, even if  
 66918 the timer was armed with absolute time. The *it\_interval* member of *value* shall contain the reload  
 66919 value last set by *timer\_settime()*.

66920 The *timer\_settime()* function shall set the time until the next expiration of the timer specified by  
 66921 *timerid* from the *it\_value* member of the *value* argument and arm the timer if the *it\_value* member  
 66922 of *value* is non-zero. If the specified timer was already armed when *timer\_settime()* is called, this  
 66923 call shall reset the time until next expiration to the *value* specified. If the *it\_value* member of *value*  
 66924 is zero, the timer shall be disarmed. The effect of disarming or resetting a timer with pending  
 66925 expiration notifications is unspecified.

66926 If the flag *TIMER\_ABSTIME* is not set in the argument *flags*, *timer\_settime()* shall behave as if the  
 66927 time until next expiration is set to be equal to the interval specified by the *it\_value* member of  
 66928 *value*. That is, the timer shall expire in *it\_value* nanoseconds from when the call is made. If the  
 66929 flag *TIMER\_ABSTIME* is set in the argument *flags*, *timer\_settime()* shall behave as if the time  
 66930 until next expiration is set to be equal to the difference between the absolute time specified by  
 66931 the *it\_value* member of *value* and the current value of the clock associated with *timerid*. That is,  
 66932 the timer shall expire when the clock reaches the value specified by the *it\_value* member of *value*.  
 66933 If the specified time has already passed, the function shall succeed and the expiration  
 66934 notification shall be made.

66935 The reload value of the timer shall be set to the value specified by the *it\_interval* member of  
 66936 *value*. When a timer is armed with a non-zero *it\_interval*, a periodic (or repetitive) timer is  
 66937 specified.

66938 Time values that are between two consecutive non-negative integer multiples of the resolution of  
 66939 the specified timer shall be rounded up to the larger multiple of the resolution. Quantization  
 66940 error shall not cause the timer to expire earlier than the rounded time value.

66941 If the argument *ovalue* is not NULL, the *timer\_settime()* function shall store, in the location  
 66942 referenced by *ovalue*, a value representing the previous amount of time before the timer would  
 66943 have expired, or zero if the timer was disarmed, together with the previous timer reload value.  
 66944 Timers shall not expire before their scheduled time.

66945 Only a single signal shall be queued to the process for a given timer at any point in time. When a  
 66946 timer for which a signal is still pending expires, no signal shall be queued, and a timer overrun  
 66947 shall occur. When a timer expiration signal is delivered to or accepted by a process, the  
 66948 *timer\_getoverrun()* function shall return the timer expiration overrun count for the specified  
 66949 timer. The overrun count returned contains the number of extra timer expirations that occurred  
 66950 between the time the signal was generated (queued) and when it was delivered or accepted, up

66951 to but not including an implementation-defined maximum of {DELAYTIMER\_MAX}. If the  
 66952 number of such extra expirations is greater than or equal to {DELAYTIMER\_MAX}, then the  
 66953 overrun count shall be set to {DELAYTIMER\_MAX}. The value returned by *timer\_getoverrun()*  
 66954 shall apply to the most recent expiration signal delivery or acceptance for the timer. If no  
 66955 expiration signal has been delivered for the timer, the return value of *timer\_getoverrun()* is  
 66956 unspecified.

#### 66957 RETURN VALUE

66958 If the *timer\_getoverrun()* function succeeds, it shall return the timer expiration overrun count as  
 66959 explained above.

66960 If the *timer\_gettime()* or *timer\_settime()* functions succeed, a value of 0 shall be returned.

66961 If an error occurs for any of these functions, the value -1 shall be returned, and *errno* set to  
 66962 indicate the error.

#### 66963 ERRORS

66964 The *timer\_settime()* function shall fail if:

66965 [EINVAL] A *value* structure specified a nanosecond value less than zero or greater than  
 66966 or equal to 1 000 million, and the *it\_value* member of that structure did not  
 66967 specify zero seconds and nanoseconds.

66968 These functions may fail if:

66969 [EINVAL] The *timerid* argument does not correspond to an ID returned by *timer\_create()*  
 66970 but not yet deleted by *timer\_delete()*.

66971 The *timer\_settime()* function may fail if:

66972 [EINVAL] The *it\_interval* member of *value* is not zero and the timer was created with  
 66973 notification by creation of a new thread (*sigev\_sigev\_notify* was  
 66974 SIGEV\_THREAD) and a fixed stack address has been set in the thread  
 66975 attribute pointed to by *sigev\_notify\_attributes*.

#### 66976 EXAMPLES

66977 None.

#### 66978 APPLICATION USAGE

66979 Using fixed stack addresses is problematic when timer expiration is signaled by the creation of a  
 66980 new thread. Since it cannot be assumed that the thread created for one expiration is finished  
 66981 before the next expiration of the timer, it could happen that two threads use the same memory as  
 66982 a stack at the same time. This is invalid and produces undefined results.

#### 66983 RATIONALE

66984 Practical clocks tick at a finite rate, with rates of 100 hertz and 1 000 hertz being common. The  
 66985 inverse of this tick rate is the clock resolution, also called the clock granularity, which in either  
 66986 case is expressed as a time duration, being 10 milliseconds and 1 millisecond respectively for  
 66987 these common rates. The granularity of practical clocks implies that if one reads a given clock  
 66988 twice in rapid succession, one may get the same time value twice; and that timers must wait for  
 66989 the next clock tick after the theoretical expiration time, to ensure that a timer never returns too  
 66990 soon. Note also that the granularity of the clock may be significantly coarser than the resolution  
 66991 of the data format used to set and get time and interval values. Also note that some  
 66992 implementations may choose to adjust time and/or interval values to exactly match the ticks of  
 66993 the underlying clock.

66994 This volume of POSIX.1-2008 defines functions that allow an application to determine the  
 66995 implementation-supported resolution for the clocks and requires an implementation to

**timer\_getoverrun()**

66996 document the resolution supported for timers and *nanosleep()* if they differ from the supported  
66997 clock resolution. This is more of a procurement issue than a runtime application issue.

66998 **FUTURE DIRECTIONS**

66999 None.

67000 **SEE ALSO**

67001 *clock\_getres()*, *timer\_create()*

67002 XBD <**time.h**>

67003 **CHANGE HISTORY**

67004 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

67005 **Issue 6**

67006 The *timer\_getoverrun()*, *timer\_gettime()*, and *timer\_settime()* functions are marked as part of the  
67007 Timers option.

67008 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
67009 implementation does not support the Timers option.

67010 The [EINVAL] error condition is updated to include the following: “and the *it\_value* member of  
67011 that structure did not specify zero seconds and nanoseconds.” This change is for IEEE PASC  
67012 Interpretation 1003.1 #89.

67013 The DESCRIPTION for *timer\_getoverrun()* is updated to clarify that “If no expiration signal has  
67014 been delivered for the timer, or if the Realtime Signals Extension is not supported, the return  
67015 value of *timer\_getoverrun()* is unspecified”.

67016 The **restrict** keyword is added to the *timer\_settime()* prototype for alignment with the  
67017 ISO/IEC 9899:1999 standard.

67018 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/140 is applied, updating the ERRORS  
67019 section so that the mandatory [EINVAL] error (“The *timerid* argument does not correspond to an  
67020 ID returned by *timer\_create()* but not yet deleted by *timer\_delete()*”) becomes optional.

67021 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/141 is applied, updating the ERRORS  
67022 section to include an optional [EINVAL] error for the case when a timer is created with the  
67023 notification method set to SIGEV\_THREAD. APPLICATION USAGE text is also added.

67024 **Issue 7**

67025 The *timer\_getoverrun()*, *timer\_gettime()*, and *timer\_settime()* functions are moved from the Timers  
67026 option to the Base.

67027 Functionality relating to the Realtime Signals Extension option is moved to the Base.

67028 **NAME**67029 `times` — get process and waited-for child process times67030 **SYNOPSIS**

```
67031 #include <sys/times.h>
67032 clock_t times(struct tms *buffer);
```

67033 **DESCRIPTION**

67034 The `times()` function shall fill the `tms` structure pointed to by `buffer` with time-accounting  
 67035 information. The `tms` structure is defined in `<sys/times.h>`.

67036 All times are measured in terms of the number of clock ticks used.

67037 The times of a terminated child process shall be included in the `tms_cutime` and `tms_cstime`  
 67038 elements of the parent when `wait()`, `waitid()`, or `waitpid()` returns the process ID of this  
 67039 terminated child. If a child process has not waited for its children, their times shall not be  
 67040 included in its times.

- 67041 • The `tms_utime` structure member is the CPU time charged for the execution of user  
 67042 instructions of the calling process.
- 67043 • The `tms_stime` structure member is the CPU time charged for execution by the system on  
 67044 behalf of the calling process.
- 67045 • The `tms_cutime` structure member is the sum of the `tms_utime` and `tms_cutime` times of the  
 67046 child processes.
- 67047 • The `tms_cstime` structure member is the sum of the `tms_stime` and `tms_cstime` times of the  
 67048 child processes.

67049 **RETURN VALUE**

67050 Upon successful completion, `times()` shall return the elapsed real time, in clock ticks, since an  
 67051 arbitrary point in the past (for example, system start-up time). This point does not change from  
 67052 one invocation of `times()` within the process to another. The return value may overflow the  
 67053 possible range of type `clock_t`. If `times()` fails, `(clock_t)-1` shall be returned and `errno` set to  
 67054 indicate the error.

67055 **ERRORS**

67056 No errors are defined.

67057 **EXAMPLES**67058 **Timing a Database Lookup**

67059 The following example defines two functions, `start_clock()` and `end_clock()`, that are used to time  
 67060 a lookup. It also defines variables of type `clock_t` and `tms` to measure the duration of  
 67061 transactions. The `start_clock()` function saves the beginning times given by the `times()` function.  
 67062 The `end_clock()` function gets the ending times and prints the difference between the two times.

```
67063 #include <sys/times.h>
67064 #include <stdio.h>
67065 ...
67066 void start_clock(void);
67067 void end_clock(char *msg);
67068 ...
67069 static clock_t st_time;
67070 static clock_t en_time;
67071 static struct tms st_cpu;
```

**times()**

```

67072     static struct tms en_cpu;
67073     ...
67074     void
67075     start_clock()
67076     {
67077         st_time = times(&st_cpu);
67078     }
67079     /* This example assumes that the result of each subtraction
67080        is within the range of values that can be represented in
67081        an integer type. */
67082     void
67083     end_clock(char *msg)
67084     {
67085         en_time = times(&en_cpu);
67086
67087         fputs(msg, stdout);
67088         printf("Real Time: %jd, User Time %jd, System Time %jd\n",
67089             (intmax_t)(en_time - st_time),
67089             (intmax_t)(en_cpu.tms_utime - st_cpu.tms_utime),
67090             (intmax_t)(en_cpu.tms_stime - st_cpu.tms_stime));
67091     }

```

**APPLICATION USAGE**

67092 Applications should use `sysconf(_SC_CLK_TCK)` to determine the number of clock ticks per  
67093 second as it may vary from system to system.  
67094

**RATIONALE**

67095 The accuracy of the times reported is intentionally left unspecified to allow implementations  
67096 flexibility in design, from uniprocessor to multi-processor networks.  
67097

67098 The inclusion of times of child processes is recursive, so that a parent process may collect the  
67099 total times of all of its descendants. But the times of a child are only added to those of its parent  
67100 when its parent successfully waits on the child. Thus, it is not guaranteed that a parent process  
67101 can always see the total times of all its descendants; see also the discussion of the term  
67102 “realtime” in `alarm()`.

67103 If the type `clock_t` is defined to be a signed 32-bit integer, it overflows in somewhat more than a  
67104 year if there are 60 clock ticks per second, or less than a year if there are 100. There are individual  
67105 systems that run continuously for longer than that. This volume of POSIX.1-2008 permits an  
67106 implementation to make the reference point for the returned value be the start-up time of the  
67107 process, rather than system start-up time.

67108 The term “charge” in this context has nothing to do with billing for services. The operating  
67109 system accounts for time used in this way. That information must be correct, regardless of how  
67110 that information is used.

**FUTURE DIRECTIONS**

67111 None.  
67112

67125 **NAME**

67126 tmpfile — create a temporary file

67127 **SYNOPSIS**

67128 #include &lt;stdio.h&gt;

67129 FILE \*tmpfile(void);

67130 **DESCRIPTION**

67131 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 67132 conflict between the requirements described here and the ISO C standard is unintentional. This  
 67133 volume of POSIX.1-2008 defers to the ISO C standard.

67134 The *tmpfile()* function shall create a temporary file and open a corresponding stream. The file  
 67135 shall be automatically deleted when all references to the file are closed. The file is opened as  
 67136 *fopen()* for update (*w+*), except that implementations may restrict the permissions, either by  
 67137 clearing the file mode bits or setting them to the value *S\_IRUSR | S\_IWUSR*.

67138 CX In some implementations, a permanent file may be left behind if the process calling *tmpfile()* is  
 67139 killed while it is processing a call to *tmpfile()*.

67140 An error message may be written to standard error if the stream cannot be opened.

67141 **RETURN VALUE**

67142 Upon successful completion, *tmpfile()* shall return a pointer to the stream of the file that is  
 67143 CX created. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

67144 **ERRORS**67145 The *tmpfile()* function shall fail if:

67146 CX [EINTR] A signal was caught during *tmpfile()*.

67147 CX [EMFILE] All file descriptors available to the process are currently open.

67148 CX [EMFILE] {STREAM\_MAX} streams are currently open in the calling process.

67149 CX [ENFILE] The maximum allowable number of files is currently open in the system.

67150 CX [ENOSPC] The directory or file system which would contain the new file cannot be  
 67151 expanded.

67152 CX [EOVERFLOW] The file is a regular file and the size of the file cannot be represented correctly  
 67153 in an object of type *off\_t*.

67154 The *tmpfile()* function may fail if:

67155 CX [EMFILE] {FOPEN\_MAX} streams are currently open in the calling process.

67156 CX [ENOMEM] Insufficient storage space is available.

67157 **EXAMPLES**67158 **Creating a Temporary File**

67159 The following example creates a temporary file for update, and returns a pointer to a stream for  
 67160 the created file in the *fp* variable.

67161 #include &lt;stdio.h&gt;

67162 ...

67163 FILE \*fp;

67164 fp = tmpfile ();

**tmpfile()**67165 **APPLICATION USAGE**

67166 It should be possible to open at least {TMP\_MAX} temporary files during the lifetime of the  
 67167 program (this limit may be shared with *tmpnam()*) and there should be no limit on the number  
 67168 simultaneously open other than this limit and any limit on the number of open file descriptors  
 67169 or streams ({OPEN\_MAX}, {FOPEN\_MAX}, {STREAM\_MAX}).

67170 **RATIONALE**

67171 None.

67172 **FUTURE DIRECTIONS**

67173 None.

67174 **SEE ALSO**

67175 *fopen()*, *mkdtemp()*, *tmpnam()*, *unlink()*

67176 XBD <stdio.h>

67177 **CHANGE HISTORY**

67178 First released in Issue 1. Derived from Issue 1 of the SVID.

67179 **Issue 5**

67180 Large File Summit extensions are added.

67181 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes  
 67182 in previous issues.

67183 **Issue 6**

67184 Extensions beyond the ISO C standard are marked.

67185 The following new requirements on POSIX implementations derive from alignment with the  
 67186 Single UNIX Specification:

- 67187 • In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support  
 67188 large files.
- 67189 • The [EMFILE] optional error condition is added.

67190 The APPLICATION USAGE section is added for alignment with the ISO/IEC 9899:1999  
 67191 standard.

67192 **Issue 7**

67193 Austin Group Interpretation 1003.1-2001 #025 is applied, clarifying that implementations may  
 67194 restrict the permissions of the file created.

67195 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

67196 SD5-XSH-ERN-149 is applied, adding the mandatory [EMFILE] error condition for  
 67197 {STREAM\_MAX} streams open.

67198 **NAME**

67199 tmpnam — create a name for a temporary file

67200 **SYNOPSIS**

```
67201 OB #include <stdio.h>
67202 char *tmpnam(char *s);
```

67203 **DESCRIPTION**

67204 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
67205 conflict between the requirements described here and the ISO C standard is unintentional. This  
67206 volume of POSIX.1-2008 defers to the ISO C standard.

67207 The *tmpnam()* function shall generate a string that is a valid filename and that is not the same as  
67208 the name of an existing file. The function is potentially capable of generating {TMP\_MAX}  
67209 different strings, but any or all of them may already be in use by existing files and thus not be  
67210 suitable return values.

67211 The *tmpnam()* function generates a different string each time it is called from the same process,  
67212 up to {TMP\_MAX} times. If it is called more than {TMP\_MAX} times, the behavior is  
67213 implementation-defined.

67214 The implementation shall behave as if no function defined in this volume of POSIX.1-2008,  
67215 except *tmpnam()*, calls *tmpnam()*.

67216 CX The *tmpnam()* function need not be thread-safe if called with a NULL parameter.

67217 **RETURN VALUE**

67218 Upon successful completion, *tmpnam()* shall return a pointer to a string. If no suitable string can  
67219 be generated, the *tmpnam()* function shall return a null pointer.

67220 If the argument *s* is a null pointer, *tmpnam()* shall leave its result in an internal static object and  
67221 return a pointer to that object. Subsequent calls to *tmpnam()* may modify the same object. If the  
67222 argument *s* is not a null pointer, it is presumed to point to an array of at least *L\_tmpnam* **chars**;  
67223 *tmpnam()* shall write its result in that array and shall return the argument as its value.

67224 **ERRORS**

67225 No errors are defined.

67226 **EXAMPLES**67227 **Generating a Filename**

67228 The following example generates a unique filename and stores it in the array pointed to by *ptr*.

```
67229 #include <stdio.h>
67230
67231 char filename[L_tmpnam+1];
67232 char *ptr;
67233
67234 ptr = tmpnam(filename);
```

67234 **APPLICATION USAGE**

67235 This function only creates filenames. It is the application's responsibility to create and remove  
67236 the files.

67237 Between the time a pathname is created and the file is opened, it is possible for some other  
67238 process to create a file with the same name. Applications may find *tmpfile()* more useful.

67239 Applications should use the *tmpfile()*, *mkstemp()*, or *mkdtemp()* functions instead of the

**tmpnam()**

67240 obsolescent *tmpnam()* function.

**67241 RATIONALE**

67242 None.

**67243 FUTURE DIRECTIONS**

67244 The *tmpnam()* function may be removed in a future version.

**67245 SEE ALSO**

67246 *fopen()*, *open()*, *mkdtemp()*, *tmpnam()*, *tmpfile()*, *unlink()*

67247 XBD [<stdio.h>](#)

**67248 CHANGE HISTORY**

67249 First released in Issue 1. Derived from Issue 1 of the SVID.

**67250 Issue 5**

67251 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

**67252 Issue 6**

67253 Extensions beyond the ISO C standard are marked.

67254 The normative text is updated to avoid use of the term “must” for application requirements.

67255 The DESCRIPTION is expanded for alignment with the ISO/IEC 9899:1999 standard.

67256 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/142 is applied, updating the  
67257 DESCRIPTION to allow implementations of the *tmpnam()* function to call *tmpnam()*.

**67258 Issue 7**

67259 Austin Group Interpretation 1003.1-2001 #148 is applied, clarifying that the *tmpnam()* function  
67260 need not be thread-safe if called with a NULL parameter.

67261 The *tmpnam()* function is marked obsolescent.

67262 **NAME**

67263 toascii — translate an integer to a 7-bit ASCII character

67264 **SYNOPSIS**

```
67265 OB XSI #include <ctype.h>
67266 int toascii(int c);
```

67267 **DESCRIPTION**67268 The *toascii()* function shall convert its argument into a 7-bit ASCII character.67269 **RETURN VALUE**67270 The *toascii()* function shall return the value (*c* &0x7f).67271 **ERRORS**

67272 No errors are returned.

67273 **EXAMPLES**

67274 None.

67275 **APPLICATION USAGE**67276 The *toascii()* function cannot be used portably in a localized application.67277 **RATIONALE**

67278 None.

67279 **FUTURE DIRECTIONS**67280 The *toascii()* function may be removed in a future version.67281 **SEE ALSO**67282 [isascii\(\)](#)67283 XBD [<ctype.h>](#)67284 **CHANGE HISTORY**

67285 First released in Issue 1. Derived from Issue 1 of the SVID.

67286 **Issue 7**67287 The *toascii()* function is marked obsolescent.

**tolower()**67288 **NAME**67289            `tolower, tolower_l` — transliterate uppercase characters to lowercase67290 **SYNOPSIS**

```
67291            #include <ctype.h>
67292            int tolower(int c);
67293 CX        int tolower_l(int c, locale_t locale);
```

67294 **DESCRIPTION**

67295 CX        For `tolower()`: The functionality described on this reference page is aligned with the ISO C  
67296 standard. Any conflict between the requirements described here and the ISO C standard is  
67297 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

67298 CX        The `tolower()` and `tolower_l()` functions have as a domain a type **int**, the value of which is  
67299 representable as an **unsigned char** or the value of EOF. If the argument has any other value, the  
67300 CX        behavior is undefined. If the argument of `tolower()` or `tolower_l()` represents an uppercase letter,  
67301 and there exists a corresponding lowercase letter as defined by character type information in the  
67302 CX        program locale or in the locale represented by `locale`, respectively (category `LC_CTYPE`), the  
67303 result shall be the corresponding lowercase letter. All other arguments in the domain are  
67304 returned unchanged.

67305 **RETURN VALUE**

67306 CX        Upon successful completion, the `tolower()` and `tolower_l()` functions shall return the lowercase  
67307 letter corresponding to the argument passed; otherwise, they shall return the argument  
67308 unchanged.

67309 **ERRORS**67310            The `tolower_l()` function may fail if:

67311 CX        **[EINVAL]** `locale` is not a valid locale object handle.

67312 **EXAMPLES**

67313            None.

67314 **APPLICATION USAGE**

67315            None.

67316 **RATIONALE**

67317            None.

67318 **FUTURE DIRECTIONS**

67324            First released in Issue 1. Derived from Issue 1 of the SVID.

67325 **Issue 6**

67326            Extensions beyond the ISO C standard are marked.

67327 **Issue 7**

67328            The `tolower_l()` function is added from The Open Group Technical Standard, 2006, Extended API  
67329 Set Part 4.

67330 **NAME**

67331            toupper, toupper\_l — transliterate lowercase characters to uppercase

67332 **SYNOPSIS**

67333            #include &lt;ctype.h&gt;

67334            int toupper(int c);

67335 CX         int toupper\_l(int c, locale\_t locale);

67336 **DESCRIPTION**67337 CX         For *toupper()*: The functionality described on this reference page is aligned with the ISO C  
67338 standard. Any conflict between the requirements described here and the ISO C standard is  
67339 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.67340 CX         The *toupper()* and *toupper\_l()* functions have as a domain a type **int**, the value of which is  
67341 representable as an **unsigned char** or the value of EOF. If the argument has any other value, the  
67342 behavior is undefined.67343 CX         If the argument of *toupper()* or *toupper\_l()* represents a lowercase letter, and there exists a  
67344 CX         corresponding uppercase letter as defined by character type information in the program locale  
67345 or in the locale represented by *locale*, respectively (category **LC\_CTYPE**), the result shall be the  
67346 corresponding uppercase letter.

67347            All other arguments in the domain are returned unchanged.

67348 **RETURN VALUE**67349 CX         Upon successful completion, *toupper()* and *toupper\_l()* shall return the uppercase letter  
67350 corresponding to the argument passed; otherwise, they shall return the argument unchanged.67351 **ERRORS**67352            The *toupper\_l()* function may fail if:67353 CX         [EINVAL] *locale* is not a valid locale object handle.67354 **EXAMPLES**

67355            None.

67356 **APPLICATION USAGE**

67357            None.

67358 **RATIONALE**

67359            None.

67360 **FUTURE DIRECTIONS**

67361            None.

67362 **SEE ALSO**67363            [setlocale\(\)](#), [uselocale\(\)](#)67364            XBD Chapter 7 (on page 135), [<ctype.h>](#), [<locale.h>](#)67365 **CHANGE HISTORY**

67366            First released in Issue 1. Derived from Issue 1 of the SVID.

67367 **Issue 6**

67368            Extensions beyond the ISO C standard are marked.

## toupper()

67369 **Issue 7**

67370 SD5-XSH-ERN-181 is applied, clarifying the RETURN VALUE section.

67371 The *toupper\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
67372 Set Part 4.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

67373 **NAME**67374 `towctrans, towctrans_l` — wide-character transliteration67375 **SYNOPSIS**

```
67376 #include <wctype.h>
67377
67377 wint_t towctrans(wint_t wc, wctrans_t desc);
67378 CX wint_t towctrans_l(wint_t wc, wctrans_t desc,
67379 locale_t locale);
```

67380 **DESCRIPTION**

67381 CX For `towctrans()`: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

67384 CX The `towctrans()` and `towctrans_l()` functions shall transliterate the wide-character code `wc` using the mapping described by `desc`.

67386 CX The current setting of the `LC_CTYPE` category in the current locale of the process or in the locale represented by `locale`, respectively, should be the same as during the call to `wctrans()` or `wctrans_l()` that returned the value `desc`.

67389 If the value of `desc` is invalid (that is, not obtained by a call to `wctrans()` or `desc` is invalidated by a subsequent call to `setlocale()` that has affected category `LC_CTYPE`), the result is unspecified.

67391 CX If the value of `desc` is invalid (that is, not obtained by a call to `wctrans_l()` with the same locale object `locale`) the result is unspecified.

67393 CX An application wishing to check for error situations should set `errno` to 0 before calling `towctrans()` or `towctrans_l()`.

67395 If `errno` is non-zero on return, an error has occurred.

67396 **RETURN VALUE**

67397 CX If successful, the `towctrans()` and `towctrans_l()` functions shall return the mapped value of `wc` using the mapping described by `desc`. Otherwise, they shall return `wc` unchanged.

67399 **ERRORS**

67400 These functions may fail if:

67401 CX [EINVAL] `desc` contains an invalid transliteration descriptor.

67402 The `towctrans_l()` function may fail if:

67403 CX [EINVAL] `locale` is not a valid locale object handle.

67404 **EXAMPLES**

67405 None.

67406 **APPLICATION USAGE**

67407 The strings "tolower" and "toupper" are reserved for the standard mapping names. In the table below, the functions in the left column are equivalent to the functions in the right column.

67409	<code>towlower(wc)</code>	<code>towctrans(wc, wctrans("tolower"))</code>
67410	<code>towlower_l(wc, locale)</code>	<code>towctrans_l(wc, wctrans("tolower"), locale)</code>
67411	<code>toupper(wc)</code>	<code>towctrans(wc, wctrans("toupper"))</code>
67412	<code>toupper_l(wc, locale)</code>	<code>towctrans_l(wc, wctrans("toupper"), locale)</code>

**towctrans()**

67427 **NAME**67428            `tolower`, `tolower_l` — transliterate uppercase wide-character code to lowercase67429 **SYNOPSIS**67430            `#include <wctype.h>`67431            `wint_t tolower(wint_t wc);`67432 CX        `wint_t tolower_l(wint_t wc, locale_t locale);`67433 **DESCRIPTION**67434 CX        For `tolower()`: The functionality described on this reference page is aligned with the ISO C  
67435 standard. Any conflict between the requirements described here and the ISO C standard is  
67436 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.67437 CX        The `tolower()` and `tolower_l()` functions have as a domain a type `wint_t`, the value of which  
67438 the application shall ensure is a character representable as a `wchar_t`, and a wide-character code  
67439 corresponding to a valid character in the current locale or the value of WEOF. If the argument  
67440 CX        has any other value, the behavior is undefined. If the argument of `tolower()` or `tolower_l()`  
67441 represents an uppercase wide-character code, and there exists a corresponding lowercase wide-  
67442 CX        character code as defined by character type information in the locale of the process or in the  
67443 locale represented by `locale`, respectively (category `LC_CTYPE`), the result shall be the  
67444 corresponding lowercase wide-character code. All other arguments in the domain are returned  
67445 unchanged.67446 **RETURN VALUE**67447 CX        Upon successful completion, the `tolower()` and `tolower_l()` functions shall return the  
67448 lowercase letter corresponding to the argument passed; otherwise, they shall return the  
67449 argument unchanged.67450 **ERRORS**67451            The `tolower_l()` function may fail if:67452 CX        `[EINVAL]` `locale` is not a valid locale object handle.67453 **EXAMPLES**

67454            None.

67455 **APPLICATION USAGE**

67456            None.

67457 **RATIONALE**

67458            None.

67465            First released in Issue 4.

**tolower()**67466 **Issue 5**

67467 The following change has been made in this version for alignment with  
67468 ISO/IEC 9899: 1990/Amendment 1: 1995 (E):

- 67469 • The SYNOPSIS has been changed to indicate that this function and associated data types  
67470 are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

67471 **Issue 6**

67472 The normative text is updated to avoid use of the term “must” for application requirements.

67473 **Issue 7**

67474 The `tolower_l()` function is added from The Open Group Technical Standard, 2006, Extended  
67475 API Set Part 4.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

67476 **NAME**

67477 towupper, towupper\_l — transliterate lowercase wide-character code to uppercase

67478 **SYNOPSIS**

67479 #include &lt;wctype.h&gt;

67480 wint\_t towupper(wint\_t wc);

67481 CX wint\_t towupper\_l(wint\_t wc, locale\_t locale);

67482 **DESCRIPTION**67483 CX For *towupper()*: The functionality described on this reference page is aligned with the ISO C  
67484 standard. Any conflict between the requirements described here and the ISO C standard is  
67485 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.67486 CX The *towupper()* and *towupper\_l()* functions have as a domain a type **wint\_t**, the value of which  
67487 the application shall ensure is a character representable as a **wchar\_t**, and a wide-character code  
67488 corresponding to a valid character in the current locale or the value of WEOF. If the argument  
67489 CX has any other value, the behavior is undefined. If the argument of *towupper()* or *towupper\_l()*  
67490 represents a lowercase wide-character code, and there exists a corresponding uppercase wide-  
67491 CX character code as defined by character type information in the locale of the process or in the  
67492 locale represented by *locale*, respectively (category *LC\_CTYPE*), the result shall be the  
67493 corresponding uppercase wide-character code. All other arguments in the domain are returned  
67494 unchanged.67495 **RETURN VALUE**67496 CX Upon successful completion, the *towupper()* and *towupper\_l()* functions shall return the  
67497 uppercase letter corresponding to the argument passed. Otherwise, they shall return the  
67498 argument unchanged.67499 **ERRORS**67500 The *towupper\_l()* function may fail if:67501 CX [EINVAL] *locale* is not a valid locale object handle.67502 **EXAMPLES**

67525 **NAME**67526 `trunc, truncf, trunc1` — round to truncated integer value67527 **SYNOPSIS**

```
67528     #include <math.h>
67529     double trunc(double x);
67530     float truncf(float x);
67531     long double trunc1(long double x);
```

67532 **DESCRIPTION**

67533 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 67534 conflict between the requirements described here and the ISO C standard is unintentional. This  
 67535 volume of POSIX.1-2008 defers to the ISO C standard.

67536 These functions shall round their argument to the integer value, in floating format, nearest to but  
 67537 no larger in magnitude than the argument.

67538 **RETURN VALUE**

67539 Upon successful completion, these functions shall return the truncated integer value.

67540 **MX** If  $x$  is NaN, a NaN shall be returned.

67541 If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.

67542 **ERRORS**

67543 No errors are defined.

67544 **EXAMPLES**

67545 None.

67546 **APPLICATION USAGE**

67547 None.

67548 **RATIONALE**

67554 **CHANGE HISTORY**

67555 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**truncate()**67556 **NAME**

67557 truncate — truncate a file to a specified length

67558 **SYNOPSIS**

67559 #include &lt;unistd.h&gt;

67560 int truncate(const char \*path, off\_t length);

67561 **DESCRIPTION**67562 The *truncate()* function shall cause the regular file named by *path* to have a size which shall be  
67563 equal to *length* bytes.67564 If the file previously was larger than *length*, the extra data is discarded. If the file was previously  
67565 shorter than *length*, its size is increased, and the extended area appears as if it were zero-filled.

67566 The application shall ensure that the process has write permission for the file.

67567 XSI If the request would cause the file size to exceed the soft file size limit for the process, the  
67568 request shall fail and the implementation shall generate the SIGXFSZ signal for the process.67569 The *truncate()* function shall not modify the file offset for any open file descriptions associated  
67570 with the file. Upon successful completion, if the file size is changed, *truncate()* shall mark for  
67571 update the last data modification and last file status change timestamps of the file, and the  
67572 S\_ISUID and S\_ISGID bits of the file mode may be cleared.67573 **RETURN VALUE**67574 Upon successful completion, *truncate()* shall return 0. Otherwise, -1 shall be returned, and *errno*  
67575 set to indicate the error.67576 **ERRORS**67577 The *truncate()* function shall fail if:

67578 [EINTR] A signal was caught during execution.

67579 [EINVAL] The *length* argument was less than 0.

67580 [EFBIG] or [EINVAL]

67581 The *length* argument was greater than the maximum file size.

67582 [EIO] An I/O error occurred while reading from or writing to a file system.

67583 [EACCES] A component of the path prefix denies search permission, or write permission  
67584 is denied on the file.

67585 [EISDIR] The named file is a directory.

67586 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
67587 argument.

67588 [ENAMETOOLONG]

67589 The length of a component of a pathname is longer than {NAME\_MAX}.

67590 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.67591 [ENOTDIR] A component of the path prefix is not a directory, or the *path* argument  
67592 contains at least one non-*<slash>* character and ends with one or more trailing  
67593 *<slash>* characters and the last pathname component names an existing file  
67594 that is neither a directory nor a symbolic link to a directory.

67595 [EROFS] The named file resides on a read-only file system.

- 67596 The *truncate()* function may fail if:
- 67597 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
67598 resolution of the *path* argument.
- 67599 [ENAMETOOLONG]  
67600 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
67601 symbolic link produced an intermediate result with a length that exceeds  
67602 {PATH\_MAX}.
- 67603 **EXAMPLES**  
67604 None.
- 67605 **APPLICATION USAGE**  
67606 None.
- 67607 **RATIONALE**  
67608 None.
- 67609 **FUTURE DIRECTIONS**  
67610 None.
- 67611 **SEE ALSO**  
67612 *open()*  
67613 XBD <*unistd.h*>
- 67614 **CHANGE HISTORY**  
67615 First released in Issue 4, Version 2.
- 67616 **Issue 5**  
67617 Moved from X/OPEN UNIX extension to BASE.  
67618 Large File Summit extensions are added.
- 67619 **Issue 6**  
67620 This reference page is split out from the *ftruncate()* reference page.  
67621 The normative text is updated to avoid use of the term “must” for application requirements.  
67622 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
67623 [ELOOP] error condition is added.
- 67624 **Issue 7**  
67625 Austin Group Interpretation 1003.1-2001 #143 is applied.  
67626 The *truncate()* function is moved from the XSI option to the Base.  
67627 Changes are made related to support for finegrained timestamps.  
67628 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
67629 pathname exists but is not a directory or a symbolic link to a directory.

**truncf()**

67630 **NAME**  
67631 `truncf, trunc1` — round to truncated integer value

67632 **SYNOPSIS**  
67633 `#include <math.h>`  
67634 `float truncf(float x);`  
67635 `long double trunc1(long double x);`

67636 **DESCRIPTION**  
67637 Refer to *trunc()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

*System Interfaces***tsearch()**67638 **NAME**67639 `tsearch` — search a binary search tree67640 **SYNOPSIS**

```
67641 XSI #include <search.h>
67642 void *tsearch(const void *key, void **rootp,
67643 int (*compar)(const void *, const void *));
```

67644 **DESCRIPTION**67645 Refer to *tdelete()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**ttyname()**67646 **NAME**67647 `ttyname, ttyname_r` — find the pathname of a terminal67648 **SYNOPSIS**

```
67649 #include <unistd.h>
67650 char *ttyname(int fildev);
67651 int ttyname_r(int fildev, char *name, size_t namesize);
```

67652 **DESCRIPTION**

67653 The `ttyname()` function shall return a pointer to a string containing a null-terminated pathname  
 67654 of the terminal associated with file descriptor *fildev*. The return value may point to static data  
 67655 whose content is overwritten by each call.

67656 The `ttyname()` function need not be thread-safe.

67657 The `ttyname_r()` function shall store the null-terminated pathname of the terminal associated  
 67658 with the file descriptor *fildev* in the character array referenced by *name*. The array is *namesize*  
 67659 characters long and should have space for the name and the terminating null character. The  
 67660 maximum length of the terminal name shall be {TTY\_NAME\_MAX}.

67661 **RETURN VALUE**

67662 Upon successful completion, `ttyname()` shall return a pointer to a string. Otherwise, a null  
 67663 pointer shall be returned and *errno* set to indicate the error.

67664 If successful, the `ttyname_r()` function shall return zero. Otherwise, an error number shall be  
 67665 returned to indicate the error.

67666 **ERRORS**

67667 The `ttyname()` function may fail if:

- 67668 [EBADF] The *fildev* argument is not a valid file descriptor.
- 67669 [ENOTTY] The file associated with the *fildev* argument is not a terminal.

67670 The `ttyname_r()` function may fail if:

- 67671 [EBADF] The *fildev* argument is not a valid file descriptor.
- 67672 [ENOTTY] The file associated with the *fildev* argument is not a terminal.
- 67673 [ERANGE] The value of *namesize* is smaller than the length of the string to be returned  
 67674 including the terminating null character.

67675 **EXAMPLES**

67676 None.

67677 **APPLICATION USAGE**

67678 None.

67679 **RATIONALE**

67680 The term “terminal” is used instead of the historical term “terminal device” in order to avoid a  
 67681 reference to an undefined term.

67682 The thread-safe version places the terminal name in a user-supplied buffer and returns a non-  
 67683 zero value if it fails. The non-thread-safe version may return the name in a static data area that  
 67684 may be overwritten by each call.

67685 **FUTURE DIRECTIONS**

67686 None.

67687 **SEE ALSO**

67688 XBD &lt;unistd.h&gt;

67689 **CHANGE HISTORY**

67690 First released in Issue 1. Derived from Issue 1 of the SVID.

67691 **Issue 5**67692 The *ttyname\_r()* function is included for alignment with the POSIX Threads Extension.67693 A note indicating that the *ttyname()* function need not be reentrant is added to the  
67694 DESCRIPTION.67695 **Issue 6**67696 The *ttyname\_r()* function is marked as part of the Thread-Safe Functions option.67697 The following new requirements on POSIX implementations derive from alignment with the  
67698 Single UNIX Specification:

- 67699
- The statement that *errno* is set on error is added.
  - The [EBADF] and [ENOTTY] optional error conditions are added.
- 67700

67701 **Issue 7**

67702 Austin Group Interpretation 1003.1-2001 #156 is applied.

67703 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

67704 The *ttyname\_r()* function is moved from the Thread-Safe Functions option to the Base.

**twalk()**67705 **NAME**

67706 twalk — traverse a binary search tree

67707 **SYNOPSIS**

```
67708 XSI #include <search.h>
67709 void twalk(const void *root,
67710           void (*action)(const void *, VISIT, int ));
```

67711 **DESCRIPTION**67712 Refer to *tdelete()*.

67713 **NAME**

67714 daylight, timezone, tzname, tzset — set timezone conversion information

67715 **SYNOPSIS**

```
67716 #include <time.h>
67717 XSI extern int daylight;
67718 extern long timezone;
67719 CX extern char *tzname[2];
67720 void tzset(void);
```

67721 **DESCRIPTION**

67722 The `tzset()` function shall use the value of the environment variable `TZ` to set time conversion information used by `ctime()`, `localtime()`, `mktime()`, and `strptime()`. If `TZ` is absent from the environment, implementation-defined default timezone information shall be used.

67725 The `tzset()` function shall set the external variable `tzname` as follows:

```
67726 tzname[0] = "std";
67727 tzname[1] = "dst";
```

67728 where `std` and `dst` are as described in XBD Chapter 8 (on page 173).

67729 XSI The `tzset()` function also shall set the external variable `daylight` to 0 if Daylight Savings Time conversions should never be applied for the timezone in use; otherwise, non-zero. The external variable `timezone` shall be set to the difference, in seconds, between Coordinated Universal Time (UTC) and local standard time.

67733 **RETURN VALUE**

67734 The `tzset()` function shall not return a value.

67735 **ERRORS**

67736 No errors are defined.

67737 **EXAMPLES**

67738 Example `TZ` variables and their timezone differences are given in the table below:

<i>TZ</i>	<i>timezone</i>
EST5EDT	5*60*60
GMT0	0*60*60
JST-9	-9*60*60
MET-1MEST	-1*60*60
MST7MDT	7*60*60
PST8PDT	8*60*60

67746 **APPLICATION USAGE**

67747 None.

67748 **RATIONALE**

67749 None.

67750 **FUTURE DIRECTIONS**

67751 None.

67752 **SEE ALSO**

67759 **NAME**67760 `ulimit` — get and set process limits67761 **SYNOPSIS**

```
67762 OB XSI #include <ulimit.h>
67763 long ulimit(int cmd, ...);
```

67764 **DESCRIPTION**

67765 The `ulimit()` function shall control process limits. The process limits that can be controlled by  
 67766 this function include the maximum size of a single file that can be written (this is equivalent to  
 67767 using `setrlimit()` with `RLIMIT_FSIZE`). The `cmd` values, defined in `<ulimit.h>`, include:

67768 **UL\_GETFSIZE** Return the file size limit (`RLIMIT_FSIZE`) of the process. The limit shall be in  
 67769 units of 512-byte blocks and shall be inherited by child processes. Files of any  
 67770 size can be read. The return value shall be the integer part of the soft file size  
 67771 limit divided by 512. If the result cannot be represented as a **long**, the result is  
 67772 unspecified.

67773 **UL\_SETFSIZE** Set the file size limit for output operations of the process to the value of the  
 67774 second argument, taken as a **long**, multiplied by 512. If the result would  
 67775 overflow an **rlim\_t**, the actual value set is unspecified. Any process may  
 67776 decrease its own limit, but only a process with appropriate privileges may  
 67777 increase the limit. The return value shall be the integer part of the new file size  
 67778 limit divided by 512.

67779 The `ulimit()` function shall not change the setting of `errno` if successful.

67780 As all return values are permissible in a successful situation, an application wishing to check for  
 67781 error situations should set `errno` to 0, then call `ulimit()`, and, if it returns `-1`, check to see if `errno` is  
 67782 non-zero.

67783 **RETURN VALUE**

67784 Upon successful completion, `ulimit()` shall return the value of the requested limit. Otherwise, `-1`  
 67785 shall be returned and `errno` set to indicate the error.

67786 **ERRORS**

67787 The `ulimit()` function shall fail and the limit shall be unchanged if:

67788 [EINVAL] The `cmd` argument is not valid.

67789 [EPERM] A process not having appropriate privileges attempts to increase its file size  
 67790 limit.

67791 **EXAMPLES**

67792 None.

67793 **APPLICATION USAGE**

67794 Since the `ulimit()` function uses type **long** rather than **rlim\_t**, this function is not sufficient for file  
 67795 sizes on many current systems. Applications should use the `getrlimit()` or `setrlimit()` functions  
 67796 instead of the obsolescent `ulimit()` function.

67797 **RATIONALE**

67798 None.

**ulimit()**67799 **FUTURE DIRECTIONS**

67800 The *ulimit()* function may be removed in a future version.

67801 **SEE ALSO**

67802 *exec*, *getrlimit()*, *write()*

67803 XBD [<ulimit.h>](#)

67804 **CHANGE HISTORY**

67805 First released in Issue 1. Derived from Issue 1 of the SVID.

67806 **Issue 5**

67807 In the description of UL\_SETFSIZE, the text is corrected to refer to **rlim\_t** rather than the  
67808 spurious **rlimit\_t**.

67809 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

67810 **Issue 7**

67811 The *ulimit()* function is marked obsolescent.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

67812 **NAME**

67813 umask — set and get the file mode creation mask

67814 **SYNOPSIS**

67815 #include &lt;sys/stat.h&gt;

67816 mode\_t umask(mode\_t *cmask*);67817 **DESCRIPTION**

67818 The *umask()* function shall set the file mode creation mask of the process to *cmask* and return the  
 67819 previous value of the mask. Only the file permission bits of *cmask* (see <sys/stat.h>) are used; the  
 67820 meaning of the other bits is implementation-defined.

67821 The file mode creation mask of the process is used to turn off permission bits in the *mode*  
 67822 argument supplied during calls to the following functions:

- 67823 • *open()*, *openat()*, *creat()*, *mkdir()*, *mkdirat()*, *mkfifo()*, and *mkfifoat()*
- 67824 XSI • *mknod()*, *mknodat()*
- 67825 MSG • *mq\_open()*
- 67826 • *sem\_open()*

67827 Bit positions that are set in *cmask* are cleared in the mode of the created file.

67828 **RETURN VALUE**

67829 The file permission bits in the value returned by *umask()* shall be the previous value of the file  
 67830 mode creation mask. The state of any other bits in that value is unspecified, except that a  
 67831 subsequent call to *umask()* with the returned value as *cmask* shall leave the state of the mask the  
 67832 same as its state before the first call, including any unspecified use of those bits.

67833 **ERRORS**

67834 No errors are defined.

67835 **EXAMPLES**

67836 None.

67837 **APPLICATION USAGE**

67838 None.

67839 **RATIONALE**

67840 Unsigned argument and return types for *umask()* were proposed. The return type and the  
 67841 argument were both changed to **mode\_t**.

67842 Historical implementations have made use of additional bits in *cmask* for their implementation-  
 67843 defined purposes. The addition of the text that the meaning of other bits of the field is  
 67844 implementation-defined permits these implementations to conform to this volume of  
 67845 POSIX.1-2008.

67846 **FUTURE DIRECTIONS**

67847 None.

67848 **SEE ALSO**67849 *creat()*, *exec*, *mkdir()*, *mkfifo()*, *mknod()*, *mq\_open()*, *open()*, *sem\_open()*

67850 XBD &lt;sys/stat.h&gt;, &lt;sys/types.h&gt;

**umask()**67851 **CHANGE HISTORY**

67852 First released in Issue 1. Derived from Issue 1 of the SVID.

67853 **Issue 6**67854 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.67855 The following new requirements on POSIX implementations derive from alignment with the  
67856 Single UNIX Specification:

- 67857
- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
67858 required for conforming implementations of previous POSIX specifications, it was not  
67859 required for UNIX applications.

67860 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/143 is applied, adding the `mknod()`,  
67861 `mq_open()`, and `sem_open()` functions to the DESCRIPTION and SEE ALSO sections.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

67862 **NAME**67863        **uname** — get the name of the current system67864 **SYNOPSIS**

67865        #include &lt;sys/utsname.h&gt;

67866        int uname(struct utsname \*name);

67867 **DESCRIPTION**67868        The *uname()* function shall store information identifying the current system in the structure pointed to by *name*.67870        The *uname()* function uses the **utsname** structure defined in <sys/utsname.h>.67871        The *uname()* function shall return a string naming the current system in the character array *sysname*. Similarly, *nodename* shall contain the name of this node within an implementation-defined communications network. The arrays *release* and *version* shall further identify the operating system. The array *machine* shall contain a name that identifies the hardware that the system is running on.

67876        The format of each member is implementation-defined.

67877 **RETURN VALUE**67878        Upon successful completion, a non-negative value shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.67880 **ERRORS**

67881        No errors are defined.

67882 **EXAMPLES**

67883        None.

67884 **APPLICATION USAGE**67885        The inclusion of the *nodename* member in this structure does not imply that it is sufficient information for interfacing to communications networks.67887 **RATIONALE**67888        The values of the structure members are not constrained to have any relation to the version of this volume of POSIX.1-2008 implemented in the operating system. An application should instead depend on `_POSIX_VERSION` and related constants defined in <unistd.h>.67891        This volume of POSIX.1-2008 does not define the sizes of the members of the structure and permits them to be of different sizes, although most implementations define them all to be the same size: eight bytes plus one byte for the string terminator. That size for *nodename* is not enough for use with many networks.67895        The *uname()* function originated in System III, System V, and related implementations, and it does not exist in Version 7 or 4.3 BSD. The values it returns are set at system compile time in those historical implementations.67898        4.3 BSD has *gethostname()* and *gethostid()*, which return a symbolic name and a numeric value, respectively. There are related *sethostname()* and *sethostid()* functions that are used to set the values the other two functions return. The former functions are included in this specification, the latter are not.67902 **FUTURE DIRECTIONS**

67903        None.

67908 **NAME**

67909 ungetc — push byte back into input stream

67910 **SYNOPSIS**

67911 #include &lt;stdio.h&gt;

67912 int ungetc(int *c*, FILE \**stream*);67913 **DESCRIPTION**

67914 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 67915 conflict between the requirements described here and the ISO C standard is unintentional. This  
 67916 volume of POSIX.1-2008 defers to the ISO C standard.

67917 The *ungetc()* function shall push the byte specified by *c* (converted to an **unsigned char**) back  
 67918 onto the input stream pointed to by *stream*. The pushed-back bytes shall be returned by  
 67919 subsequent reads on that stream in the reverse order of their pushing. A successful intervening  
 67920 call (with the stream pointed to by *stream*) to a file-positioning function (*fseek()*, *fsetpos()*, or  
 67921 *rewind()*) shall discard any pushed-back bytes for the stream. The external storage  
 67922 corresponding to the stream shall be unchanged.

67923 One byte of push-back shall be provided. If *ungetc()* is called too many times on the same stream  
 67924 without an intervening read or file-positioning operation on that stream, the operation may fail.

67925 If the value of *c* equals that of the macro EOF, the operation shall fail and the input stream shall  
 67926 be left unchanged.

67927 A successful call to *ungetc()* shall clear the end-of-file indicator for the stream. The value of the  
 67928 file-position indicator for the stream after reading or discarding all pushed-back bytes shall be  
 67929 the same as it was before the bytes were pushed back. The file-position indicator is decremented  
 67930 by each successful call to *ungetc()*; if its value was 0 before a call, its value is unspecified after  
 67931 the call.

67932 **RETURN VALUE**

67933 Upon successful completion, *ungetc()* shall return the byte pushed back after conversion.  
 67934 Otherwise, it shall return EOF.

67935 **ERRORS**

67936 No errors are defined.

67937 **EXAMPLES**

67938 None.

67939 **APPLICATION USAGE**

67940 None.

67941 **RATIONALE**

67942 None.

67943 **FUTURE DIRECTIONS**

67944 None.

67947 XBD &lt;stdio.h&gt;

67948 **CHANGE HISTORY**

67949 First released in Issue 1. Derived from Issue 1 of the SVID.

**ungetwc()**67950 **NAME**67951 `ungetwc` — push wide-character code back into the input stream67952 **SYNOPSIS**67953 `#include <stdio.h>`67954 `#include <wchar.h>`67955 `wint_t ungetwc(wint_t wc, FILE *stream);`67956 **DESCRIPTION**67957 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
67958 conflict between the requirements described here and the ISO C standard is unintentional. This  
67959 volume of POSIX.1-2008 defers to the ISO C standard.67960 The `ungetwc()` function shall push the character corresponding to the wide-character code  
67961 specified by `wc` back onto the input stream pointed to by `stream`. The pushed-back characters  
67962 shall be returned by subsequent reads on that stream in the reverse order of their pushing. A  
67963 successful intervening call (with the stream pointed to by `stream`) to a file-positioning function  
67964 (`fseek()`, `fsetpos()`, or `rewind()`) discards any pushed-back characters for the stream. The external  
67965 storage corresponding to the stream is unchanged.67966 At least one character of push-back shall be provided. If `ungetwc()` is called too many times on  
67967 the same stream without an intervening read or file-positioning operation on that stream, the  
67968 operation may fail.67969 If the value of `wc` equals that of the macro `WEOF`, the operation shall fail and the input stream  
67970 shall be left unchanged.67971 A successful call to `ungetwc()` shall clear the end-of-file indicator for the stream. The value of the  
67972 file-position indicator for the stream after reading or discarding all pushed-back characters shall  
67973 be the same as it was before the characters were pushed back. The file-position indicator is  
67974 decremented (by one or more) by each successful call to `ungetwc()`; if its value was 0 before a  
67975 call, its value is unspecified after the call.67976 **RETURN VALUE**67977 Upon successful completion, `ungetwc()` shall return the wide-character code corresponding to  
67978 the pushed-back character. Otherwise, it shall return `WEOF`.67979 **ERRORS**67980 The `ungetwc()` function may fail if:67981 **CX** **[EILSEQ]** An invalid character sequence is detected, or a wide-character code does not  
67982 correspond to a valid character.67983 **EXAMPLES**

67984 None.

**unlink()**

System Interfaces

68000 **NAME**68001 `unlink, unlinkat` — remove a directory entry relative to directory file descriptor68002 **SYNOPSIS**68003 `#include <unistd.h>`68004 `int unlink(const char *path);`68005 `int unlinkat(int fd, const char *path, int flag);`68006 **DESCRIPTION**

68007 The `unlink()` function shall remove a link to a file. If `path` names a symbolic link, `unlink()` shall  
 68008 remove the symbolic link named by `path` and shall not affect any file or directory named by the  
 68009 contents of the symbolic link. Otherwise, `unlink()` shall remove the link named by the pathname  
 68010 pointed to by `path` and shall decrement the link count of the file referenced by the link.

68011 When the file's link count becomes 0 and no process has the file open, the space occupied by the  
 68012 file shall be freed and the file shall no longer be accessible. If one or more processes have the file  
 68013 open when the last link is removed, the link shall be removed before `unlink()` returns, but the  
 68014 removal of the file contents shall be postponed until all references to the file are closed.

68015 The `path` argument shall not name a directory unless the process has appropriate privileges and  
 68016 the implementation supports using `unlink()` on directories.

68017 Upon successful completion, `unlink()` shall mark for update the last data modification and last  
 68018 file status change timestamps of the parent directory. Also, if the file's link count is not 0, the last  
 68019 file status change timestamp of the file shall be marked for update.

68020 The `unlinkat()` function shall be equivalent to the `unlink()` or `rmdir()` function except in the case  
 68021 where `path` specifies a relative path. In this case the directory entry to be removed is determined  
 68022 relative to the directory associated with the file descriptor `fd` instead of the current working  
 68023 directory. If the file descriptor was opened without `O_SEARCH`, the function shall check  
 68024 whether directory searches are permitted using the current permissions of the directory  
 68025 underlying the file descriptor. If the file descriptor was opened with `O_SEARCH`, the function  
 68026 shall not perform the check.

68027 Values for `flag` are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 68028 in `<fcntl.h>`:

68029 `AT_REMOVEDIR`68030 Remove the directory entry specified by `fd` and `path` as a directory, not a normal file.

68031 If `unlinkat()` is passed the special value `AT_FDCWD` in the `fd` parameter, the current working  
 68032 directory is used and the behavior shall be identical to a call to `unlink()` or `rmdir()` respectively,  
 68033 depending on whether or not the `AT_REMOVEDIR` bit is set in `flag`.

68034 **RETURN VALUE**

68035 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 68036 return -1 and set `errno` to indicate the error. If -1 is returned, the named file shall not be changed.

68037 **ERRORS**

68038 These functions shall fail and shall not unlink the file if:

68039 [EACCES] Search permission is denied for a component of the path prefix, or write  
 68040 permission is denied on the directory containing the directory entry to be  
 68041 removed.

68042 [EBUSY] The file named by the `path` argument cannot be unlinked because it is being  
 68043 used by the system or another process and the implementation considers this  
 68044 an error.

68045	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
68046		
68047	[ENAMETOOLONG]	
68048		The length of a component of a pathname is longer than {NAME_MAX}.
68049	[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
68050	[ENOTDIR]	A component of the path prefix is not a directory, or the <i>path</i> argument contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing <code>&lt;slash&gt;</code> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.
68051		
68052		
68053		
68054	[EPERM]	The file named by <i>path</i> is a directory, and either the calling process does not have appropriate privileges, or the implementation prohibits using <i>unlink()</i> on directories.
68055		
68056		
68057	XSI [EPERM] or [EACCES]	
68058		The <code>S_ISVTX</code> flag is set on the directory containing the file referred to by the <i>path</i> argument and the process does not satisfy the criteria specified in XBD Section 4.2 (on page 107).
68059		
68060		
68061	[EROFS]	The directory entry to be unlinked is part of a read-only file system.
68062		The <i>unlinkat()</i> function shall fail if:
68063	[EACCES]	<i>fd</i> was not opened with <code>O_SEARCH</code> and the permissions of the directory underlying <i>fd</i> do not permit directory searches.
68064		
68065	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither <code>AT_FDCWD</code> nor a valid file descriptor open for reading or searching.
68066		
68067	[EEXIST] or [ENOTEMPTY]	
68068		The <i>flag</i> parameter has the <code>AT_REMOVEDIR</code> bit set and the <i>path</i> argument names a directory that is not an empty directory, or there are hard links to the directory other than <code>dot</code> or a single entry in <code>dot-dot</code> .
68069		
68070		
68071	[ENOTDIR]	The <i>flag</i> parameter has the <code>AT_REMOVEDIR</code> bit set and <i>path</i> does not name a directory.
68072		
68073		These functions may fail and not unlink the file if:
68074	XSI [EBUSY]	The file named by <i>path</i> is a named STREAM.
68075	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
68076		
68077	[ENAMETOOLONG]	
68078		The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.
68079		
68080		
68081	[ETXTBSY]	The entry to be unlinked is the last directory entry to a pure procedure (shared text) file that is being executed.
68082		

**unlink()**

- 68083 The *unlinkat()* function may fail if:
- 68084 [EINVAL] The value of the *flag* argument is not valid.
- 68085 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT\_FDCWD nor a  
68086 file descriptor associated with a directory.

68087 **EXAMPLES**68088 **Removing a Link to a File**

68089 The following example shows how to remove a link to a file named `/home/cnd/mod1` by  
68090 removing the entry named `/modules/pass1`.

```
68091 #include <unistd.h>
68092
68092 char *path = "/modules/pass1";
68093 int status;
68094 ...
68095 status = unlink(path);
```

68096 **Checking for an Error**

68097 The following example fragment creates a temporary password lock file named **LOCKFILE**,  
68098 which is defined as `/etc/ptmp`, and gets a file descriptor for it. If the file cannot be opened for  
68099 writing, *unlink()* is used to remove the link between the file descriptor and **LOCKFILE**.

```
68100 #include <sys/types.h>
68101 #include <stdio.h>
68102 #include <fcntl.h>
68103 #include <errno.h>
68104 #include <unistd.h>
68105 #include <sys/stat.h>
68106
68106 #define LOCKFILE "/etc/ptmp"
68107
68107 int pfd; /* Integer for file descriptor returned by open call. */
68108 FILE *fpfd; /* File pointer for use in putpwent(). */
68109 ...
68110 /* Open password Lock file. If it exists, this is an error. */
68111 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL, S_IRUSR
68112 | S_IWUSR | S_IRGRP | S_IROTH)) == -1) {
68113     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
68114     exit(1);
68115 }
68116
68116 /* Lock file created; proceed with fdopen of lock file so that
68117 putpwent() can be used.
68118 */
68119 if ((fpfd = fdopen(pfd, "w")) == NULL) {
68120     close(pfd);
68121     unlink(LOCKFILE);
68122     exit(1);
68123 }
```

68124 **Replacing Files**

68125 The following example fragment uses *unlink()* to discard links to files, so that they can be  
 68126 replaced with new versions of the files. The first call removes the link to **LOCKFILE** if an error  
 68127 occurs. Successive calls remove the links to **SAVEFILE** and **PASSWDFILE** so that new links can  
 68128 be created, then removes the link to **LOCKFILE** when it is no longer needed.

```

68129 #include <sys/types.h>
68130 #include <stdio.h>
68131 #include <fcntl.h>
68132 #include <errno.h>
68133 #include <unistd.h>
68134 #include <sys/stat.h>

68135 #define LOCKFILE "/etc/ptmp"
68136 #define PASSWDFILE "/etc/passwd"
68137 #define SAVEFILE "/etc/opasswd"
68138 ...
68139 /* If no change was made, assume error and leave passwd unchanged. */
68140 if (!valid_change) {
68141     fprintf(stderr, "Could not change password for user %s\n", user);
68142     unlink(LOCKFILE);
68143     exit(1);
68144 }

68145 /* Change permissions on new password file. */
68146 chmod(LOCKFILE, S_IRUSR | S_IRGRP | S_IROTH);

68147 /* Remove saved password file. */
68148 unlink(SAVEFILE);

68149 /* Save current password file. */
68150 link(PASSWDFILE, SAVEFILE);

68151 /* Remove current password file. */
68152 unlink(PASSWDFILE);

68153 /* Save new password file as current password file. */
68154 link(LOCKFILE, PASSWDFILE);

68155 /* Remove lock file. */
68156 unlink(LOCKFILE);

68157 exit(0);

```

68158 **APPLICATION USAGE**

68159 Applications should use *rmdir()* to remove a directory.

68160 **RATIONALE**

68161 Unlinking a directory is restricted to the superuser in many historical implementations for  
 68162 reasons given in *link()* (see also *rename()*).

68163 The meaning of [EBUSY] in historical implementations is “mount point busy”. Since this volume  
 68164 of POSIX.1-2008 does not cover the system administration concepts of mounting and  
 68165 unmounting, the description of the error was changed to “resource busy”. (This meaning is used  
 68166 by some device drivers when a second process tries to open an exclusive use device.) The  
 68167 wording is also intended to allow implementations to refuse to remove a directory if it is the root  
 68168 or current working directory of any process.

**unlink()**

68169 The standard developers reviewed TR 24715-2006 and noted that LSB-conforming  
 68170 implementations may return [EISDIR] instead of [EPERM] when unlinking a directory. A change  
 68171 to permit this behavior by changing the requirement for [EPERM] to [EPERM] or [EISDIR] was  
 68172 considered, but decided against since it would break existing strictly conforming and  
 68173 conforming applications. Applications written for portability to both POSIX.1-2008 and the LSB  
 68174 should be prepared to handle either error code.

68175 The purpose of the *unlinkat()* function is to remove directory entries in directories other than the  
 68176 current working directory without exposure to race conditions. Any part of the path of a file  
 68177 could be changed in parallel to a call to *unlink()*, resulting in unspecified behavior. By opening a  
 68178 file descriptor for the target directory and using the *unlinkat()* function it can be guaranteed that  
 68179 the removed directory entry is located relative to the desired directory.

**FUTURE DIRECTIONS**

68180 None.  
 68181

**CHANGE HISTORY**

68185 First released in Issue 1. Derived from Issue 1 of the SVID.  
 68186

**Issue 5**

68187 The [EBUSY] error is added to the optional part of the ERRORS section.  
 68188

**Issue 6**

68189 The following new requirements on POSIX implementations derive from alignment with the  
 68190 Single UNIX Specification:  
 68191

- 68192 • In the DESCRIPTION, the effect is specified if *path* specifies a symbolic link.
- 68193 • The [ELOOP] mandatory error condition is added.
- 68194 • A second [ENAMETOOLONG] is added as an optional error condition.
- 68195 • The [ETXTBSY] optional error condition is added.

68196 The following changes were made to align with the IEEE P1003.1a draft standard:

- 68197 • The [ELOOP] optional error condition is added.

68198 The normative text is updated to avoid use of the term “must” for application requirements.

**Issue 7**

68200 Austin Group Interpretation 1003.1-2001 #143 is applied.

68201 Austin Group Interpretation 1003.1-2001 #181 is applied, updating the requirements for  
 68202 operations when the S\_ISVTX bit is set.

68203 Text arising from the LSB Conflicts TR is added to the RATIONALE about the use of [EPERM]  
 68204 and [EISDIR].

68205 The *unlinkat()* function is added from The Open Group Technical Standard, 2006, Extended API  
 68206 Set Part 2.

68207 Changes are made related to support for finegrained timestamps.

68208 Changes are made to allow a directory to be opened for searching.

68209  
68210

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory.

68241 **Issue 5**

68242            Moved from X/OPEN UNIX extension to BASE.

68243 **Issue 6**

68244            The normative text is updated to avoid use of the term “must” for application requirements.

68245 **NAME**

68246           unsetenv — remove an environment variable

68247 **SYNOPSIS**

```
68248 CX       #include <stdlib.h>
68249       int unsetenv(const char *name);
```

68250 **DESCRIPTION**

68251       The *unsetenv()* function shall remove an environment variable from the environment of the  
68252       calling process. The *name* argument points to a string, which is the name of the variable to be  
68253       removed. The named argument shall not contain an '=' character. If the named variable does  
68254       not exist in the current environment, the environment shall be unchanged and the function is  
68255       considered to have completed successfully.

68256       If the application modifies *environ* or the pointers to which it points, the behavior of *unsetenv()* is  
68257       undefined. The *unsetenv()* function shall update the list of pointers to which *environ* points.

68258       The *unsetenv()* function need not be thread-safe.

68259 **RETURN VALUE**

68260       Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to  
68261       indicate the error, and the environment shall be unchanged.

68262 **ERRORS**

68263       The *unsetenv()* function shall fail if:

68264       [EINVAL]       The *name* argument is a null pointer, points to an empty string, or points to a  
68265       string containing an '=' character.

68266 **EXAMPLES**

68267       None.

68268 **APPLICATION USAGE**

68269       None.

68270 **RATIONALE**

68271       Refer to the RATIONALE section in *setenv()*.

68272 **FUTURE DIRECTIONS**

68273       None.

68274 **SEE ALSO**

68276       XBD *<stdlib.h>*, *<sys/types.h>*

68277 **CHANGE HISTORY**

68278       First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

68279 **Issue 7**

68280       Austin Group Interpretation 1003.1-2001 #156 is applied.

**uselocale()**68281 **NAME**

68282           uselocale — use locale in current thread

68283 **SYNOPSIS**

```
68284 CX       #include <locale.h>
68285       locale_t uselocale(locale_t newloc);
```

68286 **DESCRIPTION**

68287       The *uselocale()* function shall set the current locale for the current thread to the locale  
68288       represented by *newloc*.

68289       The value for the *newloc* argument shall be one of the following:

- 68290           1. A value returned by the *newlocale()* or *duplocale()* functions
- 68291           2. The special locale object descriptor *LC\_GLOBAL\_LOCALE*
- 68292           3. **(locale\_t)0**

68293       Once the *uselocale()* function has been called to install a thread-local locale, the behavior of every  
68294       interface using data from the current locale shall be affected for the calling thread. The current  
68295       locale for other threads shall remain unchanged.

68296       If the *newloc* argument is a null pointer, the object returned is the current locale or  
68297       *LC\_GLOBAL\_LOCALE* if there has been no previous call to *uselocale()* for the current thread.

68298       If the *newloc* argument is *LC\_GLOBAL\_LOCALE*, the thread shall use the global locale  
68299       determined by the *setlocale()* function.

68300 **RETURN VALUE**

68301       The *uselocale()* function returns the locale handle from the previous call for the current thread. If  
68302       there was no such previous call, the function shall return the value *LC\_GLOBAL\_LOCALE*.

68303 **ERRORS**

68304       The *uselocale()* function may fail if:

68305       [EINVAL]       *locale* is not a valid locale object.

68306 **EXAMPLES**

68307       None.

68308 **APPLICATION USAGE**

68309       Unlike the *setlocale()* function, the *uselocale()* function does not allow replacing some locale  
68310       categories only. Applications that need to install a locale which differs only in a few categories  
68311       must use *newlocale()* to change a locale object equivalent to the currently used locale and install  
68312       it.

68313 **RATIONALE**

68314       None.

68315 **FUTURE DIRECTIONS**

68316       None.

68317 **SEE ALSO**

**utime()**68322 **NAME**68323 `utime` — set file access and modification times68324 **SYNOPSIS**

```
68325 OB #include <utime.h>
68326 int utime(const char *path, const struct utimbuf *times);
```

68327 **DESCRIPTION**

68328 The `utime()` function shall set the access and modification times of the file named by the `path`  
 68329 argument.

68330 If `times` is a null pointer, the access and modification times of the file shall be set to the current  
 68331 time. The effective user ID of the process shall match the owner of the file, or the process has  
 68332 write permission to the file or has appropriate privileges, to use `utime()` in this manner.

68333 If `times` is not a null pointer, `times` shall be interpreted as a pointer to a `utimbuf` structure and the  
 68334 access and modification times shall be set to the values contained in the designated structure.  
 68335 Only a process with the effective user ID equal to the user ID of the file or a process with  
 68336 appropriate privileges may use `utime()` this way.

68337 The `utimbuf` structure is defined in the `<utime.h>` header. The times in the structure `utimbuf`  
 68338 are measured in seconds since the Epoch.

68339 Upon successful completion, the `utime()` function shall mark the last file status change  
 68340 timestamp for update; see `<sys/stat.h>`.

68341 **RETURN VALUE**

68342 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and `errno` shall  
 68343 be set to indicate the error, and the file times shall not be affected.

68344 **ERRORS**

68345 The `utime()` function shall fail if:

68346 [EACCES] Search permission is denied by a component of the path prefix; or the `times`  
 68347 argument is a null pointer and the effective user ID of the process does not  
 68348 match the owner of the file, the process does not have write permission for the  
 68349 file, and the process does not have appropriate privileges.

68350 [ELOOP] A loop exists in symbolic links encountered during resolution of the `path`  
 68351 argument.

68352 [ENAMETOOLONG]

68353 The length of a component of a pathname is longer than {NAME\_MAX}.

68354 [ENOENT] A component of `path` does not name an existing file or `path` is an empty string.

68355 [ENOTDIR]

68356 A component of the path prefix is not a directory, or the `path` argument  
 68357 contains at least one non-`<slash>` character and ends with one or more trailing  
 68358 `<slash>` characters and the last pathname component names an existing file  
 that is neither a directory nor a symbolic link to a directory.

68359 [EPERM]

68360 The `times` argument is not a null pointer and the effective user ID of the calling  
 68361 process does not match the owner of the file and the calling process does not  
 have appropriate privileges.

68362 [EROFS]

The file system containing the file is read-only.

68363 The *utime()* function may fail if:

68364 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
68365 resolution of the *path* argument.

68366 [ENAMETOOLONG]

68367 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
68368 symbolic link produced an intermediate result with a length that exceeds  
68369 {PATH\_MAX}.

#### 68370 EXAMPLES

68371 None.

#### 68372 APPLICATION USAGE

68373 Since the **utimbuf** structure only contains **time\_t** variables and is not accurate to fractions of a  
68374 second, applications should use the *utimensat()* function instead of the obsolescent *utime()*  
68375 function.

#### 68376 RATIONALE

68377 The *actime* structure member must be present so that an application may set it, even though an  
68378 implementation may ignore it and not change the last data access timestamp on the file. If an  
68379 application intends to leave one of the times of a file unchanged while changing the other, it  
68380 should use *stat()* or *fstat()* to retrieve the file's *st\_atim* and *st\_mtim* parameters, set *actime* and  
68381 *modtime* in the buffer, and change one of them before making the *utime()* call.

#### 68382 FUTURE DIRECTIONS

68383 The *utime()* function may be removed in a future version.

#### 68384 SEE ALSO

68385 *fstat()*, *fstatat()*, *futimens()*

68386 XBD <sys/stat.h>, <utime.h>

#### 68387 CHANGE HISTORY

68388 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 68389 Issue 6

68390 The following new requirements on POSIX implementations derive from alignment with the  
68391 Single UNIX Specification:

- 68392 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
68393 required for conforming implementations of previous POSIX specifications, it was not  
68394 required for UNIX applications.
- 68395 • The [ELOOP] mandatory error condition is added.
- 68396 • A second [ENAMETOOLONG] is added as an optional error condition.

68397 The following changes were made to align with the IEEE P1003.1a draft standard:

- 68398 • The [ELOOP] optional error condition is added.

68399 The normative text is updated to avoid use of the term “must” for application requirements.

#### 68400 Issue 7

68401 Austin Group Interpretation 1003.1-2001 #143 is applied.

68402 The *utime()* function is marked obsolescent.

68403 Changes are made related to support for finegrained timestamps.

**utimensat()**

System Interfaces

68404 **NAME**68405 `utimensat, utimes` — set file access and modification times relative to directory file descriptor68406 **SYNOPSIS**68407 `#include <sys/stat.h>`68408 `int utimensat(int fd, const char *path, const struct timespec times[2],`  
68409 `int flag);`

**fprintf()**68424 **NAME**68425 `vdprintf`, `vfprintf`, `vprintf`, `vsprintf`, `vsnprintf` — format output of a stdarg argument list68426 **SYNOPSIS**68427 `#include <stdarg.h>`68428 `#include <stdio.h>`

```

68429 CX int vdprintf(int fildes, const char *restrict format, va_list ap);
68430 int fprintf(FILE *restrict stream, const char *restrict format,
68431 va_list ap);
68432 int vprintf(const char *restrict format, va_list ap);
68433 int vsprintf(char *restrict s, size_t n, const char *restrict format,
68434 va_list ap);
68435 int vsnprintf(char *restrict s, const char *restrict format, va_list ap);

```

68436 **DESCRIPTION**

68437 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 68438 conflict between the requirements described here and the ISO C standard is unintentional. This  
 68439 volume of POSIX.1-2008 defers to the ISO C standard.

68440 CX The `vdprintf()`, `vfprintf()`, `vprintf()`, `vsprintf()`, and `vsnprintf()` functions shall be equivalent to the  
 68441 CX `dprintf()`, `fprintf()`, `printf()`, `sprintf()`, and `sfprintf()` functions respectively, except that instead of  
 68442 being called with a variable number of arguments, they are called with an argument list as  
 68443 defined by `<stdarg.h>`.

68444 These functions shall not invoke the `va_end` macro. As these functions invoke the `va_arg` macro,  
 68445 the value of `ap` after the return is unspecified.

68446 **RETURN VALUE**68447 Refer to `fprintf()`.68448 **ERRORS**68449 Refer to `fprintf()`.68450 **EXAMPLES**

68451 None.

68452 **APPLICATION USAGE**68453 Applications using these functions should call `va_end(ap)` afterwards to clean up.68454 **RATIONALE**

68455 None.

68456 **FUTURE DIRECTIONS**

68457 None.

68458 **SEE ALSO**68459 `fprintf()`68460 XBD `<stdarg.h>`, `<stdio.h>`68461 **CHANGE HISTORY**

68462 First released in Issue 1. Derived from Issue 1 of the SVID.

68463 **Issue 5**68464 The `vsnprintf()` function is added.

68465 **Issue 6**

68466 The *vfprintf()*, *vprintf()*, *vsprintf()*, and *vsprintf()* functions are updated for alignment with the  
68467 ISO/IEC 9899:1999 standard.

68468 **Issue 7**

68469 The *vdprintf()* function is added to complement the *dprintf()* function from The Open Group  
68470 Technical Standard, 2006, Extended API Set Part 1.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**vfscanf()**68471 **NAME**68472 `vfscanf`, `vsscanf`, `vsscanf` — format input of a `stdarg` argument list68473 **SYNOPSIS**68474 `#include <stdarg.h>`68475 `#include <stdio.h>`68476 `int vfscanf(FILE *restrict stream, const char *restrict format,`  
68477 `va_list arg);`68478 `int vsscanf(const char *restrict format, va_list arg);`68479 `int vsscanf(const char *restrict s, const char *restrict format,`68480 `va_list arg);`68481 **DESCRIPTION**68482 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
68483 conflict between the requirements described here and the ISO C standard is unintentional. This  
68484 volume of POSIX.1-2008 defers to the ISO C standard.68485 The `vsscanf()`, `vfscanf()`, and `vsscanf()` functions shall be equivalent to the `scanf()`, `fscanf()`, and  
68486 `sscanf()` functions, respectively, except that instead of being called with a variable number of  
68487 arguments, they are called with an argument list as defined in the `<stdarg.h>` header. These  
68488 functions shall not invoke the `va_end` macro. As these functions invoke the `va_arg` macro, the  
68489 value of `ap` after the return is unspecified.68490 **RETURN VALUE**68491 Refer to `fscanf()`.68492 **ERRORS**68493 Refer to `fscanf()`.68494 **EXAMPLES**

68495 None.

68496 **APPLICATION USAGE**68497 Applications using these functions should call `va_end(ap)` afterwards to clean up.68498 **RATIONALE**

68499 None.

68500 **FUTURE DIRECTIONS**

68501 None.

## 68659 NAME

68660 wait, waitpid — wait for a child process to stop or terminate

## 68661 SYNOPSIS

68662 #include &lt;sys/wait.h&gt;

68663 pid\_t wait(int \*stat\_loc);

68664 pid\_t waitpid(pid\_t pid, int \*stat\_loc, int options);

## 68665 DESCRIPTION

68666 The *wait()* and *waitpid()* functions shall obtain status information pertaining to one of the  
 68667 caller's child processes. Various options permit status information to be obtained for child  
 68668 processes that have terminated or stopped. If status information is available for two or more  
 68669 child processes, the order in which their status is reported is unspecified.

68670 The *wait()* function shall suspend execution of the calling thread until status information for one  
 68671 of the terminated child processes of the calling process is available, or until delivery of a signal  
 68672 whose action is either to execute a signal-catching function or to terminate the process. If more  
 68673 than one thread is suspended in *wait()* or *waitpid()* awaiting termination of the same process,  
 68674 exactly one thread shall return the process status at the time of the target process termination. If  
 68675 status information is available prior to the call to *wait()*, return shall be immediate.

68676 The *waitpid()* function shall be equivalent to *wait()* if the *pid* argument is **(pid\_t)-1** and the  
 68677 *options* argument is 0. Otherwise, its behavior shall be modified by the values of the *pid* and  
 68678 *options* arguments.

68679 The *pid* argument specifies a set of child processes for which *status* is requested. The *waitpid()*  
 68680 function shall only return the status of a child process from this set:

- 68681 • If *pid* is equal to **(pid\_t)-1**, *status* is requested for any child process. In this respect,  
 68682 *waitpid()* is then equivalent to *wait()*.
- 68683 • If *pid* is greater than 0, it specifies the process ID of a single child process for which *status* is  
 68684 requested.
- 68685 • If *pid* is 0, *status* is requested for any child process whose process group ID is equal to that  
 68686 of the calling process.
- 68687 • If *pid* is less than **(pid\_t)-1**, *status* is requested for any child process whose process group  
 68688 ID is equal to the absolute value of *pid*.

68689 The *options* argument is constructed from the bitwise-inclusive OR of zero or more of the  
 68690 following flags, defined in the **<sys/wait.h>** header:

68691 XSI **WCONTINUED** The *waitpid()* function shall report the status of any continued child process  
 68692 specified by *pid* whose status has not been reported since it continued from a  
 68693 job control stop.

68694 **WNOHANG** The *waitpid()* function shall not suspend execution of the calling thread if  
 68695 *status* is not immediately available for one of the child processes specified by  
 68696 *pid*.

68697 **WUNTRACED** The status of any child processes specified by *pid* that are stopped, and whose  
 68698 status has not yet been reported since they stopped, shall also be reported to  
 68699 the requesting process.

68700 XSI If the calling process has SA\_NOCLDWAIT set or has SIGCHLD set to SIG\_IGN, and the process  
 68701 has no unwaited-for children that were transformed into zombie processes, the calling thread  
 68702 shall block until all of the children of the process containing the calling thread terminate, and  
 68703 *wait()* and *waitpid()* shall fail and set *errno* to [ECHILD].

**wait()**

68704 If *wait()* or *waitpid()* return because the status of a child process is available, these functions  
68705 shall return a value equal to the process ID of the child process. In this case, if the value of the  
68706 argument *stat\_loc* is not a null pointer, information shall be stored in the location pointed to by  
68707 *stat\_loc*. The value stored at the location pointed to by *stat\_loc* shall be 0 if and only if the status  
68708 returned is from a terminated child process that terminated by one of the following means:

- 68709 1. The process returned 0 from *main()*.
- 68710 2. The process called *\_exit()* or *exit()* with a *status* argument of 0.
- 68711 3. The process was terminated because the last thread in the process terminated.

68712 Regardless of its value, this information may be interpreted using the following macros, which  
68713 are defined in `<sys/wait.h>` and evaluate to integral expressions; the *stat\_val* argument is the  
68714 integer value pointed to by *stat\_loc*.

68715 WIFEXITED(*stat\_val*)  
68716 Evaluates to a non-zero value if *status* was returned for a child process that terminated  
68717 normally.

68718 WEXITSTATUS(*stat\_val*)  
68719 If the value of WIFEXITED(*stat\_val*) is non-zero, this macro evaluates to the low-order 8 bits  
68720 of the *status* argument that the child process passed to *\_exit()* or *exit()*, or the value the child  
68721 process returned from *main()*.

68722 WIFSIGNALED(*stat\_val*)  
68723 Evaluates to a non-zero value if *status* was returned for a child process that terminated due  
68724 to the receipt of a signal that was not caught (see `<signal.h>`).

68725 WTERMSIG(*stat\_val*)  
68726 If the value of WIFSIGNALED(*stat\_val*) is non-zero, this macro evaluates to the number of  
68727 the signal that caused the termination of the child process.

68728 WIFSTOPPED(*stat\_val*)  
68729 Evaluates to a non-zero value if *status* was returned for a child process that is currently  
68730 stopped.

68731 WSTOPSIG(*stat\_val*)  
68732 If the value of WIFSTOPPED(*stat\_val*) is non-zero, this macro evaluates to the number of the  
68733 signal that caused the child process to stop.

68734 XSI WIFCONTINUED(*stat\_val*)  
68735 Evaluates to a non-zero value if *status* was returned for a child process that has continued  
68736 from a job control stop.

68737 SPN It is unspecified whether the *status* value returned by calls to *wait()* or *waitpid()* for processes  
68738 created by *posix\_spawn()* or *posix\_spawnnp()* can indicate a WIFSTOPPED(*stat\_val*) before  
68739 subsequent calls to *wait()* or *waitpid()* indicate WIFEXITED(*stat\_val*) as the result of an error  
68740 detected before the new process image starts executing.

68741 It is unspecified whether the *status* value returned by calls to *wait()* or *waitpid()* for processes  
68742 created by *posix\_spawn()* or *posix\_spawnnp()* can indicate a WIFSIGNALED(*stat\_val*) if a signal is  
68743 sent to the parent's process group after *posix\_spawn()* or *posix\_spawnnp()* is called.

68744 If the information pointed to by *stat\_loc* was stored by a call to *waitpid()* that specified the  
68745 XSI WUNTRACED flag and did not specify the WCONTINUED flag, exactly one of the macros  
68746 WIFEXITED(*\*stat\_loc*), WIFSIGNALED(*\*stat\_loc*), and WIFSTOPPED(*\*stat\_loc*) shall evaluate to a  
68747 non-zero value.

68748 If the information pointed to by *stat\_loc* was stored by a call to *waitpid()* that specified the  
 68749 XSI WUNTRACED and WCONTINUED flags, exactly one of the macros WIFEXITED(\**stat\_loc*),  
 68750 XSI WIFSIGNALED(\**stat\_loc*), WIFSTOPPED(\**stat\_loc*), and WIFCONTINUED(\**stat\_loc*) shall  
 68751 evaluate to a non-zero value.

68752 If the information pointed to by *stat\_loc* was stored by a call to *waitpid()* that did not specify the  
 68753 XSI WUNTRACED or WCONTINUED flags, or by a call to the *wait()* function, exactly one of the  
 68754 macros WIFEXITED(\**stat\_loc*) and WIFSIGNALED(\**stat\_loc*) shall evaluate to a non-zero value.

68755 If the information pointed to by *stat\_loc* was stored by a call to *waitpid()* that did not specify the  
 68756 XSI WUNTRACED flag and specified the WCONTINUED flag, or by a call to the *wait()* function,  
 68757 XSI exactly one of the macros WIFEXITED(\**stat\_loc*), WIFSIGNALED(\**stat\_loc*), and  
 68758 WIFCONTINUED(\**stat\_loc*) shall evaluate to a non-zero value.

68759 If \_POSIX\_REALTIME\_SIGNALS is defined, and the implementation queues the SIGCHLD  
 68760 signal, then if *wait()* or *waitpid()* returns because the status of a child process is available, any  
 68761 pending SIGCHLD signal associated with the process ID of the child process shall be discarded.  
 68762 Any other pending SIGCHLD signals shall remain pending.

68763 Otherwise, if SIGCHLD is blocked, if *wait()* or *waitpid()* return because the status of a child  
 68764 process is available, any pending SIGCHLD signal shall be cleared unless the status of another  
 68765 child process is available.

68766 For all other conditions, it is unspecified whether child *status* will be available when a SIGCHLD  
 68767 signal is delivered.

68768 There may be additional implementation-defined circumstances under which *wait()* or *waitpid()*  
 68769 report *status*. This shall not occur unless the calling process or one of its child processes  
 68770 explicitly makes use of a non-standard extension. In these cases the interpretation of the  
 68771 reported *status* is implementation-defined.

68772 If a parent process terminates without waiting for all of its child processes to terminate, the  
 68773 remaining child processes shall be assigned a new parent process ID corresponding to an  
 68774 implementation-defined system process.

#### 68775 RETURN VALUE

68776 If *wait()* or *waitpid()* returns because the status of a child process is available, these functions  
 68777 shall return a value equal to the process ID of the child process for which *status* is reported. If  
 68778 *wait()* or *waitpid()* returns due to the delivery of a signal to the calling process, -1 shall be  
 68779 returned and *errno* set to [EINTR]. If *waitpid()* was invoked with WNOHANG set in *options*, it  
 68780 has at least one child process specified by *pid* for which *status* is not available, and *status* is not  
 68781 available for any process specified by *pid*, 0 is returned. Otherwise, (pid\_t)-1 shall be returned,  
 68782 and *errno* set to indicate the error.

#### 68783 ERRORS

68784 The *wait()* function shall fail if:

68785 [ECHILD] The calling process has no existing unwaited-for child processes.  
 68786 [EINTR] The function was interrupted by a signal. The value of the location pointed to  
 68787 by *stat\_loc* is undefined.

68788 The *waitpid()* function shall fail if:

68789 [ECHILD] The process specified by *pid* does not exist or is not a child of the calling  
 68790 process, or the process group specified by *pid* does not exist or does not have  
 68791 any member process that is a child of the calling process.

**wait()**

68792 [EINTR] The function was interrupted by a signal. The value of the location pointed to  
68793 by *stat\_loc* is undefined.

68794 [EINVAL] The *options* argument is not valid.

68795 **EXAMPLES**68796 **Waiting for a Child Process and then Checking its Status**

68797 The following example demonstrates the use of *waitpid()*, *fork()*, and the macros used to  
68798 interpret the status value returned by *waitpid()* (and *wait()*). The code segment creates a child  
68799 process which does some unspecified work. Meanwhile the parent loops performing calls to  
68800 *waitpid()* to monitor the status of the child. The loop terminates when child termination is  
68801 detected.

```
68802 #include <stdio.h>
68803 #include <stdlib.h>
68804 #include <unistd.h>
68805 #include <sys/wait.h>
68806 ...
68807 pid_t child_pid, wpid;
68808 int status;
68809
68810 child_pid = fork();
68811 if (child_pid == -1) { /* fork() failed */
68812     perror("fork");
68813     exit(EXIT_FAILURE);
68814 }
68815 if (child_pid == 0) { /* This is the child */
68816     /* Child does some work and then terminates */
68817     ...
68818 } else { /* This is the parent */
68819     do {
68820         wpid = waitpid(child_pid, &status, WUNTRACED
68821 #ifndef WCONTINUED /* Not all implementations support this */
68822 | WCONTINUED
68823 #endif
68824 );
68825 if (wpid == -1) {
68826     perror("waitpid");
68827     exit(EXIT_FAILURE);
68828 }
68829 if (WIFEXITED(status)) {
68830     printf("child exited, status=%d\n", WEXITSTATUS(status));
68831 } else if (WIFSIGNALED(status)) {
68832     printf("child killed (signal %d)\n", WTERMSIG(status));
68833 } else if (WIFSTOPPED(status)) {
68834     printf("child stopped (signal %d)\n", WSTOPSIG(status));
68835 #ifndef WIFCONTINUED /* Not all implementations support this */
68836 } else if (WIFCONTINUED(status)) {
68837     printf("child continued\n");
68838 }
```

```

68837     #endif
68838         } else { /* Non-standard case -- may never happen */
68839             printf("Unexpected status (0x%x)\n", status);
68840         }
68841     } while (!WIFEXITED(status) && !WIFSIGNALED(status));
68842 }

```

### 68843 **Waiting for a Child Process in a Signal Handler for SIGCHLD**

68844 The following example demonstrates how to use *waitpid()* in a signal handler for SIGCHLD  
68845 without passing *-1* as the *pid* argument. (See the APPLICATION USAGE section below for the  
68846 reasons why passing a *pid* of *-1* is not recommended.) The method used here relies on the  
68847 standard behavior of *waitpid()* when SIGCHLD is blocked. On historical non-conforming  
68848 systems, the status of some child processes might not be reported.

```

68849 #include <stdlib.h>
68850 #include <stdio.h>
68851 #include <signal.h>
68852 #include <sys/types.h>
68853 #include <sys/wait.h>
68854 #include <unistd.h>
68855
68856 #define CHILDREN 10
68857
68858 static void
68859 handle_sigchld(int signum, siginfo_t *sinfo, void *unused)
68860 {
68861     int status;
68862

68917     for (;;)
68918         pause();
68919 }

```

**APPLICATION USAGE**

Calls to *wait()* will collect information about any child process. This may result in interactions with other interfaces that may be waiting for their own children (such as by use of *system()*). For this and other reasons it is recommended that portable applications not use *wait()*, but instead use *waitpid()*. For these same reasons, the use of *waitpid()* with a *pid* argument of *-1*, and the use of *waitid()* with the *idtype* argument set to *P\_ALL*, are also not recommended for portable applications.

**RATIONALE**

A call to the *wait()* or *waitpid()* function only returns *status* on an immediate child process of the calling process; that is, a child that was produced by a single *fork()* call (perhaps followed by an *exec* or other function calls) from the parent. If a child produces grandchildren by further use of *fork()*, none of those grandchildren nor any of their descendants affect the behavior of a *wait()* from the original parent process. Nothing in this volume of POSIX.1-2008 prevents an implementation from providing extensions that permit a process to get *status* from a grandchild

68934 or any other process, but a process that does not use such extensions must be guaranteed to see  
68935 *status* from only its direct children.

68936 The *waitpid()* function is provided for three reasons:

- 68937 1. To support job control
- 68938 2. To permit a non-blocking version of the *wait()* function
- 68939 3. To permit a library routine, such as *system()* or *pclose()*, to wait for its children without  
68940 interfering with other terminated children for which the process has not waited

68941 The first two of these facilities are based on the *wait3()* function provided by 4.3 BSD. The  
68942 function uses the *options* argument, which is equivalent to an argument to *wait3()*. The  
68943 WUNTRACED flag is used only in conjunction with job control on systems supporting job  
68944 control. Its name comes from 4.3 BSD and refers to the fact that there are two types of stopped  
68945 processes in that implementation: processes being traced via the *ptrace()* debugging facility and  
68946 (untraced) processes stopped by job control signals. Since *ptrace()* is not part of this volume of  
68947 POSIX.1-2008, only the second type is relevant. The name WUNTRACED was retained because  
68948 its usage is the same, even though the name is not intuitively meaningful in this context.

68949 The third reason for the *waitpid()* function is to permit independent sections of a process to  
68950 spawn and wait for children without interfering with each other. For example, the following  
68951 problem occurs in developing a portable shell, or command interpreter:

```
68952 stream = popen("/bin/true");
68953 (void) system("sleep 100");
68954 (void) pclose(stream);
```

68955 On all historical implementations, the final *pclose()* fails to reap the *wait()* *status* of the *popen()*.

68956 The status values are retrieved by macros, rather than given as specific bit encodings as they are  
68957 in most historical implementations (and thus expected by existing programs). This was  
68958 necessary to eliminate a limitation on the number of signals an implementation can support that  
68959 was inherent in the traditional encodings. This volume of POSIX.1-2008 does require that a *status*  
68960 value of zero corresponds to a process calling *\_exit(0)*, as this is the most common encoding  
68961 expected by existing programs. Some of the macro names were adopted from 4.3 BSD.

68962 These macros syntactically operate on an arbitrary integer value. The behavior is undefined  
68963 unless that value is one stored by a successful call to *wait()* or *waitpid()* in the location pointed to  
68964 by the *stat\_loc* argument. An early proposal attempted to make this clearer by specifying each  
68965 argument as *\*stat\_loc* rather than *stat\_val*. However, that did not follow the conventions of other  
68966 specifications in this volume of POSIX.1-2008 or traditional usage. It also could have implied  
68967 that the argument to the macro must literally be *\*stat\_loc*; in fact, that value can be stored or  
68968 passed as an argument to other functions before being interpreted by these macros.

68969 The extension that affects *wait()* and *waitpid()* and is common in historical implementations is  
68970 the *ptrace()* function. It is called by a child process and causes that child to stop and return a  
68971 *status* that appears identical to the *status* indicated by WIFSTOPPED. The *status* of *ptrace()*  
68972 children is traditionally returned regardless of the WUNTRACED flag (or by the *wait()*  
68973 function). Most applications do not need to concern themselves with such extensions because  
68974 they have control over what extensions they or their children use. However, applications, such  
68975 as command interpreters, that invoke arbitrary processes may see this behavior when those  
68976 arbitrary processes misuse such extensions.

68977 Implementations that support **core** file creation or other implementation-defined actions on  
68978 termination of some processes traditionally provide a bit in the *status* returned by *wait()* to  
68979 indicate that such actions have occurred.

**wait()**

68980 Allowing the *wait()* family of functions to discard a pending SIGCHLD signal that is associated  
68981 with a successfully waited-for child process puts them into the *sigwait()* and *sigwaitinfo()*  
68982 category with respect to SIGCHLD.

68983 This definition allows implementations to treat a pending SIGCHLD signal as accepted by the  
68984 process in *wait()*, with the same meaning of “accepted” as when that word is applied to the  
68985 *sigwait()* family of functions.

68986 Allowing the *wait()* family of functions to behave this way permits an implementation to be able  
68987 to deal precisely with SIGCHLD signals.

68988 In particular, an implementation that does accept (discard) the SIGCHLD signal can make the  
68989 following guarantees regardless of the queuing depth of signals in general (the list of waitable  
68990 children can hold the SIGCHLD queue):

- 68991 1. If a SIGCHLD signal handler is established via *sigaction()* without the SA\_RESETHAND  
68992 flag, SIGCHLD signals can be accurately counted; that is, exactly one SIGCHLD signal  
68993 will be delivered to or accepted by the process for every child process that terminates.
- 68994 2. A single *wait()* issued from a SIGCHLD signal handler can be guaranteed to return  
68995 immediately with status information for a child process.
- 68996 3. When SA\_SIGINFO is requested, the SIGCHLD signal handler can be guaranteed to  
68997 receive a non-null pointer to a **siginfo\_t** structure that describes a child process for which  
68998 a wait via *waitpid()* or *waitid()* will not block or fail.
- 68999 4. The *system()* function will not cause the SIGCHLD handler of a process to be called as a  
69000 result of the *fork()/exec* executed within *system()* because *system()* will accept the  
69001 SIGCHLD signal when it performs a *waitpid()* for its child process. This is a desirable  
69002 behavior of *system()* so that it can be used in a library without causing side-effects to the  
69003 application linked with the library.

69004 An implementation that does not permit the *wait()* family of functions to accept (discard) a  
69005 pending SIGCHLD signal associated with a successfully waited-for child, cannot make the  
69006 guarantees described above for the following reasons:

#### 69007 Guarantee #1

69008 Although it might be assumed that reliable queuing of all SIGCHLD signals generated by  
69009 the system can make this guarantee, the counter-example is the case of a process that blocks  
69010 SIGCHLD and performs an indefinite loop of *fork()/wait()* operations. If the  
69011 implementation supports queued signals, then eventually the system will run out of  
69012 memory for the queue. The guarantee cannot be made because there must be some limit to  
69013 the depth of queuing.

#### 69014 Guarantees #2 and #3

69015 These cannot be guaranteed unless the *wait()* family of functions accepts the SIGCHLD  
69016 signal. Otherwise, a *fork()/wait()* executed while SIGCHLD is blocked (as in the *system()*  
69017 function) will result in an invocation of the handler when SIGCHLD is unblocked, after the  
69018 process has disappeared.

#### 69019 Guarantee #4

69020 Although possible to make this guarantee, *system()* would have to set the SIGCHLD  
69021 handler to SIG\_DFL so that the SIGCHLD signal generated by its *fork()* would be discarded  
69022 (the SIGCHLD default action is to be ignored), then restore it to its previous setting. This  
69023 would have the undesirable side-effect of discarding all SIGCHLD signals pending to the  
69024 process.

69025 **FUTURE DIRECTIONS**

69026 None.

69027 **SEE ALSO**69028 *exec*, *exit()*, *fork()*, *system()*, *waitid()*69029 XBD Section 4.11 (on page 110), [<signal.h>](#), [<sys/wait.h>](#)69030 **CHANGE HISTORY**

69031 First released in Issue 1. Derived from Issue 1 of the SVID.

69032 **Issue 5**

69033 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

69034 **Issue 6**69035 The following new requirements on POSIX implementations derive from alignment with the  
69036 Single UNIX Specification:

- 69037
- The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
69038 required for conforming implementations of previous POSIX specifications, it was not  
69039 required for UNIX applications.

69040 The following changes were made to align with the IEEE P1003.1a draft standard:

- 69041
- The processing of the SIGCHLD signal and the [ECHILD] error is clarified.

69042 The semantics of WIFSTOPPED(*stat\_val*), WIFEXITED(*stat\_val*), and WIFSIGNALED(*stat\_val*)  
69043 are defined with respect to *posix\_spawn()* or *posix\_spawnp()* for alignment with IEEE Std  
69044 1003.1d-1999.

69045 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

69046 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/145 is applied, adding the example to the  
69047 EXAMPLES section.69048 **Issue 7**

69049 SD5-XSH-ERN-202 is applied.

69050 APPLICATION USAGE is added, recommending that the *wait()* function not be used.69051 An additional example for *waitpid()* is added.

**waitid()**69052 **NAME**69053 `waitid` — wait for a child process to change state69054 **SYNOPSIS**69055 `#include <sys/wait.h>`69056 `int waitid(idtype_t idtype, id_t id, siginfo_t *infop, int options);`69057 **DESCRIPTION**

69058 The `waitid()` function shall suspend the calling thread until one child of the process containing  
 69059 the calling thread changes state. It records the current state of a child in the structure pointed to  
 69060 by `infop`. The fields of the structure pointed to by `infop` are filled in as described for the  
 69061 SIGCHLD signal in `<signal.h>`. If a child process changed state prior to the call to `waitid()`,  
 69062 `waitid()` shall return immediately. If more than one thread is suspended in `wait()`, `waitid()`, or  
 69063 `waitpid()` waiting for termination of the same process, exactly one thread shall return the process  
 69064 status at the time of the target process termination.

69065 The `idtype` and `id` arguments are used to specify which children `waitid()` waits for.

69066 If `idtype` is P\_PID, `waitid()` shall wait for the child with a process ID equal to `(pid_t)id`.

69067 If `idtype` is P\_PGID, `waitid()` shall wait for any child with a process group ID equal to `(pid_t)id`.

69068 If `idtype` is P\_ALL, `waitid()` shall wait for any children and `id` is ignored.

69069 The `options` argument is used to specify which state changes `waitid()` shall wait for. It is formed  
 69070 by OR'ing together the following flags:

69071 WCONTINUED Status shall be returned for any child that was stopped and has been  
 69072 continued.

69073 WEXITED Wait for processes that have exited.

69074 WNOHANG Do not hang if no status is available; return immediately.

69075 WNOWAIT Keep the process whose status is returned in `infop` in a waitable state. This  
 69076 shall not affect the state of the process; the process may be waited for again  
 69077 after this call completes.

69078 WSTOPPED Status shall be returned for any child that has stopped upon receipt of a signal.

69079 Applications shall specify at least one of the flags WEXITED, WSTOPPED, or WCONTINUED to  
 69080 be OR'ed in with the `options` argument.

69081 The application shall ensure that the `infop` argument points to a `siginfo_t` structure. If `waitid()`  
 69082 returns because a child process was found that satisfied the conditions indicated by the  
 69083 arguments `idtype` and `options`, then the structure pointed to by `infop` shall be filled in by the  
 69084 system with the status of the process. The `si_signo` member shall always be equal to SIGCHLD.

69085 **RETURN VALUE**

69086 If WNOHANG was specified and status is not available for any process specified by `idtype` and  
 69087 `id`, 0 shall be returned. If `waitid()` returns due to the change of state of one of its children, 0 shall  
 69088 be returned. Otherwise, -1 shall be returned and `errno` set to indicate the error.

69089 **ERRORS**

69090 The `waitid()` function shall fail if:

69091 [ECHILD] The calling process has no existing unwaited-for child processes.

69092 [EINTR] The `waitid()` function was interrupted by a signal.

69093 [EINVAL] An invalid value was specified for *options*, or *idtype* and *id* specify an invalid  
69094 set of processes.

#### 69095 EXAMPLES

69096 None.

#### 69097 APPLICATION USAGE

69098 Calls to *waitid()* with *idtype* equal to P\_ALL will collect information about any child process.  
69099 This may result in interactions with other interfaces that may be waiting for their own children  
69100 (such as by use of *system()*). For this reason it is recommended that portable applications not  
69101 use *waitid()* with *idtype* of P\_ALL. See also APPLICATION USAGE for *wait()*.

#### 69102 RATIONALE

69103 None.

#### 69104 FUTURE DIRECTIONS

69105 None.

#### 69106 SEE ALSO

69107 *exec*, *exit()*, *wait()*

69144 **NAME**

69145 wctomb — convert a wide-character code to a character (restartable)

69146 **SYNOPSIS**

69147 #include &lt;stdio.h&gt;

69148 size\_t wctomb(char \*restrict *s*, wchar\_t *wc*, mbstate\_t \*restrict *ps*);69149 **DESCRIPTION**69150 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
69151 conflict between the requirements described here and the ISO C standard is unintentional. This  
69152 volume of POSIX.1-2008 defers to the ISO C standard.69153 If *s* is a null pointer, the *wctomb()* function shall be equivalent to the call:69154 *wctomb(buf, L'\0', ps)*69155 where *buf* is an internal buffer.69156 If *s* is not a null pointer, the *wctomb()* function shall determine the number of bytes needed to  
69157 represent the character that corresponds to the wide character given by *wc* (including any shift  
69158 sequences), and store the resulting bytes in the array whose first element is pointed to by *s*. At  
69159 most {MB\_CUR\_MAX} bytes are stored. If *wc* is a null wide character, a null byte shall be stored,  
69160 preceded by any shift sequence needed to restore the initial shift state. The resulting state  
69161 described shall be the initial conversion state.69162 If *ps* is a null pointer, the *wctomb()* function shall use its own internal **mbstate\_t** object, which is  
69163 initialized at program start-up to the initial conversion state. Otherwise, the **mbstate\_t** object  
69164 pointed to by *ps* shall be used to completely describe the current conversion state of the  
69165 associated character sequence. The implementation shall behave as if no function defined in this  
69166 volume of POSIX.1-2008 calls *wctomb()*.69167 CX The *wctomb()* function need not be thread-safe if called with a NULL *ps* argument.69168 The behavior of this function shall be affected by the *LC\_CTYPE* category of the current locale.69169 **RETURN VALUE**69170 The *wctomb()* function shall return the number of bytes stored in the array object (including any  
69171 shift sequences). When *wc* is not a valid wide character, an encoding error shall occur. In this  
69172 case, the function shall store the value of the macro [EILSEQ] in *errno* and shall return (**size\_t**)-1;  
69173 the conversion state shall be undefined.69174 **ERRORS**69175 The *wctomb()* function shall fail if:

69176 [EILSEQ] An invalid wide-character code is detected.

69177 The *wctomb()* function may fail if:69178 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

**wcrtomb()**69179 **EXAMPLES**

69180 None.

69181 **APPLICATION USAGE**

69182 None.

69183 **RATIONALE**

69192 (E).69193 **Issue 6**

69194 In the DESCRIPTION, a note on using this function in a threaded application is added.

69195 Extensions beyond the ISO C standard are marked.

69196 The normative text is updated to avoid use of the term "must" for application requirements.

69197 The *wcrtomb()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.69198 **Issue 7**69199 Austin Group Interpretation 1003.1-2001 #148 is applied, clarifying that the *wcrtomb()* function  
69200 need not be thread-safe if called with a NULL *ps* argument.

69201 Austin Group Interpretation 1003.1-2001 #170 is applied.

69202 **NAME**

69203 `wscasecmp`, `wscasecmp_l`, `wcsncasecmp`, `wcsncasecmp_l` — case-insensitive wide-character  
 69204 string comparison

69205 **SYNOPSIS**

```
69206 CX #include <wchar.h>
69207
69207 int wscasecmp(const wchar_t *ws1, const wchar_t *ws2);
69208 int wscasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
69209 locale_t locale);
69210 int wcsncasecmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);
69211 int wcsncasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
69212 size_t n, locale_t locale);
```

69213 **DESCRIPTION**

69214 The `wscasecmp()` and `wcsncasecmp()` functions are the wide-character equivalent of the  
 69215 `strcasecmp()` and `strncasecmp()` functions, respectively.

69216 The `wscasecmp()` and `wscasecmp_l()` functions shall compare, while ignoring differences in case,  
 69217 the wide-character string pointed to by `ws1` to the wide-character string pointed to by `ws2`.

69218 The `wcsncasecmp()` and `wcsncasecmp_l()` functions shall compare, while ignoring differences in  
 69219 case, not more than `n` wide-characters from the wide-character string pointed to by `ws1` to the  
 69220 wide-character string pointed to by `ws2`.

69221 When the `LC_CTIME` category of the current locale is from the POSIX locale, these functions  
 69222 shall behave as if the strings had been converted to lowercase and then a byte comparison  
 69223 performed. Otherwise, the results are unspecified.

69224 The information for `wscasecmp_l()` and `wcsncasecmp_l()` about the case of the characters comes  
 69225 from the locale represented by `locale`.

69226 **RETURN VALUE**

69227 Upon completion, the `wscasecmp()` and `wscasecmp_l()` functions shall return an integer greater  
 69228 than, equal to, or less than 0 if the wide-character string pointed to by `ws1` is, ignoring case,  
 69229 greater than, equal to, or less than the wide-character string pointed to by `ws2`, respectively.

69230 Upon completion, the `wcsncasecmp()` and `wcsncasecmp_l()` functions shall return an integer  
 69231 greater than, equal to, or less than 0 if the possibly null wide-character terminated string pointed  
 69232 to by `ws1` is, ignoring case, greater than, equal to, or less than the possibly null wide-character  
 69233 terminated string pointed to by `ws2`, respectively.

69234 No return values are reserved to indicate an error.

69235 **ERRORS**

69236 The `wscasecmp_l()` and `wcsncasecmp_l()` functions may fail if:

69237 [EINVAL] `locale` is not a valid locale object handle.

69251 **NAME**69252 `wscat` — concatenate two wide-character strings69253 **SYNOPSIS**69254 `#include <wchar.h>`69255 `wchar_t *wscat(wchar_t *restrict ws1, const wchar_t *restrict ws2);`69256 **DESCRIPTION**

69257 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 69258 conflict between the requirements described here and the ISO C standard is unintentional. This  
 69259 volume of POSIX.1-2008 defers to the ISO C standard.

69260 The `wscat()` function shall append a copy of the wide-character string pointed to by `ws2`  
 69261 (including the terminating null wide-character code) to the end of the wide-character string  
 69262 pointed to by `ws1`. The initial wide-character code of `ws2` shall overwrite the null wide-character  
 69263 code at the end of `ws1`. If copying takes place between objects that overlap, the behavior is  
 69264 undefined.

69265 **RETURN VALUE**69266 The `wscat()` function shall return `ws1`; no return value is reserved to indicate an error.69267 **ERRORS**

69268 No errors are defined.

69269 **EXAMPLES**

69270 None.

69271 **APPLICATION USAGE**

69272 None.

69273 **RATIONALE**

69281 First released in Issue 4. Derived from the MSE working draft.

69282 **Issue 6**69283 The Open Group Corrigendum U040/2 is applied. In the RETURN VALUE section, `s1` is  
 69284 changed to `ws1`.69285 The `wscat()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

**wcschr()**69286 **NAME**69287 `wcschr` — wide-character string scanning operation69288 **SYNOPSIS**69289 `#include <wchar.h>`69290 `wchar_t *wcschr(const wchar_t *ws, wchar_t wc);`69291 **DESCRIPTION**

69292 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 69293 conflict between the requirements described here and the ISO C standard is unintentional. This  
 69294 volume of POSIX.1-2008 defers to the ISO C standard.

69295 The `wcschr()` function shall locate the first occurrence of `wc` in the wide-character string pointed  
 69296 to by `ws`. The application shall ensure that the value of `wc` is a character representable as a type  
 69297 `wchar_t` and a wide-character code corresponding to a valid character in the current locale. The  
 69298 terminating null wide-character code is considered to be part of the wide-character string.

69299 **RETURN VALUE**

69300 Upon completion, `wcschr()` shall return a pointer to the wide-character code, or a null pointer if  
 69301 the wide-character code is not found.

69302 **ERRORS**

69303 No errors are defined.

69304 **EXAMPLES**

69316 First released in Issue 4. Derived from the MSE working draft.

69317 **Issue 6**

69318 The normative text is updated to avoid use of the term “must” for application requirements.

69319 **NAME**69320 `wscmp` — compare two wide-character strings69321 **SYNOPSIS**69322 `#include <wchar.h>`69323 `int wscmp(const wchar_t *ws1, const wchar_t *ws2);`69324 **DESCRIPTION**

69325 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 69326 conflict between the requirements described here and the ISO C standard is unintentional. This  
 69327 volume of POSIX.1-2008 defers to the ISO C standard.

69328 The `wscmp()` function shall compare the wide-character string pointed to by `ws1` to the wide-  
 69329 character string pointed to by `ws2`.

69330 The sign of a non-zero return value shall be determined by the sign of the difference between the  
 69331 values of the first pair of wide-character codes that differ in the objects being compared.

69332 **RETURN VALUE**

69333 Upon completion, `wscmp()` shall return an integer greater than, equal to, or less than 0, if the  
 69334 wide-character string pointed to by `ws1` is greater than, equal to, or less than the wide-character  
 69335 string pointed to by `ws2`, respectively.

69350 First released in Issue 4. Derived from the MSE working draft.

**wscoll()**69351 **NAME**69352 `wscoll`, `wscoll_l` — wide-character string comparison using collating information69353 **SYNOPSIS**69354 `#include <wchar.h>`

```
69355 int wscoll(const wchar_t *ws1, const wchar_t *ws2);
69356 CX int wscoll_l(const wchar_t *ws1, const wchar_t *ws2,
69357 locale_t locale);
```

69358 **DESCRIPTION**

69359 CX For `wscoll()`: The functionality described on this reference page is aligned with the ISO C  
 69360 standard. Any conflict between the requirements described here and the ISO C standard is  
 69361 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

69362 CX The `wscoll()` and `wscoll_l()` functions shall compare the wide-character string pointed to by  
 69363 `ws1` to the wide-character string pointed to by `ws2`, both interpreted as appropriate to the  
 69364 CX `LC_COLLATE` category of the current locale of the process, or the locale represented by `locale`,  
 69365 respectively.

69366 CX The `wscoll()` and `wscoll_l()` functions shall not change the setting of `errno` if successful.

69367 CX An application wishing to check for error situations should set `errno` to 0 before calling `wscoll()`  
 69368 or `wscoll_l()`. If `errno` is non-zero on return, an error has occurred.

69369 **RETURN VALUE**

69370 CX Upon successful completion, `wscoll()` and `wscoll_l()` shall return an integer greater than, equal  
 69371 to, or less than 0, according to whether the wide-character string pointed to by `ws1` is greater  
 69372 than, equal to, or less than the wide-character string pointed to by `ws2`, when both are  
 69373 CX interpreted as appropriate to the current locale, or to the locale represented by `locale`,  
 69374 CX respectively. On error, `wscoll()` and `wscoll_l()` shall set `errno`, but no return value is reserved  
 69375 to indicate an error.

69376 **ERRORS**

69377 These functions may fail if:

69378 CX [EINVAL] The `ws1` or `ws2` arguments contain wide-character codes outside the domain of  
 69379 the collating sequence.

69380 The `wscoll_l()` function may fail if:

69381 CX [EINVAL] `locale` is not a valid locale object handle.

69382 **EXAMPLES**

69383 None.

69384 **APPLICATION USAGE**69385 The `wcsxfrm()` and `wscmp()` functions should be used for sorting large lists.69386 **RATIONALE**

69387 None.

69388 **FUTURE DIRECTIONS**

69389 None.

69390 **SEE ALSO**69391 `wscmp()`, `wcsxfrm()`69392 XBD `<wchar.h>`

69393 **CHANGE HISTORY**

69394 First released in Issue 4. Derived from the MSE working draft.

69395 **Issue 5**

69396 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

69397 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

69398 **Issue 7**

69399 The *wscoll\_1()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.  
69400

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**wcscpy()**69401 **NAME**69402 `wcpcpy`, `wcscpy` — copy a wide-character string, returning a pointer to its end69403 **SYNOPSIS**69404 `#include <wchar.h>`69405 CX `wchar_t *wcpcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);`  
69406 `wchar_t *wcscpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);`69407 **DESCRIPTION**69408 CX For `wcscpy()`: The functionality described on this reference page is aligned with the ISO C  
69409 standard. Any conflict between the requirements described here and the ISO C standard is  
69410 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.69411 CX The `wcpcpy()` and `wcscpy()` functions shall copy the wide-character string pointed to by `ws2`  
69412 (including the terminating null wide-character code) into the array pointed to by `ws1`.69413 The application shall ensure that there is room for at least `wcslen(ws2)+1` wide characters in the  
69414 `ws1` array, and that the `ws2` and `ws1` arrays do not overlap.

69415 If copying takes place between objects that overlap, the behavior is undefined.

69416 **RETURN VALUE**69417 CX The `wcpcpy()` function shall return a pointer to the terminating null wide-character code copied  
69418 into the `ws1` buffer.69419 The `wcscpy()` function shall return `ws1`.

69420 No return values are reserved to indicate an error.

69421 **ERRORS**

69422 No errors are defined.

69423 **EXAMPLES**

69424 None.

69425 **APPLICATION USAGE**

69426 None.

69427 **RATIONALE**

69428 None.

69429 **FUTURE DIRECTIONS**

69430 None.

69431 **SEE ALSO**69432 [strcpy\(\)](#), [wcsdup\(\)](#), [wcsncpy\(\)](#)69433 XBD [<wchar.h>](#)69434 **CHANGE HISTORY**

69435 First released in Issue 4. Derived from the MSE working draft.

69436 **Issue 6**69437 The `wcscpy()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.69438 **Issue 7**69439 The `wcpcpy()` function is added from The Open Group Technical Standard, 2006, Extended API  
69440 Set Part 1.

69441 **NAME**

69442 wscspn — get the length of a complementary wide substring

69443 **SYNOPSIS**

69444 #include &lt;wchar.h&gt;

69445 size\_t wscspn(const wchar\_t \*ws1, const wchar\_t \*ws2);

69446 **DESCRIPTION**

69447 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 69448 conflict between the requirements described here and the ISO C standard is unintentional. This  
 69449 volume of POSIX.1-2008 defers to the ISO C standard.

69450 The *wscspn()* function shall compute the length (in wide characters) of the maximum initial  
 69451 segment of the wide-character string pointed to by *ws1* which consists entirely of wide-character  
 69452 codes *not* from the wide-character string pointed to by *ws2*.

69453 **RETURN VALUE**

69454 The *wscspn()* function shall return the length of the initial substring of *ws1*; no return value is  
 69455 reserved to indicate an error.

69456 **ERRORS**

69457 No errors are defined.

69458 **EXAMPLES**

69459 None.

69460 **APPLICATION USAGE**

69461 None.

69462 **RATIONALE**

69463 None.

69464 **FUTURE DIRECTIONS**

69465 None.

69466 **SEE ALSO**69467 [wcssp\(\)](#)

69468 XBD &lt;wchar.h&gt;

69469 **CHANGE HISTORY**

69470 First released in Issue 4. Derived from the MSE working draft.

69471 **Issue 5**

69472 The RETURN VALUE section is updated to indicate that *wscspn()* returns the length of *ws1*,  
 69473 rather than *ws1* itself.

**wcsdup()**69474 **NAME**

69475           wcsdup — duplicate a wide-character string

69476 **SYNOPSIS**

```
69477 CX       #include <wchar.h>
69478       wchar_t *wcsdup(const wchar_t *string);
```

69479 **DESCRIPTION**69480           The *wcsdup()* function is the wide-character equivalent of the *strdup()* function.

69481           The *wcsdup()* function shall return a pointer to a new wide-character string, allocated as if by a  
69482           call to *malloc()*, which is the duplicate of the wide-character string *string*. The returned pointer  
69483           can be passed to *free()*. A null pointer is returned if the new wide-character string cannot be  
69484           created.

69485 **RETURN VALUE**

69486           Upon successful completion, the *wcsdup()* function shall return a pointer to the newly allocated  
69487           wide-character string. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

69488 **ERRORS**69489           The *wcsdup()* function shall fail if:

69490           [ENOMEM]       Memory large enough for the duplicate string could not be allocated.

69491 **EXAMPLES**

69492           None.

69493 **APPLICATION USAGE**

69494           For functions that allocate memory as if by *malloc()*, the application should release such memory  
69495           when it is no longer required by a call to *free()*. For *wcsdup()*, this is the return value.

69496 **RATIONALE**

69497           None.

69498 **FUTURE DIRECTIONS**

69499           None.

69500 **SEE ALSO**69501           *free()*, *strdup()*, *wscpy()*

69502           XBD &lt;wchar.h&gt;

69503 **CHANGE HISTORY**

69504           First released in Issue 7.

69505 **NAME**69506 `wcsftime` — convert date and time to a wide-character string69507 **SYNOPSIS**69508 `#include <wchar.h>`69509 `size_t wcsftime(wchar_t *restrict wcs, size_t maxsize,`  
69510 `const wchar_t *restrict format, const struct tm *restrict timeptr);`69511 **DESCRIPTION**69512 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
69513 conflict between the requirements described here and the ISO C standard is unintentional. This  
69514 volume of POSIX.1-2008 defers to the ISO C standard.69515 The `wcsftime()` function shall be equivalent to the `strftime()` function, except that:

- 69516 • The argument `wcs` points to the initial element of an array of wide characters into which  
69517 the generated output is to be placed.
- 69518 • The argument `maxsize` indicates the maximum number of wide characters to be placed in  
69519 the output array.
- 69520 • The argument `format` is a wide-character string and the conversion specifications are  
69521 replaced by corresponding sequences of wide characters.
- 69522 • The return value indicates the number of wide characters placed in the output array.

69523 If copying takes place between objects that overlap, the behavior is undefined.

69524 **RETURN VALUE**69525 If the total number of resulting wide-character codes including the terminating null wide-  
69526 character code is no more than `maxsize`, `wcsftime()` shall return the number of wide-character  
69527 codes placed into the array pointed to by `wcs`, not including the terminating null wide-character  
69528 code. Otherwise, zero is returned and the contents of the array are unspecified.69529 **ERRORS**

69530 No errors are defined.

69531 **EXAMPLES**

69532 None.

69533 **APPLICATION USAGE**

69534 None.

69535 **RATIONALE**

69536 None.

69537 **FUTURE DIRECTIONS**

69538 None.

69539 **SEE ALSO**69540 `strftime()`69541 XBD `<wchar.h>`69542 **CHANGE HISTORY**

69543 First released in Issue 4.

**wcsftime()**69544 **Issue 5**

69545 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

69546 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of the *format*  
69547 argument is changed from **const char \*** to **const wchar\_t \***.

69548 **Issue 6**

69549 The *wcsftime()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

69550 **NAME**69551 `wcslen`, `wcsnlen` — get length of a fixed-sized wide-character string69552 **SYNOPSIS**69553 `#include <wchar.h>`69554 `size_t wcslen(const wchar_t *ws);`69555 CX `size_t wcsnlen(const wchar_t *ws, size_t maxlen);`69556 **DESCRIPTION**69557 CX For `wcslen()`: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.69560 The `wcslen()` function shall compute the number of wide-character codes in the wide-character string to which `ws` points, not including the terminating null wide-character code.69562 CX The `wcsnlen()` function shall compute the smaller of the number of wide characters in the string to which `ws` points, not including the terminating null wide-character code, and the value of `maxlen`. The `wcsnlen()` function shall never examine more than the first `maxlen` characters of the wide-character string pointed to by `ws`.69566 **RETURN VALUE**69567 The `wcslen()` function shall return the length of `ws`.69568 CX The `wcsnlen()` function shall return an integer containing the smaller of either the length of the wide-character string pointed to by `ws` or `maxlen`.

69570 No return values are reserved to indicate an error.

69571 **ERRORS**

69572 No errors are defined.

**wcsncmp()**69633 **NAME**69634 `wcsncmp` — compare part of two wide-character strings69635 **SYNOPSIS**69636 `#include <wchar.h>`69637 `int wcsncmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);`69638 **DESCRIPTION**69639 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
69640 conflict between the requirements described here and the ISO C standard is unintentional. This  
69641 volume of POSIX.1-2008 defers to the ISO C standard.69642 The `wcsncmp()` function shall compare not more than *n* wide-character codes (wide-character  
69643 codes that follow a null wide-character code are not compared) from the array pointed to by *ws1*  
69644 to the array pointed to by *ws2*.69645 The sign of a non-zero return value shall be determined by the sign of the difference between the  
69646 values of the first pair of wide-character codes that differ in the objects being compared.69647 **RETURN VALUE**69648 Upon successful completion, `wcsncmp()` shall return an integer greater than, equal to, or less  
69649 than 0, if the possibly null-terminated array pointed to by *ws1* is greater than, equal to, or less  
69650 than the possibly null-terminated array pointed to by *ws2*, respectively.69651 **ERRORS**

69652 No errors are defined.

69653 **EXAMPLES**

69654 None.

69655 **APPLICATION USAGE**

69656 None.

69657 **RATIONALE**

69658 None.

69659 **FUTURE DIRECTIONS**

69660 None.

69661 **SEE ALSO**69662 [wcscasecmp\(\)](#), [wcscmp\(\)](#)69663 XBD [<wchar.h>](#)69664 **CHANGE HISTORY**

69665 First released in Issue 4. Derived from the MSE working draft.

69666 **NAME**69667 `wcpncpy`, `wcsncpy` — copy a fixed-size wide-character string, returning a pointer to its end69668 **SYNOPSIS**69669 `#include <wchar.h>`69670 CX `wchar_t *wcpncpy(wchar_t restrict *ws1, const wchar_t *restrict ws2,`  
69671 `size_t n);`69672 `wchar_t *wcsncpy(wchar_t *restrict ws1, const wchar_t *restrict ws2,`  
69673 `size_t n);`69674 **DESCRIPTION**69675 CX For `wcsncpy()`: The functionality described on this reference page is aligned with the ISO C  
69676 standard. Any conflict between the requirements described here and the ISO C standard is  
69677 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.69678 CX The `wcpncpy()` and `wcsncpy()` functions shall copy not more than *n* wide-character codes (wide-  
69679 character codes that follow a null wide-character code are not copied) from the array pointed to  
69680 by *ws2* to the array pointed to by *ws1*. If copying takes place between objects that overlap, the  
69681 behavior is undefined.69682 If the array pointed to by *ws2* is a wide-character string that is shorter than *n* wide-character  
69683 codes, null wide-character codes shall be appended to the copy in the array pointed to by *ws1*,  
69684 until *n* wide-character codes in all are written.69685 **RETURN VALUE**69686 CX If any null wide-character codes were written into the destination, the `wcpncpy()` function shall  
69687 return the address of the first such null wide-character code. Otherwise, it shall return `&ws1[n]`.69688 The `wcsncpy()` function shall return *ws1*.

69689 No return values are reserved to indicate an error.

69690 **ERRORS**

69691 No errors are defined.

69692 **EXAMPLES**

69693 None.

69694 **APPLICATION USAGE**69695 If there is no null wide-character code in the first *n* wide-character codes of the array pointed to  
69696 by *ws2*, the result is not null-terminated.69697 **RATIONALE**

69698 None.

69699 **FUTURE DIRECTIONS**

69700 None.

69786 **Issue 6**

69787 The normative text is updated to avoid use of the term “must” for application requirements.

69788 **NAME**69789 `wcsnrombs, wcsrtombs` — convert a wide-character string to a character string (restartable)69790 **SYNOPSIS**69791 `#include <wchar.h>`

```
69792 CX size_t wcsnrombs(char *restrict dst, const wchar_t **restrict src,  

69793 size_t nwc, size_t len, mbstate_t *restrict ps);  

69794 size_t wcsrtombs(char *restrict dst, const wchar_t **restrict src,  

69795 size_t len, mbstate_t *restrict ps);
```

69796 **DESCRIPTION**

69797 CX For `wcsrtombs()`: The functionality described on this reference page is aligned with the ISO C  
69798 standard. Any conflict between the requirements described here and the ISO C standard is  
69799 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

69800 The `wcsrtombs()` function shall convert a sequence of wide characters from the array indirectly  
69801 pointed to by `src` into a sequence of corresponding characters, beginning in the conversion state  
69802 described by the object pointed to by `ps`. If `dst` is not a null pointer, the converted characters  
69803 shall then be stored into the array pointed to by `dst`. Conversion continues up to and including a  
69804 terminating null wide character, which shall also be stored. Conversion shall stop earlier in the  
69805 following cases:

- 69806 • When a code is reached that does not correspond to a valid character
- 69807 • When the next character would exceed the limit of `len` total bytes to be stored in the array  
69808 pointed to by `dst` (and `dst` is not a null pointer)

69809 Each conversion shall take place as if by a call to the `wcrtomb()` function.

69810 If `dst` is not a null pointer, the pointer object pointed to by `src` shall be assigned either a null  
69811 pointer (if conversion stopped due to reaching a terminating null wide character) or the address  
69812 just past the last wide character converted (if any). If conversion stopped due to reaching a  
69813 terminating null wide character, the resulting state described shall be the initial conversion state.

69814 If `ps` is a null pointer, the `wcsrtombs()` function shall use its own internal `mbstate_t` object, which  
69815 is initialized at program start-up to the initial conversion state. Otherwise, the `mbstate_t` object  
69816 pointed to by `ps` shall be used to completely describe the current conversion state of the  
69817 associated character sequence.

69818 CX The `wcsrtombs()` function need not be thread-safe if called with a NULL `ps` argument.

69819 The `wcsnrombs()` function shall be equivalent to the `wcsrtombs()` function, except that the  
69820 conversion is limited to the first `nwc` wide characters.

69821 The behavior of these functions shall be affected by the `LC_CTYPE` category of the current locale.

69822 The implementation shall behave as if no function defined in System Interfaces volume of  
69823 POSIX.1-2008 calls these functions.

69824 **RETURN VALUE**

69825 If conversion stops because a code is reached that does not correspond to a valid character, an  
69826 encoding error occurs. In this case, these functions shall store the value of the macro `[EILSEQ]` in  
69827 `errno` and return `(size_t)-1`; the conversion state is undefined. Otherwise, these functions shall  
69828 return the number of bytes in the resulting character sequence, not including the terminating  
69829 null (if any).

**wcsrtombs()**69830 **ERRORS**

69831 These functions shall fail if:

69832 [EILSEQ] A wide-character code does not correspond to a valid character.

69833 These functions may fail if:

69834 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.69835 **EXAMPLES**

69836 None.

69837 **APPLICATION USAGE**

69838 None.

69839 **RATIONALE**

69840 None.

69841 **FUTURE DIRECTIONS**

69842 None.

69843 **SEE ALSO**69844 *mbsinit()*, *wcrtomb()*69845 XBD <*wchar.h*>69846 **CHANGE HISTORY**69847 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
69848 (E).69849 **Issue 6**

69850 In the DESCRIPTION, a note on using this function in a threaded application is added.

69851 Extensions beyond the ISO C standard are marked.

69852 The normative text is updated to avoid use of the term “must” for application requirements.

69853 The *wcsrtombs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.69854 **Issue 7**69855 Austin Group Interpretation 1003.1-2001 #148 is applied, clarifying that the *wcsrtombs()* function  
69856 need not be thread-safe if called with a NULL *ps* argument.

69857 Austin Group Interpretation 1003.1-2001 #170 is applied.

69858 The *wcnsrtombs()* function is added from The Open Group Technical Standard, 2006, Extended  
69859 API Set Part 1.

69860 **NAME**69861           wcssp<sub>n</sub> — get the length of a wide substring69862 **SYNOPSIS**

69863           #include &lt;wchar.h&gt;

69864           size\_t wcssp<sub>n</sub>(const wchar\_t \*ws1, const wchar\_t \*ws2);69865 **DESCRIPTION**

69866 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 69867 conflict between the requirements described here and the ISO C standard is unintentional. This  
 69868 volume of POSIX.1-2008 defers to the ISO C standard.

69869       The *wcssp<sub>n</sub>*( ) function shall compute the length (in wide characters) of the maximum initial  
 69870 segment of the wide-character string pointed to by *ws1* which consists entirely of wide-character  
 69871 codes from the wide-character string pointed to by *ws2*.

69872 **RETURN VALUE**

69873       The *wcssp<sub>n</sub>*( ) function shall return the length of the initial substring of *ws1*; no return value is  
 69874 reserved to indicate an error.

69875 **ERRORS**

69876       No errors are defined.

69877 **EXAMPLES**

69878       None.

69879 **APPLICATION USAGE**

69880       None.

69881 **RATIONALE**

69882       None.

69883 **FUTURE DIRECTIONS**

69884       None.

69885 **SEE ALSO**69886       *wcscsp<sub>n</sub>*( )

69887       XBD &lt;wchar.h&gt;

69888 **CHANGE HISTORY**

69889       First released in Issue 4. Derived from the MSE working draft.

69890 **Issue 5**

69891       The RETURN VALUE section is updated to indicate that *wcssp<sub>n</sub>*( ) returns the length of *ws1*  
 69892 rather than *ws1* itself.

**wcsstr()**69893 **NAME**69894 `wcsstr` — find a wide-character substring69895 **SYNOPSIS**69896 `#include <wchar.h>`69897 `wchar_t *wcsstr(const wchar_t *restrict ws1,`  
69898 `const wchar_t *restrict ws2);`69899 **DESCRIPTION**69900 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
69901 conflict between the requirements described here and the ISO C standard is unintentional. This  
69902 volume of POSIX.1-2008 defers to the ISO C standard.69903 The `wcsstr()` function shall locate the first occurrence in the wide-character string pointed to by  
69904 `ws1` of the sequence of wide characters (excluding the terminating null wide character) in the  
69905 wide-character string pointed to by `ws2`.69906 **RETURN VALUE**69907 Upon successful completion, `wcsstr()` shall return a pointer to the located wide-character string,  
69908 or a null pointer if the wide-character string is not found.69909 If `ws2` points to a wide-character string with zero length, the function shall return `ws1`.69910 **ERRORS**

69911 No errors are defined.

69912 **EXAMPLES**

69913 None.

69914 **APPLICATION USAGE**

69915 None.

69916 **RATIONALE**

69917 None.

69918 **FUTURE DIRECTIONS**

69919 None.

69920 **SEE ALSO**69921 [wcschr\(\)](#)69922 XBD [<wchar.h>](#)69923 **CHANGE HISTORY**69924 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
69925 (E).69926 **Issue 6**69927 The `wcsstr()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

69928 **NAME**

69929 wcstod, wcstof, wcstold — convert a wide-character string to a double-precision number

69930 **SYNOPSIS**

```
69931 #include <wchar.h>
69932 double wcstod(const wchar_t *restrict nptr, wchar_t **restrict endptr);
69933 float wcstof(const wchar_t *restrict nptr, wchar_t **restrict endptr);
69934 long double wcstold(const wchar_t *restrict nptr,
69935     wchar_t **restrict endptr);
```

69936 **DESCRIPTION**

69937 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 69938 conflict between the requirements described here and the ISO C standard is unintentional. This  
 69939 volume of POSIX.1-2008 defers to the ISO C standard.

69940 These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to  
 69941 **double**, **float**, and **long double** representation, respectively. First, they shall decompose the  
 69942 input wide-character string into three parts:

- 69943 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by  
 69944 *iswspace()*)
- 69945 2. A subject sequence interpreted as a floating-point constant or representing infinity or  
 69946 NaN
- 69947 3. A final wide-character string of one or more unrecognized wide-character codes,  
 69948 including the terminating null wide-character code of the input wide-character string

69949 Then they shall attempt to convert the subject sequence to a floating-point number, and return  
 69950 the result.

69951 The expected form of the subject sequence is an optional '+' or '-' sign, then one of the  
 69952 following:

- 69953 • A non-empty sequence of decimal digits optionally containing a radix character; then an  
 69954 optional exponent part consisting of the wide character 'e' or the wide character 'E',  
 69955 optionally followed by a '+' or '-' wide character, and then followed by one or more  
 69956 decimal digits
- 69957 • A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix  
 69958 character; then an optional binary exponent part consisting of the wide character 'p' or  
 69959 the wide character 'P', optionally followed by a '+' or '-' wide character, and then  
 69960 followed by one or more decimal digits
- 69961 • One of INF or INFINITY, or any other wide string equivalent except for case
- 69962 • One of NAN or NAN(*n-wchar-sequence<sub>opt</sub>*), or any other wide string ignoring case in the  
 69963 NAN part, where:

```
69964 n-wchar-sequence:
69965     digit
69966     nondigit
69967     n-wchar-sequence digit
69968     n-wchar-sequence nondigit
```

69969 The subject sequence is defined as the longest initial subsequence of the input wide string,  
 69970 starting with the first non-white-space wide character, that is of the expected form. The subject  
 69971 sequence contains no wide characters if the input wide string is not of the expected form.

**wcstod()**

- 69972 If the subject sequence has the expected form for a floating-point number, the sequence of wide  
 69973 characters starting with the first digit or the radix character (whichever occurs first) shall be  
 69974 interpreted as a floating constant according to the rules of the C language, except that the radix  
 69975 character shall be used in place of a period, and that if neither an exponent part nor a radix  
 69976 character appears in a decimal floating-point number, or if a binary exponent part does not  
 69977 appear in a hexadecimal floating-point number, an exponent part of the appropriate type with  
 69978 value zero shall be assumed to follow the last digit in the string. If the subject sequence begins  
 69979 with a minus-sign, the sequence shall be interpreted as negated. A wide-character sequence INF  
 69980 or INFINITY shall be interpreted as an infinity, if representable in the return type, else as if it  
 69981 were a floating constant that is too large for the range of the return type. A wide-character  
 69982 sequence NAN or NAN(*n-wchar-sequence<sub>opt</sub>*) shall be interpreted as a quiet NaN, if supported in  
 69983 the return type, else as if it were a subject sequence part that does not have the expected form;  
 69984 the meaning of the *n-wchar* sequences is implementation-defined. A pointer to the final wide  
 69985 string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.
- 69986 If the subject sequence has the hexadecimal form and FLT\_RADIX is a power of 2, the  
 69987 conversion shall be rounded in an implementation-defined manner.
- 69988 CX The radix character shall be as defined in the locale of the process (category LC\_NUMERIC). In  
 69989 the POSIX locale, or in a locale where the radix character is not defined, the radix character shall  
 69990 default to a <period> ( ' . ' ).
- 69991 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be  
 69992 accepted.
- 69993 If the subject sequence is empty or does not have the expected form, no conversion shall be  
 69994 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that  
 69995 *endptr* is not a null pointer.
- 69996 CX The *wcstod()* function shall not change the setting of *errno* if successful.
- 69997 Since 0 is returned on error and is also a valid return on success, an application wishing to check  
 69998 for error situations should set *errno* to 0, then call *wcstod()*, *wcstof()*, or *wcstold()*, then check  
 69999 *errno*.
- 70000 **RETURN VALUE**
- 70001 Upon successful completion, these functions shall return the converted value. If no conversion  
 70002 CX could be performed, 0 shall be returned and *errno* may be set to [EINVAL].
- 70003 If the correct value is outside the range of representable values, ±HUGE\_VAL, ±HUGE\_VALF, or  
 70004 ±HUGE\_VALL shall be returned (according to the sign of the value), and *errno* shall be set to  
 70005 [ERANGE].
- 70006 If the correct value would cause underflow, a value whose magnitude is no greater than the  
 70007 smallest normalized positive number in the return type shall be returned and *errno* set to  
 70008 [ERANGE].
- 70009 **ERRORS**
- 70010 The *wcstod()* function shall fail if:
- 70011 [ERANGE] The value to be returned would cause overflow or underflow.
- 70012 The *wcstod()* function may fail if:
- 70013 CX [EINVAL] No conversion could be performed.

70014 **EXAMPLES**

70015 None.

70016 **APPLICATION USAGE**

70017 If the subject sequence has the hexadecimal form and FLT\_RADIX is not a power of 2, and the  
 70018 result is not exactly representable, the result should be one of the two numbers in the  
 70019 appropriate internal format that are adjacent to the hexadecimal floating source value, with the  
 70020 extra stipulation that the error should have a correct sign for the current rounding direction.

70021 If the subject sequence has the decimal form and at most DECIMAL\_DIG (defined in `<float.h>`)  
 70022 significant digits, the result should be correctly rounded. If the subject sequence *D* has the  
 70023 decimal form and more than DECIMAL\_DIG significant digits, consider the two bounding,  
 70024 adjacent decimal strings *L* and *U*, both having DECIMAL\_DIG significant digits, such that the  
 70025 values of *L*, *D*, and *U* satisfy " $L \leq D \leq U$ ". The result should be one of the (equal or  
 70026 adjacent) values that would be obtained by correctly rounding *L* and *U* according to the current  
 70027 rounding direction, with the extra stipulation that the error with respect to *D* should have a  
 70028 correct sign for the current rounding direction.

70029 **RATIONALE**

70030 None.

70031 **FUTURE DIRECTIONS**

70032 None.

70033 **SEE ALSO**70034 [fscanf\(\)](#), [iswspace\(\)](#), [localeconv\(\)](#), [setlocale\(\)](#), [wcstol\(\)](#)70035 XBD Chapter 7 (on page 135), `<float.h>`, `<wchar.h>`70036 **CHANGE HISTORY**

70037 First released in Issue 4. Derived from the MSE working draft.

70038 **Issue 5**70039 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.70040 **Issue 6**

70041 Extensions beyond the ISO C standard are marked.

70042 The following new requirements on POSIX implementations derive from alignment with the  
 70043 Single UNIX Specification:

- 70044 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
 70045 added if no conversion could be performed.

70046 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 70047 • The `wcstod()` prototype is updated.
- 70048 • The `wcstof()` and `wcstold()` functions are added.
- 70049 • If the correct value for `wcstod()` would cause underflow, the return value changed from 0  
 70050 (as specified in Issue 5) to the smallest normalized positive number.
- 70051 • The DESCRIPTION, RETURN VALUE, and APPLICATION USAGE sections are  
 70052 extensively updated.

70053 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

70054 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/66 is applied, correcting the second  
 70055 paragraph in the RETURN VALUE section.

70058 **NAME**70059 `wcstoimax`, `wcstoumax` — convert a wide-character string to an integer type70060 **SYNOPSIS**

```
70061 #include <stddef.h>
70062 #include <inttypes.h>
70063
70064 intmax_t wcstoimax(const wchar_t *restrict nptr,
70065                  wchar_t **restrict endptr, int base);
70066 uintmax_t wcstoumax(const wchar_t *restrict nptr,
70067                   wchar_t **restrict endptr, int base);
```

70067 **DESCRIPTION**

70068 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 70069 conflict between the requirements described here and the ISO C standard is unintentional. This  
 70070 volume of POSIX.1-2008 defers to the ISO C standard.

70071 These functions shall be equivalent to the `wcstol()`, `wcstoll()`, `wcstoul()`, and `wcstoull()` functions,  
 70072 respectively, except that the initial portion of the wide string shall be converted to **intmax\_t** and  
 70073 **uintmax\_t** representation, respectively.

70074 **RETURN VALUE**

70075 These functions shall return the converted value, if any.

70076 If no conversion could be performed, zero shall be returned. If the correct value is outside the  
 70077 range of representable values, `{INTMAX_MAX}`, `{INTMAX_MIN}`, or `{UINTMAX_MAX}` shall  
 70078 be returned (according to the return type and sign of the value, if any), and `errno` shall be set to  
 70079 `[ERANGE]`.

70080 **ERRORS**

70081 These functions shall fail if:

- 70082 `[EINVAL]` The value of `base` is not supported.
- 70083 `[ERANGE]` The value to be returned is not representable.

70084 These functions may fail if:

- 70085 `[EINVAL]` No conversion could be performed.

70086 **EXAMPLES**

70087 None.

70088 **APPLICATION USAGE**

70089 None.

70090 **RATIONALE**

70091 None.

70092 **FUTURE DIRECTIONS**

70097 **CHANGE HISTORY**

70098 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**wcstok()**70099 **NAME**70100 `wcstok` — split a wide-character string into tokens70101 **SYNOPSIS**70102 `#include <wchar.h>`70103 `wchar_t *wcstok(wchar_t *restrict ws1, const wchar_t *restrict ws2,`  
70104 `wchar_t **restrict ptr);`70105 **DESCRIPTION**70106 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
70107 conflict between the requirements described here and the ISO C standard is unintentional. This  
70108 volume of POSIX.1-2008 defers to the ISO C standard.70109 A sequence of calls to `wcstok()` shall break the wide-character string pointed to by `ws1` into a  
70110 sequence of tokens, each of which shall be delimited by a wide-character code from the wide-  
70111 character string pointed to by `ws2`. The `ptr` argument points to a caller-provided `wchar_t` pointer  
70112 into which the `wcstok()` function shall store information necessary for it to continue scanning the  
70113 same wide-character string.70114 The first call in the sequence has `ws1` as its first argument, and is followed by calls with a null  
70115 pointer as their first argument. The separator string pointed to by `ws2` may be different from call  
70116 to call.70117 The first call in the sequence shall search the wide-character string pointed to by `ws1` for the first  
70118 wide-character code that is *not* contained in the current separator string pointed to by `ws2`. If no  
70119 such wide-character code is found, then there are no tokens in the wide-character string pointed  
70120 to by `ws1` and `wcstok()` shall return a null pointer. If such a wide-character code is found, it shall  
70121 be the start of the first token.70122 The `wcstok()` function shall then search from there for a wide-character code that *is* contained in  
70123 the current separator string. If no such wide-character code is found, the current token extends  
70124 to the end of the wide-character string pointed to by `ws1`, and subsequent searches for a token  
70125 shall return a null pointer. If such a wide-character code is found, it shall be overwritten by a  
70126 null wide character, which terminates the current token. The `wcstok()` function shall save a  
70127 pointer to the following wide-character code, from which the next search for a token shall start.70128 Each subsequent call, with a null pointer as the value of the first argument, shall start searching  
70129 from the saved pointer and behave as described above.70130 The implementation shall behave as if no function calls `wcstok()`.70131 **RETURN VALUE**70132 Upon successful completion, the `wcstok()` function shall return a pointer to the first wide-  
70133 character code of a token. Otherwise, if there is no token, `wcstok()` shall return a null pointer.70134 **ERRORS**

70135 No errors are defined.

**wcstol()**70153 **NAME**70154 `wcstol`, `wcstoll` — convert a wide-character string to a long integer70155 **SYNOPSIS**

```
70156 #include <wchar.h>
70157 long wcstol(const wchar_t *restrict nptr, wchar_t **restrict endptr,
70158             int base);
70159 long long wcstoll(const wchar_t *restrict nptr,
70160                  wchar_t **restrict endptr, int base);
```

70161 **DESCRIPTION**

70162 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 70163 conflict between the requirements described here and the ISO C standard is unintentional. This  
 70164 volume of POSIX.1-2008 defers to the ISO C standard.

70165 These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to  
 70166 **long** and **long long**, respectively. First, they shall decompose the input string into three parts:

- 70167 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by  
 70168 `iswspace()`)
- 70169 2. A subject sequence interpreted as an integer represented in some radix determined by the  
 70170 value of *base*
- 70171 3. A final wide-character string of one or more unrecognized wide-character codes,  
 70172 including the terminating null wide-character code of the input wide-character string

70173 Then they shall attempt to convert the subject sequence to an integer, and return the result.

70174 If *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,  
 70175 or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal  
 70176 constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal  
 70177 constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7'  
 70178 only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the  
 70179 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

70180 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence  
 70181 of letters and digits representing an integer with the radix specified by *base*, optionally preceded  
 70182 by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z'  
 70183 (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less  
 70184 than that of *base* shall be permitted. If the value of *base* is 16, the wide-character code  
 70185 representations of 0x or 0X may optionally precede the sequence of letters and digits, following  
 70186 the sign if present.

70187 The subject sequence is defined as the longest initial subsequence of the input wide-character  
 70188 string, starting with the first non-white-space wide-character code that is of the expected form.  
 70189 The subject sequence contains no wide-character codes if the input wide-character string is  
 70190 empty or consists entirely of white-space wide-character code, or if the first non-white-space  
 70191 wide-character code is other than a sign or a permissible letter or digit.

70192 If the subject sequence has the expected form and *base* is 0, the sequence of wide-character codes  
 70193 starting with the first digit shall be interpreted as an integer constant. If the subject sequence has  
 70194 the expected form and the value of *base* is between 2 and 36, it shall be used as the base for  
 70195 conversion, ascribing to each letter its value as given above. If the subject sequence begins with a  
 70196 minus-sign, the value resulting from the conversion shall be negated. A pointer to the final  
 70197 wide-character string shall be stored in the object pointed to by *endptr*, provided that *endptr* is  
 70198 not a null pointer.

70199 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be  
70200 accepted.

70201 If the subject sequence is empty or does not have the expected form, no conversion shall be  
70202 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that  
70203 *endptr* is not a null pointer.

70204 CX These functions shall not change the setting of *errno* if successful.

70205 Since 0, {LONG\_MIN} or {LLONG\_MIN} and {LONG\_MAX} or {LLONG\_MAX} are returned on  
70206 error and are also valid returns on success, an application wishing to check for error situations  
70207 should set *errno* to 0, then call *wcstol()* or *wcstoll()*, then check *errno*.

#### 70208 RETURN VALUE

70209 Upon successful completion, these functions shall return the converted value, if any. If no  
70210 CX conversion could be performed, 0 shall be returned and *errno* may be set to indicate the error. If  
70211 the correct value is outside the range of representable values, {LONG\_MIN}, {LONG\_MAX},  
70212 {LLONG\_MIN}, or {LLONG\_MAX} shall be returned (according to the sign of the value), and  
70213 *errno* set to [ERANGE].

#### 70214 ERRORS

70215 These functions shall fail if:

70216 CX [EINVAL] The value of *base* is not supported.

70217 [ERANGE] The value to be returned is not representable.

70218 These functions may fail if:

70219 CX [EINVAL] No conversion could be performed.

70313 **NAME**70314 `wcstoul`, `wcstoull` — convert a wide-character string to an unsigned long70315 **SYNOPSIS**

```
70316 #include <wchar.h>
70317 unsigned long wcstoul(const wchar_t *restrict nptr,
70318     wchar_t **restrict endptr, int base);
70319 unsigned long long wcstoull(const wchar_t *restrict nptr,
70320     wchar_t **restrict endptr, int base);
```

70321 **DESCRIPTION**

70322 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 70323 conflict between the requirements described here and the ISO C standard is unintentional. This  
 70324 volume of POSIX.1-2008 defers to the ISO C standard.

70325 The `wcstoul()` and `wcstoull()` functions shall convert the initial portion of the wide-character  
 70326 string pointed to by `nptr` to **unsigned long** and **unsigned long long** representation, respectively.  
 70327 First, they shall decompose the input wide-character string into three parts:

- 70328 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by  
 70329 `iswspace()`)
- 70330 2. A subject sequence interpreted as an integer represented in some radix determined by the  
 70331 value of `base`
- 70332 3. A final wide-character string of one or more unrecognized wide-character codes,  
 70333 including the terminating null wide-character code of the input wide-character string

70334 Then they shall attempt to convert the subject sequence to an unsigned integer, and return the  
 70335 result.

70336 If `base` is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,  
 70337 or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal  
 70338 constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal  
 70339 constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7'  
 70340 only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the  
 70341 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

70342 If the value of `base` is between 2 and 36, the expected form of the subject sequence is a sequence  
 70343 of letters and digits representing an integer with the radix specified by `base`, optionally preceded  
 70344 by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z'  
 70345 (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less  
 70346 than that of `base` shall be permitted. If the value of `base` is 16, the wide-character codes 0x or 0X  
 70347 may optionally precede the sequence of letters and digits, following the sign if present.

70348 The subject sequence is defined as the longest initial subsequence of the input wide-character  
 70349 string, starting with the first wide-character code that is not white space and is of the expected  
 70350 form. The subject sequence contains no wide-character codes if the input wide-character string is  
 70351 empty or consists entirely of white-space wide-character codes, or if the first wide-character  
 70352 code that is not white space is other than a sign or a permissible letter or digit.

70353 If the subject sequence has the expected form and `base` is 0, the sequence of wide-character codes  
 70354 starting with the first digit shall be interpreted as an integer constant. If the subject sequence has  
 70355 the expected form and the value of `base` is between 2 and 36, it shall be used as the base for  
 70356 conversion, ascribing to each letter its value as given above. If the subject sequence begins with a  
 70357 minus-sign, the value resulting from the conversion shall be negated. A pointer to the final  
 70358 wide-character string shall be stored in the object pointed to by `endptr`, provided that `endptr` is

**wcstoul()**

- 70359 not a null pointer.
- 70360 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be  
70361 accepted.
- 70362 If the subject sequence is empty or does not have the expected form, no conversion shall be  
70363 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that  
70364 *endptr* is not a null pointer.
- 70365 CX The *wcstoul()* function shall not change the setting of *errno* if successful.
- 70366 Since 0, {ULONG\_MAX}, and {ULLONG\_MAX} are returned on error and 0 is also a valid return  
70367 on success, an application wishing to check for error situations should set *errno* to 0, then call  
70368 *wcstoul()* or *wcstoull()*, then check *errno*.
- 70369 **RETURN VALUE**
- 70370 Upon successful completion, the *wcstoul()* and *wcstoull()* functions shall return the converted  
70371 CX value, if any. If no conversion could be performed, 0 shall be returned, and *errno* may be set to  
70372 indicate the error. If the correct value is outside the range of representable values,  
70373 {ULONG\_MAX} or {ULLONG\_MAX} respectively shall be returned and *errno* set to [ERANGE].
- 70374 **ERRORS**
- 70375 These functions shall fail if:
- 70376 CX [EINVAL] The value of *base* is not supported.
- 70377 [ERANGE] The value to be returned is not representable.
- 70378 These functions may fail if:
- 70379 CX [EINVAL] No conversion could be performed.
- 70380 **EXAMPLES**

- 70391 **CHANGE HISTORY**
- 70392 First released in Issue 4. Derived from the MSE working draft.
- 70393 **Issue 5**
- 70394 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.
- 70395 **Issue 6**
- 70396 Extensions beyond the ISO C standard are marked.

70397 The following new requirements on POSIX implementations derive from alignment with the  
70398 Single UNIX Specification:

- 70399 • The [EINVAL] error condition is added for when the value of *base* is not supported.

70400 In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
70401 added if no conversion could be performed.

70402 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 70403 • The *wcstoul()* prototype is updated.
- 70404 • The *wcstoull()* function is added.

70414 **NAME**

70415           wcswidth — number of column positions of a wide-character string

70416 **SYNOPSIS**

```
70417 XSI      #include <wchar.h>
70418      int wcswidth(const wchar_t *pwcs, size_t n);
```

70419 **DESCRIPTION**

70420       The *wcswidth()* function shall determine the number of column positions required for *n* wide-character codes (or fewer than *n* wide-character codes if a null wide-character code is encountered before *n* wide-character codes are exhausted) in the string pointed to by *pwcs*.

70423 **RETURN VALUE**

70424       The *wcswidth()* function either shall return 0 (if *pwcs* points to a null wide-character code), or return the number of column positions to be occupied by the wide-character string pointed to by *pwcs*, or return -1 (if any of the first *n* wide-character codes in the wide-character string pointed to by *pwcs* is not a printable wide-character code).

70428 **ERRORS**

70429       No errors are defined.

70430 **EXAMPLES**

70431       None.

70432 **APPLICATION USAGE**

70433       This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the return value for a non-printable wide character is not specified.

70435 **RATIONALE**

70436       None.

70437 **FUTURE DIRECTIONS**

70438       None.

70439 **SEE ALSO**70440       *wcwidth()*

70441       XBD Section 3.103 (on page 50), &lt;wchar.h&gt;

70442 **CHANGE HISTORY**

70443       First released in Issue 4. Derived from the MSE working draft.

70444 **Issue 6**

70445       The Open Group Corrigendum U021/11 is applied. The function is marked as an extension.

**wcsxfrm()**70446 **NAME**70447 `wcsxfrm, wcsxfrm_l` — wide-character string transformation70448 **SYNOPSIS**70449 `#include <wchar.h>`70450 `size_t wcsxfrm(wchar_t *restrict ws1, const wchar_t *restrict ws2,`  
70451 `size_t n);`70452 CX `size_t wcsxfrm_l(wchar_t *restrict ws1, const wchar_t *restrict ws2,`  
70453 `size_t n, locale_t locale);`70454 **DESCRIPTION**70455 CX For `wcsxfrm()`: The functionality described on this reference page is aligned with the ISO C  
70456 standard. Any conflict between the requirements described here and the ISO C standard is  
70457 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.70458 CX The `wcsxfrm()` and `wcsxfrm_l()` functions shall transform the wide-character string pointed to  
70459 by `ws2` and place the resulting wide-character string into the array pointed to by `ws1`. The  
70460 transformation shall be such that if `wcscmp()` is applied to two transformed wide strings, it shall  
70461 CX return a value greater than, equal to, or less than 0, corresponding to the result of `wcscoll()` and  
70462 `wcscoll_l()` applied to the same two original wide-character strings, and the same `LC_COLLATE`  
70463 CX category of the locale of the process or the locale object `locale`, respectively. No more than `n`  
70464 wide-character codes shall be placed into the resulting array pointed to by `ws1`, including the  
70465 terminating null wide-character code. If `n` is 0, `ws1` is permitted to be a null pointer. If copying  
70466 takes place between objects that overlap, the behavior is undefined.70467 CX The `wcsxfrm()` and `wcsxfrm_l()` functions shall not change the setting of `errno` if successful.70468 Since no return value is reserved to indicate an error, an application wishing to check for error  
70469 situations should set `errno` to 0, then call `wcsxfrm()` or `wcsxfrm_l()`, then check `errno`.70470 **RETURN VALUE**70471 CX The `wcsxfrm()` and `wcsxfrm_l()` functions shall return the length of the transformed wide-  
70472 character string (not including the terminating null wide-character code). If the value returned is  
70473 `n` or more, the contents of the array pointed to by `ws1` are unspecified.70474 CX On error, the `wcsxfrm()` and `wcsxfrm_l()` functions may set `errno`, but no return value is reserved  
70475 to indicate an error.70476 **ERRORS**

70477 These functions may fail if:

70478 CX [EINVAL] The wide-character string pointed to by `ws2` contains wide-character codes  
70479 outside the domain of the collating sequence.70480 The `wcsxfrm_l()` function may fail if:70481 CX [EINVAL] `locale` is not a valid locale object handle.

70482 **EXAMPLES**

70483 None.

70484 **APPLICATION USAGE**

70485 The transformation function is such that two transformed wide-character strings can be ordered  
 70486 by `wscmp()` as appropriate to collating sequence information in the locale of the process  
 70487 (category `LC_COLLATE`).

70488 The fact that when  $n$  is 0 `ws1` is permitted to be a null pointer is useful to determine the size of  
 70489 the `ws1` array prior to making the transformation.

70490 **RATIONALE**

70491 None.

70492 **FUTURE DIRECTIONS**

70493 None.

70494 **SEE ALSO**70495 `wscmp()`, `wscoll()`70496 XBD `<wchar.h>`70497 **CHANGE HISTORY**

70498 First released in Issue 4. Derived from the MSE working draft.

70499 **Issue 5**

70500 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

70501 The DESCRIPTION is updated to indicate that `errno` is not changed if the function is successful.70502 **Issue 6**70503 In earlier versions, this function was required to return `-1` on error.

70504 Extensions beyond the ISO C standard are marked.

70505 The following new requirements on POSIX implementations derive from alignment with the  
 70506 Single UNIX Specification:

- 70507 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is  
 70508 added if no conversion could be performed.

70509 The `wcsxfrm()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.70510 **Issue 7**

70511 The `wcsxfrm_l()` function is added from The Open Group Technical Standard, 2006, Extended  
 70512 API Set Part 4.

**wctob()**70513 **NAME**70514 `wctob` — wide-character to single-byte conversion70515 **SYNOPSIS**

```
70516 #include <stdio.h>
70517 #include <wchar.h>
70518 int wctob(wint_t c);
```

70519 **DESCRIPTION**

70520 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 70521 conflict between the requirements described here and the ISO C standard is unintentional. This  
 70522 volume of POSIX.1-2008 defers to the ISO C standard.

70523 The `wctob()` function shall determine whether `c` corresponds to a member of the extended  
 70524 character set whose character representation is a single byte when in the initial shift state.

70525 The behavior of this function shall be affected by the `LC_CTYPE` category of the current locale.

70526 **RETURN VALUE**

70527 The `wctob()` function shall return EOF if `c` does not correspond to a character with length one in  
 70528 the initial shift state. Otherwise, it shall return the single-byte representation of that character as  
 70529 an **unsigned char** converted to **int**.

70530 **ERRORS**

70531 No errors are defined.

70532 **EXAMPLES**

70533 None.

70534 **APPLICATION USAGE**

70535 None.

70536 **RATIONALE**

70537 None.

70538 **FUTURE DIRECTIONS**

70539 None.

70540 **SEE ALSO**

70541 [btowc\(\)](#)

70542 XBD [<stdio.h>](#) [<wchar.h>](#)

70543 **CHANGE HISTORY**

70544 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 70545 (E).

70546 **NAME**70547 `wctomb` — convert a wide-character code to a character70548 **SYNOPSIS**70549 `#include <stdlib.h>`70550 `int wctomb(char *s, wchar_t wchar);`70551 **DESCRIPTION**

70552 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 70553 conflict between the requirements described here and the ISO C standard is unintentional. This  
 70554 volume of POSIX.1-2008 defers to the ISO C standard.

70555 The `wctomb()` function shall determine the number of bytes needed to represent the character  
 70556 corresponding to the wide-character code whose value is `wchar` (including any change in the  
 70557 shift state). It shall store the character representation (possibly multiple bytes and any special  
 70558 bytes to change shift state) in the array object pointed to by `s` (if `s` is not a null pointer). At most  
 70559 `{MB_CUR_MAX}` bytes shall be stored. If `wchar` is 0, a null byte shall be stored, preceded by any  
 70560 shift sequence needed to restore the initial shift state, and `wctomb()` shall be left in the initial shift  
 70561 state.

70562 CX The behavior of this function is affected by the `LC_CTYPE` category of the current locale. For a  
 70563 state-dependent encoding, this function shall be placed into its initial state by a call for which its  
 70564 character pointer argument, `s`, is a null pointer. Subsequent calls with `s` as other than a null  
 70565 pointer shall cause the internal state of the function to be altered as necessary. A call with `s` as a  
 70566 null pointer shall cause this function to return a non-zero value if encodings have state  
 70567 dependency, and 0 otherwise. Changing the `LC_CTYPE` category causes the shift state of this  
 70568 function to be unspecified.

70569 The `wctomb()` function need not be thread-safe.

70570 The implementation shall behave as if no function defined in this volume of POSIX.1-2008 calls  
 70571 `wctomb()`.

70572 **RETURN VALUE**

70573 If `s` is a null pointer, `wctomb()` shall return a non-zero or 0 value, if character encodings,  
 70574 respectively, do or do not have state-dependent encodings. If `s` is not a null pointer, `wctomb()`  
 70575 shall return `-1` if the value of `wchar` does not correspond to a valid character, or return the  
 70576 number of bytes that constitute the character corresponding to the value of `wchar`.

70577 In no case shall the value returned be greater than the value of the `{MB_CUR_MAX}` macro.

70578 **ERRORS**

70579 The `wctomb()` function shall fail if:

70580 CX **[EILSEQ]** An invalid wide-character code is detected.

70581 **EXAMPLES**

70582 None.

70583 **APPLICATION USAGE**

70584 None.

70585 **RATIONALE**

70586 None.

**wctomb()**70587 **FUTURE DIRECTIONS**

70588 None.

70599 **NAME**70600 `wctrans, wctrans_l` — define character mapping70601 **SYNOPSIS**70602 `#include <wctype.h>`70603 `wctrans_t wctrans(const char *charclass);`70604 CX `wctrans_t wctrans_l(const char *charclass, locale_t locale);`70605 **DESCRIPTION**70606 CX For `wctrans()`: The functionality described on this reference page is aligned with the ISO C  
70607 standard. Any conflict between the requirements described here and the ISO C standard is  
70608 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.70609 CX The `wctrans()` and `wctrans_l()` functions are defined for valid character mapping names  
70610 identified in the current locale. The `charclass` is a string identifying a generic character mapping  
70611 name for which codeset-specific information is required. The following character mapping  
70612 names are defined in all locales: **tolower** and **toupper**.70613 These functions shall return a value of type **wctrans\_t**, which can be used as the second  
70614 CX argument to subsequent calls of `towctrans()` and `towctrans_l()`.70615 CX The `wctrans()` and `wctrans_l()` functions shall determine values of **wctrans\_t** according to the  
70616 rules of the coded character set defined by character mapping information in the locale of the  
70617 CX process or in the locale represented by `locale`, respectively (category `LC_CTYPE`).70618 The values returned by `wctrans()` shall be valid until a call to `setlocale()` that modifies the  
70619 category `LC_CTYPE`.70620 CX The values returned by `wctrans_l()` shall be valid only in calls to `wctrans_l()` with a locale  
70621 represented by `locale` with the same `LC_CTYPE` category value.70622 **RETURN VALUE**70623 CX The `wctrans()` and `wctrans_l()` functions shall return 0 and may set `errno` to indicate the error if  
70624 the given character mapping name is not valid for the current locale (category `LC_CTYPE`);  
70625 otherwise, they shall return a non-zero object of type **wctrans\_t** that can be used in calls to  
70626 CX `towctrans()` and `towctrans_l()`.70627 **ERRORS**

70628 These functions may fail if:

70629 CX **[EINVAL]** The character mapping name pointed to by `charclass` is not valid in the current  
70630 locale.70631 The `wctrans_l()` function may fail if:70632 CX **[EINVAL]** `locale` is not a valid locale object handle.70633 **EXAMPLES**

70634 None.

70648 API Set Part 4.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

70649 **NAME**

70650 wctype, wctype\_l — define character class

70651 **SYNOPSIS**

70652 #include &lt;wctype.h&gt;

70653 wctype\_t wctype(const char \*property);

70654 CX wctype\_t wctype\_l(const char \*property, locale\_t locale);

70655 **DESCRIPTION**70656 CX For *wctype()*: The functionality described on this reference page is aligned with the ISO C  
70657 standard. Any conflict between the requirements described here and the ISO C standard is  
70658 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.70659 CX The *wctype()* and *wctype\_l()* functions are defined for valid character class names as defined in  
70660 CX the current locale or in the locale represented by *locale*, respectively.70661 The *property* argument is a string identifying a generic character class for which codeset-specific  
70662 type information is required. The following character class names shall be defined in all locales:

70663	<b>alnum</b>	<b>digit</b>	<b>punct</b>
70664	<b>alpha</b>	<b>graph</b>	<b>space</b>
70665	<b>blank</b>	<b>lower</b>	<b>upper</b>
70666	<b>cntrl</b>	<b>print</b>	<b>xdigit</b>

70667 Additional character class names defined in the locale definition file (category *LC\_CTYPE*) can  
70668 also be specified.70669 These functions shall return a value of type **wctype\_t**, which can be used as the second  
70670 CX argument to subsequent calls of *iswctype()* and *iswctype\_l()*.70671 CX The *wctype()* and *wctype\_l()* functions shall determine values of **wctype\_t** according to the  
70672 rules of the coded character set defined by character type information in the locale of the process  
70673 CX or in the locale represented by *locale*, respectively (category *LC\_CTYPE*).70674 The values returned by *wctype()* shall be valid until a call to *setlocale()* that modifies the category  
70675 *LC\_CTYPE*.70676 CX The values returned by *wctype\_l()* shall be valid only in calls to *iswctype\_l()* with a locale  
70677 represented by *locale* with the same *LC\_CTYPE* category value.70678 **RETURN VALUE**70679 CX The *wctype()* and *wctype\_l()* functions shall return 0 if the given character class name is not  
70680 valid for the current locale (category *LC\_CTYPE*); otherwise, they shall return an object of type70681 CX **wctype\_t** that can be used in calls to *iswctype()* and *iswctype\_l()*.70682 **ERRORS**70683 The *wctype\_l()* function may fail if:70684 CX [EINVAL] *locale* is not a valid locale object handle.

70693 **SEE ALSO**70694 [iswctype\(\)](#)70695 XBD [<wctype.h>](#)70696 **CHANGE HISTORY**

70697 First released in Issue 4.

70698 **Issue 5**70699 The following change has been made in this version for alignment with  
70700 ISO/IEC 9899: 1990/Amendment 1: 1995 (E):

- 70701
- The SYNOPSIS has been changed to indicate that this function and associated data types  
70702 are now made visible by inclusion of the [<wctype.h>](#) header rather than [<wchar.h>](#).

70703 **Issue 7**70704 The [wctype\\_l\(\)](#) function is added from The Open Group Technical Standard, 2006, Extended API  
70705 Set Part 4.

70706 **NAME**70707 `wcwidth` — number of column positions of a wide-character code70708 **SYNOPSIS**

```
70709 xSI #include <wchar.h>
70710 int wcwidth(wchar_t wc);
```

70711 **DESCRIPTION**

70712 The `wcwidth()` function shall determine the number of column positions required for the wide  
 70713 character `wc`. The application shall ensure that the value of `wc` is a character representable as a  
 70714 **wchar\_t**, and is a wide-character code corresponding to a valid character in the current locale.

70715 **RETURN VALUE**

70716 The `wcwidth()` function shall either return 0 (if `wc` is a null wide-character code), or return the  
 70717 number of column positions to be occupied by the wide-character code `wc`, or return -1 (if `wc`  
 70718 does not correspond to a printable wide-character code).

70719 **ERRORS**

70720 No errors are defined.

70721 **EXAMPLES**

70722 None.

70723 **APPLICATION USAGE**

70724 This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the  
 70725 return value for a non-printable wide character is not specified.

70726 **RATIONALE**

70727 None.

70728 **FUTURE DIRECTIONS**

70729 None.

70730 **SEE ALSO**70731 [wcswidth\(\)](#)70732 XBD [<wchar.h>](#)70733 **CHANGE HISTORY**

70734 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working  
 70735 draft.

70736 **Issue 6**

70737 The Open Group Corrigendum U021/12 is applied. This function is marked as an extension.

70738 The normative text is updated to avoid use of the term “must” for application requirements.

**wmemchr()**70739 **NAME**70740 `wmemchr` — find a wide character in memory70741 **SYNOPSIS**70742 `#include <wchar.h>`70743 `wchar_t *wmemchr(const wchar_t *ws, wchar_t wc, size_t n);`70744 **DESCRIPTION**70745 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
70746 conflict between the requirements described here and the ISO C standard is unintentional. This  
70747 volume of POSIX.1-2008 defers to the ISO C standard.70748 The `wmemchr()` function shall locate the first occurrence of `wc` in the initial `n` wide characters of  
70749 the object pointed to by `ws`. This function shall not be affected by locale and all `wchar_t` values  
70750 shall be treated identically. The null wide character and `wchar_t` values not corresponding to  
70751 valid characters shall not be treated specially.70752 If `n` is zero, the application shall ensure that `ws` is a valid pointer and the function behaves as if  
70753 no valid occurrence of `wc` is found.70754 **RETURN VALUE**70755 The `wmemchr()` function shall return a pointer to the located wide character, or a null pointer if  
70756 the wide character does not occur in the object.70757 **ERRORS**

70758 No errors are defined.

70759 **EXAMPLES**

70760 None.

70761 **APPLICATION USAGE**

70762 None.

70763 **RATIONALE**

70764 None.

70765 **FUTURE DIRECTIONS**

70766 None.

70767 **SEE ALSO**70768 `wmemcmp()`, `wmemcpy()`, `wmemmove()`, `wmemset()`70769 XBD `<wchar.h>`70770 **CHANGE HISTORY**70771 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
70772 (E).70773 **Issue 6**

70774 The normative text is updated to avoid use of the term “must” for application requirements.

70775 **NAME**

70776           wmemcmp — compare wide characters in memory

70777 **SYNOPSIS**

70778           #include &lt;wchar.h&gt;

70779           int wmemcmp(const wchar\_t \*ws1, const wchar\_t \*ws2, size\_t n);

70780 **DESCRIPTION**70781 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
70782 conflict between the requirements described here and the ISO C standard is unintentional. This  
70783 volume of POSIX.1-2008 defers to the ISO C standard.70784       The *wmemcmp()* function shall compare the first *n* wide characters of the object pointed to by  
70785 *ws1* to the first *n* wide characters of the object pointed to by *ws2*. This function shall not be  
70786 affected by locale and all **wchar\_t** values shall be treated identically. The null wide character and  
70787 **wchar\_t** values not corresponding to valid characters shall not be treated specially.70788       If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function  
70789 shall behave as if the two objects compare equal.70790 **RETURN VALUE**70791       The *wmemcmp()* function shall return an integer greater than, equal to, or less than zero,  
70792 respectively, as the object pointed to by *ws1* is greater than, equal to, or less than the object  
70793 pointed to by *ws2*.70794 **ERRORS**

70795       No errors are defined.

70922 The normative text is updated to avoid use of the term “must” for application requirements.

70923 **NAME**

70924 wordexp, wordfree — perform word expansions

70925 **SYNOPSIS**

70926 #include &lt;wordexp.h&gt;

70927 int wordexp(const char \*restrict words, wordexp\_t \*restrict pwordexp,  
70928 int flags);

70929 void wordfree(wordexp\_t \*pwordexp);

70930 **DESCRIPTION**70931 The *wordexp()* function shall perform word expansions as described in XCU Section 2.6 (on page  
70932 2305), subject to quoting as described in XCU Section 2.2 (on page 2298), and place the list of  
70933 expanded words into the structure pointed to by *pwordexp*.70934 The *words* argument is a pointer to a string containing one or more words to be expanded. The  
70935 expansions shall be the same as would be performed by the command line interpreter if *words*  
70936 were the part of a command line representing the arguments to a utility. Therefore, the  
70937 application shall ensure that *words* does not contain an unquoted <newline> character or any of  
70938 the unquoted shell special characters ' | ', ' & ', ' ; ', ' < ', ' > ' except in the context of command  
70939 substitution as specified in XCU Section 2.6.3 (on page 2309). It also shall not contain unquoted  
70940 parentheses or braces, except in the context of command or variable substitution. The  
70941 application shall ensure that every member of *words* which it expects to have expanded by  
70942 *wordexp()* does not contain an unquoted initial comment character. The application shall also  
70943 ensure that any words which it intends to be ignored (because they begin or continue a  
70944 comment) are deleted from *words*. If the argument *words* contains an unquoted comment  
70945 character (<number-sign>) that is the beginning of a token, *wordexp()* shall either treat the  
70946 comment character as a regular character, or interpret it as a comment indicator and ignore the  
70947 remainder of *words*.70948 The structure type **wordexp\_t** is defined in the <wordexp.h> header and includes at least the  
70949 following members:

Member Type	Member Name	Description
size_t	<i>we_wordc</i>	Count of words matched by <i>words</i> .
char **	<i>we_wordv</i>	Pointer to list of expanded words.
size_t	<i>we_offs</i>	Slots to reserve at the beginning of <i>pwordexp-&gt;we_wordv</i> .

70955 The *wordexp()* function shall store the number of generated words into *pwordexp->we\_wordc* and  
70956 a pointer to a list of pointers to words in *pwordexp->we\_wordv*. Each individual field created  
70957 during field splitting (see XCU Section 2.6.5, on page 2311) or pathname expansion (see XCU  
70958 Section 2.6.6, on page 2311) shall be a separate word in the *pwordexp->we\_wordv* list. The words  
70959 shall be in order as described in XCU Section 2.6 (on page 2305). The first pointer after the last  
70960 word pointer shall be a null pointer. The expansion of special parameters described in XCU  
70961 Section 2.5.2 (on page 2302) is unspecified.70962 It is the caller's responsibility to allocate the storage pointed to by *pwordexp*. The *wordexp()*  
70963 function shall allocate other space as needed, including memory pointed to by  
70964 *pwordexp->we\_wordv*. The *wordfree()* function frees any memory associated with *pwordexp* from a  
70965 previous call to *wordexp()*.70966 The *flags* argument is used to control the behavior of *wordexp()*. The value of *flags* is the bitwise-  
70967 inclusive OR of zero or more of the following constants, which are defined in <wordexp.h>:

**wordexp()**

70968	WRDE_APPEND	Append words generated to the ones from a previous call to <i>wordexp()</i> .
70969	WRDE_DOOFFS	Make use of <i>pwordexp-&gt;we_offs</i> . If this flag is set, <i>pwordexp-&gt;we_offs</i> is used to specify how many null pointers to add to the beginning of <i>pwordexp-&gt;we_wordv</i> . In other words, <i>pwordexp-&gt;we_wordv</i> shall point to <i>pwordexp-&gt;we_offs</i> null pointers, followed by <i>pwordexp-&gt;we_wordc</i> word pointers, followed by a null pointer.
70970		
70971		
70972		
70973		
70974	WRDE_NOCMD	If the implementation supports the utilities defined in the Shell and Utilities volume of POSIX.1-2008, fail if command substitution, as specified in XCU Section 2.6.3 (on page 2309), is requested.
70975		
70976		
70977	WRDE_REUSE	The <i>pwordexp</i> argument was passed to a previous successful call to <i>wordexp()</i> , and has not been passed to <i>wordfree()</i> . The result shall be the same as if the application had called <i>wordfree()</i> and then called <i>wordexp()</i> without WRDE_REUSE.
70978		
70979		
70980		
70981	WRDE_SHOWERR	Do not redirect <i>stderr</i> to <i>/dev/null</i> .
70982	WRDE_UNDEF	Report error on an attempt to expand an undefined shell variable.
70983	The WRDE_APPEND flag can be used to append a new set of words to those generated by a previous call to <i>wordexp()</i> . The following rules apply to applications when two or more calls to <i>wordexp()</i> are made with the same value of <i>pwordexp</i> and without intervening calls to <i>wordfree()</i> :	
70984		
70985		
70986	1. The first such call shall not set WRDE_APPEND. All subsequent calls shall set it.	
70987	2. All of the calls shall set WRDE_DOOFFS, or all shall not set it.	
70988	3. After the second and each subsequent call, <i>pwordexp-&gt;we_wordv</i> shall point to a list containing the following:	
70989		
70990	a. Zero or more null pointers, as specified by WRDE_DOOFFS and	
70991	<i>pwordexp-&gt;we_offs</i>	
70992	b. Pointers to the words that were in the <i>pwordexp-&gt;we_wordv</i> list before the call, in	
70993	the same order as before	
70994	c. Pointers to the new words generated by the latest call, in the specified order	
70995	4. The count returned in <i>pwordexp-&gt;we_wordc</i> shall be the total number of words from all of	
70996	the calls.	
70997	5. The application can change any of the fields after a call to <i>wordexp()</i> , but if it does it shall	
70998	reset them to the original value before a subsequent call, using the same <i>pwordexp</i> value,	
70999	to <i>wordfree()</i> or <i>wordexp()</i> with the WRDE_APPEND or WRDE_REUSE flag.	
71000	If the implementation supports the utilities defined in the Shell and Utilities volume of	
71001	POSIX.1-2008, and <i>words</i> contains an unquoted character—<newline>, '   ', ' & ', ' ; ', ' < ', ' > ',	
71002	' ( ', ' ) ', ' { ', ' } '—in an inappropriate context, <i>wordexp()</i> shall fail, and the number of	
71003	expanded words shall be 0.	
71004	Unless WRDE_SHOWERR is set in <i>flags</i> , <i>wordexp()</i> shall redirect <i>stderr</i> to <i>/dev/null</i> for any	
71005	utilities executed as a result of command substitution while expanding <i>words</i> . If	
71006	WRDE_SHOWERR is set, <i>wordexp()</i> may write messages to <i>stderr</i> if syntax errors are detected	
71007	while expanding <i>words</i> .	
71008	The application shall ensure that if WRDE_DOOFFS is set, then <i>pwordexp-&gt;we_offs</i> has the same	
71009	value for each <i>wordexp()</i> call and <i>wordfree()</i> call using a given <i>pwordexp</i> .	

71010 The following constants are defined as error return values:

71011	WRDE_BADCHAR	One of the unquoted characters—<newline>, '   ', ' & ', ' ; ', ' < ', ' > ', ' ( ', ' ) ', ' { ', ' } '—appears in <i>words</i> in an inappropriate context.
71012		
71013	WRDE_BADVAL	Reference to undefined shell variable when WRDE_UNDEF is set in <i>flags</i> .
71014	WRDE_CMDSUB	Command substitution requested when WRDE_NOCMD was set in <i>flags</i> .
71015	WRDE_NOSPACE	Attempt to allocate memory failed.
71016	WRDE_SYNTAX	Shell syntax error, such as unbalanced parentheses or unterminated string.
71017		

#### 71018 RETURN VALUE

71019 Upon successful completion, *wordexp()* shall return 0. Otherwise, a non-zero value, as described  
 71020 in <*wordexp.h*>, shall be returned to indicate an error. If *wordexp()* returns the value  
 71021 WRDE\_NOSPACE, then *pwordexp->we\_wordc* and *pwordexp->we\_wordv* shall be updated to  
 71022 reflect any words that were successfully expanded. In other cases, they shall not be modified.

71023 The *wordfree()* function shall not return a value.

#### 71024 ERRORS

71025 No errors are defined.

#### 71026 EXAMPLES

71027 None.

#### 71028 APPLICATION USAGE

71029 The *wordexp()* function is intended to be used by an application that wants to do all of the shell's  
 71030 expansions on a word or words obtained from a user. For example, if the application prompts  
 71031 for a filename (or list of filenames) and then uses *wordexp()* to process the input, the user could  
 71032 respond with anything that would be valid as input to the shell.

71033 The WRDE\_NOCMD flag is provided for applications that, for security or other reasons, want to  
 71034 prevent a user from executing shell commands. Disallowing unquoted shell special characters  
 71035 also prevents unwanted side-effects, such as executing a command or writing a file.

71036 POSIX.1-2008 does not require the *wordexp()* function to be thread-safe if passed an expression  
 71037 referencing an environment variable while any other thread is concurrently modifying any  
 71038 environment variable; see *exec* (on page 772).

#### 71039 RATIONALE

71040 This function was included as an alternative to *glob()*. There had been continuing controversy  
 71041 over exactly what features should be included in *glob()*. It is hoped that by providing *wordexp()*  
 71042 (which provides all of the shell word expansions, but which may be slow to execute) and *glob()*  
 71043 (which is faster, but which only performs pathname expansion, without tilde or parameter  
 71044 expansion) this will satisfy the majority of applications.

71045 While *wordexp()* could be implemented entirely as a library routine, it is expected that most  
 71046 implementations run a shell in a subprocess to do the expansion.

71047 Two different approaches have been proposed for how the required information might be  
 71048 presented to the shell and the results returned. They are presented here as examples.

71049 One proposal is to extend the *echo* utility by adding a *-q* option. This option would cause *echo* to  
 71050 add a <backslash> before each <backslash> and <blank> that occurs within an argument. The  
 71051 *wordexp()* function could then invoke the shell as follows:

```
71052 (void) strcpy(buffer, "echo -q");
```

**wordexp()**

```

71053     (void) strcat(buffer, words);
71054     if ((flags & WRDE_SHOWERR) == 0)
71055         (void) strcat(buffer, "2>/dev/null");
71056     f = popen(buffer, "r");

```

71057 The *wordexp()* function would read the resulting output, remove unquoted <backslash>  
 71058 characters, and break into words at unquoted <blank> characters. If the WRDE\_NOCMD flag  
 71059 was set, *wordexp()* would have to scan *words* before starting the subshell to make sure that there  
 71060 would be no command substitution. In any case, it would have to scan *words* for unquoted  
 71061 special characters.

71062 Another proposal is to add the following options to *sh*:

71063 **-w** *wordlist*

71064 This option provides a wordlist expansion service to applications. The words in *wordlist*  
 71065 shall be expanded and the following written to standard output:

- 71066 1. The count of the number of words after expansion, in decimal, followed by a null  
 71067 byte
- 71068 2. The number of bytes needed to represent the expanded words (not including null  
 71069 separators), in decimal, followed by a null byte
- 71070 3. The expanded words, each terminated by a null byte

71071 If an error is encountered during word expansion, *sh* exits with a non-zero status after  
 71072 writing the former to report any words successfully expanded

71073 **-P** Run in "protected" mode. If specified with the **-w** option, no command substitution shall  
 71074 be performed.

71075 With these options, *wordexp()* could be implemented fairly simply by creating a subprocess  
 71076 using *fork()* and executing *sh* using the line:

```

71077 execl(<shell path>, "sh", "-P", "-w", words, (char *)0);

```

71078 after directing standard error to **/dev/null**.

71079 It seemed objectionable for a library routine to write messages to standard error, unless explicitly  
 71080 requested, so *wordexp()* is required to redirect standard error to **/dev/null** to ensure that no  
 71081 messages are generated, even for commands executed for command substitution. The  
 71082 WRDE\_SHOWERR flag can be specified to request that error messages be written.

71083 The WRDE\_REUSE flag allows the implementation to avoid the expense of freeing and  
 71084 reallocating memory, if that is possible. A minimal implementation can call *wordfree()* when  
 71085 WRDE\_REUSE is set.

#### 71086 FUTURE DIRECTIONS

71087 None.

71110 **NAME**

71111 pwrite, write — write on a file

71112 **SYNOPSIS**

```
71113 #include <unistd.h>
71114 ssize_t pwrite(int fd, const void *buf, size_t nbyte,
71115               off_t offset);
71116 ssize_t write(int fd, const void *buf, size_t nbyte);
```

71117 **DESCRIPTION**

71118 The *write()* function shall attempt to write *nbyte* bytes from the buffer pointed to by *buf* to the  
 71119 file associated with the open file descriptor, *fd*.

71120 Before any action described below is taken, and if *nbyte* is zero and the file is a regular file, the  
 71121 *write()* function may detect and return errors as described below. In the absence of errors, or if  
 71122 error detection is not performed, the *write()* function shall return zero and have no other results.  
 71123 If *nbyte* is zero and the file is not a regular file, the results are unspecified.

71124 On a regular file or other file capable of seeking, the actual writing of data shall proceed from  
 71125 the position in the file indicated by the file offset associated with *fd*. Before successful return  
 71126 from *write()*, the file offset shall be incremented by the number of bytes actually written. On a  
 71127 regular file, if the position of the last byte written is greater than or equal to the length of the file,  
 71128 the length of the file shall be set to this position plus one.

71129 On a file not capable of seeking, writing shall always take place starting at the current position.  
 71130 The value of a file offset associated with such a device is undefined.

71131 If the O\_APPEND flag of the file status flags is set, the file offset shall be set to the end of the file  
 71132 prior to each write and no intervening file modification operation shall occur between changing  
 71133 the file offset and the write operation.

71134 XSI If a *write()* requests that more bytes be written than there is room for (for example, the file size  
 71135 limit of the process or the physical end of a medium), only as many bytes as there is room for  
 71136 shall be written. For example, suppose there is space for 20 bytes more in a file before reaching a  
 71137 limit. A write of 512 bytes will return 20. The next write of a non-zero number of bytes would  
 71138 give a failure return (except as noted below).

71139 XSI If the request would cause the file size to exceed the soft file size limit for the process and there  
 71140 is no room for any bytes to be written, the request shall fail and the implementation shall  
 71141 generate the SIGXFSZ signal for the thread.

71142 If *write()* is interrupted by a signal before it writes any data, it shall return  $-1$  with *errno* set to  
 71143 [EINTR].

71144 If *write()* is interrupted by a signal after it successfully writes some data, it shall return the  
 71145 number of bytes written.

71146 If the value of *nbyte* is greater than {SSIZE\_MAX}, the result is implementation-defined.

71147 After a *write()* to a regular file has successfully returned:

- 71148 • Any successful *read()* from each byte position in the file that was modified by that write  
 71149 shall return the data specified by the *write()* for that position until such byte positions are  
 71150 again modified.
- 71151 • Any subsequent successful *write()* to the same byte position in the file shall overwrite that  
 71152 file data.

## write()

71153		Write requests to a pipe or FIFO shall be handled in the same way as a regular file with the
71154		following exceptions:
71155		• There is no file offset associated with a pipe, hence each write request shall append to the
71156		end of the pipe.
71157		• Write requests of {PIPE_BUF} bytes or less shall not be interleaved with data from other
71158		processes doing writes on the same pipe. Writes of greater than {PIPE_BUF} bytes may
71159		have data interleaved, on arbitrary boundaries, with writes by other processes, whether or
71160		not the O_NONBLOCK flag of the file status flags is set.
71161		• If the O_NONBLOCK flag is clear, a write request may cause the thread to block, but on
71162		normal completion it shall return <i>nbyte</i> .
71163		• If the O_NONBLOCK flag is set, <i>write()</i> requests shall be handled differently, in the
71164		following ways:
71165		— The <i>write()</i> function shall not block the thread.
71166		— A write request for {PIPE_BUF} or fewer bytes shall have the following effect: if there
71167		is sufficient space available in the pipe, <i>write()</i> shall transfer all the data and return
71168		the number of bytes requested. Otherwise, <i>write()</i> shall transfer no data and return
71169		−1 with <i>errno</i> set to [EAGAIN].
71170		— A write request for more than {PIPE_BUF} bytes shall cause one of the following:
71171		— When at least one byte can be written, transfer what it can and return the
71172		number of bytes written. When all data previously written to the pipe is read, it
71173		shall transfer at least {PIPE_BUF} bytes.
71174		— When no data can be written, transfer no data, and return −1 with <i>errno</i> set to
71175		[EAGAIN].
71176		When attempting to write to a file descriptor (other than a pipe or FIFO) that supports non-
71177		blocking writes and cannot accept the data immediately:
71178		• If the O_NONBLOCK flag is clear, <i>write()</i> shall block the calling thread until the data can
71179		be accepted.
71180		• If the O_NONBLOCK flag is set, <i>write()</i> shall not block the thread. If some data can be
71181		written without blocking the thread, <i>write()</i> shall write what it can and return the number
71182		of bytes written. Otherwise, it shall return −1 and set <i>errno</i> to [EAGAIN].
71183		Upon successful completion, where <i>nbyte</i> is greater than 0, <i>write()</i> shall mark for update the last
71184		data modification and last file status change timestamps of the file, and if the file is a regular file,
71185		the S_ISUID and S_ISGID bits of the file mode may be cleared.
71186		For regular files, no data transfer shall occur past the offset maximum established in the open
71187		file description associated with <i>filides</i> .
71188		If <i>filides</i> refers to a socket, <i>write()</i> shall be equivalent to <i>send()</i> with no flags set.
71189	SIO	If the O_DSYNC bit has been set, write I/O operations on the file descriptor shall complete as
71190		defined by synchronized I/O data integrity completion.
71191		If the O_SYNC bit has been set, write I/O operations on the file descriptor shall complete as
71192		defined by synchronized I/O file integrity completion.
71193	SHM	If <i>filides</i> refers to a shared memory object, the result of the <i>write()</i> function is unspecified.

71194	TYM	If <i>filides</i> refers to a typed memory object, the result of the <i>write()</i> function is unspecified.
71195	OB XSR	If <i>filides</i> refers to a STREAM, the operation of <i>write()</i> shall be determined by the values of the minimum and maximum <i>nbyte</i> range (packet size) accepted by the STREAM. These values are determined by the topmost STREAM module. If <i>nbyte</i> falls within the packet size range, <i>nbyte</i> bytes shall be written. If <i>nbyte</i> does not fall within the range and the minimum packet size value is 0, <i>write()</i> shall break the buffer into maximum packet size segments prior to sending the data downstream (the last segment may contain less than the maximum packet size). If <i>nbyte</i> does not fall within the range and the minimum value is non-zero, <i>write()</i> shall fail with <i>errno</i> set to [ERANGE]. Writing a zero-length buffer ( <i>nbyte</i> is 0) to a STREAMS device sends 0 bytes with 0 returned. However, writing a zero-length buffer to a STREAMS-based pipe or FIFO sends no message and 0 is returned. The process may issue <code>L_SWROPT ioctl()</code> to enable zero-length messages to be sent across the pipe or FIFO.
71196		
71197		
71198		
71199		
71200		
71201		
71202		
71203		
71204		
71205		
71206		When writing to a STREAM, data messages are created with a priority band of 0. When writing to a STREAM that is not a pipe or FIFO:
71207		
71208		• If <code>O_NONBLOCK</code> is clear, and the STREAM cannot accept data (the STREAM write queue is full due to internal flow control conditions), <i>write()</i> shall block until data can be accepted.
71209		
71210		
71211		• If <code>O_NONBLOCK</code> is set and the STREAM cannot accept data, <i>write()</i> shall return <code>-1</code> and set <i>errno</i> to [EAGAIN].
71212		
71213		• If <code>O_NONBLOCK</code> is set and part of the buffer has been written while a condition in which the STREAM cannot accept additional data occurs, <i>write()</i> shall terminate and return the number of bytes written.
71214		
71215		
71216		In addition, <i>write()</i> shall fail if the STREAM head has processed an asynchronous error before the call. In this case, the value of <i>errno</i> does not reflect the result of <i>write()</i> , but reflects the prior error.
71217		
71218		
71219		The <i>pwrite()</i> function shall be equivalent to <i>write()</i> , except that it writes into a given position and does not change the file offset (regardless of whether <code>O_APPEND</code> is set). The first three arguments to <i>pwrite()</i> are the same as <i>write()</i> with the addition of a fourth argument <i>offset</i> for the desired position inside the file.
71220		
71221		
71222		
71223		<b>RETURN VALUE</b>
71224		Upon successful completion, these functions shall return the number of bytes actually written to the file associated with <i>filides</i> . This number shall never be greater than <i>nbyte</i> . Otherwise, <code>-1</code> shall be returned and <i>errno</i> set to indicate the error.
71225		
71226		
71227		<b>ERRORS</b>
71228		These functions shall fail if:
71229		[EAGAIN] The <code>O_NONBLOCK</code> flag is set for the file descriptor and the thread would be delayed in the <i>write()</i> operation.
71230		
71231		[EBADF] The <i>filides</i> argument is not a valid file descriptor open for writing.
71232		[EFBIG] An attempt was made to write a file that exceeds the implementation-defined maximum file size or the file size limit of the process, and there was no room for any bytes to be written.
71233	XSI	
71234		
71235		[EFBIG] The file is a regular file, <i>nbyte</i> is greater than 0, and the starting position is greater than or equal to the offset maximum established in the open file description associated with <i>filides</i> .
71236		
71237		

## write()

71238	[EINTR]	The write operation was terminated due to the receipt of a signal, and no data was transferred.
71239		
71240	[EIO]	The process is a member of a background process group attempting to write to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.
71241		
71242		
71243		
71244	[ENOSPC]	There was no free space remaining on the device containing the file.
71245	[EPIPE]	An attempt is made to write to a pipe or FIFO that is not open for reading by any process, or that only has one end open. A SIGPIPE signal shall also be sent to the thread.
71246		
71247		
71248	OB XSR [ERANGE]	The transfer request size was outside the range supported by the STREAMS file associated with <i>fildev</i> .
71249		
71250		The <i>write()</i> function shall fail if:
71251	[EAGAIN] or [EWOULDBLOCK]	
71252		The file descriptor is for a socket, is marked O_NONBLOCK, and write would block.
71253		
71254	[ECONNRESET]	A write was attempted on a socket that is not connected.
71255	[EPIPE]	A write was attempted on a socket that is shut down for writing, or is no longer connected. In the latter case, if the socket is of type SOCK_STREAM, a SIGPIPE signal shall also be sent to the thread.
71256		
71257		
71258		These functions may fail if:
71259	OB XSR [EINVAL]	The STREAM or multiplexer referenced by <i>fildev</i> is linked (directly or indirectly) downstream from a multiplexer.
71260		
71261	[EIO]	A physical I/O error has occurred.
71262	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.
71263	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.
71264		
71265	OB XSR [ENXIO]	A hangup occurred on the STREAM being written to.
71266	OB XSR	A write to a STREAMS file may fail if an error message has been received at the STREAM head. In this case, <i>errno</i> is set to the value included in the error message.
71267		
71268		The <i>write()</i> function may fail if:
71269	[EACCES]	A write was attempted on a socket and the calling process does not have appropriate privileges.
71270		
71271	[ENETDOWN]	A write was attempted on a socket and the local network interface used to reach the destination is down.
71272		
71273	[ENETUNREACH]	
71274		A write was attempted on a socket and no route to the network is present.
71275		The <i>pwrite()</i> function shall fail and the file pointer remain unchanged if:
71276	[EINVAL]	The <i>offset</i> argument is invalid. The value is negative.

71277 [ESPIPE] *fildev* is associated with a pipe or FIFO.

## 71278 EXAMPLES

### 71279 Writing from a Buffer

71280 The following example writes data from the buffer pointed to by *buf* to the file associated with  
71281 the file descriptor *fd*.

```
71282 #include <sys/types.h>
71283 #include <string.h>
71284 ...
71285 char buf[20];
71286 size_t nbytes;
71287 ssize_t bytes_written;
71288 int fd;
71289 ...
71290 strcpy(buf, "This is a test\n");
71291 nbytes = strlen(buf);
71292 bytes_written = write(fd, buf, nbytes);
71293 ...
```

### 71294 APPLICATION USAGE

71295 None.

### 71296 RATIONALE

71297 See also the RATIONALE section in *read()*.

71298 An attempt to write to a pipe or FIFO has several major characteristics:

- 71299 • *Atomic/non-atomic*: A write is atomic if the whole amount written in one operation is not  
71300 interleaved with data from any other process. This is useful when there are multiple  
71301 writers sending data to a single reader. Applications need to know how large a write  
71302 request can be expected to be performed atomically. This maximum is called {PIPE\_BUF}.  
71303 This volume of POSIX.1-2008 does not say whether write requests for more than  
71304 {PIPE\_BUF} bytes are atomic, but requires that writes of {PIPE\_BUF} or fewer bytes shall  
71305 be atomic.
- 71306 • *Blocking/immediate*: Blocking is only possible with O\_NONBLOCK clear. If there is enough  
71307 space for all the data requested to be written immediately, the implementation should do  
71308 so. Otherwise, the calling thread may block; that is, pause until enough space is available  
71309 for writing. The effective size of a pipe or FIFO (the maximum amount that can be written  
71310 in one operation without blocking) may vary dynamically, depending on the  
71311 implementation, so it is not possible to specify a fixed value for it.

- 71312 • *Complete/partial/deferred*: A write request:

```
71313 int fildes;
71314 size_t nbyte;
71315 ssize_t ret;
71316 char *buf;
71317 ret = write(fildes, buf, nbyte);
```

71318 may return:

write()

71319 Complete *ret=nbyte*

71320 Partial *ret<nbyte*

71321 This shall never happen if *nbyte*≤{PIPE\_BUF}. If it does happen (with  
 71322 *nbyte*>{PIPE\_BUF}), this volume of POSIX.1-2008 does not guarantee  
 71323 atomicity, even if *ret*≤{PIPE\_BUF}, because atomicity is guaranteed according  
 71324 to the amount *requested*, not the amount *written*.

71325 Deferred: *ret=-1, errno=[EAGAIN]*

71326 This error indicates that a later request may succeed. It does not indicate that  
 71327 it *shall* succeed, even if *nbyte*≤{PIPE\_BUF}, because if no process reads from  
 71328 the pipe or FIFO, the write never succeeds. An application could usefully  
 71329 count the number of times [EAGAIN] is caused by a particular value of  
 71330 *nbyte*>{PIPE\_BUF} and perhaps do later writes with a smaller value, on the  
 71331 assumption that the effective size of the pipe may have decreased.

71332 Partial and deferred writes are only possible with O\_NONBLOCK set.

71333 The relations of these properties are shown in the following tables:

71334 **Write to a Pipe or FIFO with O\_NONBLOCK clear**

71335 <b>Immediately Writable:</b>	<b>None</b>	<b>Some</b>	<i>nbyte</i>
71336 <i>nbyte</i> ≤{PIPE_BUF}	Atomic blocking <i>nbyte</i>	Atomic blocking <i>nbyte</i>	Atomic immediate <i>nbyte</i>
71337 <i>nbyte</i> >{PIPE_BUF}	Blocking <i>nbyte</i>	Blocking <i>nbyte</i>	Blocking <i>nbyte</i>

71339 If the O\_NONBLOCK flag is clear, a write request shall block if the amount writable  
 71340 immediately is less than that requested. If the flag is set (by *fcntl()*), a write request shall never  
 71341 block.

71342 **Write to a Pipe or FIFO with O\_NONBLOCK set**

71343 <b>Immediately Writable:</b>	<b>None</b>	<b>Some</b>	<i>nbyte</i>
71344 <i>nbyte</i> ≤{PIPE_BUF}	-1, [EAGAIN]	-1, [EAGAIN]	Atomic <i>nbyte</i>
71345 <i>nbyte</i> >{PIPE_BUF}	-1, [EAGAIN]	< <i>nbyte</i> or -1, [EAGAIN]	≤ <i>nbyte</i> or -1, [EAGAIN]

71347 There is no exception regarding partial writes when O\_NONBLOCK is set. With the exception  
 71348 of writing to an empty pipe, this volume of POSIX.1-2008 does not specify exactly when a partial  
 71349 write is performed since that would require specifying internal details of the implementation.  
 71350 Every application should be prepared to handle partial writes when O\_NONBLOCK is set and  
 71351 the requested amount is greater than {PIPE\_BUF}, just as every application should be prepared  
 71352 to handle partial writes on other kinds of file descriptors.

71353 The intent of forcing writing at least one byte if any can be written is to assure that each write  
 71354 makes progress if there is any room in the pipe. If the pipe is empty, {PIPE\_BUF} bytes must be  
 71355 written; if not, at least some progress must have been made.

71356 Where this volume of POSIX.1-2008 requires -1 to be returned and *errno* set to [EAGAIN], most  
 71357 historical implementations return zero (with the O\_NDELAY flag set, which is the historical  
 71358 predecessor of O\_NONBLOCK, but is not itself in this volume of POSIX.1-2008). The error  
 71359 indications in this volume of POSIX.1-2008 were chosen so that an application can distinguish  
 71360 these cases from end-of-file. While *write()* cannot receive an indication of end-of-file, *read()* can,  
 71361 and the two functions have similar return values. Also, some existing systems (for example,  
 71362 Eighth Edition) permit a write of zero bytes to mean that the reader should get an end-of-file

71363 indication; for those systems, a return value of zero from *write()* indicates a successful write of  
71364 an end-of-file indication.

71365 Implementations are allowed, but not required, to perform error checking for *write()* requests of  
71366 zero bytes.

71367 The concept of a {PIPE\_MAX} limit (indicating the maximum number of bytes that can be  
71368 written to a pipe in a single operation) was considered, but rejected, because this concept would  
71369 unnecessarily limit application writing.

71370 See also the discussion of O\_NONBLOCK in *read()*.

71371 Writes can be serialized with respect to other reads and writes. If a *read()* of file data can be  
71372 proven (by any means) to occur after a *write()* of the data, it must reflect that *write()*, even if the  
71373 calls are made by different processes. A similar requirement applies to multiple write operations  
71374 to the same file position. This is needed to guarantee the propagation of data from *write()* calls  
71375 to subsequent *read()* calls. This requirement is particularly significant for networked file  
71376 systems, where some caching schemes violate these semantics.

71377 Note that this is specified in terms of *read()* and *write()*. The XSI extensions *readv()* and *writev()*  
71378 also obey these semantics. A new “high-performance” write analog that did not follow these  
71379 serialization requirements would also be permitted by this wording. This volume of  
71380 POSIX.1-2008 is also silent about any effects of application-level caching (such as that done by  
71381 *stdio*).

71382 This volume of POSIX.1-2008 does not specify the value of the file offset after an error is  
71383 returned; there are too many cases. For programming errors, such as [EBADF], the concept is  
71384 meaningless since no file is involved. For errors that are detected immediately, such as  
71385 [EAGAIN], clearly the pointer should not change. After an interrupt or hardware error, however,  
71386 an updated value would be very useful and is the behavior of many implementations.

71387 This volume of POSIX.1-2008 does not specify behavior of concurrent writes to a file from  
71388 multiple processes. Applications should use some form of concurrency control.

#### 71389 FUTURE DIRECTIONS

71390 None.

#### 71394 CHANGE HISTORY

71395 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 71396 Issue 5

71397 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
71398 Threads Extension.

71399 Large File Summit extensions are added.

71400 The *pwrite()* function is added.

#### 71401 Issue 6

71402 The DESCRIPTION states that the *write()* function does not block the thread. Previously this  
71403 said “process” rather than “thread”.

71404 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are  
71405 marked as part of the XSI STREAMS Option Group.

**write()**

- 71406 The following new requirements on POSIX implementations derive from alignment with the  
71407 Single UNIX Specification:
- 71408 • The DESCRIPTION now states that if *write()* is interrupted by a signal after it has  
71409 successfully written some data, it returns the number of bytes written. In the POSIX.1-1988  
71410 standard, it was optional whether *write()* returned the number of bytes written, or whether  
71411 it returned  $-1$  with *errno* set to [EINTR]. This is a FIPS requirement.
  - 71412 • The following changes are made to support large files:
    - 71413 — For regular files, no data transfer occurs past the offset maximum established in the  
71414 open file description associated with the *files*.
    - 71415 — A second [EFBIG] error condition is added.
  - 71416 • The [EIO] error condition is added.
  - 71417 • The [EPIPE] error condition is added for when a pipe has only one end open.
  - 71418 • The [ENXIO] optional error condition is added.
- 71419 Text referring to sockets is added to the DESCRIPTION.
- 71420 The following changes were made to align with the IEEE P1003.1a draft standard:
- 71421 • The effect of reading zero bytes is clarified.
- 71422 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
71423 *write()* results are unspecified for typed memory objects.
- 71424 The following error conditions are added for operations on sockets: [EAGAIN],  
71425 [EWOULDBLOCK], [ECONNRESET], [ENOTCONN], and [EPIPE].
- 71426 The [EIO] error is made optional.
- 71427 The [ENOBUFS] error is added for sockets.
- 71428 The following error conditions are added for operations on sockets: [EACCES], [ENETDOWN],  
71429 and [ENETUNREACH].
- 71430 The *writenv()* function is split out into a separate reference page.
- 71431 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/146 is applied, updating text in the  
71432 ERRORS section from “a SIGPIPE signal is generated to the calling process” to “a SIGPIPE  
71433 signal shall also be sent to the thread”.
- 71434 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/147 is applied, making a correction to the  
71435 RATIONALE.
- 71436 **Issue 7**
- 71437 The *pwrite()* function is moved from the XSI option to the Base.
- 71438 Functionality relating to the XSI STREAMS option is marked obsolescent.
- 71439 SD5-XSH-ERN-160 is applied, updating the DESCRIPTION to clarify the requirements for the  
71440 *pwrite()* function, and to change the use of the phrase “file pointer” to “file offset”.

71441 **NAME**

71442 writev — write a vector

71443 **SYNOPSIS**

```
71444 XSI #include <sys/uio.h>
71445      ssize_t writev(int fildev, const struct iovec *iov, int iovcnt);
```

71446 **DESCRIPTION**

71447 The *writev()* function shall be equivalent to *write()*, except as described below. The *writev()*  
 71448 function shall gather output data from the *iovcnt* buffers specified by the members of the *iov*  
 71449 array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*-1]. The *iovcnt* argument is valid if greater than 0 and less than  
 71450 or equal to {IOV\_MAX}, as defined in <limits.h>.

71451 Each *iovec* entry specifies the base address and length of an area in memory from which data  
 71452 should be written. The *writev()* function shall always write a complete area before proceeding to  
 71453 the next.

71454 If *fildev* refers to a regular file and all of the *iov\_len* members in the array pointed to by *iov* are 0,  
 71455 *writev()* shall return 0 and have no other effect. For other file types the behavior is unspecified.

71456 If the sum of the *iov\_len* values is greater than {SSIZE\_MAX}, the operation shall fail and no data  
 71457 shall be transferred.

71458 **RETURN VALUE**

71459 Upon successful completion, *writev()* shall return the number of bytes actually written.  
 71460 Otherwise, it shall return a value of -1, the file pointer shall remain unchanged, and *errno* shall  
 71461 be set to indicate an error.

71462 **ERRORS**71463 Refer to *write()*.71464 In addition, the *writev()* function shall fail if:71465 [EINVAL] The sum of the *iov\_len* values in the *iov* array would overflow an **ssize\_t**.71466 The *writev()* function may fail and set *errno* to:71467 [EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV\_MAX}.71468 **EXAMPLES**71469 **Writing Data from an Array**

71470 The following example writes data from the buffers specified by members of the *iov* array to the  
 71471 file associated with the file descriptor *fd*.

```
71472 #include <sys/types.h>
71473 #include <sys/uio.h>
71474 #include <unistd.h>
71475 ...
71476 ssize_t bytes_written;
71477 int fd;
71478 char *buf0 = "short string\n";
71479 char *buf1 = "This is a longer string\n";
71480 char *buf2 = "This is the longest string in this example\n";
71481 int iovcnt;
71482 struct iovec iov[3];
```

**writev()**

```
71483     iov[0].iov_base = buf0;
71484     iov[0].iov_len = strlen(buf0);
71485     iov[1].iov_base = buf1;
71486     iov[1].iov_len = strlen(buf1);
71487     iov[2].iov_base = buf2;
71488     iov[2].iov_len = strlen(buf2);
71489     ...
71490     iovcnt = sizeof(iov) / sizeof(struct iovec);

71491     bytes_written = writev(fd, iov, iovcnt);
71492     ...
```

**71493 APPLICATION USAGE**

71494 None.

**71495 RATIONALE**

71496 Refer to *write()*.

**71497 FUTURE DIRECTIONS**

71498 None.

*System Interfaces***wscanf()**71506 **NAME**

71507           wscanf — convert formatted wide-character input

71508 **SYNOPSIS**

71509           #include &lt;stdio.h&gt;

71510           #include &lt;wchar.h&gt;

71511           int wscanf(const wchar\_t \*restrict format, ...);

71512 **DESCRIPTION**71513           Refer to *fwscanf()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**y0()**71514 **NAME**71515 `y0, y1, yn` — Bessel functions of the second kind71516 **SYNOPSIS**

```
71517 xSI #include <math.h>
71518 double y0(double x);
71519 double y1(double x);
71520 double yn(int n, double x);
```

71521 **DESCRIPTION**

71522 The `y0()`, `y1()`, and `yn()` functions shall compute Bessel functions of  $x$  of the second kind of  
 71523 orders 0, 1, and  $n$ , respectively.

71524 An application wishing to check for error situations should set `errno` to zero and call  
 71525 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or  
 71526 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-  
 71527 zero, an error has occurred.

71528 **RETURN VALUE**

71529 Upon successful completion, these functions shall return the relevant Bessel value of  $x$  of the  
 71530 second kind.

71531 If  $x$  is NaN, NaN shall be returned.

71532 If the  $x$  argument to these functions is negative, `-HUGE_VAL` or NaN shall be returned, and a  
 71533 domain error may occur.

71534 If  $x$  is 0.0, `-HUGE_VAL` shall be returned and a pole error may occur.

71535 If the correct result would cause underflow, 0.0 shall be returned and a range error may occur.

71536 If the correct result would cause overflow, `-HUGE_VAL` or 0.0 shall be returned and a range  
 71537 error may occur.

71538 **ERRORS**

71539 These functions may fail if:

71540 **Domain Error** The value of  $x$  is negative.

71541 If the integer expression (`math_errhandling` & `MATH_ERRNO`) is non-zero,  
 71542 then `errno` shall be set to [EDOM]. If the integer expression (`math_errhandling`  
 71543 & `MATH_ERREXCEPT`) is non-zero, then the invalid floating-point exception  
 71544 shall be raised.

71545 **Pole Error** The value of  $x$  is zero.

71546 If the integer expression (`math_errhandling` & `MATH_ERRNO`) is non-zero,  
 71547 then `errno` shall be set to [ERANGE]. If the integer expression  
 71548 (`math_errhandling` & `MATH_ERREXCEPT`) is non-zero, then the divide-by-zero  
 71549 floating-point exception shall be raised.

71550 **Range Error** The correct result would cause overflow.

71551 If the integer expression (`math_errhandling` & `MATH_ERRNO`) is non-zero,  
 71552 then `errno` shall be set to [ERANGE]. If the integer expression  
 71553 (`math_errhandling` & `MATH_ERREXCEPT`) is non-zero, then the overflow  
 71554 floating-point exception shall be raised.

71555	Range Error	The value of $x$ is too large in magnitude, or the correct result would cause underflow.
71556		
71557		If the integer expression ( <i>math_errhandling</i> & MATH_ERRNO) is non-zero, then <i>errno</i> shall be set to [ERANGE]. If the integer expression ( <i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.
71558		
71559		
71560		
71561	<b>EXAMPLES</b>	
71562	None.	
71563	<b>APPLICATION USAGE</b>	
71564	On error, the expressions ( <i>math_errhandling</i> & MATH_ERRNO) and ( <i>math_errhandling</i> & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.	
71565		
71566	<b>RATIONALE</b>	
71567	None.	
71568	<b>FUTURE DIRECTIONS</b>	
71569	None.

71591

Chapter 1

71592

*Introduction*

71593

The Shell and Utilities volume of POSIX.1-2008 describes the commands and utilities offered to application programs by POSIX-conformant systems.

71594

71595 **1.1 Relationship to Other Documents**71596 **1.1.1 System Interfaces**

71597 This subsection describes some of the features provided by the System Interfaces volume of  
71598 POSIX.1-2008 that are assumed to be globally available on all systems conforming to this volume  
71599 of POSIX.1-2008. This subsection does not attempt to detail all of the features defined in the  
71600 System Interfaces volume of POSIX.1-2008 that are required by all of the utilities defined in this  
71601 volume of POSIX.1-2008; the utility and function descriptions point out additional functionality  
71602 required to provide the corresponding specific features needed by each.

71603 The following subsections describe frequently used concepts. Many of these concepts are  
71604 described in the Base Definitions volume of POSIX.1-2008. Utility and function description  
71605 statements override these defaults when appropriate.

71606 **1.1.1.1 Process Attributes**

71607 The following process attributes, as described in the System Interfaces volume of POSIX.1-2008,  
71608 are assumed to be supported for all processes in this volume of POSIX.1-2008:

71609	Controlling Terminal	Real Group ID
71610	Current Working Directory	Real User ID
71611	Effective Group ID	Root Directory
71612	Effective User ID	Saved Set-Group-ID
71613	File Descriptors	Saved Set-User-ID
71614	File Mode Creation Mask	Session Membership
71615	Process Group ID	Supplementary Group IDs
71616	Process ID	

71617 A conforming implementation may include additional process attributes.

71618 **1.1.1.2 Concurrent Execution of Processes**

71619 The following functionality of the *fork()* function defined in the System Interfaces volume of  
71620 POSIX.1-2008 shall be available on all systems conforming to this volume of POSIX.1-2008:

- 71621 1. Independent processes shall be capable of executing independently without either  
71622 process terminating.

- 71623 2. A process shall be able to create a new process with all of the attributes referenced in  
 71624 [Section 1.1.1.1](#) (on page 2279), determined according to the semantics of a call to the *fork()*  
 71625 function defined in the System Interfaces volume of POSIX.1-2008 followed by a call in  
 71626 the child process to one of the *exec* functions defined in the System Interfaces volume of  
 71627 POSIX.1-2008.
- 71628 **1.1.1.3 File Access Permissions**
- 71629 The file access control mechanism described by XBD [Section 4.4](#) (on page 108) shall apply to all  
 71630 files on an implementation conforming to this volume of POSIX.1-2008.
- 71631 **1.1.1.4 File Read, Write, and Creation**
- 71632 If a file that does not exist is to be written, it shall be created as described below, unless the  
 71633 utility description states otherwise.
- 71634 When a file that does not exist is created, the following features defined in the System Interfaces  
 71635 volume of POSIX.1-2008 shall apply unless the utility or function description states otherwise:
- 71636 1. The user ID of the file shall be set to the effective user ID of the calling process.
- 71637 2. The group ID of the file shall be set to the effective group ID of the calling process or the  
 71638 group ID of the directory in which the file is being created.
- 71639 3. If the file is a regular file, the permission bits of the file shall be set to:
- 71640  $S\_IROTH \mid S\_IWOTH \mid S\_IRGRP \mid S\_IWGRP \mid S\_IRUSR \mid S\_IWUSR$
- 71641 (see the description of *File Modes* in XBD [Chapter 13](#) (on page 219), `<sys/stat.h>`) except  
 71642 that the bits specified by the file mode creation mask of the process shall be cleared. If the  
 71643 file is a directory, the permission bits shall be set to:
- 71644  $S\_IRWXU \mid S\_IRWXG \mid S\_IRWXO$
- 71645 except that the bits specified by the file mode creation mask of the process shall be  
 71646 cleared.
- 71647 4. The last data access, last data modification, and last file status change timestamps of the  
 71648 file shall be updated as specified in XBD [Section 4.8](#) (on page 109).
- 71649 5. If the file is a directory, it shall be an empty directory; otherwise, the file shall have length  
 71650 zero.
- 71651 6. If the file is a symbolic link, the effect shall be undefined unless the `{POSIX2_SYMLINKS}`  
 71652 variable is in effect for the directory in which the symbolic link would be created.
- 71653 7. Unless otherwise specified, the file created shall be a regular file.
- 71654 When an attempt is made to create a file that already exists, the utility shall take the action  
 71655 indicated in [Table 1-1](#) (on page 2281) corresponding to the type of the file the utility is trying to  
 71656 create and the type of the existing file, unless the utility description states otherwise.

71657

**Table 1-1** Actions when Creating a File that Already Exists

Existing Type	New Type											Function Creating New
	B	C	D	F	L	M	P	Q	R	S	T	
A <i>fattach()</i> -ed STREAM	F	F	F	F	F	—	—	—	OF	—	U	N/A
B Block Special	F	F	F	F	F	U	U	U	OF	U	U	<i>mknod()</i> **
C Character Special	F	F	F	F	F	U	U	U	OF	U	U	<i>mknod()</i> **
D Directory	F	F	F	F	F	—	—	—	F	—	U	<i>mkdir()</i>
F FIFO Special File	F	F	F	F	F	—	—	—	O	—	U	<i>mkfifo()</i>
L Symbolic Link	F	F	F	F	F	—	—	—	FL	—	U	<i>symlink()</i>
M Shared Memory	F	F	F	F	F	—	—	—	—	—	U	<i>shm_open()</i>
P Semaphore	F	F	F	F	F	—	—	—	—	—	U	<i>sem_open()</i>
Q Message Queue	F	F	F	F	F	—	—	—	—	—	U	<i>mq_open()</i>
R Regular File	F	F	F	F	F	—	—	—	RF	—	U	<i>open()</i>
S Socket	F	F	F	F	F	—	—	—	—	—	U	<i>bind()</i>
T Typed Memory	F	F	F	F	F	U	U	U	U	U	U	*

71672

The following codes are used in Table 1-1:

71673

**F** Fail. The attempt to create the new file shall fail and the utility shall either continue with its operation or exit immediately with a non-zero exit status, depending on the description of the utility.

71674

71675

71676

**FL** Follow link. Unless otherwise specified, the symbolic link shall be followed as specified for pathname resolution, and the operation performed shall be as if the target of the symbolic link (after all resolution) had been named. If the target of the symbolic link does not exist, it shall be as if that nonexistent target had been named directly.

71677

71678

71679

71680

**O** Open FIFO. When attempting to create a regular file, and the existing file is a FIFO special file:

71681

71682

1. If the FIFO is not already open for reading, the attempt shall block until the FIFO is opened for reading.

71683

71684

2. Once the FIFO is open for reading, the utility shall open the FIFO for writing and continue with its operation.

71685

71686

**OF** The named file shall be opened with the consequences defined for that file type.

71687

**RF** Regular file. When attempting to create a regular file, and the existing file is a regular file:

71688

1. The user ID, group ID, and permission bits of the file shall not be changed.

71689

2. The file shall be truncated to zero length.

71690

3. The last data modification and last file status change timestamps shall be marked for update.

71691

71692

— The effect is implementation-defined unless specified by the utility description.

71693

**U** The effect is unspecified unless specified by the utility description.

71694

\* There is no portable way to create a file of this type.

71695

\*\* Not portable.

71696

When a file is to be appended, the file shall be opened in a manner equivalent to using the `O_APPEND` flag, without the `O_TRUNC` flag, in the `open()` function defined in the System Interfaces volume of POSIX.1-2008.

71697

71698

71699 When a file is to be read or written, the file shall be opened with an access mode corresponding  
 71700 to the operation to be performed. If file access permissions deny access, the requested operation  
 71701 shall fail.

71702 1.1.1.5 File Removal

71703 When a directory that is the root directory or current working directory of any process is  
 71704 removed, the effect is implementation-defined. If file access permissions deny access, the  
 71705 requested operation shall fail. Otherwise, when a file is removed:

- 71706 1. Its directory entry shall be removed from the file system.
- 71707 2. The link count of the file shall be decremented.
- 71708 3. If the file is an empty directory (see XBD Section 3.144, on page 56):
  - 71709 a. If no process has the directory open, the space occupied by the directory shall be  
 71710 freed and the directory shall no longer be accessible.
  - 71711 b. If one or more processes have the directory open, the directory contents shall be  
 71712 preserved until all references to the file have been closed.
- 71713 4. If the file is a directory that is not empty, the last file status change timestamp shall be  
 71714 marked for update.
- 71715 5. If the file is not a directory:
  - 71716 a. If the link count becomes zero:
    - 71717 i. If no process has the file open, the space occupied by the file shall be freed  
 71718 and the file shall no longer be accessible.
    - 71719 ii. If one or more processes have the file open, the file contents shall be  
 71720 preserved until all references to the file have been closed.
  - 71721 b. If the link count is not reduced to zero, the last file status change timestamp shall  
 71722 be marked for update.
- 71723 6. The last data modification and last file status change timestamps of the containing  
 71724 directory shall be marked for update.

71725 1.1.1.6 File Time Values

71726 All files shall have the three time values described by XBD Section 4.8 (on page 109).

71727 1.1.1.7 File Contents

71728 When a reference is made to the contents of a file, *pathname*, this means the equivalent of all of  
 71729 the data placed in the space pointed to by *buf* when performing the *read()* function calls in the  
 71730 following operations defined in the System Interfaces volume of POSIX.1-2008:

```
71731 while (read (fildes, buf, nbytes) > 0)
71732     ;
```

71733 If the file is indicated by a *pathname*, the file descriptor shall be determined by the  
 71734 equivalent of the following operation defined in the System Interfaces volume of POSIX.1-2008:

```
71735 fildes = open (pathname, O_RDONLY);
```

71736 The value of *nbytes* in the above sequence is unspecified; if the file is of a type where the data

- 71737 returned by *read()* would vary with different values, the value shall be one that results in the  
71738 most data being returned.
- 71739 If the *read()* function calls would return an error, it is unspecified whether the contents of the file  
71740 are considered to include any data from offsets in the file beyond where the error would be  
71741 returned.
- 71742 **1.1.1.8 Pathname Resolution**
- 71743 The pathname resolution algorithm, described by XBD [Section 4.12](#) (on page 111), shall be used  
71744 by implementations conforming to this volume of POSIX.1-2008; see also XBD [Section 4.5](#) (on  
71745 page 108).
- 71746 **1.1.1.9 Changing the Current Working Directory**
- 71747 When the current working directory (see XBD [Section 3.122](#), on page 53) is to be changed, unless  
71748 the utility or function description states otherwise, the operation shall succeed unless a call to  
71749 the *chdir()* function defined in the System Interfaces volume of POSIX.1-2008 would fail when  
71750 invoked with the new working directory pathname as its argument.
- 71751 **1.1.1.10 Establish the Locale**
- 71752 The functionality of the *setlocale()* function defined in the System Interfaces volume of  
71753 POSIX.1-2008 shall be available on all systems conforming to this volume of POSIX.1-2008; that  
71754 is, utilities that require the capability of establishing an international operating environment  
71755 shall be permitted to set the specified category of the international environment.
- 71756 **1.1.1.11 Actions Equivalent to Functions**
- 71757 Some utility descriptions specify that a utility performs actions equivalent to a function defined  
71758 in the System Interfaces volume of POSIX.1-2008. Such specifications require only that the  
71759 external effects be equivalent, not that any effect within the utility and visible only to the utility  
71760 be equivalent.
- 71761 **1.1.2 Concepts Derived from the ISO C Standard**
- 71762 Some of the standard utilities perform complex data manipulation using their own procedure  
71763 and arithmetic languages, as defined in their EXTENDED DESCRIPTION or OPERANDS  
71764 sections. Unless otherwise noted, the arithmetic and semantic concepts (precision, type  
71765 conversion, control flow, and so on) shall be equivalent to those defined in the ISO C standard,  
71766 as described in the following sections. Note that there is no requirement that the standard  
71767 utilities be implemented in any particular programming language.
- 71768 **1.1.2.1 Arithmetic Precision and Operations**
- 71769 Integer variables and constants, including the values of operands and option-arguments, used  
71770 by the standard utilities listed in this volume of POSIX.1-2008 shall be implemented as  
71771 equivalent to the ISO C standard **signed long** data type; floating point shall be implemented as  
71772 equivalent to the ISO C standard **double** type. Conversions between types shall be as described  
71773 in the ISO C standard. All variables shall be initialized to zero if they are not otherwise assigned  
71774 by the input to the application.

71775 Arithmetic operators and control flow keywords shall be implemented as equivalent to those in  
 71776 the cited ISO C standard section, as listed in Table 1-2.

71777 **Table 1-2** Selected ISO C Standard Operators and Control Flow Keywords

Operation	ISO C Standard Equivalent Reference

	Section 6.5.14, Logical OR Operator
expr?expr:expr	Section 6.5.15, Conditional Operator
=, *=, /=, %= <<=, >>=, &=, ^=,  =	Section 6.5.16, Assignment Operators
if () if () ... else switch ()	Section 6.8.4, Selection Statements
while () do ... while () for ()	Section 6.8.5, Iteration Statements
goto continue break return	Section 6.8.6, Jump Statements

71818 The evaluation of arithmetic expressions shall be equivalent to that described in Section 6.5,  
71819 Expressions, of the ISO C standard.

71820 1.1.2.2 *Mathematical Functions*

71821 Any mathematical functions with the same names as those in the following sections of the ISO C  
71822 standard:

- 71823 • Section 7.12, Mathematics, <math.h>
- 71824 • Section 7.20.2, Pseudo-Random Sequence Generation Functions

71825 shall be implemented to return the results equivalent to those returned from a call to the  
71826 corresponding function described in the ISO C standard.

71827 **1.2 Utility Limits**

71828 This section lists magnitude limitations imposed by a specific implementation. The braces  
71829 notation, {LIMIT}, is used in this volume of POSIX.1-2008 to indicate these values, but the braces  
71830 are not part of the name.

71831 **Table 1-3** Utility Limit Minimum Values

Name	Description	Value
{POSIX2_BC_BASE_MAX}	The maximum <i>obase</i> value allowed by the <i>bc</i> utility.	99
{POSIX2_BC_DIM_MAX}	The maximum number of elements permitted in an array by the <i>bc</i> utility.	2 048
{POSIX2_BC_SCALE_MAX}	The maximum <i>scale</i> value allowed by the <i>bc</i> utility.	99
{POSIX2_BC_STRING_MAX}	The maximum length of a string constant accepted by the <i>bc</i> utility.	1 000
{POSIX2_COLL_WEIGHTS_MAX}	The maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> <b>order</b> keyword in the locale definition file; see the <b>border_start</b> keyword in XBD Section 7.3.2 (on page 146).	2
{POSIX2_EXPR_NEST_MAX}	The maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.	32
{POSIX2_LINE_MAX}	Unless otherwise noted, the maximum length, in bytes, of the input line of a utility (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.	2 048
{POSIX2_RE_DUP_MAX}	The maximum number of repeated occurrences of a BRE permitted when using the interval notation $\{m,n\}$ ; see XBD Section 9.3.6 (on page 186).	255

71857 The values specified in Table 1-3 represent the lowest values conforming implementations shall  
71858 provide and, consequently, the largest values on which an application can rely without further

71859 enquiries, as described below. These values shall be accessible to applications via the *getconf*  
 71860 utility (see *getconf*, on page 2772).

71861 Implementations may provide more liberal, or less restrictive, values than shown in Table 1-3  
 71862 (on page 2285). These possibly more liberal values are accessible using the symbols in Table 1-4.

71863 The *sysconf()* function defined in the System Interfaces volume of POSIX.1-2008 or the *getconf*  
 71864 utility return the value of each symbol on each specific implementation. The value so retrieved is  
 71865 the largest, or most liberal, value that is available throughout the session lifetime, as determined  
 71866 at session creation. The literal names shown in the table apply only to the *getconf* utility; the  
 71867 high-level language binding describes the exact form of each name to be used by the interfaces  
 71868 in that binding.

71869 All numeric limits defined by the System Interfaces volume of POSIX.1-2008, such as  
 71870 {PATH\_MAX}, shall also apply to this volume of POSIX.1-2008. All the utilities defined by this  
 71871 volume of POSIX.1-2008 are implicitly limited by these values, unless otherwise noted in the  
 71872 utility descriptions.

71873 It is not guaranteed that the application can actually reach the specified limit of an  
 71874 implementation in any given case, or at all, as a lack of virtual memory or other resources may  
 71875 prevent this. The limit value indicates only that the implementation does not specifically impose  
 71876 any arbitrary, more restrictive limit.

71877 **Table 1-4** Symbolic Utility Limits

Name	Description	Minimum Value
{BC_BASE_MAX}	The maximum <i>ibase</i> value allowed by the <i>bc</i> utility.	{POSIX2_BC_BASE_MAX}
{BC_DIM_MAX}	The maximum number of elements permitted in an array by the <i>bc</i> utility.	{POSIX2_BC_DIM_MAX}
{BC_SCALE_MAX}	The maximum <i>scale</i> value allowed by the <i>bc</i> utility.	{POSIX2_BC_SCALE_MAX}
{BC_STRING_MAX}	The maximum length of a string constant accepted by the <i>bc</i> utility.	{POSIX2_BC_STRING_MAX}
{COLL_WEIGHTS_MAX}	The maximum number of weights that can be assigned to an entry of the <b>LC_COLLATE order</b> keyword in the locale definition file; see the <b>order_start</b> keyword in XBD Section 7.3.2 (on page 146).	{POSIX2_COLL_WEIGHTS_MAX}
{EXPR_NEST_MAX}	The maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.	{POSIX2_EXPR_NEST_MAX}

	Name	Description	Minimum Value
71901			
71902	{LINE_MAX}	Unless otherwise noted, the maximum length, in bytes, of the input line of a utility (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.	{POSIX2_LINE_MAX}
71903			
71904			
71905			
71906			
71907			
71908			
71909			
71910			
71911			
71912	{RE_DUP_MAX}	The maximum number of repeated occurrences of a BRE permitted when using the interval notation $\{m,n\}$ ; see XBD Section 9.3.6 (on page 186).	{POSIX2_RE_DUP_MAX}
71913			
71914			
71915			
71916			

The following value may be a constant within an implementation or may vary from one pathname to another.

71917 {POSIX2\_SYMLINKS}

71918 When referring to a directory, the system supports the creation of symbolic links within that directory; for non-directory files, the meaning of {POSIX2\_SYMLINKS} is undefined.

### 71922 1.3 Grammar Conventions

71923 Portions of this volume of POSIX.1-2008 are expressed in terms of a special grammar notation. It  
 71924 is used to portray the complex syntax of certain program input. The grammar is based on the  
 71925 syntax used by the *yacc* utility. However, it does not represent fully functional *yacc* input,  
 71926 suitable for program use; the lexical processing and all semantic requirements are described only  
 71927 in textual form. The grammar is not based on source used in any traditional implementation and  
 71928 has not been tested with the semantic code that would normally be required to accompany it.  
 71929 Furthermore, there is no implication that the partial *yacc* code presented represents the most  
 71930 efficient, or only, means of supporting the complex syntax within the utility. Implementations  
 71931 may use other programming languages or algorithms, as long as the syntax supported is the  
 71932 same as that represented by the grammar.

71933 The following typographical conventions are used in the grammar; they have no significance  
 71934 except to aid in reading.

- 71935 • The identifiers for the reserved words of the language are shown with a leading capital  
 71936 letter. (These are terminals in the grammar; for example, **While**, **Case**.)
- 71937 • The identifiers for terminals in the grammar are all named with uppercase letters and  
 71938 underscores; for example, **NEWLINE**, **ASSIGN\_OP**, **NAME**.
- 71939 • The identifiers for non-terminals are all lowercase.

## 71940 1.4 Utility Description Defaults

71941 This section describes all of the subsections used within the utility descriptions, including:

- 71942 • Intended usage of the section
- 71943 • Global defaults that affect all the standard utilities
- 71944 • The meanings of notations used in this volume of POSIX.1-2008 that are specific to
- 71945 individual utility sections

### 71946 NAME

71947 This section gives the name or names of the utility and briefly states its purpose.

### 71948 SYNOPSIS

71949 The SYNOPSIS section summarizes the syntax of the calling sequence for the utility,  
71950 including options, option-arguments, and operands. Standards for utility naming are  
71951 described in XBD Section 12.2 (on page 215); for describing the utility's arguments in  
71952 XBD Section 12.1 (on page 213).

### 71953 DESCRIPTION

71954 The DESCRIPTION section describes the actions of the utility. If the utility has a very  
71955 complex set of subcommands or its own procedural language, an EXTENDED  
71956 DESCRIPTION section is also provided. Most explanations of optional functionality are  
71957 omitted here, as they are usually explained in the OPTIONS section.

71958 As stated in Section 1.1.1.11 (on page 2283), some functions are described in terms of  
71959 equivalent functionality. When specific functions are cited, the implementation shall  
71960 provide equivalent functionality including side-effects associated with successful  
71961 execution of the function. The treatment of errors and intermediate results from the  
71962 individual functions cited is generally not specified by this volume of POSIX.1-2008.  
71963 See the utility's EXIT STATUS and CONSEQUENCES OF ERRORS sections for all  
71964 actions associated with errors encountered by the utility.

### 71965 OPTIONS

71966 The OPTIONS section describes the utility options and option-arguments, and how  
71967 they modify the actions of the utility. Standard utilities that have options either fully  
71968 comply with XBD Section 12.2 (on page 215) or describe all deviations. Apparent  
71969 disagreements between functionality descriptions in the OPTIONS and DESCRIPTION  
71970 (or EXTENDED DESCRIPTION) sections are always resolved in favor of the OPTIONS  
71971 section.

71972 Each OPTIONS section that uses the phrase "The ... utility shall conform to the Utility  
71973 Syntax Guidelines ..." refers only to the use of the utility as specified by this volume of  
71974 POSIX.1-2008; implementation extensions should also conform to the guidelines, but  
71975 may allow exceptions for historical practice.

71976 Unless otherwise stated in the utility description, when given an option unrecognized  
71977 by the implementation, or when a required option-argument is not provided, standard  
71978 utilities shall issue a diagnostic message to standard error and exit with a non-zero exit  
71979 status.

71980 All utilities in this volume of POSIX.1-2008 shall be capable of processing arguments  
71981 using eight-bit transparency.

71982 **Default Behavior:** When this section is listed as "None.", it means that the  
71983 implementation need not support any options. Standard utilities that do not accept  
71984 options, but that do accept operands, shall recognize "--" as a first argument to be  
71985 discarded.

71986 The requirement for recognizing "--" is because conforming applications need a way  
 71987 to shield their operands from any arbitrary options that the implementation may  
 71988 provide as an extension. For example, if the standard utility *foo* is listed as taking no  
 71989 options, and the application needed to give it a pathname with a leading <hyphen>, it  
 71990 could safely do it as:

71991 `foo -- -myfile`

71992 and avoid any problems with `-m` used as an extension.

### 71993 OPERANDS

71994 The OPERANDS section describes the utility operands, and how they affect the actions  
 71995 of the utility. Apparent disagreements between functionality descriptions in the  
 71996 OPERANDS and DESCRIPTION (or EXTENDED DESCRIPTION) sections shall be  
 71997 resolved in favor of the OPERANDS section.

71998 If an operand naming a file can be specified as `'-'`, which means to use the standard  
 71999 input instead of a named file, this is explicitly stated in this section. Unless otherwise  
 72000 stated, the use of multiple instances of `'-'` to mean standard input in a single  
 72001 command produces unspecified results.

72002 Unless otherwise stated, the standard utilities that accept operands shall process those  
 72003 operands in the order specified in the command line.

72004 **Default Behavior:** When this section is listed as "None.", it means that the  
 72005 implementation need not support any operands.

### 72006 STDIN

72007 The STDIN section describes the standard input of the utility. This section is frequently  
 72008 merely a reference to the following section, as many utilities treat standard input and  
 72009 input files in the same manner. Unless otherwise stated, all restrictions described in the  
 72010 INPUT FILES section shall apply to this section as well.

72011 Use of a terminal for standard input can cause any of the standard utilities that read  
 72012 standard input to stop when used in the background. For this reason, applications  
 72013 should not use interactive features in scripts to be placed in the background.

72014 The specified standard input format of the standard utilities shall not depend on the  
 72015 existence or value of the environment variables defined in this volume of POSIX.1-2008,  
 72016 except as provided by this volume of POSIX.1-2008.

72017 **Default Behavior:** When this section is listed as "Not used.", it means that the standard  
 72018 input shall not be read when the utility is used as described by this volume of  
 72019 POSIX.1-2008.

### 72020 INPUT FILES

72021 The INPUT FILES section describes the files, other than the standard input, used as  
 72022 input by the utility. It includes files named as operands and option-arguments as well  
 72023 as other files that are referred to, such as start-up and initialization files, databases, and  
 72024 so on. Commonly-used files are generally described in one place and cross-referenced  
 72025 by other utilities.

72026 All utilities in this volume of POSIX.1-2008 shall be capable of processing input files  
 72027 using eight-bit transparency.

72028 When a standard utility reads a seekable input file and terminates without an error  
 72029 before it reaches end-of-file, the utility shall ensure that the file offset in the open file  
 72030 description is properly positioned just past the last byte processed by the utility. For  
 72031 files that are not seekable, the state of the file offset in the open file description for that

72032 file is unspecified. A conforming application shall not assume that the following three  
72033 commands are equivalent:

```
72034 tail -n +2 file
72035 (sed -n 1q; cat) < file
72036 cat file | (sed -n 1q; cat)
```

72037 The second command is equivalent to the first only when the file is seekable. The third  
72038 command leaves the file offset in the open file description in an unspecified state. Other  
72039 utilities, such as *head*, *read*, and *sh*, have similar properties.

72040 Some of the standard utilities, such as filters, process input files a line or a block at a  
72041 time and have no restrictions on the maximum input file size. Some utilities may have  
72042 size limitations that are not as obvious as file space or memory limitations. Such  
72043 limitations should reflect resource limitations of some sort, not arbitrary limits set by  
72044 implementors. Implementations shall document those utilities that are limited by  
72045 constraints other than file system space, available memory, and other limits specifically  
72046 cited by this volume of POSIX.1-2008, and identify what the constraint is and indicate a  
72047 way of estimating when the constraint would be reached. Similarly, some utilities  
72048 descend the directory tree (recursively). Implementations shall also document any  
72049 limits that they may have in descending the directory tree that are beyond limits cited  
72050 by this volume of POSIX.1-2008.

72051 When an input file is described as a “text file”, the utility produces undefined results if  
72052 given input that is not from a text file, unless otherwise stated. Some utilities (for  
72053 example, *make*, *read*, *sh*) allow for continued input lines using an escaped <newline>  
72054 convention; unless otherwise stated, the utility need not be able to accumulate more  
72055 than {LINE\_MAX} bytes from a set of multiple, continued input lines. Thus, for a  
72056 conforming application the total of all the continued lines in a set cannot exceed  
72057 {LINE\_MAX}. If a utility using the escaped <newline> convention detects an end-of-  
72058 file condition immediately after an escaped <newline>, the results are unspecified.

72059 Record formats are described in a notation similar to that used by the C-language  
72060 function, *printf*(. See XBD Chapter 5 (on page 121) for a description of this notation.  
72061 The format description is intended to be sufficiently rigorous to allow other  
72062 applications to generate these input files. However, since <blank>s can legitimately be  
72063 included in some of the fields described by the standard utilities, particularly in locales  
72064 other than the POSIX locale, this intent is not always realized.

72065 **Default Behavior:** When this section is listed as “None.”, it means that no input files  
72066 are required to be supplied when the utility is used as described by this volume of  
72067 POSIX.1-2008.

## 72068 ENVIRONMENT VARIABLES

72069 The ENVIRONMENT VARIABLES section lists what variables affect the utility’s  
72070 execution.

72071 The entire manner in which environment variables described in this volume of  
72072 POSIX.1-2008 affect the behavior of each utility is described in the ENVIRONMENT  
72073 VARIABLES section for that utility, in conjunction with the global effects of the *LANG*,  
72074 XSI *LC\_ALL*, and *NLSPATH* environment variables described in XBD Chapter 8 (on page  
72075 173). The existence or value of environment variables described in this volume of  
72076 POSIX.1-2008 shall not otherwise affect the specified behavior of the standard utilities.  
72077 Any effects of the existence or value of environment variables not described by this  
72078 volume of POSIX.1-2008 upon the standard utilities are unspecified.

72079 For those standard utilities that use environment variables as a means for selecting a

72080 utility to execute (such as *CC* in *make*), the string provided to the utility is subjected to  
72081 the path search described for *PATH* in XBD Chapter 8 (on page 173).

72082 All utilities in this volume of POSIX.1-2008 shall be capable of processing environment  
72083 variable names and values using eight-bit transparency.

72084 **Default Behavior:** When this section is listed as “None.”, it means that the behavior of  
72085 the utility is not directly affected by environment variables described by this volume of  
72086 POSIX.1-2008 when the utility is used as described by this volume of POSIX.1-2008.

#### 72087 ASYNCHRONOUS EVENTS

72088 The ASYNCHRONOUS EVENTS section lists how the utility reacts to such events as  
72089 signals and what signals are caught.

72090 **Default Behavior:** When this section is listed as “Default.”, or it refers to “the standard  
72091 action for all other signals; see Section 1.4 (on page 2288)” it means that the action taken  
72092 as a result of the signal shall be one of the following:

- 72093 1. The action shall be that inherited from the parent according to the rules of  
72094 inheritance of signal actions defined in the System Interfaces volume of  
72095 POSIX.1-2008.
- 72096 2. When no action has been taken to change the default, the default action shall be  
72097 that specified by the System Interfaces volume of POSIX.1-2008.
- 72098 3. The result of the utility’s execution is as if default actions had been taken.

72099 A utility is permitted to catch a signal, perform some additional processing (such as  
72100 deleting temporary files), restore the default signal action (or action inherited from the  
72101 parent process), and resignal itself.

#### 72102 STDOUT

72103 The STDOUT section completely describes the standard output of the utility. This  
72104 section is frequently merely a reference to the following section, OUTPUT FILES,  
72105 because many utilities treat standard output and output files in the same manner.

72106 Use of a terminal for standard output may cause any of the standard utilities that write  
72107 standard output to stop when used in the background. For this reason, applications  
72108 should not use interactive features in scripts to be placed in the background.

72109 Record formats are described in a notation similar to that used by the C-language  
72110 function, *printf()*. See XBD Chapter 5 (on page 121) for a description of this notation.

72111 The specified standard output of the standard utilities shall not depend on the  
72112 existence or value of the environment variables defined in this volume of POSIX.1-2008,  
72113 except as provided by this volume of POSIX.1-2008.

72114 Some of the standard utilities describe their output using the verb *display*, defined in  
72115 XBD Section 3.133 (on page 54). Output described in the STDOUT sections of such  
72116 utilities may be produced using means other than standard output. When standard  
72117 output is directed to a terminal, the output described shall be written directly to the  
72118 terminal. Otherwise, the results are undefined.

72119 **Default Behavior:** When this section is listed as “Not used.”, it means that the standard  
72120 output shall not be written when the utility is used as described by this volume of  
72121 POSIX.1-2008.

#### 72122 STDERR

72123 The STDERR section describes the standard error output of the utility. Only those  
72124 messages that are purposely sent by the utility are described.

72125 Use of a terminal for standard error may cause any of the standard utilities that write  
 72126 standard error output to stop when used in the background. For this reason,  
 72127 applications should not use interactive features in scripts to be placed in the  
 72128 background.

72129 The format of diagnostic messages for most utilities is unspecified, but the language  
 72130 and cultural conventions of diagnostic and informative messages whose format is  
 72131 unspecified by this volume of POSIX.1-2008 should be affected by the setting of  
 72132 XSI `LC_MESSAGES` and `NLSPATH`.

72133 The specified standard error output of standard utilities shall not depend on the  
 72134 existence or value of the environment variables defined in this volume of POSIX.1-2008,  
 72135 except as provided by this volume of POSIX.1-2008.

72136 **Default Behavior:** When this section is listed as “The standard error shall be used only  
 72137 for diagnostic messages.”, it means that, unless otherwise stated, the diagnostic  
 72138 messages shall be sent to the standard error only when the exit status indicates that an  
 72139 error occurred and the utility is used as described by this volume of POSIX.1-2008.

72140 When this section is listed as “Not used.”, it means that the standard error shall not be  
 72141 used when the utility is used as described in this volume of POSIX.1-2008.

## 72142 OUTPUT FILES

72143 The OUTPUT FILES section completely describes the files created or modified by the  
 72144 utility. Temporary or system files that are created for internal usage by this utility or  
 72145 other parts of the implementation (for example, spool, log, and audit files) are not  
 72146 described in this, or any, section. The utilities creating such files and the names of such  
 72147 files are unspecified. If applications are written to use temporary or intermediate files,  
 72148 they should use the `TMPDIR` environment variable, if it is set and represents an  
 72149 accessible directory, to select the location of temporary files.

72150 Implementations shall ensure that temporary files, when used by the standard utilities,  
 72151 are named so that different utilities or multiple instances of the same utility can operate  
 72152 simultaneously without regard to their working directories, or any other process  
 72153 characteristic other than process ID. There are two exceptions to this rule:

- 72154 1. Resources for temporary files other than the name space (for example, disk  
 72155 space, available directory entries, or number of processes allowed) are not  
 72156 guaranteed.
- 72157 2. Certain standard utilities generate output files that are intended as input for  
 72158 other utilities (for example, `lex` generates `lex.yy.c`), and these cannot have unique  
 72159 names. These cases are explicitly identified in the descriptions of the respective  
 72160 utilities.

72161 Any temporary file created by the implementation shall be removed by the  
 72162 implementation upon a utility’s successful exit, exit because of errors, or before  
 72163 termination by any of the `SIGHUP`, `SIGINT`, or `SIGTERM` signals, unless specified  
 72164 otherwise by the utility description.

72165 Receipt of the `SIGQUIT` signal should generally cause termination (unless in some  
 72166 debugging mode) that would bypass any attempted recovery actions.

72167 Record formats are described in a notation similar to that used by the C-language  
 72168 function, `printf()`; see XBD Chapter 5 (on page 121) for a description of this notation.

72169 **Default Behavior:** When this section is listed as “None.”, it means that no files are  
 72170 created or modified as a consequence of direct action on the part of the utility when the  
 72171 utility is used as described by this volume of POSIX.1-2008. However, the utility may

72172 create or modify system files, such as log files, that are outside the utility's normal  
72173 execution environment.

#### 72174 EXTENDED DESCRIPTION

72175 The EXTENDED DESCRIPTION section provides a place for describing the actions of  
72176 very complicated utilities, such as text editors or language processors, which typically  
72177 have elaborate command languages.

72178 **Default Behavior:** When this section is listed as "None.", no further description is  
72179 necessary.

#### 72180 EXIT STATUS

72181 The EXIT STATUS section describes the values the utility shall return to the calling  
72182 program, or shell, and the conditions that cause these values to be returned. Usually,  
72183 utilities return zero for successful completion and values greater than zero for various  
72184 error conditions. If specific numeric values are listed in this section, the system shall  
72185 use those values for the errors described. In some cases, status values are listed more  
72186 loosely, such as >0. A strictly conforming application shall not rely on any specific  
72187 value in the range shown and shall be prepared to receive any value in the range.

72188 For example, a utility may list zero as a successful return, 1 as a failure for a specific  
72189 reason, and >1 as "an error occurred". In this case, unspecified conditions may cause a  
72190 2 or 3, or other value, to be returned. A conforming application should be written so  
72191 that it tests for successful exit status values (zero in this case), rather than relying upon  
72192 the single specific error value listed in this volume of POSIX.1-2008. In that way, it has  
72193 maximum portability, even on implementations with extensions.

72194 Unspecified error conditions may be represented by specific values not listed in this  
72195 volume of POSIX.1-2008.

#### 72196 CONSEQUENCES OF ERRORS

72197 The CONSEQUENCES OF ERRORS section describes the effects on the environment,  
72198 file systems, process state, and so on, when error conditions occur. It does not describe  
72199 error messages produced or exit status values used.

72200 The many reasons for failure of a utility are generally not specified by the utility  
72201 descriptions. Utilities may terminate prematurely if they encounter: invalid usage of  
72202 options, arguments, or environment variables; invalid usage of the complex syntaxes  
72203 expressed in EXTENDED DESCRIPTION sections; difficulties accessing, creating,  
72204 reading, or writing files; or difficulties associated with the privileges of the process.

72205 The following shall apply to each utility, unless otherwise stated:

- 72206 • If the requested action cannot be performed on an operand representing a file,  
72207 directory, user, process, and so on, the utility shall issue a diagnostic message to  
72208 standard error and continue processing the next operand in sequence, but the  
72209 final exit status shall be returned as non-zero.

72210 For a utility that recursively traverses a file hierarchy (such as *find* or *chown -R*), if  
72211 the requested action cannot be performed on a file or directory encountered in the  
72212 hierarchy, the utility shall issue a diagnostic message to standard error and  
72213 continue processing the remaining files in the hierarchy, but the final exit status  
72214 shall be returned as non-zero.

- 72215 • If the requested action characterized by an option or option-argument cannot be  
72216 performed, the utility shall issue a diagnostic message to standard error and the  
72217 exit status returned shall be non-zero.

72218 • When an unrecoverable error condition is encountered, the utility shall exit with a  
72219 non-zero exit status.

72220 • A diagnostic message shall be written to standard error whenever an error  
72221 condition occurs.

72222 When a utility encounters an error condition several actions are possible, depending on  
72223 the severity of the error and the state of the utility. Included in the possible actions of  
72224 various utilities are: deletion of temporary or intermediate work files; deletion of  
72225 incomplete files; validity checking of the file system or directory.

72226 **Default Behavior:** When this section is listed as “Default.”, it means that any changes  
72227 to the environment are unspecified.

#### 72228 APPLICATION USAGE

72229 This section is informative.

72230 The APPLICATION USAGE section gives advice to the application programmer or  
72231 user about the way the utility should be used.

#### 72232 EXAMPLES

72233 This section is informative.

72234 The EXAMPLES section gives one or more examples of usage, where appropriate. In  
72235 the event of conflict between an example and a normative part of the specification, the  
72236 normative material is to be taken as correct.

72237 In all examples, quoting has been used, showing how sample commands (utility names  
72238 combined with arguments) could be passed correctly to a shell (see *sh*) or as a string to  
72239 the *system()* function defined in the System Interfaces volume of POSIX.1-2008. Such  
72240 quoting would not be used if the utility is invoked using one of the *exec* functions  
72241 defined in the System Interfaces volume of POSIX.1-2008.

#### 72242 RATIONALE

72243 This section is informative.

72244 This section contains historical information concerning the contents of this volume of  
72245 POSIX.1-2008 and why features were included or discarded by the standard  
72246 developers.

#### 72247 FUTURE DIRECTIONS

72248 This section is informative.

72249 The FUTURE DIRECTIONS section should be used as a guide to current thinking; there  
72250 is not necessarily a commitment to implement all of these future directions in their  
72251 entirety.

#### 72252 SEE ALSO

72253 This section is informative.

72254 The SEE ALSO section lists related entries.

#### 72255 CHANGE HISTORY

72256 This section is informative.

72257 This section shows the derivation of the entry and any significant changes that have  
72258 been made to it.

72259 Certain of the standard utilities describe how they can invoke other utilities or applications, such  
72260 as by passing a command string to the command interpreter. The external influences (STDIN,  
72261 ENVIRONMENT VARIABLES, and so on) and external effects (STDOUT, CONSEQUENCES OF

72262 ERRORS, and so on) of such invoked utilities are not described in the section concerning the  
72263 standard utility that invokes them.

## 72264 1.5 Considerations for Utilities in Support of Files of Arbitrary Size

72265 The following utilities support files of any size up to the maximum that can be created by the  
72266 implementation. This support includes correct writing of file size-related values (such as file  
72267 sizes and offsets, line numbers, and block counts) and correct interpretation of command line  
72268 arguments that contain such values.

72269	<i>basename</i>	Return non-directory portion of pathname.
72270	<i>cat</i>	Concatenate and print files.
72271	<i>cd</i>	Change working directory.
72272	<i>chgrp</i>	Change file group ownership.
72273	<i>chmod</i>	Change file modes.
72274	<i>chown</i>	Change file ownership.
72275	<i>cksum</i>	Write file checksums and sizes.
72276	<i>cmp</i>	Compare two files.
72277	<i>cp</i>	Copy files.
72278	<i>dd</i>	Convert and copy a file.
72279	<i>df</i>	Report free disk space.
72280	<i>dirname</i>	Return directory portion of pathname.
72281	<i>du</i>	Estimate file space usage.
72282	<i>find</i>	Find files.
72283	<i>ln</i>	Link files.
72284	<i>ls</i>	List directory contents.
72285	<i>mkdir</i>	Make directories.
72286	<i>mv</i>	Move files.
72287	<i>pathchk</i>	Check pathnames.
72288	<i>pwd</i>	Return working directory name.
72289	<i>rmdir</i>	Remove directory entries.
72290	<i>rmdir</i>	Remove directories.
72291	<i>sh</i>	Shell, the standard command language interpreter.
72292	<i>sum</i>	Print checksum and block or byte count of a file.
72293	<i>test</i>	Evaluate expression.
72294	<i>touch</i>	Change file access and modification times.
72295	<i>ulimit</i>	Set or report file size limit.

72296 Exceptions to the requirement that utilities support files of any size up to the maximum are as  
72297 follows:

- 72298 1. Uses of files as command scripts, or for configuration or control, are exempt. For example,  
72299 it is not required that *sh* be able to read an arbitrarily large **.profile**.
- 72300 2. Shell input and output redirection are exempt. For example, it is not required that the  
72301 redirections *sum < file* or *echo foo > file* succeed for an arbitrarily large existing file.

72302 **1.6 Built-In Utilities**

72303 Any of the standard utilities may be implemented as regular built-in utilities within the  
72304 command language interpreter. This is usually done to increase the performance of frequently  
72305 used utilities or to achieve functionality that would be more difficult in a separate environment.  
72306 The utilities named in [Table 1-5](#) are frequently provided in built-in form. All of the utilities  
72307 named in the table have special properties in terms of command search order within the shell, as  
72308 described in [Section 2.9.1.1](#) (on page 2317).

72309 **Table 1-5** Regular Built-In Utilities

72310	<i>alias</i>	<i>false</i>	<i>jobs</i>	<i>read</i>	<i>wait</i>
72311	<i>bg</i>	<i>fc</i>	<i>kill</i>	<i>true</i>	
72312	<i>cd</i>	<i>fg</i>	<i>newgrp</i>	<i>umask</i>	
72313	<i>command</i>	<i>getopts</i>	<i>pwd</i>	<i>unalias</i>	

72314 However, all of the standard utilities, including the regular built-ins in the table, but not the  
72315 special built-ins described in [Section 2.14](#) (on page 2334), shall be implemented in a manner so  
72316 that they can be accessed via the *exec* family of functions as defined in the System Interfaces  
72317 volume of POSIX.1-2008 and can be invoked directly by those standard utilities that require it  
72318 (*env, find, nice, nohup, time, xargs*).

72319

Chapter 2

72320

## Shell Command Language

72321

This chapter contains the definition of the Shell Command Language.

### 72322 2.1 Shell Introduction

72323

72324

72325

The shell is a command language interpreter. This chapter describes the syntax of that command language as it is used by the *sh* utility and the *system()* and *popen()* functions defined in the System Interfaces volume of POSIX.1-2008.

72326

72327

The shell operates according to the following general overview of operations. The specific details are included in the cited sections of this chapter.

72328

72329

72330

72331

1. The shell reads its input from a file (see *sh*), from the `-c` option or from the *system()* and *popen()* functions defined in the System Interfaces volume of POSIX.1-2008. If the first line of a file of shell commands starts with the characters "#!", the results are unspecified.

72332

72333

2. The shell breaks the input into tokens: words and operators; see [Section 2.3](#) (on page 2299).

72334

72335

3. The shell parses the input into simple commands (see [Section 2.9.1](#), on page 2316) and compound commands (see [Section 2.9.4](#), on page 2321).

72336

72337

72338

4. The shell performs various expansions (separately) on different parts of each command, resulting in a list of pathnames and fields to be treated as a command and arguments; see [Section 2.6](#) (on page 2305).

72339

72340

5. The shell performs redirection (see [Section 2.7](#), on page 2312) and removes redirection operators and their operands from the parameter list.

72341

72342

72343

72344

72345

6. The shell executes a function (see [Section 2.9.5](#), on page 2324), built-in (see [Section 2.14](#), on page 2334), executable file, or script, giving the names of the arguments as positional parameters numbered 1 to *n*, and the name of the command (or in the case of a function within a script, the name of the script) as the positional parameter numbered 0 (see [Section 2.9.1.1](#), on page 2317).

72346

72347

7. The shell optionally waits for the command to complete and collects the exit status (see [Section 2.8.2](#), on page 2315).

72348 **2.2 Quoting**

72349 Quoting is used to remove the special meaning of certain characters or words to the shell.  
 72350 Quoting can be used to preserve the literal meaning of the special characters in the next  
 72351 paragraph, prevent reserved words from being recognized as such, and prevent parameter  
 72352 expansion and command substitution within here-document processing (see [Section 2.7.4](#), on  
 72353 page 2313).

72354 The application shall quote the following characters if they are to represent themselves:

72355 | & ; < > ( ) \$ ` \ " ' <space> <tab> <newline>

72356 and the following may need to be quoted under certain circumstances. That is, these characters  
 72357 may be special depending on conditions described elsewhere in this volume of POSIX.1-2008:

72358 \* ? [ # ~ = %

72359 The various quoting mechanisms are the escape character, single-quotes, and double-quotes. The  
 72360 here-document represents another form of quoting; see [Section 2.7.4](#) (on page 2313).

72361 **2.2.1 Escape Character (Backslash)**

72362 A <backslash> that is not quoted shall preserve the literal value of the following character, with  
 72363 the exception of a <newline>. If a <newline> follows the <backslash>, the shell shall interpret  
 72364 this as line continuation. The <backslash> and <newline> shall be removed before splitting the  
 72365 input into tokens. Since the escaped <newline> is removed entirely from the input and is not  
 72366 replaced by any white space, it cannot serve as a token separator.

72367 **2.2.2 Single-Quotes**

72368 Enclosing characters in single-quotes ( ' ' ) shall preserve the literal value of each character  
 72369 within the single-quotes. A single-quote cannot occur within single-quotes.

72370 **2.2.3 Double-Quotes**

72371 Enclosing characters in double-quotes ( " " ) shall preserve the literal value of all characters  
 72372 within the double-quotes, with the exception of the characters backquote, <dollar-sign>, and  
 72373 <backslash>, as follows:

72374 \$ The <dollar-sign> shall retain its special meaning introducing parameter expansion (see  
 72375 [Section 2.6.2](#), on page 2306), a form of command substitution (see [Section 2.6.3](#), on page  
 72376 2309), and arithmetic expansion (see [Section 2.6.4](#), on page 2310).

72377 The input characters within the quoted string that are also enclosed between "\$ (" and the  
 72378 matching ') ' shall not be affected by the double-quotes, but rather shall define that  
 72379 command whose output replaces the "\$ (...)" when the word is expanded. The  
 72380 tokenizing rules in [Section 2.3](#) (on page 2299), not including the alias substitutions in  
 72381 [Section 2.3.1](#) (on page 2300), shall be applied recursively to find the matching ') '.

72382 Within the string of characters from an enclosed "\$ {" to the matching ' } ' , an even number  
 72383 of unescaped double-quotes or single-quotes, if any, shall occur. A preceding <backslash>  
 72384 character shall be used to escape a literal ' ' or ' } ' . The rule in [Section 2.6.2](#) (on page  
 72385 2306) shall be used to determine the matching ' } ' .

72386       ` The backquote shall retain its special meaning introducing the other form of command  
72387 substitution (see [Section 2.6.3](#), on page 2309). The portion of the quoted string from the  
72388 initial backquote and the characters up to the next backquote that is not preceded by a  
72389 <backslash>, having escape characters removed, defines that command whose output  
72390 replaces "`...`" when the word is expanded. Either of the following cases produces  
72391 undefined results:

- 72392           • A single-quoted or double-quoted string that begins, but does not end, within the  
72393           " `...`" sequence
- 72394           • A "`...`" sequence that begins, but does not end, within the same double-quoted  
72395           string

72396       \  
72397       The <backslash> shall retain its special meaning as an escape character (see [Section 2.2.1](#), on  
page 2298) only when followed by one of the following characters when considered special:

72398       \$   `   "   \  
          <newline>

72399       The application shall ensure that a double-quote is preceded by a <backslash> to be included  
72400 within double-quotes. The parameter '@' has special meaning inside double-quotes and is  
72401 described in [Section 2.5.2](#) (on page 2302).

## 72402 2.3 Token Recognition

72403       The shell shall read its input in terms of lines from a file, from a terminal in the case of an  
72404 interactive shell, or from a string in the case of *sh -c* or *system()*. The input lines can be of  
72405 unlimited length. These lines shall be parsed using two major modes: ordinary token recognition  
72406 and processing of here-documents.

72407       When an **io\_here** token has been recognized by the grammar (see [Section 2.10](#), on page 2325),  
72408 one or more of the subsequent lines immediately following the next **NEWLINE** token form the  
72409 body of one or more here-documents and shall be parsed according to the rules of [Section 2.7.4](#)  
72410 (on page 2313).

72411       When it is not processing an **io\_here**, the shell shall break its input into tokens by applying the  
72412 first applicable rule below to the next character in its input. The token shall be from the current  
72413 position in the input until a token is delimited according to one of the rules below; the characters  
72414 forming the token are exactly those in the input, including any quoting characters. If it is  
72415 indicated that a token is delimited, and no characters have been included in a token, processing  
72416 shall continue until an actual token is delimited.

- 72417           1. If the end of input is recognized, the current token shall be delimited. If there is no  
72418           current token, the end-of-input indicator shall be returned as the token.
- 72419           2. If the previous character was used as part of an operator and the current character is not  
72420           quoted and can be used with the current characters to form an operator, it shall be used as  
72421           part of that (operator) token.
- 72422           3. If the previous character was used as part of an operator and the current character cannot  
72423           be used with the current characters to form an operator, the operator containing the  
72424           previous character shall be delimited.
- 72425           4. If the current character is <backslash>, single-quote, or double-quote and it is not quoted,  
72426           it shall affect quoting for subsequent characters up to the end of the quoted text. The rules  
72427           for quoting are as described in [Section 2.2](#) (on page 2298). During token recognition no  
72428           substitutions shall be actually performed, and the result token shall contain exactly the  
72429           characters that appear in the input (except for <newline> joining), unmodified, including

- 72430 any embedded or enclosing quotes or substitution operators, between the <quotation-
- 72431 mark> and the end of the quoted text. The token shall not be delimited by the end of the
- 72432 quoted field.
- 72433 5. If the current character is an unquoted ' \$ ' or ' ` ', the shell shall identify the start of any
- 72434 candidates for parameter expansion (Section 2.6.2, on page 2306), command substitution
- 72435 (Section 2.6.3, on page 2309), or arithmetic expansion (Section 2.6.4, on page 2310) from
- 72436 their introductory unquoted character sequences: ' \$ ' or "\$ {", "\$ (" or ' ` ', and "\$ ( (",
- 72437 respectively. The shell shall read sufficient input to determine the end of the unit to be
- 72438 expanded (as explained in the cited sections). While processing the characters, if
- 72439 instances of expansions or quoting are found nested within the substitution, the shell
- 72440 shall recursively process them in the manner specified for the construct that is found. The
- 72441 characters found from the beginning of the substitution to its end, allowing for any
- 72442 recursion necessary to recognize embedded constructs, shall be included unmodified in
- 72443 the result token, including any embedded or enclosing substitution operators or quotes.
- 72444 The token shall not be delimited by the end of the substitution.
- 72445 6. If the current character is not quoted and can be used as the first character of a new
- 72446 operator, the current token (if any) shall be delimited. The current character shall be used
- 72447 as the beginning of the next (operator) token.
- 72448 7. If the current character is an unquoted <newline>, the current token shall be delimited.
- 72449 8. If the current character is an unquoted <blank>, any token containing the previous
- 72450 character is delimited and the current character shall be discarded.
- 72451 9. If the previous character was part of a word, the current character shall be appended to
- 72452 that word.
- 72453 10. If the current character is a ' # ', it and all subsequent characters up to, but excluding, the
- 72454 next <newline> shall be discarded as a comment. The <newline> that ends the line is not
- 72455 considered part of the comment.
- 72456 11. The current character is used as the start of a new word.

72457 Once a token is delimited, it is categorized as required by the grammar in Section 2.10 (on page

72458 2325).

### 72459 2.3.1 Alias Substitution

72460 After a token has been delimited, but before applying the grammatical rules in Section 2.10 (on

72461 page 2325), a resulting word that is identified to be the command name word of a simple

72462 command shall be examined to determine whether it is an unquoted, valid alias name. However,

72463 reserved words in correct grammatical context shall not be candidates for alias substitution. A

72464 valid alias name (see XBD Section 3.10, on page 34) shall be one that has been defined by the

72465 *alias* utility and not subsequently undefined using *unalias*. Implementations also may provide

72466 predefined valid aliases that are in effect when the shell is invoked. To prevent infinite loops in

72467 recursive aliasing, if the shell is not currently processing an alias of the same name, the word

72468 shall be replaced by the value of the alias; otherwise, it shall not be replaced.

72469 If the value of the alias replacing the word ends in a <blank>, the shell shall check the next

72470 command word for alias substitution; this process shall continue until a word is found that is

72471 not a valid alias or an alias value does not end in a <blank>.

72472 When used as specified by this volume of POSIX.1-2008, alias definitions shall not be inherited

72473 by separate invocations of the shell or by the utility execution environments invoked by the

72474 shell; see Section 2.12 (on page 2331).

## 72475 2.4 Reserved Words

72476 Reserved words are words that have special meaning to the shell; see [Section 2.9](#) (on page 2316).  
72477 The following words shall be recognized as reserved words:

72478	<b>!</b>	<b>do</b>	<b>esac</b>	<b>in</b>
72479	<b>{</b>	<b>done</b>	<b>fi</b>	<b>then</b>
72480	<b>}</b>	<b>elif</b>	<b>for</b>	<b>until</b>
72481	<b>case</b>	<b>else</b>	<b>if</b>	<b>while</b>

72482 This recognition shall only occur when none of the characters is quoted and when the word is  
72483 used as:

- 72484 • The first word of a command
- 72485 • The first word following one of the reserved words other than **case**, **for**, or **in**
- 72486 • The third word in a **case** command (only **in** is valid in this case)
- 72487 • The third word in a **for** command (only **in** and **do** are valid in this case)

72488 See the grammar in [Section 2.10](#) (on page 2325).

72489 The following words may be recognized as reserved words on some implementations (when  
72490 none of the characters are quoted), causing unspecified results:

72491	<b>[[</b>	<b>]]</b>	<b>function</b>	<b>select</b>
-------	-----------	-----------	-----------------	---------------

72492 Words that are the concatenation of a name and a <colon> ( ' : ' ) are reserved; their use produces  
72493 unspecified results.

## 72494 2.5 Parameters and Variables

72495 A parameter can be denoted by a name, a number, or one of the special characters listed in  
72496 [Section 2.5.2](#) (on page 2302). A variable is a parameter denoted by a name.

72497 A parameter is set if it has an assigned value (null is a valid value). Once a variable is set, it can  
72498 only be unset by using the *unset* special built-in command.

### 72499 2.5.1 Positional Parameters

72500 A positional parameter is a parameter denoted by the decimal value represented by one or more  
72501 digits, other than the single digit 0. The digits denoting the positional parameters shall always  
72502 be interpreted as a decimal value, even if there is a leading zero. When a positional parameter  
72503 with more than one digit is specified, the application shall enclose the digits in braces (see  
72504 [Section 2.6.2](#), on page 2306). Positional parameters are initially assigned when the shell is  
72505 invoked (see *sh*), temporarily replaced when a shell function is invoked (see [Section 2.9.5](#), on  
72506 page 2324), and can be reassigned with the *set* special built-in command.

72507 **2.5.2 Special Parameters**

72508 Listed below are the special parameters and the values to which they shall expand. Only the  
72509 values of the special parameters are listed; see [Section 2.6](#) (on page 2305) for a detailed summary  
72510 of all the stages involved in expanding words.

72511 @ Expands to the positional parameters, starting from one. When the expansion occurs within  
72512 double-quotes, and where field splitting (see [Section 2.6.5](#), on page 2311) is performed, each  
72513 positional parameter shall expand as a separate field, with the provision that the expansion  
72514 of the first parameter shall still be joined with the beginning part of the original word  
72515 (assuming that the expanded parameter was embedded within a word), and the expansion  
72516 of the last parameter shall still be joined with the last part of the original word. If there are  
72517 no positional parameters, the expansion of ' @ ' shall generate zero fields, even when ' @ ' is  
72518 double-quoted.

72519 \* Expands to the positional parameters, starting from one. When the expansion occurs within  
72520 a double-quoted string (see [Section 2.2.3](#), on page 2298), it shall expand to a single field with  
72521 the value of each parameter separated by the first character of the *IFS* variable, or by a  
72522 <space> if *IFS* is unset. If *IFS* is set to a null string, this is not equivalent to unsetting it; its  
72523 first character does not exist, so the parameter values are concatenated.

72524 # Expands to the decimal number of positional parameters. The command name (parameter  
72525 0) shall not be counted in the number given by ' # ' because it is a special parameter, not a  
72526 positional parameter.

72527 ? Expands to the decimal exit status of the most recent pipeline (see [Section 2.9.2](#), on page  
72528 2318).

72529 – (Hyphen.) Expands to the current option flags (the single-letter option names concatenated  
72530 into a string) as specified on invocation, by the *set* special built-in command, or implicitly  
72531 by the shell.

72532 \$ Expands to the decimal process ID of the invoked shell. In a subshell (see [Section 2.12](#), on  
72533 page 2331), ' \$ ' shall expand to the same value as that of the current shell.

72534 ! Expands to the decimal process ID of the most recent background command (see [Section  
72535 2.9.3](#), on page 2319) executed from the current shell. (For example, background commands  
72536 executed from subshells do not affect the value of " \$ ! " in the current shell environment.)  
72537 For a pipeline, the process ID is that of the last command in the pipeline.

72538 0 (Zero.) Expands to the name of the shell or shell script. See *sh* (on page 3163) for a detailed  
72539 description of how this name is derived.

72540 See the description of the *IFS* variable in [Section 2.5.3](#).

72541 **2.5.3 Shell Variables**

72542 Variables shall be initialized from the environment (as defined by XBD [Chapter 8](#) (on page 173)  
72543 and the *exec* function in the System Interfaces volume of POSIX.1-2008) and can be given new  
72544 values with variable assignment commands. If a variable is initialized from the environment, it  
72545 shall be marked for export immediately; see the *export* special built-in. New variables can be  
72546 defined and initialized with variable assignments, with the *read* or *getopts* utilities, with the *name*  
72547 parameter in a **for** loop, with the  $\${name=word}$  expansion, or with other mechanisms provided  
72548 as implementation extensions.

72549		The following variables shall affect the execution of the shell:
72550	UP XSI	<b>ENV</b> The processing of the <i>ENV</i> shell variable shall be supported on all XSI-conformant systems or if the system supports the User Portability Utilities option.
72551		
72552		
72553		This variable, when and only when an interactive shell is invoked, shall be subjected to parameter expansion (see Section 2.6.2, on page 2306) by the shell and the resulting value shall be used as a pathname of a file containing shell commands to execute in the current environment. The file need not be executable. If the expanded value of <i>ENV</i> is not an absolute pathname, the results are unspecified. <i>ENV</i> shall be ignored if the user's real and effective user IDs or real and effective group IDs are different.
72554		
72555		
72556		
72557		
72558		
72559		
72560	<i>HOME</i>	The pathname of the user's home directory. The contents of <i>HOME</i> are used in tilde expansion (see Section 2.6.1, on page 2305).
72561		
72562	<i>IFS</i>	A string treated as a list of characters that is used for field splitting and to split lines into fields with the <i>read</i> command.
72563		
72564		If <i>IFS</i> is not set, it shall behave as normal for an unset variable, except that field splitting by the shell and line splitting by the <i>read</i> command shall be performed as if the value of <i>IFS</i> is <space><tab><newline>; see Section 2.6.5 (on page 2311).
72565		
72566		
72567		
72568		Implementations may ignore the value of <i>IFS</i> in the environment, or the absence of <i>IFS</i> from the environment, at the time the shell is invoked, in which case the shell shall set <i>IFS</i> to <space><tab><newline> when it is invoked.
72569		
72570		
72571	<i>LANG</i>	Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.)
72572		
72573		
72574		
72575	<i>LC_ALL</i>	The value of this variable overrides the <i>LC_*</i> variables and <i>LANG</i> , as described in XBD Chapter 8 (on page 173).
72576		
72577	<i>LC_COLLATE</i>	Determine the behavior of range expressions, equivalence classes, and multi-character collating elements within pattern matching.
72578		
72579	<i>LC_CTYPE</i>	Determine the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters), which characters are defined as letters (character class <b>alpha</b> ) and <blank> characters (character class <b>blank</b> ), and the behavior of character classes within pattern matching. Changing the value of <i>LC_CTYPE</i> after the shell has started shall not affect the lexical processing of shell commands in the current shell execution environment or its subshells. Invoking a shell script or performing <i>exec sh</i> subjects the new shell to the changes in <i>LC_CTYPE</i> .
72580		
72581		
72582		
72583		
72584		
72585		
72586		
72587	<i>LC_MESSAGES</i>	Determine the language in which messages should be written.
72588	<i>LINENO</i>	Set by the shell to a decimal number representing the current sequential line number (numbered starting with 1) within a script or function before it executes each command. If the user unsets or resets <i>LINENO</i> , the variable may lose its special meaning for the life of the shell. If the shell is not currently executing a script or function, the value of <i>LINENO</i> is unspecified. This volume of POSIX.1-2008 specifies the effects of the variable only for systems supporting the User Portability Utilities option.
72589		
72590		
72591		
72592		
72593		
72594		

72595	XSI	<b>NLSPATH</b>	Determine the location of message catalogs for the processing of
72596			<b>LC_MESSAGES.</b>
72597		<b>PATH</b>	A string formatted as described in XBD Chapter 8 (on page 173), used to effect
72598			command interpretation; see Section 2.9.1.1 (on page 2317).
72599		<b>PPID</b>	Set by the shell to the decimal value of its parent process ID during
72600			initialization of the shell. In a subshell (see Section 2.12, on page 2331), <i>PPID</i>
72601			shall be set to the same value as that of the parent of the current shell. For
72602			example, <i>echo \$PPID</i> and ( <i>echo \$PPID</i> ) would produce the same value. This
72603			volume of POSIX.1-2008 specifies the effects of the variable only for systems
72604			supporting the User Portability Utilities option.
72605		<b>PS1</b>	Each time an interactive shell is ready to read a command, the value of this
72606			variable shall be subjected to parameter expansion and written to standard
72607			error. The default value shall be "\$ ". For users who have specific additional
72608			implementation-defined privileges, the default may be another,
72609			implementation-defined value. The shell shall replace each instance of the
72610			character '!' in <i>PS1</i> with the history file number of the next command to be
72611			typed. Escaping the '!' with another '!' (that is, "!!") shall place the literal
72612			character '!' in the prompt. This volume of POSIX.1-2008 specifies the effects
72613			of the variable only for systems supporting the User Portability Utilities
72614			option.
72615		<b>PS2</b>	Each time the user enters a <newline> prior to completing a command line in
72616			an interactive shell, the value of this variable shall be subjected to parameter
72617			expansion and written to standard error. The default value is "> ". This
72618			volume of POSIX.1-2008 specifies the effects of the variable only for systems
72619			supporting the User Portability Utilities option.
72620		<b>PS4</b>	When an execution trace ( <i>set -x</i> ) is being performed in an interactive shell,
72621			before each line in the execution trace, the value of this variable shall be
72622			subjected to parameter expansion and written to standard error. The default
72623			value is "+ ". This volume of POSIX.1-2008 specifies the effects of the
72624			variable only for systems supporting the User Portability Utilities option.
72625		<b>PWD</b>	Set by the shell and by the <i>cd</i> utility. In the shell the value shall be initialized
72626			from the environment as follows. If a value for <i>PWD</i> is passed to the shell in
72627			the environment when it is executed, the value is an absolute pathname of the
72628			current working directory that is no longer than {PATH_MAX} bytes including
72629			the terminating null byte, and the value does not contain any components that
72630			are dot or dot-dot, then the shell shall set <i>PWD</i> to the value from the
72631			environment. Otherwise, if a value for <i>PWD</i> is passed to the shell in the
72632			environment when it is executed, the value is an absolute pathname of the
72633			current working directory, and the value does not contain any components
72634			that are dot or dot-dot, then it is unspecified whether the shell sets <i>PWD</i> to the
72635			value from the environment or sets <i>PWD</i> to the pathname that would be
72636			output by <i>pwd -P</i> . Otherwise, the <i>sh</i> utility sets <i>PWD</i> to the pathname that
72637			would be output by <i>pwd -P</i> . In cases where <i>PWD</i> is set to the value from the
72638			environment, the value can contain components that refer to files of type
72639			symbolic link. In cases where <i>PWD</i> is set to the pathname that would be
72640			output by <i>pwd -P</i> , if there is insufficient permission on the current working
72641			directory, or on any parent of that directory, to determine what that pathname
72642			would be, the value of <i>PWD</i> is unspecified. Assignments to this variable may
72643			be ignored. If an application sets or unsets the value of <i>PWD</i> , the behaviors of
72644			the <i>cd</i> and <i>pwd</i> utilities are unspecified.

## 2.6 Word Expansions

This section describes the various expansions that are performed on words. Not all expansions are performed on every word, as explained in the following sections.

Tilde expansions, parameter expansions, command substitutions, arithmetic expansions, and quote removals that occur within a single word expand to a single field. It is only field splitting or pathname expansion that can create multiple fields from a single word. The single exception to this rule is the expansion of the special parameter '@' within double-quotes, as described in [Section 2.5.2](#) (on page 2302).

The order of word expansion shall be as follows:

1. Tilde expansion (see [Section 2.6.1](#)), parameter expansion (see [Section 2.6.2](#), on page 2306), command substitution (see [Section 2.6.3](#), on page 2309), and arithmetic expansion (see [Section 2.6.4](#), on page 2310) shall be performed, beginning to end. See item 5 in [Section 2.3](#) (on page 2299).
2. Field splitting (see [Section 2.6.5](#), on page 2311) shall be performed on the portions of the fields generated by step 1, unless *IFS* is null.
3. Pathname expansion (see [Section 2.6.6](#), on page 2311) shall be performed, unless *set -f* is in effect.
4. Quote removal (see [Section 2.6.7](#), on page 2311) shall always be performed last.

The expansions described in this section shall occur in the same shell environment as that in which the command is executed.

If the complete expansion appropriate for a word results in an empty field, that empty field shall be deleted from the list of fields that form the completely expanded command, unless the original word contained single-quote or double-quote characters.

The '\$' character is used to introduce parameter expansion, command substitution, or arithmetic evaluation. If an unquoted '\$' is followed by a character that is either not numeric, the name of one of the special parameters (see [Section 2.5.2](#), on page 2302), a valid first character of a variable name, a <left-curly-bracket> ('{') or a <left-parenthesis>, the result is unspecified.

### 2.6.1 Tilde Expansion

A "tilde-prefix" consists of an unquoted <tilde> character at the beginning of a word, followed by all of the characters preceding the first unquoted <slash> in the word, or all the characters in the word if there is no <slash>. In an assignment (see [XBD Section 4.22](#), on page 118), multiple tilde-prefixes can be used: at the beginning of the word (that is, following the <equals-sign> of the assignment), following any unquoted <colon>, or both. A tilde-prefix in an assignment is terminated by the first unquoted <colon> or <slash>. If none of the characters in the tilde-prefix are quoted, the characters in the tilde-prefix following the <tilde> are treated as a possible login name from the user database. A portable login name cannot contain characters outside the set given in the description of the *LOGNAME* environment variable in [XBD Section 8.3](#) (on page 177). If the login name is null (that is, the tilde-prefix contains only the tilde), the tilde-prefix is replaced by the value of the variable *HOME*. If *HOME* is unset, the results are unspecified. Otherwise, the tilde-prefix shall be replaced by a pathname of the initial working directory associated with the login name obtained using the *getpwnam()* function as defined in the System Interfaces volume of POSIX.1-2008. If the system does not recognize the login name, the results are undefined.

The pathname resulting from tilde expansion shall be treated as if quoted to prevent it being

72689 altered by field splitting and pathname expansion.

## 72690 2.6.2 Parameter Expansion

72691 The format for parameter expansion is as follows:

72692  $\${expression}$

72693 where *expression* consists of all characters until the matching `'``'`. Any `'``'` escaped by a  
72694 `<backslash>` or within a quoted string, and characters in embedded arithmetic expansions,  
72695 command substitutions, and variable expansions, shall not be examined in determining the  
72696 matching `'``'`.

72697 The simplest form for parameter expansion is:

72698  $\${parameter}$

72699 The value, if any, of *parameter* shall be substituted.

72700 The parameter name or symbol can be enclosed in braces, which are optional except for  
72701 positional parameters with more than one digit or when *parameter* is followed by a character that  
72702 could be interpreted as part of the name. The matching closing brace shall be determined by  
72703 counting brace levels, skipping over enclosed quoted strings, and command substitutions.

72704 If the parameter name or symbol is not enclosed in braces, the expansion shall use the longest  
72705 valid name (see XBD Section 3.230, on page 70), whether or not the symbol represented by that  
72706 name exists.

72707 If a parameter expansion occurs inside double quotes:

- 72708 • Pathname expansion shall not be performed on the results of the expansion.
- 72709 • Field splitting shall not be performed on the results of the expansion, with the exception of  
72710 `'@'`; see Section 2.5.2 (on page 2302).

72711 In addition, a parameter expansion can be modified by using one of the following formats. In  
72712 each case that a value of *word* is needed (based on the state of *parameter*, as described below),  
72713 *word* shall be subjected to tilde expansion, parameter expansion, command substitution, and  
72714 arithmetic expansion. If *word* is not needed, it shall not be expanded. The `'``'` character that  
72715 delimits the following parameter expansion modifications shall be determined as described  
72716 previously in this section and in Section 2.2.3 (on page 2298). (For example,  $\{\{\mathbf{foo-bar}\}\mathbf{xyz}\}$   
72717 would result in the expansion of **foo** followed by the string **xyz** if **foo** is set, else the string  
72718 `"barxyz"`).

72719  $\${parameter}:-word$  **Use Default Values.** If *parameter* is unset or null, the expansion of *word*  
72720 shall be substituted; otherwise, the value of *parameter* shall be substituted.

72721  $\${parameter}:=word$  **Assign Default Values.** If *parameter* is unset or null, the expansion of  
72722 *word* shall be assigned to *parameter*. In all cases, the final value of  
72723 *parameter* shall be substituted. Only variables, not positional parameters  
72724 or special parameters, can be assigned in this way.

72725  $\${parameter}?:[word]$  **Indicate Error if Null or Unset.** If *parameter* is unset or null, the  
72726 expansion of *word* (or a message indicating it is unset if *word* is omitted)  
72727 shall be written to standard error and the shell exits with a non-zero exit  
72728 status. Otherwise, the value of *parameter* shall be substituted. An  
72729 interactive shell need not exit.

72768 **Examples**72769 `${parameter:-word}`72770 In this example, `ls` is executed only if `x` is null or unset. (The `$(ls)` command substitution notation is explained in [Section 2.6.3](#) (on page 2309).)72771 `echo ${x:-$(ls)}`72772 `unset X`72773 `echo ${X:=abc}`72774 `abc`72775 `unset posix`72776 `echo ${posix:?}`72777 `sh: posix: parameter null or not set`72778 `set a b c`72779 `echo ${3:+posix}`72780 `posix`72781 `HOME=/usr/posix`72782 `echo ${#HOME}`72783 `10`72784 `x=file.c`72785 `echo ${x%.c}.o`72786 `file.o`72787 `x=posix/src/std`72788 `echo ${x%*/}`72789 `posix`72790 `x=$HOME/src/cmd`72791 `echo ${x#HOME}`72792 `/src/cmd`72793 `x=/one/two/three`72794 `echo ${x##*/}`72795 `three`72796 `x=$HOME/src/cmd`72797 `echo ${x#HOME}`72798 `/src/cmd`72799 `x=/one/two/three`72800 `echo ${x##*/}`72801 `three`

72802

72803

72804

72805

72806

72807

The double-quoting of patterns is different depending on where the double-quotes are placed:

`"${x#*}"` The <asterisk> is a pattern character.

`${x#"*"}`  The literal <asterisk> is quoted and not special.

### 72808 2.6.3 Command Substitution

72809 Command substitution allows the output of a command to be substituted in place of the  
72810 command name itself. Command substitution shall occur when the command is enclosed as  
72811 follows:

72812 `$(command)`

72813 or (backquoted version):

72814 ``command``

72815 The shell shall expand the command substitution by executing *command* in a subshell  
72816 environment (see Section 2.12, on page 2331) and replacing the command substitution (the text  
72817 of *command* plus the enclosing "\$ ( )" or backquotes) with the standard output of the command,  
72818 removing sequences of one or more <newline> characters at the end of the substitution.  
72819 Embedded <newline> characters before the end of the output shall not be removed; however,  
72820 they may be treated as field delimiters and eliminated during field splitting, depending on the  
72821 value of *IFS* and quoting that is in effect. If the output contains any null bytes, the behavior is  
72822 unspecified.

72823 Within the backquoted style of command substitution, <backslash> shall retain its literal  
72824 meaning, except when followed by: '\$', '`', or <backslash>. The search for the matching  
72825 backquote shall be satisfied by the first unquoted non-escaped backquote; during this search, if a  
72826 non-escaped backquote is encountered within a shell comment, a here-document, an embedded  
72827 command substitution of the \$(*command*) form, or a quoted string, undefined results occur. A  
72828 single-quoted or double-quoted string that begins, but does not end, within the "`...`"  
72829 sequence produces undefined results.

72830 With the \$(*command*) form, all characters following the open parenthesis to the matching closing  
72831 parenthesis constitute the *command*. Any valid shell script can be used for *command*, except a  
72832 script consisting solely of redirections which produces unspecified results.

72833 The results of command substitution shall not be processed for further tilde expansion,  
72834 parameter expansion, command substitution, or arithmetic expansion. If a command  
72835 substitution occurs inside double-quotes, field splitting and pathname expansion shall not be  
72836 performed on the results of the substitution.

72837 Command substitution can be nested. To specify nesting within the backquoted version, the  
72838 application shall precede the inner backquotes with <backslash> characters; for example:

72839 `\`command\``

72840 If the command substitution consists of a single subshell, such as:

72841 `$( (command) )`

72842 a conforming application shall separate the "\$ (" and ' (' into two tokens (that is, separate  
72843 them with white space). This is required to avoid any ambiguities with arithmetic expansion.

72844 **2.6.4 Arithmetic Expansion**

72845 Arithmetic expansion provides a mechanism for evaluating an arithmetic expression and  
 72846 substituting its value. The format for arithmetic expansion shall be as follows:

72847 `$( (expression) )`

72848 The expression shall be treated as if it were in double-quotes, except that a double-quote inside  
 72849 the expression is not treated specially. The shell shall expand all tokens in the expression for  
 72850 parameter expansion, command substitution, and quote removal.

72851 Next, the shell shall treat this as an arithmetic expression and substitute the value of the  
 72852 expression. The arithmetic expression shall be processed according to the rules given in [Section](#)  
 72853 [1.1.2.1](#) (on page 2283), with the following exceptions:

- 72854 • Only signed long integer arithmetic is required.
- 72855 • Only the decimal-constant, octal-constant, and hexadecimal-constant constants specified in  
 72856 the ISO C standard, Section 6.4.4.1 are required to be recognized as constants.
- 72857 • The `sizeof()` operator and the prefix and postfix "++" and "--" operators are not required.
- 72858 • Selection, iteration, and jump statements are not supported.

72859 All changes to variables in an arithmetic expression shall be in effect after the arithmetic  
 72860 expansion, as in the parameter expansion " `${x=value} "`"

72861 If the shell variable `x` contains a value that forms a valid integer constant, then the arithmetic  
 72862 expansions " `$( (x) ) "`" and " `$( ($x) ) "`" shall return the same value.

72863 As an extension, the shell may recognize arithmetic expressions beyond those listed. The shell  
 72864 may use a signed integer type with a rank larger than the rank of **signed long**. The shell may  
 72865 use a real-floating type instead of **signed long** as long as it does not affect the results in cases  
 72866 where there is no overflow. If the expression is invalid, the expansion fails and the shell shall  
 72867 write a message to standard error indicating the failure.

72868 **Examples**

72869 A simple example using arithmetic expansion:

```
72870 # repeat a command 100 times
72871 x=100
72872 while [ $x -gt 0 ]
72873 do
72874     command
72875     x=$((x-1))
72876 done
```

72877 **2.6.5 Field Splitting**

72878 After parameter expansion (Section 2.6.2, on page 2306), command substitution (Section 2.6.3, on  
72879 page 2309), and arithmetic expansion (Section 2.6.4, on page 2310), the shell shall scan the results  
72880 of expansions and substitutions that did not occur in double-quotes for field splitting and  
72881 multiple fields can result.

72882 The shell shall treat each character of the *IFS* as a delimiter and use the delimiters as field  
72883 terminators to split the results of parameter expansion and command substitution into fields.

72884 1. If the value of *IFS* is a <space>, <tab>, and <newline>, or if it is unset, any sequence of  
72885 <space>, <tab>, or <newline> characters at the beginning or end of the input shall be  
72886 ignored and any sequence of those characters within the input shall delimit a field. For  
72887 example, the input:

72888 <newline><space><tab>foo<tab><tab>bar<space>

72889 yields two fields, **foo** and **bar**.

72890 2. If the value of *IFS* is null, no field splitting shall be performed.

72891 3. Otherwise, the following rules shall be applied in sequence. The term “*IFS* white space”  
72892 is used to mean any sequence (zero or more instances) of white-space characters that are  
72893 in the *IFS* value (for example, if *IFS* contains <space>/<comma>/<tab>, any sequence of  
72894 <space> and <tab> characters is considered *IFS* white space).

72895 a. *IFS* white space shall be ignored at the beginning and end of the input.

72896 b. Each occurrence in the input of an *IFS* character that is not *IFS* white space, along  
72897 with any adjacent *IFS* white space, shall delimit a field, as described previously.

72898 c. Non-zero-length *IFS* white space shall delimit a field.

72899 **2.6.6 Pathname Expansion**

72900 After field splitting, if *set -f* is not in effect, each field in the resulting command line shall be  
72901 expanded using the algorithm described in Section 2.13 (on page 2332), qualified by the rules in  
72902 Section 2.13.3 (on page 2333).

72903 **2.6.7 Quote Removal**

72904 The quote characters (<backslash>, single-quote, and double-quote) that were present in the  
72905 original word shall be removed unless they have themselves been quoted.

72906 **2.7 Redirection**

72907 Redirection is used to open and close files for the current shell execution environment (see  
72908 [Section 2.12](#), on page 2331) or for any command. Redirection operators can be used with  
72909 numbers representing file descriptors (see [XBD Section 3.166](#), on page 60) as described below.

72910 The overall format used for redirection is:

72911 `[n] redir-op word`

72912 The number *n* is an optional decimal number designating the file descriptor number; the  
72913 application shall ensure it is delimited from any preceding text and immediately precede the  
72914 redirection operator *redir-op*. If *n* is quoted, the number shall not be recognized as part of the  
72915 redirection expression. For example:

72916 `echo \2>a`

72917 writes the character 2 into file **a**. If any part of *redir-op* is quoted, no redirection expression is  
72918 recognized. For example:

72919 `echo 2\>a`

72920 writes the characters 2>a to standard output. The optional number, redirection operator, and  
72921 *word* shall not appear in the arguments provided to the command to be executed (if any).

72922 Open files are represented by decimal numbers starting with zero. The largest possible value is  
72923 implementation-defined; however, all implementations shall support at least 0 to 9, inclusive, for  
72924 use by the application. These numbers are called "file descriptors". The values 0, 1, and 2 have  
72925 special meaning and conventional uses and are implied by certain redirection operations; they  
72926 are referred to as *standard input*, *standard output*, and *standard error*, respectively. Programs  
72927 usually take their input from standard input, and write output on standard output. Error  
72928 messages are usually written on standard error. The redirection operators can be preceded by  
72929 one or more digits (with no intervening <blank> characters allowed) to designate the file  
72930 descriptor number.

72931 If the redirection operator is "<<" or "<<=", the word that follows the redirection operator shall  
72932 be subjected to quote removal; it is unspecified whether any of the other expansions occur. For  
72933 the other redirection operators, the word that follows the redirection operator shall be subjected  
72934 to tilde expansion, parameter expansion, command substitution, arithmetic expansion, and  
72935 quote removal. Pathname expansion shall not be performed on the word by a non-interactive  
72936 shell; an interactive shell may perform it, but shall do so only when the expansion would result  
72937 in one word.

72938 If more than one redirection operator is specified with a command, the order of evaluation is  
72939 from beginning to end.

72940 A failure to open or create a file shall cause a redirection to fail.

72941 **2.7.1 Redirecting Input**

72942 Input redirection shall cause the file whose name results from the expansion of *word* to be  
72943 opened for reading on the designated file descriptor, or standard input if the file descriptor is  
72944 not specified.

72945 The general format for redirecting input is:

72946 `[n] <word`

72947 where the optional *n* represents the file descriptor number. If the number is omitted, the

72948 redirection shall refer to standard input (file descriptor 0).

### 72949 2.7.2 Redirecting Output

72950 The two general formats for redirecting output are:

72951 `[n]>word`

72952 `[n]>|word`

72953 where the optional *n* represents the file descriptor number. If the number is omitted, the  
72954 redirection shall refer to standard output (file descriptor 1).

72955 Output redirection using the '`>`' format shall fail if the *noclobber* option is set (see the  
72956 description of *set -C*) and the file named by the expansion of *word* exists and is a regular file.  
72957 Otherwise, redirection using the '`>`' or '`>|`' formats shall cause the file whose name results  
72958 from the expansion of *word* to be created and opened for output on the designated file  
72959 descriptor, or standard output if none is specified. If the file does not exist, it shall be created;  
72960 otherwise, it shall be truncated to be an empty file after being opened.

### 72961 2.7.3 Appending Redirected Output

72962 Appended output redirection shall cause the file whose name results from the expansion of  
72963 *word* to be opened for output on the designated file descriptor. The file is opened as if the *open()*  
72964 function as defined in the System Interfaces volume of POSIX.1-2008 was called with the  
72965 `O_APPEND` flag. If the file does not exist, it shall be created.

72966 The general format for appending redirected output is as follows:

72967 `[n]>>word`

72968 where the optional *n* represents the file descriptor number. If the number is omitted, the  
72969 redirection refers to standard output (file descriptor 1).

### 72970 2.7.4 Here-Document

72971 The redirection operators "`<<`" and "`<<-`" both allow redirection of lines contained in a shell  
72972 input file, known as a "here-document", to the input of a command.

72973 The here-document shall be treated as a single word that begins after the next <newline> and  
72974 continues until there is a line containing only the delimiter and a <newline>, with no <blank>  
72975 characters in between. Then the next here-document starts, if there is one. The format is as  
72976 follows:

72977 `[n]<<word`

72978 `here-document`

72979 `delimiter`

72980 where the optional *n* represents the file descriptor number. If the number is omitted, the here-  
72981 document refers to standard input (file descriptor 0).

72982 If any character in *word* is quoted, the delimiter shall be formed by performing quote removal on  
72983 *word*, and the here-document lines shall not be expanded. Otherwise, the delimiter shall be the  
72984 *word* itself.

72985 If no characters in *word* are quoted, all lines of the here-document shall be expanded for  
72986 parameter expansion, command substitution, and arithmetic expansion. In this case, the

72987 <backslash> in the input behaves as the <backslash> inside double-quotes (see [Section 2.2.3](#), on  
72988 page 2298). However, the double-quote character (' ') shall not be treated specially within a  
72989 here-document, except when the double-quote appears within "\$ ()", "`", or "\${ }".

72990 If the redirection symbol is "<<-", all leading <tab> characters shall be stripped from input lines  
72991 and the line containing the trailing delimiter. If more than one "<<" or "<<-" operator is  
72992 specified on a line, the here-document associated with the first operator shall be supplied first  
72993 by the application and shall be read first by the shell.

72994 When a here-document is read from a terminal device and the shell is interactive, it shall write  
72995 the contents of the variable *PS2*, processed as described in [Section 2.5.3](#) (on page 2302), to  
72996 standard error before reading each line of input until the delimiter has been recognized.

### 72997 Examples

72998 An example of a here-document follows:

```
72999 cat <<eof1; cat <<eof2
73000 Hi,
73001 eof1
73002 Helene.
73003 eof2
```

## 73004 2.7.5 Duplicating an Input File Descriptor

73005 The redirection operator:

```
73006 [n]<&word
```

73007 shall duplicate one input file descriptor from another, or shall close one. If *word* evaluates to one  
73008 or more digits, the file descriptor denoted by *n*, or standard input if *n* is not specified, shall be  
73009 made to be a copy of the file descriptor denoted by *word*; if the digits in *word* do not represent a  
73010 file descriptor already open for input, a redirection error shall result; see [Section 2.8.1](#) (on page  
73011 2315). If *word* evaluates to '-', file descriptor *n*, or standard input if *n* is not specified, shall be  
73012 closed. Attempts to close a file descriptor that is not open shall not constitute an error. If *word*  
73013 evaluates to something else, the behavior is unspecified.

## 73014 2.7.6 Duplicating an Output File Descriptor

73015 The redirection operator:

```
73016 [n]>&word
```

73017 shall duplicate one output file descriptor from another, or shall close one. If *word* evaluates to  
73018 one or more digits, the file descriptor denoted by *n*, or standard output if *n* is not specified, shall  
73019 be made to be a copy of the file descriptor denoted by *word*; if the digits in *word* do not represent  
73020 a file descriptor already open for output, a redirection error shall result; see [Section 2.8.1](#) (on  
73021 page 2315). If *word* evaluates to '-', file descriptor *n*, or standard output if *n* is not specified, is  
73022 closed. Attempts to close a file descriptor that is not open shall not constitute an error. If *word*  
73023 evaluates to something else, the behavior is unspecified.

### 73024 2.7.7 Open File Descriptors for Reading and Writing

73025 The redirection operator:

73026 `[n] <>word`

73027 shall cause the file whose name is the expansion of *word* to be opened for both reading and  
73028 writing on the file descriptor denoted by *n*, or standard input if *n* is not specified. If the file does  
73029 not exist, it shall be created.

## 73030 2.8 Exit Status and Errors

### 73031 2.8.1 Consequences of Shell Errors

73032 For a non-interactive shell, an error condition encountered by a special built-in (see [Section 2.14](#),  
73033 on page 2334) or other type of utility shall cause the shell to write a diagnostic message to  
73034 standard error and exit as shown in the following table:

Error	Special Built-In	Other Utilities
Shell language syntax error	Shall exit	Shall exit
Utility syntax error (option or operand error)	Shall exit	Shall not exit
Redirection error	Shall exit	Shall not exit
Variable assignment error	Shall exit	Shall not exit
Expansion error	Shall exit	Shall exit
Command not found	N/A	May exit
Dot script not found	Shall exit	N/A

73043 An expansion error is one that occurs when the shell expansions defined in [Section 2.6](#) (on page  
73044 2305) are carried out (for example, "`$(x!y)`", because `'!'` is not a valid operator); an  
73045 implementation may treat these as syntax errors if it is able to detect them during tokenization,  
73046 rather than during expansion.

73047 If any of the errors shown as "shall exit" or "(may) exit" occur in a subshell, the subshell shall  
73048 (respectively may) exit with a non-zero status, but the script containing the subshell shall not  
73049 exit because of the error.

73050 In all of the cases shown in the table, an interactive shell shall write a diagnostic message to  
73051 standard error without exiting.

### 73052 2.8.2 Exit Status for Commands

73053 Each command has an exit status that can influence the behavior of other shell commands. The  
73054 exit status of commands that are not utilities is documented in this section. The exit status of the  
73055 standard utilities is documented in their respective sections.

73056 If a command is not found, the exit status shall be 127. If the command name is found, but it is  
73057 not an executable utility, the exit status shall be 126. Applications that invoke utilities without  
73058 using the shell should use these exit status values to report similar errors.

73059 If a command fails during word expansion or redirection, its exit status shall be greater than  
73060 zero.

73061 Internally, for purposes of deciding whether a command exits with a non-zero exit status, the  
 73062 shell shall recognize the entire status value retrieved for the command by the equivalent of the  
 73063 *wait()* function WEXITSTATUS macro (as defined in the System Interfaces volume of  
 73064 POSIX.1-2008). When reporting the exit status with the special parameter '?', the shell shall  
 73065 report the full eight bits of exit status available. The exit status of a command that terminated  
 73066 because it received a signal shall be reported as greater than 128.

## 73067 2.9 Shell Commands

73068 This section describes the basic structure of shell commands. The following command  
 73069 descriptions each describe a format of the command that is only used to aid the reader in  
 73070 recognizing the command type, and does not formally represent the syntax. Each description  
 73071 discusses the semantics of the command; for a formal definition of the command language,  
 73072 consult Section 2.10 (on page 2325).

73073 A *command* is one of the following:

- 73074 • Simple command (see Section 2.9.1)
- 73075 • Pipeline (see Section 2.9.2, on page 2318)
- 73076 • List compound-list (see Section 2.9.3, on page 2319)
- 73077 • Compound command (see Section 2.9.4, on page 2321)
- 73078 • Function definition (see Section 2.9.5, on page 2324)

73079 Unless otherwise stated, the exit status of a command shall be that of the last simple command  
 73080 executed by the command. There shall be no limit on the size of any shell command other than  
 73081 that imposed by the underlying system (memory constraints, {ARG\_MAX}, and so on).

### 73082 2.9.1 Simple Commands

73083 A “simple command” is a sequence of optional variable assignments and redirections, in any  
 73084 sequence, optionally followed by words and redirections, terminated by a control operator.

73085 When a given simple command is required to be executed (that is, when any conditional  
 73086 construct such as an AND-OR list or a **case** statement has not bypassed the simple command),  
 73087 the following expansions, assignments, and redirections shall all be performed from the  
 73088 beginning of the command text to the end:

- 73089 1. The words that are recognized as variable assignments or redirections according to  
 73090 Section 2.10.2 (on page 2325) are saved for processing in steps 3 and 4.
- 73091 2. The words that are not variable assignments or redirections shall be expanded. If any  
 73092 fields remain following their expansion, the first field shall be considered the command  
 73093 name and remaining fields are the arguments for the command.
- 73094 3. Redirections shall be performed as described in Section 2.7 (on page 2312).
- 73095 4. Each variable assignment shall be expanded for tilde expansion, parameter expansion,  
 73096 command substitution, arithmetic expansion, and quote removal prior to assigning the  
 73097 value.

73098 In the preceding list, the order of steps 3 and 4 may be reversed if no command name results  
 73099 from step 2 or if the command name matches the name of a special built-in utility; see Section  
 73100 2.14 (on page 2334).

73101 If no command name results, variable assignments shall affect the current execution  
 73102 environment. Otherwise, the variable assignments shall be exported for the execution  
 73103 environment of the command and shall not affect the current execution environment (except for  
 73104 special built-ins). If any of the variable assignments attempt to assign a value to a read-only  
 73105 variable, a variable assignment error shall occur. See Section 2.8.1 (on page 2315) for the  
 73106 consequences of these errors.

73107 If there is no command name, any redirections shall be performed in a subshell environment; it  
 73108 is unspecified whether this subshell environment is the same one as that used for a command  
 73109 substitution within the command. (To affect the current execution environment, see the *exec*  
 73110 special built-in.) If any of the redirections performed in the current shell execution environment  
 73111 fail, the command shall immediately fail with an exit status greater than zero, and the shell shall  
 73112 write an error message indicating the failure. See Section 2.8.1 (on page 2315) for the  
 73113 consequences of these failures on interactive and non-interactive shells.

73114 If there is a command name, execution shall continue as described in Section 2.9.1.1. If there is  
 73115 no command name, but the command contained a command substitution, the command shall  
 73116 complete with the exit status of the last command substitution performed. Otherwise, the  
 73117 command shall complete with a zero exit status.

#### 73118 2.9.1.1 Command Search and Execution

73119 If a simple command results in a command name and an optional list of arguments, the  
 73120 following actions shall be performed:

- 73121 1. If the command name does not contain any <slash> characters, the first successful step in  
 73122 the following sequence shall occur:
  - 73123 a. If the command name matches the name of a special built-in utility, that special  
 73124 built-in utility shall be invoked.
  - 73125 b. If the command name matches the name of a function known to this shell, the  
 73126 function shall be invoked as described in Section 2.9.5 (on page 2324). If the  
 73127 implementation has provided a standard utility in the form of a function, it shall  
 73128 not be recognized at this point. It shall be invoked in conjunction with the path  
 73129 search in step 1d.
  - 73130 c. If the command name matches the name of a utility listed in the following table,  
 73131 that utility shall be invoked.

73132	<i>alias</i>	<i>false</i>	<i>jobs</i>	<i>read</i>	<i>wait</i>
73133	<i>bg</i>	<i>fc</i>	<i>kill</i>	<i>true</i>	
73134	<i>cd</i>	<i>fg</i>	<i>newgrp</i>	<i>umask</i>	
73135	<i>command</i>	<i>getopts</i>	<i>pwd</i>	<i>unalias</i>	

- 73136 d. Otherwise, the command shall be searched for using the *PATH* environment  
 73137 variable as described in XBD Chapter 8 (on page 173):

- 73138 i. If the search is successful:
  - 73139 a. If the system has implemented the utility as a regular built-in or as a  
 73140 shell function, it shall be invoked at this point in the path search.
  - 73141 b. Otherwise, the shell executes the utility in a separate utility  
 73142 environment (see Section 2.12, on page 2331) with actions equivalent  
 73143 to calling the *execve()* function as defined in the System Interfaces  
 73144 volume of POSIX.1-2008 with the *path* argument set to the pathname  
 73145 resulting from the search, *arg0* set to the command name, and the

- 73146 remaining arguments set to the operands, if any.
- 73147 If the *execve()* function fails due to an error equivalent to the  
73148 [ENOEXEC] error defined in the System Interfaces volume of  
73149 POSIX.1-2008, the shell shall execute a command equivalent to  
73150 having a shell invoked with the pathname resulting from the search  
73151 as its first operand, with any remaining arguments passed to the new  
73152 shell, except that the value of "\$0" in the new shell may be set to the  
73153 command name. If the executable file is not a text file, the shell may  
73154 bypass this command execution. In this case, it shall write an error  
73155 message, and shall return an exit status of 126.
- 73156 Once a utility has been searched for and found (either as a result of this  
73157 specific search or as part of an unspecified shell start-up activity), an  
73158 implementation may remember its location and need not search for the  
73159 utility again unless the *PATH* variable has been the subject of an assignment.  
73160 If the remembered location fails for a subsequent invocation, the shell shall  
73161 repeat the search to find the new location for the utility, if any.
- 73162 ii. If the search is unsuccessful, the command shall fail with an exit status of  
73163 127 and the shell shall write an error message.
- 73164 2. If the command name contains at least one <slash>, the shell shall execute the utility in a  
73165 separate utility environment with actions equivalent to calling the *execve()* function  
73166 defined in the System Interfaces volume of POSIX.1-2008 with the *path* and *arg0*  
73167 arguments set to the command name, and the remaining arguments set to the operands, if  
73168 any.
- 73169 If the *execve()* function fails due to an error equivalent to the [ENOEXEC] error, the shell  
73170 shall execute a command equivalent to having a shell invoked with the command name  
73171 as its first operand, with any remaining arguments passed to the new shell. If the  
73172 executable file is not a text file, the shell may bypass this command execution. In this case,  
73173 it shall write an error message and shall return an exit status of 126.

## 73174 2.9.2 Pipelines

73175 A *pipeline* is a sequence of one or more commands separated by the control operator '|'. The  
73176 standard output of all but the last command shall be connected to the standard input of the next  
73177 command.

73178 The format for a pipeline is:

```
73179 [!] command1 [ | command2 ... ]
```

73180 The standard output of *command1* shall be connected to the standard input of *command2*. The  
73181 standard input, standard output, or both of a command shall be considered to be assigned by  
73182 the pipeline before any redirection specified by redirection operators that are part of the  
73183 command (see Section 2.7, on page 2312).

73184 If the pipeline is not in the background (see Section 2.9.3.1, on page 2319), the shell shall wait for  
73185 the last command specified in the pipeline to complete, and may also wait for all commands to  
73186 complete.

73187 **Exit Status**

73188 If the reserved word **!** does not precede the pipeline, the exit status shall be the exit status of the  
 73189 last command specified in the pipeline. Otherwise, the exit status shall be the logical NOT of the  
 73190 exit status of the last command. That is, if the last command returns zero, the exit status shall be  
 73191 1; if the last command returns greater than zero, the exit status shall be zero.

73192 **2.9.3 Lists**

73193 An *AND-OR list* is a sequence of one or more pipelines separated by the operators "**&&**" and  
 73194 "**||**".

73195 A *list* is a sequence of one or more AND-OR lists separated by the operators '**;**', '**&'** and  
 73196 optionally terminated by '**;**', '**&'**, or **<newline>**.

73197 The operators "**&&**" and "**||**" shall have equal precedence and shall be evaluated with left  
 73198 associativity. For example, both of the following commands write solely **bar** to standard output:

```
73199 false && echo foo || echo bar
73200 true || echo foo && echo bar
```

73201 A '**;**' or **<newline>** terminator shall cause the preceding AND-OR list to be executed  
 73202 sequentially; an '**&'** shall cause asynchronous execution of the preceding AND-OR list.

73203 The term "compound-list" is derived from the grammar in Section 2.10 (on page 2325); it is  
 73204 equivalent to a sequence of *lists*, separated by **<newline>** characters, that can be preceded or  
 73205 followed by an arbitrary number of **<newline>** characters.

73206 **Examples**

73207 The following is an example that illustrates **<newline>** characters in compound-lists:

```
73208 while
73209     # a couple of <newline>s
73210     # a list
73211     date && who || ls; cat file
73212     # a couple of <newline>s
73213     # another list
73214     wc file > output & true
73215 do
73216     # 2 lists
73217     ls
73218     cat file
73219 done
```

73220 **2.9.3.1 Asynchronous Lists**

73221 If a command is terminated by the control operator **<ampersand>** ('**&'**), the shell shall execute  
 73222 the command asynchronously in a subshell. This means that the shell shall not wait for the  
 73223 command to finish before executing the next command.

73224 The format for running a command in the background is:

```
73225 command1 & [command2 & ... ]
```

73226 The standard input for an asynchronous list, before any explicit redirections are performed, shall  
 73227 be considered to be assigned to a file that has the same properties as `/dev/null`. If it is an  
 73228 interactive shell, this need not happen. In all cases, explicit redirection of standard input shall  
 73229 override this activity.

73230 When an element of an asynchronous list (the portion of the list ended by an `&`,  
 73231 such as `command1`, above) is started by the shell, the process ID of the last command in the  
 73232 asynchronous list element shall become known in the current shell execution environment; see  
 73233 [Section 2.12](#) (on page 2331). This process ID shall remain known until:

- 73234 1. The command terminates and the application waits for the process ID.
- 73235 2. Another asynchronous list is invoked before "\$!" (corresponding to the previous  
 73236 asynchronous list) is expanded in the current execution environment.

73237 The implementation need not retain more than the `{CHILD_MAX}` most recent entries in its list  
 73238 of known process IDs in the current shell execution environment.

#### 73239 **Exit Status**

73240 The exit status of an asynchronous list shall be zero.

#### 73241 2.9.3.2 *Sequential Lists*

73242 Commands that are separated by a `<semicolon>` (`' ; '`) shall be executed sequentially.

73243 The format for executing commands sequentially shall be:

73244 `command1 [ ; command2 ] ...`

73245 Each command shall be expanded and executed in the order specified.

#### 73246 **Exit Status**

73247 The exit status of a sequential list shall be the exit status of the last command in the list.

#### 73248 2.9.3.3 *AND Lists*

73249 The control operator `"&&"` denotes an AND list. The format shall be:

73250 `command1 [ && command2 ] ...`

73251 First `command1` shall be executed. If its exit status is zero, `command2` shall be executed, and so on,  
 73252 until a command has a non-zero exit status or there are no more commands left to execute. The  
 73253 commands are expanded only if they are executed.

#### 73254 **Exit Status**

73255 The exit status of an AND list shall be the exit status of the last command that is executed in the  
 73256 list.

#### 73257 2.9.3.4 *OR Lists*

73258 The control operator `"||"` denotes an OR List. The format shall be:

73259 `command1 [ || command2 ] ...`

73260 First, `command1` shall be executed. If its exit status is non-zero, `command2` shall be executed, and  
 73261 so on, until a command has a zero exit status or there are no more commands left to execute.

73262 **Exit Status**

73263 The exit status of an OR list shall be the exit status of the last command that is executed in the  
73264 list.

73265 **2.9.4 Compound Commands**

73266 The shell has several programming constructs that are “compound commands”, which provide  
73267 control flow for commands. Each of these compound commands has a reserved word or control  
73268 operator at the beginning, and a corresponding terminator reserved word or operator at the end.  
73269 In addition, each can be followed by redirections on the same line as the terminator. Each  
73270 redirection shall apply to all the commands within the compound command that do not  
73271 explicitly override that redirection.

73272 **2.9.4.1 Grouping Commands**

73273 The format for grouping commands is as follows:

73274 (*compound-list*) Execute *compound-list* in a subshell environment; see Section 2.12 (on page  
73275 2331). Variable assignments and built-in commands that affect the  
73276 environment shall not remain in effect after the list finishes.

73277 { *compound-list*;} Execute *compound-list* in the current process environment. The semicolon  
73278 shown here is an example of a control operator delimiting the } reserved  
73279 word. Other delimiters are possible, as shown in Section 2.10 (on page  
73280 2325); a <newline> is frequently used.

73281 **Exit Status**

73282 The exit status of a grouping command shall be the exit status of *compound-list*.

73283 **2.9.4.2 The for Loop**

73284 The **for** loop shall execute a sequence of commands for each member in a list of *items*. The **for**  
73285 loop requires that the reserved words **do** and **done** be used to delimit the sequence of  
73286 commands.

73287 The format for the **for** loop is as follows:

```
73288 for name [ in [word ... ] ]
73289 do
73290     compound-list
73291 done
```

73292 First, the list of words following **in** shall be expanded to generate a list of items. Then, the  
73293 variable *name* shall be set to each item, in turn, and the *compound-list* executed each time. If no  
73294 items result from the expansion, the *compound-list* shall not be executed. Omitting:

```
73295 in word...
```

73296 shall be equivalent to:

```
73297 in "$@"
```

73298 **Exit Status**

73299 The exit status of a **for** command shall be the exit status of the last command that executes. If  
73300 there are no items, the exit status shall be zero.

73301 2.9.4.3 *Case Conditional Construct*

73302 The conditional construct **case** shall execute the *compound-list* corresponding to the first one of  
73303 several *patterns* (see Section 2.13, on page 2332) that is matched by the string resulting from the  
73304 tilde expansion, parameter expansion, command substitution, arithmetic expansion, and quote  
73305 removal of the given word. The reserved word **in** shall denote the beginning of the patterns to  
73306 be matched. Multiple patterns with the same *compound-list* shall be delimited by the '|' symbol.  
73307 The control operator ')' terminates a list of patterns corresponding to a given action.  
73308 The *compound-list* for each list of patterns, with the possible exception of the last, shall be  
73309 terminated with ";;". The **case** construct terminates with the reserved word **esac** (**case**  
73310 reversed).

73311 The format for the **case** construct is as follows:

```
73312 case word in
73313     [ (]pattern1) compound-list;;
73314     [ [ (]pattern[ | pattern] ... ) compound-list;;] ...
73315     [ [ (]pattern[ | pattern] ... ) compound-list]
73316 esac
```

73317 The ";;" is optional for the last *compound-list*.

73318 In order from the beginning to the end of the **case** statement, each *pattern* that labels a *compound-*  
73319 *list* shall be subjected to tilde expansion, parameter expansion, command substitution, and  
73320 arithmetic expansion, and the result of these expansions shall be compared against the  
73321 expansion of *word*, according to the rules described in Section 2.13 (on page 2332) (which also  
73322 describes the effect of quoting parts of the pattern). After the first match, no more patterns shall  
73323 be expanded, and the *compound-list* shall be executed. The order of expansion and comparison of  
73324 multiple *patterns* that label a *compound-list* statement is unspecified.

73325 **Exit Status**

73326 The exit status of **case** shall be zero if no patterns are matched. Otherwise, the exit status shall be  
73327 the exit status of the last command executed in the *compound-list*.

73328 2.9.4.4 *The if Conditional Construct*

73329 The **if** command shall execute a *compound-list* and use its exit status to determine whether to  
73330 execute another *compound-list*.

73331 The format for the **if** construct is as follows:

```
73332 if compound-list
73333 then
73334     compound-list
73335 [elif compound-list
73336 then
73337     compound-list] ...
73338 [else
73339     compound-list]
73340 fi
```

73341 The **if** *compound-list* shall be executed; if its exit status is zero, the **then** *compound-list* shall be  
 73342 executed and the command shall complete. Otherwise, each **elif** *compound-list* shall be executed,  
 73343 in turn, and if its exit status is zero, the **then** *compound-list* shall be executed and the command  
 73344 shall complete. Otherwise, the **else** *compound-list* shall be executed.

#### 73345 **Exit Status**

73346 The exit status of the **if** command shall be the exit status of the **then** or **else** *compound-list* that  
 73347 was executed, or zero, if none was executed.

#### 73348 2.9.4.5 *The while Loop*

73349 The **while** loop shall continuously execute one *compound-list* as long as another *compound-list* has  
 73350 a zero exit status.

73351 The format of the **while** loop is as follows:

```
73352 while compound-list-1
73353 do
73354     compound-list-2
73355 done
```

73356 The *compound-list-1* shall be executed, and if it has a non-zero exit status, the **while** command  
 73357 shall complete. Otherwise, the *compound-list-2* shall be executed, and the process shall repeat.

#### 73358 **Exit Status**

73359 The exit status of the **while** loop shall be the exit status of the last *compound-list-2* executed, or  
 73360 zero if none was executed.

#### 73361 2.9.4.6 *The until Loop*

73362 The **until** loop shall continuously execute one *compound-list* as long as another *compound-list* has  
 73363 a non-zero exit status.

73364 The format of the **until** loop is as follows:

```
73365 until compound-list-1
73366 do
73367     compound-list-2
73368 done
```

73369 The *compound-list-1* shall be executed, and if it has a zero exit status, the **until** command  
 73370 completes. Otherwise, the *compound-list-2* shall be executed, and the process repeats.

#### 73371 **Exit Status**

73372 The exit status of the **until** loop shall be the exit status of the last *compound-list-2* executed, or  
 73373 zero if none was executed.

73374 **2.9.5 Function Definition Command**

73375 A function is a user-defined name that is used as a simple command to call a compound  
73376 command with new positional parameters. A function is defined with a “function definition  
73377 command”.

73378 The format of a function definition command is as follows:

73379 *fname()* *compound-command*[*io-redirect* ...]

73380 The function is named *fname*; the application shall ensure that it is a name (see XBD Section  
73381 3.230, on page 70). An implementation may allow other characters in a function name as an  
73382 extension. The implementation shall maintain separate name spaces for functions and variables.

73383 The argument *compound-command* represents a compound command, as described in Section  
73384 2.9.4 (on page 2321).

73385 When the function is declared, none of the expansions in Section 2.6 (on page 2305) shall be  
73386 performed on the text in *compound-command* or *io-redirect*; all expansions shall be performed as  
73387 normal each time the function is called. Similarly, the optional *io-redirect* redirections and any  
73388 variable assignments within *compound-command* shall be performed during the execution of the  
73389 function itself, not the function definition. See Section 2.8.1 (on page 2315) for the consequences  
73390 of failures of these operations on interactive and non-interactive shells.

73391 When a function is executed, it shall have the syntax-error and variable-assignment properties  
73392 described for special built-in utilities in the enumerated list at the beginning of Section 2.14 (on  
73393 page 2334).

73394 The *compound-command* shall be executed whenever the function name is specified as the name  
73395 of a simple command (see Section 2.9.1.1, on page 2317). The operands to the command  
73396 temporarily shall become the positional parameters during the execution of the *compound-*  
73397 *command*; the special parameter '#' also shall be changed to reflect the number of operands.  
73398 The special parameter 0 shall be unchanged. When the function completes, the values of the  
73399 positional parameters and the special parameter '#' shall be restored to the values they had  
73400 before the function was executed. If the special built-in *return* is executed in the *compound-*  
73401 *command*, the function completes and execution shall resume with the next command after the  
73402 function call.

73403 **Exit Status**

73404 The exit status of a function definition shall be zero if the function was declared successfully;  
73405 otherwise, it shall be greater than zero. The exit status of a function invocation shall be the exit  
73406 status of the last command executed by the function.

73407 **2.10 Shell Grammar**

73408 The following grammar defines the Shell Command Language. This formal syntax shall take  
73409 precedence over the preceding text syntax description.

73410 **2.10.1 Shell Grammar Lexical Conventions**

73411 The input language to the shell must be first recognized at the character level. The resulting  
73412 tokens shall be classified by their immediate context according to the following rules (applied in  
73413 order). These rules shall be used to determine what a “token” is that is subject to parsing at the  
73414 token level. The rules for token recognition in [Section 2.3](#) (on page 2299) shall apply.

- 73415 1. A <newline> shall be returned as the token identifier **NEWLINE**.
- 73416 2. If the token is an operator, the token identifier for that operator shall result.
- 73417 3. If the string consists solely of digits and the delimiter character is one of '<' or '>', the  
73418 token identifier **IO\_NUMBER** shall be returned.
- 73419 4. Otherwise, the token identifier **TOKEN** results.

73420 Further distinction on **TOKEN** is context-dependent. It may be that the same **TOKEN** yields  
73421 **WORD**, a **NAME**, an **ASSIGNMENT**, or one of the reserved words below, dependent upon the  
73422 context. Some of the productions in the grammar below are annotated with a rule number from  
73423 the following list. When a **TOKEN** is seen where one of those annotated productions could be  
73424 used to reduce the symbol, the applicable rule shall be applied to convert the token identifier  
73425 type of the **TOKEN** to a token identifier acceptable at that point in the grammar. The reduction  
73426 shall then proceed based upon the token identifier type yielded by the rule applied. When more  
73427 than one rule applies, the highest numbered rule shall apply (which in turn may refer to another  
73428 rule). (Note that except in rule 7, the presence of an '=' in the token has no effect.)

73429 The **WORD** tokens shall have the word expansion rules applied to them immediately before the  
73430 associated command is executed, not at the time the command is parsed.

73431 **2.10.2 Shell Grammar Rules**

- 73432 1. [Command Name]

73433 When the **TOKEN** is exactly a reserved word, the token identifier for that reserved word  
73434 shall result. Otherwise, the token **WORD** shall be returned. Also, if the parser is in any  
73435 state where only a reserved word could be the next correct token, proceed as above.

73436 **Note:** Because at this point <quotation-mark> characters are retained in the token, quoted  
73437 strings cannot be recognized as reserved words. This rule also implies that reserved  
73438 words are not recognized except in certain positions in the input, such as after a  
73439 <newline> or <semicolon>; the grammar presumes that if the reserved word is  
73440 intended, it is properly delimited by the user, and does not attempt to reflect that  
73441 requirement directly. Also note that line joining is done before tokenization, as described  
73442 in [Section 2.2.1](#) (on page 2298), so escaped <newline> characters are already removed at  
73443 this point.

73444 Rule 1 is not directly referenced in the grammar, but is referred to by other rules, or  
73445 applies globally.

- 73446 2. [Redirection to or from filename]

73447 The expansions specified in [Section 2.7](#) (on page 2312) shall occur. As specified there,  
73448 exactly one field can result (or the result is unspecified), and there are additional

- 73449 requirements on pathname expansion.
- 73450 3. [Redirection from here-document]
- 73451 Quote removal shall be applied to the word to determine the delimiter that is used to find  
73452 the end of the here-document that begins after the next <newline>.
- 73453 4. [Case statement termination]
- 73454 When the **TOKEN** is exactly the reserved word **esac**, the token identifier for **esac** shall  
73455 result. Otherwise, the token **WORD** shall be returned.
- 73456 5. [**NAME** in **for**]
- 73457 When the **TOKEN** meets the requirements for a name (see XBD Section 3.230, on page  
73458 70), the token identifier **NAME** shall result. Otherwise, the token **WORD** shall be  
73459 returned.
- 73460 6. [Third word of **for** and **case**]
- 73461 a. [**case** only]
- 73462 When the **TOKEN** is exactly the reserved word **in**, the token identifier for **in** shall  
73463 result. Otherwise, the token **WORD** shall be returned.
- 73464 b. [**for** only]
- 73465 When the **TOKEN** is exactly the reserved word **in** or **do**, the token identifier for **in**  
73466 or **do** shall result, respectively. Otherwise, the token **WORD** shall be returned.
- 73467 (For a. and b.: As indicated in the grammar, a *linebreak* precedes the tokens **in** and **do**. If  
73468 <newline> characters are present at the indicated location, it is the token after them that is  
73469 treated in this fashion.)
- 73470 7. [Assignment preceding command name]
- 73471 a. [When the first word]
- 73472 If the **TOKEN** does not contain the character '=' , rule 1 is applied. Otherwise, 7b  
73473 shall be applied.
- 73474 b. [Not the first word]
- 73475 If the **TOKEN** contains the <equals-sign> character:
- 73476 If it begins with '=' , the token **WORD** shall be returned.
- 73477 — If all the characters preceding '=' form a valid name (see XBD Section 3.230,  
73478 on page 70), the token **ASSIGNMENT\_WORD** shall be returned. (Quoted  
73479 characters cannot participate in forming a valid name.)
- 73480 — Otherwise, it is unspecified whether it is **ASSIGNMENT\_WORD** or **WORD**  
73481 that is returned.
- 73482 Assignment to the **NAME** shall occur as specified in Section 2.9.1 (on page 2316).
- 73483 8. [**NAME** in function]
- 73484 When the **TOKEN** is exactly a reserved word, the token identifier for that reserved word  
73485 shall result. Otherwise, when the **TOKEN** meets the requirements for a name, the token  
73486 identifier **NAME** shall result. Otherwise, rule 7 applies.
- 73487 9. [Body of function]
- 73488 Word expansion and assignment shall never occur, even when required by the rules

73489 above, when this rule is being parsed. Each **TOKEN** that might either be expanded or  
 73490 have assignment applied to it shall instead be returned as a single **WORD** consisting only  
 73491 of characters that are exactly the token described in Section 2.3 (on page 2299).

## 73675 2.11 Signals and Error Handling

73676 When a command is in an asynchronous list, it shall inherit from the shell a signal action of  
73677 ignored (SIG\_IGN) for the SIGQUIT and SIGINT signals, and may inherit a signal mask in  
73678 which SIGQUIT and SIGINT are blocked. Otherwise, the signal actions and signal mask  
73679 inherited by the command shall be the same as those inherited by the shell from its parent  
73680 unless a signal action is modified by the *trap* special built-in (see *trap*)

73681 When a signal for which a trap has been set is received while the shell is waiting for the  
73682 completion of a utility executing a foreground command, the trap associated with that signal  
73683 shall not be executed until after the foreground command has completed. When the shell is  
73684 waiting, by means of the *wait* utility, for asynchronous commands to complete, the reception of a  
73685 signal for which a trap has been set shall cause the *wait* utility to return immediately with an exit  
73686 status >128, immediately after which the trap associated with that signal shall be taken.

73687 If multiple signals are pending for the shell for which there are associated trap actions, the order  
73688 of execution of trap actions is unspecified.

73689 **2.12 Shell Execution Environment**

73690 A shell execution environment consists of the following:

- 73691 • Open files inherited upon invocation of the shell, plus open files controlled by *exec*
- 73692 • Working directory as set by *cd*
- 73693 • File creation mask set by *umask*
- 73694 • Current traps set by *trap*
- 73695 • Shell parameters that are set by variable assignment (see the *set* special built-in) or from
- 73696 the System Interfaces volume of POSIX.1-2008 environment inherited by the shell when it
- 73697 begins (see the *export* special built-in)
- 73698 • Shell functions; see Section 2.9.5 (on page 2324)
- 73699 • Options turned on at invocation or by *set*
- 73700 • Process IDs of the last commands in asynchronous lists known to this shell environment;
- 73701 see Section 2.9.3.1 (on page 2319)
- 73702 • Shell aliases; see Section 2.3.1 (on page 2300)

73703 Utilities other than the special built-ins (see Section 2.14, on page 2334) shall be invoked in a  
 73704 separate environment that consists of the following. The initial value of these objects shall be the  
 73705 same as that for the parent shell, except as noted below.

- 73706 • Open files inherited on invocation of the shell, open files controlled by the *exec* special  
 73707 built-in plus any modifications, and additions specified by any redirections to the utility
- 73708 • Current working directory
- 73709 • File creation mask
- 73710 • If the utility is a shell script, traps caught by the shell shall be set to the default values and  
 73711 traps ignored by the shell shall be set to be ignored by the utility; if the utility is not a shell  
 73712 script, the trap actions (default or ignore) shall be mapped into the appropriate signal  
 73713 handling actions for the utility
- 73714 • Variables with the *export* attribute, along with those explicitly exported for the duration of  
 73715 the command, shall be passed to the utility environment variables

73716 The environment of the shell process shall not be changed by the utility unless explicitly  
 73717 specified by the utility description (for example, *cd* and *umask*).

73718 A subshell environment shall be created as a duplicate of the shell environment, except that  
 73719 signal traps set by that shell environment shall be set to the default values. Changes made to the  
 73720 subshell environment shall not affect the shell environment. Command substitution, commands  
 73721 that are grouped with parentheses, and asynchronous lists shall be executed in a subshell  
 73722 environment. Additionally, each command of a multi-command pipeline is in a subshell  
 73723 environment; as an extension, however, any or all commands in a pipeline may be executed in  
 73724 the current environment. All other commands shall be executed in the current shell  
 73725 environment.

## 73726 2.13 Pattern Matching Notation

73727 The pattern matching notation described in this section is used to specify patterns for matching  
 73728 strings in the shell. Historically, pattern matching notation is related to, but slightly different  
 73729 from, the regular expression notation described in XBD [Chapter 9](#) (on page 181). For this reason,  
 73730 the description of the rules for this pattern matching notation are based on the description of  
 73731 regular expression notation, modified to account for the differences.

### 73732 2.13.1 Patterns Matching a Single Character

73733 The following patterns matching a single character shall match a single character: ordinary  
 73734 characters, special pattern characters, and pattern bracket expressions. The pattern bracket  
 73735 expression also shall match a single collating element. A <backslash> character shall escape the  
 73736 following character. The escaping <backslash> shall be discarded.

73737 An ordinary character is a pattern that shall match itself. It can be any character in the supported  
 73738 character set except for NUL, those special shell characters in [Section 2.2](#) (on page 2298) that  
 73739 require quoting, and the following three special pattern characters. Matching shall be based on  
 73740 the bit pattern used for encoding the character, not on the graphic representation of the  
 73741 character. If any character (ordinary, shell special, or pattern special) is quoted, that pattern shall  
 73742 match the character itself. The shell special characters always require quoting.

73743 When unquoted and outside a bracket expression, the following three characters shall have  
 73744 special meaning in the specification of patterns:

- 73745 ? A <question-mark> is a pattern that shall match any character.
- 73746 \* An <asterisk> is a pattern that shall match multiple characters, as described in [Section](#)  
 73747 [2.13.2](#).
- 73748 [ If an open bracket introduces a bracket expression as in XBD [Section 9.3.5](#) (on page 184),  
 73749 except that the <exclamation-mark> character ('!') shall replace the <circumflex>  
 73750 character ('^') in its role in a non-matching list in the regular expression notation, it shall  
 73751 introduce a pattern bracket expression. A bracket expression starting with an unquoted  
 73752 <circumflex> character produces unspecified results. Otherwise, '[' shall match the  
 73753 character itself.

73754 When pattern matching is used where shell quote removal is not performed (such as in the  
 73755 argument to the *find -name* primary when *find* is being called using one of the *exec* functions as  
 73756 defined in the System Interfaces volume of POSIX.1-2008, or in the *pattern* argument to the  
 73757 *fnmatch()* function), special characters can be escaped to remove their special meaning by  
 73758 preceding them with a <backslash> character. This escaping <backslash> is discarded. The  
 73759 sequence "\\\" represents one literal <backslash>. All of the requirements and effects of quoting  
 73760 on ordinary, shell special, and special pattern characters shall apply to escaping in this context.

### 73761 2.13.2 Patterns Matching Multiple Characters

73762 The following rules are used to construct patterns matching multiple characters from patterns  
 73763 matching a single character:

- 73764 1. The <asterisk> ('\*') is a pattern that shall match any string, including the null string.
- 73765 2. The concatenation of patterns matching a single character is a valid pattern that shall  
 73766 match the concatenation of the single characters or collating elements matched by each of  
 73767 the concatenated patterns.

- 73768 3. The concatenation of one or more patterns matching a single character with one or more  
 73769 <asterisk> characters is a valid pattern. In such patterns, each <asterisk> shall match a  
 73770 string of zero or more characters, matching the greatest possible number of characters  
 73771 that still allows the remainder of the pattern to match the string.

### 73772 2.13.3 Patterns Used for Filename Expansion

73773 The rules described so far in Section 2.13.1 (on page 2332) and Section 2.13.2 (on page 2332) are  
 73774 qualified by the following rules that apply when pattern matching notation is used for filename  
 73775 expansion:

- 73776 1. The <slash> character in a pathname shall be explicitly matched by using one or more  
 73777 <slash> characters in the pattern; it shall neither be matched by the <asterisk> or  
 73778 <question-mark> special characters nor by a bracket expression. <slash> characters in the  
 73779 pattern shall be identified before bracket expressions; thus, a <slash> cannot be included  
 73780 in a pattern bracket expression used for filename expansion. If a <slash> character is  
 73781 found following an unescaped <left-square-bracket> character before a corresponding  
 73782 <right-square-bracket> is found, the open bracket shall be treated as an ordinary  
 73783 character. For example, the pattern "a[b/c]d" does not match such pathnames as **abd**  
 73784 or **a/d**. It only matches a pathname of literally **a[b/c]d**.
- 73785 2. If a filename begins with a <period> ( ' . ' ), the <period> shall be explicitly matched by  
 73786 using a <period> as the first character of the pattern or immediately following a <slash>  
 73787 character. The leading <period> shall not be matched by:
- 73788 • The <asterisk> or <question-mark> special characters
  - 73789 • A bracket expression containing a non-matching list, such as "[!a]", a range  
 73790 expression, such as "[%=0]", or a character class expression, such as  
 73791 "[[:punct:]]"

73792 It is unspecified whether an explicit <period> in a bracket expression matching list, such  
 73793 as "[.abc]", can match a leading <period> in a filename.

- 73794 3. Specified patterns shall be matched against existing filenames and pathnames, as  
 73795 appropriate. Each component that contains a pattern character shall require read  
 73796 permission in the directory containing that component. Any component, except the last,  
 73797 that does not contain a pattern character shall require search permission. For example,  
 73798 given the pattern:

73799 /foo/bar/x\*/bam

73800 search permission is needed for directories / and **foo**, search and read permissions are  
 73801 needed for directory **bar**, and search permission is needed for each **x\*** directory. If the  
 73802 pattern matches any existing filenames or pathnames, the pattern shall be replaced with  
 73803 those filenames and pathnames, sorted according to the collating sequence in effect in the  
 73804 current locale.

73805 If the pattern contains an open bracket ( ' [ ' ) that does not introduce a bracket expression  
 73806 as in XBD Section 9.3.5 (on page 184), it is unspecified whether other unquoted pattern  
 73807 matching characters within the same slash-delimited component of the pattern retain  
 73808 their special meanings or are treated as ordinary characters. For example, the pattern  
 73809 "a\*[/b\*" may match all filenames beginning with ' b ' in the directory "a\*[" or it may  
 73810 match all filenames beginning with ' b ' in all directories with names beginning with ' a '  
 73811 and ending with ' [ ' .

73812 If the pattern does not match any existing filenames or pathnames, the pattern string shall

73813 be left unchanged.

## 73814 2.14 Special Built-In Utilities

73815 The following “special built-in” utilities shall be supported in the shell command language. The  
73816 output of each command, if any, shall be written to standard output, subject to the normal  
73817 redirection and piping possible with all commands.

73818 The term “built-in” implies that the shell can execute the utility directly and does not need to  
73819 search for it. An implementation may choose to make any utility a built-in; however, the special  
73820 built-in utilities described here differ from regular built-in utilities in two respects:

- 73821 1. A syntax error in a special built-in utility may cause a shell executing that utility to abort,  
73822 while a syntax error in a regular built-in utility shall not cause a shell executing that  
73823 utility to abort. (See [Section 2.8.1](#) (on page 2315) for the consequences of errors on  
73824 interactive and non-interactive shells.) If a special built-in utility encountering a syntax  
73825 error does not abort the shell, its exit value shall be non-zero.
- 73826 2. Variable assignments specified with special built-in utilities remain in effect after the  
73827 built-in completes; this shall not be the case with a regular built-in or other utility.

73828 The special built-in utilities in this section need not be provided in a manner accessible via the  
73829 *exec* family of functions defined in the System Interfaces volume of POSIX.1-2008.

73830 Some of the special built-ins are described as conforming to XBD [Section 12.2](#) (on page 215). For  
73831 those that are not, the requirement in [Section 1.4](#) (on page 2288) that “--” be recognized as a  
73832 first argument to be discarded does not apply and a conforming application shall not use that  
73833 argument.

73834 **NAME**

73835 break — exit from for, while, or until loop

73836 **SYNOPSIS**73837 break [*n*]73838 **DESCRIPTION**

73839 The *break* utility shall exit from the smallest enclosing **for**, **while**, or **until** loop, if any; or from  
 73840 the *n*th enclosing loop if *n* is specified. The value of *n* is an unsigned decimal integer greater  
 73841 than or equal to 1. The default shall be equivalent to *n*=1. If *n* is greater than the number of  
 73842 enclosing loops, the outermost enclosing loop shall be exited. Execution shall continue with the  
 73843 command immediately following the loop.

73844 **OPTIONS**

73845 None.

73846 **OPERANDS**

73847 See the DESCRIPTION.

73848 **STDIN**

73849 Not used.

73850 **INPUT FILES**

73851 None.

73852 **ENVIRONMENT VARIABLES**

73853 None.

73854 **ASYNCHRONOUS EVENTS**

73855 Default.

73856 **STDOUT**

73857 Not used.

73858 **STDERR**

73859 The standard error shall be used only for diagnostic messages.

73860 **OUTPUT FILES**

73861 None.

73862 **EXTENDED DESCRIPTION**

73863 None.

73864 **EXIT STATUS**

73865 0 Successful completion.

73866 >0 The *n* value was not an unsigned decimal integer greater than or equal to 1.73867 **CONSEQUENCES OF ERRORS**

73868 Default.

**break**73869 **APPLICATION USAGE**

73870 None.

73871 **EXAMPLES**

```

73872     for i in *
73873     do
73874         if test -d "$i"
73875         then break
73876         fi
73877     done

```

73878 **RATIONALE**

73879 In early proposals, consideration was given to expanding the syntax of *break* and *continue* to refer  
 73880 to a label associated with the appropriate loop as a preferable alternative to the *n* method.  
 73881 However, this volume of POSIX.1-2008 does reserve the name space of command names ending  
 73882 with a <colon>. It is anticipated that a future implementation could take advantage of this and  
 73883 provide something like:

```

73884     outofloop: for i in a b c d e
73885     do
73886         for j in 0 1 2 3 4 5 6 7 8 9
73887         do
73888             if test -r "${i}${j}"
73889             then break outofloop
73890             fi
73891         done
73892     done

```

73893 and that this might be standardized after implementation experience is achieved.

73894 **FUTURE DIRECTIONS**

73895 None.

73896 **SEE ALSO**73897 [Section 2.14](#) (on page 2334)73898 **CHANGE HISTORY**73899 **Issue 6**

73900 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
 73901 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
 73902 behavior is intended.

73903 **NAME**

73904 colon — null utility

73905 **SYNOPSIS**73906 : [*argument*...]73907 **DESCRIPTION**73908 This utility shall only expand command *arguments*. It is used when a command is needed, as in  
73909 the **then** condition of an **if** command, but nothing is to be done by the command.73910 **OPTIONS**

73911 None.

73912 **OPERANDS**

73913 See the DESCRIPTION.

73914 **STDIN**

73915 Not used.

73916 **INPUT FILES**

73917 None.

73918 **ENVIRONMENT VARIABLES**

73919 None.

73920 **ASYNCHRONOUS EVENTS**

73921 Default.

73922 **STDOUT**

73923 Not used.

73924 **STDERR**

73925 The standard error shall be used only for diagnostic messages.

73926 **OUTPUT FILES**

73927 None.

73928 **EXTENDED DESCRIPTION**

73929 None.

73930 **EXIT STATUS**

73931 Zero.

73932 **CONSEQUENCES OF ERRORS**

73933 Default.

73934 **APPLICATION USAGE**

73935 None.

73936 **EXAMPLES**

```

73937 : ${X=abc}
73938 if     false
73939 then  :
73940 else  echo $X
73941 fi
73942 abc

```

73943 As with any of the special built-ins, the null utility can also have variable assignments and  
73944 redirections associated with it, such as:73945 `x=y : > z`

**colon***Shell Command Language*

73946 which sets variable *x* to the value *y* (so that it persists after the null utility completes) and creates  
73947 or truncates file *z*.

**RATIONALE**

73948 None.  
73949

**FUTURE DIRECTIONS**

73950 None.

73961 **NAME**

73962 continue — continue for, while, or until loop

73963 **SYNOPSIS**73964 continue [*n*]73965 **DESCRIPTION**

73966 The *continue* utility shall return to the top of the smallest enclosing **for**, **while**, or **until** loop, or to  
 73967 the top of the *n*th enclosing loop, if *n* is specified. This involves repeating the condition list of a  
 73968 **while** or **until** loop or performing the next assignment of a **for** loop, and re-executing the loop if  
 73969 appropriate.

73970 The value of *n* is a decimal integer greater than or equal to 1. The default shall be equivalent to  
 73971 *n*=1. If *n* is greater than the number of enclosing loops, the outermost enclosing loop shall be  
 73972 used.

73973 **OPTIONS**

73974 None.

73975 **OPERANDS**

73976 See the DESCRIPTION.

73977 **STDIN**

73978 Not used.

73979 **INPUT FILES**

73980 None.

73981 **ENVIRONMENT VARIABLES**

73982 None.

73983 **ASYNCHRONOUS EVENTS**

73984 Default.

73985 **STDOUT**

73986 Not used.

73987 **STDERR**

73988 The standard error shall be used only for diagnostic messages.

73989 **OUTPUT FILES**

73990 None.

73991 **EXTENDED DESCRIPTION**

73992 None.

73993 **EXIT STATUS**

73994 0 Successful completion.

73995 >0 The *n* value was not an unsigned decimal integer greater than or equal to 1.73996 **CONSEQUENCES OF ERRORS**

73997 Default.

**continue**

Shell Command Language

73998 **APPLICATION USAGE**

73999 None.

74000 **EXAMPLES**

```
74001     for i in *
74002     do
74003         if test -d "$i"
74004         then continue
74005         fi
74006         printf '%s' is not a directory.\n' "$i"
74007     done
```

74008 **RATIONALE**

74009 None.

74010 **FUTURE DIRECTIONS**

74011 None.

74012 **SEE ALSO**74013 [Section 2.14](#) (on page 2334)74014 **CHANGE HISTORY**74015 **Issue 6**

74016 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
74017 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
74018 behavior is intended.

74019 **Issue 7**74020 The example is changed to use the *printf* utility rather than *echo*.

74021 **NAME**

74022 dot — execute commands in the current environment

74023 **SYNOPSIS**74024 . *file*74025 **DESCRIPTION**74026 The shell shall execute commands from the *file* in the current environment.

74027 If *file* does not contain a <slash>, the shell shall use the search path specified by *PATH* to find the  
 74028 directory containing *file*. Unlike normal command search, however, the file searched for by the  
 74029 *dot* utility need not be executable. If no readable file is found, a non-interactive shell shall abort;  
 74030 an interactive shell shall write a diagnostic message to standard error, but this condition shall  
 74031 not be considered a syntax error.

74032 **OPTIONS**

74033 None.

74034 **OPERANDS**

74035 See the DESCRIPTION.

74036 **STDIN**

74037 Not used.

74038 **INPUT FILES**

74039 See the DESCRIPTION.

74040 **ENVIRONMENT VARIABLES**

74041 See the DESCRIPTION.

74042 **ASYNCHRONOUS EVENTS**

74043 Default.

74044 **STDOUT**

74045 Not used.

74046 **STDERR**

74047 The standard error shall be used only for diagnostic messages.

74048 **OUTPUT FILES**

74049 None.

74050 **EXTENDED DESCRIPTION**

74051 None.

74052 **EXIT STATUS**

74053 Returns the value of the last command executed, or a zero exit status if no command is executed.

74054 **CONSEQUENCES OF ERRORS**

74055 Default.

**dot**74056 **APPLICATION USAGE**

74057 None.

74058 **EXAMPLES**74059 `cat foobar`74060 `foo=hello bar=world`74061 `./foobar`74062 `echo $foo $bar`74063 `hello world`74064 **RATIONALE**

74065 Some older implementations searched the current directory for the *file*, even if the value of *PATH*  
74066 disallowed it. This behavior was omitted from this volume of POSIX.1-2008 due to concerns  
74067 about introducing the susceptibility to trojan horses that the user might be trying to avoid by  
74068 leaving **dot** out of *PATH*.

74069 The KornShell version of *dot* takes optional arguments that are set to the positional parameters.  
74070 This is a valid extension that allows a *dot* script to behave identically to a function.

74071 **FUTURE DIRECTIONS**

74072 None.

74138 **NAME**74139 `exec` — execute commands and open, close, or copy file descriptors74140 **SYNOPSIS**74141 `exec [command [argument...]]`74142 **DESCRIPTION**74143 The `exec` utility shall open, close, and/or copy file descriptors as specified by any redirections as  
74144 part of the command.74145 If `exec` is specified without `command` or `arguments`, and any file descriptors with numbers greater  
74146 than 2 are opened with associated redirection statements, it is unspecified whether those file  
74147 descriptors remain open when the shell invokes another utility. Scripts concerned that child  
74148 shells could misuse open file descriptors can always close them explicitly, as shown in one of the  
74149 following examples.74150 If `exec` is specified with `command`, it shall replace the shell with `command` without creating a new  
74151 process. If `arguments` are specified, they shall be arguments to `command`. Redirection affects the  
74152 current shell execution environment.74153 **OPTIONS**

74154 None.

74155 **OPERANDS**

74156 See the DESCRIPTION.

74157 **STDIN**

74158 Not used.

74159 **INPUT FILES**

74160 None.

74161 **ENVIRONMENT VARIABLES**

74162 None.

74163 **ASYNCHRONOUS EVENTS**

74164 Default.

74165 **STDOUT**

74166 Not used.

74167 **STDERR**

74168 The standard error shall be used only for diagnostic messages.

74169 **OUTPUT FILES**

74170 None.

74171 **EXTENDED DESCRIPTION**

74172 None.

74173 **EXIT STATUS**74174 If `command` is specified, `exec` shall not return to the shell; rather, the exit status of the process shall  
74175 be the exit status of the program implementing `command`, which overlaid the shell. If `command` is  
74176 not found, the exit status shall be 127. If `command` is found, but it is not an executable utility, the  
74177 exit status shall be 126. If a redirection error occurs (see [Section 2.8.1](#), on page 2315), the shell  
74178 shall exit with a value in the range 1–125. Otherwise, `exec` shall return a zero exit status.

74179 **CONSEQUENCES OF ERRORS**

74180 Default.

74181 **APPLICATION USAGE**

74182 None.

74183 **EXAMPLES**74184 Open *readfile* as file descriptor 3 for reading:74185 `exec 3< readfile`74186 Open *writefile* as file descriptor 4 for writing:74187 `exec 4> writefile`

74188 Make file descriptor 5 a copy of file descriptor 0:

74189 `exec 5<&0`

74190 Close file descriptor 3:

74191 `exec 3<&-`74192 Cat the file **maggie** by replacing the current shell with the *cat* utility:74193 `exec cat maggie`74194 **RATIONALE**

74195 Most historical implementations were not conformant in that:

74196 `foo=bar exec cmd`74197 did not pass **foo** to **cmd**.74198 **FUTURE DIRECTIONS**

74199 None.

74200 **SEE ALSO**74201 [Section 2.14](#) (on page 2334)74202 **CHANGE HISTORY**74203 **Issue 6**74204 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
74205 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
74206 behavior is intended.74207 **Issue 7**

74208 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

74209 **NAME**

74210 exit — cause the shell to exit

74211 **SYNOPSIS**74212 exit [*n*]74213 **DESCRIPTION**

74214 The *exit* utility shall cause the shell to exit with the exit status specified by the unsigned decimal  
 74215 integer *n*. If *n* is specified, but its value is not between 0 and 255 inclusively, the exit status is  
 74216 undefined.

74217 A *trap* on **EXIT** shall be executed before the shell terminates, except when the *exit* utility is  
 74218 invoked in that *trap* itself, in which case the shell shall exit immediately.

74219 **OPTIONS**

74220 None.

74221 **OPERANDS**

74222 See the DESCRIPTION.

74223 **STDIN**

74224 Not used.

74225 **INPUT FILES**

74226 None.

74227 **ENVIRONMENT VARIABLES**

74228 None.

74229 **ASYNCHRONOUS EVENTS**

74230 Default.

74231 **STDOUT**

74232 Not used.

74233 **STDERR**

74234 The standard error shall be used only for diagnostic messages.

74235 **OUTPUT FILES**

74236 None.

74237 **EXTENDED DESCRIPTION**

74238 None.

74239 **EXIT STATUS**

74240 The exit status shall be *n*, if specified. Otherwise, the value shall be the exit value of the last  
 74241 command executed, or zero if no command was executed. When *exit* is executed in a *trap* action,  
 74242 the last command is considered to be the command that executed immediately preceding the  
 74243 *trap* action.

74244 **CONSEQUENCES OF ERRORS**

74245 Default.

**exit***Shell Command Language*74246 **APPLICATION USAGE**

74247 None.

74248 **EXAMPLES**74249 Exit with a *true* value:74250 `exit 0`74251 Exit with a *false* value:74252 `exit 1`74253 **RATIONALE**74254 As explained in other sections, certain exit status values have been reserved for special uses and  
74255 should be used by applications only for those purposes:

74256 126 A file to be executed was found, but it was not an executable utility.

74257 127 A utility to be executed was not found.

74258 &gt;128 A command was interrupted by a signal.

74259 **FUTURE DIRECTIONS**

74260 None.

74261 **SEE ALSO**74262 [Section 2.14](#) (on page 2334)74263 **CHANGE HISTORY**74264 **Issue 6**74265 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
74266 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
74267 behavior is intended.

74268 **NAME**

74269 export — set the export attribute for variables

74270 **SYNOPSIS**

74271 export name [=word] . . .

74272 export -p

74273 **DESCRIPTION**74274 The shell shall give the *export* attribute to the variables corresponding to the specified *names*,  
74275 which shall cause them to be in the environment of subsequently executed commands. If the  
74276 name of a variable is followed by =*word*, then the value of that variable shall be set to *word*.74277 The *export* special built-in shall support XBD Section 12.2 (on page 215).74278 When **-p** is specified, *export* shall write to the standard output the names and values of all  
74279 exported variables, in the following format:

74280 "export %s=%s\n", &lt;name&gt;, &lt;value&gt;

74281 if *name* is set, and:

74282 "export %s\n", &lt;name&gt;

74283 if *name* is unset.74284 The shell shall format the output, including the proper use of quoting, so that it is suitable for  
74285 reinput to the shell as commands that achieve the same exporting results, except:

- 74286 1. Read-only variables with values cannot be reset.
- 
- 74287 2. Variables that were unset at the time they were output need not be reset to the unset state
- 
- 74288 if a value is assigned to the variable between the time the state was saved and the time at
- 
- 74289 which the saved output is reinput to the shell.

74290 When no arguments are given, the results are unspecified.

74291 **OPTIONS**

74292 See the DESCRIPTION.

74293 **OPERANDS**

74294 See the DESCRIPTION.

74295 **STDIN**

74296 Not used.

74297 **INPUT FILES**

74298 None.

74299 **ENVIRONMENT VARIABLES**

74300 None.

74301 **ASYNCHRONOUS EVENTS**

74302 Default.

74303 **STDOUT**

74304 See the DESCRIPTION.

74305 **STDERR**

74306 The standard error shall be used only for diagnostic messages.

**export**74307 **OUTPUT FILES**

74308 None.

74309 **EXTENDED DESCRIPTION**

74310 None.

74311 **EXIT STATUS**

74312 Zero.

74313 **CONSEQUENCES OF ERRORS**

74314 Default.

74315 **APPLICATION USAGE**

74316 None.

74317 **EXAMPLES**74318 Export *PWD* and *HOME* variables:74319 

```
export PWD HOME
```

74320 Set and export the *PATH* variable:74321 

```
export PATH=/local/bin:$PATH
```

74322 Save and restore all exported variables:

```
74323 export -p > temp-file
74324 unset a lot of variables
74325 ... processing
74326 . temp-file
```

74327 **RATIONALE**

74328 Some historical shells use the no-argument case as the functional equivalent of what is required  
 74329 here with **-p**. This feature was left unspecified because it is not historical practice in all shells,  
 74330 and some scripts may rely on the now-unspecified results on their implementations. Attempts to  
 74331 specify the **-p** output as the default case were unsuccessful in achieving consensus. The **-p**  
 74332 option was added to allow portable access to the values that can be saved and then later restored  
 74333 using; for example, a *dot* script.

74334 **FUTURE DIRECTIONS**

74335 None.

74336 **SEE ALSO**74337 [Section 2.14](#) (on page 2334)74338 [XBD Section 12.2](#) (on page 215)74339 **CHANGE HISTORY**74340 **Issue 6**

74341 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the format when a variable is unset.

74342 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
 74343 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
 74344 behavior is intended.

74345 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/6 is applied, adding the following text to  
 74346 the end of the first paragraph of the DESCRIPTION: "If the name of a variable is followed by  
 74347 =*word*, then the value of that variable shall be set to *word*". The reason for this change is that the  
 74348 SYNOPSIS for *export* includes:

74349        `export name [=word] . . .`

74350        but the meaning of the optional “=word” is never explained in the text.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**readonly**

Shell Command Language

74351 **NAME**

74352           readonly — set the readonly attribute for variables

74353 **SYNOPSIS**

74354           readonly name [=word] . . .

74355           readonly -p

74356 **DESCRIPTION**

74357           The variables whose *names* are specified shall be given the *readonly* attribute. The values of  
 74358           variables with the *readonly* attribute cannot be changed by subsequent assignment, nor can those  
 74359           variables be unset by the *unset* utility. If the name of a variable is followed by =*word*, then the  
 74360           value of that variable shall be set to *word*.

74361           The *readonly* special built-in shall support XBD [Section 12.2](#) (on page 215).

74362           When **-p** is specified, *readonly* writes to the standard output the names and values of all read-  
 74363           only variables, in the following format:

74364           "readonly %s=%s\n", &lt;name&gt;, &lt;value&gt;

74365           if *name* is set, and

74366           "readonly %s\n", &lt;name&gt;

74367           if *name* is unset.

74368           The shell shall format the output, including the proper use of quoting, so that it is suitable for  
 74369           reinput to the shell as commands that achieve the same value and *readonly* attribute-setting  
 74370           results in a shell execution environment in which:

- 74371           1. Variables with values at the time they were output do not have the *readonly* attribute set.
- 74372           2. Variables that were unset at the time they were output do not have a value at the time at  
 74373           which the saved output is reinput to the shell.

74374           When no arguments are given, the results are unspecified.

74375 **OPTIONS**

74376           See the DESCRIPTION.

74377 **OPERANDS**

74378           See the DESCRIPTION.

74379 **STDIN**

74380           Not used.

74381 **INPUT FILES**

74382           None.

74383 **ENVIRONMENT VARIABLES**

74384           None.

74385 **ASYNCHRONOUS EVENTS**

74386           Default.

74387 **STDOUT**

74388           See the DESCRIPTION.

74389 **STDERR**

74390 The standard error shall be used only for diagnostic messages.

74391 **OUTPUT FILES**

74392 None.

74393 **EXTENDED DESCRIPTION**

74394 None.

74395 **EXIT STATUS**

74396 Zero.

74397 **CONSEQUENCES OF ERRORS**

74398 Default.

74399 **APPLICATION USAGE**

74400 None.

74401 **EXAMPLES**74402 `readonly HOME PWD`74403 **RATIONALE**74404 Some historical shells preserve the *readonly* attribute across separate invocations. This volume of  
74405 POSIX.1-2008 allows this behavior, but does not require it.74406 The `-p` option allows portable access to the values that can be saved and then later restored  
74407 using, for example, a *dot* script. Also see the RATIONALE for *export* (on page 2349) for a  
74408 description of the no-argument and `-p` output cases and a related example.74409 Read-only functions were considered, but they were omitted as not being historical practice or  
74410 particularly useful. Furthermore, functions must not be read-only across invocations to preclude  
74411 “spoofing” (spoofing is the term for the practice of creating a program that acts like a well-  
74412 known utility with the intent of subverting the real intent of the user) of administrative or  
74413 security-relevant (or security-conscious) shell scripts.74414 **FUTURE DIRECTIONS**

74415 None.

74416 **SEE ALSO**74417 [Section 2.14](#) (on page 2334)74418 XBD [Section 12.2](#) (on page 215)74419 **CHANGE HISTORY**74420 **Issue 6**

74421 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the format when a variable is unset.

74422 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
74423 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
74424 behavior is intended.74425 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/7 is applied, adding the following text to  
74426 the end of the first paragraph of the DESCRIPTION: “If the name of a variable is followed by  
74427 `=word`, then the value of that variable shall be set to `word`.”. The reason for this change is that the  
74428 SYNOPSIS for *readonly* includes:

## readonly

*Shell Command Language*

74429        `readonly name [=word] . . .`

74430        but the meaning of the optional “=word” is never explained in the text.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

74431 **NAME**

74432 return — return from a function

74433 **SYNOPSIS**74434 return [*n*]74435 **DESCRIPTION**74436 The *return* utility shall cause the shell to stop executing the current function or *dot* script. If the  
74437 shell is not currently executing a function or *dot* script, the results are unspecified.74438 **OPTIONS**

74439 None.

74440 **OPERANDS**

74441 See the DESCRIPTION.

74442 **STDIN**

74443 Not used.

74444 **INPUT FILES**

74445 None.

74446 **ENVIRONMENT VARIABLES**

74447 None.

74448 **ASYNCHRONOUS EVENTS**

74449 Default.

74450 **STDOUT**

74451 Not used.

74452 **STDERR**

74453 The standard error shall be used only for diagnostic messages.

74454 **OUTPUT FILES**

74455 None.

74456 **EXTENDED DESCRIPTION**

74457 None.

74458 **EXIT STATUS**74459 The value of the special parameter '?' shall be set to *n*, an unsigned decimal integer, or to the  
74460 exit status of the last command executed if *n* is not specified. If the value of *n* is greater than 255,  
74461 the results are undefined. When *return* is executed in a *trap* action, the last command is  
74462 considered to be the command that executed immediately preceding the *trap* action.74463 **CONSEQUENCES OF ERRORS**

74464 Default.

74465 **APPLICATION USAGE**

74466 None.

74467 **EXAMPLES**

74468 None.

74469 **RATIONALE**74470 The behavior of *return* when not in a function or *dot* script differs between the System V shell  
74471 and the KornShell. In the System V shell this is an error, whereas in the KornShell, the effect is  
74472 the same as *exit*.

74473 The results of returning a number greater than 255 are undefined because of differing practices

**return***Shell Command Language*

74474 in the various historical implementations. Some shells AND out all but the low-order 8 bits;  
74475 others allow larger values, but not of unlimited size.

74476 See the discussion of appropriate exit status values under *exit* (on page 2347).

**74477 FUTURE DIRECTIONS**

74478 None.

**74479 SEE ALSO**

74480 [Section 2.14](#) (on page 2334)

**74481 CHANGE HISTORY****74482 Issue 6**

74483 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
74484 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
74485 behavior is intended.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

74486 **NAME**

74487 set — set or unset options and positional parameters

74488 **SYNOPSIS**74489 set [-abCefhmnvux] [-o *option*] [*argument...*]74490 set [+abCefhmnvux] [+o *option*] [*argument...*]74491 set -- [*argument...*]

74492 set -o

74493 set +o

74494 **DESCRIPTION**

74495 If no *options* or *arguments* are specified, *set* shall write the names and values of all shell variables  
 74496 in the collation sequence of the current locale. Each *name* shall start on a separate line, using the  
 74497 format:

74498 "%s=%s\n", &lt;name&gt;, &lt;value&gt;

74499 The *value* string shall be written with appropriate quoting; see the description of shell quoting in  
 74500 Section 2.2 (on page 2298). The output shall be suitable for reinput to the shell, setting or  
 74501 resetting, as far as possible, the variables that are currently set; read-only variables cannot be  
 74502 reset.

74503 When options are specified, they shall set or unset attributes of the shell, as described below.  
 74504 When *arguments* are specified, they cause positional parameters to be set or unset, as described  
 74505 below. Setting or unsetting attributes and positional parameters are not necessarily related  
 74506 actions, but they can be combined in a single invocation of *set*.

74507 The *set* special built-in shall support XBD Section 12.2 (on page 215) except that options can be  
 74508 specified with either a leading <hyphen> (meaning enable the option) or <plus-sign> (meaning  
 74509 disable it) unless otherwise specified.

74510 Implementations shall support the options in the following list in both their <hyphen> and  
 74511 <plus-sign> forms. These options can also be specified as options to *sh*.

74512 **-a** When this option is on, the *export* attribute shall be set for each variable to which an  
 74513 assignment is performed; see XBD Section 4.22 (on page 118). If the assignment precedes a  
 74514 utility name in a command, the *export* attribute shall not persist in the current execution  
 74515 environment after the utility completes, with the exception that preceding one of the special  
 74516 built-in utilities causes the *export* attribute to persist after the built-in has completed. If the  
 74517 assignment does not precede a utility name in the command, or if the assignment is a result  
 74518 of the operation of the *getopts* or *read* utilities, the *export* attribute shall persist until the  
 74519 variable is unset.

74520 **-b** This option shall be supported if the implementation supports the User Portability Utilities  
 74521 option. It shall cause the shell to notify the user asynchronously of background job  
 74522 completions. The following message is written to standard error:

74523 "[%d]c %s%s\n", &lt;job-number&gt;, &lt;current&gt;, &lt;status&gt;, &lt;job-name&gt;

74524 where the fields shall be as follows:

74525 <current> The character '+' identifies the job that would be used as a default for  
 74526 the *fg* or *bg* utilities; this job can also be specified using the *job\_id* "%+" or  
 74527 "%%". The character '-' identifies the job that would become the default  
 74528 if the current default job were to exit; this job can also be specified using  
 74529 the *job\_id* "%-". For other jobs, this field is a <space>. At most one job

- 74530 can be identified with '+' and at most one job can be identified with '-'.  
 74531 If there is any suspended job, then the current job shall be a suspended  
 74532 job. If there are at least two suspended jobs, then the previous job also  
 74533 shall be a suspended job.
- 74534 <job-number> A number that can be used to identify the process group to the *wait*, *fg*, *bg*,  
 74535 and *kill* utilities. Using these utilities, the job can be identified by prefixing  
 74536 the job number with '%'.  
 74537 <status> Unspecified.  
 74538 <job-name> Unspecified.
- 74539 When the shell notifies the user a job has been completed, it may remove the job's process  
 74540 ID from the list of those known in the current shell execution environment; see [Section](#)  
 74541 [2.9.3.1](#) (on page 2319). Asynchronous notification shall not be enabled by default.
- 74542 -C (Uppercase C.) Prevent existing files from being overwritten by the shell's '>' redirection  
 74543 operator (see [Section 2.7.2](#), on page 2313); the '>|' redirection operator shall override this  
 74544 *noclobber* option for an individual file.
- 74545 -e When this option is on, if a simple command fails for any of the reasons listed in [Section](#)  
 74546 [2.8.1](#) (on page 2315) or returns an exit status value >0, and is not part of the compound list  
 74547 following a **while**, **until**, or **if** keyword, and is not a part of an AND or OR list, and is not a  
 74548 pipeline preceded by the ! reserved word, then the shell shall immediately exit.
- 74549 -f The shell shall disable pathname expansion.
- 74550 -h Locate and remember utilities invoked by functions as those functions are defined (the  
 74551 utilities are normally located when the function is executed).
- 74552 -m This option shall be supported if the implementation supports the User Portability Utilities  
 74553 option. All jobs shall be run in their own process groups. Immediately before the shell issues  
 74554 a prompt after completion of the background job, a message reporting the exit status of the  
 74555 background job shall be written to standard error. If a foreground job stops, the shell shall  
 74556 write a message to standard error to that effect, formatted as described by the *jobs* utility. In  
 74557 addition, if a job changes status other than exiting (for example, if it stops for input or  
 74558 output or is stopped by a SIGSTOP signal), the shell shall write a similar message  
 74559 immediately prior to writing the next prompt. This option is enabled by default for  
 74560 interactive shells.
- 74561 -n The shell shall read commands but does not execute them; this can be used to check for  
 74562 shell script syntax errors. An interactive shell may ignore this option.
- 74563 -o Write the current settings of the options to standard output in an unspecified format.
- 74564 +o Write the current option settings to standard output in a format that is suitable for reinput  
 74565 to the shell as commands that achieve the same options settings.
- 74566 -o *option*  
 74567 This option is supported if the system supports the User Portability Utilities option. It shall  
 74568 set various options, many of which shall be equivalent to the single option letters. The  
 74569 following values of *option* shall be supported:
- 74570 *allexport* Equivalent to -a.  
 74571 *errexit* Equivalent to -e.

74572	<i>ignoreeof</i>	Prevent an interactive shell from exiting on end-of-file. This setting prevents accidental logouts when <control>-D is entered. A user shall explicitly <i>exit</i> to leave the interactive shell.
74573		
74574		
74575	<i>monitor</i>	Equivalent to <b>-m</b> . This option is supported if the system supports the User Portability Utilities option.
74576		
74577	<i>noclobber</i>	Equivalent to <b>-C</b> (uppercase C).
74578	<i>noglob</i>	Equivalent to <b>-f</b> .
74579	<i>noexec</i>	Equivalent to <b>-n</b> .
74580	<i>nolog</i>	Prevent the entry of function definitions into the command history; see <a href="#">Command History List</a> (on page 3167).
74581		
74582	<i>notify</i>	Equivalent to <b>-b</b> .
74583	<i>nounset</i>	Equivalent to <b>-u</b> .
74584	<i>verbose</i>	Equivalent to <b>-v</b> .
74585	<i>vi</i>	Allow shell command line editing using the built-in <i>vi</i> editor. Enabling <i>vi</i> mode shall disable any other command line editing mode provided as an implementation extension.
74586		
74587		
74588		It need not be possible to set <i>vi</i> mode on for certain block-mode terminals.
74589	<i>xtrace</i>	Equivalent to <b>-x</b> .
74590	<b>-u</b>	The shell shall write a message to standard error when it tries to expand a variable that is not set and immediately exit. An interactive shell shall not exit.
74591		
74592	<b>-v</b>	The shell shall write its input to standard error as it is read.
74593	<b>-x</b>	The shell shall write to standard error a trace for each command after it expands the command and before it executes it. It is unspecified whether the command that turns tracing off is traced.
74594		
74595		
74596		The default for all these options shall be off (unset) unless stated otherwise in the description of the option or unless the shell was invoked with them on; see <i>sh</i> .
74597		
74598		The remaining arguments shall be assigned in order to the positional parameters. The special parameter '#' shall be set to reflect the number of positional parameters. All positional parameters shall be unset before any new values are assigned.
74599		
74600		
74601		If the first argument is <b>'-'</b> , the results are unspecified.
74602		The special argument <b>"--"</b> immediately following the <i>set</i> command name can be used to delimit the arguments if the first argument begins with <b>'+'</b> or <b>'-'</b> , or to prevent inadvertent listing of all shell variables when there are no arguments. The command <i>set --</i> without <i>argument</i> shall unset all positional parameters and set the special parameter '#' to zero.
74603		
74604		
74605		
74606	<b>OPTIONS</b>	
74607		See the DESCRIPTION.
74608	<b>OPERANDS</b>	
74609		See the DESCRIPTION.

**set**74610 **STDIN**

74611 Not used.

74612 **INPUT FILES**

74613 None.

74614 **ENVIRONMENT VARIABLES**

74615 None.

74616 **ASYNCHRONOUS EVENTS**

74617 Default.

74618 **STDOUT**

74619 See the DESCRIPTION.

74620 **STDERR**

74621 The standard error shall be used only for diagnostic messages.

74622 **OUTPUT FILES**

74623 None.

74624 **EXTENDED DESCRIPTION**

74625 None.

74626 **EXIT STATUS**

74627 Zero.

74628 **CONSEQUENCES OF ERRORS**

74629 Default.

74630 **APPLICATION USAGE**

74631 None.

74632 **EXAMPLES**

74633 Write out all variables and their values:

74634 `set`

74635 Set \$1, \$2, and \$3 and set "\$#" to 3:

74636 `set c a b`74637 Turn on the `-x` and `-v` options:74638 `set -xv`

74639 Unset all positional parameters:

74640 `set --`74641 Set \$1 to the value of `x`, even if it begins with `'-'` or `'+'`:74642 `set -- "$x"`74643 Set the positional parameters to the expansion of `x`, even if `x` expands with a leading `'-'` or `'+'`:74644 `set -- $x`74645 **RATIONALE**

74646 The `set --` form is listed specifically in the SYNOPSIS even though this usage is implied by the  
 74647 Utility Syntax Guidelines. The explanation of this feature removes any ambiguity about whether  
 74648 the `set --` form might be misinterpreted as being equivalent to `set` without any options or  
 74649 arguments. The functionality of this form has been adopted from the KornShell. In System V, `set`

74650 -- only unsets parameters if there is at least one argument; the only way to unset all parameters  
 74651 is to use *shift*. Using the KornShell version should not affect System V scripts because there  
 74652 should be no reason to issue it without arguments deliberately; if it were issued as, for example:

```
74653 set -- "$@"
```

74654 and there were in fact no arguments resulting from "\$@", unsetting the parameters would have  
 74655 no result.

74656 The *set +* form in early proposals was omitted as being an unnecessary duplication of *set* alone  
 74657 and not widespread historical practice.

74658 The *noclobber* option was changed to allow *set -C* as well as the *set -o noclobber* option. The  
 74659 single-letter version was added so that the historical "\$-" paradigm would not be broken; see  
 74660 [Section 2.5.2](#) (on page 2302).

74661 The *-h* flag is related to command name hashing. See *hash* (on page 2788).

74662 The following *set* flags were omitted intentionally with the following rationale:

74663 **-k** The *-k* flag was originally added by the author of the Bourne shell to make it easier for  
 74664 users of pre-release versions of the shell. In early versions of the Bourne shell the construct  
 74665 *set name=value* had to be used to assign values to shell variables. The problem with *-k* is  
 74666 that the behavior affects parsing, virtually precluding writing any compilers. To explain the  
 74667 behavior of *-k*, it is necessary to describe the parsing algorithm, which is implementation-  
 74668 defined. For example:

```
74669 set -k; echo name=value
```

74670 and:

```
74671 set -k  
74672 echo name=value
```

74673 behave differently. The interaction with functions is even more complex. What is more, the  
 74674 *-k* flag is never needed, since the command line could have been reordered.

74675 **-t** The *-t* flag is hard to specify and almost never used. The only known use could be done  
 74676 with here-documents. Moreover, the behavior with *ksh* and *sh* differs. The reference page  
 74677 says that it exits after reading and executing one command. What is one command? If the  
 74678 input is *date:date*, *sh* executes both *date* commands while *ksh* does only the first.

74679 Consideration was given to rewriting *set* to simplify its confusing syntax. A specific suggestion  
 74680 was that the *unset* utility should be used to unset options instead of using the non-*getopt*(-)-able  
 74681 *+option* syntax. However, the conclusion was reached that the historical practice of using *+option*  
 74682 was satisfactory and that there was no compelling reason to modify such widespread historical  
 74683 practice.

74684 The *-o* option was adopted from the KornShell to address user needs. In addition to its  
 74685 generally friendly interface, *-o* is needed to provide the *vi* command line editing mode, for  
 74686 which historical practice yields no single-letter option name. (Although it might have been  
 74687 possible to invent such a letter, it was recognized that other editing modes would be developed  
 74688 and *-o* provides ample name space for describing such extensions.)

74689 Historical implementations are inconsistent in the format used for *-o* option status reporting.  
 74690 The *+o* format without an option-argument was added to allow portable access to the options  
 74691 that can be saved and then later restored using, for instance, a dot script.

74692 Historically, *sh* did trace the command *set +x*, but *ksh* did not.

- 74693 The *ignoreof* setting prevents accidental logouts when the end-of-file character (typically  
74694 <control>-D) is entered. A user shall explicitly *exit* to leave the interactive shell.
- 74695 The *set -m* option was added to apply only to the UPE because it applies primarily to interactive  
74696 use, not shell script applications.
- 74697 The ability to do asynchronous notification became available in the 1988 version of the  
74698 KornShell. To have it occur, the user had to issue the command:
- 74699 `trap "jobs -n" CLD`
- 74700 The C shell provides two different levels of an asynchronous notification capability. The  
74701 environment variable *notify* is analogous to what is done in *set -b* or *set -o notify*. When set, it  
74702 notifies the user immediately of background job completions. When unset, this capability is  
74703 turned off.
- 74704 The other notification ability comes through the built-in utility *notify*. The syntax is:
- 74705 `notify [%job ... ]`
- 74706 By issuing *notify* with no operands, it causes the C shell to notify the user asynchronously when  
74707 the state of the current job changes. If given operands, *notify* asynchronously informs the user of  
74708 changes in the states of the specified jobs.
- 74709 To add asynchronous notification to the POSIX shell, neither the KornShell extensions to *trap*,  
74710 nor the C shell *notify* environment variable seemed appropriate (*notify* is not a proper POSIX  
74711 environment variable name).
- 74712 The *set -b* option was selected as a compromise.
- 74713 The *notify* built-in was considered to have more functionality than was required for simple  
74714 asynchronous notification.
- 74715 **FUTURE DIRECTIONS**
- 74716 None.
- 74717 **SEE ALSO**
- 74718 [Section 2.14](#) (on page 2334), [hash](#)
- 74719 [XBD Section 4.22](#) (on page 118), [Section 12.2](#) (on page 215)
- 74720 **CHANGE HISTORY**
- 74721 **Issue 6**
- 74722 The obsolescent *set* command name followed by ' - ' has been removed.
- 74723 The following new requirements on POSIX implementations derive from alignment with the  
74724 Single UNIX Specification:
- 74725 • The *nolog* option is added to *set -o*.
- 74726 IEEE PASC Interpretation 1003.2 #167 is applied, clarifying that the options default also takes  
74727 into account the description of the option.
- 74728 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
74729 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
74730 behavior is intended.
- 74731 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/8 is applied, changing the square  
74732 brackets in the example in RATIONALE to be in bold, which is the typeface used for optional  
74733 items.

74734 **Issue 7**

74735 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first  
74736 argument is ' -' .

74737 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

74738 XSI shading is removed from the -h functionality.

**shift***Shell Command Language*74739 **NAME**

74740 shift — shift positional parameters

74741 **SYNOPSIS**74742 shift [*n*]74743 **DESCRIPTION**

74744 The positional parameters shall be shifted. Positional parameter 1 shall be assigned the value of  
 74745 parameter (1+*n*), parameter 2 shall be assigned the value of parameter (2+*n*), and so on. The  
 74746 parameters represented by the numbers "\$#" down to "\$#-*n*+1" shall be unset, and the  
 74747 parameter '#' is updated to reflect the new number of positional parameters.

74748 The value *n* shall be an unsigned decimal integer less than or equal to the value of the special  
 74749 parameter '#'. If *n* is not given, it shall be assumed to be 1. If *n* is 0, the positional and special  
 74750 parameters are not changed.

**times**

Shell Command Language

74793 **NAME**74794 `times` — write process times74795 **SYNOPSIS**74796 `times`74797 **DESCRIPTION**74798 The *times* utility shall write the accumulated user and system times for the shell and for all of its  
74799 child processes, in the following POSIX locale format:74800 "%dm%fs %dm%fs\n%dm%fs %dm%fs\n", <shell user minutes>,  
74801 <shell user seconds>, <shell system minutes>,  
74802 <shell system seconds>, <children user minutes>,  
74803 <children user seconds>, <children system minutes>,  
74804 <children system seconds>74805 The four pairs of times shall correspond to the members of the <sys/times.h> `tms` structure  
74806 (defined in XBD Chapter 13, on page 219) as returned by `times()`: `tms_utime`, `tms_stime`,  
74807 `tms_cutime`, and `tms_cstime`, respectively.74808 **OPTIONS**

74809 None.

74810 **OPERANDS**

74840 shells.74841 **FUTURE DIRECTIONS**

74842 None.

74843 **SEE ALSO**74844 [Section 2.14](#) (on page 2334)74845 XBD [<sys/times.h>](#)74846 **CHANGE HISTORY**74847 **Issue 6**74848 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/9 is applied, changing text in the  
74849 DESCRIPTION from: "Write the accumulated user and system times for the shell and for all of  
74850 its child processes ..." to: "The *times* utility shall write the accumulated user and system times for  
74851 the shell and for all of its child processes ...".

**trap**

Shell Command Language

74852 **NAME**

74853 trap — trap signals

74854 **SYNOPSIS**

```
74855 trap n [condition...]
74856 trap [action condition...]
```

74857 **DESCRIPTION**

74858 If the first operand is an unsigned decimal integer, the shell shall treat all operands as  
 74859 conditions, and shall reset each condition to the default value. Otherwise, if there are operands,  
 74860 the first is treated as an action and the remaining as conditions.

74861 If *action* is '-', the shell shall reset each *condition* to the default value. If *action* is null (" "), the  
 74862 shell shall ignore each specified *condition* if it arises. Otherwise, the argument *action* shall be read  
 74863 and executed by the shell when one of the corresponding conditions arises. The action of *trap*  
 74864 shall override a previous action (either default action or one explicitly set). The value of "\$?"  
 74865 after the *trap* action completes shall be the value it had before *trap* was invoked.

74866 The condition can be EXIT, 0 (equivalent to EXIT), or a signal specified using a symbolic name,  
 74867 without the SIG prefix, as listed in the tables of signal names in the <signal.h> header defined in  
 74868 XBD Chapter 13 (on page 219); for example, HUP, INT, QUIT, TERM. Implementations may  
 74869 permit names with the SIG prefix or ignore case in signal names as an extension. Setting a trap  
 74870 for SIGKILL or SIGSTOP produces undefined results.

74871 The environment in which the shell executes a *trap* on EXIT shall be identical to the environment  
 74872 immediately after the last command executed before the *trap* on EXIT was taken.

74873 Each time *trap* is invoked, the *action* argument shall be processed in a manner equivalent to:

```
74874 eval action
```

74875 Signals that were ignored on entry to a non-interactive shell cannot be trapped or reset, although  
 74876 no error need be reported when attempting to do so. An interactive shell may reset or catch  
 74877 signals ignored on entry. Traps shall remain in place for a given shell until explicitly changed  
 74878 with another *trap* command.

74879 When a subshell is entered, traps that are not being ignored are set to the default actions. This  
 74880 does not imply that the *trap* command cannot be used within the subshell to set new traps.

74881 The *trap* command with no arguments shall write to standard output a list of commands  
 74882 associated with each condition. The format shall be:

```
74883 "trap -- %s %s ...\n", <action>, <condition> ...
```

74884 The shell shall format the output, including the proper use of quoting, so that it is suitable for  
 74885 reinput to the shell as commands that achieve the same trapping results. For example:

```
74886 save_traps=$(trap)
74887 ...
74888 eval "$save_traps"
```

74889 XSI  
 74890 XSI-conformant systems also allow numeric signal numbers for the conditions corresponding to  
 the following signal names:

```
74891 1  SIGHUP
74892 2  SIGINT
74893 3  SIGQUIT
```

74894	6	SIGABRT
74895	9	SIGKILL
74896	14	SIGALRM
74897	15	SIGTERM

74898 The *trap* special built-in shall conform to XBD [Section 12.2](#) (on page 215).

#### 74899 OPTIONS

74900 None.

#### 74901 OPERANDS

74902 See the DESCRIPTION.

#### 74903 STDIN

74904 Not used.

#### 74905 INPUT FILES

74906 None.

#### 74907 ENVIRONMENT VARIABLES

74908 None.

#### 74909 ASYNCHRONOUS EVENTS

74910 Default.

#### 74911 STDOUT

74912 See the DESCRIPTION.

#### 74913 STDERR

74914 The standard error shall be used only for diagnostic messages.

#### 74915 OUTPUT FILES

74916 None.

#### 74917 EXTENDED DESCRIPTION

74918 None.

#### 74919 EXIT STATUS

74920 XSI If the trap name or number is invalid, a non-zero exit status shall be returned; otherwise, zero  
 74921 XSI shall be returned. For both interactive and non-interactive shells, invalid signal names or  
 74922 numbers shall not be considered a syntax error and do not cause the shell to abort.

#### 74923 CONSEQUENCES OF ERRORS

74924 Default.

#### 74925 APPLICATION USAGE

74926 None.

#### 74927 EXAMPLES

74928 Write out a list of all traps and actions:

74929 trap

74930 Set a trap so the *logout* utility in the directory referred to by the *HOME* environment variable  
 74931 executes when the shell terminates:

74932 trap '\$HOME/logout' EXIT

74933 or:

**trap**

74934 `trap '$HOME/logout' 0`

74935 Unset traps on INT, QUIT, TERM, and EXIT:

74936 `trap - INT QUIT TERM EXIT`

74937 **RATIONALE**

74938 Implementations may permit lowercase signal names as an extension. Implementations may  
74939 also accept the names with the SIG prefix; no known historical shell does so. The *trap* and *kill*  
74940 utilities in this volume of POSIX.1-2008 are now consistent in their omission of the SIG prefix for  
74941 signal names. Some *kill* implementations do not allow the prefix, and *kill -l* lists the signals  
74942 without prefixes.

74943 Trapping SIGKILL or SIGSTOP is syntactically accepted by some historical implementations, but  
74944 it has no effect. Portable POSIX applications cannot attempt to trap these signals.

74945 The output format is not historical practice. Since the output of historical *trap* commands is not  
74946 portable (because numeric signal values are not portable) and had to change to become so, an  
74947 opportunity was taken to format the output in a way that a shell script could use to save and  
74948 then later reuse a trap if it wanted.

74949 The KornShell uses an **ERR** trap that is triggered whenever *set -e* would cause an exit. This is  
74950 allowable as an extension, but was not mandated, as other shells have not used it.

74951 The text about the environment for the EXIT trap invalidates the behavior of some historical  
74952 versions of interactive shells which, for example, close the standard input before executing a  
74953 trap on 0. For example, in some historical interactive shell sessions the following trap on 0  
74954 would always print "--":

74955 `trap 'read foo; echo "$foo"' 0`

74956 The command:

74957 `trap '$cmd' 0`

74958 causes the contents of the shell variable *cmd* to be executed as a command when the shell exits.  
74959 Using double-quotes instead of single-quotes might have unexpected behavior, since in theory  
74960 the value of *cmd* might be a decimal integer which would be treated as a condition, not an  
74961 action; or *cmd* might begin with '-'. Also, using double-quotes will cause the value of *cmd* to be  
74962 expanded twice, once when *trap* is executed, and once when the condition arises.

74963 **FUTURE DIRECTIONS**

74964 None.

74965 **SEE ALSO**

74966 [Section 2.14](#) (on page 2334)

74967 [XBD Section 12.2](#) (on page 215), [<signal.h>](#)

74968 **CHANGE HISTORY**

74969 **Issue 6**

74970 XSI-conforming implementations provide the mapping of signal names to numbers given above  
74971 (previously this had been marked obsolescent). Other implementations need not provide this  
74972 optional mapping.

74973 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
74974 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
74975 behavior is intended.

74976 **Issue 7**

74977 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

74978 Austin Group Interpretation 1003.1-2001 #116 is applied.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**unset**74979 **NAME**

74980           unset — unset values and attributes of variables and functions

74981 **SYNOPSIS**74982           unset [-fv] *name*...74983 **DESCRIPTION**74984           Each variable or function specified by *name* shall be unset.74985           If **-v** is specified, *name* refers to a variable name and the shell shall unset it and remove it from  
74986           the environment. Read-only variables cannot be unset.74987           If **-f** is specified, *name* refers to a function and the shell shall unset the function definition.74988           If neither **-f** nor **-v** is specified, *name* refers to a variable; if a variable by that name does not  
74989           exist, it is unspecified whether a function by that name, if any, shall be unset.74990           Unsetting a variable or function that was not previously set shall not be considered an error and  
74991           does not cause the shell to abort.74992           The *unset* special built-in shall support XBD [Section 12.2](#) (on page 215).

74993           Note that:

74994           VARIABLE=

74995           is not equivalent to an *unset* of **VARIABLE**; in the example, **VARIABLE** is set to ". Also, the  
74996           variables that can be *unset* should not be misinterpreted to include the special parameters (see  
74997           [Section 2.5.2](#), on page 2302).74998 **OPTIONS**

74999           See the DESCRIPTION.

75000 **OPERANDS**

75001           See the DESCRIPTION.

75002 **STDIN**

75003           Not used.

75004 **INPUT FILES**

75005           None.

75006 **ENVIRONMENT VARIABLES**

75007           None.

75008 **ASYNCHRONOUS EVENTS**

75009           Default.

75010 **STDOUT**

75011           Not used.

75012 **STDERR**

75013           The standard error shall be used only for diagnostic messages.

75014 **OUTPUT FILES**

75015           None.

75016 **EXTENDED DESCRIPTION**

75017           None.

75018 **EXIT STATUS**75019           0 All *name* operands were successfully unset.75020           >0 At least one *name* could not be unset.75021 **CONSEQUENCES OF ERRORS**

75022           Default.

75023 **APPLICATION USAGE**

75024           None.

75025 **EXAMPLES**75026           Unset *VISUAL* variable:

75027           unset -v VISUAL

75028           Unset the functions **foo** and **bar**:

75029           unset -f foo bar

75030 **RATIONALE**75031           Consideration was given to omitting the `-f` option in favor of an *unfunction* utility, but the  
75032           standard developers decided to retain historical practice.75033           The `-v` option was introduced because System V historically used one name space for both  
75034           variables and functions. When *unset* is used without options, System V historically unset either a  
75035           function or a variable, and there was no confusion about which one was intended. A portable  
75036           POSIX application can use *unset* without an option to unset a variable, but not a function; the `-f`  
75037           option must be used.75038 **FUTURE DIRECTIONS**

75039           None.

75040 **SEE ALSO**75041           [Section 2.14](#) (on page 2334)75042           XBD [Section 12.2](#) (on page 215)75043 **CHANGE HISTORY**75044 **Issue 6**75045           IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page  
75046           sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in  
75047           behavior is intended.75048 **Issue 7**

75049           SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

75050

Chapter 3

75051

**Batch Environment Services**

75052 OB BE

This chapter describes the services and utilities that shall be implemented on all systems that claim conformance to the Batch Environment Services and Utilities option. The functionality described in this section shall be provided on implementations that support the Batch Environment Services and Utilities option (and the rest of this section is not further shaded for this option).

75055

75056

Note that the Batch Environment Services and Utilities option is marked obsolescent in Issue 7.

75058

**3.1 General Concepts**

75059

**3.1.1 Batch Client-Server Interaction**

75060

Batch jobs are created and managed by batch servers. A batch client interacts with a batch server to access batch services on behalf of the user. In order to use batch services, a user must have access to a batch client.

75061

75062

75063

A batch server is a computational entity, such as a daemon process, that provides batch services. Batch servers route, queue, modify, and execute batch jobs on behalf of batch clients.

75064

75065

The batch utilities described in this volume of POSIX.1-2008 (and listed in [Table 3-1](#)) are clients of batch services; they allow users to perform actions on the job such as creating, modifying, and deleting batch jobs from a shell command line. Although these batch utilities may be said to accomplish certain services, they actually obtain services on behalf of a user by means of requests to batch servers.

75066

75067

75068

75069

75070

**Table 3-1** Batch Utilities

75071

*qalter*    *qmove*    *qrls*    *qstat*

75072

*qdel*    *qmsg*    *qselect*    *qsub*

75073

*qhold*    *qrerun*    *qsig*

75074

Client-server interaction takes place by means of the batch requests defined in this chapter.

75075

Because direct access to batch jobs and queues is limited to batch servers, clients and servers of different implementations can interoperate, since dependencies on private structures for batch jobs and queues are limited to batch servers. Also, batch servers may be clients of other batch servers.

75076

75077

75078

75079 **3.1.2 Batch Queues**

75080 Two types of batch queue are described: routing queues and execution queues. When a batch job  
75081 is placed in a routing queue, it is a candidate for routing. A batch job is removed from routing  
75082 queues under the following conditions:

- 75083 • The batch job has been routed to another queue.
- 75084 • The batch job has been deleted from the batch queue.
- 75085 • The batch job has been aborted.

75086 When a batch job is placed in an execution queue, it is a candidate for execution.

75087 A batch job is removed from an execution queue under the following conditions:

- 75088 • The batch job has been executed and exited.
- 75089 • The batch job has been aborted.
- 75090 • The batch job has been deleted from the batch queue.
- 75091 • The batch job has been moved to another queue.

75092 Access to a batch queue is limited to the batch server that manages the batch queue. Clients  
75093 never access a batch queue or a batch job directly, either to read or write information; all client  
75094 access to batch queues or jobs takes place through batch servers.

75095 **3.1.3 Batch Job Creation**

75096 When a batch server creates a batch job on behalf of a client, it shall assign a batch job identifier  
75097 to the job. A batch job identifier consists of both a sequence number that is unique among the  
75098 sequence numbers issued by that server and the name of the server. Since the batch server name  
75099 is unique within a name space, the job identifier is likewise unique within the name space.

75100 The batch server that creates a batch job shall return the batch server-assigned job identifier to  
75101 the client that requested the job creation. If the batch server routes or moves the job to another  
75102 server, it sends the job identifier with the job. Once assigned, the job identifier of a batch job  
75103 shall never change.

75104 **3.1.4 Batch Job Tracking**

75105 Since a batch job may be moved after creation, the batch server name component of the job  
75106 identifier need not indicate the location of the job. An implementation may provide a batch job  
75107 tracking mechanism, in which case the user generally does not need to know the location of the  
75108 job. However, an implementation need not provide a batch job tracking mechanism, in which  
75109 case the user must find routed jobs by probing the possible destinations.

75110 **3.1.5 Batch Job Routing**

75111 To route a batch job, a batch server either moves the job to some other queue that is managed by  
75112 the batch server, or requests that some other batch server accept the job.

75113 Each routing queue has one or more queues to which it can route batch jobs. The batch server  
75114 administrator creates routing queues.

75115 A batch server may route a batch job from a routing queue to another routing queue. Batch  
75116 servers shall prevent or otherwise handle cases of circular routing paths. As a deferred service, a  
75117 batch server routes jobs from the routing queues that it manages. The algorithm by which a  
75118 batch server selects a batch queue to which to route a batch job is implementation-defined.

75119 A batch job need not be eligible for routing to all the batch queues fed by the routing queue from  
75120 which it is routed. A batch server that has been asked to accept the job may reject the request if  
75121 the job requires resources that are unavailable to that batch server, or if the client is not  
75122 authorized to access the batch server.

75123 Batch servers may route high-priority jobs before low-priority jobs, but, on other than  
75124 overloaded systems, the effect may be imperceptible to the user. If all the batch servers fed by a  
75125 routing queue reject requests to accept the job for reasons that are permanent, the batch server  
75126 that manages the job shall abort the job. If all or some rejections are temporary, the batch server  
75127 should try to route the job again at some later point.

75128 The reasons for rejecting a batch job are implementation-defined.

75129 The reasons for which the routing should be retried later and the reasons for which the job  
75130 should be aborted are also implementation-defined.

75131 **3.1.6 Batch Job Execution**

75132 To execute a batch job is to create a session leader (a process) that runs the shell program  
75133 indicated by the *Shell\_Path* attribute of the job. The script shall be passed to the program as its  
75134 standard input. An implementation may pass the script to the program by other  
75135 implementation-defined means. At the time a batch job begins execution, it is defined to enter  
75136 the RUNNING state. The primary program that is executed by a batch job is typically, though  
75137 not necessarily, a shell program.

75138 A batch server shall execute eligible jobs as a deferred service—no client request is necessary  
75139 once the batch job is created and eligible. However, the attributes of a batch job, such as the job  
75140 hold type, may render the job ineligible. A batch server shall scan the execution queues that it  
75141 manages for jobs that are eligible for execution. The algorithm by which the batch server selects  
75142 eligible jobs for execution is implementation-defined.

75143 As part of creating the process for the batch job, the batch server shall open the standard output  
75144 and standard error streams of the session.

75145 The attributes of a batch job may indicate that the batch server executing the job shall send mail  
75146 to a list of users at the time it begins execution of the job.

75147 **3.1.7 Batch Job Exit**

75148 When the session leader of an executing job terminates, the job exits. As part of exiting a batch  
 75149 job, the batch server that manages the job shall remove the job from the batch queue in which it  
 75150 resides. The server shall transfer output files of the job to a location described by the attributes of  
 75151 the job.

75152 The attributes of a batch job may indicate that the batch server managing the job shall send mail  
 75153 to a list of users at the time the job exits.

75154 **3.1.8 Batch Job Abort**

75155 A batch server shall abort jobs for which a required deferred service cannot be performed. The  
 75156 attributes of a batch job may indicate that the batch server that aborts the job shall send mail to a  
 75157 list of users at the time it aborts the job.

75158 **3.1.9 Batch Authorization**

75159 Clients, such as the batch environment utilities (marked BE), access batch services by means of  
 75160 requests to one or more batch servers. To acquire the services of any given batch server, the user  
 75161 identifier under which the client runs must be authorized to use that batch server.

75162 The user with an associated user name that creates a batch job shall own the job and can perform  
 75163 actions such as read, modify, delete, and move.

75164 A user identifier of the same value at a different host need not be the same user. For example,  
 75165 user name *smith* at host **alpha** may or may not represent the same person as user name *smith* at  
 75166 host **beta**. Likewise, the same person may have access to different user names on different hosts.

75167 An implementation may optionally provide an authorization mechanism that permits one user  
 75168 name to access jobs under another user name.

75169 A process on a client host may be authorized to run processes under multiple user names at a  
 75170 batch server host. Where appropriate, the utilities defined in this volume of POSIX.1-2008  
 75171 provide a means for a user to choose from among such user names when creating or modifying  
 75172 a batch job.

75173 **3.1.10 Batch Administration**

75174 The processing of a batch job by a batch server is affected by the attributes of the job. The  
 75175 processing of a batch job may also be affected by the attributes of the batch queue in which the  
 75176 job resides and by the status of the batch server that manages the job. See also XBD [Chapter 3](#)  
 75177 (on page 33) for batch definitions.

75178 **3.1.11 Batch Notification**

75179 Whereas batch servers are persistent entities, clients are often transient. For example, the *qsub*  
 75180 utility creates a batch job and exits. For this reason, batch servers notify users of batch job events  
 75181 by sending mail to the user that owns the job, or to other designated users.

75182 **3.2 Batch Services**

75183 The presence of Batch Environment Services and Utilities option services is indicated by the  
 75184 configuration variable `POSIX2_PBS`. A conforming batch server provides services as defined in  
 75185 this section.

75186 A batch server shall provide batch services in two ways:

- 75187 1. The batch server provides a service at the request of a client.
- 75188 2. The batch server provides a deferred service as a result of a change in conditions  
 75189 monitored by the batch server.

75190 If a batch server cannot complete a request, it shall reject the request. If a batch server cannot  
 75191 complete a deferred service for a batch job, the batch server shall abort the batch job. [Table 3-2](#)  
 75192 is a summary of environment variables that shall be supported by an implementation of the batch  
 75193 server and utilities.

75194 **Table 3-2** Environment Variable Summary

Variable	Description
<code>PBS_DPREFIX</code>	Defines the directive prefix (see <i>qsub</i> )
<code>PBS_ENVIRONMENT</code>	Batch Job is batch or interactive (see <a href="#">Section 3.2.2.1</a> )
<code>PBS_JOBID</code>	The <i>job_identifier</i> attribute of job (see <a href="#">Section 3.2.3.8</a> )
<code>PBS_JOBNAME</code>	The <i>job_name</i> attribute of job (see <a href="#">Section 3.2.3.8</a> )
<code>PBS_O_HOME</code>	Defines the <i>HOME</i> of the batch client (see <i>qsub</i> )
<code>PBS_O_HOST</code>	Defines the host name of the batch client (see <i>qsub</i> )
<code>PBS_O_LANG</code>	Defines the <i>LANG</i> of the batch client (see <i>qsub</i> )
<code>PBS_O_LOGNAME</code>	Defines the <i>LOGNAME</i> of the batch client (see <i>qsub</i> )
<code>PBS_O_MAIL</code>	Defines the <i>MAIL</i> of the batch client (see <i>qsub</i> )
<code>PBS_O_PATH</code>	Defines the <i>PATH</i> of the batch client (see <i>qsub</i> )
<code>PBS_O_QUEUE</code>	Defines the submit queue of the batch client (see <i>qsub</i> )
<code>PBS_O_SHELL</code>	Defines the <i>SHELL</i> of the batch client (see <i>qsub</i> )
<code>PBS_O_TZ</code>	Defines the <i>TZ</i> of the batch client (see <i>qsub</i> )
<code>PBS_O_WORKDIR</code>	Defines the working directory of the batch client (see <i>qsub</i> )
<code>PBS_QUEUE</code>	Defines the initial execution queue (see <a href="#">Section 3.2.2.1</a> )

75211 **3.2.1 Batch Job States**

75212 A batch job shall always be in one of the following states: QUEUED, RUNNING, HELD,  
75213 WAITING, EXITING, or TRANSITING. The state of a batch job determines the types of requests  
75214 that the batch server that manages the batch job can accept for the batch job. A batch server shall  
75215 change the state of a batch job either in response to service requests from clients or as a result of  
75216 deferred services, such as job execution or job routing.

75217 A batch job that is in the QUEUED state resides in a queue but is still pending either execution  
75218 or routing, depending on the queue type.

75219 A batch server that queues a batch job in a routing queue shall put the batch job in the QUEUED  
75220 state. A batch server that puts a batch job in an execution queue, but has not yet executed the  
75221 batch job, shall put the batch job in the QUEUED state. A batch job that resides in an execution  
75222 queue and is executing is defined to be in the RUNNING state. While a batch job is in the  
75223 RUNNING state, a session leader is associated with the batch job.

75224 A batch job that resides in an execution queue, but is ineligible to run because of a hold attribute,  
75225 is defined to be in the HELD state.

75226 A batch job that is not held, but must wait until a future date and time before executing, is  
75227 defined to be in the WAITING state.

75228 When the session leader associated with a running job exits, the batch job shall be placed in the  
75229 EXITING state.

75230 A batch job for which the session leader has terminated is defined to be in the EXITING state,  
75231 and the batch server that manages such a batch job cannot accept job modification requests that  
75232 affect the batch job. While a batch job is in the EXITING state, the batch server that manages the  
75233 batch job is staging output files and notifying clients of job completion. Once a batch job has  
75234 exited, it no longer exists as an object managed by a batch server.

75235 A batch job that is being moved from a routing queue to another queue is defined to be in the  
75236 TRANSITING state.

75237 When a batch job in a routing queue has been selected to be moved to a new destination, then  
75238 the batch job shall be in either the QUEUED state or the TRANSITING state, depending on the  
75239 batch server implementation.

75240 Batch jobs with either an *Execution\_Time* attribute value set in the future or a *Hold\_Types* attribute  
75241 of value not equal to NO\_HOLD, or both, may be routed or held in the routing queue. The  
75242 treatment of jobs with the *Execution\_Time* or *Hold\_Types* attributes in a routing queue is  
75243 implementation-defined.

75244 When a batch job in a routing queue has not been selected to be moved to a new destination and  
75245 the batch job has a *Hold\_Types* attribute value of other than NO\_HOLD, then the job should be in  
75246 the HELD state.

75247 **Note:** The effect of a hold upon a batch job in a routing queue is implementation-defined. The  
75248 implementation should use the state that matches whether the batch job can route with a hold  
75249 or not.

75250 When a batch job in a routing queue has not been selected to be moved to a new destination and  
75251 the batch job has:

- 75252 • A *Hold\_Types* attribute value of NO\_HOLD
- 75253 • An *Execution\_Time* attribute in the past

75254 then the batch job shall be in the QUEUED state.

75255 When a batch job in a routing queue has not been selected to be moved to a new destination and  
75256 the batch job has:

- 75257 • A *Hold\_Types* attribute value of NO\_HOLD
- 75258 • An *Execution\_Time* attribute in the future

75259 then the batch job may be in the WAITING state.

75260 **Note:** The effect of a future execution time upon a batch job in a routing queue is implementation-  
75261 defined. The implementation should use the state that matches whether the batch job can route  
75262 with a hold or not.

75263 [Table 3-3](#) describes the next state of a batch job, given the current state of the batch job and the  
75264 type of request. [Table 3-4](#) (on page 2383) describes the response of a batch server to a request,  
75265 given the current state of the batch job and the type of request.

### 75266 3.2.2 Deferred Batch Services

75267 This section describes the deferred services performed by batch servers: job execution, job  
75268 routing, job exit, job abort, and the rerunning of jobs after a restart.

#### 75269 3.2.2.1 Batch Job Execution

75270 To execute a batch job is to create a session leader (a process) that runs the shell program  
75271 indicated by the *Shell\_Path\_List* attribute of the batch job. The script is passed to the program as  
75272 its standard input. An implementation may pass the script to the program by other  
75273 implementation-defined means. At the time a batch job begins execution, it is defined to enter  
75274 the RUNNING state.

75275 **Table 3-3** Next State Table

Request Type	Current State						
	X	Q	R	H	W	E	T
Queue Batch Job Request	Q	e	e	e	e	e	e
Modify Batch Job Request	e	Q	R	H	W	e	T
Delete Batch Job Request	e	X	E	X	X	E	X
Batch Job Message Request	e	Q	R	H	W	E	T
Rerun Batch Job Request	e	e	Q	e	e	e	e
Signal Batch Job Request	e	e	R	H	W	e	e
Batch Job Status Request	e	Q	R	H	W	E	T
Batch Queue Status Request	X	Q	R	H	W	E	T
Server Status Request	X	Q	R	H	W	E	T
Select Batch Jobs Request	X	Q	R	H	W	E	T
Move Batch Job Request	e	Q	R	H	W	e	T
Hold Batch Job Request	e	H	R/H	H	H	e	T
Release Batch Job Request	e	Q	R	Q/W/H	W	e	T
Server Shutdown Request	X	Q	Q	H	W	E	T
Locate Batch Job Request	e	Q	R	H	W	E	T

75293 **Legend**

75294 X Nonexistent

75295 Q QUEUED

75296 R RUNNING

75297 H HELD

75298 W WAITING

75299 E EXITING

75300 T TRANSITING

75301 e Error

75302 A batch server that has an execution queue containing jobs is said to own the queue and manage  
 75303 the batch jobs in that queue. A batch server that has been started shall execute the batch jobs in  
 75304 the execution queues owned by the batch server. The batch server shall schedule for execution  
 75305 those jobs in the execution queues that are in the QUEUED state. The algorithm for scheduling  
 75306 jobs is implementation-defined.

75307 A batch server that executes a batch job shall create, in the environment of the session leader of  
 75308 the batch job, an environment variable named *PBS\_ENVIRONMENT*, the value of which is the  
 75309 string *PBS\_BATCH* encoded in the portable character set.

75310 A batch server that executes a batch job shall create, in the environment of the session leader of  
 75311 the batch job, an environment variable named *PBS\_QUEUE*, the value of which is the name of  
 75312 the execution queue of the batch job encoded in the portable character set.

75313 To rerun a batch job is to requeue a batch job that is currently executing and then kill the session  
 75314 leader of the executing job by sending a SIGKILL prior to completion; see [Section 3.2.3.11](#) (on  
 75315 page 2395). A batch server that reruns a batch job shall append the standard output and  
 75316 standard error files of the batch job to the corresponding files of the previous execution, if they  
 75317 exist, with appropriate annotation. If either file does not exist, that file shall be created as in  
 75318 normal execution.

75319

Table 3-4 Results/Output Table

Request Type	Current State						
	X	Q	R	H	W	E	T
Queue Batch Job Request	O	e	e	e	e	e	e

75337 **Legend**

75338 O OK

75339 e Error message

75340 The execution of a batch job by a batch server shall be controlled by job, queue, and server  
75341 attributes, as defined in this section.

75342 **Account\_Name Attribute**

75343 Batch accounting is an optional feature of batch servers. If a batch server implements  
75344 accounting, the statements in this section apply and the configuration variable  
75345 POSIX2\_PBS\_ACCOUNTING shall be set to 1.

75346 A batch server that executes a batch job shall charge the account named in the *Account\_Name*  
75347 attribute of the batch job for resources consumed by the batch job.

75348 If the *Account\_Name* attribute of the batch job is absent from the batch job attribute list or is  
75349 altered while the batch job is in execution, the batch server action is implementation-defined.

75350 **Checkpoint Attribute**

75351 Batch checkpointing is an optional feature of batch servers. If a batch server implements  
75352 checkpointing, the statements in this section apply and the configuration variable  
75353 POSIX2\_PBS\_CHECKPOINT shall be set to 1.

75354 There are two attributes associated with the checkpointing feature: *Checkpoint* and  
75355 *Minimum\_Cpu\_Interval*. *Checkpoint* is a batch job attribute, while *Minimum\_Cpu\_Interval* is a  
75356 queue attribute. An implementation that does not support checkpointing shall support the  
75357 *Checkpoint* job attribute to the extent that the batch server shall maintain and pass this attribute  
75358 to other servers.

75359 The behavior of a batch server that executes a batch job for which the value of the *Checkpoint*  
75360 attribute is CHECKPOINT\_UNSPECIFIED is implementation-defined. A batch server that  
75361 executes a batch job for which the value of the *Checkpoint* attribute is NO\_CHECKPOINT shall

75362 not checkpoint the batch job.

75363 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is  
75364 CHECKPOINT\_AT\_SHUTDOWN shall checkpoint the batch job only when the batch server  
75365 accepts a request to shut down during the time when the batch job is in the RUNNING state.

75366 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is  
75367 CHECKPOINT\_AT\_MIN\_CPU\_INTERVAL shall checkpoint the batch job at the interval  
75368 specified by the *Minimum\_Cpu\_Interval* attribute of the queue for which the batch job has been  
75369 selected. The *Minimum\_Cpu\_Interval* attribute shall be specified in units of CPU minutes.

75370 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is an  
75371 unsigned integer shall checkpoint the batch job at an interval that is the value of either the  
75372 *Checkpoint* attribute, or the *Minimum\_Cpu\_Interval* attribute of the queue for which the batch job  
75373 has been selected, whichever is greater. Both intervals shall be in units of CPU minutes. When  
75374 the *Minimum\_Cpu\_Interval* attribute is greater than the *Checkpoint* attribute, the batch job shall  
75375 write a warning message to the standard error stream of the batch job.

#### 75376 **Error\_Path Attribute**

75377 The *Error\_Path* attribute of a running job cannot be changed by a *Modify Batch Job Request*. When  
75378 the *Join\_Path* attribute of the batch job is set to the value FALSE and the *Keep\_Files* attribute of  
75379 the batch job does not contain the value KEEP\_STD\_ERROR, a batch server that executes a batch  
75380 job shall perform one of the following actions:

- 75381 • Set the standard error stream of the session leader of the batch job to the path described by  
75382 the value of the *Error\_Path* attribute of the batch job.
- 75383 • Buffer the standard error of the session leader of the batch job until completion of the batch  
75384 job, and when the batch job exits return the contents to the destination described by the  
75385 value of the *Error\_Path* attribute of the batch job.

75386 Applications shall not rely on having access to the standard error of a batch job prior to the  
75387 completion of the batch job.

75388 When the *Error\_Path* attribute does not specify a host name, then the batch server shall retain the  
75389 standard error of the batch job on the host of execution.

75390 When the *Error\_Path* attribute does specify a host name and the *Keep\_Files* attribute does not  
75391 contain the value KEEP\_STD\_ERROR, then the final destination of the standard error of the  
75392 batch job shall be on the host whose host name is specified.

75393 If the path indicated by the value of the *Error\_Path* attribute of the batch job is a relative path, the  
75394 batch server shall expand the path relative to the home directory of the user on the host to which  
75395 the file is being returned.

75396 When the batch server buffers the standard error of the batch job and the file cannot be opened  
75397 for write upon completion of the batch job, then the server shall place the standard error in an  
75398 implementation-defined location and notify the user of the location via mail. It shall be possible  
75399 for the user to process this mail using the *mailx* utility.

75400 If a batch server that does not buffer the standard error cannot open the standard error path of  
75401 the batch job for write access, then the batch server shall abort the batch job.

75402 **Execution\_Time Attribute**

75403 A batch server shall not execute a batch job before the time represented by the value of the  
75404 *Execution\_Time* attribute of the batch job. The *Execution\_Time* attribute is defined in seconds since  
75405 the Epoch.

75406 **Hold\_Types Attribute**

75407 A batch server shall support the following hold types:

- 75408 s Can be set or released by a user with at least a privilege level of batch administrator  
75409 (SYSTEM).
- 75410 o Can be set or released by a user with at least a privilege level of batch operator  
75411 (OPERATOR).
- 75412 u Can be set or released by the user with at least a privilege level of user, where the user is  
75413 defined in the *Job\_Owner* attribute (USER).
- 75414 n Indicates that none of the *Hold\_Types* attributes are set (NO\_HOLD).

75415 An implementation may define other hold types. Any additional hold types, how they are  
75416 specified, their internal representation, their behavior, and how they affect the behavior of other  
75417 utilities are implementation-defined.

75418 The value of the *Hold\_Types* attribute shall be the union of the valid hold types ('s', 'o', 'u',  
75419 and any implementation-defined hold types), or 'n'.

75420 A batch server shall not execute a batch job if the *Hold\_Types* attribute of the batch job has a  
75421 value other than NO\_HOLD. If the *Hold\_Types* attribute of the batch job has a value other than  
75422 NO\_HOLD, the batch job shall be in the HELD state.

75423 **Job\_Owner Attribute**

75424 The *Job\_Owner* attribute consists of a pair of user name and host name values of the form:

75425 `username@hostname`

75426 A batch server that accepts a *Queue Batch Job Request* shall set the *Job\_Owner* attribute to a string  
75427 that is the `username@hostname` of the user who submitted the job.

75428 **Join\_Path Attribute**

75429 A batch server that executes a batch job for which the value of the *Join\_Path* attribute is TRUE  
75430 shall ignore the value of the *Error\_Path* attribute and merge the standard error of the batch job  
75431 with the standard output of the batch job.

75432 **Keep\_Files Attribute**

75433 A batch server that executes a batch job for which the value of the *Keep\_Files* attribute includes  
75434 the value KEEP\_STD\_OUTPUT shall retain the standard output of the batch job on the host  
75435 where execution occurs. The standard output shall be retained in the home directory of the user  
75436 under whose user ID the batch job is executed and the filename shall be the default filename for  
75437 the standard output as defined under the `-o` option of the *qsub* utility. The *Output\_Path* attribute  
75438 is not modified.

75439 A batch server that executes a batch job for which the value of the *Keep\_Files* attribute includes  
75440 the value KEEP\_STD\_ERROR shall retain the standard error of the batch job on the host where  
75441 execution occurs. The standard error shall be retained in the home directory of the user under  
75442 whose user ID the batch job is executed and the filename shall be the default filename for

75443 standard error as defined under the `-e` option of the `qsub` utility. The `Error_Path` attribute is not  
75444 modified.

75445 A batch server that executes a batch job for which the value of the `Keep_Files` attribute includes  
75446 values other than `KEEP_STD_OUTPUT` and `KEEP_STD_ERROR` shall retain these other files on  
75447 the host where execution occurs. These files (with implementation-defined names) shall be  
75448 retained in the home directory of the user under whose user identifier the batch job is executed.

#### 75449 **Mail\_Points and Mail\_Users Attributes**

75450 A batch server that executes a batch job for which one of the values of the `Mail_Points` attribute is  
75451 the value `MAIL_AT_BEGINNING` shall send a mail message to each user account listed in the  
75452 `Mail_Users` attribute of the batch job.

75453 The mail message shall contain at least the batch job identifier, queue, and server at which the  
75454 batch job currently resides, and the `Job_Owner` attribute.

#### 75455 **Output\_Path Attribute**

75456 The `Output_Path` attribute of a running job cannot be changed by a `Modify Batch Job Request`.  
75457 When the `Keep_Files` attribute of the batch job does not contain the value `KEEP_STD_OUTPUT`, a  
75458 batch server that executes a batch job shall either:

- 75459 • Set the standard output stream of the session leader of the batch job to the destination  
75460 described by the value of the `Output_Path` attribute of the batch job.

75461 or:

- 75462 • Buffer the standard output of the session leader of the batch job until completion of the  
75463 batch job, and when the batch job exits return the contents to the destination described by  
75464 the value of the `Output_Path` attribute of the batch job.

75465 When the `Output_Path` attribute does not specify a host name, then the batch server shall retain  
75466 the standard output of the batch job on the host of execution.

75467 When the `Keep_Files` attribute does not contain the value `KEEP_STD_OUTPUT` and the  
75468 `Output_Path` attribute does specify a host name, then the final destination of the standard output  
75469 of the batch job shall be on the host specified.

75470 If the path specified in the `Output_Path` attribute of the batch job is a relative path, the batch  
75471 server shall expand the path relative to the home directory of the user on the host to which the  
75472 file is being returned.

75473 Whether or not the batch server buffers the standard output of the batch job until completion of  
75474 the batch job is implementation-defined. Applications shall not rely on having access to the  
75475 standard output of a batch job prior to the completion of the batch job.

75476 When the batch server does buffer the standard output of the batch job and the file cannot be  
75477 opened for write upon completion of the batch job, then the batch server shall place the standard  
75478 output in an implementation-defined location and notify the user of the location via mail. It shall  
75479 be possible for the user to process this mail using the `mailx` utility.

75480 If a batch server that does not buffer the standard output cannot open the standard output path  
75481 of the batch job for write access, then the batch server shall abort the batch job.

75482 **Priority Attribute**

75483 A batch server implementation may choose to preferentially execute a batch job based on the  
 75484 *Priority* attribute. The interpretation of the batch job *Priority* attribute by a batch server is  
 75485 implementation-defined. If an implementation uses the *Priority* attribute, it shall interpret larger  
 75486 values of the *Priority* attribute to mean the batch job shall be preferentially selected for execution.

75487 **Rerunable Attribute**

75488 A batch job that began execution but did not complete, because the batch server either shut  
 75489 down or terminated abnormally, shall be requeued if the *Rerunable* attribute of the batch job has  
 75490 the value TRUE.

75491 If a batch job, which was requeued after beginning execution but prior to completion, has a valid  
 75492 checkpoint file and the batch server supports checkpointing, then the batch job shall be restarted  
 75493 from the last valid checkpoint.

75494 If the batch job cannot be restarted from a checkpoint, then when a batch job has a *Rerunable*  
 75495 attribute value of TRUE and was requeued after beginning execution but prior to completion,  
 75496 the batch server shall place the batch job into execution at the beginning of the job.

75497 When a batch job has a *Rerunable* attribute value other than TRUE and was requeued after  
 75498 beginning execution but prior to completion, and the batch job cannot be restarted from a  
 75499 checkpoint, then the batch server shall abort the batch job.

75500 **Resource\_List Attribute**

75501 A batch server that executes a batch job shall establish the resource limits of the session leader of  
 75502 the batch job according to the values of the *Resource\_List* attribute of the batch job. Resource  
 75503 limits shall be enforced by an implementation-defined method.

75504 **Shell\_Path\_List Attribute**

75505 The *Shell\_Path\_List* job attribute consists of a list of pairs of pathname and host name values. The  
 75506 host name component can be omitted, in which case the pathname serves as the default  
 75507 pathname when a batch server cannot find the name of the host on which it is running in the list.

75508 A batch server that executes a batch job shall select, from the value of the *Shell\_Path\_List*  
 75509 attribute of the batch job, a pathname where the shell to execute the batch job shall be found.  
 75510 The batch server shall select the pathname, in order of preference, according to the following  
 75511 methods:

- 75512 • Select the pathname that contains the name of the host on which the batch server is  
 75513 running.
- 75514 • Select the pathname for which the host name has been omitted.
- 75515 • Select the pathname for the login shell of the user under which the batch job is to execute.

75516 If the shell path value selected is an invalid pathname, the batch server shall abort the batch job.

75517 If the value of the selected pathname from the *Shell\_Path\_List* attribute of the batch job  
 75518 represents a partial path, the batch server shall expand the path relative to a path that is  
 75519 implementation-defined.

75520 The batch server that executes the batch job shall execute the program that was selected from the  
 75521 *Shell\_Path\_List* attribute of the batch job. The batch server shall pass the path to the script of the  
 75522 batch job as the first argument to the shell program.

75523 **User\_List Attribute**

75524 The *User\_List* job attribute consists of a list of pairs of user name and host name values. The host  
 75525 name component can be omitted, in which case the user name serves as a default when a batch  
 75526 server cannot find the name of the host on which it is running in the list.

75527 A batch server that executes a batch job shall select, from the value of the *User\_List* attribute of  
 75528 the batch job, a user name under which to create the session leader. The server shall select the  
 75529 user name, in order of preference, according to the following methods:

- 75530 • Select the user name of a value that contains the name of the host on which the batch  
 75531 server executes.
- 75532 • Select the user name of a value for which the host name has been omitted.
- 75533 • Select the user name from the *Job\_Owner* attribute of the batch job.

75534 **Variable\_List Attribute**

75535 A batch server that executes a batch job shall create, in the environment of the session leader of  
 75536 the batch job, each environment variable listed in the *Variable\_List* attribute of the batch job, and  
 75537 set the value of each such environment variable to that of the corresponding variable in the  
 75538 variable list.

75539 3.2.2.2 *Batch Job Routing*

75540 To route a batch job is to select a queue from a list and move the batch job to that queue.

75541 A batch server that has routing queues, which have been started, shall route the jobs in the  
 75542 routing queues owned by the batch server. A batch server may delay the routing of a batch job.  
 75543 The algorithm for selecting a batch job and the queue to which it will be routed is  
 75544 implementation-defined.

75545 When a routing queue has multiple possible destinations specified, then the precedence of the  
 75546 destinations is implementation-defined.

75547 A batch server that routes a batch job to a queue at another server shall move the batch job into  
 75548 the target queue with a *Queue Batch Job Request*.

75549 If the target server rejects the *Queue Batch Job Request*, the routing server shall retry routing the  
 75550 batch job or abort the batch job. A batch server that retries failed routings shall provide a means  
 75551 for the batch administrator to specify the number of retries and the minimum period of time  
 75552 between retries. The means by which an administrator specifies the number of retries and the  
 75553 delay between retries is implementation-defined. When the number of retries specified by the  
 75554 batch administrator has been exhausted, the batch server shall abort the batch job and perform  
 75555 the functions of *Batch Job Exit*; see Section 3.2.2.3.

75556 3.2.2.3 *Batch Job Exit*

75557 For each job in the EXITING state, the batch server that exited the batch job shall perform the  
 75558 following deferred services in the order specified:

- 75559 1. If buffering standard error, move that file into the location specified by the *Error\_Path*  
 75560 attribute of the batch job.
- 75561 2. If buffering standard output, move that file into the location specified by the *Output\_Path*  
 75562 attribute of the batch job.

75563 3. If the *Mail\_Points* attribute of the batch job includes MAIL\_AT\_EXIT, send mail to the  
 75564 users listed in the *Mail\_Users* attribute of the batch job. The mail message shall contain at  
 75565 least the batch job identifier, queue, and server at which the batch job currently resides,  
 75566 and the *Job\_Owner* attribute.

75567 4. Remove the batch job from the queue.

75568 If a batch server that buffers the standard error output cannot return the standard error file to  
 75569 the standard error path at the time the batch job exits, the batch server shall do one of the  
 75570 following:

- 75571 • Mail the standard error file to the batch job owner.
- 75572 • Save the standard error file and mail the location and name of the file where the standard  
 75573 error is stored to the batch job owner.
- 75574 • Save the standard error file and notify the user by other implementation-defined means.

75575 If a batch server that buffers the standard output cannot return the standard output file to the  
 75576 standard output path at the time the batch job exits, the batch server shall do one of the  
 75577 following:

- 75578 • Mail the standard output file to the batch job owner.
- 75579 • Save the standard output file and mail the location and name of the file where the standard  
 75580 output is stored to the batch job owner.
- 75581 • Save the standard output file and notify the user by other implementation-defined means.

75582 At the conclusion of job exit processing, the batch job is no longer managed by a batch server.

#### 75583 3.2.2.4 *Batch Server Restart*

75584 A batch server that has been either shutdown or terminated abnormally, and has returned to  
 75585 operation, is said to have “restarted”.

75586 Upon restarting, a batch server shall requeue those jobs managed by the batch server that were  
 75587 in the RUNNING state at the time the batch server shut down and for which the *Rerunable*  
 75588 attribute of the batch job has the value TRUE.

75589 Queues are defined to be non-volatile. A batch server shall store the content of queues that it  
 75590 controls in such a way that server and system shutdowns do not erase the content of the queues.

#### 75591 3.2.2.5 *Batch Job Abort*

75592 A batch server that cannot perform a deferred service for a batch job shall abort the batch job.

75593 A batch server that aborts a batch job shall perform the following services:

- 75594 • Delete the batch job from the queue in which it resides.
- 75595 • If the *Mail\_Points* attribute of the batch job includes the value MAIL\_AT\_ABORT, send  
 75596 mail to the users listed in the value of the *Mail\_Users* attribute of the job. The mail message  
 75597 shall contain at least the batch job identifier, queue, and server at which the batch job  
 75598 currently resides, the *Job\_Owner* attribute, and the reason for the abort.
- 75599 • If the batch job was in the RUNNING state, terminate the session leader of the executing  
 75600 job by sending the session leader a SIGKILL, place the batch job in the EXITING state, and  
 75601 perform the actions of *Batch Job Exit*.

75602 **3.2.3 Requested Batch Services**

75603 This section describes the services provided by batch servers in response to requests from  
 75604 clients. Table 3-5 summarizes the current set of batch service requests and for each gives its type  
 75605 (deferred or not) and whether it is an optional function.

75606 **Table 3-5** Batch Services Summary

Batch Service	Deferred	Optional
<i>Batch Job Execution</i>	Yes	No
<i>Batch Job Routing</i>	Yes	No
<i>Batch Job Exit</i>	Yes	No
<i>Batch Server Restart</i>	Yes	No
<i>Batch Job Abort</i>	Yes	No
<i>Delete Batch Job Request</i>	No	No
<i>Hold Batch Job Request</i>	No	No
<i>Batch Job Message Request</i>	No	Yes
<i>Batch Job Status Request</i>	No	No
<i>Locate Batch Job Request</i>	No	Yes
<i>Modify Batch Job Request</i>	No	No
<i>Move Batch Job Request</i>	No	No
<i>Queue Batch Job Request</i>	No	No
<i>Batch Queue Status Request</i>	No	No
<i>Release Batch Job Request</i>	No	No
<i>Rerun Batch Job Request</i>	No	No
<i>Select Batch Jobs Request</i>	No	No
<i>Server Shutdown Request</i>	No	No
<i>Server Status Request</i>	No	No
<i>Signal Batch Job Request</i>	No	No
<i>Track Batch Job Request</i>	No	Yes

75629 If a request is rejected because the batch client is not authorized to perform the action, the batch  
 75630 server shall return the same status as when the batch job does not exist.

75631 **3.2.3.1 Delete Batch Job Request**

75632 A batch job is defined to have been deleted when it has been removed from the queue in which  
 75633 it resides and not instantiated in another queue. A client requests that the server that manages a  
 75634 batch job delete the batch job. Such a request is called a *Delete Batch Job Request*.

75635 A batch server shall reject a *Delete Batch Job Request* if any of the following statements are true:

- 75636 • The user of the batch client is not authorized to delete the designated job.
- 75637 • The designated job is not managed by the batch server.
- 75638 • The designated job is in a state inconsistent with the delete request.

75639 A batch server may reject a *Delete Batch Job Request* for other implementation-defined reasons.  
 75640 The method used to determine whether the user of a client is authorized to perform the  
 75641 requested action is implementation-defined.

75642 A batch server requested to delete a batch job shall delete the batch job if the batch job exists and  
 75643 is not in the EXITING state.

75644 A batch server that deletes a batch job in the RUNNING state shall send a SIGKILL signal to the

75645 session leader of the batch job. It is implementation-defined whether additional signals are sent  
75646 to the session leader of the job prior to sending the SIGKILL signal.

75647 A batch server that deletes a batch job in the RUNNING state shall place the batch job in the  
75648 EXITING state after it has killed the session leader of the batch job and shall perform the actions  
75649 of *Batch Job Exit*.

### 75650 3.2.3.2 *Hold Batch Job Request*

75651 A batch client can request that the batch server add one or more holds to a batch job. Such a  
75652 request is called a *Hold Batch Job Request*.

75653 A batch server shall reject a *Hold Batch Job Request* if any of the following statements are true:

- 75654 • The batch server does not support one or more of the requested holds to be added to the  
75655 batch job.
- 75656 • The user of the batch client is not authorized to add one or more of the requested holds to  
75657 the batch job.
- 75658 • The batch server does not manage the specified job.
- 75659 • The designated job is in the EXITING state.

75660 A batch server may reject a *Hold Batch Job Request* for other implementation-defined reasons. The  
75661 method used to determine whether the user of a client is authorized to perform the requested  
75662 action is implementation-defined.

75663 A batch server that accepts a *Hold Batch Job Request* for a batch job in the RUNNING state shall  
75664 place a hold on the batch job. The effects, if any, the hold will have on a batch job in the  
75665 RUNNING state are implementation-defined.

75666 A batch server that accepts a *Hold Batch Job Request* shall add each type of hold listed in the *Hold*  
75667 *Batch Job Request*, that is not already present, to the value of the *Hold\_Types* attribute of the batch  
75668 job.

### 75669 3.2.3.3 *Batch Job Message Request*

75670 *Batch Job Message Request* is an optional feature of batch servers. If an implementation supports  
75671 *Batch Job Message Request*, the statements in this section apply and the configuration variable  
75672 POSIX2\_PBS\_MESSAGE shall be set to 1.

75673 A batch client can request that a batch server write a message into certain output files of a batch  
75674 job. Such a request is called a *Batch Job Message Request*.

75675 A batch server shall reject a *Batch Job Message Request* if any of the following statements are true:

- 75676 • The batch server does not support sending messages to jobs.
- 75677 • The user of the batch client is not authorized to post a message to the designated job.
- 75678 • The designated job does not exist on the batch server.
- 75679 • The designated job is not in the RUNNING state.

75680 A batch server may reject a *Batch Job Message Request* for other implementation-defined reasons.  
75681 The method used to determine whether the user of a client is authorized to perform the  
75682 requested action is implementation-defined.

75683 A batch server that accepts a *Batch Job Message Request* shall write the message sent by the batch  
75684 client into the files indicated by the batch client.

*Batch Services**Batch Environment Services*75685 3.2.3.4 *Batch Job Status Request*

75686 A batch client can request that a batch server respond with the status and attributes of a batch  
75687 job. Such a request is called a *Batch Job Status Request*.

75688 A batch server shall reject a *Batch Job Status Request* if any of the following statements are true:

- 75689 • The user of the batch client is not authorized to query the status of the designated job.
- 75690 • The designated job is not managed by the batch server.

75691 A batch server may reject a *Batch Job Status Request* for other implementation-defined reasons.  
75692 The method used to determine whether the user of a client is authorized to perform the  
75693 requested action is implementation-defined.

75694 A batch server that accepts a *Batch Job Status Request* shall return a *Batch Job Status Message* to the  
75695 batch client.

75696 A batch server may return other information in response to a *Batch Job Status Request*.

75697 3.2.3.5 *Locate Batch Job Request*

75698 *Locate Batch Job Request* is an optional feature of batch servers. If an implementation supports  
75699 *Locate Batch Job Request*, the statements in this section apply and the configuration variable  
75700 POSIX2\_PBS\_LOCATE shall be set to 1.

75701 A batch client can ask a batch server to respond with the location of a batch job that was created  
75702 by the batch server. Such a request is called a *Locate Batch Job Request*.

75703 A batch server that accepts a *Locate Batch Job Request* shall return a *Batch Job Location Message* to  
75704 the batch client.

75705 A batch server may reject a *Locate Batch Job Request* for a batch job that was not created by that  
75706 server.

75707 A batch server may reject a *Locate Batch Job Request* for a batch job that is no longer managed by  
75708 that server; that is, for a batch job that is not in a queue owned by that server.

75709 A batch server may reject a *Locate Batch Job Request* for other implementation-defined reasons.

75710 3.2.3.6 *Modify Batch Job Request*

75711 Batch clients modify (alter) the attributes of a batch job by making a request to the server that  
75712 manages the batch job. Such a request is called a *Modify Batch Job Request*.

75713 A batch server shall reject a *Modify Batch Job Request* if any of the following statements are true:

- 75714 • The user of the batch client is not authorized to make the requested modification to the  
75715 batch job.
- 75716 • The designated job is not managed by the batch server.
- 75717 • The requested modification is inconsistent with the state of the batch job.
- 75718 • An unrecognized resource is requested for a batch job in an execution queue.

75719 A batch server may reject a *Modify Batch Job Request* for other implementation-defined reasons.  
75720 The method used to determine whether the user of a client is authorized to perform the  
75721 requested action is implementation-defined.

75722 A batch server that accepts a *Modify Batch Job Request* shall modify all the specified attributes of  
75723 the batch job. A batch server that rejects a *Modify Batch Job Request* shall modify none of the

75724 attributes of the batch job.

75725 If the servicing by a batch server of an otherwise valid request would result in no change, then  
75726 the batch server shall indicate successful completion of the request.

### 75727 3.2.3.7 Move Batch Job Request

75728 A batch client can request that a batch server move a batch job to another destination. Such a  
75729 request is called a *Move Batch Job Request*.

75730 A batch server shall reject a *Move Batch Job Request* if any of the following statements are true:

- 75731 • The user of the batch client is not authorized to remove the designated job from the queue  
75732 in which the batch job resides.
- 75733 • The user of the batch client is not authorized to move the designated job to the destination.
- 75734 • The designated job is not managed by the batch server.
- 75735 • The designated job is in the EXITING state.
- 75736 • The destination is inaccessible.

75737 A batch server can reject a *Move Batch Job Request* for other implementation-defined reasons. The  
75738 method used to determine whether the user of a client is authorized to perform the requested  
75739 action is implementation-defined.

75740 A batch server that accepts a *Move Batch Job Request* shall perform the following services:

- 75741 • Queue the designated job at the destination.
- 75742 • Remove the designated job from the queue in which the batch job resides.

75743 If the destination resides on another batch server, the batch server shall queue the batch job at  
75744 the destination by sending a *Queue Batch Job Request* to the other server. If the *Queue Batch Job*  
75745 *Request* fails, the batch server shall reject the *Move Batch Job Request*. If the *Queue Batch Job*  
75746 *Request* succeeds, the batch server shall remove the batch job from its queue.

75747 The batch server shall not modify any attributes of the batch job.

### 75748 3.2.3.8 Queue Batch Job Request

75749 A batch queue is controlled by one and only one batch server. A batch server is said to own the  
75750 queues that it controls. Batch clients make requests of batch servers to have jobs queued. Such a  
75751 request is called a *Queue Batch Job Request*.

75752 A batch server requested to queue a batch job for which the queue is not specified shall select an  
75753 implementation-defined queue for the batch job. Such a queue is called the “default queue” of  
75754 the batch server. The implementation shall provide the means for a batch administrator to  
75755 specify the default queue. The queue, whether specified or defaulted, is called the “target  
75756 queue”.

75757 A batch server shall reject a *Queue Batch Job Request* if any of the following statements are true:

- 75758 • The client is not authorized to create a batch job in the target queue.
- 75759 • The request specifies a queue that does not exist on the batch server.
- 75760 • The target queue is an execution queue and the batch server cannot satisfy a resource  
75761 requirement of the batch job.

- 75762           • The target queue is an execution queue and an unrecognized resource is requested.
- 75763           • The target queue is an execution queue, the batch server does not support checkpointing,  
75764           and the value of the *Checkpoint* attribute of the batch job is not NO\_CHECKPOINT.
- 75765           • The job requires access to a user identifier that the batch client is not authorized to access.
- 75766           A batch server may reject a *Queue Batch Job Request* for other implementation-defined reasons.
- 75767           A batch server that accepts a *Queue Batch Job Request* for a batch job for which the  
75768           PBS\_O\_QUEUE value is missing from the value of the *Variable\_List* attribute of the batch job  
75769           shall add that variable to the list and set the value to the name of the target queue. Once set, no  
75770           server shall change the value of PBS\_O\_QUEUE, even if the batch job is moved to another  
75771           queue.
- 75772           A batch server that accepts a *Queue Batch Job Request* for a batch job for which the PBS\_JOBID  
75773           value is missing from the value of the *Variable\_List* attribute shall add that variable to the list and  
75774           set the value to the batch job identifier assigned by the server in the format:
- 75775           sequence\_number.server
- 75776           A batch server that accepts a *Queue Batch Job Request* for a batch job for which the  
75777           PBS\_JOBNAME value is missing from the value of the *Variable\_List* attribute of the batch job  
75778           shall add that variable to the list and set the value to the *Job\_Name* attribute of the batch job.
- 75779   3.2.3.9   *Batch Queue Status Request*
- 75780           A batch client can request that a batch server respond with the status and attributes of a queue.  
75781           Such a request is called a *Batch Queue Status Request*.
- 75782           A batch server shall reject a *Batch Queue Status Request* if any of the following statements are  
75783           true:
- 75784           • The user of the batch client is not authorized to query the status of the designated queue.
- 75785           • The designated queue does not exist on the batch server.
- 75786           A batch server may reject a *Batch Queue Status Request* for other implementation-defined reasons.  
75787           The method used to determine whether the user of a client is authorized to perform the  
75788           requested action is implementation-defined.
- 75789           A batch server that accepts a *Batch Queue Status Request* shall return a *Batch Queue Status Reply* to  
75790           the batch client.
- 75791   3.2.3.10 *Release Batch Job Request*
- 75792           A batch client can request that the server remove one or more holds from a batch job. Such a  
75793           request is called a *Release Batch Job Request*.
- 75794           A batch server shall reject a *Release Batch Job Request* if any of the following statements are true:
- 75795           • The user of the batch client is not authorized to remove one or more of the requested holds  
75796           from the batch job.
- 75797           • The batch server does not manage the specified job.
- 75798           A batch server may reject a *Release Batch Job Request* for other implementation-defined reasons.  
75799           The method used to determine whether the user of a client is authorized to perform the  
75800           requested action is implementation-defined.
- 75801           A batch server that accepts a *Release Batch Job Request* shall remove each type of hold listed in the

75802 *Release Batch Job Request*, that is present, from the value of the *Hold\_Types* attribute of the batch  
75803 job.

#### 75804 3.2.3.11 *Rerun Batch Job Request*

75805 To rerun a batch job is to kill the session leader of the batch job and leave the batch job eligible  
75806 for re-execution. A batch client can request that a batch server rerun a batch job. Such a request  
75807 is called *Rerun Batch Job Request*.

75808 A batch server shall reject a *Rerun Batch Job Request* if any of the following statements are true:

- 75809 • The user of the batch client is not authorized to rerun the designated job.
- 75810 • The *Rerunable* attribute of the designated job has the value FALSE.
- 75811 • The designated job is not in the RUNNING state.
- 75812 • The batch server does not manage the designated job.

75813 A batch server may reject a *Rerun Batch Job Request* for other implementation-defined reasons.  
75814 The method used to determine whether the user of a client is authorized to perform the  
75815 requested action is implementation-defined.

75816 A batch server that rejects a *Rerun Batch Job Request* shall in no way modify the execution of the  
75817 batch job.

75818 A batch server that accepts a request to rerun a batch job shall perform the following services:

- 75819 • Requeue the batch job in the execution queue in which it was executing.
- 75820 • Send a SIGKILL signal to the process group of the session leader of the batch job.

75821 An implementation may indicate to the batch job owner that the batch job has been rerun.  
75822 Whether and how the batch job owner is notified that a batch job is rerun is implementation-  
75823 defined.

75824 A batch server that reruns a batch job may send other implementation-defined signals to the  
75825 session leader of the batch job prior to sending the SIGKILL signal.

75826 A batch server may preferentially select a rerun job for execution. Whether rerun jobs shall be  
75827 selected for execution before other jobs is implementation-defined.

#### 75828 3.2.3.12 *Select Batch Jobs Request*

75829 A batch client can request from a batch server a list of jobs managed by that server that match a  
75830 list of selection criteria. Such a request is called a *Select Batch Jobs Request*. All the batch jobs  
75831 managed by the batch server that receives the request are candidates for selection.

75832 A batch server that accepts a *Select Batch Jobs Request* shall return a list of zero or more job  
75833 identifiers that correspond to jobs that meet the selection criteria.

75834 If the batch client is not authorized to query the status of a batch job, the batch server shall not  
75835 select the batch job.

75836 3.2.3.13 *Server Shutdown Request*

75837 A batch server is defined to have shut down when it does not respond to requests from clients  
75838 and does not perform deferred services for jobs. A batch client can request that a batch server  
75839 shut down. Such a request is called a *Server Shutdown Request*.

75840 A batch server shall reject a *Server Shutdown Request* from a client that is not authorized to shut  
75841 down the batch server. The method used to determine whether the user of a client is authorized  
75842 to perform the requested action is implementation-defined.

75843 A batch server may reject a *Server Shutdown Request* for other implementation-defined reasons.  
75844 The reasons for which a *Server Shutdown Request* may be rejected are implementation-defined.

75845 At server shutdown, a batch server shall do, in order of preference, one of the following:

- 75846 • If checkpointing is implemented and the batch job is checkpointable, then checkpoint the  
75847 batch job and requeue it.
- 75848 • If the batch job is rerunnable, then requeue the batch job to be rerun (restarted from the  
75849 beginning).
- 75850 • Abort the batch job.

75851 3.2.3.14 *Server Status Request*

75852 A batch client can request that a batch server respond with the status and attributes of the batch  
75853 server. Such a request is called a *Server Status Request*.

75854 A batch server shall reject a *Server Status Request* if the following statement is true:

- 75855 • The user of the batch client is not authorized to query the status of the designated server.

75856 A batch server may reject a *Server Status Request* for other implementation-defined reasons. The  
75857 method used to determine whether the user of a client is authorized to perform the requested  
75858 action is implementation-defined.

75859 A batch server that accepts a *Server Status Request* shall return a *Server Status Reply* to the batch  
75860 client.

75861 3.2.3.15 *Signal Batch Job Request*

75862 A batch client can request that a batch server signal the session leader of a batch job. Such a  
75863 request is called a *Signal Batch Job Request*.

75864 A batch server shall reject a *Signal Batch Job Request* if any of the following statements are true:

- 75865 • The user of the batch client is not authorized to signal the batch job.
- 75866 • The job is not in the RUNNING state.
- 75867 • The batch server does not manage the designated job.
- 75868 • The requested signal is not supported by the implementation.

75869 A batch server may reject a *Signal Batch Job Request* for other implementation-defined reasons.  
75870 The method used to determine whether the user of a client is authorized to perform the  
75871 requested action is implementation-defined.

75872 A batch server that accepts a request to signal a batch job shall send the signal requested by the  
75873 batch client to the process group of the session leader of the batch job.

75874 3.2.3.16 *Track Batch Job Request*

75875 *Track Batch Job Request* is an optional feature of batch servers. If an implementation supports  
75876 *Track Batch Job Request*, the statements in this section apply and the configuration variable  
75877 POSIX2\_PBS\_TRACK shall be set to 1.

75878 *Track Batch Job Request* provides a method for tracking the current location of a batch job. Clients  
75879 may use the tracking information to determine the batch server that should receive a batch  
75880 server request.

75881 If *Track Batch Job Request* is supported by a batch server, then when the batch server queues a  
75882 batch job as a result of a *Queue Batch Job Request*, and the batch server is not the batch server that  
75883 created the batch job, the batch server shall send a *Track Batch Job Request* to the batch server that  
75884 created the job.

75885 If *Track Batch Job Request* is supported by a batch server, then the *Track Batch Job Request* may also  
75886 be sent to other servers as a backup to the primary server. The method by which backup servers  
75887 are specified is implementation-defined.

75888 If *Track Batch Job Request* is supported by a batch server that receives a *Track Batch Job Request*,  
75889 then the batch server shall record the current location of the batch job as contained in the  
75890 request.

75891 **3.3 Common Behavior for Batch Environment Utilities**75892 **3.3.1 Batch Job Identifier**

75893 A utility shall recognize *job\_identifiers* of the format:

75894 [sequence\_number] [.server\_name] [@server]

75895 where:

75896 *sequence\_number* An integer that, when combined with *server\_name*, provides a batch job  
75897 identifier that is unique within the batch system.

75898 *server\_name* The name of the batch server to which the batch job was originally submitted.

75899 *server* The name of the batch server that is currently managing the batch job.

75900 If the application omits the batch *server\_name* portion of a batch job identifier, a utility shall use  
75901 the name of a default batch server.

75902 If the application omits the batch *server* portion of a batch job identifier, a utility shall use:

- 75903 • The batch server indicated by *server\_name*, if present
- 75904 • The name of the default batch server
- 75905 • The name of the batch server that is currently managing the batch job

75906 If only @*server* is specified, then the status of all jobs owned by the user on the requested server  
75907 is listed.

75908 The means by which a utility determines the default batch server is implementation-defined.

75909 If the application presents the batch *server* portion of a batch job identifier to a utility, the utility  
75910 shall send the request to the specified server.

75911 A strictly conforming application shall use the syntax described for the job identifier. Whenever  
 75912 a batch job identifier is specified whose syntax is not recognized by an implementation, then a  
 75913 message for each error that occurs shall be written to standard error and the utility shall exit  
 75914 with an exit status greater than zero.

75915 When a batch job identifier is supplied as an argument to a batch utility and the *server\_name*  
 75916 portion of the batch job identifier is omitted, then the utility shall use the name of the default  
 75917 batch server.

75918 When a batch job identifier is supplied as an argument to a batch utility and the batch *server*  
 75919 portion of the batch job identifier is omitted, then the utility shall use either:

- 75920 • The name of the default batch server
- 75921 or:
- 75922 • The name of the batch server that is currently managing the batch job

75923 When a batch job identifier is supplied as an argument to a batch utility and the batch *server*  
 75924 portion of the batch job identifier is specified, then the utility shall send the required *Batch Server*  
 75925 *Request* to the specified server.

### 75926 3.3.2 Destination

75927 The utility shall recognize a *destination* of the format:

75928 [queue] [@server]

75929 where:

75930 *queue* The name of a valid execution or routing queue at the batch server denoted by  
 75931 @*server*, defined as a string of up to 15 alphanumeric characters in the portable  
 75932 character set (see XBD Section 6.1, on page 125) where the first character is  
 75933 alphabetic.

75934 *server* The name of a batch server, defined as a string of alphanumeric characters in the  
 75935 portable character set.

75936 If the application omits the batch *server* portion of a destination, then the utility shall use either:

- 75937 • The name of the default batch server
- 75938 or:
- 75939 • The name of the batch server that is currently managing the batch job

75940 The means by which a utility determines the default batch server is implementation-defined.

75941 If the application omits the *queue* portion of a destination, then the utility shall use the name of  
 75942 the default queue at the batch server chosen. The means by which a batch server determines its  
 75943 default queue is implementation-defined. If a destination is specified in the *queue@server* form,  
 75944 then the utility shall use the specified queue at the specified server.

75945 A strictly conforming application shall use the syntax described for a destination. Whenever a  
 75946 destination is specified whose syntax is not recognized by an implementation, then a message  
 75947 shall be written to standard error and the utility shall exit with an exit status greater than zero.

75948 **3.3.3 Multiple Keyword-Value Pairs**

75949 For each option that can have multiple keyword-value pair arguments, the following rules shall  
 75950 apply. Examples of options that can have list-oriented option-arguments are `-u value@keyword`  
 75951 and `-l keyword=value`.

75952 1. If a batch utility is presented with a list-oriented option-argument for which a keyword  
 75953 has a corresponding value that begins with a single or double-quote, then the utility shall  
 75954 stop interpreting the input stream for delimiters until a second single or double-quote,  
 75955 respectively, is encountered. This feature allows some flexibility for a <comma> (',' ) or  
 75956 <equals-sign> ('=' ) to be part of the value string for a particular keyword; for example:

75957 `keywd1=' val1, val2' , keywd2="val3, val4"`

75958 **Note:** This may require the user to escape the quotes as in the following command:

75959 `foo -xkeywd1='\ val1, val2\' , keywd2=\"val3, val4\"`

75960 2. If a batch server is presented with a list-oriented attribute that has a keyword that was  
 75961 encountered earlier in the list, then the later entry for that keyword shall replace the  
 75962 earlier entry.

75963 3. If a batch server is presented with a list-oriented attribute that has a keyword without any  
 75964 corresponding value of the form `keyword=` or `@keyword` and the same keyword was  
 75965 encountered earlier in the list, then the prior entry for that keyword shall be ignored by  
 75966 the batch server.

75967 4. If a batch utility is expecting a list-oriented option-argument entry of the form  
 75968 `keyword=value`, but is presented with an entry of the form `keyword` without any  
 75969 corresponding `value`, then the entry shall be treated as though a default value of NULL  
 75970 was assigned (that is, `keyword=NULL`) for entry parsing purposes. The utility shall  
 75971 include only the keyword, not the NULL value, in the associated job attribute.

75972 5. If a batch utility is expecting a list-oriented option-argument entry of the form  
 75973 `value@keyword`, but is presented with an entry of the form `value` without any  
 75974 corresponding `keyword`, then the entry shall be treated as though a keyword of NULL was  
 75975 assigned (that is, `value@NULL`) for entry parsing purposes. The utility shall include only  
 75976 the value, not the NULL keyword, in the associated job attribute.

75977 6. A batch server shall accept a list-oriented attribute that has multiple occurrences of the  
 75978 same keyword, interpreting the keywords, in order, with the last value encountered  
 75979 taking precedence over prior instances of the same keyword. This rule allows, but does  
 75980 not require, a batch utility to preprocess the attribute to remove duplicate keywords.

75981 7. If a batch utility is presented with multiple list-oriented option-arguments on the  
 75982 command line or in script directives, or both, for a single option, then the utility shall  
 75983 concatenate, in order, any command line keyword and value pairs to the end of any  
 75984 directive keyword and value pairs separated by a single <comma> to produce a single  
 75985 string that is an equivalent, valid option-argument. The resulting string shall be assigned  
 75986 to the associated attribute of the batch job (after optionally removing duplicate entries as  
 75987 described in item 6).

Chapter 4

75989

 Utilities

75990

This chapter contains the definitions of the utilities, as follows:

75991

- Mandatory utilities that are present on every conformant system

75992

- Optional utilities that are present only on systems supporting the associated option; see [Section 1.7.1](#) (on page 7) for information on the options in this volume of POSIX.1-2008

75993

**admin**

Utilities

75994 **NAME**75995 **admin** — create and administer SCCS files (**DEVELOPMENT**)75996 **SYNOPSIS**

```

75997 xSI admin -i [name] [-n] [-a login] [-d flag] [-e login] [-f flag]
75998         [-m mrlist] [-r rel] [-t name] [-y comment]] newfile
75999
76000 admin -n [-a login] [-d flag] [-e login] [-f flag] [-m mrlist]
76001         [-t name]] [-y comment]] newfile...
76002
76003 admin [-a login] [-d flag] [-m mrlist] [-r rel] [-t name]] file...
76004
76005 admin -h file...
76006
76007 admin -z file...

```

76004 **DESCRIPTION**

76005 The *admin* utility shall create new SCCS files or change parameters of existing ones. If a named  
 76006 file does not exist, it shall be created, and its parameters shall be initialized according to the  
 76007 specified options. Parameters not initialized by an option shall be assigned a default value. If a  
 76008 named file does exist, parameters corresponding to specified options shall be changed, and other  
 76009 parameters shall be left as is.

76010 All SCCS filenames supplied by the application shall be of the form *s.filename*. New SCCS files  
 76011 shall be given read-only permission mode. Write permission in the parent directory is required  
 76012 to create a file. All writing done by *admin* shall be to a temporary *x-file*, named *x.filename* (see *get*)  
 76013 created with read-only mode if *admin* is creating a new SCCS file, or created with the same mode  
 76014 as that of the SCCS file if the file already exists. After successful execution of *admin*, the SCCS file  
 76015 shall be removed (if it exists), and the *x-file* shall be renamed with the name of the SCCS file. This  
 76016 ensures that changes are made to the SCCS file only if no errors occur.

76017 The *admin* utility shall also use a transient lock file (named *z.filename*), which is used to prevent  
 76018 simultaneous updates to the SCCS file; see *get*.

76019 **OPTIONS**

76020 The *admin* utility shall conform to XBD Section 12.2 (on page 215), except that the *-i*, *-t*, and *-y*  
 76021 options have optional option-arguments. These optional option-arguments shall not be  
 76022 presented as separate arguments. The following options are supported:

76023 **-n** Create a new SCCS file. When *-n* is used without *-i*, the SCCS file shall be created  
 76024 with control information but without any file data.

76025 **-i[name]** Specify the *name* of a file from which the text for a new SCCS file shall be taken.  
 76026 The text constitutes the first delta of the file (see the *-r* option for the delta  
 76027 numbering scheme). If the *-i* option is used, but the *name* option-argument is  
 76028 omitted, the text shall be obtained by reading the standard input. If this option is  
 76029 omitted, the SCCS file shall be created with control information but without any  
 76030 file data. The *-i* option implies the *-n* option.

76031 **-r SID** Specify the SID of the initial delta to be inserted. This SID shall be a trunk SID; that  
 76032 is, the branch and sequence numbers shall be zero or missing. The level number is  
 76033 optional, and defaults to 1.

76034 **-t[name]** Specify the *name* of a file from which descriptive text for the SCCS file shall be  
 76035 taken. In the case of existing SCCS files (neither *-i* nor *-n* is specified):

- 76036 • A **-t** option without a *name* option-argument shall cause the removal of  
76037 descriptive text (if any) currently in the SCCS file.
- 76038 • A **-t** option with a *name* option-argument shall cause the text (if any) in the  
76039 named file to replace the descriptive text (if any) currently in the SCCS file.
- 76040 **-f flag** Specify a *flag*, and, possibly, a value for the *flag*, to be placed in the SCCS file.  
76041 Several **-f** options may be supplied on a single *admin* command line.  
76042 Implementations shall recognize the following flags and associated values:
- 76043 **b** Allow use of the **-b** option on a *get* command to create branch deltas.
- 76044 **cceil** Specify the highest release (that is, ceiling), a number less than or equal to  
76045 9999, which may be retrieved by a *get* command for editing. The default  
76046 value for an unspecified **c** flag shall be 9999.
- 76047 **ffloor** Specify the lowest release (that is, floor), a number greater than 0 but less  
76048 than 9999, which may be retrieved by a *get* command for editing. The  
76049 default value for an unspecified **f** flag shall be 1.
- 76050 **dSID** Specify the default delta number (SID) to be used by a *get* command.
- 76051 **istr** Treat the “No ID keywords” message issued by *get* or *delta* as a fatal error.  
76052 In the absence of this flag, the message is only a warning. The message is  
76053 issued if no SCCS identification keywords (see *get*) are found in the text  
76054 retrieved or stored in the SCCS file. If a value is supplied, the application  
76055 shall ensure that the keywords exactly match the given string; however,  
76056 the string shall contain a keyword, and no embedded <newline>  
76057 characters.
- 76058 **j** Allow concurrent *get* commands for editing on the same SID of an SCCS  
76059 file. This allows multiple concurrent updates to the same version of the  
76060 SCCS file.
- 76061 **l~~list~~** Specify a *list* of releases to which deltas can no longer be made (that is, *get*  
76062 **-e** against one of these locked releases fails). Conforming applications  
76063 shall use the following syntax to specify a *list*. Implementations may  
76064 accept additional forms as an extension:
- 76065 <list> ::= a | <range-list>  
76066 <range-list> ::= <range> | <range-list>, <range>  
76067 <range> ::= <SID>
- 76068 The character *a* in the *list* shall be equivalent to specifying all releases for  
76069 the named SCCS file. The non-terminal <SID> in range shall be the delta  
76070 number of an existing delta associated with the SCCS file.
- 76071 **n** Cause *delta* to create a null delta in each of those releases (if any) being  
76072 skipped when a delta is made in a new release (for example, in making  
76073 delta 5.1 after delta 2.7, releases 3 and 4 are skipped). These null deltas  
76074 shall serve as anchor points so that branch deltas may later be created  
76075 from them. The absence of this flag shall cause skipped releases to be  
76076 nonexistent in the SCCS file, preventing branch deltas from being created  
76077 from them in the future. During the initial creation of an SCCS file, the **n**  
76078 flag may be ignored; that is, if the **-r** option is used to set the release  
76079 number of the initial SID to a value greater than 1, null deltas need not be  
76080 created for the “skipped” releases.

76081	<b>qtext</b>	Substitute user-definable <i>text</i> for all occurrences of the %Q% keyword in the SCCS file text retrieved by <i>get</i> .
76082		
76083	<b>mmod</b>	Specify the module name of the SCCS file substituted for all occurrences of the %M% keyword in the SCCS file text retrieved by <i>get</i> . If the <b>m</b> flag is not specified, the value assigned shall be the name of the SCCS file with the leading ' .' removed.
76084		
76085		
76086		
76087	<b>ttype</b>	Specify the <i>type</i> of module in the SCCS file substituted for all occurrences of the %Y% keyword in the SCCS file text retrieved by <i>get</i> .
76088		
76089	<b>vpgm</b>	Cause <i>delta</i> to prompt for modification request (MR) numbers as the reason for creating a delta. The optional value specifies the name of an MR number validation program. (If this flag is set when creating an SCCS file, the application shall ensure that the <b>m</b> option is also used even if its value is null.)
76090		
76091		
76092		
76093		
76094	<b>-d flag</b>	Remove (delete) the specified <i>flag</i> from an SCCS file. Several <b>-d</b> options may be supplied on a single <i>admin</i> command. See the <b>-f</b> option for allowable <i>flag</i> names. (The <b>l</b> list flag gives a <i>list</i> of releases to be unlocked. See the <b>-f</b> option for further description of the <b>l</b> flag and the syntax of a <i>list</i> .)
76095		
76096		
76097		
76098	<b>-a login</b>	Specify a <i>login</i> name, or numerical group ID, to be added to the list of users who may make deltas (changes) to the SCCS file. A group ID shall be equivalent to specifying all <i>login</i> names common to that group ID. Several <b>-a</b> options may be used on a single <i>admin</i> command line. As many <i>logins</i> , or numerical group IDs, as desired may be on the list simultaneously. If the list of users is empty, then anyone may add deltas. If <i>login</i> or group ID is preceded by a '!', the users so specified shall be denied permission to make deltas.
76099		
76100		
76101		
76102		
76103		
76104		
76105	<b>-e login</b>	Specify a <i>login</i> name, or numerical group ID, to be erased from the list of users allowed to make deltas (changes) to the SCCS file. Specifying a group ID is equivalent to specifying all <i>login</i> names common to that group ID. Several <b>-e</b> options may be used on a single <i>admin</i> command line.
76106		
76107		
76108		
76109	<b>-y[comment]</b>	Insert the <i>comment</i> text into the SCCS file as a comment for the initial delta in a manner identical to that of <i>delta</i> . In the POSIX locale, omission of the <b>-y</b> option shall result in a default comment line being inserted in the form:
76110		
76111		
76112		"date and time created %s %s by %s", <date>, <time>, <login>
76113		where <date> is expressed in the format of the <i>date</i> utility's %y/%m/%d conversion specification, <time> in the format of the <i>date</i> utility's %T conversion specification format, and <login> is the login name of the user creating the file.
76114		
76115		
76116	<b>-m mrlist</b>	Insert the list of modification request (MR) numbers into the SCCS file as the reason for creating the initial delta in a manner identical to <i>delta</i> . The application shall ensure that the <b>v</b> flag is set and the MR numbers are validated if the <b>v</b> flag has a value (the name of an MR number validation program). A diagnostic message shall be written if the <b>v</b> flag is not set or MR validation fails.
76117		
76118		
76119		
76120		
76121	<b>-h</b>	Check the structure of the SCCS file and compare the newly computed checksum with the checksum that is stored in the SCCS file. If the newly computed checksum does not match the checksum in the SCCS file, a diagnostic message shall be written.
76122		
76123		
76124		

76125        **-z**            Recompute the SCCS file checksum and store it in the first line of the SCCS file (see  
76126                    the **-h** option above). Note that use of this option on a truly corrupted file may  
76127                    prevent future detection of the corruption.

#### 76128 **OPERANDS**

76129        The following operands shall be supported:

76130        *file*            A pathname of an existing SCCS file or a directory. If *file* is a directory, the *admin*  
76131                    utility shall behave as though each file in the directory were specified as a named  
76132                    file, except that non-SCCS files (last component of the pathname does not begin  
76133                    with **s**.) and unreadable files shall be silently ignored.

76134        *newfile*        A pathname of an SCCS file to be created.

76135        If exactly one *file* or *newfile* operand appears, and it is **'-'**, the standard input shall be read; each  
76136                    line of the standard input shall be taken to be the name of an SCCS file to be processed. Non-  
76137                    SCCS files and unreadable files shall be silently ignored.

#### 76138 **STDIN**

76139        The standard input shall be a text file used only if **-i** is specified without an option-argument or  
76140                    if a *file* or *newfile* operand is specified as **'-'**. If the first character of any standard input line is  
76141                    <SOH> in the POSIX locale, the results are unspecified.

#### 76142 **INPUT FILES**

76143        The existing SCCS files shall be text files of an unspecified format.

76144        The application shall ensure that the file named by the **-i** option's *name* option-argument shall  
76145                    be a text file; if the first character of any line in this file is <SOH> in the POSIX locale, the results  
76146                    are unspecified. If this file contains more than 99 999 lines, the number of lines recorded in the  
76147                    header for this file shall be 99 999 for this delta.

#### 76148 **ENVIRONMENT VARIABLES**

76149        The following environment variables shall affect the execution of *admin*:

76150        **LANG**            Provide a default value for the internationalization variables that are unset or null.  
76151                    (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
76152                    variables used to determine the values of locale categories.)

76153        **LC\_ALL**        If set to a non-empty string value, override the values of all the other  
76154                    internationalization variables.

76155        **LC\_CTYPE**        Determine the locale for the interpretation of sequences of bytes of text data as  
76156                    characters (for example, single-byte as opposed to multi-byte characters in  
76157                    arguments and input files).

76158        **LC\_MESSAGES**

76159                    Determine the locale that should be used to affect the format and contents of  
76160                    diagnostic messages written to standard error and the contents of the default **-y**  
76161                    comment.

76162        **NLSPATH**        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 76163 **ASYNCHRONOUS EVENTS**

76164        Default.

#### 76165 **STDOUT**

76166        Not used.

76167 **STDERR**

76168 The standard error shall be used only for diagnostic messages.

76169 **OUTPUT FILES**

76170 Any SCCS files created shall be text files of an unspecified format. During processing of a *file*, a locking *z-file*, as described in *get* (on page 2764), may be created and deleted.

76172 **EXTENDED DESCRIPTION**

76173 None.

76174 **EXIT STATUS**

76175 The following exit values shall be returned:

76176 0 Successful completion.

76177 >0 An error occurred.

76178 **CONSEQUENCES OF ERRORS**

76179 Default.

76180 **APPLICATION USAGE**

76181 It is recommended that directories containing SCCS files be writable by the owner only, and that SCCS files themselves be read-only. The mode of the directories should allow only the owner to modify SCCS files contained in the directories. The mode of the SCCS files prevents any modification at all except by SCCS commands.

76185 **EXAMPLES**

76186 None.

76187 **RATIONALE**

76188 None.

76189 **FUTURE DIRECTIONS**

76190 None.

76191 **SEE ALSO**

76192 *delta*, *get*, *prs*, *what*

76193 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

76194 **CHANGE HISTORY**

76195 First released in Issue 2.

76196 **Issue 6**

76197 The normative text is reworded to avoid use of the term “must” for application requirements, and to emphasize the term “shall” for implementation requirements.

76199 The grammar is updated.

76200 The Open Group Base Resolution bwg2001-007 is applied, adding new text to the INPUT FILES section warning that the maximum lines recorded in the file is 99 999.

76202 The Open Group Base Resolution bwg2001-009 is applied, amending the description of the **-h** option.

76204 **NAME**

76205 alias — define or display aliases

76206 **SYNOPSIS**76207 alias [*alias-name*[=*string*]...]76208 **DESCRIPTION**

76209 The *alias* utility shall create or redefine alias definitions or write the values of existing alias  
 76210 definitions to standard output. An alias definition provides a string value that shall replace a  
 76211 command name when it is encountered; see [Section 2.3.1](#) (on page 2300).

76212 An alias definition shall affect the current shell execution environment and the execution  
 76213 environments of the subshells of the current shell. When used as specified by this volume of  
 76214 POSIX.1-2008, the alias definition shall not affect the parent process of the current shell nor any  
 76215 utility environment invoked by the shell; see [Section 2.12](#) (on page 2331).

76216 **OPTIONS**

76217 None.

76218 **OPERANDS**

76219 The following operands shall be supported:

76220 *alias-name* Write the alias definition to standard output.76221 *alias-name=string*76222 Assign the value of *string* to the alias *alias-name*.

76223 If no operands are given, all alias definitions shall be written to standard output.

76224 **STDIN**

76225 Not used.

76226 **INPUT FILES**

76227 None.

76228 **ENVIRONMENT VARIABLES**76229 The following environment variables shall affect the execution of *alias*:

76230 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 76231 (See [XBD Section 8.2](#) (on page 174) for the precedence of internationalization  
 76232 variables used to determine the values of locale categories.)

76233 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 76234 internationalization variables.

76235 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 76236 characters (for example, single-byte as opposed to multi-byte characters in  
 76237 arguments).

76238 *LC\_MESSAGES*

76239 Determine the locale that should be used to affect the format and contents of  
 76240 diagnostic messages written to standard error.

76241 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.76242 **ASYNCHRONOUS EVENTS**

76243 Default.

76244 **STDOUT**

76245 The format for displaying aliases (when no operands or only *name* operands are specified) shall  
76246 be:

76247 `"%s=%s\n", name, value`

76248 The *value* string shall be written with appropriate quoting so that it is suitable for reinput to the  
76249 shell. See the description of shell quoting in Section 2.2 (on page 2298).

76250 **STDERR**

76251 The standard error shall be used only for diagnostic messages.

76252 **OUTPUT FILES**

76253 None.

76254 **EXTENDED DESCRIPTION**

76255 None.

76256 **EXIT STATUS**

76257 The following exit values shall be returned:

76258 0 Successful completion.

76259 >0 One of the *name* operands specified did not have an alias definition, or an error occurred.

76260 **CONSEQUENCES OF ERRORS**

76261 Default.

76262 **APPLICATION USAGE**

76263 None.

76264 **EXAMPLES**

76265 1. Create a short alias for a commonly used *ls* command:

76266 `alias lf="ls -CF"`

76267 2. Create a simple "redo" command to repeat previous entries in the command history file:

76268 `alias r='fc -s'`

76269 3. Use 1K units for *du*:

76270 `alias du=du\ -k`

76271 4. Set up *nohup* so that it can deal with an argument that is itself an alias name:

76272 `alias nohup="nohup "`

76273 **RATIONALE**

76274 The *alias* description is based on historical KornShell implementations. Known differences exist  
76275 between that and the C shell. The KornShell version was adopted to be consistent with all the  
76276 other KornShell features in this volume of POSIX.1-2008, such as command line editing.

76277 Since *alias* affects the current shell execution environment, it is generally provided as a shell  
76278 regular built-in.

76279 Historical versions of the KornShell have allowed aliases to be exported to scripts that are  
76280 invoked by the same shell. This is triggered by the *alias -x* flag; it is allowed by this volume of  
76281 POSIX.1-2008 only when an explicit extension such as *-x* is used. The standard developers  
76282 considered that aliases were of use primarily to interactive users and that they should normally  
76283 not affect shell scripts called by those users; functions are available to such scripts.

76284 Historical versions of the KornShell had not written aliases in a quoted manner suitable for  
76285 reentry to the shell, but this volume of POSIX.1-2008 has made this a requirement for all similar  
76286 output. Therefore, consistency was chosen over this detail of historical practice.

76287 **FUTURE DIRECTIONS**

76288 None.

76289 **SEE ALSO**

76290 [Section 2.9.5](#) (on page 2324)

76291 XBD [Chapter 8](#) (on page 173)

76292 **CHANGE HISTORY**

76293 First released in Issue 4.

76294 **Issue 6**

76295 This utility is marked as part of the User Portability Utilities option.

76296 The APPLICATION USAGE section is added.

76297 **Issue 7**

76298 The *alias* utility is moved from the User Portability Utilities option to the Base. User Portability  
76299 Utilities is now an option for interactive utilities.

76300 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

76301 The first example is changed to remove the creation of an alias for a standard utility that alters  
76302 its behavior to be non-conforming.

## 76303 NAME

76304 ar — create and maintain library archives

## 76305 SYNOPSIS

76306 SD ar -d [-v] archive file...

76307 XSI ar -m [-v] archive file...

76308 ar -m -a [-v] posname archive file...

76309 ar -m -b [-v] posname archive file...

76310 ar -m -i [-v] posname archive file...

76311 XSI ar -p [-v] [-s] archive [file...]

76312 XSI ar -q [-cv] archive file...

76313 ar -r [-cuv] archive file...

76314 XSI ar -r -a [-cuv] posname archive file...

76315 ar -r -b [-cuv] posname archive file...

76316 ar -r -i [-cuv] posname archive file...

76317 XSI ar -t [-v] [-s] archive [file...]

76318 XSI ar -x [-v] [-sCT] archive [file...]

## 76319 DESCRIPTION

76320 The *ar* utility is part of the Software Development Utilities option.

76321 The *ar* utility can be used to create and maintain groups of files combined into an archive. Once  
 76322 an archive has been created, new files can be added, and existing files in an archive can be  
 76323 extracted, deleted, or replaced. When an archive consists entirely of valid object files, the  
 76324 implementation shall format the archive so that it is usable as a library for link editing (see *c99*  
 76325 and *fort77*). When some of the archived files are not valid object files, the suitability of the  
 76326 XSI archive for library use is undefined. If an archive consists entirely of printable files, the entire  
 76327 archive shall be printable.

76328 When *ar* creates an archive, it creates administrative information indicating whether a symbol  
 76329 table is present in the archive. When there is at least one object file that *ar* recognizes as such in  
 76330 the archive, an archive symbol table shall be created in the archive and maintained by *ar*; it is  
 76331 used by the link editor to search the archive. Whenever the *ar* utility is used to create or update  
 76332 the contents of such an archive, the symbol table shall be rebuilt. The *-s* option shall force the  
 76333 symbol table to be rebuilt.

76334 All *file* operands can be pathnames. However, files within archives shall be named by a filename,  
 76335 which is the last component of the pathname used when the file was entered into the archive.  
 76336 The comparison of *file* operands to the names of files in archives shall be performed by  
 76337 comparing the last component of the operand to the name of the file in the archive.

76338 It is unspecified whether multiple files in the archive may be identically named. In the case of  
 76339 XSI such files, however, each *file* and *posname* operand shall match only the first file in the archive  
 76340 having a name that is the same as the last component of the operand.

76341 **OPTIONS**

76342 The *ar* utility shall conform to XBD Section 12.2 (on page 215), except for Guideline 9.

76343 The following options shall be supported:

- 76344 XSI **-a** Position new files in the archive after the file named by the *posname* operand.
- 76345 XSI **-b** Position new files in the archive before the file named by the *posname* operand.
- 76346 **-c** Suppress the diagnostic message that is written to standard error by default when the archive *archive* is created.
- 76347
- 76348 XSI **-C** Prevent extracted files from replacing like-named files in the file system. This option is useful when **-T** is also used, to prevent truncated filenames from replacing files with the same prefix.
- 76349
- 76350
- 76351 **-d** Delete one or more *files* from *archive*.
- 76352 XSI **-i** Position new files in the archive before the file in the archive named by the *posname* operand (equivalent to **-b**).
- 76353
- 76354 XSI **-m** Move the named files in the archive. The **-a**, **-b**, or **-i** options with the *posname* operand indicate the position; otherwise, move the names files in the archive to the end of the archive.
- 76355
- 76356
- 76357 **-p** Write the contents of the *files* in the archive named by *file* operands from *archive* to the standard output. If no *file* operands are specified, the contents of all files in the archive shall be written in the order of the archive.
- 76358
- 76359
- 76360 XSI **-q** Append the named files to the end of the archive. In this case *ar* does not check whether the added files are already in the archive. This is useful to bypass the searching otherwise done when creating a large archive piece by piece.
- 76361
- 76362
- 76363 **-r** Replace or add *files* to *archive*. If the archive named by *archive* does not exist, a new archive shall be created and a diagnostic message shall be written to standard error (unless the **-c** option is specified). If no *files* are specified and the *archive* exists, the results are undefined. Files that replace existing files in the archive shall not change the order of the archive. Files that do not replace existing files in the archive shall be appended to the archive unless a **-a**, **-b**, or **-i** option specifies another position.
- 76364
- 76365
- 76366
- 76367
- 76368 XSI
- 76369 XSI **-s** Force the regeneration of the archive symbol table even if *ar* is not invoked with an option that modifies the archive contents. This option is useful to restore the archive symbol table after it has been stripped; see *strip*.
- 76370
- 76371
- 76372 **-t** Write a table of contents of *archive* to the standard output. Only the files specified by the *file* operands shall be included in the written list. If no *file* operands are specified, all files in *archive* shall be included in the order of the archive.
- 76373
- 76374
- 76375 XSI **-T** Allow filename truncation of extracted files whose archive names are longer than the file system can support. By default, extracting a file with a name that is too long shall be an error; a diagnostic message shall be written and the file shall not be extracted.
- 76376
- 76377
- 76378
- 76379 **-u** Update older files in the archive. When used with the **-r** option, files in the archive shall be replaced only if the corresponding *file* has a modification time that is at least as new as the modification time of the file in the archive.
- 76380
- 76381

- 76382        **-v**            Give verbose output. When used with the option characters **-d**, **-r**, or **-x**, write a  
76383 detailed file-by-file description of the archive creation and maintenance activity, as  
76384 described in the STDOUT section.
- 76385                    When used with **-p**, write the name of the file in the archive to the standard output  
76386 before writing the file in the archive itself to the standard output, as described in  
76387 the STDOUT section.
- 76388                    When used with **-t**, include a long listing of information about the files in the  
76389 archive, as described in the STDOUT section.
- 76390        **-x**            Extract the files in the archive named by the *file* operands from *archive*. The  
76391 contents of the archive shall not be changed. If no *file* operands are given, all files  
76392 in the archive shall be extracted. The modification time of each file extracted shall  
76393 be set to the time the file is extracted from the archive.

**OPERANDS**

76394            The following operands shall be supported:

- 76395            *archive*        A pathname of the archive.
- 76396            *file*             A pathname. Only the last component shall be used when comparing against the  
76397 names of files in the archive. If two or more *file* operands have the same last  
76398 pathname component (basename), the results are unspecified. The  
76399 implementation's archive format shall not truncate valid filenames of files added  
76400 to or replaced in the archive.
- 76401
- 76402 XSI        *posname*        The name of a file in the archive, used for relative positioning; see options **-m** and  
76403 **-r**.

**STDIN**

76404            Not used.

**INPUT FILES**

76406            The archive named by *archive* shall be a file in the format created by *ar -r*.

**ENVIRONMENT VARIABLES**

76408            The following environment variables shall affect the execution of *ar*:

- 76410        *LANG*            Provide a default value for the internationalization variables that are unset or null.  
76411 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
76412 variables used to determine the values of locale categories.)
- 76413        *LC\_ALL*         If set to a non-empty string value, override the values of all the other  
76414 internationalization variables.
- 76415        *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
76416 characters (for example, single-byte as opposed to multi-byte characters in  
76417 arguments and input files).
- 76418        *LC\_MESSAGES*   Determine the locale that should be used to affect the format and contents of  
76419 diagnostic messages written to standard error.  
76420
- 76421        *LC\_TIME*        Determine the format and content for date and time strings written by *ar -tv*.
- 76422 XSI        *NLSPATH*        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

76423	<i>TMPDIR</i>	Determine the pathname that overrides the default directory for temporary files, if any.
76424		
76425	<i>TZ</i>	Determine the timezone used to calculate date and time strings written by <i>ar -tv</i> . If <i>TZ</i> is unset or null, an unspecified default timezone shall be used.
76426		
76427	<b>ASYNCHRONOUS EVENTS</b>	
76428	Default.	
76429	<b>STDOUT</b>	
76430		If the <b>-d</b> option is used with the <b>-v</b> option, the standard output format shall be:
76431		"d - %s\n", <file>
76432		where <i>file</i> is the operand specified on the command line.
76433		If the <b>-p</b> option is used with the <b>-v</b> option, <i>ar</i> shall precede the contents of each file with:
76434		"\n<%s>\n\n", <file>
76435		where <i>file</i> is the operand specified on the command line, if <i>file</i> operands were specified, and the name of the file in the archive if they were not.
76436		
76437		If the <b>-r</b> option is used with the <b>-v</b> option:
76438		• If <i>file</i> is already in the archive, the standard output format shall be:
76439		"r - %s\n", <file>
76440		where < <i>file</i> > is the operand specified on the command line.
76441		• If <i>file</i> is not already in the archive, the standard output format shall be:
76442		"a - %s\n", <file>
76443		where < <i>file</i> > is the operand specified on the command line.
76444		If the <b>-t</b> option is used, <i>ar</i> shall write the names of the files in the archive to the standard output in the format:
76445		
76446		"%s\n", <file>
76447		where <i>file</i> is the operand specified on the command line, if <i>file</i> operands were specified, or the name of the file in the archive if they were not.
76448		
76449		If the <b>-t</b> option is used with the <b>-v</b> option, the standard output format shall be:
76450		"%s %u/%u %u %s %d %d:%d %d %s\n", <member mode>, <user ID>, <group ID>, <number of bytes in member>, <abbreviated month>, <day-of-month>, <hour>, <minute>, <year>, <file>
76451		
76452		
76453		
76454		where:
76455	< <i>file</i> >	Shall be the operand specified on the command line, if <i>file</i> operands were specified, or the name of the file in the archive if they were not.
76456		
76457	< <i>member mode</i> >	
76458		Shall be formatted the same as the < <i>file mode</i> > string defined in the STDOUT section of <i>ls</i> , except that the first character, the < <i>entry type</i> >, is not used; the string represents the file mode of the file in the archive at the time it was added to or replaced in the archive.
76459		
76460		
76461		

76462 The following represent the last-modification time of a file when it was most recently added to  
76463 or replaced in the archive:

76464 <abbreviated month>

76465 Equivalent to the format of the %b conversion specification format in *date*.

76466 <day-of-month>

76467 Equivalent to the format of the %e conversion specification format in *date*.

76468 <hour>

Equivalent to the format of the %H conversion specification format in *date*.

76469 <minute>

Equivalent to the format of the %M conversion specification format in *date*.

76470 <year>

Equivalent to the format of the %Y conversion specification format in *date*.

76471 When *LC\_TIME* does not specify the POSIX locale, a different format and order of presentation  
76472 of these fields relative to each other may be used in a format appropriate in the specified locale.

76473 If the *-x* option is used with the *-v* option, the standard output format shall be:

76474 "x - %s\n", <file>

76475 where *file* is the operand specified on the command line, if *file* operands were specified, or the  
76476 name of the file in the archive if they were not.

#### 76477 **STDERR**

76478 The standard error shall be used only for diagnostic messages. The diagnostic message about  
76479 creating a new archive when *-c* is not specified shall not modify the exit status.

#### 76480 **OUTPUT FILES**

76481 Archives are files with unspecified formats.

#### 76482 **EXTENDED DESCRIPTION**

76483 None.

#### 76484 **EXIT STATUS**

76485 The following exit values shall be returned:

76486 0 Successful completion.

76487 >0 An error occurred.

#### 76488 **CONSEQUENCES OF ERRORS**

76489 Default.

#### 76490 **APPLICATION USAGE**

76491 None.

#### 76492 **EXAMPLES**

76493 None.

#### 76494 **RATIONALE**

76495 The archive format is not described. It is recognized that there are several known *ar* formats,  
76496 which are not compatible. The *ar* utility is included, however, to allow creation of archives that  
76497 are intended for use only on one machine. The archive is specified as a file, and it can be moved  
76498 as a file. This does allow an archive to be moved from one machine to another machine that uses  
76499 the same implementation of *ar*.

76500 Utilities such as *pax* (and its forebears *tar* and *cpio*) also provide portable "archives". This is a not  
76501 a duplication; the *ar* utility is included to provide an interface primarily for *make* and the  
76502 compilers, based on a historical model.

- 76503 In historical implementations, the `-q` option (available on XSI-conforming systems) is known to  
 76504 execute quickly because *ar* does not check on whether the added members are already in the  
 76505 archive. This is useful to bypass the searching otherwise done when creating a large archive  
 76506 piece-by-piece. These remarks may but need not remain true for a brand new implementation of  
 76507 this utility; hence, these remarks have been moved into the RATIONALE.
- 76508 BSD implementations historically required applications to provide the `-s` option whenever the  
 76509 archive was supposed to contain a symbol table. As in this volume of POSIX.1-2008, System V  
 76510 historically creates or updates an archive symbol table whenever an object file is removed from,  
 76511 added to, or updated in the archive.
- 76512 The OPERANDS section requires what might seem to be true without specifying it: the archive  
 76513 cannot truncate the filenames below {NAME\_MAX}. Some historical implementations do so,  
 76514 however, causing unexpected results for the application. Therefore, this volume of POSIX.1-2008  
 76515 makes the requirement explicit to avoid misunderstandings.
- 76516 According to the System V documentation, the options `-dmpqrtx` are not required to begin with  
 76517 a <hyphen> ('-'). This volume of POSIX.1-2008 requires that a conforming application use the  
 76518 leading <hyphen>.
- 76519 The archive format used by the 4.4 BSD implementation is documented in this RATIONALE as  
 76520 an example:
- 76521 A file created by *ar* begins with the "magic" string "`!<arch>\n". The rest of the archive  
 76522 is made up of objects, each of which is composed of a header for a file, a possible filename,  
 76523 and the file contents. The header is portable between machine architectures, and, if the file  
 76524 contents are printable, the archive is itself printable.`
- 76525 The header is made up of six ASCII fields, followed by a two-character trailer. The fields  
 76526 are the object name (16 characters), the file last modification time (12 characters), the user  
 76527 and group IDs (each 6 characters), the file mode (8 characters), and the file size (10  
 76528 characters). All numeric fields are in decimal, except for the file mode, which is in octal.
- 76529 The modification time is the file `st_mtime` field. The user and group IDs are the file `st_uid`  
 76530 and `st_gid` fields. The file mode is the file `st_mode` field. The file size is the file `st_size` field.  
 76531 The two-byte trailer is the string "`\code><newline>`".
- 76532 Only the name field has any provision for overflow. If any filename is more than 16  
 76533 characters in length or contains an embedded space, the string "`#1/`" followed by the  
 76534 ASCII length of the name is written in the name field. The file size (stored in the archive  
 76535 header) is incremented by the length of the name. The name is then written immediately  
 76536 following the archive header.
- 76537 Any unused characters in any of these fields are written as <space> characters. If any fields  
 76538 are their particular maximum number of characters in length, there is no separation  
 76539 between the fields.
- 76540 Objects in the archive are always an even number of bytes long; files that are an odd  
 76541 number of bytes long are padded with a <newline>, although the size in the header does  
 76542 not reflect this.
- 76543 The *ar* utility description requires that (when all its members are valid object files) *ar* produce an  
 76544 object code library, which the linkage editor can use to extract object modules. If the linkage  
 76545 editor needs a symbol table to permit random access to the archive, *ar* must provide it; however,  
 76546 *ar* does not require a symbol table.
- 76547 The BSD `-o` option was omitted. It is a rare conforming application that uses *ar* to extract object

76548 code from a library with concern for its modification time, since this can only be of importance  
76549 to *make*. Hence, since this functionality is not deemed important for applications portability, the  
76550 modification time of the extracted files is set to the current time.

76551 There is at least one known implementation (for a small computer) that can accommodate only  
76552 object files for that system, disallowing mixed object and other files. The ability to handle any  
76553 type of file is not only historical practice for most implementations, but is also a reasonable  
76554 expectation.

76555 Consideration was given to changing the output format of *ar -tv* to the same format as the  
76556 output of *ls -l*. This would have made parsing the output of *ar* the same as that of *ls*. This was  
76557 rejected in part because the current *ar* format is commonly used and changes would break  
76558 historical usage. Second, *ar* gives the user ID and group ID in numeric format separated by a  
76559 <slash>. Changing this to be the user name and group name would not be correct if the archive  
76560 were moved to a machine that contained a different user database. Since *ar* cannot know  
76561 whether the archive was generated on the same machine, it cannot tell what to report.

76562 The text on the *-ur* option combination is historical practice—since one filename can easily  
76563 represent two different files (for example, */a/foo* and */b/foo*), it is reasonable to replace the file in  
76564 the archive even when the modification time in the archive is identical to that in the file system.

#### 76565 FUTURE DIRECTIONS

76566 None.

#### 76567 SEE ALSO

76568 *c99*, *date*, *fort77*, *pax*, *strip*

76569 XBD Chapter 8 (on page 173), Section 12.2 (on page 215), <*unistd.h*>, description of  
76570 {POSIX\_NO\_TRUNC}

#### 76571 CHANGE HISTORY

76572 First released in Issue 2.

#### 76573 Issue 5

76574 The FUTURE DIRECTIONS section is added.

#### 76575 Issue 6

76576 This utility is marked as part of the Software Development Utilities option.

76577 The STDOUT description is changed for the *-v* option to align with the IEEE P1003.2b draft  
76578 standard.

76579 The normative text is reworded to avoid use of the term “must” for application requirements.

76580 The TZ entry is added to the ENVIRONMENT VARIABLES section.

76581 IEEE PASC Interpretation 1003.2 #198 is applied, changing the description to consistently use  
76582 “file” to refer to a file in the file system hierarchy, “archive” to refer to the archive being  
76583 operated upon by the *ar* utility, and “file in the archive” to refer to a copy of a file that is  
76584 contained in the archive.

76585 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/10 is applied, making corrections to the  
76586 SYNOPSIS. The change was needed since the *-a*, *-b*, and *-i* options are mutually-exclusive, and  
76587 *posname* is required if any of these options is specified.

76588 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/11 is applied, correcting the description  
76589 of the two-byte trailer in RATIONALE which had missed out a backquote. The correct trailer is a  
76590 backquote followed by a <newline>.

76591 **Issue 7**

76592 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
76593 apply.

76594 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

76595 The description of the `-t` option is changed to say "Only the files specified ...".

76596 **NAME**

76597           asa — interpret carriage-control characters

76598 **SYNOPSIS**76599 FR       asa [*file...*]76600 **DESCRIPTION**76601           The *asa* utility shall write its input files to standard output, mapping carriage-control characters  
76602           from the text files to line-printer control sequences in an implementation-defined manner.76603           The first character of every line shall be removed from the input, and the following actions are  
76604           performed.

76605           If the character removed is:

76606           &lt;space&gt;       The rest of the line is output without change.

76607           0            A &lt;newline&gt; is output, then the rest of the input line.

76608           1            One or more implementation-defined characters that causes an advance to the next  
76609           page shall be output, followed by the rest of the input line.76610           +            The <newline> of the previous line shall be replaced with one or more  
76611           implementation-defined characters that causes printing to return to column  
76612           position 1, followed by the rest of the input line. If the '+' is the first character in  
76613           the input, it shall be equivalent to <space>.76614           The action of the *asa* utility is unspecified upon encountering any character other than those  
76615           listed above as the first character in a line.76616 **OPTIONS**

76617           None.

76618 **OPERANDS**76619           *file*           A pathname of a text file used for input. If no *file* operands are specified, the  
76620           standard input shall be used.76621 **STDIN**76622           The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
76623           operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
76624           the standard input shall not be used. See the INPUT FILES section.76625 **INPUT FILES**

76626           The input files shall be text files.

76627 **ENVIRONMENT VARIABLES**76628           The following environment variables shall affect the execution of *asa*:76629           LANG           Provide a default value for the internationalization variables that are unset or null.  
76630           (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
76631           variables used to determine the values of locale categories.)76632           LC\_ALL          If set to a non-empty string value, override the values of all the other  
76633           internationalization variables.76634           LC\_CTYPE       Determine the locale for the interpretation of sequences of bytes of text data as  
76635           characters (for example, single-byte as opposed to multi-byte characters in  
76636           arguments and input files).

76637	<i>LC_MESSAGES</i>	
76638		Determine the locale that should be used to affect the format and contents of
76639		diagnostic messages written to standard error.
76640	XSI	<i>NLSPATH</i> Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
76641	<b>ASYNCHRONOUS EVENTS</b>	
76642		Default.
76643	<b>STDOUT</b>	
76644		The standard output shall be the text from the input file modified as described in the
76645		DESCRIPTION section.
76646	<b>STDERR</b>	
76647		None.
76648	<b>OUTPUT FILES</b>	
76649		None.
76650	<b>EXTENDED DESCRIPTION</b>	
76651		None.
76652	<b>EXIT STATUS</b>	
76653		The following exit values shall be returned:
76654	0	All input files were output successfully.
76655	>0	An error occurred.
76656	<b>CONSEQUENCES OF ERRORS</b>	
76657		Default.
76658	<b>APPLICATION USAGE</b>	
76659		None.
76660	<b>EXAMPLES</b>	
76661	1.	The following command:
76662		<i>asa file</i>
76663		permits the viewing of <i>file</i> (created by a program using FORTRAN-style carriage-control
76664		characters) on a terminal.
76665	2.	The following command:
76666		<i>a.out   asa   lp</i>
76667		formats the FORTRAN output of <b>a.out</b> and directs it to the printer.
76668	<b>RATIONALE</b>	
76669		The <i>asa</i> utility is needed to map “standard” FORTRAN 77 output into a form acceptable to
76670		contemporary printers. Usually, <i>asa</i> is used to pipe data to the <i>lp</i> utility; see <i>lp</i> .
76671		This utility is generally used only by FORTRAN programs. The standard developers decided to
76672		retain <i>asa</i> to avoid breaking the historical large base of FORTRAN applications that put carriage-
76673		control characters in their output files. There is no requirement that a system have a FORTRAN
76674		compiler in order to run applications that need <i>asa</i> .
76675		Historical implementations have used an ASCII <form-feed> in response to a 1 and an ASCII
76676		<carriage-return> in response to a '+' . It is suggested that implementations treat characters
76677		other than 0, 1, and '+' as <space> in the absence of any compelling reason to do otherwise.

- 76678            However, the action is listed here as “unspecified”, permitting an implementation to provide  
76679            extensions to access fast multiple-line slewing and channel seeking in a non-portable manner.
- 76680    **FUTURE DIRECTIONS**
- 76681            None.
- 76682    **SEE ALSO**
- 76683            *fort77, lp*
- 76684            XBD [Chapter 8](#) (on page 173)
- 76685    **CHANGE HISTORY**
- 76686            First released in Issue 4.
- 76687    **Issue 6**
- 76688            This utility is marked as part of the FORTRAN Runtime Utilities option.
- 76689            The normative text is reworded to avoid use of the term “must” for application requirements.
- 76690    **Issue 7**
- 76691            Austin Group Interpretation 1003.1-2001 #092 is applied.
- 76692            SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

76693 **NAME**

76694 at — execute commands at a later time

76695 **SYNOPSIS**76696 at [-m] [-f *file*] [-q *queuename*] -t *time\_arg*76697 at [-m] [-f *file*] [-q *queuename*] *timespec...*76698 at -r *at\_job\_id...*76699 at -l -q *queuename*76700 at -l [*at\_job\_id...*]76701 **DESCRIPTION**76702 The *at* utility shall read commands from standard input and group them together as an *at-job*, to  
76703 be executed at a later time.76704 The *at-job* shall be executed in a separate invocation of the shell, running in a separate process  
76705 group with no controlling terminal, except that the environment variables, current working  
76706 directory, file creation mask, and other implementation-defined execution-time attributes in  
76707 effect when the *at* utility is executed shall be retained and used when the *at-job* is executed.76708 When the *at-job* is submitted, the *at\_job\_id* and scheduled time shall be written to standard error.  
76709 The *at\_job\_id* is an identifier that shall be a string consisting solely of alphanumeric characters  
76710 and the <period> character. The *at\_job\_id* shall be assigned by the system when the job is  
76711 scheduled such that it uniquely identifies a particular job.76712 User notification and the processing of the job's standard output and standard error are  
76713 described under the **-m** option.76714 XSI Users shall be permitted to use *at* if their name appears in the file **at.allow** which is located in an  
76715 implementation-defined directory. If that file does not exist, the file **at.deny**, which is located in  
76716 an implementation-defined directory, shall be checked to determine whether the user shall be  
76717 denied access to *at*. If neither file exists, only a process with appropriate privileges shall be  
76718 allowed to submit a job. If only **at.deny** exists and is empty, global usage shall be permitted. The  
76719 **at.allow** and **at.deny** files shall consist of one user name per line.76720 **OPTIONS**76721 The *at* utility shall conform to XBD [Section 12.2](#) (on page 215).

76722 The following options shall be supported:

76723 **-f file** Specify the pathname of a file to be used as the source of the *at-job*, instead of  
76724 standard input.76725 **-l** (The letter ell.) Report all jobs scheduled for the invoking user if no *at\_job\_id*  
76726 operands are specified. If *at\_job\_ids* are specified, report only information for these  
76727 jobs. The output shall be written to standard output.76728 **-m** Send mail to the invoking user after the *at-job* has run, announcing its completion.  
76729 Standard output and standard error produced by the *at-job* shall be mailed to the  
76730 user as well, unless redirected elsewhere. Mail shall be sent even if the job  
76731 produces no output.76732 If **-m** is not used, the job's standard output and standard error shall be provided to  
76733 the user by means of mail, unless they are redirected elsewhere; if there is no such  
76734 output to provide, the implementation need not notify the user of the job's  
76735 completion.

- 76736            **-q** *queuename*  
 76737            Specify in which queue to schedule a job for submission. When used with the **-l**  
 76738            option, limit the search to that particular queue. By default, at-jobs shall be  
 76739            scheduled in queue *a*. In contrast, queue *b* shall be reserved for batch jobs; see  
 76740            *batch*. The meanings of all other *queuenames* are implementation-defined. If **-q** is  
 76741            specified along with either of the **-t** *time\_arg* or *timespec* arguments, the results are  
 76742            unspecified.
- 76743            **-r**            Remove the jobs with the specified *at\_job\_id* operands that were previously  
 76744            scheduled by the *at* utility.
- 76745            **-t** *time\_arg*    Submit the job to be run at the time specified by the *time* option-argument, which  
 76746            the application shall ensure has the format as specified by the *touch -t time* utility.

## 76747 OPERANDS

76748 The following operands shall be supported:

- 76749            *at\_job\_id*      The name reported by a previous invocation of the *at* utility at the time the job was  
 76750            scheduled.
- 76751            *timespec*      Submit the job to be run at the date and time specified. All of the *timespec* operands  
 76752            are interpreted as if they were separated by <space> characters and concatenated,  
 76753            and shall be parsed as described in the grammar at the end of this section. The date  
 76754            and time shall be interpreted as being in the timezone of the user (as determined  
 76755            by the *TZ* variable), unless a timezone name appears as part of *time*, below.
- 76756            In the POSIX locale, the following describes the three parts of the time specification  
 76757            string. All of the values from the *LC\_TIME* categories in the POSIX locale shall be  
 76758            recognized in a case-insensitive manner.
- 76759            *time*            The time can be specified as one, two, or four digits. One-digit and  
 76760            two-digit numbers shall be taken to be hours; four-digit numbers to  
 76761            be hours and minutes. The time can alternatively be specified as two  
 76762            numbers separated by a <colon>, meaning *hour:minute*. An AM/PM  
 76763            indication (one of the values from the **am\_pm** keywords in the  
 76764            *LC\_TIME* locale category) can follow the time; otherwise, a 24-hour  
 76765            clock time shall be understood. A timezone name can also follow to  
 76766            further qualify the time. The acceptable timezone names are  
 76767            implementation-defined, except that they shall be case-insensitive  
 76768            and the string **utc** is supported to indicate the time is in Coordinated  
 76769            Universal Time. In the POSIX locale, the *time* field can also be one of  
 76770            the following tokens:
- 76771                       **midnight**      Indicates the time 12:00 am (00:00).
- 76772                       **noon**            Indicates the time 12:00 pm.
- 76773                       **now**            Indicates the current day and time. Invoking *at* <**now**>  
 76774            shall submit an at-job for potentially immediate  
 76775            execution (that is, subject only to unspecified  
 76776            scheduling delays).
- 76777            *date*            An optional *date* can be specified as either a month name (one of the  
 76778            values from the **mon** or **abmon** keywords in the *LC\_TIME* locale  
 76779            category) followed by a day number (and possibly year number  
 76780            preceded by a comma), or a day of the week (one of the values from  
 76781            the **day** or **abday** keywords in the *LC\_TIME* locale category). In the

76782 POSIX locale, two special days shall be recognized:

76783 **today** Indicates the current day.

76784 **tomorrow** Indicates the day following the current day.

76785 If no *date* is given, **today** shall be assumed if the given time is greater  
76786 than the current time, and **tomorrow** shall be assumed if it is less. If  
76787 the given month is less than the current month (and no year is given),  
76788 next year shall be assumed.

76789 *increment* The optional *increment* shall be a number preceded by a <plus-sign>  
76790 ('+') and suffixed by one of the following: **minutes**, **hours**, **days**,  
76791 **weeks**, **months**, or **years**. (The singular forms shall also be accepted.)  
76792 The keyword **next** shall be equivalent to an increment number of +1.  
76793 For example, the following are equivalent commands:

76794 at 2pm + 1 week  
76795 at 2pm next week

76796 The following grammar describes the precise format of *timespec* in the POSIX locale. The general  
76797 conventions for this style of grammar are described in Section 1.3 (on page 2287). This formal  
76798 syntax shall take precedence over the preceding text syntax description. The longest possible  
76799 token or delimiter shall be recognized at a given point. When used in a *timespec*, white space  
76800 shall also delimit tokens.

```
76801 %token hr24clock_hr_min
76802 %token hr24clock_hour
76803 /*
76804 An hr24clock_hr_min is a one, two, or four-digit number. A one-digit
76805 or two-digit number constitutes an hr24clock_hour. An hr24clock_hour
76806 may be any of the single digits [0,9], or may be double digits, ranging
76807 from [00,23]. If an hr24clock_hr_min is a four-digit number, the
76808 first two digits shall be a valid hr24clock_hour, while the last two
76809 represent the number of minutes, from [00,59].
76810 */
```

```
76811 %token wallclock_hr_min
76812 %token wallclock_hour
76813 /*
76814 A wallclock_hr_min is a one, two-digit, or four-digit number.
76815 A one digit or two-digit number constitutes a wallclock_hour.
76816 A wallclock_hour may be any of the single digits [1,9], or may
76817 be double digits, ranging from [01,12]. If a wallclock_hr_min
76818 is a four-digit number, the first two digits shall be a valid
76819 wallclock_hour, while the last two represent the number of
76820 minutes, from [00,59].
76821 */
```

```
76822 %token minute
76823 /*
76824 A minute is a one or two-digit number whose value can be [0,9]

**76904 STDIN**

76905 The standard input shall be a text file consisting of commands acceptable to the shell command  
76906 language described in [Chapter 2](#) (on page 2297). The standard input shall only be used if no `-f`  
76907 `file` option is specified.

**76908 INPUT FILES**

76909 See the STDIN section.

76910 XSI The text files `at.allow` and `at.deny`, which are located in an implementation-defined directory,  
76911 shall contain zero or more user names, one per line, of users who are, respectively, authorized or  
76912 denied access to the `at` and `batch` utilities.

**76913 ENVIRONMENT VARIABLES**

76914 The following environment variables shall affect the execution of `at`:

76915 `LANG` Provide a default value for the internationalization variables that are unset or null.  
76916 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
76917 variables used to determine the values of locale categories.)

76918 `LC_ALL` If set to a non-empty string value, override the values of all the other  
76919 internationalization variables.

76920 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
76921 characters (for example, single-byte as opposed to multi-byte characters in  
76922 arguments and input files).

76923	<i>LC_MESSAGES</i>	
76924		Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error and informative messages written to standard output.
76925		
76926		
76927	XSI <i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
76928	<i>LC_TIME</i>	Determine the format and contents for date and time strings written and accepted by <i>at</i> .
76929		
76930	<i>SHELL</i>	Determine a name of a command interpreter to be used to invoke the <i>at</i> -job: If the variable is unset or null, <i>sh</i> shall be used. If it is set to a value other than a name for <i>sh</i> , the implementation shall do one of the following: use that shell; use <i>sh</i> ; use the login shell from the user database; or any of the preceding accompanied by a warning diagnostic about which was chosen.
76931		
76932		
76933		
76934		
76935	<i>TZ</i>	Determine the timezone. The job shall be submitted for execution at the time specified by <i>timespec</i> or <i>-t time</i> relative to the timezone specified by the <i>TZ</i> variable. If <i>timespec</i> specifies a timezone, it shall override <i>TZ</i> . If <i>timespec</i> does not specify a timezone and <i>TZ</i> is unset or null, an unspecified default timezone shall be used.
76936		
76937		
76938		
76939		
76940	<b>ASYNCHRONOUS EVENTS</b>	
76941		Default.
76942	<b>STDOUT</b>	
76943		When standard input is a terminal, prompts of unspecified format for each line of the user input described in the STDIN section may be written to standard output.
76944		
76945		In the POSIX locale, the following shall be written to the standard output for each job when jobs are listed in response to the <i>-l</i> option:
76946		
76947		<code>"%s\t%s\n", at_job_id, &lt;date&gt;</code>
76948		where <i>date</i> shall be equivalent in format to the output of:
76949		<code>date +"%a %b %e %T %Y"</code>
76950		The date and time written shall be adjusted so that they appear in the timezone of the user (as determined by the <i>TZ</i> variable).
76951		
76952	<b>STDERR</b>	
76953		In the POSIX locale, the following shall be written to standard error when a job has been successfully submitted:
76954		
76955		<code>"job %s at %s\n", at_job_id, &lt;date&gt;</code>
76956		where <i>date</i> has the same format as that described in the STDOUT section. Neither this, nor warning messages concerning the selection of the command interpreter, shall be considered a diagnostic that changes the exit status.
76957		
76958		
76959		Diagnostic messages, if any, shall be written to standard error.
76960	<b>OUTPUT FILES</b>	
76961		None.
76962	<b>EXTENDED DESCRIPTION</b>	
76963		None.

76964 **EXIT STATUS**

76965 The following exit values shall be returned:

76966 0 The *at* utility successfully submitted, removed, or listed a job or jobs.

76967 &gt;0 An error occurred.

76968 **CONSEQUENCES OF ERRORS**

76969 The job shall not be scheduled, removed, or listed.

76970 **APPLICATION USAGE**76971 The format of the *at* command line shown here is guaranteed only for the POSIX locale. Other  
76972 cultures may be supported with substantially different interfaces, although implementations are  
76973 encouraged to provide comparable levels of functionality.76974 Since the commands run in a separate shell invocation, running in a separate process group with  
76975 no controlling terminal, open file descriptors, traps, and priority inherited from the invoking  
76976 environment are lost.76977 Some implementations do not allow substitution of different shells using *SHELL*. System V  
76978 systems, for example, have used the login shell value for the user in */etc/passwd*. To select  
76979 reliably another command interpreter, the user must include it as part of the script, such as:76980 \$ at 1800  
76981 myshell myscript  
76982 EOT  
76983 **job ... at ...**  
76984 \$76985 **EXAMPLES**

76986 1. This sequence can be used at a terminal:

76987 at -m 0730 tomorrow  
76988 sort < file >outfile  
76989 EOT76990 2. This sequence, which demonstrates redirecting standard error to a pipe, is useful in a  
76991 command procedure (the sequence of output redirection specifications is significant):76992 at now + 1 hour <<!  
76993 diff file1 file2 2>&1 >outfile | mailx mygroup  
76994 !76995 3. To have a job reschedule itself, *at* can be invoked from within the at-job. For example, this  
76996 daily processing script named **my.daily** runs every day (although *crontab* is a more  
76997 appropriate vehicle for such work):76998 # my.daily runs every day  
76999 *daily processing*  
77000 at now tomorrow < my.daily77001 4. The spacing of the three portions of the POSIX locale *timespec* is quite flexible as long as  
77002 there are no ambiguities. Examples of various times and operand presentation include:77003 at 0815am Jan 24  
77004 at 8 :15amjan24  
77005 at now "+ 1day"  
77006 at 5 pm FRIday  
77007 at '17

77008                   utc+  
77009                   30minutes'

#### 77010 RATIONALE

77011                   The *at* utility reads from standard input the commands to be executed at a later time. It may be  
77012                   useful to redirect standard output and standard error within the specified commands.

77013                   The *-t time* option was added as a new capability to support an internationalized way of  
77014                   specifying a time for execution of the submitted job.

77015                   Early proposals added a “jobname” concept as a way of giving submitted jobs names that are  
77016                   meaningful to the user submitting them. The historical, system-specified *at\_job\_id* gives no  
77017                   indication of what the job is. Upon further reflection, it was decided that the benefit of this was  
77018                   not worth the change in historical interface. The *at* functionality is useful in simple  
77019                   environments, but in large or complex situations, the functionality provided by the Batch  
77020                   Services option is more suitable.

77021                   The *-q* option historically has been an undocumented option, used mainly by the *batch* utility.

77022                   The System V *-m* option was added to provide a method for informing users that an at-job had  
77023                   completed. Otherwise, users are only informed when output to standard error or standard  
77024                   output are not redirected.

77025                   The behavior of *at <now>* was changed in an early proposal from being unspecified to  
77026                   submitting a job for potentially immediate execution. Historical BSD *at* implementations support  
77027                   this. Historical System V implementations give an error in that case, but a change to the System  
77028                   V versions should have no backwards-compatibility ramifications.

77029                   On BSD-based systems, a *-u user* option has allowed those with appropriate privileges to access  
77030                   the work of other users. Since this is primarily a system administration feature and is not  
77031                   universally implemented, it has been omitted. Similarly, a specification for the output format for  
77032                   a user with appropriate privileges viewing the queues of other users has been omitted.

77033                   The *-f file* option from System V is used instead of the BSD method of using the last operand as  
77034                   the pathname. The BSD method is ambiguous—does:

77035                   at 1200 friday

77036                   mean the same thing if there is a file named **friday** in the current directory?

77037                   The *at\_job\_id* is composed of a limited character set in historical practice, and it is mandated here  
77038                   to invalidate systems that might try using characters that require shell quoting or that could not  
77039                   be easily parsed by shell scripts.

77040                   The *at* utility varies between System V and BSD systems in the way timezones are used. On  
77041                   System V systems, the *TZ* variable affects the at-job submission times and the times displayed  
77042                   for the user. On BSD systems, *TZ* is not taken into account. The BSD behavior is easily achieved  
77043                   with the current specification. If the user wishes to have the timezone default to that of the  
77044                   system, they merely need to issue the *at* command immediately following an unsetting or null  
77045                   assignment to *TZ*. For example:

77046                   TZ= at noon ...

77047                   gives the desired BSD result.

77048                   While the *yacc*-like grammar specified in the OPERANDS section is lexically unambiguous with  
77049                   respect to the digit strings, a lexical analyzer would probably be written to look for and return  
77050                   digit strings in those cases. The parser could then check whether the digit string returned is a  
77051                   valid *day\_number*, *year\_number*, and so on, based on the context.

77052 **FUTURE DIRECTIONS**

77053 None.

77054 **SEE ALSO**77055 *batch, crontab*77056 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)77057 **CHANGE HISTORY**

77058 First released in Issue 2.

77059 **Issue 6**

77060 This utility is marked as part of the User Portability Utilities option.

77061 The following new requirements on POSIX implementations derive from alignment with the  
77062 Single UNIX Specification:

- 77063
- If **-m** is not used, the job's standard output and standard error are provided to the user by  
77064 mail.

77065 The effects of using the **-q** and **-t** options as defined in the IEEE P1003.2b draft standard are  
77066 specified.

77067 The normative text is reworded to avoid use of the term "must" for application requirements.

77068 **Issue 7**77069 The *at* utility is moved from the User Portability Utilities option to the Base. User Portability  
77070 Utilities is now an option for interactive utilities.77071 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced  
77072 by the *at* utility.

77073 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**awk**

Utilities

77074 **NAME**

77075 awk — pattern scanning and processing language

77076 **SYNOPSIS**77077 awk [-F *ERE*] [-v *assignment*]... *program* [*argument*...]77078 awk [-F *ERE*] -f *progfile* [-f *progfile*]... [-v *assignment*]...  
77079 [*argument*...]77080 **DESCRIPTION**77081 The *awk* utility shall execute programs written in the *awk* programming language, which is  
77082 specialized for textual data manipulation. An *awk* program is a sequence of patterns and  
77083 corresponding actions. When input is read that matches a pattern, the action associated with that  
77084 pattern is carried out.77085 Input shall be interpreted as a sequence of records. By default, a record is a line, less its  
77086 terminating <newline>, but this can be changed by using the **RS** built-in variable. Each record of  
77087 input shall be matched in turn against each pattern in the program. For each pattern matched,  
77088 the associated action shall be executed.77089 The *awk* utility shall interpret each input record as a sequence of fields where, by default, a field  
77090 is a string of non-<blank> characters. This default white-space field delimiter can be changed by  
77091 using the **FS** built-in variable or **-F *ERE***. The *awk* utility shall denote the first field in a record \$1,  
77092 the second \$2, and so on. The symbol \$0 shall refer to the entire record; setting any other field  
77093 causes the re-evaluation of \$0. Assigning to \$0 shall reset the values of all other fields and the **NF**  
77094 built-in variable.77095 **OPTIONS**77096 The *awk* utility shall conform to XBD Section 12.2 (on page 215).

77097 The following options shall be supported:

77098 **-F *ERE*** Define the input field separator to be the extended regular expression *ERE*, before  
77099 any input is read; see [Regular Expressions](#) (on page 2439).77100 **-f *progfile*** Specify the pathname of the file *progfile* containing an *awk* program. If multiple  
77101 instances of this option are specified, the concatenation of the files specified as  
77102 *progfile* in the order specified shall be the *awk* program. The *awk* program can  
77103 alternatively be specified in the command line as a single argument.77104 **-v *assignment***77105 The application shall ensure that the *assignment* argument is in the same form as an  
77106 *assignment* operand. The specified variable assignment shall occur prior to  
77107 executing the *awk* program, including the actions associated with **BEGIN** patterns  
77108 (if any). Multiple occurrences of this option can be specified.77109 **OPERANDS**

77110 The following operands shall be supported:

77111 *program* If no **-f** option is specified, the first operand to *awk* shall be the text of the *awk*  
77112 program. The application shall supply the *program* operand as a single argument to  
77113 *awk*. If the text does not end in a <newline>, *awk* shall interpret the text as if it did.77114 *argument* Either of the following two types of *argument* can be intermixed:77115 *file* A pathname of a file that contains the input to be read, which is  
77116 matched against the set of patterns in the program. If no *file* operands  
77117 are specified, or if a *file* operand is '-', the standard input shall be  
77118 used.

77119 *assignment* An operand that begins with an <underscore> or alphabetic  
 77120 character from the portable character set (see the table in XBD Section  
 77121 6.1, on page 125), followed by a sequence of underscores, digits, and  
 77122 alphabetic characters from the portable character set, followed by the '='  
 77123 character, shall specify a variable assignment rather than a pathname.  
 77124 The characters before the '=' represent the name of an *awk* variable;  
 77125 if that name is an *awk* reserved word (see Grammar, on page 2447)  
 77126 the behavior is undefined. The characters following the <equals-  
 77127 sign> shall be interpreted as if they appeared in the *awk* program  
 77128 preceded and followed by a double-quote ('"') character, as a  
 77129 **STRING** token (see Grammar, on page 2447), except that if the last  
 77130 character is an unescaped <backslash>, it shall be interpreted as a  
 77131 literal <backslash> rather than as the first character of the sequence  
 77132 "\". The variable shall be assigned the value of that **STRING**  
 77133 token and, if appropriate, shall be considered a *numeric string* (see  
 77134 Expressions in *awk*, on page 2433), the variable shall also be assigned  
 77135 its numeric value. Each such variable assignment shall occur just  
 77136 prior to the processing of the following *file*, if any. Thus, an  
 77137 assignment before the first *file* argument shall be executed after the  
 77138 **BEGIN** actions (if any), while an assignment after the last *file*  
 77139 argument shall occur before the **END** actions (if any). If there are no  
 77140 *file* arguments, assignments shall be executed before processing the  
 77141 standard input.

#### 77142 **STDIN**

77143 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-' ;  
 77144 see the INPUT FILES section. If the *awk* program contains no actions and no patterns, but is  
 77145 otherwise a valid *awk* program, standard input and any *file* operands shall not be read and *awk*  
 77146 shall exit with a return status of zero.

#### 77147 **INPUT FILES**

77148 Input files to the *awk* program from any of the following sources shall be text files:

- 77149 • Any *file* operands or their equivalents, achieved by modifying the *awk* variables **ARGV**  
 77150 and **ARGC**
- 77151 • Standard input in the absence of any *file* operands
- 77152 • Arguments to the **getline** function

77153 Whether the variable **RS** is set to a value other than a <newline> or not, for these files,  
 77154 implementations shall support records terminated with the specified separator up to  
 77155 {LINE\_MAX} bytes and may support longer records.

77156 If **-f *progfile*** is specified, the application shall ensure that the files named by each of the *progfile*  
 77157 option-arguments are text files and their concatenation, in the same order as they appear in the  
 77158 arguments, is an *awk* program.

#### 77159 **ENVIRONMENT VARIABLES**

77160 The following environment variables shall affect the execution of *awk*:

77161 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 77162 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 77163 variables used to determine the values of locale categories.)

77164	<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
77165		
77166	<i>LC_COLLATE</i>	
77167		Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements within regular expressions and in comparisons of string values.
77168		
77169		
77170	<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files), the behavior of character classes within regular expressions, the identification of characters as letters, and the mapping of uppercase and lowercase characters for the <b>toupper</b> and <b>tolower</b> functions.
77171		
77172		
77173		
77174		
77175	<i>LC_MESSAGES</i>	
77176		Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
77177		
77178	<i>LC_NUMERIC</i>	
77179		Determine the radix character used when interpreting numeric input, performing conversions between numeric and string values, and formatting numeric output.
77180		Regardless of locale, the <period> character (the decimal-point character of the POSIX locale) is the decimal-point character recognized in processing <i>awk</i> programs (including assignments in command line arguments).
77181		
77182		
77183		
77184	XSI <i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
77185	<i>PATH</i>	Determine the search path when looking for commands executed by <i>system(expr)</i> , or input and output pipes; see XBD Chapter 8 (on page 173).
77186		
77187		In addition, all environment variables shall be visible via the <i>awk</i> variable <b>ENVIRON</b> .
77188	<b>ASYNCHRONOUS EVENTS</b>	
77189		Default.
77190	<b>STDOUT</b>	
77191		The nature of the output files depends on the <i>awk</i> program.
77192	<b>STDERR</b>	
77193		The standard error shall be used only for diagnostic messages.
77194	<b>OUTPUT FILES</b>	
77195		The nature of the output files depends on the <i>awk</i> program.
77196	<b>EXTENDED DESCRIPTION</b>	
77197		<b>Overall Program Structure</b>
77198		An <i>awk</i> program is composed of pairs of the form:
77199		<i>pattern</i> { <i>action</i> }
77200		Either the pattern or the action (including the enclosing brace characters) can be omitted.
77201		A missing pattern shall match any record of input, and a missing action shall be equivalent to:
77202		{ <i>print</i> }
77203		Execution of the <i>awk</i> program shall start by first executing the actions associated with all <b>BEGIN</b> patterns in the order they occur in the program. Then each <i>file</i> operand (or standard input if no files were specified) shall be processed in turn by reading data from the file until a record
77204		
77205		

77206 separator is seen (<newline> by default). Before the first reference to a field in the record is  
 77207 evaluated, the record shall be split into fields, according to the rules in [Regular Expressions](#) (on  
 77208 page 2439), using the value of **FS** that was current at the time the record was read. Each pattern  
 77209 in the program then shall be evaluated in the order of occurrence, and the action associated with  
 77210 each pattern that matches the current record executed. The action for a matching pattern shall be  
 77211 executed before evaluating subsequent patterns. Finally, the actions associated with all **END**  
 77212 patterns shall be executed in the order they occur in the program.

### 77213 Expressions in awk

77214 Expressions describe computations used in *patterns* and *actions*. In the following table, valid  
 77215 expression operations are given in groups from highest precedence first to lowest precedence  
 77216 last, with equal-precedence operators grouped between horizontal lines. In expression  
 77217 evaluation, where the grammar is formally ambiguous, higher precedence operators shall be  
 77218 evaluated before lower precedence operators. In this table *expr*, *expr1*, *expr2*, and *expr3* represent  
 77219 any expression, while *lvalue* represents any entity that can be assigned to (that is, on the left side  
 77220 of an assignment operator). The precise syntax of expressions is given in [Grammar](#) (on page  
 77221 2447).

77222 **Table 4-1** Expressions in Decreasing Precedence in *awk*

Syntax	Name	Type of Result	Associativity
( <i>expr</i> )	Grouping	Type of <i>expr</i>	N/A
\$ <i>expr</i>	Field reference	String	N/A
<i>lvalue</i> ++	Post-increment	Numeric	N/A
<i>lvalue</i> --	Post-decrement	Numeric	N/A
++ <i>lvalue</i>	Pre-increment	Numeric	N/A
-- <i>lvalue</i>	Pre-decrement	Numeric	N/A
<i>expr</i> ^ <i>expr</i>	Exponentiation	Numeric	Right
! <i>expr</i>	Logical not	Numeric	N/A
+ <i>expr</i>	Unary plus	Numeric	N/A
- <i>expr</i>	Unary minus	Numeric	N/A
<i>expr</i> * <i>expr</i>	Multiplication	Numeric	Left
<i>expr</i> / <i>expr</i>	Division	Numeric	Left
<i>expr</i> % <i>expr</i>	Modulus	Numeric	Left
<i>expr</i> + <i>expr</i>	Addition	Numeric	Left
<i>expr</i> - <i>expr</i>	Subtraction	Numeric	Left
<i>expr</i> <i>expr</i>	String concatenation	String	Left
<i>expr</i> < <i>expr</i>	Less than	Numeric	None
<i>expr</i> <= <i>expr</i>	Less than or equal to	Numeric	None
<i>expr</i> != <i>expr</i>	Not equal to	Numeric	None
<i>expr</i> == <i>expr</i>	Equal to	Numeric	None
<i>expr</i> > <i>expr</i>	Greater than	Numeric	None
<i>expr</i> >= <i>expr</i>	Greater than or equal to	Numeric	None
<i>expr</i> ~ <i>expr</i>	ERE match	Numeric	None
<i>expr</i> !~ <i>expr</i>	ERE non-match	Numeric	None
<i>expr</i> in <i>array</i>	Array membership	Numeric	Left
( <i>index</i> ) in <i>array</i>	Multi-dimension array	Numeric	Left

	Syntax	Name	Type of Result	Associativity
77250		membership		
77251				
77252	<code>expr &amp;&amp; expr</code>	Logical AND	Numeric	Left
77253	<code>expr    expr</code>	Logical OR	Numeric	Left
77254	<code>expr1 ? expr2 : expr3</code>	Conditional expression	Type of selected <i>expr2</i> or <i>expr3</i>	Right
77255				
77256	<code>lvalue ^= expr</code>	Exponentiation assignment	Numeric	Right
77257	<code>lvalue %= expr</code>	Modulus assignment	Numeric	Right
77258	<code>lvalue *= expr</code>	Multiplication assignment	Numeric	Right
77259	<code>lvalue /= expr</code>	Division assignment	Numeric	Right
77260	<code>lvalue += expr</code>	Addition assignment	Numeric	Right
77261	<code>lvalue -= expr</code>	Subtraction assignment	Numeric	Right
77262	<code>lvalue = expr</code>	Assignment	Type of <i>expr</i>	Right

77263 Each expression shall have either a string value, a numeric value, or both. Except as stated for  
 77264 specific contexts, the value of an expression shall be implicitly converted to the type needed for  
 77265 the context in which it is used. A string value shall be converted to a numeric value either by the  
 77266 equivalent of the following calls to functions defined by the ISO C standard:

```
77267 setlocale(LC_NUMERIC, "");
77268 numeric_value = atof(string_value);
```

77269 or by converting the initial portion of the string to type **double** representation as follows:

77270 The input string is decomposed into two parts: an initial, possibly empty, sequence of  
 77271 white-space characters (as specified by `isspace()`) and a subject sequence interpreted as a  
 77272 floating-point constant.

77273 The expected form of the subject sequence is an optional '+' or '-' sign, then a non-  
 77274 empty sequence of digits optionally containing a <period>, then an optional exponent  
 77275 part. An exponent part consists of 'e' or 'E', followed by an optional sign, followed by  
 77276 one or more decimal digits.

77277 The sequence starting with the first digit or the <period> (whichever occurs first) is  
 77278 interpreted as a floating constant of the C language, and if neither an exponent part nor a  
 77279 <period> appears, a <period> is assumed to follow the last digit in the string. If the subject  
 77280 sequence begins with a minus-sign, the value resulting from the conversion is negated.

77281 A numeric value that is exactly equal to the value of an integer (see [Section 1.1.2](#), on page 2283)  
 77282 shall be converted to a string by the equivalent of a call to the **sprintf** function (see [String](#)  
 77283 [Functions](#), on page 2444) with the string "%d" as the *fmt* argument and the numeric value being  
 77284 converted as the first and only *expr* argument. Any other numeric value shall be converted to a  
 77285 string by the equivalent of a call to the **sprintf** function with the value of the variable  
 77286 **CONVFMT** as the *fmt* argument and the numeric value being converted as the first and only  
 77287 *expr* argument. The result of the conversion is unspecified if the value of **CONVFMT** is not a  
 77288 floating-point format specification. This volume of POSIX.1-2008 specifies no explicit  
 77289 conversions between numbers and strings. An application can force an expression to be treated  
 77290 as a number by adding zero to it, or can force it to be treated as a string by concatenating the null  
 77291 string (" ") to it.

77292 A string value shall be considered a *numeric string* if it comes from one of the following:

- 77293 1. Field variables

- 77294 2. Input from the *getline()* function
- 77295 3. **FILENAME**
- 77296 4. **ARGV** array elements
- 77297 5. **ENVIRON** array elements
- 77298 6. Array elements created by the *split()* function
- 77299 7. A command line variable assignment
- 77300 8. Variable assignment from another numeric string variable

77301 and an implementation-dependent condition corresponding to either case (a) or (b) below is met.

77302

- 77303 a. After the equivalent of the following calls to functions defined by the ISO C standard, *string\_value\_end* would differ from *string\_value*, and any characters before the terminating null character in *string\_value\_end* would be <blank> characters:

```
77306 char *string_value_end;
77307 setlocale(LC_NUMERIC, "");
77308 numeric_value = strtod (string_value, &string_value_end);
```

- 77309 b. After all the following conversions have been applied, the resulting string would lexically be recognized as a **NUMBER** token as described by the lexical conventions in [Grammar](#) (on page 2447):

- 77312 — All leading and trailing <blank> characters are discarded.
- 77313 — If the first non-<blank> is '+' or '-', it is discarded.
- 77314 — Each occurrence of the decimal point character from the current locale is changed to a <period>.

77316 In case (a) the numeric value of the *numeric string* shall be the value that would be returned by the *strtod()* call. In case (b) if the first non-<blank> is '-', the numeric value of the *numeric string* shall be the negation of the numeric value of the recognized **NUMBER** token; otherwise, the numeric value of the *numeric string* shall be the numeric value of the recognized **NUMBER** token. Whether or not a string is a *numeric string* shall be relevant only in contexts where that term is used in this section.

77322 When an expression is used in a Boolean context, if it has a numeric value, a value of zero shall be treated as false and any other value shall be treated as true. Otherwise, a string value of the null string shall be treated as false and any other value shall be treated as true. A Boolean context shall be one of the following:

- 77326 • The first subexpression of a conditional expression
- 77327 • An expression operated on by logical NOT, logical AND, or logical OR
- 77328 • The second expression of a **for** statement
- 77329 • The expression of an **if** statement
- 77330 • The expression of the **while** clause in either a **while** or **do...while** statement
- 77331 • An expression used as a pattern (as in Overall Program Structure)

77332 All arithmetic shall follow the semantics of floating-point arithmetic as specified by the ISO C standard (see [Section 1.1.2](#), on page 2283).

77334 The value of the expression:

77335 `expr1 ^ expr2`

77336 shall be equivalent to the value returned by the ISO C standard function call:

77337 `pow(expr1, expr2)`

77338 The expression:

77339 `lvalue ^= expr`

77340 shall be equivalent to the ISO C standard expression:

77341 `lvalue = pow(lvalue, expr)`

77342 except that `lvalue` shall be evaluated only once. The value of the expression:

77343 `expr1 % expr2`

77344 shall be equivalent to the value returned by the ISO C standard function call:

77345 `fmod(expr1, expr2)`

77346 The expression:

77347 `lvalue %= expr`

77348 shall be equivalent to the ISO C standard expression:

77349 `lvalue = fmod(lvalue, expr)`

77350 except that `lvalue` shall be evaluated only once.

77351 Variables and fields shall be set by the assignment statement:

77352 `lvalue = expression`

77353 and the type of *expression* shall determine the resulting variable type. The assignment includes the arithmetic assignments ("`+=`", "`-=`", "`*=`", "`/=`", "`%=`", "`^=`", "`++`", "`--`") all of which shall produce a numeric result. The left-hand side of an assignment and the target of increment and decrement operators can be one of a variable, an array with index, or a field selector.

77357 The *awk* language supplies arrays that are used for storing numbers or strings. Arrays need not be declared. They shall initially be empty, and their sizes shall change dynamically. The subscripts, or element identifiers, are strings, providing a type of associative array capability. An array name followed by a subscript within square brackets can be used as an `lvalue` and thus as an expression, as described in the grammar; see [Grammar](#) (on page 2447). Unsubscripted array names can be used in only the following contexts:

- 77363 • A parameter in a function definition or function call
- 77364 • The **NAME** token following any use of the keyword **in** as specified in the grammar (see [Grammar](#), on page 2447); if the name used in this context is not an array name, the behavior is undefined

77367 A valid array *index* shall consist of one or more <comma>-separated expressions, similar to the way in which multi-dimensional arrays are indexed in some programming languages. Because *awk* arrays are really one-dimensional, such a <comma>-separated list shall be converted to a single string by concatenating the string values of the separate expressions, each separated from the other by the value of the **SUBSEP** variable. Thus, the following two index operations shall be equivalent:

77373 `var[expr1, expr2, ... exprn]`

77374 `var[expr1 SUBSEP expr2 SUBSEP ... SUBSEP exprn]`

77375 The application shall ensure that a multi-dimensioned *index* used with the **in** operator is  
 77376 parenthesized. The **in** operator, which tests for the existence of a particular array element, shall  
 77377 not cause that element to exist. Any other reference to a nonexistent array element shall  
 77378 automatically create it.

77379 Comparisons (with the '<', '<=', '!=', '==', '>', and '>=' operators) shall be made  
 77380 numerically if both operands are numeric, if one is numeric and the other has a string value that  
 77381 is a numeric string, or if one is numeric and the other has the uninitialized value. Otherwise,  
 77382 operands shall be converted to strings as required and a string comparison shall be made using  
 77383 the locale-specific collation sequence. The value of the comparison expression shall be 1 if the  
 77384 relation is true, or 0 if the relation is false.

### 77385 Variables and Special Variables

77386 Variables can be used in an *awk* program by referencing them. With the exception of function  
 77387 parameters (see [User-Defined Functions](#), on page 2446), they are not explicitly declared.  
 77388 Function parameter names shall be local to the function; all other variable names shall be global.  
 77389 The same name shall not be used as both a function parameter name and as the name of a  
 77390 function or a special *awk* variable. The same name shall not be used both as a variable name with  
 77391 global scope and as the name of a function. The same name shall not be used within the same  
 77392 scope both as a scalar variable and as an array. Uninitialized variables, including scalar  
 77393 variables, array elements, and field variables, shall have an uninitialized value. An uninitialized  
 77394 value shall have both a numeric value of zero and a string value of the empty string. Evaluation  
 77395 of variables with an uninitialized value, to either string or numeric, shall be determined by the  
 77396 context in which they are used.

77397 Field variables shall be designated by a '\$' followed by a number or numerical expression. The  
 77398 effect of the field number *expression* evaluating to anything other than a non-negative integer is  
 77399 unspecified; uninitialized variables or string values need not be converted to numeric values in  
 77400 this context. New field variables can be created by assigning a value to them. References to  
 77401 nonexistent fields (that is, fields after \$NF), shall evaluate to the uninitialized value. Such  
 77402 references shall not create new fields. However, assigning to a nonexistent field (for example,  
 77403 \$(NF+2)=5) shall increase the value of NF; create any intervening fields with the uninitialized  
 77404 value; and cause the value of \$0 to be recomputed, with the fields being separated by the value  
 77405 of OFS. Each field variable shall have a string value or an uninitialized value when created.  
 77406 Field variables shall have the uninitialized value when created from \$0 using FS and the variable  
 77407 does not contain any characters. If appropriate, the field variable shall be considered a numeric  
 77408 string (see [Expressions in awk](#), on page 2433).

77409 Implementations shall support the following other special variables that are set by *awk*:

77410 **ARGC** The number of elements in the **ARGV** array.

77411 **ARGV** An array of command line arguments, excluding options and the *program*  
 77412 argument, numbered from zero to **ARGC**-1.

77413 The arguments in **ARGV** can be modified or added to; **ARGC** can be altered. As  
 77414 each input file ends, *awk* shall treat the next non-null element of **ARGV**, up to the  
 77415 current value of **ARGC**-1, inclusive, as the name of the next input file. Thus,  
 77416 setting an element of **ARGV** to null means that it shall not be treated as an input  
 77417 file. The name '-' indicates the standard input. If an argument matches the format  
 77418 of an *assignment* operand, this argument shall be treated as an *assignment* rather  
 77419 than a *file* argument.

77420	<b>CONVFMT</b>	The <b>printf</b> format for converting numbers to strings (except for output statements, where <b>OFMT</b> is used); "% . 6g" by default.
77421		
77422	<b>ENVIRON</b>	An array representing the value of the environment, as described in the <i>exec</i> functions defined in the System Interfaces volume of POSIX.1-2008. The indices of the array shall be strings consisting of the names of the environment variables, and the value of each array element shall be a string consisting of the value of that variable. If appropriate, the environment variable shall be considered a <i>numeric string</i> (see <a href="#">Expressions in awk</a> , on page 2433); the array element shall also have its numeric value.
77423		
77424		
77425		
77426		
77427		
77428		
77429		In all cases where the behavior of <i>awk</i> is affected by environment variables (including the environment of any commands that <i>awk</i> executes via the <b>system</b> function or via pipeline redirections with the <b>print</b> statement, the <b>printf</b> statement, or the <b>getline</b> function), the environment used shall be the environment at the time <i>awk</i> began executing; it is implementation-defined whether any modification of <b>ENVIRON</b> affects this environment.
77430		
77431		
77432		
77433		
77434		
77435	<b>FILENAME</b>	A pathname of the current input file. Inside a <b>BEGIN</b> action the value is undefined. Inside an <b>END</b> action the value shall be the name of the last input file processed.
77436		
77437		
77438	<b>FNR</b>	The ordinal number of the current record in the current file. Inside a <b>BEGIN</b> action the value shall be zero. Inside an <b>END</b> action the value shall be the number of the last record processed in the last file processed.
77439		
77440		
77441	<b>FS</b>	Input field separator regular expression; a <space> by default.
77442	<b>NF</b>	The number of fields in the current record. Inside a <b>BEGIN</b> action, the use of <b>NF</b> is undefined unless a <b>getline</b> function without a <i>var</i> argument is executed previously. Inside an <b>END</b> action, <b>NF</b> shall retain the value it had for the last record read, unless a subsequent, redirected, <b>getline</b> function without a <i>var</i> argument is performed prior to entering the <b>END</b> action.
77443		
77444		
77445		
77446		
77447	<b>NR</b>	The ordinal number of the current record from the start of input. Inside a <b>BEGIN</b> action the value shall be zero. Inside an <b>END</b> action the value shall be the number of the last record processed.
77448		
77449		
77450	<b>OFMT</b>	The <b>printf</b> format for converting numbers to strings in output statements (see <a href="#">Output Statements</a> , on page 2442); "% . 6g" by default. The result of the conversion is unspecified if the value of <b>OFMT</b> is not a floating-point format specification.
77451		
77452		
77453	<b>OFS</b>	The <b>print</b> statement output field separator; <space> by default.
77454	<b>ORS</b>	The <b>print</b> statement output record separator; a <newline> by default.
77455	<b>RLENGTH</b>	The length of the string matched by the <b>match</b> function.
77456	<b>RS</b>	The first character of the string value of <b>RS</b> shall be the input record separator; a <newline> by default. If <b>RS</b> contains more than one character, the results are unspecified. If <b>RS</b> is null, then records are separated by sequences consisting of a <newline> plus one or more blank lines, leading or trailing blank lines shall not result in empty records at the beginning or end of the input, and a <newline> shall always be a field separator, no matter what the value of <b>FS</b> is.
77457		
77458		
77459		
77460		
77461		
77462	<b>RSTART</b>	The starting position of the string matched by the <b>match</b> function, numbering from 1. This shall always be equivalent to the return value of the <b>match</b> function.
77463		

77464 **SUBSEP** The subscript separator string for multi-dimensional arrays; the default value is  
77465 implementation-defined.

### 77466 Regular Expressions

77467 The *awk* utility shall make use of the extended regular expression notation (see XBD Section 9.4,  
77468 on page 188) except that it shall allow the use of C-language conventions for escaping special  
77469 characters within the EREs, as specified in the table in XBD Chapter 5 (on page 121) ('\\',  
77470 '\\a', '\\b', '\\f', '\\n', '\\r', '\\t', '\\v') and the following table; these escape sequences  
77471 shall be recognized both inside and outside bracket expressions. Note that records need not be  
77472 separated by <newline> characters and string constants can contain <newline> characters, so  
77473 even the "\\n" sequence is valid in *awk* EREs. Using a <slash> character within an ERE requires  
77474 the escaping shown in the following table.

77475 **Table 4-2** Escape Sequences in *awk*

Escape Sequence	Description	Meaning
\"	<backslash> <quotation-mark>	<quotation-mark> character
\/	<backslash> <slash>	<slash> character
\\ddd	A <backslash> character followed by the longest sequence of one, two, or three octal-digit characters (01234567). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.	The character whose encoding is represented by the one, two, or three-digit octal integer. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <backslash> for each byte.
\\c	A <backslash> character followed by any character not described in this table or in the table in XBD Chapter 5 (on page 121) ('\\', '\\a', '\\b', '\\f', '\\h', '\\r', '\\t', '\\v').	Undefined

77492 A regular expression can be matched against a specific field or string by using one of the two  
77493 regular expression matching operators, '~' and '!~'. These operators shall interpret their  
77494 right-hand operand as a regular expression and their left-hand operand as a string. If the regular  
77495 expression matches the string, the '~' expression shall evaluate to a value of 1, and the '!~'  
77496 expression shall evaluate to a value of 0. (The regular expression matching operation is as  
77497 defined by the term matched in XBD Section 9.1 (on page 181), where a match occurs on any part  
77498 of the string unless the regular expression is limited with the <circumflex> or <dollar-sign>  
77499 special characters.) If the regular expression does not match the string, the '~' expression shall  
77500 evaluate to a value of 0, and the '!~' expression shall evaluate to a value of 1. If the right-hand  
77501 operand is any expression other than the lexical token ERE, the string value of the expression  
77502 shall be interpreted as an extended regular expression, including the escape conventions  
77503 described above. Note that these same escape conventions shall also be applied in determining  
77504 the value of a string literal (the lexical token STRING), and thus shall be applied a second time  
77505 when a string literal is used in this context.

77506 When an ERE token appears as an expression in any context other than as the right-hand of the  
77507 '~' or '!~' operator or as one of the built-in function arguments described below, the value of  
77508 the resulting expression shall be the equivalent of:

77509 \$0 ~ /ere/

77510 The *ere* argument to the **gsub**, **match**, **sub** functions, and the *fs* argument to the **split** function  
 77511 (see [String Functions](#), on page 2444) shall be interpreted as extended regular expressions. These  
 77512 can be either **ERE** tokens or arbitrary expressions, and shall be interpreted in the same manner  
 77513 as the right-hand side of the '*~*' or '!~' operator.

77514 An extended regular expression can be used to separate fields by using the **-F ERE** option or by  
 77515 assigning a string containing the expression to the built-in variable **FS**. The default value of the  
 77516 **FS** variable shall be a single <space>. The following describes **FS** behavior:

- 77517 1. If **FS** is a null string, the behavior is unspecified.
- 77518 2. If **FS** is a single character:
  - 77519 a. If **FS** is <space>, skip leading and trailing <blank> characters; fields shall be  
 77520 delimited by sets of one or more <blank> characters.
  - 77521 b. Otherwise, if **FS** is any other character *c*, fields shall be delimited by each single  
 77522 occurrence of *c*.
- 77523 3. Otherwise, the string value of **FS** shall be considered to be an extended regular  
 77524 expression. Each occurrence of a sequence matching the extended regular expression shall  
 77525 delimit fields.

77526 Except for the '*~*' and '!~' operators, and in the **gsub**, **match**, **split**, and **sub** built-in functions,  
 77527 ERE matching shall be based on input records; that is, record separator characters (the first  
 77528 character of the value of the variable **RS**, <newline> by default) cannot be embedded in the  
 77529 expression, and no expression shall match the record separator character. If the record separator  
 77530 is not <newline>, <newline> characters embedded in the expression can be matched. For the  
 77531 '*~*' and '!~' operators, and in those four built-in functions, ERE matching shall be based on  
 77532 text strings; that is, any character (including <newline> and the record separator) can be  
 77533 embedded in the pattern, and an appropriate pattern shall match any character. However, in all  
 77534 *awk* ERE matching, the use of one or more NUL characters in the pattern, input record, or text  
 77535 string produces undefined results.

### 77536 Patterns

77537 A *pattern* is any valid *expression*, a range specified by two expressions separated by a comma, or  
 77538 one of the two special patterns **BEGIN** or **END**.

### 77539 Special Patterns

77540 The *awk* utility shall recognize two special patterns, **BEGIN** and **END**. Each **BEGIN** pattern  
 77541 shall be matched once and its associated action executed before the first record of input is read—  
 77542 except possibly by use of the **getline** function (see [Input/Output and General Functions](#), on  
 77543 page 2445) in a prior **BEGIN** action—and before command line assignment is done. Each **END**  
 77544 pattern shall be matched once and its associated action executed after the last record of input has  
 77545 been read. These two patterns shall have associated actions.

77546 **BEGIN** and **END** shall not combine with other patterns. Multiple **BEGIN** and **END** patterns  
 77547 shall be allowed. The actions associated with the **BEGIN** patterns shall be executed in the order  
 77548 specified in the program, as are the **END** actions. An **END** pattern can precede a **BEGIN** pattern  
 77549 in a program.

77550 If an *awk* program consists of only actions with the pattern **BEGIN**, and the **BEGIN** action  
 77551 contains no **getline** function, *awk* shall exit without reading its input when the last statement in  
 77552 the last **BEGIN** action is executed. If an *awk* program consists of only actions with the pattern

77553 **END** or only actions with the patterns **BEGIN** and **END**, the input shall be read before the  
77554 statements in the **END** actions are executed.

### 77555 **Expression Patterns**

77556 An expression pattern shall be evaluated as if it were an expression in a Boolean context. If the  
77557 result is true, the pattern shall be considered to match, and the associated action (if any) shall be  
77558 executed. If the result is false, the action shall not be executed.

### 77559 **Pattern Ranges**

77560 A pattern range consists of two expressions separated by a comma; in this case, the action shall  
77561 be performed for all records between a match of the first expression and the following match of  
77562 the second expression, inclusive. At this point, the pattern range can be repeated starting at  
77563 input records subsequent to the end of the matched range.

### 77564 **Actions**

77565 An action is a sequence of statements as shown in the grammar in [Grammar](#) (on page 2447).  
77566 Any single statement can be replaced by a statement list enclosed in curly braces. The  
77567 application shall ensure that statements in a statement list are separated by <newline> or  
77568 <semicolon> characters. Statements in a statement list shall be executed sequentially in the order  
77569 that they appear.

77570 The *expression* acting as the conditional in an **if** statement shall be evaluated and if it is non-zero  
77571 or non-null, the following statement shall be executed; otherwise, if **else** is present, the statement  
77572 following the **else** shall be executed.

77573 The **if**, **while**, **do...while**, **for**, **break**, and **continue** statements are based on the ISO C standard  
77574 (see [Section 1.1.2](#), on page 2283), except that the Boolean expressions shall be treated as  
77575 described in [Expressions in awk](#) (on page 2433), and except in the case of:

77576 `for (variable in array)`

77577 which shall iterate, assigning each *index* of *array* to *variable* in an unspecified order. The results of  
77578 adding new elements to *array* within such a **for** loop are undefined. If a **break** or **continue**  
77579 statement occurs outside of a loop, the behavior is undefined.

77580 The **delete** statement shall remove an individual array element. Thus, the following code deletes  
77581 an entire array:

```
77582 for (index in array)
77583     delete array[index]
```

77584 The **next** statement shall cause all further processing of the current input record to be  
77585 abandoned. The behavior is undefined if a **next** statement appears or is invoked in a **BEGIN** or  
77586 **END** action.

77587 The **exit** statement shall invoke all **END** actions in the order in which they occur in the program  
77588 source and then terminate the program without reading further input. An **exit** statement inside  
77589 an **END** action shall terminate the program without further execution of **END** actions. If an  
77590 expression is specified in an **exit** statement, its numeric value shall be the exit status of *awk*,  
77591 unless subsequent errors are encountered or a subsequent **exit** statement with an expression is  
77592 executed.

77593 **Output Statements**

77594 Both **print** and **printf** statements shall write to standard output by default. The output shall be  
77595 written to the location specified by *output\_redirection* if one is supplied, as follows:

```
77596 > expression
77597 >> expression
77598 | expression
```

77599 In all cases, the *expression* shall be evaluated to produce a string that is used as a pathname into  
77600 which to write (for '>' or ">>") or as a command to be executed (for '|'). Using the first two  
77601 forms, if the file of that name is not currently open, it shall be opened, creating it if necessary  
77602 and using the first form, truncating the file. The output then shall be appended to the file. As  
77603 long as the file remains open, subsequent calls in which *expression* evaluates to the same string  
77604 value shall simply append output to the file. The file remains open until the **close** function (see  
77605 [Input/Output and General Functions](#), on page 2445) is called with an expression that evaluates  
77606 to the same string value.

77607 The third form shall write output onto a stream piped to the input of a command. The stream  
77608 shall be created if no stream is currently open with the value of *expression* as its command name.  
77609 The stream created shall be equivalent to one created by a call to the *popen()* function defined in  
77610 the System Interfaces volume of POSIX.1-2008 with the value of *expression* as the *command*  
77611 argument and a value of *w* as the *mode* argument. As long as the stream remains open,  
77612 subsequent calls in which *expression* evaluates to the same string value shall write output to the  
77613 existing stream. The stream shall remain open until the **close** function (see [Input/Output and](#)  
77614 [General Functions](#), on page 2445) is called with an expression that evaluates to the same string  
77615 value. At that time, the stream shall be closed as if by a call to the *pclose()* function defined in  
77616 the System Interfaces volume of POSIX.1-2008.

77617 As described in detail by the grammar in [Grammar](#) (on page 2447), these output statements shall  
77618 take a <comma>-separated list of *expressions* referred to in the grammar by the non-terminal  
77619 symbols **expr\_list**, **print\_expr\_list**, or **print\_expr\_list\_opt**. This list is referred to here as the  
77620 *expression list*, and each member is referred to as an *expression argument*.

77621 The **print** statement shall write the value of each expression argument onto the indicated output  
77622 stream separated by the current output field separator (see variable **OFS** above), and terminated  
77623 by the output record separator (see variable **ORS** above). All expression arguments shall be  
77624 taken as strings, being converted if necessary; this conversion shall be as described in  
77625 [Expressions in awk](#) (on page 2433), with the exception that the **printf** format in **OFMT** shall be  
77626 used instead of the value in **CONVFMT**. An empty expression list shall stand for the whole  
77627 input record (\$0).

77628 The **printf** statement shall produce output based on a notation similar to the File Format  
77629 Notation used to describe file formats in this volume of POSIX.1-2008 (see [XBD Chapter 5](#), on  
77630 page 121). Output shall be produced as specified with the first *expression* argument as the string  
77631 *format* and subsequent *expression* arguments as the strings *arg1* to *argn*, inclusive, with the  
77632 following exceptions:

- 77633 1. The *format* shall be an actual character string rather than a graphical representation.  
77634 Therefore, it cannot contain empty character positions. The <space> in the *format* string,  
77635 in any context other than a *flag* of a conversion specification, shall be treated as an  
77636 ordinary character that is copied to the output.
- 77637 2. If the character set contains a 'Δ' character and that character appears in the *format*  
77638 string, it shall be treated as an ordinary character that is copied to the output.

- 77639 3. The *escape sequences* beginning with a <backslash> character shall be treated as sequences  
77640 of ordinary characters that are copied to the output. Note that these same sequences shall  
77641 be interpreted lexically by *awk* when they appear in literal strings, but they shall not be  
77642 treated specially by the **printf** statement.
- 77643 4. A *field width* or *precision* can be specified as the ' \* ' character instead of a digit string. In  
77644 this case the next argument from the expression list shall be fetched and its numeric value  
77645 taken as the field width or precision.
- 77646 5. The implementation shall not precede or follow output from the *d* or *u* conversion  
77647 specifier characters with <blank> characters not specified by the *format* string.
- 77648 6. The implementation shall not precede output from the *o* conversion specifier character  
77649 with leading zeros not specified by the *format* string.
- 77650 7. For the *c* conversion specifier character: if the argument has a numeric value, the  
77651 character whose encoding is that value shall be output. If the value is zero or is not the  
77652 encoding of any character in the character set, the behavior is undefined. If the argument  
77653 does not have a numeric value, the first character of the string value shall be output; if the  
77654 string does not contain any characters, the behavior is undefined.
- 77655 8. For each conversion specification that consumes an argument, the next expression  
77656 argument shall be evaluated. With the exception of the *c* conversion specifier character,  
77657 the value shall be converted (according to the rules specified in [Expressions in awk](#), on  
77658 page 2433) to the appropriate type for the conversion specification.
- 77659 9. If there are insufficient expression arguments to satisfy all the conversion specifications in  
77660 the *format* string, the behavior is undefined.
- 77661 10. If any character sequence in the *format* string begins with a ' % ' character, but does not  
77662 form a valid conversion specification, the behavior is unspecified.

77663 Both **print** and **printf** can output at least {LINE\_MAX} bytes.

## 77664 Functions

77665 The *awk* language has a variety of built-in functions: arithmetic, string, input/output, and  
77666 general.

### 77667 Arithmetic Functions

77668 The arithmetic functions, except for **int**, shall be based on the ISO C standard (see [Section 1.1.2](#),  
77669 on page 2283). The behavior is undefined in cases where the ISO C standard specifies that an  
77670 error be returned or that the behavior is undefined. Although the grammar (see [Grammar](#), on  
77671 page 2447) permits built-in functions to appear with no arguments or parentheses, unless the  
77672 argument or parentheses are indicated as optional in the following list (by displaying them  
77673 within the " [ ] " brackets), such use is undefined.

- 77674 **atan2**(*y,x*) Return arctangent of *y/x* in radians in the range  $[-\pi, \pi]$ .
- 77675 **cos**(*x*) Return cosine of *x*, where *x* is in radians.
- 77676 **sin**(*x*) Return sine of *x*, where *x* is in radians.
- 77677 **exp**(*x*) Return the exponential function of *x*.
- 77678 **log**(*x*) Return the natural logarithm of *x*.

77679	<b>sqrt</b> ( <i>x</i> )	Return the square root of <i>x</i> .
77680	<b>int</b> ( <i>x</i> )	Return the argument truncated to an integer. Truncation shall be toward 0 when <i>x</i> >0.
77681		
77682	<b>rand</b> ()	Return a random number <i>n</i> , such that $0 \leq n < 1$ .
77683	<b>srand</b> ([ <i>expr</i> ])	Set the seed value for <i>rand</i> to <i>expr</i> or use the time of day if <i>expr</i> is omitted. The previous seed value shall be returned.
77684		

77685 **String Functions**

77686 The string functions in the following list shall be supported. Although the grammar (see  
77687 [Grammar](#), on page 2447) permits built-in functions to appear with no arguments or parentheses,  
77688 unless the argument or parentheses are indicated as optional in the following list (by displaying  
77689 them within the " [ ] " brackets), such use is undefined.

77690	<b>gsub</b> ( <i>ere</i> , <i>repl</i> [, <i>in</i> ])	
77691		Behave like <b>sub</b> (see below), except that it shall replace all occurrences of the
77692		regular expression (like the <i>ed</i> utility global substitute) in \$0 or in the <i>in</i> argument,
77693		when specified.
77694	<b>index</b> ( <i>s</i> , <i>t</i> )	Return the position, in characters, numbering from 1, in string <i>s</i> where string <i>t</i> first
77695		occurs, or zero if it does not occur at all.
77696	<b>length</b> ([ <i>s</i> ])	Return the length, in characters, of its argument taken as a string, or of the whole
77697		record, \$0, if there is no argument.
77698	<b>match</b> ( <i>s</i> , <i>ere</i> )	Return the position, in characters, numbering from 1, in string <i>s</i> where the
77699		extended regular expression <i>ere</i> occurs, or zero if it does not occur at all. RSTART
77700		shall be set to the starting position (which is the same as the returned value), zero
77701		if no match is found; RLENGTH shall be set to the length of the matched string, -1
77702		if no match is found.
77703	<b>split</b> ( <i>s</i> , <i>a</i> [, <i>fs</i> ])	
77704		Split the string <i>s</i> into array elements <i>a</i> [1], <i>a</i> [2], ..., <i>a</i> [ <i>n</i> ], and return <i>n</i> . All elements
77705		of the array shall be deleted before the split is performed. The separation shall be
77706		done with the ERE <i>fs</i> or with the field separator <b>FS</b> if <i>fs</i> is not given. Each array
77707		element shall have a string value when created and, if appropriate, the array
77708		element shall be considered a numeric string (see <a href="#">Expressions in awk</a> , on page
77709		2433). The effect of a null string as the value of <i>fs</i> is unspecified.
77710	<b>sprintf</b> ( <i>fmt</i> , <i>expr</i> , <i>expr</i> , ...)	
77711		Format the expressions according to the <b>printf</b> format given by <i>fmt</i> and return the
77712		resulting string.
77713	<b>sub</b> ( <i>ere</i> , <i>repl</i> [, <i>in</i> ])	
77714		Substitute the string <i>repl</i> in place of the first instance of the extended regular
77715		expression <i>ERE</i> in string <i>in</i> and return the number of substitutions. An
77716		<ampersand> (' & ') appearing in the string <i>repl</i> shall be replaced by the string
77717		from <i>in</i> that matches the ERE. An <ampersand> preceded with a <backslash> shall
77718		be interpreted as the literal <ampersand> character. An occurrence of two
77719		consecutive <backslash> characters shall be interpreted as just a single literal
77720		<backslash> character. Any other occurrence of a <backslash> (for example,
77721		preceding any other character) shall be treated as a literal <backslash> character.
77722		Note that if <i>repl</i> is a string literal (the lexical token <b>STRING</b> ; see <a href="#">Grammar</a> , on page
77723		2447), the handling of the <ampersand> character occurs after any lexical

- 77724 processing, including any lexical <backslash>-escape sequence processing. If *in* is  
 77725 specified and it is not an lvalue (see [Expressions in awk](#), on page 2433), the  
 77726 behavior is undefined. If *in* is omitted, *awk* shall use the current record (\$0) in its  
 77727 place.
- 77728 **substr**(*s*, *m*[, *n* ])  
 77729 Return the at most *n*-character substring of *s* that begins at position *m*, numbering  
 77730 from 1. If *n* is omitted, or if *n* specifies more characters than are left in the string,  
 77731 the length of the substring shall be limited by the length of the string *s*.
- 77732 **tolower**(*s*) Return a string based on the string *s*. Each character in *s* that is an uppercase letter  
 77733 specified to have a **tolower** mapping by the *LC\_CTYPE* category of the current  
 77734 locale shall be replaced in the returned string by the lowercase letter specified by  
 77735 the mapping. Other characters in *s* shall be unchanged in the returned string.
- 77736 **toupper**(*s*) Return a string based on the string *s*. Each character in *s* that is a lowercase letter  
 77737 specified to have a **toupper** mapping by the *LC\_CTYPE* category of the current  
 77738 locale is replaced in the returned string by the uppercase letter specified by the  
 77739 mapping. Other characters in *s* are unchanged in the returned string.
- 77740 All of the preceding functions that take *ERE* as a parameter expect a pattern or a string valued  
 77741 expression that is a regular expression as defined in [Regular Expressions](#) (on page 2439).
- 77742 **Input/Output and General Functions**
- 77743 The input/output and general functions are:
- 77744 **close**(*expression*)  
 77745 Close the file or pipe opened by a **print** or **printf** statement or a call to **getline** with  
 77746 the same string-valued *expression*. The limit on the number of open *expression*  
 77747 arguments is implementation-defined. If the close was successful, the function  
 77748 shall return zero; otherwise, it shall return non-zero.
- 77749 *expression* | **getline** [*var*]  
 77750 Read a record of input from a stream piped from the output of a command. The  
 77751 stream shall be created if no stream is currently open with the value of *expression* as  
 77752 its command name. The stream created shall be equivalent to one created by a call  
 77753 to the *popen*() function with the value of *expression* as the *command* argument and a  
 77754 value of *r* as the *mode* argument. As long as the stream remains open, subsequent  
 77755 calls in which *expression* evaluates to the same string value shall read subsequent  
 77756 records from the stream. The stream shall remain open until the **close** function is  
 77757 called with an expression that evaluates to the same string value. At that time, the  
 77758 stream shall be closed as if by a call to the *pclose*() function. If *var* is omitted, \$0 and  
 77759 NF shall be set; otherwise, *var* shall be set and, if appropriate, it shall be considered  
 77760 a numeric string (see [Expressions in awk](#), on page 2433).
- 77761 The **getline** operator can form ambiguous constructs when there are  
 77762 unparenthesized operators (including concatenate) to the left of the ' | ' (to the  
 77763 beginning of the expression containing **getline**). In the context of the ' \$ ' operator,  
 77764 ' | ' shall behave as if it had a lower precedence than ' \$ '. The result of evaluating  
 77765 other operators is unspecified, and conforming applications shall parenthesize  
 77766 properly all such usages.
- 77767 **getline** Set \$0 to the next input record from the current input file. This form of **getline** shall  
 77768 set the NF, NR, and FNR variables.

77769 **getline** *var* Set variable *var* to the next input record from the current input file and, if  
 77770 appropriate, *var* shall be considered a numeric string (see [Expressions in awk](#), on  
 77771 page 2433). This form of **getline** shall set the **FNR** and **NR** variables.

77772 **getline** [*var*] < *expression*  
 77773 Read the next record of input from a named file. The *expression* shall be evaluated  
 77774 to produce a string that is used as a pathname. If the file of that name is not  
 77775 currently open, it shall be opened. As long as the stream remains open, subsequent  
 77776 calls in which *expression* evaluates to the same string value shall read subsequent  
 77777 records from the file. The file shall remain open until the **close** function is called  
 77778 with an expression that evaluates to the same string value. If *var* is omitted, **\$0** and  
 77779 **NF** shall be set; otherwise, *var* shall be set and, if appropriate, it shall be considered  
 77780 a numeric string (see [Expressions in awk](#), on page 2433).

77781 The **getline** operator can form ambiguous constructs when there are  
 77782 unparenthesized binary operators (including concatenate) to the right of the '<'  
 77783 (up to the end of the expression containing the **getline**). The result of evaluating  
 77784 such a construct is unspecified, and conforming applications shall parenthesize  
 77785 properly all such usages.

77786 **system**(*expression*)  
 77787 Execute the command given by *expression* in a manner equivalent to the *system*()  
 77788 function defined in the System Interfaces volume of POSIX.1-2008 and return the  
 77789 exit status of the command.

77790 All forms of **getline** shall return 1 for successful input, zero for end-of-file, and -1 for an error.

77791 Where strings are used as the name of a file or pipeline, the application shall ensure that the  
 77792 strings are textually identical. The terminology "same string value" implies that "equivalent  
 77793 strings", even those that differ only by <space> characters, represent different files.

#### 77794 User-Defined Functions

77795 The *awk* language also provides user-defined functions. Such functions can be defined as:

```
77796 function name([parameter, ...]) { statements }
```

77797 A function can be referred to anywhere in an *awk* program; in particular, its use can precede its  
 77798 definition. The scope of a function is global.

77799 Function parameters, if present, can be either scalars or arrays; the behavior is undefined if an  
 77800 array name is passed as a parameter that the function uses as a scalar, or if a scalar expression is  
 77801 passed as a parameter that the function uses as an array. Function parameters shall be passed by  
 77802 value if scalar and by reference if array name.

77803 The number of parameters in the function definition need not match the number of parameters  
 77804 in the function call. Excess formal parameters can be used as local variables. If fewer arguments  
 77805 are supplied in a function call than are in the function definition, the extra parameters that are  
 77806 used in the function body as scalars shall evaluate to the uninitialized value until they are  
 77807 otherwise initialized, and the extra parameters that are used in the function body as arrays shall  
 77808 be treated as uninitialized arrays where each element evaluates to the uninitialized value until  
 77809 otherwise initialized.

77810 When invoking a function, no white space can be placed between the function name and the  
 77811 opening parenthesis. Function calls can be nested and recursive calls can be made upon  
 77812 functions. Upon return from any nested or recursive function call, the values of all of the calling  
 77813 function's parameters shall be unchanged, except for array parameters passed by reference. The

77814 **return** statement can be used to return a value. If a **return** statement appears outside of a  
77815 function definition, the behavior is undefined.

77816 In the function definition, <newline> characters shall be optional before the opening brace and  
77817 after the closing brace. Function definitions can appear anywhere in the program where a  
77818 *pattern-action* pair is allowed.

## 77819 Grammar

77820 The grammar in this section and the lexical conventions in the following section shall together  
77821 describe the syntax for *awk* programs. The general conventions for this style of grammar are  
77822 described in Section 1.3 (on page 2287). A valid program can be represented as the non-terminal  
77823 symbol *program* in the grammar. This formal syntax shall take precedence over the preceding  
77824 text syntax description.

```

77825 %token NAME NUMBER STRING ERE
77826 %token FUNC_NAME /* Name followed by '(' without white space. */

77827 /* Keywords */
77828 %token Begin End
77829 /* 'BEGIN' 'END' */

77830 %token Break Continue Delete Do Else

78108 This grammar has several ambiguities that shall be resolved as follows:

- 78109 • Operator precedence and associativity shall be as described in Table 4-1 (on page 2433).
- 78110 • In case of ambiguity, an **else** shall be associated with the most immediately preceding **if**
- 78111 that would satisfy the grammar.
- 78112 • In some contexts, a <slash> ('/') that is used to surround an ERE could also be the
- 78113 division operator. This shall be resolved in such a way that wherever the division operator
- 78114 could appear, a <slash> is assumed to be the division operator. (There is no unary division
- 78115 operator.)

78116 Each expression in an *awk* program shall conform to the precedence and associativity rules, even

78117 when this is not needed to resolve an ambiguity. For example, because '\$' has higher

78118 precedence than '++', the string "\$x++--" is not a valid *awk* expression, even though it is

78119 unambiguously parsed by the grammar as "\$ (x++) --".

78120 One convention that might not be obvious from the formal grammar is where <newline>

78121 characters are acceptable. There are several obvious placements such as terminating a statement,

78122 and a <backslash> can be used to escape <newline> characters between any lexical tokens. In

78123 addition, <newline> characters without <backslash> characters can follow a comma, an open

78124 brace, logical AND operator ("&&"), logical OR operator ("||"), the **do** keyword, the **else**

78125 keyword, and the closing parenthesis of an **if**, **for**, or **while** statement. For example:

```

78126 { print $1,
78127         $2 }

```

## 78128 Lexical Conventions

78129 The lexical conventions for *awk* programs, with respect to the preceding grammar, shall be as

78130 follows:

- 78131 1. Except as noted, *awk* shall recognize the longest possible token or delimiter beginning at a
- 78132 given point.
- 78133 2. A comment shall consist of any characters beginning with the <number-sign> character
- 78134 and terminated by, but excluding the next occurrence of, a <newline>. Comments shall
- 78135 have no effect, except to delimit lexical tokens.
- 78136 3. The <newline> shall be recognized as the token **NEWLINE**.
- 78137 4. A <backslash> character immediately followed by a <newline> shall have no effect.
- 78138 5. The token **STRING** shall represent a string constant. A string constant shall begin with
- 78139 the character ' "'. Within a string constant, a <backslash> character shall be considered
- 78140 to begin an escape sequence as specified in the table in XBD Chapter 5 (on page 121)
- 78141 ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v'). In addition, the escape sequences
- 78142 in Table 4-2 (on page 2439) shall be recognized. A <newline> shall not occur within a
- 78143 string constant. A string constant shall be terminated by the first unescaped occurrence of
- 78144 the character ' "' after the one that begins the string constant. The value of the string

- 78145 shall be the sequence of all unescaped characters and values of escape sequences  
 78146 between, but not including, the two delimiting ' ' characters.
- 78147 6. The token **ERE** represents an extended regular expression constant. An ERE constant  
 78148 shall begin with the <slash> character. Within an ERE constant, a <backslash> character  
 78149 shall be considered to begin an escape sequence as specified in the table in XBD Chapter 5  
 78150 (on page 121). In addition, the escape sequences in Table 4-2 (on page 2439) shall be  
 78151 recognized. The application shall ensure that a <newline> does not occur within an ERE  
 78152 constant. An ERE constant shall be terminated by the first unescaped occurrence of the  
 78153 <slash> character after the one that begins the ERE constant. The extended regular  
 78154 expression represented by the ERE constant shall be the sequence of all unescaped  
 78155 characters and values of escape sequences between, but not including, the two delimiting  
 78156 <slash> characters.
- 78157 7. A <blank> shall have no effect, except to delimit lexical tokens or within **STRING** or **ERE**  
 78158 tokens.
- 78159 8. The token **NUMBER** shall represent a numeric constant. Its form and numeric value shall  
 78160 either be equivalent to the **decimal-floating-constant** token as specified by the ISO C  
 78161 standard, or it shall be a sequence of decimal digits and shall be evaluated as an integer  
 78162 constant in decimal. In addition, implementations may accept numeric constants with the  
 78163 form and numeric value equivalent to the **hexadecimal-constant** and **hexadecimal-**  
 78164 **floating-constant** tokens as specified by the ISO C standard.
- 78165 If the value is too large or too small to be representable (see Section 1.1.2, on page 2283),  
 78166 the behavior is undefined.
- 78167 9. A sequence of underscores, digits, and alphabetic characters from the portable character set (see  
 78168 XBD Section 6.1, on page 125), beginning with an <underscore> or alphabetic character,  
 78169 shall be considered a word.
- 78170 10. The following words are keywords that shall be recognized as individual tokens; the  
 78171 name of the token is the same as the keyword:
- |       |                 |               |             |                 |              |               |
|-------|-----------------|---------------|-------------|-----------------|--------------|---------------|
| 78172 | <b>BEGIN</b>    | <b>delete</b> | <b>END</b>  | <b>function</b> | <b>in</b>    | <b>printf</b> |
| 78173 | <b>break</b>    | <b>do</b>     | <b>exit</b> | <b>getline</b>  | <b>next</b>  | <b>return</b> |
| 78174 | <b>continue</b> | <b>else</b>   | <b>for</b>  | <b>if</b>       | <b>print</b> | <b>while</b>  |
- 78175 11. The following words are names of built-in functions and shall be recognized as the token  
 78176 **BUILTIN\_FUNC\_NAME**:
- |       |              |               |              |                |                |                |
|-------|--------------|---------------|--------------|----------------|----------------|----------------|
| 78177 | <b>atan2</b> | <b>gsub</b>   | <b>log</b>   | <b>split</b>   | <b>sub</b>     | <b>toupper</b> |
| 78178 | <b>close</b> | <b>index</b>  | <b>match</b> | <b>sprintf</b> | <b>substr</b>  |                |
| 78179 | <b>cos</b>   | <b>int</b>    | <b>rand</b>  | <b>sqrt</b>    | <b>system</b>  |                |
| 78180 | <b>exp</b>   | <b>length</b> | <b>sin</b>   | <b>srand</b>   | <b>tolower</b> |                |
- 78181 The above-listed keywords and names of built-in functions are considered reserved  
 78182 words.
- 78183 12. The token **NAME** shall consist of a word that is not a keyword or a name of a built-in  
 78184 function and is not followed immediately (without any delimiters) by the ' ( ' character.
- 78185 13. The token **FUNC\_NAME** shall consist of a word that is not a keyword or a name of a  
 78186 built-in function, followed immediately (without any delimiters) by the ' ( ' character.  
 78187 The ' ( ' character shall not be included as part of the token.

78188 14. The following two-character sequences shall be recognized as the named tokens:

Token Name	Sequence	Token Name	Sequence
ADD_ASSIGN	+=	NO_MATCH	!~
SUB_ASSIGN	--	EQ	==
MUL_ASSIGN	*=	LE	<=
DIV_ASSIGN	/=	GE	>=
MOD_ASSIGN	%=	NE	!=
POW_ASSIGN	^=	INCR	++
OR		DECR	--
AND	&&	APPEND	>>

78198 15. The following single characters shall be recognized as tokens whose names are the  
78199 character:

78200 <newline> { } ( ) [ ] , ; + - \* % ^ ! > < | ? : ~ \$ =

78201 There is a lexical ambiguity between the token **ERE** and the tokens **'/'** and **DIV\_ASSIGN**.  
78202 When an input sequence begins with a <slash> character in any syntactic context where the  
78203 token **'/'** or **DIV\_ASSIGN** could appear as the next token in a valid program, the longer of  
78204 those two tokens that can be recognized shall be recognized. In any other syntactic context  
78205 where the token **ERE** could appear as the next token in a valid program, the token **ERE** shall be  
78206 recognized.

#### 78207 EXIT STATUS

78208 The following exit values shall be returned:

78209 0 All input files were processed successfully.

78210 >0 An error occurred.

78211 The exit status can be altered within the program by using an **exit** expression.

#### 78212 CONSEQUENCES OF ERRORS

78213 If any *file* operand is specified and the named file cannot be accessed, *awk* shall write a  
78214 diagnostic message to standard error and terminate without any further action.

78215 If the program specified by either the *program* operand or a *progfile* operand is not a valid *awk*  
78216 program (as specified in the EXTENDED DESCRIPTION section), the behavior is undefined.

#### 78217 APPLICATION USAGE

78218 The **index**, **length**, **match**, and **substr** functions should not be confused with similar functions in  
78219 the ISO C standard; the *awk* versions deal with characters, while the ISO C standard deals with  
78220 bytes.

78221 Because the concatenation operation is represented by adjacent expressions rather than an  
78222 explicit operator, it is often necessary to use parentheses to enforce the proper evaluation  
78223 precedence.

#### 78224 EXAMPLES

78225 The *awk* program specified in the command line is most easily specified within single-quotes (for  
78226 example, *'program'*) for applications using *sh*, because *awk* programs commonly contain  
78227 characters that are special to the shell, including double-quotes. In the cases where an *awk*  
78228 program contains single-quote characters, it is usually easiest to specify most of the program as  
78229 strings within single-quotes concatenated by the shell with quoted single-quote characters. For  
78230 example:

78231 `awk '/'\''/ { print "quote:", $0 }'`

78232 prints all lines from the standard input containing a single-quote character, prefixed with *quote*..

78233 The following are examples of simple *awk* programs:

- 78234 1. Write to the standard output all input lines for which field 3 is greater than 5:

78235 `$3 > 5`

- 78236 2. Write every tenth line:

78237 `(NR % 10) == 0`

- 78238 3. Write any line with a substring matching the regular expression:

78239 `/(G|D)(2[0-9][[:alpha:]]*)/`

- 78240 4. Print any line with a substring containing a 'G' or 'D', followed by a sequence of digits  
78241 and characters. This example uses character classes **digit** and **alpha** to match language-  
78242 independent digit and alphabetic characters respectively:

78243 `/(G|D)([[:digit:]][[:alpha:]]*)/`

- 78244 5. Write any line in which the second field matches the regular expression and the fourth  
78245 field does not:

78246 `$2 ~ /xyz/ && $4 !~ /xyz/`

- 78247 6. Write any line in which the second field contains a <backslash>:

78248 `$2 ~ /\`

- 78249 7. Write any line in which the second field contains a <backslash>. Note that  
78250 <backslash>-escapes are interpreted twice; once in lexical processing of the string and  
78251 once in processing the regular expression:

78252 `$2 ~ "\\`

- 78253 8. Write the second to the last and the last field in each line. Separate the fields by a <colon>:

78254 `{OFS=":";print $(NF-1), $NF}`

- 78255 9. Write the line number and number of fields in each line. The three strings representing  
78256 the line number, the <colon>, and the number of fields are concatenated and that string is  
78257 written to standard output:

78258 `{print NR ":" NF}`

- 78259 10. Write lines longer than 72 characters:

78260 `length($0) > 72`

- 78261 11. Write the first two fields in opposite order separated by **OFS**:

78262 `{ print $2, $1 }`

- 78263 12. Same, with input fields separated by a <comma> or <space> and <tab> characters, or  
78264 both:

78265 `BEGIN { FS = ", [ \t]*|[ \t]+" }`

78266 `{ print $2, $1 }`

- 78267 13. Add up the first column, print sum, and average:

78268 `{s += $1 }`

78269 `END {print "sum is ", s, " average is", s/NR}`

- 78270 14. Write fields in reverse order, one per line (many lines out for each line in):
- ```
78271 { for (i = NF; i > 0; --i) print $i }
```
- 78272 15. Write all lines between occurrences of the strings **start** and **stop**:
- ```
78273 /start/, /stop/
```
- 78274 16. Write all lines whose first field is different from the previous one:
- ```
78275 $1 != prev { print; prev = $1 }
```
- 78276 17. Simulate *echo*:
- ```
78277 BEGIN {
78278     for (i = 1; i < ARGV; ++i)
78279         printf("%s%s", ARGV[i], i==ARGV-1?"\n":" ")
78280 }
```
- 78281 18. Write the path prefixes contained in the *PATH* environment variable, one per line:
- ```
78282 BEGIN {
78283     n = split (ENVIRON["PATH"], path, ":")
78284     for (i = 1; i <= n; ++i)
78285         print path[i]
78286 }
```
- 78287 19. If there is a file named **input** containing page headers of the form:
- ```
78288 Page #
```
- 78289 and a file named **program** that contains:
- ```
78290 /Page/    { $2 = n++; }
78291           { print }
```
- 78292 then the command line:
- ```
78293 awk -f program n=5 input
```
- 78294 prints the file **input**, filling in page numbers starting at 5.

**RATIONALE**

78295 This description is based on the new *awk*, "nawk", (see the referenced *The AWK Programming*  
 78296 *Language*), which introduced a number of new features to the historical *awk*:

- 78298 1. New keywords: **delete**, **do**, **function**, **return**
- 78299 2. New built-in functions: **atan2**, **close**, **cos**, **gsub**, **match**, **rand**, **sin**, **srand**, **sub**, **system**
- 78300 3. New predefined variables: **FNR**, **ARGC**, **ARGV**, **RSTART**, **RLENGTH**, **SUBSEP**
- 78301 4. New expression operators: **?**, **:**, **..**, **^**
- 78302 5. The **FS** variable and the third argument to **split**, now treated as extended regular  
 78303 expressions.
- 78304 6. The operator precedence, changed to more closely match the C language. Two examples  
 78305 of code that operate differently are:

```
78306 while ( n /= 10 > 1) ...
78307 if (!"wk" ~ /bwk/) ...
```

78308 Several features have been added based on newer implementations of *awk*:

- 78309 • Multiple instances of `-f progfile` are permitted.
- 78310 • The new option `-v assignment`.
- 78311 • The new predefined variable `ENVIRON`.
- 78312 • New built-in functions `toupper` and `tolower`.
- 78313 • More formatting capabilities are added to `printf` to match the ISO C standard.

78314 The overall *awk* syntax has always been based on the C language, with a few features from the  
 78315 shell command language and other sources. Because of this, it is not completely compatible with  
 78316 any other language, which has caused confusion for some users. It is not the intent of the  
 78317 standard developers to address such issues. A few relatively minor changes toward making the  
 78318 language more compatible with the ISO C standard were made; most of these changes are based  
 78319 on similar changes in recent implementations, as described above. There remain several C-  
 78320 language conventions that are not in *awk*. One of the notable ones is the `<comma>` operator,  
 78321 which is commonly used to specify multiple expressions in the C language `for` statement. Also,  
 78322 there are various places where *awk* is more restrictive than the C language regarding the type of  
 78323 expression that can be used in a given context. These limitations are due to the different features  
 78324 that the *awk* language does provide.

78325 Regular expressions in *awk* have been extended somewhat from historical implementations to  
 78326 make them a pure superset of extended regular expressions, as defined by POSIX.1-2008 (see  
 78327 XBD Section 9.4, on page 188). The main extensions are internationalization features and  
 78328 interval expressions. Historical implementations of *awk* have long supported  
 78329 `<backslash>`-escape sequences as an extension to extended regular expressions, and this  
 78330 extension has been retained despite inconsistency with other utilities. The number of escape  
 78331 sequences recognized in both extended regular expressions and strings has varied (generally  
 78332 increasing with time) among implementations. The set specified by POSIX.1-2008 includes most  
 78333 sequences known to be supported by popular implementations and by the ISO C standard. One  
 78334 sequence that is not supported is hexadecimal value escapes beginning with `'\x'`. This would  
 78335 allow values expressed in more than 9 bits to be used within *awk* as in the ISO C standard.  
 78336 However, because this syntax has a non-deterministic length, it does not permit the subsequent  
 78337 character to be a hexadecimal digit. This limitation can be dealt with in the C language by the  
 78338 use of lexical string concatenation. In the *awk* language, concatenation could also be a solution  
 78339 for strings, but not for extended regular expressions (either lexical ERE tokens or strings used  
 78340 dynamically as regular expressions). Because of this limitation, the feature has not been added to  
 78341 POSIX.1-2008.

78342 When a string variable is used in a context where an extended regular expression normally  
 78343 appears (where the lexical token ERE is used in the grammar) the string does not contain the  
 78344 literal `<slash>` characters.

78345 Some versions of *awk* allow the form:

```
78346 func name(args, ... ) { statements }
```

78347 This has been deprecated by the authors of the language, who asked that it not be specified.

78348 Historical implementations of *awk* produce an error if a `next` statement is executed in a `BEGIN`  
 78349 action, and cause *awk* to terminate if a `next` statement is executed in an `END` action. This  
 78350 behavior has not been documented, and it was not believed that it was necessary to standardize  
 78351 it.

78352 The specification of conversions between string and numeric values is much more detailed than  
 78353 in the documentation of historical implementations or in the referenced *The AWK Programming*  
 78354 *Language*. Although most of the behavior is designed to be intuitive, the details are necessary to

78355 ensure compatible behavior from different implementations. This is especially important in  
 78356 relational expressions since the types of the operands determine whether a string or numeric  
 78357 comparison is performed. From the perspective of an application developer, it is usually  
 78358 sufficient to expect intuitive behavior and to force conversions (by adding zero or concatenating  
 78359 a null string) when the type of an expression does not obviously match what is needed. The  
 78360 intent has been to specify historical practice in almost all cases. The one exception is that, in  
 78361 historical implementations, variables and constants maintain both string and numeric values  
 78362 after their original value is converted by any use. This means that referencing a variable or  
 78363 constant can have unexpected side-effects. For example, with historical implementations the  
 78364 following program:

```
78365 {
78366     a = "+2"
78367     b = 2
78368     if (NR % 2)
78369         c = a + b
78370     if (a == b)
78371         print "numeric comparison"
78372     else
78373         print "string comparison"
78374 }
```

78375 would perform a numeric comparison (and output numeric comparison) for each odd-  
 78376 numbered line, but perform a string comparison (and output string comparison) for each even-  
 78377 numbered line. POSIX.1-2008 ensures that comparisons will be numeric if necessary. With  
 78378 historical implementations, the following program:

```
78379 BEGIN {
78380     OFMT = "%e"
78381     print 3.14
78382     OFMT = "%f"
78383     print 3.14
78384 }
```

78385 would output "3.140000e+00" twice, because in the second **print** statement the constant  
 78386 "3.14" would have a string value from the previous conversion. POSIX.1-2008 requires that the  
 78387 output of the second **print** statement be "3.140000". The behavior of historical  
 78388 implementations was seen as too unintuitive and unpredictable.

78389 It was pointed out that with the rules contained in early drafts, the following script would print  
 78390 nothing:

```
78391 BEGIN {
78392     y[1.5] = 1
78393     OFMT = "%e"
78394     print y[1.5]
78395 }
```

78396 Therefore, a new variable, **CONVFMT**, was introduced. The **OFMT** variable is now restricted to  
 78397 affecting output conversions of numbers to strings and **CONVFMT** is used for internal  
 78398 conversions, such as comparisons or array indexing. The default value is the same as that for  
 78399 **OFMT**, so unless a program changes **CONVFMT** (which no historical program would do), it  
 78400 will receive the historical behavior associated with internal string conversions.

78401 The POSIX *awk* lexical and syntactic conventions are specified more formally than in other  
 78402 sources. Again the intent has been to specify historical practice. One convention that may not be

78403 obvious from the formal grammar as in other verbal descriptions is where <newline> characters  
 78404 are acceptable. There are several obvious placements such as terminating a statement, and a  
 78405 <backslash> can be used to escape <newline> characters between any lexical tokens. In addition,  
 78406 <newline> characters without <backslash> characters can follow a comma, an open brace, a  
 78407 logical AND operator ("&&"), a logical OR operator ("||"), the **do** keyword, the **else** keyword,  
 78408 and the closing parenthesis of an **if**, **for**, or **while** statement. For example:

```
78409 { print $1,  
78410     $2 }
```

78411 The requirement that *awk* add a trailing <newline> to the program argument text is to simplify  
 78412 the grammar, making it match a text file in form. There is no way for an application or test suite  
 78413 to determine whether a literal <newline> is added or whether *awk* simply acts as if it did.

78414 POSIX.1-2008 requires several changes from historical implementations in order to support  
 78415 internationalization. Probably the most subtle of these is the use of the decimal-point character,  
 78416 defined by the *LC\_NUMERIC* category of the locale, in representations of floating-point  
 78417 numbers. This locale-specific character is used in recognizing numeric input, in converting  
 78418 between strings and numeric values, and in formatting output. However, regardless of locale,  
 78419 the <period> character (the decimal-point character of the POSIX locale) is the decimal-point  
 78420 character recognized in processing *awk* programs (including assignments in command line  
 78421 arguments). This is essentially the same convention as the one used in the ISO C standard. The  
 78422 difference is that the C language includes the *setlocale()* function, which permits an application  
 78423 to modify its locale. Because of this capability, a C application begins executing with its locale set  
 78424 to the C locale, and only executes in the environment-specified locale after an explicit call to  
 78425 *setlocale()*. However, adding such an elaborate new feature to the *awk* language was seen as  
 78426 inappropriate for POSIX.1-2008. It is possible to execute an *awk* program explicitly in any desired  
 78427 locale by setting the environment in the shell.

78428 The undefined behavior resulting from NULs in extended regular expressions allows future  
 78429 extensions for the GNU *gawk* program to process binary data.

78430 The behavior in the case of invalid *awk* programs (including lexical, syntactic, and semantic  
 78431 errors) is undefined because it was considered overly limiting on implementations to specify. In  
 78432 most cases such errors can be expected to produce a diagnostic and a non-zero exit status.  
 78433 However, some implementations may choose to extend the language in ways that make use of  
 78434 certain invalid constructs. Other invalid constructs might be deemed worthy of a warning, but  
 78435 otherwise cause some reasonable behavior. Still other constructs may be very difficult to detect  
 78436 in some implementations. Also, different implementations might detect a given error during an  
 78437 initial parsing of the program (before reading any input files) while others might detect it when  
 78438 executing the program after reading some input. Implementors should be aware that diagnosing  
 78439 errors as early as possible and producing useful diagnostics can ease debugging of applications,  
 78440 and thus make an implementation more usable.

78441 The unspecified behavior from using multi-character **RS** values is to allow possible future  
 78442 extensions based on extended regular expressions used for record separators. Historical  
 78443 implementations take the first character of the string and ignore the others.

78444 Unspecified behavior when *split(string,array,<null>)* is used is to allow a proposed future  
 78445 extension that would split up a string into an array of individual characters.

78446 In the context of the **getline** function, equally good arguments for different precedences of the |  
 78447 and < operators can be made. Historical practice has been that:

```
78448 getline < "a" "b"
```

78449 is parsed as:

78450 ( getline < "a" ) "b"

78451 although many would argue that the intent was that the file **ab** should be read. However:

78452 getline < "x" + 1

78453 parses as:

78454 getline < ( "x" + 1 )

78455 Similar problems occur with the | version of **getline**, particularly in combination with **\$**. For  
78456 example:

78457 \$"echo hi" | getline

78458 (This situation is particularly problematic when used in a **print** statement, where the |**getline**  
78459 part might be a redirection of the **print**.)

78460 Since in most cases such constructs are not (or at least should not) be used (because they have a  
78461 natural ambiguity for which there is no conventional parsing), the meaning of these constructs  
78462 has been made explicitly unspecified. (The effect is that a conforming application that runs into  
78463 the problem must parenthesize to resolve the ambiguity.) There appeared to be few if any actual  
78464 uses of such constructs.

78465 Grammars can be written that would cause an error under these circumstances. Where  
78466 backwards-compatibility is not a large consideration, implementors may wish to use such  
78467 grammars.

78468 Some historical implementations have allowed some built-in functions to be called without an  
78469 argument list, the result being a default argument list chosen in some "reasonable" way. Use of  
78470 **length** as a synonym for **length(\$0)** is the only one of these forms that is thought to be widely  
78471 known or widely used; this particular form is documented in various places (for example, most  
78472 historical *awk* reference pages, although not in the referenced *The AWK Programming Language*) as  
78473 legitimate practice. With this exception, default argument lists have always been undocumented  
78474 and vaguely defined, and it is not at all clear how (or if) they should be generalized to user-  
78475 defined functions. They add no useful functionality and preclude possible future extensions that  
78476 might need to name functions without calling them. Not standardizing them seems the simplest  
78477 course. The standard developers considered that **length** merited special treatment, however,  
78478 since it has been documented in the past and sees possibly substantial use in historical  
78479 programs. Accordingly, this usage has been made legitimate, but Issue 5 removed the  
78480 obsolescent marking for XSI-conforming implementations and many otherwise conforming  
78481 applications depend on this feature.

78482 In **sub** and **gsub**, if *repl* is a string literal (the lexical token **STRING**), then two consecutive  
78483 <backslash> characters should be used in the string to ensure a single <backslash> will precede  
78484 the <ampersand> when the resultant string is passed to the function. (For example, to specify  
78485 one literal <ampersand> in the replacement string, use **gsub(ERE, "\\&")**.)

78486 Historically, the only special character in the *repl* argument of **sub** and **gsub** string functions was  
78487 the <ampersand> ('&') character and preceding it with the <backslash> character was used to  
78488 turn off its special meaning.

78489 The description in the ISO POSIX-2:1993 standard introduced behavior such that the  
78490 <backslash> character was another special character and it was unspecified whether there were  
78491 any other special characters. This description introduced several portability problems, some of  
78492 which are described below, and so it has been replaced with the more historical description.  
78493 Some of the problems include:

- 78494 • Historically, to create the replacement string, a script could use `gsub(ERE, "\\&")`, but  
 78495 with the ISO POSIX-2:1993 standard wording, it was necessary to use `gsub(ERE,`  
 78496 `"\\\\&")`. The `<backslash>` characters are doubled here because all string literals are  
 78497 subject to lexical analysis, which would reduce each pair of `<backslash>` characters to a  
 78498 single `<backslash>` before being passed to `gsub`.
- 78499 • Since it was unspecified what the special characters were, for portable scripts to guarantee  
 78500 that characters are printed literally, each character had to be preceded with a `<backslash>`.  
 78501 (For example, a portable script had to use `gsub(ERE, "\\h\\i")` to produce a replacement  
 78502 string of "hi".)

78503 The description for comparisons in the ISO POSIX-2:1993 standard did not properly describe  
 78504 historical practice because of the way numeric strings are compared as numbers. The current  
 78505 rules cause the following code:

```
78506 if (0 == "000")
78507     print "strange, but true"
78508 else
78509     print "not true"
```

78510 to do a numeric comparison, causing the `if` to succeed. It should be intuitively obvious that this  
 78511 is incorrect behavior, and indeed, no historical implementation of `awk` actually behaves this way.

78512 To fix this problem, the definition of *numeric string* was enhanced to include only those values  
 78513 obtained from specific circumstances (mostly external sources) where it is not possible to  
 78514 determine unambiguously whether the value is intended to be a string or a numeric.

78515 Variables that are assigned to a numeric string shall also be treated as a numeric string. (For  
 78516 example, the notion of a numeric string can be propagated across assignments.) In comparisons,  
 78517 all variables having the uninitialized value are to be treated as a numeric operand evaluating to  
 78518 the numeric value zero.

78519 Uninitialized variables include all types of variables including scalars, array elements, and  
 78520 fields. The definition of an uninitialized value in [Variables and Special Variables](#) (on page 2437)  
 78521 is necessary to describe the value placed on uninitialized variables and on fields that are valid  
 78522 (for example, `< $NF`) but have no characters in them and to describe how these variables are to  
 78523 be used in comparisons. A valid field, such as `$1`, that has no characters in it can be obtained  
 78524 from an input line of `"\t\t\t"` when `FS='\t'`. Historically, the comparison (`$1<10`) was done  
 78525 numerically after evaluating `$1` to the value zero.

78526 The phrase `"... also shall have the numeric value of the numeric string"` was removed from  
 78527 several sections of the ISO POSIX-2:1993 standard because it specifies an unnecessary  
 78528 implementation detail. It is not necessary for POSIX.1-2008 to specify that these objects be  
 78529 assigned two different values. It is only necessary to specify that these objects may evaluate to  
 78530 two different values depending on context.

78531 Historical implementations of `awk` did not parse hexadecimal integer or floating constants like  
 78532 `"0xa"` and `"0xap0"`. Due to an oversight, the 2001 through 2004 editions of this standard  
 78533 required support for hexadecimal floating constants. This was due to the reference to `atof()`.  
 78534 This version of the standard allows but does not require implementations to use `atof()` and  
 78535 includes a description of how floating-point numbers are recognized as an alternative to match  
 78536 historic behavior. The intent of this change is to allow implementations to recognize floating-  
 78537 point constants according to either the ISO/IEC 9899:1990 standard or ISO/IEC 9899:1999  
 78538 standard, and to allow (but not require) implementations to recognize hexadecimal integer  
 78539 constants.

78540 Historical implementations of `awk` did not support floating-point infinities and NaNs in *numeric*

78541 *strings*; e.g., "-INF" and "NaN". However, implementations that use the *atof()* or *strtod()*  
 78542 functions to do the conversion picked up support for these values if they used a  
 78543 ISO/IEC 9899:1999 standard version of the function instead of a ISO/IEC 9899:1990 standard  
 78544 version. Due to an oversight, the 2001 through 2004 editions of this standard did not allow  
 78545 support for infinities and NaNs, but in this revision support is allowed (but not required). This is  
 78546 a silent change to the behavior of *awk* programs; for example, in the POSIX locale the expression:

78547 (" -INF" + 0 < 0)

78548 formerly had the value 0 because "-INF" converted to 0, but now it may have the value 0 or 1.

#### 78549 FUTURE DIRECTIONS

78550 None.

#### 78551 SEE ALSO

78552 [Section 1.3](#) (on page 2287), *grep*, *lex*, *sed*

78553 XBD [Chapter 5](#) (on page 121), [Section 6.1](#) (on page 125), [Chapter 8](#) (on page 173), [Chapter 9](#) (on  
 78554 page 181), [Section 12.2](#) (on page 215)

#### 78556 CHANGE HISTORY

78557 First released in Issue 2.

#### 78558 Issue 5

78559 The FUTURE DIRECTIONS section is added.

#### 78560 Issue 6

78561 The *awk* utility is aligned with the IEEE P1003.2b draft standard.

78562 The normative text is reworded to avoid use of the term "must" for application requirements.

78563 IEEE PASC Interpretation 1003.2 #211 is applied, adding the sentence "An occurrence of two  
 78564 consecutive <backslash> characters shall be interpreted as just a single literal <backslash>  
 78565 character." into the description of the **sub** string function.

#### 78566 Issue 7

78567 PASC Interpretation 1003.2-1992 #107 (SD5-XCU-ERN-73) is applied, updating the description of  
 78568 the **OFS** variable.

78569 Austin Group Interpretation 1003.1-2001 #189 is applied.

78570 Austin Group Interpretation 1003.1-2001 #201 is applied, permitting implementations to support  
 78571 infinities and NaNs.

78572 SD5-XCU-ERN-79 is applied, restoring the horizontal lines to [Table 4-1](#) (on page 2433), and  
 78573 SD5-XCU-ERN-80 is applied, changing the order of some table entries.

78574 SD5-XCU-ERN-87 is applied, updating the descriptive text of the Grammar.

78575 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

78576 The EXTENDED DESCRIPTION is changed to make the support of hexadecimal integer and  
 78577 floating constants optional.

**basename**

Utilities

78578 **NAME**78579 `basename` — return non-directory portion of a pathname78580 **SYNOPSIS**78581 `basename string [suffix]`78582 **DESCRIPTION**

78583 The *string* operand shall be treated as a pathname, as defined in XBD Section 3.266 (on page 75).  
 78584 The string *string* shall be converted to the filename corresponding to the last pathname  
 78585 component in *string* and then the suffix string *suffix*, if present, shall be removed. This shall be  
 78586 done by performing actions equivalent to the following steps in order:

- 78587 1. If *string* is a null string, it is unspecified whether the resulting string is `./` or a null  
 78588 string. In either case, skip steps 2 through 6.
- 78589 2. If *string* is `"/"`, it is implementation-defined whether steps 3 to 6 are skipped or  
 78590 processed.
- 78591 3. If *string* consists entirely of `<slash>` characters, *string* shall be set to a single `<slash>`  
 78592 character. In this case, skip steps 4 to 6.
- 78593 4. If there are any trailing `<slash>` characters in *string*, they shall be removed.
- 78594 5. If there are any `<slash>` characters remaining in *string*, the prefix of *string* up to and  
 78595 including the last `<slash>` character in *string* shall be removed.
- 78596 6. If the *suffix* operand is present, is not identical to the characters remaining in *string*, and is  
 78597 identical to a suffix of the characters remaining in *string*, the suffix *suffix* shall be removed  
 78598 from *string*. Otherwise, *string* is not modified by this step. It shall not be considered an  
 78599 error if *suffix* is not found in *string*.

78600 The resulting string shall be written to standard output.

78601 **OPTIONS**

78602 None.

78603 **OPERANDS**

78604 The following operands shall be supported:

78605 *string* A string.

78606 *suffix* A string.

78607 **STDIN**

78608 Not used.

78609 **INPUT FILES**

78610 None.

78611 **ENVIRONMENT VARIABLES**78612 The following environment variables shall affect the execution of *basename*:

78613 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 78614 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 78615 variables used to determine the values of locale categories.)

78616 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 78617 internationalization variables.

78618 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 78619 characters (for example, single-byte as opposed to multi-byte characters in  
 78620 arguments).

78621 *LC\_MESSAGES*

78622 Determine the locale that should be used to affect the format and contents of

78623 diagnostic messages written to standard error.

78624 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

78625 **ASYNCHRONOUS EVENTS**

78626 Default.

78627 **STDOUT**

78628 The *basename* utility shall write a line to the standard output in the following format:

78629 "%s\n", <resulting string>

78630 **STDERR**

78631 The standard error shall be used only for diagnostic messages.

78632 **OUTPUT FILES**

78633 None.

78634 **EXTENDED DESCRIPTION**

78635 None.

78636 **EXIT STATUS**

78637 The following exit values shall be returned:

78638 0 Successful completion.

78639 >0 An error occurred.

78640 **CONSEQUENCES OF ERRORS**

78641 Default.

78642 **APPLICATION USAGE**

78643 The definition of *pathname* specifies implementation-defined behavior for pathnames starting

78644 with two <slash> characters. Therefore, applications shall not arbitrarily add <slash> characters

78645 to the beginning of a pathname unless they can ensure that there are more or less than two or are

78646 prepared to deal with the implementation-defined consequences.

78647 **EXAMPLES**

78648 If the string *string* is a valid pathname:

78649 `$(basename "string")`

78650 produces a filename that could be used to open the file named by *string* in the directory returned

78651 by:

78652 `$(dirname "string")`

78653 If the string *string* is not a valid pathname, the same algorithm is used, but the result need not be

78654 a valid filename. The *basename* utility is not expected to make any judgements about the validity

78655 of *string* as a pathname; it just follows the specified algorithm to produce a result string.

78656 The following shell script compiles `/usr/src/cmd/cat.c` and moves the output to a file named `cat`

78657 in the current directory when invoked with the argument `/usr/src/cmd/cat` or with the argument

78658 `/usr/src/cmd/cat.c`:

78659 `c99 $(dirname "$1")/$(basename "$1" .c) .c`

78660 `mv a.out $(basename "$1" .c)`

78661 **RATIONALE**

78662 The behaviors of *basename* and *dirname* have been coordinated so that when *string* is a valid  
78663 pathname:

78664 `$(basename "string")`

78665 would be a valid filename for the file in the directory:

78666 `$(dirname "string")`

78667 This would not work for the early proposal versions of these utilities due to the way it specified  
78668 handling of trailing <slash> characters.

78669 Since the definition of *pathname* specifies implementation-defined behavior for pathnames  
78670 starting with two <slash> characters, this volume of POSIX.1-2008 specifies similar  
78671 implementation-defined behavior for the *basename* and *dirname* utilities.

78672 **FUTURE DIRECTIONS**

78673 None.

78674 **SEE ALSO**

78675 [Section 2.5](#) (on page 2301), *dirname*

78676 XBD [Section 3.266](#) (on page 75), [Chapter 8](#) (on page 173)

78677 **CHANGE HISTORY**

78678 First released in Issue 2.

78679 **Issue 6**

78680 IEEE PASC Interpretation 1003.2 #164 is applied.

78681 The normative text is reworded to avoid use of the term "must" for application requirements.

78682 **NAME**

78683 batch — schedule commands to be executed in a batch queue

78684 **SYNOPSIS**78685 *batch*78686 **DESCRIPTION**78687 The *batch* utility shall read commands from standard input and schedule them for execution in a  
78688 batch queue. It shall be the equivalent of the command:78689 `at -q b -m now`78690 where queue *b* is a special *at* queue, specifically for batch jobs. Batch jobs shall be submitted to  
78691 the batch queue with no time constraints and shall be run by the system using algorithms, based  
78692 on unspecified factors, that may vary with each invocation of *batch*.78693 XSI Users shall be permitted to use *batch* if their name appears in the file **at.allow**, which is located in  
78694 an implementation-defined directory. If that file does not exist, the file **at.deny**, which is located  
78695 in an implementation-defined directory, shall be checked to determine whether the user shall be  
78696 denied access to *batch*. If neither file exists, only a process with appropriate privileges shall be  
78697 allowed to submit a job. If only **at.deny** exists and is empty, global usage shall be permitted. The  
78698 **at.allow** and **at.deny** files shall consist of one user name per line.78699 **OPTIONS**

78700 None.

78701 **OPERANDS**

78702 None.

78703 **STDIN**78704 The standard input shall be a text file consisting of commands acceptable to the shell command  
78705 language described in Chapter 2 (on page 2297).78706 **INPUT FILES**78707 XSI The text files **at.allow** and **at.deny**, which are located in an implementation-defined directory,  
78708 shall contain zero or more user names, one per line, of users who are, respectively, authorized or  
78709 denied access to the *at* and *batch* utilities.78710 **ENVIRONMENT VARIABLES**78711 The following environment variables shall affect the execution of *batch*:78712 **LANG** Provide a default value for the internationalization variables that are unset or null.  
78713 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
78714 variables used to determine the values of locale categories.)78715 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
78716 internationalization variables.78717 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
78718 characters (for example, single-byte as opposed to multi-byte characters in  
78719 arguments and input files).78720 **LC\_MESSAGES**78721 Determine the locale that should be used to affect the format and contents of  
78722 diagnostic messages written to standard error and informative messages written to  
78723 standard output.78724 **LC\_TIME** Determine the format and contents for date and time strings written by *batch*.

78725	XSI	<b>NLSPATH</b>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
78726		<b>SHELL</b>	Determine the name of a command interpreter to be used to invoke the at-job. If the variable is unset or null, <i>sh</i> shall be used. If it is set to a value other than a name for <i>sh</i> , the implementation shall do one of the following: use that shell; use <i>sh</i> ; use the login shell from the user database; any of the preceding accompanied by a warning diagnostic about which was chosen.
78727			
78728			
78729			
78730			
78731		<b>TZ</b>	Determine the timezone. The job shall be submitted for execution at the time specified by <i>timespec</i> or <i>-t time</i> relative to the timezone specified by the <i>TZ</i> variable. If <i>timespec</i> specifies a timezone, it overrides <i>TZ</i> . If <i>timespec</i> does not specify a timezone and <i>TZ</i> is unset or null, an unspecified default timezone shall be used.
78732			
78733			
78734			
78735			
78736		<b>ASYNCHRONOUS EVENTS</b>	
78737		Default.	
78738		<b>STDOUT</b>	
78739			When standard input is a terminal, prompts of unspecified format for each line of the user input described in the STDIN section may be written to standard output.
78740			
78741		<b>STDERR</b>	
78742			The following shall be written to standard error when a job has been successfully submitted:
78743			"job %s at %s\n", <i>at_job_id</i> , <date>
78744			where <i>date</i> shall be equivalent in format to the output of:
78745			date +"%a %b %e %T %Y"
78746			The date and time written shall be adjusted so that they appear in the timezone of the user (as determined by the <i>TZ</i> variable).
78747			
78748			Neither this, nor warning messages concerning the selection of the command interpreter, are considered a diagnostic that changes the exit status.
78749			
78750			Diagnostic messages, if any, shall be written to standard error.
78751		<b>OUTPUT FILES</b>	
78752		None.	
78753		<b>EXTENDED DESCRIPTION</b>	
78754		None.	
78755		<b>EXIT STATUS</b>	
78756			The following exit values shall be returned:
78757		0	Successful completion.
78758		>0	An error occurred.
78759		<b>CONSEQUENCES OF ERRORS</b>	
78760			The job shall not be scheduled.

78761 **APPLICATION USAGE**

78762 It may be useful to redirect standard output within the specified commands.

78763 **EXAMPLES**

78764 1. This sequence can be used at a terminal:

78765 

```
batch
78766 sort < file >outfile
78767 EOT
```

78768 2. This sequence, which demonstrates redirecting standard error to a pipe, is useful in a  
78769 command procedure (the sequence of output redirection specifications is significant):78770 

```
batch <<!
78771 diff file1 file2 2>&1 >outfile | mailx mygroup
78772 !
```

78773 **RATIONALE**78774 Early proposals described *batch* in a manner totally separated from *at*, even though the historical  
78775 model treated it almost as a synonym for *at -qb*. A number of features were added to list and  
78776 control batch work separately from those in *at*. Upon further reflection, it was decided that the  
78777 benefit of this did not merit the change to the historical interface.78778 The *-m* option was included on the equivalent *at* command because it is historical practice to  
78779 mail results to the submitter, even if all job-produced output is redirected. As explained in the  
78780 RATIONALE for *at*, the *now* keyword submits the job for immediate execution (after scheduling  
78781 delays), despite some historical systems where *at now* would have been considered an error.78782 **FUTURE DIRECTIONS**

78783 None.

78784 **SEE ALSO**78785 *at*

78786 XBD Chapter 8 (on page 173)

78787 **CHANGE HISTORY**

78788 First released in Issue 2.

78789 **Issue 6**

78790 This utility is marked as part of the User Portability Utilities option.

78791 The NAME is changed to align with the IEEE P1003.2b draft standard.

78792 The normative text is reworded to avoid use of the term “must” for application requirements.

78793 **Issue 7**78794 The *batch* utility is moved from the User Portability Utilities option to the Base. User Portability  
78795 Utilities is now an option for interactive utilities.78796 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced  
78797 by the *batch* utility.

78798 **NAME**

78799 bc — arbitrary-precision arithmetic language

78800 **SYNOPSIS**78801 bc [-l] [*file...*]78802 **DESCRIPTION**

78803 The *bc* utility shall implement an arbitrary precision calculator. It shall take input from any files  
 78804 given, then read from the standard input. If the standard input and standard output to *bc* are  
 78805 attached to a terminal, the invocation of *bc* shall be considered to be *interactive*, causing  
 78806 behavioral constraints described in the following sections.

78807 **OPTIONS**78808 The *bc* utility shall conform to XBD Section 12.2 (on page 215).

78809 The following option shall be supported:

78810 **-l** (The letter ell.) Define the math functions and initialize *scale* to 20, instead of the  
 78811 default zero; see the EXTENDED DESCRIPTION section.

78812 **OPERANDS**

78813 The following operand shall be supported:

78814 *file* A pathname of a text file containing *bc* program statements. After all *files* have  
 78815 been read, *bc* shall read the standard input.

78816 **STDIN**

78817 See the INPUT FILES section.

78818 **INPUT FILES**

78819 Input files shall be text files containing a sequence of comments, statements, and function  
 78820 definitions that shall be executed as they are read.

78821 **ENVIRONMENT VARIABLES**78822 The following environment variables shall affect the execution of *bc*:

78823 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 78824 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 78825 variables used to determine the values of locale categories.)

78826 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 78827 internationalization variables.

78828 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 78829 characters (for example, single-byte as opposed to multi-byte characters in  
 78830 arguments and input files).

78831 **LC\_MESSAGES**

78832 Determine the locale that should be used to affect the format and contents of  
 78833 diagnostic messages written to standard error.

78834 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

78835 **ASYNCHRONOUS EVENTS**

78836 Default.

78837 **STDOUT**

78838 The output of the *bc* utility shall be controlled by the program read, and consist of zero or more  
 78839 lines containing the value of all executed expressions without assignments. The radix and  
 78840 precision of the output shall be controlled by the values of the **obase** and **scale** variables; see the  
 78841 EXTENDED DESCRIPTION section.

78842 **STDERR**

78843 The standard error shall be used only for diagnostic messages.

78844 **OUTPUT FILES**

78845 None.

78846 **EXTENDED DESCRIPTION**78847 **Grammar**

78848 The grammar in this section and the lexical conventions in the following section shall together  
 78849 describe the syntax for *bc* programs. The general conventions for this style of grammar are  
 78850 described in [Section 1.3](#) (on page 2287). A valid program can be represented as the non-terminal  
 78851 symbol **program** in the grammar. This formal syntax shall take precedence over the text syntax  
 78852 description.

```

78853 %token      EOF NEWLINE STRING LETTER NUMBER
78854 %token      MUL_OP

```

### 78954 Lexical Conventions in bc

78955 The lexical conventions for *bc* programs, with respect to the preceding grammar, shall be as  
78956 follows:

- 78957 1. Except as noted, *bc* shall recognize the longest possible token or delimiter beginning at a  
78958 given point.
- 78959 2. A comment shall consist of any characters beginning with the two adjacent characters  
78960 `"/*"` and terminated by the next occurrence of the two adjacent characters `"*/"`.  
78961 Comments shall have no effect except to delimit lexical tokens.
- 78962 3. The `<newline>` shall be recognized as the token **NEWLINE**.
- 78963 4. The token **STRING** shall represent a string constant; it shall consist of any characters  
78964 beginning with the double-quote character (`'"`) and terminated by another occurrence  
78965 of the double-quote character. The value of the string is the sequence of all characters  
78966 between, but not including, the two double-quote characters. All characters shall be taken  
78967 literally from the input, and there is no way to specify a string containing a double-quote  
78968 character. The length of the value of each string shall be limited to `{BC_STRING_MAX}`  
78969 bytes.
- 78970 5. A `<blank>` shall have no effect except as an ordinary character if it appears within a  
78971 **STRING** token, or to delimit a lexical token other than **STRING**.
- 78972 6. The combination of a `<backslash>` character immediately followed by a `<newline>` shall  
78973 have no effect other than to delimit lexical tokens with the following exceptions:

- 78974                   • It shall be interpreted as the character sequence "`\<newline>`" in **STRING** tokens.
- 78975                   • It shall be ignored as part of a multi-line **NUMBER** token.
- 78976           7. The token **NUMBER** shall represent a numeric constant. It shall be recognized by the  
78977 following grammar:
- 78978           NUMBER : integer  
78979                   | '.' integer  
78980                   | integer '.'  
78981                   | integer '.' integer  
78982                   ;
- 78983           integer : digit  
78984                   | integer digit  
78985                   ;
- 78986           digit : 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7  
78987                   | 8 | 9 | A | B | C | D | E | F  
78988                   ;
- 78989           8. The value of a **NUMBER** token shall be interpreted as a numeral in the base specified by  
78990 the value of the internal register **ibase** (described below). Each of the **digit** characters  
78991 shall have the value from 0 to 15 in the order listed here, and the `<period>` character shall  
78992 represent the radix point. The behavior is undefined if digits greater than or equal to the  
78993 value of **ibase** appear in the token. However, note the exception for single-digit values  
78994 being assigned to **ibase** and **obase** themselves, in [Operations in bc](#) (on page 2475).
- 78995           9. The following keywords shall be recognized as tokens:
- 78996           **auto**       **ibase**       **length**   **return**   **while**  
78997           **break**   **if**       **obase**   **scale**  
78998           **define**   **for**      **quit**   **sqrt**
- 78999           10. Any of the following characters occurring anywhere except within a keyword shall be  
79000 recognized as the token **LETTER**:
- 79001           a b c d e f g h i j k l m n o p q r s t u v w x y z
- 79002           11. The following single-character and two-character sequences shall be recognized as the  
79003 token **ASSIGN\_OP**:
- 79004           = += -= \*= /= %= ^=
- 79005           12. If an '=' character, as the beginning of a token, is followed by a '-' character with no  
79006 intervening delimiter, the behavior is undefined.
- 79007           13. The following single-characters shall be recognized as the token **MUL\_OP**:
- 79008           \* / %
- 79009           14. The following single-character and two-character sequences shall be recognized as the  
79010 token **REL\_OP**:
- 79011           == <= >= != < >
- 79012           15. The following two-character sequences shall be recognized as the token **INCR\_DECR**:
- 79013           ++ --

79014 16. The following single characters shall be recognized as tokens whose names are the  
79015 character:

79016 <newline> ( ) , + - ; [ ] ^ { }

79017 17. The token **EOF** is returned when the end of input is reached.

### 79018 Operations in bc

79019 There are three kinds of identifiers: ordinary identifiers, array identifiers, and function  
79020 identifiers. All three types consist of single lowercase letters. Array identifiers shall be followed  
79021 by square brackets ("[]"). An array subscript is required except in an argument or auto list.  
79022 Arrays are singly dimensioned and can contain up to {BC\_DIM\_MAX} elements. Indexing shall  
79023 begin at zero so an array is indexed from 0 to {BC\_DIM\_MAX}-1. Subscripts shall be truncated  
79024 to integers. The application shall ensure that function identifiers are followed by parentheses,  
79025 possibly enclosing arguments. The three types of identifiers do not conflict.

79026 The following table summarizes the rules for precedence and associativity of all operators.  
79027 Operators on the same line shall have the same precedence; rows are in order of decreasing  
79028 precedence.

79029 **Table 4-3** Operators in *bc*

Operator	Associativity
++, --	N/A
unary -	N/A
^	Right to left
*, /, %	Left to right
+, binary -	Left to right
=, +=, -=, *=, /=, %=, ^=	Right to left
==, <=, >=, !=, <, >	None

79038 Each expression or named expression has a *scale*, which is the number of decimal digits that  
79039 shall be maintained as the fractional portion of the expression.

79040 *Named expressions* are places where values are stored. Named expressions shall be valid on the  
79041 left side of an assignment. The value of a named expression shall be the value stored in the place  
79042 named. Simple identifiers and array elements are named expressions; they have an initial value  
79043 of zero and an initial scale of zero.

79044 The internal registers **scale**, **ibase**, and **obase** are all named expressions. The scale of an  
79045 expression consisting of the name of one of these registers shall be zero; values assigned to any  
79046 of these registers are truncated to integers. The **scale** register shall contain a global value used in  
79047 computing the scale of expressions (as described below). The value of the register **scale** is  
79048 limited to  $0 \leq \text{scale} \leq \{\text{BC\_SCALE\_MAX}\}$  and shall have a default value of zero. The **ibase** and  
79049 **obase** registers are the input and output number radix, respectively. The value of **ibase** shall be  
79050 limited to:

79051  $2 \leq \text{ibase} \leq 16$

79052 The value of **obase** shall be limited to:

79053  $2 \leq \text{obase} \leq \{\text{BC\_BASE\_MAX}\}$

79054 When either **ibase** or **obase** is assigned a single **digit** value from the list in [Lexical Conventions](#)  
79055 [in bc](#) (on page 2473), the value shall be assumed in hexadecimal. (For example, **ibase=A** sets to  
79056 base ten, regardless of the current **ibase** value.) Otherwise, the behavior is undefined when

79057 digits greater than or equal to the value of **ibase** appear in the input. Both **ibase** and **obase** shall  
79058 have initial values of 10.

79059 Internal computations shall be conducted as if in decimal, regardless of the input and output  
79060 bases, to the specified number of decimal digits. When an exact result is not achieved (for  
79061 example, **scale**=0; 3.2/1), the result shall be truncated.

79062 For all values of **obase** specified by this volume of POSIX.1-2008, *bc* shall output numeric values  
79063 by performing each of the following steps in order:

- 79064 1. If the value is less than zero, a <hyphen> ( ' - ' ) character shall be output.
- 79065 2. One of the following is output, depending on the numerical value:
  - 79066 • If the absolute value of the numerical value is greater than or equal to one, the  
79067 integer portion of the value shall be output as a series of digits appropriate to **obase**  
79068 (as described below), most significant digit first. The most significant non-zero digit  
79069 shall be output next, followed by each successively less significant digit.
  - 79070 • If the absolute value of the numerical value is less than one but greater than zero  
79071 and the scale of the numerical value is greater than zero, it is unspecified whether  
79072 the character 0 is output.
  - 79073 • If the numerical value is zero, the character 0 shall be output.
- 79074 3. If the scale of the value is greater than zero and the numeric value is not zero, a <period>  
79075 character shall be output, followed by a series of digits appropriate to **obase** (as described  
79076 below) representing the most significant portion of the fractional part of the value. If *s*  
79077 represents the scale of the value being output, the number of digits output shall be *s* if  
79078 **obase** is 10, less than or equal to *s* if **obase** is greater than 10, or greater than or equal to *s*  
79079 if **obase** is less than 10. For **obase** values other than 10, this should be the number of  
79080 digits needed to represent a precision of  $10^s$ .

79081 For **obase** values from 2 to 16, valid digits are the first **obase** of the single characters:

79082 0 1 2 3 4 5 6 7 8 9 A B C D E F

79083 which represent the values zero to 15, inclusive, respectively.

79084 For bases greater than 16, each digit shall be written as a separate multi-digit decimal number.  
79085 Each digit except the most significant fractional digit shall be preceded by a single <space>. For  
79086 bases from 17 to 100, *bc* shall write two-digit decimal numbers; for bases from 101 to 1 000, three-  
79087 digit decimal strings, and so on. For example, the decimal number 1 024 in base 25 would be  
79088 written as:

79089 Δ01Δ15Δ24

79090 and in base 125, as:

79091 Δ008Δ024

79092 Very large numbers shall be split across lines with 70 characters per line in the POSIX locale;  
79093 other locales may split at different character boundaries. Lines that are continued shall end with  
79094 a <backslash>.

79095 A function call shall consist of a function name followed by parentheses containing a  
79096 <comma>-separated list of expressions, which are the function arguments. A whole array  
79097 passed as an argument shall be specified by the array name followed by empty square brackets.  
79098 All function arguments shall be passed by value. As a result, changes made to the formal  
79099 parameters shall have no effect on the actual arguments. If the function terminates by executing

- 79100 a **return** statement, the value of the function shall be the value of the expression in the  
 79101 parentheses of the **return** statement or shall be zero if no expression is provided or if there is no  
 79102 **return** statement.
- 79103 The result of **sqrt**(*expression*) shall be the square root of the expression. The result shall be  
 79104 truncated in the least significant decimal place. The scale of the result shall be the scale of the  
 79105 expression or the value of **scale**, whichever is larger.
- 79106 The result of **length**(*expression*) shall be the total number of significant decimal digits in the  
 79107 expression. The scale of the result shall be zero.
- 79108 The result of **scale**(*expression*) shall be the scale of the expression. The scale of the result shall be  
 79109 zero.
- 79110 A numeric constant shall be an expression. The scale shall be the number of digits that follow the  
 79111 radix point in the input representing the constant, or zero if no radix point appears.
- 79112 The sequence ( *expression* ) shall be an expression with the same value and scale as *expression*.  
 79113 The parentheses can be used to alter the normal precedence.
- 79114 The semantics of the unary and binary operators are as follows:
- 79115 *-expression*  
 79116 The result shall be the negative of the *expression*. The scale of the result shall be the scale of  
 79117 *expression*.
- 79118 The unary increment and decrement operators shall not modify the scale of the named  
 79119 expression upon which they operate. The scale of the result shall be the scale of that named  
 79120 expression.
- 79121 *++named-expression*  
 79122 The named expression shall be incremented by one. The result shall be the value of the  
 79123 named expression after incrementing.
- 79124 *--named-expression*  
 79125 The named expression shall be decremented by one. The result shall be the value of the  
 79126 named expression after decrementing.
- 79127 *named-expression++*  
 79128 The named expression shall be incremented by one. The result shall be the value of the  
 79129 named expression before incrementing.
- 79130 *named-expression--*  
 79131 The named expression shall be decremented by one. The result shall be the value of the  
 79132 named expression before decrementing.
- 79133 The exponentiation operator, <circumflex> ( ' ^ ' ), shall bind right to left.
- 79134 *expression^expression*  
 79135 The result shall be the first *expression* raised to the power of the second *expression*. If the  
 79136 second expression is not an integer, the behavior is undefined. If *a* is the scale of the left  
 79137 expression and *b* is the absolute value of the right expression, the scale of the result shall be:  
 79138 if  $b \geq 0$   $\min(a * b, \max(\text{scale}, a))$  if  $b < 0$  *scale*
- 79139 The multiplicative operators ( ' \* ' , ' / ' , ' % ' ) shall bind left to right.
- 79140 *expression\*expression*  
 79141 The result shall be the product of the two expressions. If *a* and *b* are the scales of the two  
 79142 expressions, then the scale of the result shall be:

79143  $\min(a+b, \max(\text{scale}, a, b))$

79144 *expression*/*expression*

79145 The result shall be the quotient of the two expressions. The scale of the result shall be the  
79146 value of **scale**.

79147 *expression*%*expression*

79148 For expressions *a* and *b*, *a*%*b* shall be evaluated equivalent to the steps:

79149 1. Compute *a*/*b* to current scale.

79150 2. Use the result to compute:

79151  $a - (a / b) * b$

79152 to scale:

79153  $\max(\text{scale} + \text{scale}(b), \text{scale}(a))$

79154 The scale of the result shall be:

79155  $\max(\text{scale} + \text{scale}(b), \text{scale}(a))$

79156 When **scale** is zero, the '**%**' operator is the mathematical remainder operator.

79157 The additive operators ('+', '-') shall bind left to right.

79158 *expression*+*expression*

79159 The result shall be the sum of the two expressions. The scale of the result shall be the  
79160 maximum of the scales of the expressions.

79161 *expression*-*expression*

79162 The result shall be the difference of the two expressions. The scale of the result shall be the  
79163 maximum of the scales of the expressions.

79164 The assignment operators ('=', '+=', '-=', '\*=', '/=', '%=', '^=') shall bind right to left.

79165 *named-expression*=*expression*

79166 This expression shall result in assigning the value of the expression on the right to the  
79167 named expression on the left. The scale of both the named expression and the result shall be  
79168 the scale of *expression*.

79169 The compound assignment forms:

79170 *named-expression* <operator>= *expression*

79171 shall be equivalent to:

79172 *named-expression*=*named-expression* <operator> *expression*

79173 except that the *named-expression* shall be evaluated only once.

79174 Unlike all other operators, the relational operators ('<', '>', '<=', '>=', '==', '!=') shall be  
79175 only valid as the object of an **if**, **while**, or inside a **for** statement.

79176 *expression1*<*expression2*

79177 The relation shall be true if the value of *expression1* is strictly less than the value of  
79178 *expression2*.

79179 *expression1*>*expression2*

79180 The relation shall be true if the value of *expression1* is strictly greater than the value of  
79181 *expression2*.

79182 *expression1* <= *expression2*

79183 The relation shall be true if the value of *expression1* is less than or equal to the value of  
79184 *expression2*.

79185 *expression1* >= *expression2*

79186 The relation shall be true if the value of *expression1* is greater than or equal to the value of  
79187 *expression2*.

79188 *expression1* = *expression2*

79189 The relation shall be true if the values of *expression1* and *expression2* are equal.

79190 *expression1* != *expression2*

79191 The relation shall be true if the values of *expression1* and *expression2* are unequal.

79192 There are only two storage classes in *bc*: global and automatic (local). Only identifiers that are  
79193 local to a function need be declared with the **auto** command. The arguments to a function shall  
79194 be local to the function. All other identifiers are assumed to be global and available to all  
79195 functions. All identifiers, global and local, have initial values of zero. Identifiers declared as auto  
79196 shall be allocated on entry to the function and released on returning from the function. They  
79197 therefore do not retain values between function calls. Auto arrays shall be specified by the array  
79198 name followed by empty square brackets. On entry to a function, the old values of the names  
79199 that appear as parameters and as automatic variables shall be pushed onto a stack. Until the  
79200 function returns, reference to these names shall refer only to the new values.

79201 References to any of these names from other functions that are called from this function also  
79202 refer to the new value until one of those functions uses the same name for a local variable.

79203 When a statement is an expression, unless the main operator is an assignment, execution of the  
79204 statement shall write the value of the expression followed by a <newline>.

79205 When a statement is a string, execution of the statement shall write the value of the string.

79206 Statements separated by <semicolon> or <newline> characters shall be executed sequentially. In  
79207 an interactive invocation of *bc*, each time a <newline> is read that satisfies the grammatical  
79208 production:

79209 `input_item : semicolon_list NEWLINE`

79210 the sequential list of statements making up the **semicolon\_list** shall be executed immediately  
79211 and any output produced by that execution shall be written without any delay due to buffering.

79212 In an **if** statement (**if**(*relation*) *statement*), the *statement* shall be executed if the relation is true.

79213 The **while** statement (**while**(*relation*) *statement*) implements a loop in which the *relation* is tested;  
79214 each time the *relation* is true, the *statement* shall be executed and the *relation* retested. When the  
79215 *relation* is false, execution shall resume after *statement*.

79216 A **for** statement (**for**(*expression*; *relation*; *expression*) *statement*) shall be the same as:

79217 `first-expression`  
79218 `while (relation) {`  
79219 `statement`  
79220 `last-expression`  
79221 `}`

79222 The application shall ensure that all three expressions are present.

79223 The **break** statement shall cause termination of a **for** or **while** statement.

79224 The **auto** statement (**auto** *identifier* [*identifier*] ...) shall cause the values of the identifiers to be

79225 pushed down. The identifiers can be ordinary identifiers or array identifiers. Array identifiers  
79226 shall be specified by following the array name by empty square brackets. The application shall  
79227 ensure that the **auto** statement is the first statement in a function definition.

79228 A **define** statement:

```
79229 define LETTER ( opt_parameter_list ) {
79230     opt_auto_define_list
79231     statement_list
79232 }
```

79233 defines a function named **LETTER**. If a function named **LETTER** was previously defined, the  
79234 **define** statement shall replace the previous definition. The expression:

```
79235 LETTER ( opt_argument_list )
```

79236 shall invoke the function named **LETTER**. The behavior is undefined if the number of  
79237 arguments in the invocation does not match the number of parameters in the definition.  
79238 Functions shall be defined before they are invoked. A function shall be considered to be defined  
79239 within its own body, so recursive calls are valid. The values of numeric constants within a  
79240 function shall be interpreted in the base specified by the value of the **ibase** register when the  
79241 function is invoked.

79242 The **return** statements (**return** and **return(expression)**) shall cause termination of a function,  
79243 popping of its auto variables, and specification of the result of the function. The first form shall  
79244 be equivalent to **return(0)**. The value and scale of the result returned by the function shall be the  
79245 value and scale of the expression returned.

79246 The **quit** statement (**quit**) shall stop execution of a *bc* program at the point where the statement  
79247 occurs in the input, even if it occurs in a function definition, or in an **if**, **for**, or **while** statement.

79248 The following functions shall be defined when the **-I** option is specified:

```
79249 s( expression )
79250     Sine of argument in radians.
79251 c( expression )
79252     Cosine of argument in radians.
79253 a( expression )
79254     Arctangent of argument.
79255 l( expression )
79256     Natural logarithm of argument.
79257 e( expression )
79258     Exponential function of argument.
79259 j( expression, expression )
79260     Bessel function of integer order.
```

79261 The scale of the result returned by these functions shall be the value of the **scale** register at the  
79262 time the function is invoked. The value of the **scale** register after these functions have completed  
79263 their execution shall be the same value it had upon invocation. The behavior is undefined if any  
79264 of these functions is invoked with an argument outside the domain of the mathematical  
79265 function.

79266 **EXIT STATUS**

79267 The following exit values shall be returned:

79268 0 All input files were processed successfully.

79269 *unspecified* An error occurred.79270 **CONSEQUENCES OF ERRORS**79271 If any *file* operand is specified and the named file cannot be accessed, *bc* shall write a diagnostic message to standard error and terminate without any further action.79272  
79273 In an interactive invocation of *bc*, the utility should print an error message and recover following any error in the input. In a non-interactive invocation of *bc*, invalid input causes undefined behavior.79276 **APPLICATION USAGE**79277 Automatic variables in *bc* do not work in exactly the same way as in either C or PL/1.79278 For historical reasons, the exit status from *bc* cannot be relied upon to indicate that an error has occurred. Returning zero after an error is possible. Therefore, *bc* should be used primarily by interactive users (who can react to error messages) or by application programs that can somehow validate the answers returned as not including error messages.79282 The *bc* utility always uses the <period> ( ' . ' ) character to represent a radix point, regardless of any decimal-point character specified as part of the current locale. In languages like C or *awk*, the <period> character is used in program source, so it can be portable and unambiguous, while the locale-specific character is used in input and output. Because there is no distinction between source and input in *bc*, this arrangement would not be possible. Using the locale-specific character in *bc*'s input would introduce ambiguities into the language; consider the following example in a locale with a <comma> as the decimal-point character:79289 

```
define f(a,b) {
79290     ...
79291 }
79292 ...
79293 f(1,2,3)
```

79294 Because of such ambiguities, the &lt;period&gt; character is used in input. Having input follow different conventions from output would be confusing in either pipeline usage or interactive usage, so the &lt;period&gt; is also used in output.

79297 **EXAMPLES**79298 In the shell, the following assigns an approximation of the first ten digits of ' $\pi$ ' to the variable *x*:79299 

```
x=$(printf "%s\n" 'scale = 10; 104348/33215' | bc)
```

79300 The following *bc* program prints the same approximation of ' $\pi$ ', with a label, to standard output:79302 

```
scale = 10
79303 "pi equals "
79304 104348 / 33215
```

79305 The following defines a function to compute an approximate value of the exponential function (note that such a function is predefined if the *-l* option is specified):79307 

```
scale = 20
79308 define e(x) {
79309     auto a, b, c, i, s
```

```

79310         a = 1
79311         b = 1
79312         s = 1
79313         for (i = 1; 1 == 1; i++){
79314             a = a*x
79315             b = b*i
79316             c = a/b
79317             if (c == 0) {
79318                 return(s)
79319             }
79320             s = s+c
79321         }
79322     }

```

79323 The following prints approximate values of the exponential function of the first ten integers:

```

79324     for (i = 1; i <= 10; ++i) {
79325         e(i)
79326     }

```

#### 79327 RATIONALE

79328 The *bc* utility is implemented historically as a front-end processor for *dc*; *dc* was not selected to  
79329 be part of this volume of POSIX.1-2008 because *bc* was thought to have a more intuitive  
79330 programmatic interface. Current implementations that implement *bc* using *dc* are expected to be  
79331 compliant.

79332 The exit status for error conditions has been left unspecified for several reasons:

- 79333 • The *bc* utility is used in both interactive and non-interactive situations. Different exit codes  
79334 may be appropriate for the two uses.
- 79335 • It is unclear when a non-zero exit should be given; divide-by-zero, undefined functions,  
79336 and syntax errors are all possibilities.
- 79337 • It is not clear what utility the exit status has.
- 79338 • In the 4.3 BSD, System V, and Ninth Edition implementations, *bc* works in conjunction with  
79339 *dc*. The *dc* utility is the parent, *bc* is the child. This was done to cleanly terminate *bc* if *dc*  
79340 aborted.

79341 The decision to have *bc* exit upon encountering an inaccessible input file is based on the belief  
79342 that *bc file1 file2* is used most often when at least *file1* contains data/function  
79343 declarations/initializations. Having *bc* continue with prerequisite files missing is probably not  
79344 useful. There is no implication in the CONSEQUENCES OF ERRORS section that *bc* must check  
79345 all its files for accessibility before opening any of them.

79346 There was considerable debate on the appropriateness of the language accepted by *bc*. Several  
79347 reviewers preferred to see either a pure subset of the C language or some changes to make the  
79348 language more compatible with C. While the *bc* language has some obvious similarities to C, it  
79349 has never claimed to be compatible with any version of C. An interpreter for a subset of C might  
79350 be a very worthwhile utility, and it could potentially make *bc* obsolete. However, no such utility  
79351 is known in historical practice, and it was not within the scope of this volume of POSIX.1-2008 to  
79352 define such a language and utility. If and when they are defined, it may be appropriate to  
79353 include them in a future version of this standard. This left the following alternatives:

- 79354 1. Exclude any calculator language from this volume of POSIX.1-2008.
- 79355 The consensus of the standard developers was that a simple programmatic calculator  
79356 language is very useful for both applications and interactive users. The only arguments  
79357 for excluding any calculator were that it would become obsolete if and when a C-  
79358 compatible one emerged, or that the absence would encourage the development of such a  
79359 C-compatible one. These arguments did not sufficiently address the needs of current  
79360 application developers.
- 79361 2. Standardize the historical *dc*, possibly with minor modifications.
- 79362 The consensus of the standard developers was that *dc* is a fundamentally less usable  
79363 language and that that would be far too severe a penalty for avoiding the issue of being  
79364 similar to but incompatible with C.
- 79365 3. Standardize the historical *bc*, possibly with minor modifications.
- 79366 This was the approach taken. Most of the proponents of changing the language would not  
79367 have been satisfied until most or all of the incompatibilities with C were resolved. Since  
79368 most of the changes considered most desirable would break historical applications and  
79369 require significant modification to historical implementations, almost no modifications  
79370 were made. The one significant modification that was made was the replacement of the  
79371 historical *bc* assignment operators "*=*", and so on, with the more modern "*+=*", and so  
79372 on. The older versions are considered to be fundamentally flawed because of the lexical  
79373 ambiguity in uses like *a=-1*.
- 79374 In order to permit implementations to deal with backwards-compatibility as they see fit,  
79375 the behavior of this one ambiguous construct was made undefined. (At least three  
79376 implementations have been known to support this change already, so the degree of  
79377 change involved should not be great.)
- 79378 The '*%*' operator is the mathematical remainder operator when **scale** is zero. The behavior of  
79379 this operator for other values of **scale** is from historical implementations of *bc*, and has been  
79380 maintained for the sake of historical applications despite its non-intuitive nature.
- 79381 Historical implementations permit setting **ibase** and **obase** to a broader range of values. This  
79382 includes values less than 2, which were not seen as sufficiently useful to standardize. These  
79383 implementations do not interpret input properly for values of **ibase** that are greater than 16. This  
79384 is because numeric constants are recognized syntactically, rather than lexically, as described in  
79385 this volume of POSIX.1-2008. They are built from lexical tokens of single hexadecimal digits and  
79386 <period> characters. Since <blank> characters between tokens are not visible at the syntactic  
79387 level, it is not possible to recognize the multi-digit "digits" used in the higher bases properly.  
79388 The ability to recognize input in these bases was not considered useful enough to require  
79389 modifying these implementations. Note that the recognition of numeric constants at the  
79390 syntactic level is not a problem with conformance to this volume of POSIX.1-2008, as it does not  
79391 impact the behavior of conforming applications (and correct *bc* programs). Historical  
79392 implementations also accept input with all of the digits '*0*'–'*9*' and '*A*'–'*F*' regardless of the  
79393 value of **ibase**; since digits with value greater than or equal to **ibase** are not really appropriate,  
79394 the behavior when they appear is undefined, except for the common case of:
- ```
79395 ibase=8;
79396     /* Process in octal base. */
79397 ...
79398 ibase=A
79399     /* Restore decimal base. */
```
- 79400 In some historical implementations, if the expression to be written is an uninitialized array

79401 element, a leading <space> and/or up to four leading 0 characters may be output before the  
79402 character zero. This behavior is considered a bug; it is unlikely that any currently conforming  
79403 application relies on:

79404 `echo 'b[3]' | bc`

79405 returning 00000 rather than 0.

79406 Exact calculation of the number of fractional digits to output for a given value in a base other  
79407 than 10 can be computationally expensive. Historical implementations use a faster  
79408 approximation, and this is permitted. Note that the requirements apply only to values of **obase**  
79409 that this volume of POSIX.1-2008 requires implementations to support (in particular, not to 1, 0,  
79410 or negative bases, if an implementation supports them as an extension).

79411 Historical implementations of *bc* did not allow array parameters to be passed as the last  
79412 parameter to a function. New implementations are encouraged to remove this restriction even  
79413 though it is not required by the grammar.

#### 79414 **FUTURE DIRECTIONS**

79415 None.

#### 79416 **SEE ALSO**

79417 [Section 1.3](#) (on page 2287), *awk*

79418 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 79419 **CHANGE HISTORY**

79420 First released in Issue 4.

#### 79421 **Issue 5**

79422 The FUTURE DIRECTIONS section is added.

#### 79423 **Issue 6**

79424 Updated to align with the IEEE P1003.2b draft standard, which included resolution of several  
79425 interpretations of the ISO POSIX-2:1993 standard.

79426 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 79427 **Issue 7**

79428 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

79429 **NAME**79430 `bg` — run jobs in the background79431 **SYNOPSIS**79432 UP `bg [job_id...]`79433 **DESCRIPTION**

79434 If job control is enabled (see the description of `set -m`), the `bg` utility shall resume suspended jobs  
 79435 from the current environment (see [Section 2.12](#), on page 2331) by running them as background  
 79436 jobs. If the job specified by `job_id` is already a running background job, the `bg` utility shall have  
 79437 no effect and shall exit successfully.

79438 Using `bg` to place a job into the background shall cause its process ID to become “known in the  
 79439 current shell execution environment”, as if it had been started as an asynchronous list; see  
 79440 [Section 2.9.3.1](#) (on page 2319).

79441 **OPTIONS**

79442 None.

79443 **OPERANDS**

79444 The following operand shall be supported:

79445 `job_id` Specify the job to be resumed as a background job. If no `job_id` operand is given,  
 79446 the most recently suspended job shall be used. The format of `job_id` is described in  
 79447 XBD [Section 3.203](#) (on page 65).

79448 **STDIN**

79449 Not used.

79450 **INPUT FILES**

79451 None.

79452 **ENVIRONMENT VARIABLES**79453 The following environment variables shall affect the execution of `bg`:

79454 `LANG` Provide a default value for the internationalization variables that are unset or null.  
 79455 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 79456 variables used to determine the values of locale categories.)

79457 `LC_ALL` If set to a non-empty string value, override the values of all the other  
 79458 internationalization variables.

79459 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
 79460 characters (for example, single-byte as opposed to multi-byte characters in  
 79461 arguments).

79462 `LC_MESSAGES`

79463 Determine the locale that should be used to affect the format and contents of  
 79464 diagnostic messages written to standard error.

79465 XSI `NLSPATH` Determine the location of message catalogs for the processing of `LC_MESSAGES`.

79466 **ASYNCHRONOUS EVENTS**

79467 Default.

79468 **STDOUT**79469 The output of `bg` shall consist of a line in the format:

79470 "[%d] %s\n", &lt;job-number&gt;, &lt;command&gt;

79471 where the fields are as follows:

79472 *<job-number>* A number that can be used to identify the job to the *wait*, *fg*, and *kill* utilities. Using  
79473 these utilities, the job can be identified by prefixing the job number with ' % ' .

79474 *<command>* The associated command that was given to the shell.

#### 79475 **STDERR**

79476 The standard error shall be used only for diagnostic messages.

#### 79477 **OUTPUT FILES**

79478 None.

#### 79479 **EXTENDED DESCRIPTION**

79480 None.

#### 79481 **EXIT STATUS**

79482 The following exit values shall be returned:

79483 0 Successful completion.

79484 >0 An error occurred.

#### 79485 **CONSEQUENCES OF ERRORS**

79486 If job control is disabled, the *bg* utility shall exit with an error and no job shall be placed in the  
79487 background.

#### 79488 **APPLICATION USAGE**

79489 A job is generally suspended by typing the SUSP character (<control>-Z on most systems); see  
79490 XBD Chapter 11 (on page 199). At that point, *bg* can put the job into the background. This is  
79491 most effective when the job is expecting no terminal input and its output has been redirected to  
79492 non-terminal files. A background job can be forced to stop when it has terminal output by  
79493 issuing the command:

79494 `stty tostop`

79495 A background job can be stopped with the command:

79496 `kill -s stop job ID`

79497 The *bg* utility does not work as expected when it is operating in its own utility execution  
79498 environment because that environment has no suspended jobs. In the following examples:

79499 `... | xargs bg`  
79500 `(bg)`

79501 each *bg* operates in a different environment and does not share its parent shell's understanding  
79502 of jobs. For this reason, *bg* is generally implemented as a shell regular built-in.

#### 79503 **EXAMPLES**

79504 None.

#### 79505 **RATIONALE**

79506 The extensions to the shell specified in this volume of POSIX.1-2008 have mostly been based on  
79507 features provided by the KornShell. The job control features provided by *bg*, *fg*, and *jobs* are also  
79508 based on the KornShell. The standard developers examined the characteristics of the C shell  
79509 versions of these utilities and found that differences exist. Despite widespread use of the C shell,  
79510 the KornShell versions were selected for this volume of POSIX.1-2008 to maintain a degree of  
79511 uniformity with the rest of the KornShell features selected (such as the very popular command  
79512 line editing features).

- 79513 The *bg* utility is expected to wrap its output if the output exceeds the number of display  
79514 columns.
- 79515 **FUTURE DIRECTIONS**
- 79516 None.
- 79517 **SEE ALSO**
- 79518 [Section 2.9.3.1](#) (on page 2319), *fg*, *kill*, *jobs*, *wait*

- 79520 **CHANGE HISTORY**
- 79521 First released in Issue 4.
- 79522 **Issue 6**
- 79523 This utility is marked as part of the User Portability Utilities option.
- 79524 The JC margin marker on the SYNOPSIS is removed since support for Job Control is mandatory  
79525 in this version. This is a FIPS requirement.
- 79526 **Issue 7**
- 79527 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

## 79528 NAME

79529 c99 — compile standard C programs

## 79530 SYNOPSIS

```
79531 CD c99 [options...] pathname [[pathname] [-I directory]
79532 [-L directory] [-l library]]...
```

## 79533 DESCRIPTION

79534 The *c99* utility is an interface to the standard C compilation system; it shall accept source code  
 79535 conforming to the ISO C standard. The system conceptually consists of a compiler and link  
 79536 editor. The input files referenced by *pathname* operands and *-I* option-arguments shall be  
 79537 compiled and linked to produce an executable file. (It is unspecified whether the linking occurs  
 79538 entirely within the operation of *c99*; some implementations may produce objects that are not  
 79539 fully resolved until the file is executed.)

79540 If the *-c* option is specified, for all *pathname* operands of the form *file.c*, the files:

79541  $\$(\text{basename } \textit{pathname} \textit{.c}) \textit{.o}$

79542 shall be created as the result of successful compilation. If the *-o* option is not specified, it is  
 79543 unspecified whether such *.o* files are created or deleted for the *file.c* operands.

79544 If there are no options that prevent link editing (such as *-c* or *-E*), and all input files compile and  
 79545 link without error, the resulting executable file shall be written according to the *-o outfile* option  
 79546 (if present) or to the file **a.out**.

79547 The executable file shall be created as specified in Section 1.1.1.4 (on page 2280), except that the  
 79548 file permission bits shall be set to:

79549 S\_IRWXO | S\_IRWXG | S\_IRWXU

79550 and the bits specified by the *umask* of the process shall be cleared.

## 79551 OPTIONS

79552 The *c99* utility shall conform to XBD Section 12.2 (on page 215), except that:

- 79553 • Options can be interspersed with operands.
- 79554 • The order of specifying the *-I*, *-L*, and *-l* options, and the order of specifying *-l* options  
 79555 with respect to *pathname* operands is significant.
- 79556 • Conforming applications shall specify each option separately; that is, grouping option  
 79557 letters (for example, *-cO*) need not be recognized by all implementations.

79558 The following options shall be supported:

79559 *-c* Suppress the link-edit phase of the compilation, and do not remove any object files  
 79560 that are produced.

79561 *-D name[=value]*

79562 Define *name* as if by a C-language **#define** directive. If no *=value* is given, a value of  
 79563 1 shall be used. The *-D* option has lower precedence than the *-U* option. That is, if  
 79564 *name* is used in both a *-U* and a *-D* option, *name* shall be undefined regardless of  
 79565 the order of the options. Additional implementation-defined *names* may be  
 79566 provided by the compiler. Implementations shall support at least 2048 bytes of *-D*  
 79567 definitions and 256 *names*.

- 79568        **-E**        Copy C-language source files to standard output, expanding all preprocessor  
79569        directives; no compilation shall be performed. If any operand is not a text file, the  
79570        effects are unspecified.
- 79571        **-g**        Produce symbolic information in the object or executable files; the nature of this  
79572        information is unspecified, and may be modified by implementation-defined  
79573        interactions with other options.
- 79574        **-I *directory***    Change the algorithm for searching for headers whose names are not absolute  
79575        pathnames to look in the *directory* named by the *directory* pathname before looking  
79576        in the usual places. Thus, headers whose names are enclosed in double-quotes (" ")  
79577        shall be searched for first in the directory of the file with the **#include** line, then in  
79578        directories named in **-I** options, and last in the usual places. For headers whose  
79579        names are enclosed in angle brackets ("**<**" "**>**"), the header shall be searched for only  
79580        in directories named in **-I** options and then in the usual places. Directories named  
79581        in **-I** options shall be searched in the order specified. Implementations shall  
79582        support at least ten instances of this option in a single **c99** command invocation.
- 79583        **-L *directory***    Change the algorithm of searching for the libraries named in the **-l** objects to look  
79584        in the *directory* named by the *directory* pathname before looking in the usual  
79585        places. Directories named in **-L** options shall be searched in the order specified.  
79586        Implementations shall support at least ten instances of this option in a single **c99**  
79587        command invocation. If a *directory* specified by a **-L** option contains files with  
79588        names starting with any of the strings "libc.", "libl.", "libpthread.",  
79589        "libm.", "librt.", "libtrace.", "libxnet.", or "liby.", the results are  
79590        unspecified.
- 79591        **-l *library***        Search the library named **lib*library*.a**. A library shall be searched when its name is  
79592        encountered, so the placement of a **-l** option is significant. Several standard  
79593        libraries can be specified in this manner, as described in the EXTENDED  
79594        DESCRIPTION section. Implementations may recognize implementation-defined  
79595        suffixes other than **.a** as denoting libraries.
- 79596        **-O *optlevel***        Specify the level of code optimization. If the *optlevel* option-argument is the digit  
79597        '0', all special code optimizations shall be disabled. If it is the digit '1', the  
79598        nature of the optimization is unspecified. If the **-O** option is omitted, the nature of  
79599        the system's default optimization is unspecified. It is unspecified whether code  
79600        generated in the presence of the **-O 0** option is the same as that generated when  
79601        **-O** is omitted. Other *optlevel* values may be supported.
- 79602        **-o *outfile***        Use the pathname *outfile*, instead of the default **a.out**, for the executable file  
79603        produced. If the **-o** option is present with **-c** or **-E**, the result is unspecified.
- 79604        **-s**        Produce object or executable files, or both, from which symbolic and other  
79605        information not required for proper execution using the *exec* family defined in the  
79606        System Interfaces volume of POSIX.1-2008 has been removed (stripped). If both **-g**  
79607        and **-s** options are present, the action taken is unspecified.
- 79608        **-U *name***        Remove any initial definition of *name*.
- 79609        Multiple instances of the **-D**, **-I**, **-L**, **-l**, and **-U** options can be specified.
- 79610        **OPERANDS**
- 79611        The application shall ensure that at least one *pathname* operand is specified. The following forms  
79612        for *pathname* operands shall be supported:

- 79613 *file.c* A C-language source file to be compiled and optionally linked. The application  
79614 shall ensure that the operand is of this form if the `-c` option is used.
- 79615 *file.a* A library of object files typically produced by the *ar* utility, and passed directly to  
79616 the link editor. Implementations may recognize implementation-defined suffixes  
79617 other than *.a* as denoting object file libraries.
- 79618 *file.o* An object file produced by *c99 -c* and passed directly to the link editor.  
79619 Implementations may recognize implementation-defined suffixes other than *.o* as  
79620 denoting object files.
- 79621 The processing of other files is implementation-defined.
- 79622 **STDIN**
- 79623 Not used.
- 79624 **INPUT FILES**
- 79625 The input file shall be one of the following: a text file containing a C-language source program,  
79626 an object file in the format produced by *c99 -c*, or a library of object files, in the format produced  
79627 by archiving zero or more object files, using *ar*. Implementations may supply additional utilities  
79628 that produce files in these formats. Additional input file formats are implementation-defined.
- 79629 **ENVIRONMENT VARIABLES**
- 79630 The following environment variables shall affect the execution of *c99*:
- 79631 *LANG* Provide a default value for the internationalization variables that are unset or null.  
79632 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
79633 variables used to determine the values of locale categories.)
- 79634 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
79635 internationalization variables.
- 79636 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
79637 characters (for example, single-byte as opposed to multi-byte characters in  
79638 arguments and input files).
- 79639 *LC\_MESSAGES*
- 79640 Determine the locale that should be used to affect the format and contents of  
79641 diagnostic messages written to standard error.
- 79642 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 79643 *TMPDIR* Provide a pathname that should override the default directory for temporary files,  
79644 XSI if any. On XSI-conforming systems, provide a pathname that shall override the  
79645 default directory for temporary files, if any.
- 79646 **ASYNCHRONOUS EVENTS**
- 79647 Default.
- 79648 **STDOUT**
- 79649 If more than one *pathname* operand ending in *.c* (or possibly other unspecified suffixes) is given,  
79650 for each such file:
- 79651 `"%s:\n", <pathname>`
- 79652 may be written. These messages, if written, shall precede the processing of each input file; they  
79653 shall not be written to the standard output if they are written to the standard error, as described  
79654 in the `STDERR` section.
- 79655 If the `-E` option is specified, the standard output shall be a text file that represents the results of

79656 the preprocessing stage of the language; it may contain extra information appropriate for  
79657 subsequent compilation passes.

#### 79658 **STDERR**

79659 The standard error shall be used only for diagnostic messages. If more than one *pathname*  
79660 operand ending in *.c* (or possibly other unspecified suffixes) is given, for each such file:

79661 "%s:\n", <pathname>

79662 may be written to allow identification of the diagnostic and warning messages with the  
79663 appropriate input file. These messages, if written, shall precede the processing of each input file;  
79664 they shall not be written to the standard error if they are written to the standard output, as  
79665 described in the STDOUT section.

79666 This utility may produce warning messages about certain conditions that do not warrant  
79667 returning an error (non-zero) exit value.

#### 79668 **OUTPUT FILES**

79669 Object files or executable files or both are produced in unspecified formats. If the pathname of  
79670 an object file or executable file to be created by *c99* resolves to an existing directory entry for a  
79671 file that is not a regular file, it is unspecified whether *c99* shall attempt to create the file or shall  
79672 issue a diagnostic and exit with a non-zero exit status.

#### 79673 **EXTENDED DESCRIPTION**

##### 79674 **Standard Libraries**

79675 The *c99* utility shall recognize the following **-l** options for standard libraries:

79676 **-l c** This option shall make available all interfaces referenced in the System Interfaces  
79677 volume of POSIX.1-2008, with the possible exception of those interfaces listed as  
79678 residing in <aio.h>, <arpa/inet.h>, <complex.h>, <fenv.h>, <math.h>,  
79679 <mqueue.h>, <netdb.h>, <net/if.h>, <netinet/in.h>, <pthread.h>, <sched.h>,  
79680 <semaphore.h>, <spawn.h>, <sys/socket.h>, *pthread\_kill()*, and *pthread\_sigmask()*  
79681 in <signal.h>, <trace.h>, interfaces marked as optional in <sys/mman.h>,  
79682 interfaces marked as ADV (Advisory Information) in <fcntl.h>, and interfaces  
79683 beginning with the prefix *clock\_* or *time\_* in <time.h>. This option shall not be  
79684 required to be present to cause a search of this library.

79685 **-l l** This option shall make available all interfaces required by the C-language output  
79686 of *lex* that are not made available through the **-l c** option.

79687 **-l pthread** This option shall make available all interfaces referenced in <pthread.h> and  
79688 *pthread\_kill()* and *pthread\_sigmask()* referenced in <signal.h>. An implementation  
79689 may search this library in the absence of this option.

79690 **-l m** This option shall make available all interfaces referenced in <math.h>,  
79691 <complex.h>, and <fenv.h>. An implementation may search this library in the  
79692 absence of this option.

79693 **-l rt** This option shall make available all interfaces referenced in <aio.h>, <mqueue.h>,  
79694 <sched.h>, <semaphore.h>, and <spawn.h>, interfaces marked as optional in  
79695 <sys/mman.h>, interfaces marked as ADV (Advisory Information) in <fcntl.h>,  
79696 and interfaces beginning with the prefix *clock\_* and *time\_* in <time.h>. An  
79697 implementation may search this library in the absence of this option.

- 79698 OB **-l trace** This option shall make available all interfaces referenced in `<trace.h>`. An implementation may search this library in the absence of this option.
- 79699
- 79700 **-l xnet** This option shall make available all interfaces referenced in `<arpa/inet.h>`, `<netdb.h>`, `<net/if.h>`, `<netinet/in.h>`, and `<sys/socket.h>`. An implementation may search this library in the absence of this option.
- 79701
- 79702
- 79703 **-l y** This option shall make available all interfaces required by the C-language output of *yacc* that are not made available through the `-l c` option.
- 79704

79705 In the absence of options that inhibit invocation of the link editor, such as `-c` or `-E`, the *c99* utility shall cause the equivalent of a `-l c` option to be passed to the link editor after the last *pathname* operand or `-l` option, causing it to be searched after all other object files and libraries are loaded.

79706

79707

79708 OB It is unspecified whether the libraries `libc.a`, `libl.a`, `libm.a`, `libpthread.a`, `librt.a`, `libtrace.a`, `libxnet.a`, or `liby.a` exist as regular files. The implementation may accept as `-l` option-arguments names of objects that do not exist as regular files.

79709

79710

79711 **External Symbols**

79712 The C compiler and link editor shall support the significance of external symbols up to a length of at least 31 bytes; the action taken upon encountering symbols exceeding the implementation-defined maximum symbol length is unspecified.

79713

79714

79715 The compiler and link editor shall support a minimum of 511 external symbols per source or object file, and a minimum of 4095 external symbols in total. A diagnostic message shall be written to the standard output if the implementation-defined limit is exceeded; other actions are unspecified.

79716

79717

79718

79719 **Programming Environments**

79720 All implementations shall support one of the following programming environments as a default. Implementations may support more than one of the following programming environments. Applications can use *sysconf()* or *getconf* to determine which programming environments are supported.

79721

79722

79723

79724 **Table 4-4** Programming Environments: Type Sizes

| Programming Environment<br><i>getconf</i> Name | Bits in<br>int | Bits in<br>long | Bits in<br>pointer | Bits in<br>off_t |
|------------------------------------------------|----------------|-----------------|--------------------|------------------|
| _POSIX_V7_ILP32_OFF32                          | 32             | 32              | 32                 | 32               |
| _POSIX_V7_ILP32_OFFBIG                         | 32             | 32              | 32                 | ≥64              |
| _POSIX_V7_LP64_OFF64                           | 32             | 64              | 64                 | 64               |
| _POSIX_V7_LP64_OFFBIG                          | ≥32            | ≥64             | ≥64                | ≥64              |

79731 All implementations shall support one or more environments where the widths of the following types are no greater than the width of type `long`:

79732

- 79733 `blksize_t` `ptrdiff_t` `tcflag_t`
- 79734 `cc_t` `size_t` `wchar_t`
- 79735 `mode_t` `speed_t` `wint_t`
- 79736 `nfds_t` `ssize_t`
- 79737 `pid_t` `suseconds_t`

79738 The executable files created when these environments are selected shall be in a proper format for

79739 execution by the *exec* family of functions. Each environment may be one of the ones in Table 4-4  
 79740 (on page 2492), or it may be another environment. The names for the environments that meet  
 79741 this requirement shall be output by a *getconf* command using the  
 79742 POSIX\_V7\_WIDTH\_RESTRICTED\_ENVS argument, as a <newline>-separated list of names  
 79743 suitable for use with the *getconf* -v option. If more than one environment meets the requirement,  
 79744 the names of all such environments shall be output on separate lines. Any of these names can  
 79745 then be used in a subsequent *getconf* command to obtain the flags specific to that environment  
 79746 with the following suffixes added as appropriate:

79747 `_CFLAGS` To get the C compiler flags.

79748 `_LDFLAGS` To get the linker/loader flags.

79749 `_LIBS` To get the libraries.

79750 This requirement may be removed in a future version.

79751 When this utility processes a file containing a function called *main()*, it shall be defined with a  
 79752 return type equivalent to `int`. Using return from the initial call to *main()* shall be equivalent  
 79753 (other than with respect to language scope issues) to calling *exit()* with the returned value.  
 79754 Reaching the end of the initial call to *main()* shall be equivalent to calling *exit(0)*. The  
 79755 implementation shall not declare a prototype for this function.

79756 Implementations provide configuration strings for C compiler flags, linker/loader flags, and  
 79757 libraries for each supported environment. When an application needs to use a specific  
 79758 programming environment rather than the implementation default programming environment  
 79759 while compiling, the application shall first verify that the implementation supports the desired  
 79760 environment. If the desired programming environment is supported, the application shall then  
 79761 invoke *c99* with the appropriate C compiler flags as the first options for the compile, the  
 79762 appropriate linker/loader flags after any other options except `-I` but before any operands or `-I`  
 79763 options, and the appropriate libraries at the end of the operands and `-I` options.

79764 Conforming applications shall not attempt to link together object files compiled for different  
 79765 programming models. Applications shall also be aware that binary data placed in shared  
 79766 memory or in files might not be recognized by applications built for other programming models.

79767 **Table 4-5** Programming Environments: *c99* Arguments

| 79768<br>79769          | Programming Environment<br><i>getconf</i> Name | Use                                                  | <i>c99</i> Arguments<br><i>getconf</i> Name                                                                                        |
|-------------------------|------------------------------------------------|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| 79770<br>79771<br>79772 | <code>_POSIX_V7_ILP32_OFF32</code>             | C Compiler Flags<br>Linker/Loader Flags<br>Libraries | <code>POSIX_V7_ILP32_OFF32_CFLAGS</code><br><code>POSIX_V7_ILP32_OFF32_LDFLAGS</code><br><code>POSIX_V7_ILP32_OFF32_LIBS</code>    |
| 79773<br>79774<br>79775 | <code>_POSIX_V7_ILP32_OFFBIG</code>            | C Compiler Flags<br>Linker/Loader Flags<br>Libraries | <code>POSIX_V7_ILP32_OFFBIG_CFLAGS</code><br><code>POSIX_V7_ILP32_OFFBIG_LDFLAGS</code><br><code>POSIX_V7_ILP32_OFFBIG_LIBS</code> |
| 79776<br>79777<br>79778 | <code>_POSIX_V7_LP64_OFF64</code>              | C Compiler Flags<br>Linker/Loader Flags<br>Libraries | <code>POSIX_V7_LP64_OFF64_CFLAGS</code><br><code>POSIX_V7_LP64_OFF64_LDFLAGS</code><br><code>POSIX_V7_LP64_OFF64_LIBS</code>       |
| 79779<br>79780<br>79781 | <code>_POSIX_V7_LP64_OFFBIG</code>             | C Compiler Flags<br>Linker/Loader Flags<br>Libraries | <code>POSIX_V7_LP64_OFFBIG_CFLAGS</code><br><code>POSIX_V7_LP64_OFFBIG_LDFLAGS</code><br><code>POSIX_V7_LP64_OFFBIG_LIBS</code>    |

79782 In addition to the type size programming environments above, all implementations also support

79783 a multi-threaded programming environment that is orthogonal to all of the programming  
79784 environments listed above. The *getconf* utility can be used to get flags for the threaded  
79785 programming environment, as indicated in Table 4-6.

79786 **Table 4-6** Threaded Programming Environment: *c99* Arguments

| 79787<br>79788 | Programming Environment<br><i>getconf</i> Name | Use                                     | <i>c99</i> Arguments<br><i>getconf</i> Name         |
|----------------|------------------------------------------------|-----------------------------------------|-----------------------------------------------------|
| 79789<br>79790 | _POSIX_THREADS                                 | C Compiler Flags<br>Linker/Loader Flags | POSIX_V7_THREADS_CFLAGS<br>POSIX_V7_THREADS_IDFLAGS |

79791 These programming environment flags may be used in conjunction with any of the type size  
79792 programming environments supported by the implementation.

#### 79793 EXIT STATUS

79794 The following exit values shall be returned:

- 79795 0 Successful compilation or link edit.
- 79796 >0 An error occurred.

#### 79797 CONSEQUENCES OF ERRORS

79798 When *c99* encounters a compilation error that causes an object file not to be created, it shall write  
79799 a diagnostic to standard error and continue to compile other source code operands, but it shall  
79800 not perform the link phase and return a non-zero exit status. If the link edit is unsuccessful, a  
79801 diagnostic message shall be written to standard error and *c99* exits with a non-zero status. A  
79802 conforming application shall rely on the exit status of *c99*, rather than on the existence or mode  
79803 of the executable file.

#### 79804 APPLICATION USAGE

79805 Since the *c99* utility usually creates files in the current directory during the compilation process,  
79806 it is typically necessary to run the *c99* utility in a directory in which a file can be created.

79807 On systems providing POSIX Conformance (see XBD Chapter 2, on page 15), *c99* is required  
79808 only with the C-Language Development option; XSI-conformant systems always provide *c99*.

79809 Some historical implementations have created *.o* files when *-c* is not specified and more than  
79810 one source file is given. Since this area is left unspecified, the application cannot rely on *.o* files  
79811 being created, but it also must be prepared for any related *.o* files that already exist being deleted  
79812 at the completion of the link edit.

79813 There is the possible implication that if a user supplies versions of the standard functions (before  
79814 they would be encountered by an implicit *-l c* or explicit *-l m*), that those versions would be  
79815 used in place of the standard versions. There are various reasons this might not be true  
79816 (functions defined as macros, manipulations for clean name space, and so on), so the existence of  
79817 files named in the same manner as the standard libraries within the *-L* directories is explicitly  
79818 stated to produce unspecified behavior.

79819 All of the functions specified in the System Interfaces volume of POSIX.1-2008 may be made  
79820 visible by implementations when the Standard C Library is searched. Conforming applications  
79821 must explicitly request searching the other standard libraries when functions made visible by  
79822 those libraries are used.

79823 In the ISO C standard the mapping from physical source characters to the C source character set  
79824 is implementation-defined. Implementations may strip white-space characters before the  
79825 terminating <newline> of a (physical) line as part of this mapping and, as a consequence of this,

79826 one or more white-space characters (and no other characters) between a <backslash> character  
 79827 and the <newline> character that terminates the line produces implementation-defined results.  
 79828 Portable applications should not use such constructs.

79829 Some *c99* compilers not conforming to POSIX.1-2008 do not support trigraphs by default.

### 79830 EXAMPLES

79831 1. The following usage example compiles **foo.c** and creates the executable file **foo**:

```
79832 c99 -o foo foo.c
```

79833 The following usage example compiles **foo.c** and creates the object file **foo.o**:

```
79834 c99 -c foo.c
```

79835 The following usage example compiles **foo.c** and creates the executable file **a.out**:

```
79836 c99 foo.c
```

79837 The following usage example compiles **foo.c**, links it with **bar.o**, and creates the  
 79838 executable file **a.out**. It may also create and leave **foo.o**:

```
79839 c99 foo.c bar.o
```

79840 2. The following example shows how an application using threads interfaces can test for  
 79841 support of and use a programming environment supporting 32-bit **int**, **long**, and **pointer**  
 79842 types and an **off\_t** type using at least 64 bits:

```
79843 offbig_env=$(getconf _POSIX_V7_ILP32_OFFBIG)
79844 if [ $offbig_env != "-1" ] && [ $offbig_env != "undefined" ]
79845 then
79846     c99 $(getconf POSIX_V7_ILP32_OFFBIG_CFLAGS) \
79847         $(getconf POSIX_V7_THREADS_CFLAGS) -D_XOPEN_SOURCE=700 \
79848         $(getconf POSIX_V7_ILP32_OFFBIG_LDFLAGS) \
79849         $(getconf POSIX_V7_THREADS_LDFLAGS) foo.c -o foo \
79850         $(getconf POSIX_V7_ILP32_OFFBIG_LIBS) \
79851         -l pthread
79852 else
79853     echo ILP32_OFFBIG programming environment not supported
79854     exit 1
79855 fi
```

79856 3. The following examples clarify the use and interactions of **-L** and **-l** options.

79857 Consider the case in which module **a.c** calls function *f()* in library **libQ.a**, and module **b.c**  
 79858 calls function *g()* in library **libp.a**. Assume that both libraries reside in **/a/b/c**. The  
 79859 command line to compile and link in the desired way is:

```
79860 c99 -L /a/b/c main.o a.c -l Q b.c -l p
```

79861 In this case the **-L** option need only precede the first **-l** option, since both **libQ.a** and  
 79862 **libp.a** reside in the same directory.

79863 Multiple **-L** options can be used when library name collisions occur. Building on the  
 79864 previous example, suppose that the user wants to use a new **libp.a**, in **/a/a/a**, but still  
 79865 wants *f()* from **/a/b/c/libQ.a**:

```
79866 c99 -L /a/a/a -L /a/b/c main.o a.c -l Q b.c -l p
```

79867 In this example, the linker searches the **-L** options in the order specified, and finds

79868 */a/a/a/libp.a* before */a/b/c/libp.a* when resolving references for **b.c**. The order of the **-l**  
 79869 options is still important, however.

79870 4. The following example shows how an application can use a programming environment  
 79871 where the widths of the following types:

79872 **blksize\_t, cc\_t, mode\_t, nfd\_t, pid\_t, ptrdiff\_t, size\_t, speed\_t, ssize\_t, suseconds\_t,**  
 79873 **tcflag\_t, wchar\_t, wint\_t**

79874 are no greater than the width of type **long**:

79875 # First choose one of the listed environments ...

79876 # ... if there are no additional constraints, the first one will do:  
 79877 CENV=\$(getconf POSIX\_V7\_WIDTH\_RESTRICTED\_ENVS | head -n 1)

79878 # ... or, if an environment that supports large files is preferred,  
 79879 # look for names that contain "OFF64" or "OFFBIG". (This chooses  
 79880 # the last one in the list if none match.)  
 79881 for CENV in \$(getconf POSIX\_V7\_WIDTH\_RESTRICTED\_ENVS)  
 79882 do  
 79883 case \$CENV in  
 79884 \*OFF64\*|\*OFFBIG\*) break ;;  
 79885 esac  
 79886 done

79887 # The chosen environment name can now be used like this:

79888 c99 \$(getconf \${CENV}\_CFLAGS) -D \_POSIX\_C\_SOURCE=200809L \  
 79889 \$(getconf \${CENV}\_LD\_FLAGS) foo.c -o foo \  
 79890 \$(getconf \${CENV}\_LIBS)

#### 79891 RATIONALE

79892 The **c99** utility is based on the **c89** utility originally introduced in the ISO POSIX-2:1993  
 79893 standard.

79894 Some of the changes from **c89** include the ability to intersperse options and operands (which  
 79895 many **c89** implementations allowed despite it not being specified), the description of **-l** as an  
 79896 option instead of an operand, and the modification to the contents of the Standard Libraries  
 79897 section to account for new headers and options; for example, **<spawn.h>** added to the  
 79898 description of **-l rt**, and **-l trace** added for the Tracing option.

79899 POSIX.1-2008 specifies that the **c99** utility must be able to use regular files for **\*.o** files and for  
 79900 **a.out** files. Implementations are free to overwrite existing files of other types when attempting to  
 79901 create object files and executable files, but are not required to do so. If something other than a  
 79902 regular file is specified and using it fails for any reason, **c99** is required to issue a diagnostic  
 79903 message and exit with a non-zero exit status. But for some file types, the problem may not be  
 79904 noticed for a long time. For example, if a FIFO named **a.out** exists in the current directory, **c99**  
 79905 may attempt to open **a.out** and will hang in the *open()* call until another process opens the FIFO  
 79906 for reading. Then **c99** may write most of the **a.out** to the FIFO and fail when it tries to seek back  
 79907 close to the start of the file to insert a timestamp (FIFOs are not seekable files). The **c99** utility is  
 79908 also allowed to issue a diagnostic immediately if it encounters an **a.out** or **\*.o** file that is not a  
 79909 regular file. For portable use, applications should ensure that any **a.out**, **-o** option-argument, or  
 79910 **\*.o** files corresponding to any **\*.c** files do not conflict with names already in use that are not  
 79911 regular files or symbolic links that point to regular files.

79912 On many systems, multi-threaded applications run in a programming environment that is

79913 distinct from that used by single-threaded applications. This multi-threaded programming  
 79914 environment (in addition to needing to specify `-l pthread` at link time) may require additional  
 79915 flags to be set when headers are processed at compile time (`-D_REENTRANT` being common).  
 79916 This programming environment is orthogonal to the type size programming environments  
 79917 discussed above and listed in [Table 4-4](#) (on page 2492). This version of the standard adds `getconf`  
 79918 utility calls to provide the C compiler flags and linker/loader flags needed to support multi-  
 79919 threaded applications. Note that on a system where single-threaded applications are a special  
 79920 case of a multi-threaded application, both of these `getconf` calls may return NULL strings, on  
 79921 other implementations both of these strings may be non-NULL strings.

79922 The C standardization committee invented trigraphs (e.g., "??!" to represent '~() to address  
 79923 character portability problems in development environments based on national variants of the  
 79924 7-bit ISO/IEC 646:1991 standard character set. However, these environments were already  
 79925 obsolete by the time the first ISO C standard was published, and in practice trigraphs have not  
 79926 been used for their intended purpose, and usually are intended to have their original meaning in  
 79927 K&R C. For example, in practice a C-language source string like "What??!" is usually intended  
 79928 to end in two <question-mark> characters and an <exclamation-mark>, not in '~() .

#### 79929 FUTURE DIRECTIONS

79930 None.

#### 79931 SEE ALSO

#### 79935 CHANGE HISTORY

79936 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

79937 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/12 is applied, correcting the EXTENDED  
 79938 DESCRIPTION of `-l c` and `-l m`. Previously, the text did not take into account the presence of  
 79939 the `c99` math headers.

79940 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/13 is applied, changing the reference to  
 79941 the `libxnet` library to `libxnet.a`.

79942 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/5 is applied, updating the OPTIONS  
 79943 section, so that the names of files contained in the directory specified by the `-L` option are not  
 79944 assumed to end in the `.a` suffix. The set of library prefixes is also updated.

79945 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/6 is applied, removing the lead  
 79946 underscore from the `POSIX_V6_WIDTH_RESTRICTED_ENVS` variable in the EXTENDED  
 79947 DESCRIPTION and the EXAMPLES sections.

#### 79948 Issue 7

79949 Austin Group Interpretation 1003.1-2001 #020 (SD5-XCU-ERN-10) is applied, adding to the  
 79950 OUTPUT FILES section and also adding associated RATIONALE.

79951 Austin Group Interpretation 1003.1-2001 #095 is applied, clarifying the `-l library` operand.

79952 Austin Group Interpretation 1003.1-2001 #166 is applied.

79953 Austin Group Interpretation 1003.1-2001 #190 is applied, clarifying the handling of trailing  
 79954 white-space characters.

79955 Austin Group Interpretation 1003.1-2001 #191 is applied, adding APPLICATION USAGE and  
 79956 RATIONALE regarding C-language trigraphs.

- 79957 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
79958 apply (options can be interspersed with operands).
- 79959 SD5-XCU-ERN-11 is applied, adding the `<net/if.h>` header to the descriptions of `-l c` and  
79960 `-l xnet`.
- 79961 SD5-XCU-ERN-65 is applied, updating the EXAMPLES section.
- 79962 SD5-XCU-ERN-67 and SD5-XCU-ERN-97 are applied, updating the SYNOPSIS.
- 79963 SD5-XCU-ERN-133 is applied, updating the EXTENDED DESCRIPTION.
- 79964 The *getconf* variables for the supported programming environments are updated to be V7.
- 79965 The `-l trace` operand is marked obsolescent.
- 79966 The *c99* reference page is rewritten to describe `-l` as an option rather than an operand.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

79967 **NAME**

79968 cal — print a calendar

79969 **SYNOPSIS**79970 XSI cal `[[month] year]`79971 **DESCRIPTION**

79972 The *cal* utility shall write a calendar to standard output using the Julian calendar for dates from  
 79973 January 1, 1 through September 2, 1752 and the Gregorian calendar for dates from September 14,  
 79974 1752 through December 31, 9999 as though the Gregorian calendar had been adopted on  
 79975 September 14, 1752.

79976 **OPTIONS**

79977 None.

79978 **OPERANDS**

79979 The following operands shall be supported:

79980 *month* Specify the month to be displayed, represented as a decimal integer from 1  
 79981 (January) to 12 (December). The default shall be the current month.

79982 *year* Specify the year for which the calendar is displayed, represented as a decimal  
 79983 integer from 1 to 9999. The default shall be the current year.

79984 **STDIN**

79985 Not used.

79986 **INPUT FILES**

79987 None.

79988 **ENVIRONMENT VARIABLES**79989 The following environment variables shall affect the execution of *cal*:

79990 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 79991 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 79992 variables used to determine the values of locale categories.)

79993 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 79994 internationalization variables.

79995 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 79996 characters (for example, single-byte as opposed to multi-byte characters in  
 79997 arguments).

79998 *LC\_MESSAGES*

79999 Determine the locale that should be used to affect the format and contents of  
 80000 diagnostic messages written to standard error, and informative messages written  
 80001 to standard output.

80002 *LC\_TIME* Determine the format and contents of the calendar.

80003 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

80004 *TZ* Determine the timezone used to calculate the value of the current month.

80005 **ASYNCHRONOUS EVENTS**

80006 Default.

- 80007 **STDOUT**  
80008 The standard output shall be used to display the calendar, in an unspecified format.
- 80009 **STDERR**  
80010 The standard error shall be used only for diagnostic messages.
- 80011 **OUTPUT FILES**  
80012 None.
- 80013 **EXTENDED DESCRIPTION**  
80014 None.
- 80015 **EXIT STATUS**  
80016 The following exit values shall be returned:  
80017 0 Successful completion.  
80018 >0 An error occurred.
- 80019 **CONSEQUENCES OF ERRORS**  
80020 Default.
- 80021 **APPLICATION USAGE**  
80022 Note that:  
80023 cal 83  
80024 refers to A.D. 83, not 1983.
- 80025 **EXAMPLES**  
80026 None.
- 80027 **RATIONALE**  
80028 None.
- 80029 **FUTURE DIRECTIONS**  
80030 A future version of this standard may support locale-specific recognition of the date of adoption  
80031 of the Gregorian calendar.
- 80032 **SEE ALSO**  
80033 XBD [Chapter 8](#) (on page 173)
- 80034 **CHANGE HISTORY**  
80035 First released in Issue 2.
- 80036 **Issue 6**  
80037 The DESCRIPTION is updated to allow for traditional behavior for years before the adoption of  
80038 the Gregorian calendar.
- 80039 **Issue 7**  
80040 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

80041 **NAME**

80042           cat — concatenate and print files

80043 **SYNOPSIS**80044           cat [-u] [*file...*]80045 **DESCRIPTION**80046           The *cat* utility shall read files in sequence and shall write their contents to the standard output in  
80047           the same sequence.80048 **OPTIONS**80049           The *cat* utility shall conform to XBD [Section 12.2](#) (on page 215).

80050           The following option shall be supported:

80051           **-u**           Write bytes from the input file to the standard output without delay as each is  
80052           read.80053 **OPERANDS**

80054           The following operand shall be supported:

80055           *file*           A pathname of an input file. If no *file* operands are specified, the standard input  
80056           shall be used. If a *file* is '-', the *cat* utility shall read from the standard input at  
80057           that point in the sequence. The *cat* utility shall not close and reopen standard input  
80058           when it is referenced in this way, but shall accept multiple occurrences of '-' as a  
80059           *file* operand.80060 **STDIN**80061           The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
80062           See the INPUT FILES section.80063 **INPUT FILES**

80064           The input files can be any file type.

80065 **ENVIRONMENT VARIABLES**80066           The following environment variables shall affect the execution of *cat*:80067           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
80068           (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
80069           variables used to determine the values of locale categories.)80070           **LC\_ALL**        If set to a non-empty string value, override the values of all the other  
80071           internationalization variables.80072           **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
80073           characters (for example, single-byte as opposed to multi-byte characters in  
80074           arguments).80075           **LC\_MESSAGES**80076           Determine the locale that should be used to affect the format and contents of  
80077           diagnostic messages written to standard error.80078           **XSI**           **NLSPATH**   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.80079 **ASYNCHRONOUS EVENTS**

80080           Default.

80081 **STDOUT**

80082 The standard output shall contain the sequence of bytes read from the input files. Nothing else  
80083 shall be written to the standard output.

80084 **STDERR**

80085 The standard error shall be used only for diagnostic messages.

80086 **OUTPUT FILES**

80087 None.

80088 **EXTENDED DESCRIPTION**

80089 None.

80090 **EXIT STATUS**

80091 The following exit values shall be returned:

80092 0 All input files were output successfully.

80093 >0 An error occurred.

80094 **CONSEQUENCES OF ERRORS**

80095 Default.

80096 **APPLICATION USAGE**

80097 The **-u** option has value in prototyping non-blocking reads from FIFOs. The intent is to support  
80098 the following sequence:

```
80099 mkfifo foo
80100 cat -u foo > /dev/tty13 &
80101 cat -u > foo
```

80102 It is unspecified whether standard output is or is not buffered in the default case. This is  
80103 sometimes of interest when standard output is associated with a terminal, since buffering may  
80104 delay the output. The presence of the **-u** option guarantees that unbuffered I/O is available. It is  
80105 implementation-defined whether the *cat* utility buffers output if the **-u** option is not specified.  
80106 Traditionally, the **-u** option is implemented using the equivalent of the *setvbuf()* function  
80107 defined in the System Interfaces volume of POSIX.1-2008.

80108 **EXAMPLES**

80109 The following command:

```
80110 cat myfile
```

80111 writes the contents of the file **myfile** to standard output.

80112 The following command:

```
80113 cat doc1 doc2 > doc.all
```

80114 concatenates the files **doc1** and **doc2** and writes the result to **doc.all**.

80115 Because of the shell language mechanism used to perform output redirection, a command such  
80116 as this:

```
80117 cat doc doc.end > doc
```

80118 causes the original data in **doc** to be lost.

80119 The command:

```
80120 cat start - middle - end > file
```

80121 when standard input is a terminal, gets two arbitrary pieces of input from the terminal with a

80122 single invocation of *cat*. Note, however, that if standard input is a regular file, this would be  
80123 equivalent to the command:

```
80124 cat start - middle /dev/null end > file
```

80125 because the entire contents of the file would be consumed by *cat* the first time '-' was used as a  
80126 file operand and an end-of-file condition would be detected immediately when '-' was  
80127 referenced the second time.

#### 80128 RATIONALE

80129 Historical versions of the *cat* utility include the *-e*, *-t*, and *-v*, options which permit the ends of  
80130 lines, <tab> characters, and invisible characters, respectively, to be rendered visible in the  
80131 output. The standard developers omitted these options because they provide too fine a degree of  
80132 control over what is made visible, and similar output can be obtained using a command such as:

```
80133 sed -n l pathname
```

80134 The latter also has the advantage that its output is unambiguous, whereas the output of  
80135 historical *cat -etv* is not.

80136 The *-s* option was omitted because it corresponds to different functions in BSD and System  
80137 V-based systems. The BSD *-s* option to squeeze blank lines can be accomplished by the shell  
80138 script shown in the following example:

```
80139 sed -n '  
80140 # Write non-empty lines.  
80141 ./ {  
80142     p  
80143     d  
80144 }  
80145 # Write a single empty line, then look for more empty lines.  
80146 /^$/ p  
80147 # Get next line, discard the held <newline> (empty line),  
80148 # and look for more empty lines.  
80149 :Empty  
80150 /^$/ {  
80151     N  
80152     s/./ /  
80153     b Empty  
80154 }  
80155 # Write the non-empty line before going back to search  
80156 # for the first in a set of empty lines.  
80157     p  
80158 '
```

80159 The System V *-s* option to silence error messages can be accomplished by redirecting the  
80160 standard error. Note that the BSD documentation for *cat* uses the term "blank line" to mean the  
80161 same as the POSIX "empty line": a line consisting only of a <newline>.

80162 The BSD *-n* option was omitted because similar functionality can be obtained from the *-n*  
80163 option of the *pr* utility.

#### 80164 FUTURE DIRECTIONS

80165 None.

80166 **SEE ALSO**80167 [more](#)80168 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)80169 XSH [setobuf\(\)](#)80170 **CHANGE HISTORY**

80171 First released in Issue 2.

80172 **Issue 7**

80173 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

80174 SD5-XCU-ERN-174 is applied, changing the RATIONALE.

80175 **NAME**

80176 cd — change the working directory

80177 **SYNOPSIS**80178 cd [-L|-P] [*directory*]

80179 cd -

80180 **DESCRIPTION**

80181 The *cd* utility shall change the working directory of the current shell execution environment (see  
 80182 [Section 2.12](#), on page 2331) by executing the following steps in sequence. (In the following steps,  
 80183 the symbol **curpath** represents an intermediate value used to simplify the description of the  
 80184 algorithm used by *cd*. There is no requirement that **curpath** be made visible to the application.)

- 80185 1. If no *directory* operand is given and the *HOME* environment variable is empty or  
 80186 undefined, the default behavior is implementation-defined and no further steps shall be  
 80187 taken.
- 80188 2. If no *directory* operand is given and the *HOME* environment variable is set to a non-empty  
 80189 value, the *cd* utility shall behave as if the directory named in the *HOME* environment  
 80190 variable was specified as the *directory* operand.
- 80191 3. If the *directory* operand begins with a <slash> character, set **curpath** to the operand and  
 80192 proceed to step 7.
- 80193 4. If the first component of the *directory* operand is dot or dot-dot, proceed to step 6.
- 80194 5. Starting with the first pathname in the <colon>-separated pathnames of *CDPATH* (see the  
 80195 ENVIRONMENT VARIABLES section) if the pathname is non-null, test if the  
 80196 concatenation of that pathname, a <slash> character if that pathname did not end with a  
 80197 <slash> character, and the *directory* operand names a directory. If the pathname is null,  
 80198 test if the concatenation of dot, a <slash> character, and the operand names a directory. In  
 80199 either case, if the resulting string names an existing directory, set **curpath** to that string  
 80200 and proceed to step 7. Otherwise, repeat this step with the next pathname in *CDPATH*  
 80201 until all pathnames have been tested.
- 80202 6. If the **-P** option is in effect, set **curpath** to the *directory* operand. Otherwise, set **curpath** to  
 80203 the string formed by the concatenation of the value of *PWD*, a <slash> character if the  
 80204 value of *PWD* did not end with a <slash> character, and the operand.
- 80205 7. If the **-P** option is in effect, proceed to step 10. If **curpath** does not begin with a <slash>  
 80206 character, set **curpath** to the string formed by the concatenation of the value of *PWD*, a  
 80207 <slash> character if the value of *PWD* did not end with a <slash> character, and **curpath**.
- 80208 8. The **curpath** value shall then be converted to canonical form as follows, considering each  
 80209 component from beginning to end, in sequence:
  - 80210 a. Dot components and any <slash> characters that separate them from the next  
 80211 component shall be deleted.
  - 80212 b. For each dot-dot component, if there is a preceding component and it is neither  
 80213 root nor dot-dot, then:
    - 80214 i. If the preceding component does not refer (in the context of pathname  
 80215 resolution with symbolic links followed) to a directory, then the *cd* utility  
 80216 shall display an appropriate error message and no further steps shall be  
 80217 taken.

- 80218 ii. The preceding component, all <slash> characters separating the preceding  
80219 component from dot-dot, dot-dot, and all <slash> characters separating dot-  
80220 dot from the following component (if any) shall be deleted.
- 80221 c. An implementation may further simplify **curpath** by removing any trailing  
80222 <slash> characters that are not also leading <slash> characters, replacing multiple  
80223 non-leading consecutive <slash> characters with a single <slash>, and replacing  
80224 three or more leading <slash> characters with a single <slash>. If, as a result of  
80225 this canonicalization, the **curpath** variable is null, no further steps shall be taken.
- 80226 9. If **curpath** is longer than {PATH\_MAX} bytes (including the terminating null) and the  
80227 *directory* operand was not longer than {PATH\_MAX} bytes (including the terminating  
80228 null), then **curpath** shall be converted from an absolute pathname to an equivalent  
80229 relative pathname if possible. This conversion shall always be considered possible if the  
80230 value of *PWD*, with a trailing <slash> added if it does not already have one, is an initial  
80231 substring of **curpath**. Whether or not it is considered possible under other circumstances  
80232 is unspecified. Implementations may also apply this conversion if **curpath** is not longer  
80233 than {PATH\_MAX} bytes or the *directory* operand was longer than {PATH\_MAX} bytes.
- 80234 10. The *cd* utility shall then perform actions equivalent to the *chdir()* function called with  
80235 **curpath** as the *path* argument. If these actions fail for any reason, the *cd* utility shall  
80236 display an appropriate error message and the remainder of this step shall not be  
80237 executed. If the **-P** option is not in effect, the *PWD* environment variable shall be set to  
80238 the value that **curpath** had on entry to step 9 (i.e., before conversion to a relative  
80239 pathname). If the **-P** option is in effect, the *PWD* environment variable shall be set to the  
80240 string that would be output by *pwd -P*. If there is insufficient permission on the new  
80241 directory, or on any parent of that directory, to determine the current working directory,  
80242 the value of the *PWD* environment variable is unspecified.

80243 If, during the execution of the above steps, the *PWD* environment variable is changed, the  
80244 *OLDPWD* environment variable shall also be changed to the value of the old working directory  
80245 (that is the current working directory immediately prior to the call to *cd*).

#### 80246 OPTIONS

80247 The *cd* utility shall conform to XBD Section 12.2 (on page 215).

80248 The following options shall be supported by the implementation:

- 80249 **-L** Handle the operand dot-dot logically; symbolic link components shall not be  
80250 resolved before dot-dot components are processed (see steps 8. and 9. in the  
80251 DESCRIPTION).
- 80252 **-P** Handle the operand dot-dot physically; symbolic link components shall be  
80253 resolved before dot-dot components are processed (see step 7. in the  
80254 DESCRIPTION).

80255 If both **-L** and **-P** options are specified, the last of these options shall be used and all others  
80256 ignored. If neither **-L** nor **-P** is specified, the operand shall be handled dot-dot logically; see the  
80257 DESCRIPTION.

#### 80258 OPERANDS

80259 The following operands shall be supported:

- 80260 *directory* An absolute or relative pathname of the directory that shall become the new  
80261 working directory. The interpretation of a relative pathname by *cd* depends on the  
80262 **-L** option and the *CDPATH* and *PWD* environment variables. If *directory* is an  
80263 empty string, the results are unspecified.

- 80264 – When a <hyphen> is used as the operand, this shall be equivalent to the command:
- 80265 `cd "$OLDPWD" && pwd`
- 80266 which changes to the previous working directory and then writes its name.
- 80267 **STDIN**
- 80268 Not used.
- 80269 **INPUT FILES**
- 80270 None.
- 80271 **ENVIRONMENT VARIABLES**
- 80272 The following environment variables shall affect the execution of *cd*:
- 80273 *CDPATH* A <colon>-separated list of pathnames that refer to directories. The *cd* utility shall
- 80274 use this list in its attempt to change the directory, as described in the
- 80275 DESCRIPTION. An empty string in place of a directory pathname represents the
- 80276 current directory. If *CDPATH* is not set, it shall be treated as if it were an empty
- 80277 string.
- 80278 *HOME* The name of the directory, used when no *directory* operand is specified.
- 80279 *LANG* Provide a default value for the internationalization variables that are unset or null.
- 80280 (See XBD Section 8.2 (on page 174) for the precedence of internationalization
- 80281 variables used to determine the values of locale categories.)
- 80282 *LC\_ALL* If set to a non-empty string value, override the values of all the other
- 80283 internationalization variables.
- 80284 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
- 80285 characters (for example, single-byte as opposed to multi-byte characters in
- 80286 arguments).
- 80287 *LC\_MESSAGES*
- 80288 Determine the locale that should be used to affect the format and contents of
- 80289 diagnostic messages written to standard error.
- 80290 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 80291 *OLDPWD* A pathname of the previous working directory, used by *cd -*.
- 80292 *PWD* This variable shall be set as specified in the DESCRIPTION. If an application sets
- 80293 or unsets the value of *PWD*, the behavior of *cd* is unspecified.
- 80294 **ASYNCHRONOUS EVENTS**
- 80295 Default.
- 80296 **STDOUT**
- 80297 If a non-empty directory name from *CDPATH* is used, or if *cd -* is used, an absolute pathname of
- 80298 the new working directory shall be written to the standard output as follows:
- 80299 `"%s\n", <new directory>`
- 80300 Otherwise, there shall be no output.
- 80301 **STDERR**
- 80302 The standard error shall be used only for diagnostic messages.

**cd**

Utilities

80303 **OUTPUT FILES**

80304 None.

80305 **EXTENDED DESCRIPTION**

80306 None.

80307 **EXIT STATUS**

80308 The following exit values shall be returned:

80309 0 The directory was successfully changed.

80310 &gt;0 An error occurred.

80311 **CONSEQUENCES OF ERRORS**

80312 The working directory shall remain unchanged.

80313 **APPLICATION USAGE**

80314 Since *cd* affects the current shell execution environment, it is always provided as a shell regular  
 80315 built-in. If it is called in a subshell or separate utility execution environment, such as one of the  
 80316 following:

```
80317 (cd /tmp)
80318 nohup cd
80319 find . -exec cd {} \;
```

80320 it does not affect the working directory of the caller's environment.

80321 The user must have execute (search) permission in *directory* in order to change to it.80322 **EXAMPLES**

80323 None.

80324 **RATIONALE**

80325 The use of the *CDPATH* was introduced in the System V shell. Its use is analogous to the use of  
 80326 the *PATH* variable in the shell. The BSD C shell used a shell parameter *cdpath* for this purpose.

80327 A common extension when *HOME* is undefined is to get the login directory from the user  
 80328 database for the invoking user. This does not occur on System V implementations.

80329 Some historical shells, such as the KornShell, took special actions when the directory name  
 80330 contained a dot-dot component, selecting the logical parent of the directory, rather than the  
 80331 actual parent directory; that is, it moved up one level toward the '/' in the pathname,  
 80332 remembering what the user typed, rather than performing the equivalent of:

```
80333 chdir("../");
```

80334 In such a shell, the following commands would not necessarily produce equivalent output for all  
 80335 directories:

```
80336 cd .. && ls      ls ..
```

80337 This behavior is now the default. It is not consistent with the definition of dot-dot in most  
 80338 historical practice; that is, while this behavior has been optionally available in the KornShell,  
 80339 other shells have historically not supported this functionality. The logical pathname is stored in  
 80340 the *PWD* environment variable when the *cd* utility completes and this value is used to construct  
 80341 the next directory name if *cd* is invoked with the *-L* option.

80342 **FUTURE DIRECTIONS**

80343 None.

80344 **SEE ALSO**80345 [Section 2.12](#) (on page 2331), *pwd*80346 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)80347 XSH *chdir()*80348 **CHANGE HISTORY**

80349 First released in Issue 2.

80350 **Issue 6**80351 The following new requirements on POSIX implementations derive from alignment with the  
80352 Single UNIX Specification:

- 80353
- The *cd* – operand, *PWD*, and *OLDPWD* are added.

80354 The *-L* and *-P* options are added to align with the IEEE P1003.2b draft standard. This also  
80355 includes the introduction of a new description to include the effect of these options.80356 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/14 is applied, changing the SYNOPSIS to  
80357 make it clear that the *-L* and *-P* options are mutually-exclusive.80358 **Issue 7**

80359 Austin Group Interpretation 1003.1-2001 #037 is applied.

80360 Austin Group Interpretation 1003.1-2001 #199 is applied, clarifying how the *od* utility handles  
80361 concatenation of two pathnames when the first pathname ends in a <slash> character.

80362 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

80363 Step 7 of the processing performed by *cd* is revised to refer to **curpath** instead of “the operand”.80364 Changes to the *pwd* utility and *PWD* environment variable have been made to match the  
80365 changes to the *getcwd()* function made for Austin Group Interpretation 1003.1-2001 #140.

**cflow**

Utilities

80366 **NAME**80367 **cflow** — generate a C-language flowgraph (**DEVELOPMENT**)80368 **SYNOPSIS**

```
80369 xSI cflow [-r] [-d num] [-D name[=def]]... [-i incl] [-I dir]...
80370 [-U dir]... file...
```

80371 **DESCRIPTION**

80372 The *cflow* utility shall analyze a collection of object files or assembler, C-language, *lex*, or *yacc*  
 80373 source files, and attempt to build a graph, written to standard output, charting the external  
 80374 references.

80375 **OPTIONS**

80376 The *cflow* utility shall conform to XBD Section 12.2 (on page 215), except that the order of the **-D**,  
 80377 **-I**, and **-U** options (which are identical to their interpretation by *c99*) is significant.

80378 The following options shall be supported:

- 80379 **-d** *num* Indicate the depth at which the flowgraph is cut off. The application shall ensure  
 80380 that the argument *num* is a decimal integer. By default this is a very large number  
 80381 (typically greater than 32 000). Attempts to set the cut-off depth to a non-positive  
 80382 integer shall be ignored.
- 80383 **-i** *incl* Increase the number of included symbols. The *incl* option-argument is one of the  
 80384 following characters:
- 80385 *x* Include external and static data symbols. The default shall be to include only  
 80386 functions in the flowgraph.
- 80387 *\_* (Underscore) Include names that begin with an <underscore>. The default  
 80388 shall be to exclude these functions (and data if **-i x** is used).
- 80389 **-r** Reverse the caller: callee relationship, producing an inverted listing showing the  
 80390 callers of each function. The listing shall also be sorted in lexicographical order by  
 80391 callee.

80392 **OPERANDS**

80393 The following operand is supported:

- 80394 *file* The pathname of a file for which a graph is to be generated. Filenames suffixed by  
 80395 **.l** shall be taken to be *lex* input, **.y** as *yacc* input, **.c** as *c99* input, and **.i** as the  
 80396 output of *c99* **-E**. Such files shall be processed as appropriate, determined by their  
 80397 suffix.
- 80398 Files suffixed by **.s** (conventionally assembler source) may have more limited  
 80399 information extracted from them.

80400 **STDIN**

80401 Not used.

80402 **INPUT FILES**

80403 The input files shall be object files or assembler, C-language, *lex*, or *yacc* source files.

80404 **ENVIRONMENT VARIABLES**

80405 The following environment variables shall affect the execution of *cflow*:

- 80406 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 80407 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 80408 variables used to determine the values of locale categories.)

|       |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 80409 | <i>LC_ALL</i>                 | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 80425 |                               | Each line of output begins with a reference (that is, line) number, followed by indentation of at least one column position per level. This is followed by the name of the global, a <colon>, and its definition. Normally globals are only functions not defined as an external or beginning with an <underscore>; see the <b>OPTIONS</b> section for the <i>-i</i> inclusion option. For information extracted from C-language source, the definition consists of an abstract type declaration (for example, <b>char</b> *) and, delimited by angle brackets, the name of the source file and the line number where the definition was found. Definitions extracted from object files indicate the filename and location counter under which the symbol appeared (for example, <i>text</i> ). |

| 80442 | <b>EXIT STATUS</b>            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 80443 |                               | The following exit values shall be returned:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 80444 |                               | 0 Successful completion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 80445 |                               | >0 An error occurred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 80446 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 80447 |                               | Default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

80448 **APPLICATION USAGE**

80449 Files produced by *lex* and *yacc* cause the reordering of line number declarations, and this can  
 80450 confuse *cflow*. To obtain proper results, the input of *yacc* or *lex* must be directed to *cflow*.

80451 **EXAMPLES**

80452 Given the following in **file.c**:

```
80453     int i;
80454     int f();
80455     int g();
80456     int h();
80457     int
80458     main()
80459     {
80460         f();
80461         g();
80462         f();
80463     }
80464     int
80465     f()
80466     {
80467         i = h();
80468     }
```

80469 The command:

```
80470 cflow -i x file.c
```

80471 produces the output:

```
80472 1 main: int(), <file.c 6>
80473 2   f: int(), <file.c 13>
80474 3     h: <>
80475 4     i: int, <file.c 1>
80476 5     g: <>
```

80477 **RATIONALE**

80478 None.

80479 **FUTURE DIRECTIONS**

80480 None.

80481 **SEE ALSO**

80484 **CHANGE HISTORY**

80485 First released in Issue 2.

80486 **Issue 6**

80487 The normative text is reworded to avoid use of the term “must” for application requirements.

80488 **Issue 7**

80489 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

80490 **NAME**

80491 chgrp — change the file group ownership

80492 **SYNOPSIS**80493 chgrp [-h] *group file...*80494 chgrp -R [-H|-L|-P] *group file...*80495 **DESCRIPTION**80496 The *chgrp* utility shall set the group ID of the file named by each *file* operand to the group ID  
80497 specified by the *group* operand.80498 For each *file* operand, or, if the **-R** option is used, each file encountered while walking the  
80499 directory trees specified by the *file* operands, the *chgrp* utility shall perform actions equivalent to  
80500 the *chown()* function defined in the System Interfaces volume of POSIX.1-2008, called with the  
80501 following arguments:

- 80502 • The *file* operand shall be used as the *path* argument.
- 80503 • The user ID of the file shall be used as the *owner* argument.
- 80504 • The specified group ID shall be used as the *group* argument.

80505 Unless *chgrp* is invoked by a process with appropriate privileges, the set-user-ID and set-group-  
80506 ID bits of a regular file shall be cleared upon successful completion; the set-user-ID and set-  
80507 group-ID bits of other file types may be cleared.80508 **OPTIONS**80509 The *chgrp* utility shall conform to XBD Section 12.2 (on page 215).

80510 The following options shall be supported by the implementation:

- 80511 **-h** If the system supports group IDs for symbolic links, for each *file* operand that  
80512 names a file of type symbolic link, *chgrp* shall attempt to set the group ID of the  
80513 symbolic link instead of the file referenced by the symbolic link. If the system does  
80514 not support group IDs for symbolic links, for each *file* operand that names a file of  
80515 type symbolic link, *chgrp* shall do nothing more with the current file and shall go  
80516 on to any remaining files.
- 80517 **-H** If the **-R** option is specified and a symbolic link referencing a file of type directory  
80518 is specified on the command line, *chgrp* shall change the group of the directory  
80519 referenced by the symbolic link and all files in the file hierarchy below it.
- 80520 **-L** If the **-R** option is specified and a symbolic link referencing a file of type directory  
80521 is specified on the command line or encountered during the traversal of a file  
80522 hierarchy, *chgrp* shall change the group of the directory referenced by the symbolic  
80523 link and all files in the file hierarchy below it.
- 80524 **-P** If the **-R** option is specified and a symbolic link is specified on the command line  
80525 or encountered during the traversal of a file hierarchy, *chgrp* shall change the group  
80526 ID of the symbolic link if the system supports this operation. The *chgrp* utility shall  
80527 not follow the symbolic link to any other part of the file hierarchy.
- 80528 **-R** Recursively change file group IDs. For each *file* operand that names a directory,  
80529 *chgrp* shall change the group of the directory and all files in the file hierarchy  
80530 below it. Unless a **-H**, **-L**, or **-P** option is specified, it is unspecified which of these  
80531 options will be used as the default.

80532 Specifying more than one of the mutually-exclusive options **-H**, **-L**, and **-P** shall not be  
80533 considered an error. The last option specified shall determine the behavior of the utility.

**chgrp**

Utilities

80534 **OPERANDS**

80535 The following operands shall be supported:

80536 *group* A group name from the group database or a numeric group ID. Either specifies a  
 80537 group ID to be given to each file named by one of the *file* operands. If a numeric  
 80538 *group* operand exists in the group database as a group name, the group ID number  
 80539 associated with that group name is used as the group ID.

80540 *file* A pathname of a file whose group ID is to be modified.

80541 **STDIN**

80542 Not used.

80543 **INPUT FILES**

80544 None.

80545 **ENVIRONMENT VARIABLES**80546 The following environment variables shall affect the execution of *chgrp*:

80547 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 80548 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 80549 variables used to determine the values of locale categories.)

80550 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 80551 internationalization variables.

80552 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 80553 characters (for example, single-byte as opposed to multi-byte characters in  
 80554 arguments).

80555 *LC\_MESSAGES*

80556 Determine the locale that should be used to affect the format and contents of  
 80557 diagnostic messages written to standard error.

80558 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

80559 **ASYNCHRONOUS EVENTS**

80560 Default.

80561 **STDOUT**

80562 Not used.

80563 **STDERR**

80564 The standard error shall be used only for diagnostic messages.

80565 **OUTPUT FILES**

80566 None.

80567 **EXTENDED DESCRIPTION**

80568 None.

80569 **EXIT STATUS**

80570 The following exit values shall be returned:

80571 0 The utility executed successfully and all requested changes were made.

80572 &gt;0 An error occurred.

80573 **CONSEQUENCES OF ERRORS**

80574 Default.

80575 **APPLICATION USAGE**80576 Only the owner of a file or the user with appropriate privileges may change the owner or group  
80577 of a file.80578 Some implementations restrict the use of *chgrp* to a user with appropriate privileges when the  
80579 *group* specified is not the effective group ID or one of the supplementary group IDs of the calling  
80580 process.80581 **EXAMPLES**

80582 None.

80583 **RATIONALE**80584 The System V and BSD versions use different exit status codes. Some implementations used the  
80585 exit status as a count of the number of errors that occurred; this practice is unworkable since it  
80586 can overflow the range of valid exit status values. The standard developers chose to mask these  
80587 by specifying only 0 and >0 as exit values.80588 The functionality of *chgrp* is described substantially through references to *chown*(). In this way,  
80589 there is no duplication of effort required for describing the interactions of permissions, multiple  
80590 groups, and so on.80591 **FUTURE DIRECTIONS**

80592 None.

80593 **SEE ALSO**80594 *chmod*, *chown*

80595 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

80596 XSH *chown*()80597 **CHANGE HISTORY**

80598 First released in Issue 2.

80599 **Issue 6**80600 New options **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These  
80601 options affect the processing of symbolic links.80602 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS  
80603 section to "Default".80604 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/15 is applied, changing the SYNOPSIS to  
80605 make it clear that **-h** and **-R** are optional.80606 **Issue 7**80607 SD5-XCU-ERN-8 is applied, removing the **-R** from the first line of the SYNOPSIS.

80608 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**chmod**

Utilities

80609 **NAME**80610 `chmod` — change the file modes80611 **SYNOPSIS**80612 `chmod [-R] mode file...`80613 **DESCRIPTION**80614 The *chmod* utility shall change any or all of the file mode bits of the file named by each *file*  
80615 operand in the way specified by the *mode* operand.80616 It is implementation-defined whether and how the *chmod* utility affects any alternate or  
80617 additional file access control mechanism (see XBD Section 4.4, on page 108) being used for the  
80618 specified file.80619 Only a process whose effective user ID matches the user ID of the file, or a process with  
80620 appropriate privileges, shall be permitted to change the file mode bits of a file.80621 Upon successfully changing the file mode bits of a file, the *chmod* utility shall mark for update  
80622 the last file status change timestamp of the file.80623 **OPTIONS**80624 The *chmod* utility shall conform to XBD Section 12.2 (on page 215).

80625 The following option shall be supported:

80626 **-R** Recursively change file mode bits. For each *file* operand that names a directory,  
80627 *chmod* shall change the file mode bits of the directory and all files in the file  
80628 hierarchy below it.80629 **OPERANDS**

80630 The following operands shall be supported:

80631 *mode* Represents the change to be made to the file mode bits of each file named by one of  
80632 the *file* operands; see the EXTENDED DESCRIPTION section.80633 *file* A pathname of a file whose file mode bits shall be modified.80634 **STDIN**

80635 Not used.

80636 **INPUT FILES**

80637 None.

80638 **ENVIRONMENT VARIABLES**80639 The following environment variables shall affect the execution of *chmod*:80640 **LANG** Provide a default value for the internationalization variables that are unset or null.  
80641 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
80642 variables used to determine the values of locale categories.)80643 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
80644 internationalization variables.80645 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
80646 characters (for example, single-byte as opposed to multi-byte characters in  
80647 arguments).80648 **LC\_MESSAGES**80649 Determine the locale that should be used to affect the format and contents of  
80650 diagnostic messages written to standard error.

|       |     |                             |                                                                                                                                                        |
|-------|-----|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 80651 | XSI | <b>NLSPATH</b>              | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                  |
| 80652 |     | <b>ASYNCHRONOUS EVENTS</b>  |                                                                                                                                                        |
| 80653 |     |                             | Default.                                                                                                                                               |
| 80654 |     | <b>STDOUT</b>               |                                                                                                                                                        |
| 80655 |     |                             | Not used.                                                                                                                                              |
| 80656 |     | <b>STDERR</b>               |                                                                                                                                                        |
| 80657 |     |                             | The standard error shall be used only for diagnostic messages.                                                                                         |
| 80658 |     | <b>OUTPUT FILES</b>         |                                                                                                                                                        |
| 80659 |     |                             | None.                                                                                                                                                  |
| 80660 |     | <b>EXTENDED DESCRIPTION</b> |                                                                                                                                                        |
| 80661 |     |                             | The <i>mode</i> operand shall be either a <i>symbolic_mode</i> expression or a non-negative octal integer. The                                         |
| 80662 |     |                             | <i>symbolic_mode</i> form is described by the grammar later in this section.                                                                           |
| 80663 |     |                             | Each <b>clause</b> shall specify an operation to be performed on the current file mode bits of each <i>file</i> .                                      |
| 80664 |     |                             | The operations shall be performed on each <i>file</i> in the order in which the <b>clauses</b> are specified.                                          |
| 80665 |     |                             | The <b>who</b> symbols <b>u</b> , <b>g</b> , and <b>o</b> shall specify the <i>user</i> , <i>group</i> , and <i>other</i> parts of the file mode bits, |
| 80666 |     |                             | respectively. A <b>who</b> consisting of the symbol <b>a</b> shall be equivalent to <b>ugo</b> .                                                       |
| 80667 |     |                             | The <b>perm</b> symbols <b>r</b> , <b>w</b> , and <b>x</b> represent the <i>read</i> , <i>write</i> , and <i>execute/search</i> portions of file mode  |
| 80668 |     |                             | bits, respectively. The <b>perm</b> symbol <b>s</b> shall represent the <i>set-user-ID-on-execution</i> (when <b>who</b>                               |
| 80669 |     |                             | contains or implies <b>u</b> ) and <i>set-group-ID-on-execution</i> (when <b>who</b> contains or implies <b>g</b> ) bits.                              |
| 80670 |     |                             | The <b>perm</b> symbol <b>X</b> shall represent the <i>execute/search</i> portion of the file mode bits if the file is a                               |
| 80671 |     |                             | directory or if the current (unmodified) file mode bits have at least one of the execute bits                                                          |
| 80672 |     |                             | ( <b>S_IXUSR</b> , <b>S_IXGRP</b> , or <b>S_IXOTH</b> ) set. It shall be ignored if the file is not a directory and none of                            |
| 80673 |     |                             | the execute bits are set in the current file mode bits.                                                                                                |
| 80674 |     |                             | The <b>permcop</b> symbols <b>u</b> , <b>g</b> , and <b>o</b> shall represent the current permissions associated with the                              |
| 80675 |     |                             | <i>user</i> , <i>group</i> , and <i>other</i> parts of the file mode bits, respectively. For the remainder of this section,                            |
| 80676 |     |                             | <b>perm</b> refers to the non-terminals <b>perm</b> and <b>permcop</b> in the grammar.                                                                 |
| 80677 |     |                             | If multiple <b>actionlists</b> are grouped with a single <b>wholist</b> in the grammar, each <b>actionlist</b> shall be                                |
| 80678 |     |                             | applied in the order specified with that <b>wholist</b> . The <i>op</i> symbols shall represent the operation                                          |
| 80679 |     |                             | performed, as follows:                                                                                                                                 |
| 80680 |     | +                           | If <b>perm</b> is not specified, the '+' operation shall not change the file mode bits.                                                                |
| 80681 |     |                             | If <b>who</b> is not specified, the file mode bits represented by <b>perm</b> for the owner, group, and                                                |
| 80682 |     |                             | other permissions, except for those with corresponding bits in the file mode creation mask                                                             |
| 80683 |     |                             | of the invoking process, shall be set.                                                                                                                 |
| 80684 |     |                             | Otherwise, the file mode bits represented by the specified <b>who</b> and <b>perm</b> values shall be set.                                             |
| 80685 |     | -                           | If <b>perm</b> is not specified, the '-' operation shall not change the file mode bits.                                                                |
| 80686 |     |                             | If <b>who</b> is not specified, the file mode bits represented by <b>perm</b> for the owner, group, and                                                |
| 80687 |     |                             | other permissions, except for those with corresponding bits in the file mode creation mask                                                             |
| 80688 |     |                             | of the invoking process, shall be cleared.                                                                                                             |
| 80689 |     |                             | Otherwise, the file mode bits represented by the specified <b>who</b> and <b>perm</b> values shall be                                                  |
| 80690 |     |                             | cleared.                                                                                                                                               |
| 80691 |     | =                           | Clear the file mode bits specified by the <b>who</b> value, or, if no <b>who</b> value is specified, all of the                                        |
| 80692 |     |                             | file mode bits specified in this volume of POSIX.1-2008.                                                                                               |

**chmod**

80693 If **perm** is not specified, the '=' operation shall make no further modifications to the file  
80694 mode bits.

80695 If **who** is not specified, the file mode bits represented by **perm** for the owner, group, and  
80696 other permissions, except for those with corresponding bits in the file mode creation mask  
80697 of the invoking process, shall be set.

80698 Otherwise, the file mode bits represented by the specified **who** and **perm** values shall be set.

80699 When using the symbolic mode form on a regular file, it is implementation-defined whether or  
80700 not:

- 80701 • Requests to set the set-user-ID-on-execution or set-group-ID-on-execution bit when all  
80702 execute bits are currently clear and none are being set are ignored.
- 80703 • Requests to clear all execute bits also clear the set-user-ID-on-execution and set-group-ID-  
80704 on-execution bits.
- 80705 • Requests to clear the set-user-ID-on-execution or set-group-ID-on-execution bits when all  
80706 execute bits are currently clear are ignored. However, if the command *ls -l file* writes an *s*  
80707 in the position indicating that the set-user-ID-on-execution or set-group-ID-on-execution is  
80708 set, the commands *chmod u-s file* or *chmod g-s file*, respectively, shall not be ignored.

80709 When using the symbolic mode form on other file types, it is implementation-defined whether  
80710 or not requests to set or clear the set-user-ID-on-execution or set-group-ID-on-execution bits are  
80711 honored.

80712 If the **who** symbol **o** is used in conjunction with the **perm** symbol **s** with no other **who** symbols  
80713 being specified, the set-user-ID-on-execution and set-group-ID-on-execution bits shall not be  
80714 modified. It shall not be an error to specify the **who** symbol **o** in conjunction with the **perm**  
80715 symbol **s**.

80716 XSI The **perm** symbol **t** shall specify the S\_ISVTX bit. When used with a file of type directory, it can  
80717 be used with the **who** symbol **a**, or with no **who** symbol. It shall not be an error to specify a **who**  
80718 symbol of **u**, **g**, or **o** in conjunction with the **perm** symbol **t**, but the meaning of these  
80719 combinations is unspecified. The effect when using the **perm** symbol **t** with any file type other  
80720 than directory is unspecified.

80721 For an octal integer *mode* operand, the file mode bits shall be set absolutely.

80722 For each bit set in the octal number, the corresponding file permission bit shown in the following  
80723 table shall be set; all other file permission bits shall be cleared. For regular files, for each bit set in  
80724 the octal number corresponding to the set-user-ID-on-execution or the set-group-ID-on-  
80725 execution, bits shown in the following table shall be set; if these bits are not set in the octal  
80726 number, they are cleared. For other file types, it is implementation-defined whether or not  
80727 requests to set or clear the set-user-ID-on-execution or set-group-ID-on-execution bits are  
80728 honored.

| Octal | Mode Bit | | | | | | |
|---|---|---|---|---|---|---|---|
| 4000  | S_ISUID  | 0400  | S_IRUSR  | 0040  | S_IRGRP  | 0004  | S_IROTH  |
| 2000  | S_ISGID  | 0200  | S_IWUSR  | 0020  | S_IWGRP  | 0002  | S_IWOTH  |
| 1000  | S_ISVTX  | 0100  | S_IXUSR  | 0010  | S_IXGRP  | 0001  | S_IXOTH  |

80729  
80730  
80731  
80732 XSI  
80733 When bits are set in the octal number other than those listed in the table above, the behavior is  
80734 unspecified.

80735 **Grammar for chmod**

80736 The grammar and lexical conventions in this section describe the syntax for the *symbolic\_mode*  
 80737 operand. The general conventions for this style of grammar are described in [Section 1.3](#) (on page  
 80738 2287). A valid *symbolic\_mode* can be represented as the non-terminal symbol *symbolic\_mode* in  
 80739 the grammar. This formal syntax shall take precedence over the preceding text syntax  
 80740 description.

80741 The lexical processing is based entirely on single characters. Implementations need not allow  
 80742 <blank> characters within the single argument being processed.

```
80743 %start    symbolic_mode
80744 %%
```

```
80745 symbolic_mode    : clause
80746                  | symbolic_mode ',' clause

80768                  | perm permlist
80769                  ;
```

```
80770 XSI perm      : 'r' | 'w' | 'x' | 'X' | 's' | 't'
80771                  ;
```

80772 **EXIT STATUS**

80773 The following exit values shall be returned:

80774 0 The utility executed successfully and all requested changes were made.

80775 >0 An error occurred.

# chmod

80776 **CONSEQUENCES OF ERRORS**

80777 Default.

80778 **APPLICATION USAGE**

80779 Some implementations of the *chmod* utility change the mode of a directory before the files in the  
 80780 directory when performing a recursive (**-R** option) change; others change the directory mode  
 80781 after the files in the directory. If an application tries to remove read or search permission for a  
 80782 file hierarchy, the removal attempt fails if the directory is changed first; on the other hand, trying  
 80783 to re-enable permissions to a restricted hierarchy fails if directories are changed last. Users  
 80784 should not try to make a hierarchy inaccessible to themselves.

80785 Some implementations of *chmod* never used the *umask* of the process when changing modes;  
 80786 systems conformant with this volume of POSIX.1-2008 do so when **who** is not specified. Note  
 80787 the difference between:

80788 `chmod a-w file`

80789 which removes all write permissions, and:

80790 `chmod -- -w file`

80791 which removes write permissions that would be allowed if **file** was created with the same  
 80792 *umask*.

80793 Conforming applications should never assume that they know how the set-user-ID and set-  
 80794 group-ID bits on directories are interpreted.

80795 **EXAMPLES**

| Mode         | Results                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------|
| <i>a+=</i>   | Equivalent to <i>a+,a=</i> ; clears all file mode bits.                                            |
| <i>go+-w</i> | Equivalent to <i>go+,go-w</i> ; clears group and other write bits.                                 |
| <i>g=0-w</i> | Equivalent to <i>g=0,g-w</i> ; sets group bit to match other bits and then clears group write bit. |
| <i>g-r+w</i> | Equivalent to <i>g-r,g+w</i> ; clears group read bit and sets group write bit.                     |
| <i>u0=g</i>  | Sets owner bits to match group bits and sets other bits to match group bits.                       |

80806 **RATIONALE**

80807 The functionality of *chmod* is described substantially through references to concepts defined in  
 80808 the System Interfaces volume of POSIX.1-2008. In this way, there is less duplication of effort  
 80809 required for describing the interactions of permissions. However, the behavior of this utility is  
 80810 not described in terms of the *chmod()* function from the System Interfaces volume of  
 80811 POSIX.1-2008 because that specification requires certain side-effects upon alternate file access  
 80812 control mechanisms that might not be appropriate, depending on the implementation.

80813 Implementations that support mandatory file and record locking as specified by the 1984  
 80814 /usr/group standard historically used the combination of set-group-ID bit set and group  
 80815 execute bit clear to indicate mandatory locking. This condition is usually set or cleared with the  
 80816 symbolic mode **perm** symbol **l** instead of the **perm** symbols **s** and **x** so that the mandatory  
 80817 locking mode is not changed without explicit indication that that was what the user intended.  
 80818 Therefore, the details on how the implementation treats these conditions must be defined in the  
 80819 documentation. This volume of POSIX.1-2008 does not require mandatory locking (nor does the  
 80820 System Interfaces volume of POSIX.1-2008), but does allow it as an extension. However, this  
 80821 volume of POSIX.1-2008 does require that the *ls* and *chmod* utilities work consistently in this

80822 area. If `ls -l file` indicates that the set-group-ID bit is set, `chmod g-s file` must clear it (assuming  
80823 appropriate privileges exist to change modes).

80824 The System V and BSD versions use different exit status codes. Some implementations used the  
80825 exit status as a count of the number of errors that occurred; this practice is unworkable since it  
80826 can overflow the range of valid exit status values. This problem is avoided here by specifying  
80827 only 0 and >0 as exit values.

80828 The System Interfaces volume of POSIX.1-2008 indicates that implementation-defined  
80829 restrictions may cause the S\_ISUID and S\_ISGID bits to be ignored. This volume of POSIX.1-2008  
80830 allows the `chmod` utility to choose to modify these bits before calling `chmod()` (or some function  
80831 providing equivalent capabilities) for non-regular files. Among other things, this allows  
80832 implementations that use the set-user-ID and set-group-ID bits on directories to enable extended  
80833 features to handle these extensions in an intelligent manner.

80834 The **X perm** symbol was adopted from BSD-based systems because it provides commonly  
80835 desired functionality when doing recursive (`-R` option) modifications. Similar functionality is  
80836 not provided by the `find` utility. Historical BSD versions of `chmod`, however, only supported **X**  
80837 with `op+`; it has been extended in this volume of POSIX.1-2008 because it is also useful with `op=`.  
80838 (It has also been added for `op-` even though it duplicates `x`, in this case, because it is intuitive  
80839 and easier to explain.)

80840 The grammar was extended with the `permcoppy` non-terminal to allow historical-practice forms of  
80841 symbolic modes like `o=u-g` (that is, set the “other” permissions to the permissions of “owner”  
80842 minus the permissions of “group”).

#### 80843 FUTURE DIRECTIONS

80844 None.

#### 80845 SEE ALSO

80846 [ls](#), [umask](#)

80848 XSH [chmod\(\)](#)

#### 80849 CHANGE HISTORY

80850 First released in Issue 2.

#### 80851 Issue 6

80852 The following new requirements on POSIX implementations derive from alignment with the  
80853 Single UNIX Specification:

- 80854 • Octal modes have been kept and made mandatory despite being marked obsolescent in the  
80855 ISO POSIX-2: 1993 standard.

80856 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS  
80857 section to “Default.”.

80858 The Open Group Base Resolution bwg2001-010 is applied, adding the description of the  
80859 S\_ISVTX bit and the **t perm** symbol as part of the XSI option.

80860 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/16 is applied, changing the XSI shaded  
80861 text in the EXTENDED DESCRIPTION from:

80862 “The **perm** symbol **t** shall specify the S\_ISVTX bit and shall apply to directories only. The  
80863 effect when using it with any other file type is unspecified. It can be used with the **who**  
80864 symbols **o**, **a**, or with no **who** symbol. It shall not be an error to specify a **who** symbol of **u**  
80865 or **g** in conjunction with the **perm** symbol **t**; it shall be ignored for **u** and **g**.”

**chmod***Utilities*

80866 to:

80867 “The **perm** symbol **t** shall specify the S\_ISVTX bit. When used with a file of type directory,  
80868 it can be used with the **who** symbol **a**, or with no **who** symbol. It shall not be an error to  
80869 specify a **who** symbol of **u**, **g**, or **o** in conjunction with the **perm** symbol **t**, but the meaning  
80870 of these combinations is unspecified. The effect when using the **perm** symbol **t** with any  
80871 file type other than directory is unspecified.”

80872 This change is to permit historical behavior.

80873 **Issue 7**

80874 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

80875 Austin Group Interpretation 1003.1-2001 #130 is applied, adding text to the DESCRIPTION  
80876 about about marking for update the last file status change timestamp of the file.

80877 **NAME**

80878 chown — change the file ownership

80879 **SYNOPSIS**

80880 chown [-h] owner[:group] file...

80881 chown -R [-H|-L|-P] owner[:group] file...

80882 **DESCRIPTION**80883 The *chown* utility shall set the user ID of the file named by each *file* operand to the user ID  
80884 specified by the *owner* operand.80885 For each *file* operand, or, if the **-R** option is used, each file encountered while walking the  
80886 directory trees specified by the *file* operands, the *chown* utility shall perform actions equivalent to  
80887 the *chown()* function defined in the System Interfaces volume of POSIX.1-2008, called with the  
80888 following arguments:

- 80889 1. The *file* operand shall be used as the *path* argument.
- 80890 2. The user ID indicated by the *owner* portion of the first operand shall be used as the *owner*  
80891 argument.
- 80892 3. If the *group* portion of the first operand is given, the group ID indicated by it shall be used  
80893 as the *group* argument; otherwise, the group ownership shall not be changed.

80894 Unless *chown* is invoked by a process with appropriate privileges, the set-user-ID and set-group-  
80895 ID bits of a regular file shall be cleared upon successful completion; the set-user-ID and set-  
80896 group-ID bits of other file types may be cleared.80897 **OPTIONS**80898 The *chown* utility shall conform to XBD Section 12.2 (on page 215).

80899 The following options shall be supported by the implementation:

- 80900 **-h** For each file operand that names a file of type symbolic link, *chown* shall attempt to  
80901 set the user ID of the symbolic link. If a group ID was specified, for each file  
80902 operand that names a file of type symbolic link, *chown* shall attempt to set the  
80903 group ID of the symbolic link.
- 80904 **-H** If the **-R** option is specified and a symbolic link referencing a file of type directory  
80905 is specified on the command line, *chown* shall change the user ID (and group ID, if  
80906 specified) of the directory referenced by the symbolic link and all files in the file  
80907 hierarchy below it.
- 80908 **-L** If the **-R** option is specified and a symbolic link referencing a file of type directory  
80909 is specified on the command line or encountered during the traversal of a file  
80910 hierarchy, *chown* shall change the user ID (and group ID, if specified) of the  
80911 directory referenced by the symbolic link and all files in the file hierarchy below it.
- 80912 **-P** If the **-R** option is specified and a symbolic link is specified on the command line  
80913 or encountered during the traversal of a file hierarchy, *chown* shall change the  
80914 owner ID (and group ID, if specified) of the symbolic link. The *chown* utility shall  
80915 not follow the symbolic link to any other part of the file hierarchy.
- 80916 **-R** Recursively change file user and group IDs. For each *file* operand that names a  
80917 directory, *chown* shall change the user ID (and group ID, if specified) of the  
80918 directory and all files in the file hierarchy below it. Unless a **-H**, **-L**, or **-P** option is  
80919 specified, it is unspecified which of these options will be used as the default.

80920 Specifying more than one of the mutually-exclusive options **-H**, **-L**, and **-P** shall not be

**chown**

Utilities

80921 considered an error. The last option specified shall determine the behavior of the utility.

80922 **OPERANDS**

80923 The following operands shall be supported:

80924 *owner[:group]* A user ID and optional group ID to be assigned to *file*. The *owner* portion of this  
 80925 operand shall be a user name from the user database or a numeric user ID. Either  
 80926 specifies a user ID which shall be given to each file named by one of the *file*  
 80927 operands. If a numeric *owner* operand exists in the user database as a user name,  
 80928 the user ID number associated with that user name shall be used as the user ID.  
 80929 Similarly, if the *group* portion of this operand is present, it shall be a group name  
 80930 from the group database or a numeric group ID. Either specifies a group ID which  
 80931 shall be given to each file. If a numeric group operand exists in the group database  
 80932 as a group name, the group ID number associated with that group name shall be  
 80933 used as the group ID.

80934 *file* A pathname of a file whose user ID is to be modified.

80935 **STDIN**

80936 Not used.

80937 **INPUT FILES**

80938 None.

80939 **ENVIRONMENT VARIABLES**

80940 The following environment variables shall affect the execution of *chown*:

80941 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 80942 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 80943 variables used to determine the values of locale categories.)

80944 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 80945 internationalization variables.

80946 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 80947 characters (for example, single-byte as opposed to multi-byte characters in  
 80948 arguments).

80949 *LC\_MESSAGES*

80950 Determine the locale that should be used to affect the format and contents of  
 80951 diagnostic messages written to standard error.

80952 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

80953 **ASYNCHRONOUS EVENTS**

80954 Default.

80955 **STDOUT**

80956 Not used.

80957 **STDERR**

80958 The standard error shall be used only for diagnostic messages.

80959 **OUTPUT FILES**

80960 None.

80961 **EXTENDED DESCRIPTION**

80962 None.

80963 **EXIT STATUS**

80964 The following exit values shall be returned:

80965 0 The utility executed successfully and all requested changes were made.

80966 &gt;0 An error occurred.

80967 **CONSEQUENCES OF ERRORS**

80968 Default.

80969 **APPLICATION USAGE**80970 Only the owner of a file or the user with appropriate privileges may change the owner or group  
80971 of a file.80972 Some implementations restrict the use of *chown* to a user with appropriate privileges.80973 **EXAMPLES**

80974 None.

80975 **RATIONALE**80976 The System V and BSD versions use different exit status codes. Some implementations used the  
80977 exit status as a count of the number of errors that occurred; this practice is unworkable since it  
80978 can overflow the range of valid exit status values. These are masked by specifying only 0 and >0  
80979 as exit values.80980 The functionality of *chown* is described substantially through references to functions in the  
80981 System Interfaces volume of POSIX.1-2008. In this way, there is no duplication of effort required  
80982 for describing the interactions of permissions, multiple groups, and so on.80983 The 4.3 BSD method of specifying both owner and group was included in this volume of  
80984 POSIX.1-2008 because:

- 80985 • There are cases where the desired end condition could not be achieved using the *chgrp* and  
80986 *chown* (that only changed the user ID) utilities. (If the current owner is not a member of the  
80987 desired group and the desired owner is not a member of the current group, the *chown*()  
80988 function could fail unless both owner and group are changed at the same time.)
- 80989 • Even if they could be changed independently, in cases where both are being changed, there  
80990 is a 100% performance penalty caused by being forced to invoke both utilities.

80991 The BSD syntax *user[.group]* was changed to *user[:group]* in this volume of POSIX.1-2008 because  
80992 the <period> is a valid character in login names (as specified by the Base Definitions volume of  
80993 POSIX.1-2008, login names consist of characters in the portable filename character set). The  
80994 <colon> character was chosen as the replacement for the <period> character because it would  
80995 never be allowed as a character in a user name or group name on historical implementations.

80996 The **-R** option is considered by some observers as an undesirable departure from the historical  
80997 UNIX system tools approach; since a tool, *find*, already exists to recurse over directories, there  
80998 seemed to be no good reason to require other tools to have to duplicate that functionality.  
80999 However, the **-R** option was deemed an important user convenience, is far more efficient than  
81000 forking a separate process for each element of the directory hierarchy, and is in widespread  
81001 historical use.

**chown**

Utilities

81002 **FUTURE DIRECTIONS**

81003 None.

81004 **SEE ALSO**81005 *chgrp, chmod*

81006 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

81007 XSH *chown()*81008 **CHANGE HISTORY**

81009 First released in Issue 2.

81010 **Issue 6**81011 New options **-h**, **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These options affect the processing of symbolic links.

81012 The normative text is reworded to avoid use of the term “must” for application requirements.

81013 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS section to “Default.”.

81014 The “otherwise, ...” text in item 3. of the DESCRIPTION is changed to “otherwise, the group ownership shall not be changed”.

81015 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/17 is applied, changing the SYNOPSIS to make it clear that **-h** and **-R** are optional.81020 **Issue 7**81021 SD5-XCU-ERN-9 is applied, removing the **-R** from the first line of the SYNOPSIS.

81022 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81023 The description of the **-h** and **-P** options is revised.

81024 **NAME**

81025 cksum — write file checksums and sizes

81026 **SYNOPSIS**81027 cksum [*file...*]81028 **DESCRIPTION**

81029 The *cksum* utility shall calculate and write to standard output a cyclic redundancy check (CRC)  
 81030 for each input file, and also write to standard output the number of octets in each file. The CRC  
 81031 used is based on the polynomial used for CRC error checking in the ISO/IEC 8802-3:1996  
 81032 standard (Ethernet).

81033 The encoding for the CRC checksum is defined by the generating polynomial:

$$81034 G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

81035 Mathematically, the CRC value corresponding to a given file shall be defined by the following  
 81036 procedure:

- 81037 1. The *n* bits to be evaluated are considered to be the coefficients of a mod 2 polynomial  
 81038  $M(x)$  of degree  $n-1$ . These *n* bits are the bits from the file, with the most significant bit  
 81039 being the most significant bit of the first octet of the file and the last bit being the least  
 81040 significant bit of the last octet, padded with zero bits (if necessary) to achieve an integral  
 81041 number of octets, followed by one or more octets representing the length of the file as a  
 81042 binary value, least significant octet first. The smallest number of octets capable of  
 81043 representing this integer shall be used.
- 81044 2.  $M(x)$  is multiplied by  $x^{32}$  (that is, shifted left 32 bits) and divided by  $G(x)$  using mod 2  
 81045 division, producing a remainder  $R(x)$  of degree  $\leq 31$ .
- 81046 3. The coefficients of  $R(x)$  are considered to be a 32-bit sequence.
- 81047 4. The bit sequence is complemented and the result is the CRC.

81048 **OPTIONS**

81049 None.

81050 **OPERANDS**

81051 The following operand shall be supported:

81052 *file* A pathname of a file to be checked. If no *file* operands are specified, the standard  
 81053 input shall be used.

81054 **STDIN**

81055 The standard input shall be used if no *file* operands are specified, and shall be used if a *file*  
 81056 operand is '-' and the implementation treats the '-' as meaning standard input. Otherwise,  
 81057 the standard input shall not be used. See the INPUT FILES section.

81058 **INPUT FILES**

81059 The input files can be any file type.

81060 **ENVIRONMENT VARIABLES**81061 The following environment variables shall affect the execution of *cksum*:

81062 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 81063 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 81064 variables used to determine the values of locale categories.)

81065 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 81066 internationalization variables.

**cksum**

Utilities

- 81067 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
81068 characters (for example, single-byte as opposed to multi-byte characters in  
81069 arguments).
- 81070 *LC\_MESSAGES*  
81071 Determine the locale that should be used to affect the format and contents of  
81072 diagnostic messages written to standard error.
- 81073 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 81074 **ASYNCHRONOUS EVENTS**  
81075 Default.
- 81076 **STDOUT**  
81077 For each file processed successfully, the *cksum* utility shall write in the following format:  
81078 "%u %d %s\n", <checksum>, <# of octets>, <pathname>  
81079 If no *file* operand was specified, the *pathname* and its leading <space> shall be omitted.
- 81080 **STDERR**  
81081 The standard error shall be used only for diagnostic messages.
- 81082 **OUTPUT FILES**  
81083 None.
- 81084 **EXTENDED DESCRIPTION**  
81085 None.
- 81086 **EXIT STATUS**  
81087 The following exit values shall be returned:  
81088 0 All files were processed successfully.  
81089 >0 An error occurred.
- 81090 **CONSEQUENCES OF ERRORS**  
81091 Default.
- 81092 **APPLICATION USAGE**  
81093 The *cksum* utility is typically used to quickly compare a suspect file against a trusted version of  
81094 the same, such as to ensure that files transmitted over noisy media arrive intact. However, this  
81095 comparison cannot be considered cryptographically secure. The chances of a damaged file  
81096 producing the same CRC as the original are small; deliberate deception is difficult, but probably  
81097 not impossible.
- 81098 Although input files to *cksum* can be any type, the results need not be what would be expected  
81099 on character special device files or on file types not described by the System Interfaces volume of  
81100 POSIX.1-2008. Since this volume of POSIX.1-2008 does not specify the block size used when  
81101 doing input, checksums of character special files need not process all of the data in those files.
- 81102 The algorithm is expressed in terms of a bitstream divided into octets. If a file is transmitted  
81103 between two systems and undergoes any data transformation (such as changing little-endian  
81104 byte ordering to big-endian), identical CRC values cannot be expected. Implementations  
81105 performing such transformations may extend *cksum* to handle such situations.
- 81106 **EXAMPLES**  
81107 None.

81108 **RATIONALE**

81109 The following C-language program can be used as a model to describe the algorithm. It assumes  
 81110 that a **char** is one octet. It also assumes that the entire file is available for one pass through the  
 81111 function. This was done for simplicity in demonstrating the algorithm, rather than as an  
 81112 implementation model.

81167      unsigned long memcrc(const unsigned char *b, size_t n)
81168      {
81169      /*  Input arguments:
81170      *   const char*   b == byte sequence to checksum
81171      *   size_t       n == length of sequence
81172      */

81173          register unsigned   i, c, s = 0;

81174          for (i = n; i > 0; --i) {
81175              c = (unsigned) (*b++);
81176              s = (s << 8) ^ crctab[(s >> 24) ^ c];
81177          }

81178          /* Extend with the length of the string. */
81179          while (n != 0) {
81180              c = n & 0377;
81181              n >>= 8;
81182              s = (s << 8) ^ crctab[(s >> 24) ^ c];
81183          }

81184          return ~s;
81185      }

```

81186 The historical practice of writing the number of “blocks” has been changed to writing the  
81187 number of octets, since the latter is not only more useful, but also since historical  
81188 implementations have not been consistent in defining what a “block” meant.

81189 The algorithm used was selected to increase the operational robustness of *cksum*. Neither the  
81190 System V nor BSD *sum* algorithm was selected. Since each of these was different and each was  
81191 the default behavior on those systems, no realistic compromise was available if either were  
81192 selected—some set of historical applications would break. Therefore, the name was changed to  
81193 *cksum*. Although the historical *sum* commands will probably continue to be provided for many  
81194 years, programs designed for portability across systems should use the new name.

81195 The algorithm selected is based on that used by the ISO/IEC 8802-3: 1996 standard (Ethernet) for  
81196 the frame check sequence field. The algorithm used does not match the technical definition of a  
81197 *checksum*; the term is used for historical reasons. The length of the file is included in the CRC  
81198 calculation because this parallels inclusion of a length field by Ethernet in its CRC, but also  
81199 because it guards against inadvertent collisions between files that begin with different series of  
81200 zero octets. The chance that two different files produce identical CRCs is much greater when  
81201 their lengths are not considered. Keeping the length and the checksum of the file itself separate  
81202 would yield a slightly more robust algorithm, but historical usage has always been that a single  
81203 number (the checksum as printed) represents the signature of the file. It was decided that  
81204 historical usage was the more important consideration.

81205 Early proposals contained modifications to the Ethernet algorithm that involved extracting table

81206 values whenever an intermediate result became zero. This was demonstrated to be less robust  
81207 than the current method and mathematically difficult to describe or justify.

81208 The calculation used is identical to that given in pseudo-code in the referenced Sarwate article.  
81209 The pseudo-code rendition is:

```
81210 X ← 0; Y ← 0;
81211 for i ← m - 1 step -1 until 0 do
81212     begin
81213         T ← X(1) ^ A[i];
81214         X(1) ← X(0); X(0) ← Y(1); Y(1) ← Y(0); Y(0) ← 0;
81215         comment: f[T] and f'[T] denote the T-th words in the
81216                 table f and f' ;
81217         X ← X ^ f[T]; Y ← Y ^ f'[T];
81218     end
```

81219 The pseudo-code is reproduced exactly as given; however, note that in the case of *cksum*, **A[i]**  
81220 represents a byte of the file, the words **X** and **Y** are treated as a single 32-bit value, and the tables  
81221 **f** and **f'** are a single table containing 32-bit values.

81222 The referenced Sarwate article also discusses generating the table.

81231 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**cmp**

Utilities

81232 **NAME**81233 `cmp` — compare two files81234 **SYNOPSIS**81235 `cmp [-l|-s] file1 file2`81236 **DESCRIPTION**

81237 The *cmp* utility shall compare two files. The *cmp* utility shall write no output if the files are the  
 81238 same. Under default options, if they differ, it shall write to standard output the byte and line  
 81239 number at which the first difference occurred. Bytes and lines shall be numbered beginning with  
 81240 1.

81241 **OPTIONS**81242 The *cmp* utility shall conform to XBD [Section 12.2](#) (on page 215).

81243 The following options shall be supported:

81244 **-l** (Lowercase ell.) Write the byte number (decimal) and the differing bytes (octal) for  
 81245 each difference.

81246 **-s** Write nothing for differing files; return exit status only.

81247 **OPERANDS**

81248 The following operands shall be supported:

81249 *file1* A pathname of the first file to be compared. If *file1* is '-', the standard input shall  
 81250 be used.

81251 *file2* A pathname of the second file to be compared. If *file2* is '-', the standard input  
 81252 shall be used.

81253 If both *file1* and *file2* refer to standard input or refer to the same FIFO special, block special, or  
 81254 character special file, the results are undefined.

81255 **STDIN**

81256 The standard input shall be used only if the *file1* or *file2* operand refers to standard input. See the  
 81257 INPUT FILES section.

81258 **INPUT FILES**

81259 The input files can be any file type.

81260 **ENVIRONMENT VARIABLES**81261 The following environment variables shall affect the execution of *cmp*:

81262 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 81263 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 81264 variables used to determine the values of locale categories.)

81265 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 81266 internationalization variables.

81267 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 81268 characters (for example, single-byte as opposed to multi-byte characters in  
 81269 arguments).

81270 **LC\_MESSAGES**

81271 Determine the locale that should be used to affect the format and contents of  
 81272 diagnostic messages written to standard error and informative messages written to  
 81273 standard output.

- 81274 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 81275 **ASYNCHRONOUS EVENTS**
- 81276 Default.
- 81277 **STDOUT**
- 81278 In the POSIX locale, results of the comparison shall be written to standard output. When no
- 81279 options are used, the format shall be:
- 81280 "%s %s differ: char %d, line %d\n", *file1*, *file2*,
- 81281 <*byte number*>, <*line number*>
- 81282 When the **-l** option is used, the format shall be:
- 81283 "%d %o %o\n", <*byte number*>, <*differing byte*>,
- 81284 <*differing byte*>
- 81285 for each byte that differs. The first <*differing byte*> number is from *file1* while the second is from
- 81286 *file2*. In both cases, <*byte number*> shall be relative to the beginning of the file, beginning with 1.
- 81287 No output shall be written to standard output when the **-s** option is used.
- 81288 **STDERR**
- 81289 The standard error shall be used only for diagnostic messages. If the **-l** option is used and *file1*
- 81290 and *file2* differ in length, or if the **-s** option is not used and *file1* and *file2* are identical for the
- 81291 entire length of the shorter file, in the POSIX locale the following diagnostic message shall be
- 81292 written:
- 81293 "cmp: EOF on %s%s\n", <*name of shorter file*>, <*additional info*>
- 81294 The <*additional info*> field shall either be null or a string that starts with a <blank> and contains
- 81295 no <newline> characters. Some implementations report on the number of lines in this case.
- 81296 **OUTPUT FILES**
- 81297 None.
- 81298 **EXTENDED DESCRIPTION**
- 81299 None.
- 81300 **EXIT STATUS**
- 81301 The following exit values shall be returned:
- 81302 0 The files are identical.
- 81303 1 The files are different; this includes the case where one file is identical to the first part of the
- 81304 other.
- 81305 >1 An error occurred.
- 81306 **CONSEQUENCES OF ERRORS**
- 81307 Default.

81308 **APPLICATION USAGE**

81309 Although input files to *cmp* can be any type, the results might not be what would be expected on  
 81310 character special device files or on file types not described by the System Interfaces volume of  
 81311 POSIX.1-2008. Since this volume of POSIX.1-2008 does not specify the block size used when  
 81312 doing input, comparisons of character special files need not compare all of the data in those files.

81313 For files which are not text files, line numbers simply reflect the presence of a <newline>  
 81314 without any implication that the file is organized into lines.

81315 **EXAMPLES**

81316 None.

81317 **RATIONALE**

81318 The global language in [Section 1.4](#) (on page 2288) indicates that using two mutually-exclusive  
 81319 options together produces unspecified results. Some System V implementations consider the  
 81320 option usage:

81321 `cmp -l -s ...`

81322 to be an error. They also treat:

81323 `cmp -s -l ...`

81324 as if no options were specified. Both of these behaviors are considered bugs, but are allowed.

81325 The word **char** in the standard output format comes from historical usage, even though it is  
 81326 actually a byte number. When *cmp* is supported in other locales, implementations are  
 81327 encouraged to use the word *byte* or its equivalent in another language. Users should not  
 81328 interpret this difference to indicate that the functionality of the utility changed between locales.

81329 Some implementations report on the number of lines in the identical-but-shorter file case. This is  
 81330 allowed by the inclusion of the <additional info> fields in the output format. The restriction on  
 81331 having a leading <blank> and no <newline> characters is to make parsing for the filename  
 81332 easier. It is recognized that some filenames containing white-space characters make parsing  
 81333 difficult anyway, but the restriction does aid programs used on systems where the names are  
 81334 predominantly well behaved.

81335 **FUTURE DIRECTIONS**

81336 None.

81337 **SEE ALSO**

81338 *comm*, *diff*

81341 First released in Issue 2.

81342 **Issue 7**

81343 SD5-XCU-ERN-96 is applied, updating the STDERR section.

81344 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81345 **NAME**

81346 comm — select or reject lines common to two files

81347 **SYNOPSIS**81348 comm [-123] *file1 file2*81349 **DESCRIPTION**81350 The *comm* utility shall read *file1* and *file2*, which should be ordered in the current collating  
81351 sequence, and produce three text columns as output: lines only in *file1*, lines only in *file2*, and  
81352 lines in both files.81353 If the lines in both files are not ordered according to the collating sequence of the current locale,  
81354 the results are unspecified.81355 **OPTIONS**81356 The *comm* utility shall conform to XBD Section 12.2 (on page 215).

81357 The following options shall be supported:

- 81358 -1 Suppress the output column of lines unique to *file1*.
- 81359 -2 Suppress the output column of lines unique to *file2*.
- 81360 -3 Suppress the output column of lines duplicated in *file1* and *file2*.

81361 **OPERANDS**

81362 The following operands shall be supported:

- 81363 *file1* A pathname of the first file to be compared. If *file1* is '-', the standard input shall  
81364 be used.
- 81365 *file2* A pathname of the second file to be compared. If *file2* is '-', the standard input  
81366 shall be used.

81367 If both *file1* and *file2* refer to standard input or to the same FIFO special, block special, or  
81368 character special file, the results are undefined.81369 **STDIN**81370 The standard input shall be used only if one of the *file1* or *file2* operands refers to standard input.  
81371 See the INPUT FILES section.81372 **INPUT FILES**

81373 The input files shall be text files.

81374 **ENVIRONMENT VARIABLES**81375 The following environment variables shall affect the execution of *comm*:81376 *LANG* Provide a default value for the internationalization variables that are unset or null.  
81377 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
81378 variables used to determine the values of locale categories.)81379 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
81380 internationalization variables.81381 *LC\_COLLATE*81382 Determine the locale for the collating sequence *comm* expects to have been used  
81383 when the input files were sorted.81384 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
81385 characters (for example, single-byte as opposed to multi-byte characters in  
81386 arguments and input files).

- 81387 *LC\_MESSAGES*
- 81388 Determine the locale that should be used to affect the format and contents of
- 81389 diagnostic messages written to standard error.
- 81390 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 81391 **ASYNCHRONOUS EVENTS**
- 81392 Default.
- 81393 **STDOUT**
- 81394 The *comm* utility shall produce output depending on the options selected. If the *-1*, *-2*, and *-3*
- 81395 options are all selected, *comm* shall write nothing to standard output.
- 81396 If the *-1* option is not selected, lines contained only in *file1* shall be written using the format:
- 81397 "%s\n", <line in file1>
- 81398 If the *-2* option is not selected, lines contained only in *file2* are written using the format:
- 81399 "%s%s\n", <lead>, <line in file2>
- 81400 where the string <lead> is as follows:
- 81401 <tab> The *-1* option is not selected.
- 81402 null string The *-1* option is selected.
- 81403 If the *-3* option is not selected, lines contained in both files shall be written using the format:
- 81404 "%s%s\n", <lead>, <line in both>
- 81405 where the string <lead> is as follows:
- 81406 <tab><tab> Neither the *-1* nor the *-2* option is selected.
- 81407 <tab> Exactly one of the *-1* and *-2* options is selected.
- 81408 null string Both the *-1* and *-2* options are selected.
- 81409 If the input files were ordered according to the collating sequence of the current locale, the lines
- 81410 written shall be in the collating sequence of the original lines.
- 81411 **STDERR**
- 81412 The standard error shall be used only for diagnostic messages.
- 81413 **OUTPUT FILES**
- 81414 None.
- 81415 **EXTENDED DESCRIPTION**
- 81416 None.
- 81417 **EXIT STATUS**
- 81418 The following exit values shall be returned:
- 81419 0 All input files were successfully output as specified.
- 81420 >0 An error occurred.
- 81421 **CONSEQUENCES OF ERRORS**
- 81422 Default.

81423 **APPLICATION USAGE**

81424 If the input files are not properly presorted, the output of *comm* might not be useful.

81425 **EXAMPLES**

81426 If a file named **xcu** contains a sorted list of the utilities in this volume of POSIX.1-2008, a file  
 81427 named **xpg3** contains a sorted list of the utilities specified in the X/Open Portability Guide, Issue  
 81428 3, and a file named **svid89** contains a sorted list of the utilities in the System V Interface  
 81429 Definition Third Edition:

81430 `comm -23 xcu xpg3 | comm -23 - svid89`

81431 would print a list of utilities in this volume of POSIX.1-2008 not specified by either of the other  
 81432 documents:

81433 `comm -12 xcu xpg3 | comm -12 - svid89`

81434 would print a list of utilities specified by all three documents, and:

81435 `comm -12 xpg3 svid89 | comm -23 - xcu`

81436 would print a list of utilities specified by both XPG3 and the SVID, but not specified in this  
 81437 volume of POSIX.1-2008.

81438 **RATIONALE**

81439 None.

81440 **FUTURE DIRECTIONS**

81441 None.

81444 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

81445 **CHANGE HISTORY**

81446 First released in Issue 2.

81447 **Issue 6**

81448 The normative text is reworded to avoid use of the term “must” for application requirements.

**command**

Utilities

81449 **NAME**81450 `command` — execute a simple command81451 **SYNOPSIS**81452 `command [-p] command_name [argument...]`81453 `command [-p] [-v|-V] command_name`81454 **DESCRIPTION**81455 The *command* utility shall cause the shell to treat the arguments as a simple command,  
81456 suppressing the shell function lookup that is described in Section 2.9.1.1 (on page 2317), item 1b.81457 If the *command\_name* is the same as the name of one of the special built-in utilities, the special  
81458 properties in the enumerated list at the beginning of Section 2.14 (on page 2334) shall not occur.  
81459 In every other respect, if *command\_name* is not the name of a function, the effect of *command*  
81460 (with no options) shall be the same as omitting *command*.81461 When the `-v` or `-V` option is used, the *command* utility shall provide information concerning  
81462 how a command name is interpreted by the shell.81463 **OPTIONS**81464 The *command* utility shall conform to XBD Section 12.2 (on page 215).

81465 The following options shall be supported:

81466 `-p` Perform the command search using a default value for *PATH* that is guaranteed to  
81467 find all of the standard utilities.81468 `-v` Write a string to standard output that indicates the pathname or command that  
81469 will be used by the shell, in the current shell execution environment (see Section  
81470 2.12, on page 2331), to invoke *command\_name*, but do not invoke *command\_name*.81471 • Utilities, regular built-in utilities, *command\_names* including a `<slash>`  
81472 character, and any implementation-defined functions that are found using  
81473 the *PATH* variable (as described in Section 2.9.1.1, on page 2317), shall be  
81474 written as absolute pathnames.81475 • Shell functions, special built-in utilities, regular built-in utilities not  
81476 associated with a *PATH* search, and shell reserved words shall be written as  
81477 just their names.81478 • An alias shall be written as a command line that represents its alias  
81479 definition.81480 • Otherwise, no output shall be written and the exit status shall reflect that the  
81481 name was not found.81482 `-V` Write a string to standard output that indicates how the name given in the  
81483 *command\_name* operand will be interpreted by the shell, in the current shell  
81484 execution environment (see Section 2.12, on page 2331), but do not invoke  
81485 *command\_name*. Although the format of this string is unspecified, it shall indicate  
81486 in which of the following categories *command\_name* falls and shall include the  
81487 information stated:81488 • Utilities, regular built-in utilities, and any implementation-defined functions  
81489 that are found using the *PATH* variable (as described in Section 2.9.1.1, on  
81490 page 2317), shall be identified as such and include the absolute pathname in  
81491 the string.

- 81492 • Other shell functions shall be identified as functions.
- 81493 • Aliases shall be identified as aliases and their definitions included in the
- 81494 string.
- 81495 • Special built-in utilities shall be identified as special built-in utilities.
- 81496 • Regular built-in utilities not associated with a *PATH* search shall be identified
- 81497 as regular built-in utilities. (The term “regular” need not be used.)
- 81498 • Shell reserved words shall be identified as reserved words.

**81499 OPERANDS**

81500 The following operands shall be supported:

81501 *argument* One of the strings treated as an argument to *command\_name*.

81502 *command\_name*

81503 The name of a utility or a special built-in utility.

**81504 STDIN**

81505 Not used.

**81506 INPUT FILES**

81507 None.

**81508 ENVIRONMENT VARIABLES**

81509 The following environment variables shall affect the execution of *command*:

81510 *LANG* Provide a default value for the internationalization variables that are unset or null.  
81511 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
81512 variables used to determine the values of locale categories.)

81513 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
81514 internationalization variables.

81515 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
81516 characters (for example, single-byte as opposed to multi-byte characters in  
81517 arguments).

81518 *LC\_MESSAGES*

81519 Determine the locale that should be used to affect the format and contents of  
81520 diagnostic messages written to standard error and informative messages written to  
81521 standard output.

81522 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

81523 *PATH* Determine the search path used during the command search described in Section  
81524 2.9.1.1 (on page 2317), except as described under the *-p* option.

**81525 ASYNCHRONOUS EVENTS**

81526 Default.

**81527 STDOUT**

81528 When the *-v* option is specified, standard output shall be formatted as:

81529 "%s\n", *<pathname or command>*

81530 When the *-V* option is specified, standard output shall be formatted as:

81531 "%s\n", *<unspecified>*

**command**

Utilities

81532 **STDERR**

81533 The standard error shall be used only for diagnostic messages.

81534 **OUTPUT FILES**

81535 None.

81536 **EXTENDED DESCRIPTION**

81537 None.

81538 **EXIT STATUS**81539 When the `-v` or `-V` options are specified, the following exit values shall be returned:

81540 0 Successful completion.

81541 >0 The *command\_name* could not be found or an error occurred.

81542 Otherwise, the following exit values shall be returned:

81543 126 The utility specified by *command\_name* was found but could not be invoked.81544 127 An error occurred in the *command* utility or the utility specified by *command\_name* could not be found.81546 Otherwise, the exit status of *command* shall be that of the simple command specified by the arguments to *command*.81548 **CONSEQUENCES OF ERRORS**

81549 Default.

81550 **APPLICATION USAGE**81551 The order for command search allows functions to override regular built-ins and path searches.  
81552 This utility is necessary to allow functions that have the same name as a utility to call the utility  
81553 (instead of a recursive call to the function).81554 The system default path is available using *getconf*; however, since *getconf* may need to have the  
81555 *PATH* set up before it can be called itself, the following can be used:81556 `command -p getconf PATH`81557 There are some advantages to suppressing the special characteristics of special built-ins on  
81558 occasion. For example:81559 `command exec > unwritable-file`81560 does not cause a non-interactive script to abort, so that the output status can be checked by the  
81561 script.81562 The *command*, *env*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if an  
81563 error occurs so that applications can distinguish “failure to find a utility” from “invoked utility  
81564 exited with an error indication”. The value 127 was chosen because it is not commonly used for  
81565 other meanings; most utilities use small values for “normal error conditions” and the values  
81566 above 128 can be confused with termination due to receipt of a signal. The value 126 was chosen  
81567 in a similar manner to indicate that the utility could be found, but not invoked. Some scripts  
81568 produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
81569 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
81570 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
81571 any other reason.81572 Since the `-v` and `-V` options of *command* produce output in relation to the current shell execution  
81573 environment, *command* is generally provided as a shell regular built-in. If it is called in a subshell  
81574 or separate utility execution environment, such as one of the following:

81575 (PATH=foo command -v)  
81576 nohup command -v

81577 it does not necessarily produce correct results. For example, when called with *nohup* or an *exec*  
81578 function, in a separate utility execution environment, most implementations are not able to  
81579 identify aliases, functions, or special built-ins.

81580 Two types of regular built-ins could be encountered on a system and these are described  
81581 separately by *command*. The description of command search in Section 2.9.1.1 (on page 2317)  
81582 allows for a standard utility to be implemented as a regular built-in as long as it is found in the  
81583 appropriate place in a *PATH* search. So, for example, *command -v true* might yield */bin/true* or  
81584 some similar pathname. Other implementation-defined utilities that are not defined by this  
81585 volume of POSIX.1-2008 might exist only as built-ins and have no pathname associated with  
81586 them. These produce output identified as (regular) built-ins. Applications encountering these are  
81587 not able to count on *execing* them, using them with *nohup*, overriding them with a different  
81588 *PATH*, and so on.

#### 81589 EXAMPLES

- 81590 1. Make a version of *cd* that always prints out the new working directory exactly once:

```
81591 cd() {
81592     command cd "$@" >/dev/null
81593     pwd
81594 }
```

- 81595 2. Start off a “secure shell script” in which the script avoids being spoofed by its parent:

```
81596 IFS='
81597 '
81598 # The preceding value should be <space><tab><newline>.
81599 # Set IFS to its default value.

81600 \unalias -a
81601 # Unset all possible aliases.
81602 # Note that unalias is escaped to prevent an alias
81603 # being used for unalias.

81604 unset -f command
81605 # Ensure command is not a user function.

81606 PATH="$$(command -p getconf PATH):$PATH"
81607 # Put on a reliable PATH prefix.

81608 # ...
```

81609 At this point, given correct permissions on the directories called by *PATH*, the script has  
81610 the ability to ensure that any utility it calls is the intended one. It is being very cautious  
81611 because it assumes that implementation extensions may be present that would allow user  
81612 functions to exist when it is invoked; this capability is not specified by this volume of  
81613 POSIX.1-2008, but it is not prohibited as an extension. For example, the *ENV* variable  
81614 precedes the invocation of the script with a user start-up script. Such a script could define  
81615 functions to spoof the application.

#### 81616 RATIONALE

81617 Since *command* is a regular built-in utility it is always found prior to the *PATH* search.

81618 There is nothing in the description of *command* that implies the command line is parsed any  
81619 differently from that of any other simple command. For example:

81620 `command a | b ; c`

81621 is not parsed in any special way that causes `'|'` or  `';'`  to be treated other than a pipe operator  
81622 or `<semicolon>` or that prevents function lookup on `b` or `c`.

81623 The *command* utility is somewhat similar to the Eighth Edition shell *builtin* command, but since  
81624 *command* also goes to the file system to search for utilities, the name *builtin* would not be  
81625 intuitive.

81626 The *command* utility is most likely to be provided as a regular built-in. It is not listed as a special  
81627 built-in for the following reasons:

- 81628 • The removal of exportable functions made the special precedence of a special built-in  
81629 unnecessary.
- 81630 • A special built-in has special properties (see [Section 2.14](#), on page 2334) that were  
81631 inappropriate for invoking other utilities. For example, two commands such as:

81632 `date > unwritable-file`

81633 `command date > unwritable-file`

81634 would have entirely different results; in a non-interactive script, the former would  
81635 continue to execute the next command, the latter would abort. Introducing this semantic  
81636 difference along with suppressing functions was seen to be non-intuitive.

81637 The `-p` option is present because it is useful to be able to ensure a safe path search that finds all  
81638 the standard utilities. This search might not be identical to the one that occurs through one of the  
81639 *exec* functions (as defined in the System Interfaces volume of POSIX.1-2008) when *PATH* is unset.  
81640 At the very least, this feature is required to allow the script to access the correct version of *getconf*  
81641 so that the value of the default path can be accurately retrieved.

81642 The *command* `-v` and `-V` options were added to satisfy requirements from users that are  
81643 currently accomplished by three different historical utilities: *type* in the System V shell, *whence* in  
81644 the KornShell, and *which* in the C shell. Since there is no historical agreement on how and what  
81645 to accomplish here, the POSIX *command* utility was enhanced and the historical utilities were left  
81646 unmodified. The C shell *which* merely conducts a path search. The KornShell *whence* is more  
81647 elaborate—in addition to the categories required by POSIX, it also reports on tracked aliases,  
81648 exported aliases, and undefined functions.

81649 The output format of `-V` was left mostly unspecified because human users are its only audience.  
81650 Applications should not be written to care about this information; they can use the output of `-v`  
81651 to differentiate between various types of commands, but the additional information that may be  
81652 emitted by the more verbose `-V` is not needed and should not be arbitrarily constrained in its  
81653 verbosity or localization for application parsing reasons.

#### 81654 FUTURE DIRECTIONS

81655 None.

81660 **CHANGE HISTORY**

81661 First released in Issue 4.

81662 **Issue 7**

81663 Austin Group Interpretation 1003.1-2001 #196 is applied, changing the SYNOPSIS to allow `-p` to  
81664 be used with `-v` (or `-V`).

81665 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81666 The *command* utility is moved from the User Portability Utilities option to the Base. User  
81667 Portability Utilities is now an option for interactive utilities.

81668 The APPLICATION USAGE and EXAMPLES are revised to replace the non-standard  
81669 `getconf_CS_PATH` with `getconf PATH`.

**compress**

Utilities

81670 **NAME**81671 `compress` — compress data81672 **SYNOPSIS**81673 XSI `compress [-fv] [-b bits] [file...]`81674 `compress [-cfv] [-b bits] [file]`81675 **DESCRIPTION**81676 The *compress* utility shall attempt to reduce the size of the named files by using adaptive Lempel-  
81677 Ziv coding algorithm.81678 **Note:** Lempel-Ziv is US Patent 4464650, issued to William Eastman, Abraham Lempel, Jacob Ziv,  
81679 Martin Cohn on August 7th, 1984, and assigned to Sperry Corporation.81680 Lempel-Ziv-Welch compression is covered by US Patent 4558302, issued to Terry A. Welch on  
81681 December 10th, 1985, and assigned to Sperry Corporation.81682 On systems not supporting adaptive Lempel-Ziv coding algorithm, the input files shall not be  
81683 changed and an error value greater than two shall be returned. Except when the output is to the  
81684 standard output, each file shall be replaced by one with the extension *.Z*. If the invoking process  
81685 has appropriate privileges, the ownership, modes, access time, and modification time of the  
81686 original file are preserved. If appending the *.Z* to the filename would make the name exceed  
81687 {NAME\_MAX} bytes, the command shall fail. If no files are specified, the standard input shall be  
81688 compressed to the standard output.81689 **OPTIONS**81690 The *compress* utility shall conform to XBD Section 12.2 (on page 215).

81691 The following options shall be supported:

81692 **-b** *bits* Specify the maximum number of bits to use in a code. For a conforming  
81693 application, the *bits* argument shall be:81694  $9 \leq bits \leq 14$ 81695 The implementation may allow *bits* values of greater than 14. The default is 14, 15,  
81696 or 16.81697 **-c** Cause *compress* to write to the standard output; the input file is not changed, and  
81698 no *.Z* files are created.81699 **-f** Force compression of *file*, even if it does not actually reduce the size of the file, or if  
81700 the corresponding *file.Z* file already exists. If the **-f** option is not given, and the  
81701 process is not running in the background, the user is prompted as to whether an  
81702 existing *file.Z* file should be overwritten. If the response is affirmative, the existing  
81703 file will be overwritten.81704 **-v** Write the percentage reduction of each file to standard error.81705 **OPERANDS**

81706 The following operand shall be supported:

81707 *file* A pathname of a file to be compressed.81708 **STDIN**81709 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*.

81710 **INPUT FILES**

81711 If *file* operands are specified, the input files contain the data to be compressed.

81712 **ENVIRONMENT VARIABLES**

81713 The following environment variables shall affect the execution of *compress*:

81714 *LANG* Provide a default value for the internationalization variables that are unset or null.  
81715 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
81716 variables used to determine the values of locale categories.)

81717 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
81718 internationalization variables.

81719 *LC\_COLLATE*

81720 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
81721 character collating elements used in the extended regular expression defined for  
81722 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

81723 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
81724 characters (for example, single-byte as opposed to multi-byte characters in  
81725 arguments), the behavior of character classes used in the extended regular  
81726 expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

81727 *LC\_MESSAGES*

81728 Determine the locale used to process affirmative responses, and the locale used to  
81729 affect the format and contents of diagnostic messages, prompts, and the output  
81730 from the **-v** option written to standard error.

81731 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

81732 **ASYNCHRONOUS EVENTS**

81733 Default.

81734 **STDOUT**

81735 If no *file* operands are specified, or if a *file* operand is '-', or if the **-c** option is specified, the  
81736 standard output contains the compressed output.

81737 **STDERR**

81738 The standard error shall be used only for diagnostic and prompt messages and the output from  
81739 **-v**.

81740 **OUTPUT FILES**

81741 The output files shall contain the compressed output. The format of compressed files is  
81742 unspecified and interchange of such files between implementations (including access via  
81743 unspecified file sharing mechanisms) is not required by POSIX.1-2008.

81744 **EXTENDED DESCRIPTION**

81745 None.

81746 **EXIT STATUS**

81747 The following exit values shall be returned:

81748 0 Successful completion.

81749 1 An error occurred.

81750 2 One or more files were not compressed because they would have increased in size (and the  
81751 **-f** option was not specified).

**compress**

Utilities

81752 >2 An error occurred.

81753 **CONSEQUENCES OF ERRORS**

81754 The input file shall remain unmodified.

81755 **APPLICATION USAGE**

81756 The amount of compression obtained depends on the size of the input, the number of *bits* per  
81757 code, and the distribution of common substrings. Typically, text such as source code or English is  
81758 reduced by 50-60%. Compression is generally much better than that achieved by Huffman  
81759 coding or adaptive Huffman coding (*compact*), and takes less time to compute.

81760 Although *compress* strictly follows the default actions upon receipt of a signal or when an error  
81761 occurs, some unexpected results may occur. In some implementations it is likely that a partially  
81762 compressed file is left in place, alongside its uncompressed input file. Since the general  
81763 operation of *compress* is to delete the uncompressed file only after the *.Z* file has been  
81764 successfully filled, an application should always carefully check the exit status of *compress* before  
81765 arbitrarily deleting files that have like-named neighbors with *.Z* suffixes.

81766 The limit of 14 on the *bits* option-argument is to achieve portability to all systems (within the  
81767 restrictions imposed by the lack of an explicit published file format). Some implementations  
81768 based on 16-bit architectures cannot support 15 or 16-bit uncompression.

81769 **EXAMPLES**

81770 None.

81771 **RATIONALE**

81772 None.

81773 **FUTURE DIRECTIONS**

81774 None.

81778 **CHANGE HISTORY**

81779 First released in Issue 4

81780 **Issue 6**

81781 The normative text is reworded to avoid use of the term “must” for application requirements.

81782 An error case is added for systems not supporting adaptive Lempel-Ziv coding.

81783 **Issue 7**

81784 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81785 Austin Group Interpretation 1003.1-2001 #125 is applied, revising the ENVIRONMENT  
81786 VARIABLES section.

81787 **NAME**

81788 cp — copy files

81789 **SYNOPSIS**81790 cp [-PfiP] *source\_file target\_file*81791 cp [-PfiP] *source\_file... target*81792 cp -R [-H|-L|-P] [-fiP] *source\_file... target*81793 **DESCRIPTION**

81794 The first synopsis form is denoted by two operands, neither of which are existing files of type  
 81795 directory. The *cp* utility shall copy the contents of *source\_file* (or, if *source\_file* is a file of type  
 81796 symbolic link, the contents of the file referenced by *source\_file*) to the destination path named by  
 81797 *target\_file*.

81798 The second synopsis form is denoted by two or more operands where the **-R** option is not  
 81799 specified and the first synopsis form is not applicable. It shall be an error if any *source\_file* is a file  
 81800 of type directory, if *target* does not exist, or if *target* does not name a directory. The *cp* utility shall  
 81801 copy the contents of each *source\_file* (or, if *source\_file* is a file of type symbolic link, the contents of  
 81802 the file referenced by *source\_file*) to the destination path named by the concatenation of *target*, a  
 81803 single <slash> character if *target* did not end in a <slash>, and the last component of *source\_file*.

81804 The third synopsis form is denoted by two or more operands where the **-R** option is specified.  
 81805 The *cp* utility shall copy each file in the file hierarchy rooted in each *source\_file* to a destination  
 81806 path named as follows:

- 81807 • If *target* exists and names an existing directory, the name of the corresponding destination  
 81808 path for each file in the file hierarchy shall be the concatenation of *target*, a single <slash>  
 81809 character if *target* did not end in a <slash>, and the pathname of the file relative to the  
 81810 directory containing *source\_file*.
- 81811 • If *target* does not exist and two operands are specified, the name of the corresponding  
 81812 destination path for *source\_file* shall be *target*; the name of the corresponding destination  
 81813 path for all other files in the file hierarchy shall be the concatenation of *target*, a <slash>  
 81814 character, and the pathname of the file relative to *source\_file*.

81815 It shall be an error if *target* does not exist and more than two operands are specified, or if *target*  
 81816 exists and does not name a directory.

81817 In the following description, the term *dest\_file* refers to the file named by the destination path.  
 81818 The term *source\_file* refers to the file that is being copied, whether specified as an operand or a  
 81819 file in a file hierarchy rooted in a *source\_file* operand. If *source\_file* is a file of type symbolic link:

- 81820 • If the **-R** option was not specified, *cp* shall take actions based on the type and contents of  
 81821 the file referenced by the symbolic link, and not by the symbolic link itself, unless the **-P**  
 81822 option was specified.
- 81823 • If the **-R** option was specified:
  - 81824 — If none of the options **-H**, **-L**, nor **-P** were specified, it is unspecified which of **-H**,  
 81825 **-L**, or **-P** will be used as a default.
  - 81826 — If the **-H** option was specified, *cp* shall take actions based on the type and contents of  
 81827 the file referenced by any symbolic link specified as a *source\_file* operand.
  - 81828 — If the **-L** option was specified, *cp* shall take actions based on the type and contents of  
 81829 the file referenced by any symbolic link specified as a *source\_file* operand or any  
 81830 symbolic links encountered during traversal of a file hierarchy.

81831 — If the `-P` option was specified, `cp` shall copy any symbolic link specified as a  
 81832 `source_file` operand and any symbolic links encountered during traversal of a file  
 81833 hierarchy, and shall not follow any symbolic links.

81834 For each `source_file`, the following steps shall be taken:

- 81835 1. If `source_file` references the same file as `dest_file`, `cp` may write a diagnostic message to  
 81836 standard error; it shall do nothing more with `source_file` and shall go on to any remaining  
 81837 files.
- 81838 2. If `source_file` is of type directory, the following steps shall be taken:
  - 81839 a. If the `-R` option was not specified, `cp` shall write a diagnostic message to standard  
 81840 error, do nothing more with `source_file`, and go on to any remaining files.
  - 81841 b. If `source_file` was not specified as an operand and `source_file` is dot or dot-dot, `cp`  
 81842 shall do nothing more with `source_file` and go on to any remaining files.
  - 81843 c. If `dest_file` exists and it is a file type not specified by the System Interfaces volume  
 81844 of POSIX.1-2008, the behavior is implementation-defined.
  - 81845 d. If `dest_file` exists and it is not of type directory, `cp` shall write a diagnostic message  
 81846 to standard error, do nothing more with `source_file` or any files below `source_file` in  
 81847 the file hierarchy, and go on to any remaining files.
  - 81848 e. If the directory `dest_file` does not exist, it shall be created with file permission bits  
 81849 set to the same value as those of `source_file`, modified by the file creation mask of  
 81850 the user if the `-p` option was not specified, and then bitwise-inclusively OR'ed  
 81851 with `S_IRWXU`. If `dest_file` cannot be created, `cp` shall write a diagnostic message to  
 81852 standard error, do nothing more with `source_file`, and go on to any remaining files.  
 81853 It is unspecified if `cp` attempts to copy files in the file hierarchy rooted in `source_file`.
  - 81854 f. The files in the directory `source_file` shall be copied to the directory `dest_file`, taking  
 81855 the four steps (1 to 4) listed here with the files as `source_files`.
  - 81856 g. If `dest_file` was created, its file permission bits shall be changed (if necessary) to be  
 81857 the same as those of `source_file`, modified by the file creation mask of the user if the  
 81858 `-p` option was not specified.
  - 81859 h. The `cp` utility shall do nothing more with `source_file` and go on to any remaining  
 81860 files.
- 81861 3. If `source_file` is of type regular file, the following steps shall be taken:
  - 81862 a. The behavior is unspecified if `dest_file` exists and was written by a previous step.  
 81863 Otherwise, if `dest_file` exists, the following steps shall be taken:
    - 81864 i. If the `-i` option is in effect, the `cp` utility shall write a prompt to the standard  
 81865 error and read a line from the standard input. If the response is not  
 81866 affirmative, `cp` shall do nothing more with `source_file` and go on to any  
 81867 remaining files.
    - 81868 ii. A file descriptor for `dest_file` shall be obtained by performing actions  
 81869 equivalent to the `open()` function defined in the System Interfaces volume of  
 81870 POSIX.1-2008 called using `dest_file` as the `path` argument, and the bitwise-  
 81871 inclusive OR of `O_WRONLY` and `O_TRUNC` as the `oflag` argument.
    - 81872 iii. If the attempt to obtain a file descriptor fails and the `-f` option is in effect, `cp`  
 81873 shall attempt to remove the file by performing actions equivalent to the  
 81874 `unlink()` function defined in the System Interfaces volume of POSIX.1-2008

- 81875 called using *dest\_file* as the *path* argument. If this attempt succeeds, *cp* shall  
81876 continue with step 3b.
- 81877 b. If *dest\_file* does not exist, a file descriptor shall be obtained by performing actions  
81878 equivalent to the *open()* function defined in the System Interfaces volume of  
81879 POSIX.1-2008 called using *dest\_file* as the *path* argument, and the bitwise-inclusive  
81880 OR of *O\_WRONLY* and *O\_CREAT* as the *oflag* argument. The file permission bits  
81881 of *source\_file* shall be the *mode* argument.
- 81882 c. If the attempt to obtain a file descriptor fails, *cp* shall write a diagnostic message to  
81883 standard error, do nothing more with *source\_file*, and go on to any remaining files.
- 81884 d. The contents of *source\_file* shall be written to the file descriptor. Any write errors  
81885 shall cause *cp* to write a diagnostic message to standard error and continue to step  
81886 3e.
- 81887 e. The file descriptor shall be closed.
- 81888 f. The *cp* utility shall do nothing more with *source\_file*. If a write error occurred in  
81889 step 3d, it is unspecified if *cp* continues with any remaining files. If no write error  
81890 occurred in step 3d, *cp* shall go on to any remaining files.
- 81891 4. Otherwise, the **-R** option was specified, and the following steps shall be taken:
- 81892 a. The *dest\_file* shall be created with the same file type as *source\_file*.
- 81893 b. If *source\_file* is a file of type FIFO, the file permission bits shall be the same as those  
81894 of *source\_file*, modified by the file creation mask of the user if the **-p** option was not  
81895 specified. Otherwise, the permissions, owner ID, and group ID of *dest\_file* are  
81896 implementation-defined.
- 81897 If this creation fails for any reason, *cp* shall write a diagnostic message to standard  
81898 error, do nothing more with *source\_file*, and go on to any remaining files.
- 81899 c. If *source\_file* is a file of type symbolic link, and the options require the symbolic link  
81900 itself to be acted upon, the pathname contained in *dest\_file* shall be the same as the  
81901 pathname contained in *source\_file*.
- 81902 If this fails for any reason, *cp* shall write a diagnostic message to standard error, do  
81903 nothing more with *source\_file*, and go on to any remaining files.
- 81904 If the implementation provides additional or alternate access control mechanisms (see XBD  
81905 [Section 4.4](#), on page 108), their effect on copies of files is implementation-defined.

**OPTIONS**

- 81906 The *cp* utility shall conform to XBD [Section 12.2](#) (on page 215).
- 81907 The following options shall be supported:
- 81908
- 81909 **-f** If a file descriptor for a destination file cannot be obtained, as described in step  
81910 3.a.ii., attempt to unlink the destination file and proceed.
- 81911 **-H** Take actions based on the type and contents of the file referenced by any symbolic  
81912 link specified as a *source\_file* operand.
- 81913 **-i** Write a prompt to standard error before copying to any existing non-directory  
81914 destination file. If the response from the standard input is affirmative, the copy  
81915 shall be attempted; otherwise, it shall not.

|       |                              |                                                                                                                                                                                                                                      |
|-------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 81916 | -L                           | Take actions based on the type and contents of the file referenced by any symbolic link specified as a <i>source_file</i> operand or any symbolic links encountered during traversal of a file hierarchy.                            |
| 81917 |                              |                                                                                                                                                                                                                                      |
| 81918 |                              |                                                                                                                                                                                                                                      |
| 81919 | -P                           | Take actions on any symbolic link specified as a <i>source_file</i> operand or any symbolic link encountered during traversal of a file hierarchy.                                                                                   |
| 81920 |                              |                                                                                                                                                                                                                                      |
| 81921 | -p                           | Duplicate the following characteristics of each source file in the corresponding destination file:                                                                                                                                   |
| 81922 |                              |                                                                                                                                                                                                                                      |
| 81923 |                              | 1. The time of last data modification and time of last access. If this duplication fails for any reason, <i>cp</i> shall write a diagnostic message to standard error.                                                               |
| 81924 |                              |                                                                                                                                                                                                                                      |
| 81925 |                              | 2. The user ID and group ID. If this duplication fails for any reason, it is unspecified whether <i>cp</i> writes a diagnostic message to standard error.                                                                            |
| 81926 |                              |                                                                                                                                                                                                                                      |
| 81927 |                              | 3. The file permission bits and the S_ISUID and S_ISGID bits. Other, implementation-defined, bits may be duplicated as well. If this duplication fails for any reason, <i>cp</i> shall write a diagnostic message to standard error. |
| 81928 |                              |                                                                                                                                                                                                                                      |
| 81929 |                              |                                                                                                                                                                                                                                      |
| 81930 |                              | If the user ID or the group ID cannot be duplicated, the file permission bits S_ISUID and S_ISGID shall be cleared. If these bits are present in the source file but                                                                 |
| 81931 |                              | are not duplicated in the destination file, it is unspecified whether <i>cp</i> writes a                                                                                                                                             |
| 81932 |                              | diagnostic message to standard error.                                                                                                                                                                                                |
| 81933 |                              |                                                                                                                                                                                                                                      |
| 81934 |                              | The order in which the preceding characteristics are duplicated is unspecified. The                                                                                                                                                  |
| 81935 |                              | <i>dest_file</i> shall not be deleted if these characteristics cannot be preserved.                                                                                                                                                  |
| 81936 | -R                           | Copy file hierarchies.                                                                                                                                                                                                               |
| 81937 |                              | Specifying more than one of the mutually-exclusive options -H, -L, and -P shall not be                                                                                                                                               |
| 81938 |                              | considered an error. The last option specified shall determine the behavior of the utility.                                                                                                                                          |

| 81981 | <b>OUTPUT FILES</b>           |                                                                                                                                                                                                                                                                                                                                                          |
| 81982 |                               | The output files may be of any type.                                                                                                                                                                                                                                                                                                                     |
| 81983 | <b>EXTENDED DESCRIPTION</b>   |                                                                                                                                                                                                                                                                                                                                                          |
| 81984 |                               | None.                                                                                                                                                                                                                                                                                                                                                    |
| 81985 | <b>EXIT STATUS</b>            |                                                                                                                                                                                                                                                                                                                                                          |
| 81986 |                               | The following exit values shall be returned:                                                                                                                                                                                                                                                                                                             |
| 81987 |                               | 0 All files were copied successfully.                                                                                                                                                                                                                                                                                                                    |
| 81988 |                               | >0 An error occurred.                                                                                                                                                                                                                                                                                                                                    |
| 81989 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                                                                                                                                                                                                                          |
| 81990 |                               | If <b>cp</b> is prematurely terminated by a signal or error, files or file hierarchies may be only partially copied and files and directories may have incorrect permissions or access and modification times.                                                                                                                                           |
| 81991 |                               |                                                                                                                                                                                                                                                                                                                                                          |
| 81992 |                               |                                                                                                                                                                                                                                                                                                                                                          |

81993 **APPLICATION USAGE**

81994 The set-user-ID and set-group-ID bits are explicitly cleared when files are created. This is to  
 81995 prevent users from creating programs that are set-user-ID or set-group-ID to them when copying  
 81996 files or to make set-user-ID or set-group-ID files accessible to new groups of users. For example,  
 81997 if a file is set-user-ID and the copy has a different group ID than the source, a new group of users  
 81998 has execute permission to a set-user-ID program than did previously. In particular, this is a  
 81999 problem for superusers copying users' trees.

82000 **EXAMPLES**

82001 None.

82002 **RATIONALE**

82003 The `-i` option exists on BSD systems, giving applications and users a way to avoid accidentally  
 82004 removing files when copying. Although the 4.3 BSD version does not prompt if the standard  
 82005 input is not a terminal, the standard developers decided that use of `-i` is a request for  
 82006 interaction, so when the destination path exists, the utility takes instructions from whatever  
 82007 responds on standard input.

82008 The exact format of the interactive prompts is unspecified. Only the general nature of the  
 82009 contents of prompts are specified because implementations may desire more descriptive  
 82010 prompts than those used on historical implementations. Therefore, an application using the `-i`  
 82011 option relies on the system to provide the most suitable dialog directly with the user, based on  
 82012 the behavior specified.

82013 The `-p` option is historical practice on BSD systems, duplicating the time of last data  
 82014 modification and time of last access. This volume of POSIX.1-2008 extends it to preserve the user  
 82015 and group IDs, as well as the file permissions. This requirement has obvious problems in that  
 82016 the directories are almost certainly modified after being copied. This volume of POSIX.1-2008  
 82017 requires that the modification times be preserved. The statement that the order in which the  
 82018 characteristics are duplicated is unspecified is to permit implementations to provide the  
 82019 maximum amount of security for the user. Implementations should take into account the  
 82020 obvious security issues involved in setting the owner, group, and mode in the wrong order or  
 82021 creating files with an owner, group, or mode different from the final value.

82022 It is unspecified whether `cp` writes diagnostic messages when the user and group IDs cannot be  
 82023 set due to the widespread practice of users using `-p` to duplicate some portion of the file  
 82024 characteristics, indifferent to the duplication of others. Historic implementations only write  
 82025 diagnostic messages on errors other than [EPERM].

82026 Earlier versions of this standard included support for the `-r` option to copy file hierarchies. The  
 82027 `-r` option is historical practice on BSD and BSD-derived systems. This option is no longer  
 82028 specified by POSIX.1-2008 but may be present in some implementations. The `-R` option was  
 82029 added as a close synonym to the `-r` option, selected for consistency with all other options in this  
 82030 volume of POSIX.1-2008 that do recursive directory descent.

82031 The difference between `-R` and the removed `-r` option is in the treatment by `cp` of file types other  
 82032 than regular and directory. It was implementation-defined how the `-` option treated special files  
 82033 to allow both historical implementations and those that chose to support `-r` with the same  
 82034 abilities as `-R` defined by this volume of POSIX.1-2008. The original `-r` flag, for historic reasons,  
 82035 did not handle special files any differently from regular files, but always read the file and copied  
 82036 its contents. This had obvious problems in the presence of special file types; for example,  
 82037 character devices, FIFOs, and sockets.

82038 When a failure occurs during the copying of a file hierarchy, `cp` is required to attempt to copy  
 82039 files that are on the same level in the hierarchy or above the file where the failure occurred. It is  
 82040 unspecified if `cp` shall attempt to copy files below the file where the failure occurred (which

82041 cannot succeed in any case).

82042 Permissions, owners, and groups of created special file types have been deliberately left as  
82043 implementation-defined. This is to allow systems to satisfy special requirements (for example,  
82044 allowing users to create character special devices, but requiring them to be owned by a certain  
82045 group). In general, it is strongly suggested that the permissions, owner, and group be the same  
82046 as if the user had run the historical *mknod*, *ln*, or other utility to create the file. It is also probable  
82047 that additional privileges are required to create block, character, or other implementation-  
82048 defined special file types.

82049 Additionally, the *-p* option explicitly requires that all set-user-ID and set-group-ID permissions  
82050 be discarded if any of the owner or group IDs cannot be set. This is to keep users from  
82051 unintentionally giving away special privilege when copying programs.

82052 When creating regular files, historical versions of *cp* use the mode of the source file as modified  
82053 by the file mode creation mask. Other choices would have been to use the mode of the source file  
82054 unmodified by the creation mask or to use the same mode as would be given to a new file  
82055 created by the user (plus the execution bits of the source file) and then modify it by the file mode  
82056 creation mask. In the absence of any strong reason to change historic practice, it was in large part  
82057 retained.

82058 When creating directories, historical versions of *cp* use the mode of the source directory, plus  
82059 read, write, and search bits for the owner, as modified by the file mode creation mask. This is  
82060 done so that *cp* can copy trees where the user has read permission, but the owner does not. A  
82061 side-effect is that if the file creation mask denies the owner permissions, *cp* fails. Also, once the  
82062 copy is done, historical versions of *cp* set the permissions on the created directory to be the same  
82063 as the source directory, unmodified by the file creation mask.

82064 This behavior has been modified so that *cp* is always able to create the contents of the directory,  
82065 regardless of the file creation mask. After the copy is done, the permissions are set to be the same  
82066 as the source directory, as modified by the file creation mask. This latter change from historical  
82067 behavior is to prevent users from accidentally creating directories with permissions beyond  
82068 those they would normally set and for consistency with the behavior of *cp* in creating files.

82069 It is not a requirement that *cp* detect attempts to copy a file to itself; however, implementations  
82070 are strongly encouraged to do so. Historical implementations have detected the attempt in most  
82071 cases.

82072 There are two methods of copying subtrees in this volume of POSIX.1-2008. The other method is  
82073 described as part of the *pax* utility (see *pax*). Both methods are historical practice. The *cp* utility  
82074 provides a simpler, more intuitive interface, while *pax* offers a finer granularity of control. Each  
82075 provides additional functionality to the other; in particular, *pax* maintains the hard-link structure  
82076 of the hierarchy, while *cp* does not. It is the intention of the standard developers that the results  
82077 be similar (using appropriate option combinations in both utilities). The results are not required  
82078 to be identical; there seemed insufficient gain to applications to balance the difficulty of  
82079 implementations having to guarantee that the results would be exactly identical.

82080 The wording allowing *cp* to copy a directory to implementation-defined file types not specified  
82081 by the System Interfaces volume of POSIX.1-2008 is provided so that implementations  
82082 supporting symbolic links are not required to prohibit copying directories to symbolic links.  
82083 Other extensions to the System Interfaces volume of POSIX.1-2008 file types may need to use  
82084 this loophole as well.

82085 **FUTURE DIRECTIONS**

82086 None.

82087 **SEE ALSO**82088 *mv, find, ln, pax*82089 XBD [Section 4.4](#) (on page 108), [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)82090 XSH *open()*, *unlink()*82091 **CHANGE HISTORY**

82092 First released in Issue 2.

82093 **Issue 6**82094 The `-r` option is marked obsolescent.82095 The new options `-H`, `-L`, and `-P` are added to align with the IEEE P1003.2b draft standard. These  
82096 options affect the processing of symbolic links.82097 IEEE PASC Interpretation 1003.2 #194 is applied, adding a description of the `-P` option.82098 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/18 is applied, correcting an error in the  
82099 SEE ALSO section.82100 **Issue 7**82101 Austin Group Interpretation 1003.1-2001 #126 is applied, changing the description of the  
82102 `LC_MESSAGES` environment variable.

82103 Austin Group Interpretations 1003.1-2001 #092, #164, #165, and #168 are applied.

82104 SD5-XCU-ERN-31 and SD5-XCU-ERN-42 are applied, updating the DESCRIPTION.

82105 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82106 SD5-XCU-ERN-102 is applied, clarifying the `-i` option within the OPTIONS section.82107 The obsolescent `-r` option is removed.82108 The `-P` option is added to the SYNOPSIS and to the DESCRIPTION with respect to the `-R`  
82109 option.

82110 **NAME**

82111 crontab — schedule periodic background work

82112 **SYNOPSIS**82113 crontab [*file*]82114 UP crontab [**-e**|-l|-r]82115 **DESCRIPTION**

82116 UP The *crontab* utility shall create, replace, or edit a user's crontab entry; a crontab entry is a list of  
 82117 commands and the times at which they shall be executed. The new crontab entry can be input by  
 82118 UP specifying *file* or input from standard input if no *file* operand is specified, or by using an editor,  
 82119 if **-e** is specified.

82120 Upon execution of a command from a crontab entry, the implementation shall supply a default  
 82121 environment, defining at least the following environment variables:

82122 *HOME* A pathname of the user's home directory.82123 *LOGNAME* The user's login name.82124 *PATH* A string representing a search path guaranteed to find all of the standard utilities.82125 *SHELL* A pathname of the command interpreter. When *crontab* is invoked as specified by  
 82126 this volume of POSIX.1-2008, the value shall be a pathname for *sh*.

82127 The values of these variables when *crontab* is invoked as specified by this volume of  
 82128 POSIX.1-2008 shall not affect the default values provided when the scheduled command is run.

82129 If standard output and standard error are not redirected by commands executed from the  
 82130 crontab entry, any generated output or errors shall be mailed, via an implementation-defined  
 82131 method, to the user.

82132 XSI Users shall be permitted to use *crontab* if their names appear in the file **cron.allow** which is  
 82133 located in an implementation-defined directory. If that file does not exist, the file **cron.deny**,  
 82134 which is located in an implementation-defined directory, shall be checked to determine whether  
 82135 the user shall be denied access to *crontab*. If neither file exists, only a process with appropriate  
 82136 privileges shall be allowed to submit a job. If only **cron.deny** exists and is empty, global usage  
 82137 shall be permitted. The **cron.allow** and **cron.deny** files shall consist of one user name per line.

82138 **OPTIONS**82139 The *crontab* utility shall conform to XBD Section 12.2 (on page 215).

82140 The following options shall be supported:

82141 UP **-e** Edit a copy of the invoking user's crontab entry, or create an empty entry to edit if  
 82142 the crontab entry does not exist. When editing is complete, the entry shall be  
 82143 installed as the user's crontab entry.

82144 **-l** (The letter ell.) List the invoking user's crontab entry.82145 **-r** Remove the invoking user's crontab entry.82146 **OPERANDS**

82147 The following operand shall be supported:

82148 *file* The pathname of a file that contains specifications, in the format defined in the  
 82149 INPUT FILES section, for crontab entries.

**crontab**82150 **STDIN**

82151 See the INPUT FILES section.

82152 **INPUT FILES**82153 In the POSIX locale, the user or application shall ensure that a crontab entry is a text file  
82154 consisting of lines of six fields each. The fields shall be separated by <blank> characters. The  
82155 first five fields shall be integer patterns that specify the following:

- 82156 1. Minute [0,59]
- 82157 2. Hour [0,23]
- 82158 3. Day of the month [1,31]
- 82159 4. Month of the year [1,12]
- 82160 5. Day of the week ([0,6] with 0=Sunday)

82161 Each of these patterns can be either an <asterisk> (meaning all valid values), an element, or a list  
82162 of elements separated by <comma> characters. An element shall be either a number or two  
82163 numbers separated by a <hyphen> (meaning an inclusive range). The specification of days can  
82164 be made by two fields (day of the month and day of the week). If month, day of month, and day  
82165 of week are all <asterisk> characters, every day shall be matched. If either the month or day of  
82166 month is specified as an element or list, but the day of week is an <asterisk>, the month and day  
82167 of month fields shall specify the days that match. If both month and day of month are specified  
82168 as an <asterisk>, but day of week is an element or list, then only the specified days of the week  
82169 match. Finally, if either the month or day of month is specified as an element or list, and the day  
82170 of week is also specified as an element or list, then any day matching either the month and day  
82171 of month, or the day of week, shall be matched.

82172 The sixth field of a line in a crontab entry is a string that shall be executed by *sh* at the specified  
82173 times. A <percent-sign> character in this field shall be translated to a <newline>. Any character  
82174 preceded by a <backslash> (including the '%') shall cause that character to be treated literally.  
82175 Only the first line (up to a '%' or end-of-line) of the command field shall be executed by the  
82176 command interpreter. The other lines shall be made available to the command as standard input.

82177 Blank lines and those whose first non-&lt;blank&gt; is '#' shall be ignored.

82178 XSI The text files **crontab.allow** and **crontab.deny**, which are located in an implementation-defined  
82179 directory, shall contain zero or more user names, one per line, of users who are, respectively,  
82180 authorized or denied access to the service underlying the *crontab* utility.

82181 **ENVIRONMENT VARIABLES**82182 The following environment variables shall affect the execution of *crontab*:

- |       |                 |                                                                                                                                                                                                                                    |
|-------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 82183 | <i>EDITOR</i>   | Determine the editor to be invoked when the <b>-e</b> option is specified. The default editor shall be <i>vi</i> .                                                                                                                 |
| 82184 |                 |                                                                                                                                                                                                                                    |
| 82185 | <i>LANG</i>     | Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 174) for the precedence of internationalization variables used to determine the values of locale categories.) |
| 82186 |                 |                                                                                                                                                                                                                                    |
| 82187 |                 |                                                                                                                                                                                                                                    |
| 82188 | <i>LC_ALL</i>   | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                           |
| 82189 |                 |                                                                                                                                                                                                                                    |
| 82190 | <i>LC_CTYPE</i> | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).                                          |
| 82191 |                 |                                                                                                                                                                                                                                    |
| 82192 |                 |                                                                                                                                                                                                                                    |

|       |     |                               |                                                                                                                           |
|-------|-----|-------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| 82193 |     | <i>LC_MESSAGES</i>            |                                                                                                                           |
| 82194 |     |                               | Determine the locale that should be used to affect the format and contents of                                             |
| 82195 |     |                               | diagnostic messages written to standard error.                                                                            |
| 82196 | XSI | <i>NLSPATH</i>                | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                     |
| 82197 |     | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                                           |
| 82198 |     |                               | Default.                                                                                                                  |
| 82199 |     | <b>STDOUT</b>                 |                                                                                                                           |
| 82200 |     |                               | If the <code>-l</code> option is specified, the crontab entry shall be written to the standard output.                    |
| 82201 |     | <b>STDERR</b>                 |                                                                                                                           |
| 82202 |     |                               | The standard error shall be used only for diagnostic messages.                                                            |
| 82203 |     | <b>OUTPUT FILES</b>           |                                                                                                                           |
| 82204 |     |                               | None.                                                                                                                     |
| 82205 |     | <b>EXTENDED DESCRIPTION</b>   |                                                                                                                           |
| 82206 |     |                               | None.                                                                                                                     |
| 82207 |     | <b>EXIT STATUS</b>            |                                                                                                                           |
| 82208 |     |                               | The following exit values shall be returned:                                                                              |
| 82209 |     | 0                             | Successful completion.                                                                                                    |
| 82210 |     | >0                            | An error occurred.                                                                                                        |
| 82211 |     | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                           |
| 82212 | UP  |                               | The user's crontab entry is not submitted, removed, <b>edited</b> , or listed.                                            |
| 82213 |     | <b>APPLICATION USAGE</b>      |                                                                                                                           |
| 82214 |     |                               | The format of the crontab entry shown here is guaranteed only for the POSIX locale. Other                                 |
| 82215 |     |                               | cultures may be supported with substantially different interfaces, although implementations are                           |
| 82216 |     |                               | encouraged to provide comparable levels of functionality.                                                                 |
| 82217 |     |                               | The default settings of the <i>HOME</i> , <i>LOGNAME</i> , <i>PATH</i> , and <i>SHELL</i> variables that are given to the |
| 82218 |     |                               | scheduled job are not affected by the settings of those variables when <i>crontab</i> is run; as stated,                  |
| 82219 |     |                               | they are defaults. The text about "invoked as specified by this volume of POSIX.1-2008" means                             |
| 82220 |     |                               | that the implementation may provide extensions that allow these variables to be affected at                               |
| 82221 |     |                               | runtime, but that the user has to take explicit action in order to access the extension, such as give                     |
| 82222 |     |                               | a new option flag or modify the format of the crontab entry.                                                              |
| 82223 |     |                               | A typical user error is to type only <i>crontab</i> ; this causes the system to wait for the new crontab                  |
| 82224 |     |                               | entry on standard input. If end-of-file is typed (generally <code>&lt;control&gt;-D</code> ), the crontab entry is        |
| 82225 |     |                               | replaced by an empty file. In this case, the user should type the interrupt character, which                              |
| 82226 |     |                               | prevents the crontab entry from being replaced.                                                                           |
| 82227 |     | <b>EXAMPLES</b>               |                                                                                                                           |
| 82228 |     | 1.                            | Clean up <b>core</b> files every weekday morning at 3:15 am:                                                              |
| 82229 |     |                               | <code>15 3 * * 1-5 find "\$HOME" -name core -exec rm -f {} + 2&gt;/dev/null</code>                                        |
| 82230 |     | 2.                            | Mail a birthday greeting:                                                                                                 |
| 82231 |     |                               | <code>0 12 14 2 * mailx john%Happy Birthday!%Time for lunch.</code>                                                       |
| 82232 |     | 3.                            | As an example of specifying the two types of days:                                                                        |
| 82233 |     |                               | <code>0 0 1,15 * 1</code>                                                                                                 |

82234 would run a command on the first and fifteenth of each month, as well as on every  
 82235 Monday. To specify days by only one field, the other field should be set to '\*'; for  
 82236 example:

82237 0 0 \* \* 1

82238 would run a command only on Mondays.

#### 82239 RATIONALE

82240 All references to a *cron* daemon and to *cron files* have been omitted. Although historical  
 82241 implementations have used this arrangement, there is no reason to limit future implementations.

82242 This description of *crontab* is designed to support only users with normal privileges. The format  
 82243 of the input is based on the System V *crontab*; however, there is no requirement here that the  
 82244 actual system database used by the *cron* daemon (or a similar mechanism) use this format  
 82245 internally. For example, systems derived from BSD are likely to have an additional field  
 82246 appended that indicates the user identity to be used when the job is submitted.

82247 The *-e* option was adopted from the SVID as a user convenience, although it does not exist in all  
 82248 historical implementations.

#### 82249 FUTURE DIRECTIONS

82250 None.

#### 82251 SEE ALSO

82252 *at*

82253 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

#### 82254 CHANGE HISTORY

82255 First released in Issue 2.

#### 82256 Issue 6

82257 This utility is marked as part of the User Portability Utilities option.

82258 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 82259 Issue 7

82260 The *crontab* utility (except for the *-e* option) is moved from the User Portability Utilities option  
 82261 to the Base. User Portability Utilities is now an option for interactive utilities.

82262 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced  
 82263 by the *crontab* utility.

82264 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82265 The first example is changed to remove the unreliable use of *find | xargs*.

## 82266 NAME

82267 csplit — split files based on context

## 82268 SYNOPSIS

82269 csplit [-ks] [-f *prefix*] [-n *number*] *file arg...*

## 82270 DESCRIPTION

82271 The *csplit* utility shall read the file named by the *file* operand, write all or part of that file into  
82272 other files as directed by the *arg* operands, and write the sizes of the files.

## 82273 OPTIONS

82274 The *csplit* utility shall conform to XBD Section 12.2 (on page 215).

82275 The following options shall be supported:

82276 **-f *prefix*** Name the created files *prefix00*, *prefix01*, ..., *prefixn*. The default is *xx00* ... *xxn*. If  
82277 the *prefix* argument would create a filename exceeding {NAME\_MAX} bytes, an  
82278 error shall result, *csplit* shall exit with a diagnostic message and no files shall be  
82279 created.82280 **-k** Leave previously created files intact. By default, *csplit* shall remove created files if  
82281 an error occurs.82282 **-n *number*** Use *number* decimal digits to form filenames for the file pieces. The default shall be  
82283 2.82284 **-s** Suppress the output of file size messages.

## 82285 OPERANDS

82286 The following operands shall be supported:

82287 *file* The pathname of a text file to be split. If *file* is '-', the standard input shall be  
82288 used.82289 Each *arg* operand can be one of the following:82290 */rexp/[offset]*82291 A file shall be created using the content of the lines from the current line up to, but  
82292 not including, the line that results from the evaluation of the regular expression  
82293 with *offset*, if any, applied. The regular expression *rexp* shall follow the rules for  
82294 basic regular expressions described in XBD Section 9.3 (on page 183). The  
82295 application shall use the sequence "\/" to specify a <slash> character within the  
82296 *rexp*. The optional offset shall be a positive or negative integer value representing a  
82297 number of lines. A positive integer value can be preceded by '+'. If the selection  
82298 of lines from an *offset* expression of this type would create a file with zero lines, or  
82299 one with greater than the number of lines left in the input file, the results are  
82300 unspecified. After the section is created, the current line shall be set to the line that  
82301 results from the evaluation of the regular expression with any offset applied. If the  
82302 current line is the first line in the file and a regular expression operation has not yet  
82303 been performed, the pattern match of *rexp* shall be applied from the current line to  
82304 the end of the file. Otherwise, the pattern match of *rexp* shall be applied from the  
82305 line following the current line to the end of the file.82306 *%rexp%[offset]*82307 Equivalent to */rexp/[offset]*, except that no file shall be created for the selected  
82308 section of the input file. The application shall use the sequence "\%" to specify a  
82309 <percent-sign> character within the *rexp*.

**csplit**

Utilities

- 82310 *line\_no* Create a file from the current line up to (but not including) the line number *line\_no*.  
 82311 Lines in the file shall be numbered starting at one. The current line becomes  
 82312 *line\_no*.
- 82313 {*num*} Repeat operand. This operand can follow any of the operands described  
 82314 previously. If it follows a *rexp* type operand, that operand shall be applied *num*  
 82315 more times. If it follows a *line\_no* operand, the file shall be split every *line\_no* lines,  
 82316 *num* times, from that point.
- 82317 An error shall be reported if an operand does not reference a line between the current position  
 82318 and the end of the file.
- 82319 **STDIN**
- 82320 See the INPUT FILES section.
- 82321 **INPUT FILES**
- 82322 The input file shall be a text file.
- 82323 **ENVIRONMENT VARIABLES**
- 82324 The following environment variables shall affect the execution of *csplit*:
- 82325 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 82326 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 82327 variables used to determine the values of locale categories.)
- 82328 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 82329 internationalization variables.
- 82330 *LC\_COLLATE*
- 82331 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 82332 character collating elements within regular expressions.
- 82333 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 82334 characters (for example, single-byte as opposed to multi-byte characters in  
 82335 arguments and input files) and the behavior of character classes within regular  
 82336 expressions.
- 82337 *LC\_MESSAGES*
- 82338 Determine the locale that should be used to affect the format and contents of  
 82339 diagnostic messages written to standard error.
- 82340 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 82341 **ASYNCHRONOUS EVENTS**
- 82342 If the *-k* option is specified, created files shall be retained. Otherwise, the default action occurs.
- 82343 **STDOUT**
- 82344 Unless the *-s* option is used, the standard output shall consist of one line per file created, with a  
 82345 format as follows:
- 82346 "%d\n", <file size in bytes>
- 82347 **STDERR**
- 82348 The standard error shall be used only for diagnostic messages.
- 82349 **OUTPUT FILES**
- 82350 The output files shall contain portions of the original input file; otherwise, unchanged.

82351 **EXTENDED DESCRIPTION**

82352 None.

82353 **EXIT STATUS**

82354 The following exit values shall be returned:

82355 0 Successful completion.

82356 &gt;0 An error occurred.

82357 **CONSEQUENCES OF ERRORS**82358 By default, created files shall be removed if an error occurs. When the `-k` option is specified,  
82359 created files shall not be removed if an error occurs.82360 **APPLICATION USAGE**

82361 None.

82362 **EXAMPLES**82363 1. This example creates four files, **cobol00** ... **cobol03**:82364 `csplit -f cobol file '/procedure division/' /par5./ /par16./`

82365 After editing the split files, they can be recombined as follows:

82366 `cat cobol0[0-3] > file`

82367 Note that this example overwrites the original file.

82368 2. This example would split the file after the first 99 lines, and every 100 lines thereafter, up  
82369 to 9 999 lines; this is because lines in the file are numbered from 1 rather than zero, for  
82370 historical reasons:82371 `csplit -k file 100 {99}`82372 3. Assuming that **prog.c** follows the C-language coding convention of ending routines with  
82373 a `'}'` at the beginning of the line, this example creates a file containing each separate C  
82374 routine (up to 21) in **prog.c**:82375 `csplit -k prog.c '%main(%' '/^}/+1' {20}`82376 **RATIONALE**82377 The `-n` option was added to extend the range of filenames that could be handled.82378 Consideration was given to adding a `-a` flag to use the alphabetic filename generation used by  
82379 the historical *split* utility, but the functionality added by the `-n` option was deemed to make  
82380 alphabetic naming unnecessary.82381 **FUTURE DIRECTIONS**

82382 None.

82383 **SEE ALSO**82384 *sed*, *split*

82385 XBD Chapter 8 (on page 173), Section 9.3 (on page 183), Section 12.2 (on page 215)

82386 **CHANGE HISTORY**

82387 First released in Issue 2.

**csplit**

Utilities

- 82388 **Issue 5**  
82389 The FUTURE DIRECTIONS section is added.
- 82390 **Issue 6**  
82391 This utility is marked as part of the User Portability Utilities option.  
82392 The APPLICATION USAGE section is added.  
82393 The description of regular expression operands is changed to align with the IEEE P1003.2b draft  
82394 standard.  
82395 The normative text is reworded to avoid use of the term “must” for application requirements.
- 82396 **Issue 7**  
82397 The *csplit* utility is moved from the User Portability Utilities option to the Base. User Portability  
82398 Utilities is now an option for interactive utilities.  
82399 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.  
82400 The SYNOPSIS and OPERANDS sections are revised to use a single *arg* to split a file into two  
82401 pieces.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

82402 **NAME**

82403 ctags — create a tags file (DEVELOPMENT, FORTRAN)

82404 **SYNOPSIS**82405 SD `ctags [-a] [-f tagsfile] pathname...`82406 `ctags -x pathname...`82407 **DESCRIPTION**

82408 The *ctags* utility shall be provided on systems that support the the Software Development  
 82409 Utilities option, and either or both of the C-Language Development Utilities option and  
 82410 FORTRAN Development Utilities option. On other systems, it is optional.

82411 The *ctags* utility shall write a *tagsfile* or an index of objects from C-language or FORTRAN source  
 82412 files specified by the *pathname* operands. The *tagsfile* shall list the locators of language-specific  
 82413 objects within the source files. A locator consists of a name, *pathname*, and either a search  
 82414 pattern or a line number that can be used in searching for the object definition. The objects that  
 82415 shall be recognized are specified in the EXTENDED DESCRIPTION section.

82416 **OPTIONS**82417 The *ctags* utility shall conform to XBD Section 12.2 (on page 215).

82418 The following options shall be supported:

82419 **-a** Append to *tagsfile*.82420 **-f *tagsfile*** Write the object locator lists into *tagsfile* instead of the default file named **tags** in the  
82421 current directory.82422 **-x** Produce a list of object names, the line number, and filename in which each is  
82423 defined, as well as the text of that line, and write this to the standard output. A  
82424 *tagsfile* shall not be created when **-x** is specified.82425 **OPERANDS**82426 The following *pathname* operands are supported:82427 ***file.c*** Files with basenames ending with the **.c** suffix shall be treated as C-language  
82428 source code. Such files that are not valid input to *c99* produce unspecified results.82429 ***file.h*** Files with basenames ending with the **.h** suffix shall be treated as C-language  
82430 source code. Such files that are not valid input to *c99* produce unspecified results.82431 ***file.f*** Files with basenames ending with the **.f** suffix shall be treated as FORTRAN-  
82432 language source code. Such files that are not valid input to *fort77* produce  
82433 unspecified results.

82434 The handling of other files is implementation-defined.

82435 **STDIN**

82436 See the INPUT FILES section.

82437 **INPUT FILES**82438 The input files shall be text files containing source code in the language indicated by the  
82439 operand filename suffixes.82440 **ENVIRONMENT VARIABLES**

- 82441 The following environment variables shall affect the execution of *ctags*:
- 82442 *LANG* Provide a default value for the internationalization variables that are unset or null.  
82443 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
82444 variables used to determine the values of locale categories.)
- 82445 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
82446 internationalization variables.
- 82447 *LC\_COLLATE*  
82448 Determine the order in which output is sorted for the *-x* option. The POSIX locale  
82449 determines the order in which the *tagsfile* is written.
- 82450 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
82451 characters (for example, single-byte as opposed to multi-byte characters in  
82452 arguments and input files). When processing C-language source code, if the locale  
82453 is not compatible with the C locale described by the ISO C standard, the results are  
82454 unspecified.
- 82455 *LC\_MESSAGES*  
82456 Determine the locale that should be used to affect the format and contents of  
82457 diagnostic messages written to standard error.
- 82458 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 82459 **ASYNCHRONOUS EVENTS**
- 82460 Default.
- 82461 **STDOUT**
- 82462 The list of object name information produced by the *-x* option shall be written to standard  
82463 output in the following format:
- 82464 "%s %d %s %s", <object-name>, <line-number>, <filename>, <text>
- 82465 where <text> is the text of line <line-number> of file <filename>.
- 82466 **STDERR**
- 82467 The standard error shall be used only for diagnostic messages.
- 82468 **OUTPUT FILES**
- 82469 When the *-x* option is not specified, the format of the output file shall be:
- 82470 "%s\t%s\t/ %s/\n", <identifier>, <filename>, <pattern>
- 82471 where <pattern> is a search pattern that could be used by an editor to find the defining instance  
82472 of <identifier> in <filename> (where *defining instance* is indicated by the declarations listed in the  
82473 EXTENDED DESCRIPTION).
- 82474 An optional <circumflex> ('*^*') can be added as a prefix to <pattern>, and an optional <dollar-  
82475 sign> can be appended to <pattern> to indicate that the pattern is anchored to the beginning  
82476 (end) of a line of text. Any <slash> or <backslash> characters in <pattern> shall be preceded by a  
82477 <backslash> character. The anchoring <circumflex>, <dollar-sign>, and escaping <backslash>  
82478 characters shall not be considered part of the search pattern. All other characters in the search  
82479 pattern shall be considered literal characters.

82480 An alternative format is:

82481 "%s\t%s\t?%s?\n", <identifier>, <filename>, <pattern>

82482 which is identical to the first format except that <slash> characters in <pattern> shall not be  
82483 preceded by escaping <backslash> characters, and <question-mark> characters in <pattern>  
82484 shall be preceded by <backslash> characters.

82485 A second alternative format is:

82486 "%s\t%s\t%d\n", <identifier>, <filename>, <lineno>

82487 where <lineno> is a decimal line number that could be used by an editor to find <identifier> in  
82488 <filename>.

82489 Neither alternative format shall be produced by *ctags* when it is used as described by  
82490 POSIX.1-2008, but the standard utilities that process tags files shall be able to process those  
82491 formats as well as the first format.

82492 In any of these formats, the file shall be sorted by identifier, based on the collation sequence in  
82493 the POSIX locale.

#### 82494 EXTENDED DESCRIPTION

82495 If the operand identifies C-language source, the *ctags* utility shall attempt to produce an output  
82496 line for each of the following objects:

- 82497 • Function definitions
- 82498 • Type definitions
- 82499 • Macros with arguments

82500 It may also produce output for any of the following objects:

- 82501 • Function prototypes
- 82502 • Structures
- 82503 • Unions
- 82504 • Global variable definitions
- 82505 • Enumeration types
- 82506 • Macros without arguments
- 82507 • **#define** statements
- 82508 • **#line** statements

82509 Any **#if** and **#ifdef** statements shall produce no output. The tag **main** is treated specially in C  
82510 programs. The tag formed shall be created by prefixing **M** to the name of the file, with the  
82511 trailing **.c**, and leading pathname components (if any) removed.

82512 On systems that do not support the C-Language Development Utilities option, *ctags* produces  
82513 unspecified results for C-language source code files. It should write to standard error a message  
82514 identifying this condition and cause a non-zero exit status to be produced.

82515 If the operand identifies FORTRAN source, the *ctags* utility shall produce an output line for each  
82516 function definition. It may also produce output for any of the following objects:

- 82517 • Subroutine definitions

**ctags***Utilities*

- 82518 • COMMON statements
- 82519 • PARAMETER statements
- 82520 • DATA and BLOCK DATA statements
- 82521 • Statement numbers

82522 On systems that do not support the FORTRAN Development Utilities option, *ctags* produces  
 82523 unspecified results for FORTRAN source code files. It should write to standard error a message  
 82524 identifying this condition and cause a non-zero exit status to be produced.

82525 It is implementation-defined what other objects (including duplicate identifiers) produce output.

**EXIT STATUS**

82526 The following exit values shall be returned:

- 82528 0 Successful completion.
- 82529 >0 An error occurred.

**CONSEQUENCES OF ERRORS**

82530 Default.

**APPLICATION USAGE**

82532 The output with `-x` is meant to be a simple index that can be written out as an off-line readable  
 82533 function index. If the input files to *ctags* (such as `.c` files) were not created using the same locale  
 82534 as that in effect when *ctags* `-x` is run, results might not be as expected.

82536 The description of C-language processing says “attempts to” because the C language can be  
 82537 greatly confused, especially through the use of `#defines`, and this utility would be of no use if  
 82538 the real C preprocessor were run to identify them. The output from *ctags* may be fooled and  
 82539 incorrect for various constructs.

**EXAMPLES**

82540 None.

**RATIONALE**

82542 The option list was significantly reduced from that provided by historical implementations. The  
 82543 `-F` option was omitted as redundant, since it is the default. The `-B` option was omitted as being  
 82544 of very limited usefulness. The `-t` option was omitted since the recognition of `typedefs` is now  
 82545 required for C source files. The `-u` option was omitted because the update function was judged  
 82546 to be not only inefficient, but also rarely needed.

82548 An early proposal included a `-w` option to suppress warning diagnostics. Since the types of such  
 82549 diagnostics could not be described, the option was omitted as being not useful.

82550 The text for `LC_CTYPE` about compatibility with the C locale acknowledges that the ISO C  
 82551 standard imposes requirements on the locale used to process C source. This could easily be a  
 82552 superset of that known as “the C locale” by way of implementation extensions, or one of a few  
 82553 alternative locales for systems supporting different codesets. No statement is made for  
 82554 FORTRAN because the ANSI X3.9-1978 standard (FORTRAN 77) does not (yet) define a similar  
 82555 locale concept. However, a general rule in this volume of POSIX.1-2008 is that any time that  
 82556 locales do not match (preparing a file for one locale and processing it in another), the results are  
 82557 suspect.

82558 The collation sequence of the tags file is not affected by `LC_COLLATE` because it is typically not  
 82559 used by human readers, but only by programs such as *vi* to locate the tag within the source files.  
 82560 Using the POSIX locale eliminates some of the problems of coordinating locales between the  
 82561 *ctags* file creator and the *vi* file reader.

82562 Historically, the tags file has been used only by *ex* and *vi*. However, the format of the tags file  
 82563 has been published to encourage other programs to use the tags in new ways. The format allows  
 82564 either patterns or line numbers to find the identifiers because the historical *vi* recognizes either.  
 82565 The *ctags* utility does not produce the format using line numbers because it is not useful  
 82566 following any source file changes that add or delete lines. The documented search patterns  
 82567 match historical practice. It should be noted that literal leading `<circumflex>` or trailing `<dollar-`  
 82568 `sign>` characters in the search pattern will only behave correctly if anchored to the beginning of  
 82569 the line or end of the line by an additional `<circumflex>` or `<dollar-sign>` character.

82570 Historical implementations also understand the objects used by the languages Pascal and  
 82571 sometimes LISP, and they understand the C source output by *lex* and *yacc*. The *ctags* utility is not  
 82572 required to accommodate these languages, although implementors are encouraged to do so.

82573 The following historical option was not specified, as *vgrind* is not included in this volume of  
 82574 POSIX.1-2008:

82575 **-v** If the `-v` flag is given, an index of the form expected by *vgrind* is produced on the  
 82576 standard output. This listing contains the function name, filename, and page  
 82577 number (assuming 64-line pages). Since the output is sorted into lexicographic  
 82578 order, it may be desired to run the output through *sort -f*. Sample use:

```
82579 ctags -v files | sort -f > index vgrind -x index
```

82580 The special treatment of the tag **main** makes the use of *ctags* practical in directories with more  
 82581 than one program.

#### 82582 FUTURE DIRECTIONS

82583 None.

#### 82584 SEE ALSO

82585 [c99](#), [fort77](#), [vi](#)

82586 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 82587 CHANGE HISTORY

82588 First released in Issue 4.

#### 82589 Issue 5

82590 The FUTURE DIRECTIONS section is added.

#### 82591 Issue 6

82592 This utility is marked as part of the User Portability Utilities option.

82593 The OUTPUT FILES section is changed to align with the IEEE P1003.2b draft standard.

82594 The normative text is reworded to avoid use of the term “must” for application requirements.

82595 IEEE PASC Interpretation 1003.2 #168 is applied, changing “create” to “write” in the  
 82596 DESCRIPTION.

#### 82597 Issue 7

82598 The *ctags* utility is no longer dependent on support for the User Portability Utilities option.

82599 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

**cut**

Utilities

82600 **NAME**82601 **cut** — cut out selected fields of each line of a file82602 **SYNOPSIS**82603 **cut** *-b list* [*-n*] [*file...*]82604 **cut** *-c list* [*file...*]82605 **cut** *-f list* [*-d delim*] [*-s*] [*file...*]82606 **DESCRIPTION**82607 The *cut* utility shall cut out bytes (*-b* option), characters (*-c* option), or character-delimited fields  
82608 (*-f* option) from each line in one or more files, concatenate them, and write them to standard  
82609 output.82610 **OPTIONS**82611 The *cut* utility shall conform to XBD Section 12.2 (on page 215).82612 The application shall ensure that the option-argument *list* (see options *-b*, *-c*, and *-f* below) is a  
82613 <comma>-separated list or <blank>-separated list of positive numbers and ranges. Ranges can  
82614 be in three forms. The first is two positive numbers separated by a <hyphen> (*low-high*), which  
82615 represents all fields from the first number to the second number. The second is a positive  
82616 number preceded by a <hyphen> (*-high*), which represents all fields from field number 1 to that  
82617 number. The third is a positive number followed by a <hyphen> (*low-*), which represents that  
82618 number to the last field, inclusive. The elements in *list* can be repeated, can overlap, and can be  
82619 specified in any order, but the bytes, characters, or fields selected shall be written in the order of  
82620 the input data. If an element appears in the selection list more than once, it shall be written  
82621 exactly once.

82622 The following options shall be supported:

82623 **-b list** Cut based on a *list* of bytes. Each selected byte shall be output unless the *-n* option  
82624 is also specified. It shall not be an error to select bytes not present in the input line.82625 **-c list** Cut based on a *list* of characters. Each selected character shall be output. It shall  
82626 not be an error to select characters not present in the input line.82627 **-d delim** Set the field delimiter to the character *delim*. The default is the <tab>.82628 **-f list** Cut based on a *list* of fields, assumed to be separated in the file by a delimiter  
82629 character (see *-d*). Each selected field shall be output. Output fields shall be  
82630 separated by a single occurrence of the field delimiter character. Lines with no field  
82631 delimiters shall be passed through intact, unless *-s* is specified. It shall not be an  
82632 error to select fields not present in the input line.82633 **-n** Do not split characters. When specified with the *-b* option, each element in *list* of  
82634 the form *low-high* (<hyphen>-separated numbers) shall be modified as follows:

- 82635
- If the byte selected by *low* is not the first byte of a character, *low* shall be  
82636 decremented to select the first byte of the character originally selected by *low*.  
82637 If the byte selected by *high* is not the last byte of a character, *high* shall be  
82638 decremented to select the last byte of the character prior to the character  
82639 originally selected by *high*, or zero if there is no prior character. If the  
82640 resulting range element has *high* equal to zero or *low* greater than *high*, the list  
82641 element shall be dropped from *list* for that input line without causing an  
82642 error.

82643 Each element in *list* of the form *low-* shall be treated as above with *high* set to the  
82644 number of bytes in the current line, not including the terminating <newline>. Each

- 82645 element in *list* of the form *-high* shall be treated as above with *low* set to 1. Each  
 82646 element in *list* of the form *num* (a single number) shall be treated as above with *low*  
 82647 set to *num* and *high* set to *num*.
- 82648 **-s** Suppress lines with no delimiter characters, when used with the **-f** option. Unless  
 82649 specified, lines with no delimiters shall be passed through untouched.
- 82650 **OPERANDS**
- 82651 The following operand shall be supported:
- 82652 *file* A pathname of an input file. If no *file* operands are specified, or if a *file* operand is  
 82653 '*-*', the standard input shall be used.
- 82654 **STDIN**
- 82655 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '*-*'.  
 82656 See the INPUT FILES section.
- 82657 **INPUT FILES**
- 82658 The input files shall be text files, except that line lengths shall be unlimited.
- 82659 **ENVIRONMENT VARIABLES**
- 82660 The following environment variables shall affect the execution of *cut*:
- 82661 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 82662 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 82663 variables used to determine the values of locale categories.)
- 82664 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 82665 internationalization variables.
- 82666 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 82667 characters (for example, single-byte as opposed to multi-byte characters in  
 82668 arguments and input files).
- 82669 *LC\_MESSAGES*
- 82670 Determine the locale that should be used to affect the format and contents of  
 82671 diagnostic messages written to standard error.
- 82672 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 82673 **ASYNCHRONOUS EVENTS**
- 82674 Default.
- 82675 **STDOUT**
- 82676 The *cut* utility output shall be a concatenation of the selected bytes, characters, or fields (one of  
 82677 the following):
- 82678 "%s\n", <concatenation of bytes>
- 82679 "%s\n", <concatenation of characters>
- 82680 "%s\n", <concatenation of fields and field delimiters>
- 82681 **STDERR**
- 82682 The standard error shall be used only for diagnostic messages.
- 82683 **OUTPUT FILES**
- 82684 None.

## 82685 EXTENDED DESCRIPTION

82686 None.

## 82687 EXIT STATUS

82688 The following exit values shall be returned:

82689 0 All input files were output successfully.

82690 &gt;0 An error occurred.

## 82691 CONSEQUENCES OF ERRORS

82692 Default.

## 82693 APPLICATION USAGE

82694 The *cut* and *fold* utilities can be used to create text files out of files with arbitrary line lengths.  
 82695 The *cut* utility should be used when the number of lines (or records) needs to remain constant.  
 82696 The *fold* utility should be used when the contents of long lines need to be kept contiguous.

82697 Earlier versions of the *cut* utility worked in an environment where bytes and characters were  
 82698 considered equivalent (modulo <backspace> and <tab> processing in some implementations). In  
 82699 the extended world of multi-byte characters, the new **-b** option has been added. The **-n** option  
 82700 (used with **-b**) allows it to be used to act on bytes rounded to character boundaries. The  
 82701 algorithm specified for **-n** guarantees that:

82702 `cut -b 1-500 -n file > file1`82703 `cut -b 501- -n file > file2`

82704 ends up with all the characters in **file** appearing exactly once in **file1** or **file2**. (There is,  
 82705 however, a <newline> in both **file1** and **file2** for each <newline> in **file**.)

## 82706 EXAMPLES

82707 Examples of the option qualifier list:

82708 1,4,7 Select the first, fourth, and seventh bytes, characters, or fields and field delimiters.

82709 1-3,8 Equivalent to 1,2,3,8.

82710 -5,10 Equivalent to 1,2,3,4,5,10.

82711 3- Equivalent to third to last, inclusive.

82712 The *low-high* forms are not always equivalent when used with **-b** and **-n** and multi-byte  
 82713 characters; see the description of **-n**.

82714 The following command:

82715 `cut -d : -f 1,6 /etc/passwd`

82716 reads the System V password file (user database) and produces lines of the form:

82717 `<user ID>:<home directory>`

82718 Most utilities in this volume of POSIX.1-2008 work on text files. The *cut* utility can be used to  
 82719 turn files with arbitrary line lengths into a set of text files containing the same data. The *paste*  
 82720 utility can be used to create (or recreate) files with arbitrary line lengths. For example, if **file**  
 82721 contains long lines:

82722 `cut -b 1-500 -n file > file1`82723 `cut -b 501- -n file > file2`

82724 creates **file1** (a text file) with lines no longer than 500 bytes (plus the <newline>) and **file2** that  
 82725 contains the remainder of the data from **file**. (Note that **file2** is not a text file if there are lines in

82726 **file** that are longer than 500 + {LINE\_MAX} bytes.) The original file can be recreated from **file1**  
82727 and **file2** using the command:

```
82728 paste -d "\0" file1 file2 > file
```

#### 82729 RATIONALE

82730 Some historical implementations do not count <backspace> characters in determining character  
82731 counts with the **-c** option. This may be useful for using *cut* for processing *nroff* output. It was  
82732 deliberately decided not to have the **-c** option treat either <backspace> or <tab> characters in  
82733 any special fashion. The *fold* utility does treat these characters specially.

82734 Unlike other utilities, some historical implementations of *cut* exit after not finding an input file,  
82735 rather than continuing to process the remaining *file* operands. This behavior is prohibited by this  
82736 volume of POSIX.1-2008, where only the exit status is affected by this problem.

82737 The behavior of *cut* when provided with either mutually-exclusive options or options that do  
82738 not work logically together has been deliberately left unspecified in favor of global wording in  
82739 [Section 1.4](#) (on page 2288).

82740 The OPTIONS section was changed in response to IEEE PASC Interpretation 1003.2 #149. The  
82741 change represents historical practice on all known systems. The original standard was  
82742 ambiguous on the nature of the output.

82743 The *list* option-arguments are historically used to select the portions of the line to be written, but  
82744 do not affect the order of the data. For example:

```
82745 echo abcdefghi | cut -c6,2,4-7,1
```

82746 yields "abdefg".

82747 A proposal to enhance *cut* with the following option:

82748 **-o** Preserve the selected field order. When this option is specified, each byte, character, or field  
82749 (or ranges of such) shall be written in the order specified by the *list* option-argument, even if  
82750 this requires multiple outputs of the same bytes, characters, or fields.

82751 was rejected because this type of enhancement is outside the scope of the IEEE P1003.2b draft  
82752 standard.

#### 82753 FUTURE DIRECTIONS

82754 None.

#### 82755 SEE ALSO

82756 [Section 2.5](#) (on page 2301), [fold](#), [grep](#), [paste](#)

82757 [XBD Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)

#### 82758 CHANGE HISTORY

82759 First released in Issue 2.

#### 82760 Issue 6

82761 The OPTIONS section is changed to align with the IEEE P1003.2b draft standard.

82762 The normative text is reworded to avoid use of the term "must" for application requirements.

#### 82763 Issue 7

82764 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82765 SD5-XCU-ERN-171 is applied, adding APPLICATION USAGE.

**cxref**

Utilities

82766 **NAME**82767 `cxref` — generate a C-language program cross-reference table (**DEVELOPMENT**)82768 **SYNOPSIS**

```
82769 xSI cxref [-cs] [-o file] [-w num] [-D name[=def]]... [-I dir]...
82770 [-U name]... file...
```

82771 **DESCRIPTION**

82772 The `cxref` utility shall analyze a collection of C-language *files* and attempt to build a cross-  
 82773 reference table. Information from **#define** lines shall be included in the symbol table. A sorted  
 82774 listing shall be written to standard output of all symbols (auto, static, and global) in each *file*  
 82775 separately, or with the `-c` option, in combination. Each symbol shall contain an <asterisk> before  
 82776 the declaring reference.

82777 **OPTIONS**

82778 The `cxref` utility shall conform to XBD [Section 12.2](#) (on page 215), except that the order of the `-D`,  
 82779 `-I`, and `-U` options (which are identical to their interpretation by `c99`) is significant. The  
 82780 following options shall be supported:

- 82781 `-c` Write a combined cross-reference of all input files.
- 82782 `-s` Operate silently; do not print input filenames.
- 82783 `-o file` Direct output to named *file*.
- 82784 `-w num` Format output no wider than *num* (decimal) columns. This option defaults to 80 if  
 82785 *num* is not specified or is less than 51.
- 82786 `-D` Equivalent to `c99`.
- 82787 `-I` Equivalent to `c99`.
- 82788 `-U` Equivalent to `c99`.

82789 **OPERANDS**

82790 The following operand shall be supported:

- 82791 *file* A pathname of a C-language source file.

82792 **STDIN**

82793 Not used.

82794 **INPUT FILES**

82795 The input files are C-language source files.

82796 **ENVIRONMENT VARIABLES**

82797 The following environment variables shall affect the execution of `cxref`:

- 82798 `LANG` Provide a default value for the internationalization variables that are unset or null.  
 82799 (See XBD [Section 8.2](#) (on page 174) for the precedence of internationalization  
 82800 variables used to determine the values of locale categories.)
- 82801 `LC_ALL` If set to a non-empty string value, override the values of all the other  
 82802 internationalization variables.
- 82803 `LC_COLLATE`  
 82804 Determine the locale for the ordering of the output.
- 82805 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
 82806 characters (for example, single-byte as opposed to multi-byte characters in  
 82807 arguments and input files).

- 82808 *LC\_MESSAGES*
- 82809 Determine the locale that should be used to affect the format and contents of
- 82810 diagnostic messages written to standard error.
- 82811 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 82812 **ASYNCHRONOUS EVENTS**
- 82813 Default.
- 82814 **STDOUT**
- 82815 The standard output shall be used for the cross-reference listing, unless the `-o` option is used to
- 82816 select a different output file.
- 82817 The format of standard output is unspecified, except that the following information shall be
- 82818 included:
- 82819 • If the `-c` option is not specified, each portion of the listing shall start with the name of the
  - 82820 input file on a separate line.
  - 82821 • The name line shall be followed by a sorted list of symbols, each with its associated
  - 82822 location pathname, the name of the function in which it appears (if it is not a function
  - 82823 name itself), and line number references.
  - 82824 • Each line number may be preceded by an <asterisk> (`'*'` ) flag, meaning that this is the
  - 82825 declaring reference. Other single-character flags, with implementation-defined meanings,
  - 82826 may be included.
- 82827 **STDERR**
- 82828 The standard error shall be used only for diagnostic messages.
- 82829 **OUTPUT FILES**
- 82830 The output file named by the `-o` option shall be used instead of standard output.
- 82831 **EXTENDED DESCRIPTION**
- 82832 None.
- 82833 **EXIT STATUS**
- 82834 The following exit values shall be returned:
- 82835 0 Successful completion.
  - 82836 >0 An error occurred.
- 82837 **CONSEQUENCES OF ERRORS**
- 82838 Default.
- 82839 **APPLICATION USAGE**
- 82840 None.
- 82841 **EXAMPLES**
- 82842 None.
- 82843 **RATIONALE**
- 82844 None.
- 82845 **FUTURE DIRECTIONS**
- 82846 None.

82847 **SEE ALSO**82848 [c99](#)82849 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)82850 **CHANGE HISTORY**

82851 First released in Issue 2.

82852 **Issue 5**82853 In the SYNOPSIS, [-U *dir*] is changed to [-U *name*].82854 **Issue 6**

82855 The APPLICATION USAGE section is added.

82856 **Issue 7**

82857 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

## Utilities

## date

## 82858 NAME

82859 date — write the date and time

## 82860 SYNOPSIS

82861 date [-u] [+format]

82862 XSI date [-u] mmddhhmm[[cc]yy]

## 82863 DESCRIPTION

82864 XSI The *date* utility shall write the date and time to standard output or attempt to set the system  
 82865 date and time. By default, the current date and time shall be written. If an operand beginning  
 82866 with '+' is specified, the output format of *date* shall be controlled by the conversion  
 82867 specifications and other text in the operand.

## 82868 OPTIONS

82869 The *date* utility shall conform to XBD Section 12.2 (on page 215).

82870 The following option shall be supported:

82871 **-u** Perform operations as if the *TZ* environment variable was set to the string "UTC0",  
 82872 or its equivalent historical value of "GMT0". Otherwise, *date* shall use the timezone  
 82873 indicated by the *TZ* environment variable or the system default if that variable is  
 82874 unset or null.

## 82875 OPERANDS

82876 The following operands shall be supported:

82877 **+format** When the format is specified, each conversion specifier shall be replaced in the  
 82878 standard output by its corresponding value. All other characters shall be copied to  
 82879 the output without change. The output shall always be terminated with a  
 82880 <newline>.

## 82881 Conversion Specifications

82882 %a Locale's abbreviated weekday name.  
 82883 %A Locale's full weekday name.  
 82884 %b Locale's abbreviated month name.  
 82885 %B Locale's full month name.  
 82886 %c Locale's appropriate date and time representation.  
 82887 %C Century (a year divided by 100 and truncated to an integer) as a decimal  
 82888 number [00,99].  
 82889 %d Day of the month as a decimal number [01,31].  
 82890 %D Date in the format *mm/dd/yy*.  
 82891 %e Day of the month as a decimal number [1,31] in a two-digit field with  
 82892 leading <space> character fill.  
 82893 %h A synonym for %b.  
 82894 %H Hour (24-hour clock) as a decimal number [00,23].  
 82895 %I Hour (12-hour clock) as a decimal number [01,12].

| 82959 |              | Attempt to set the system date and time from the value given in the operand. This is only possible if the user has appropriate privileges and the system permits the setting of the system date and time. The first <i>mm</i> is the month (number); <i>dd</i> is the day (number); <i>hh</i> is the hour (number, 24-hour system); the second <i>mm</i> is the minute (number); <i>cc</i> is the century and is the first two digits of the year (this is optional); <i>yy</i> is the last two digits of the year and is optional. If century is not specified, then values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive. The current year is the default if <i>yy</i> is omitted. |

| 82970 |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 82971 | <b>STDIN</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 82972 |              | Not used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**date**

Utilities

82973 **INPUT FILES**

82974 None.

82975 **ENVIRONMENT VARIABLES**82976 The following environment variables shall affect the execution of *date*:

82977 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 82978 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 82979 variables used to determine the values of locale categories.)

82980 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 82981 internationalization variables.

82982 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 82983 characters (for example, single-byte as opposed to multi-byte characters in  
 82984 arguments).

82985 *LC\_MESSAGES*

82986 Determine the locale that should be used to affect the format and contents of  
 82987 diagnostic messages written to standard error.

82988 *LC\_TIME* Determine the format and contents of date and time strings written by *date*.

82989 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

82990 *TZ* Determine the timezone in which the time and date are written, unless the *-u*  
 82991 option is specified. If the *TZ* variable is unset or null and *-u* is not specified, an  
 82992 unspecified system default timezone is used.

82993 **ASYNCHRONOUS EVENTS**

82994 Default.

82995 **STDOUT**

82996 When no formatting operand is specified, the output in the POSIX locale shall be equivalent to  
 82997 specifying:

82998 `date "+%a %b %e %H:%M:%S %Z %Y"`

82999 **STDERR**

83000 The standard error shall be used only for diagnostic messages.

83001 **OUTPUT FILES**

83002 None.

83003 **EXTENDED DESCRIPTION**

83004 None.

83005 **EXIT STATUS**

83006 The following exit values shall be returned:

83007 0 The date was written successfully.

83008 &gt;0 An error occurred.

83009 **CONSEQUENCES OF ERRORS**

83010 Default.

83011 **APPLICATION USAGE**

83012 Conversion specifiers are of unspecified format when not in the POSIX locale. Some of them can  
83013 contain <newline> characters in some locales, so it may be difficult to use the format shown in  
83014 standard output for parsing the output of *date* in those locales.

83015 The range of values for %S extends from 0 to 60 seconds to accommodate the occasional leap  
83016 second.

83017 Although certain of the conversion specifiers in the POSIX locale (such as the name of the  
83018 month) are shown with initial capital letters, this need not be the case in other locales. Programs  
83019 using these fields may need to adjust the capitalization if the output is going to be used at the  
83020 beginning of a sentence.

83021 The date string formatting capabilities are intended for use in Gregorian-style calendars,  
83022 possibly with a different starting year (or years). The %x and %c conversion specifications,  
83023 however, are intended for local representation; these may be based on a different, non-Gregorian  
83024 calendar.

83025 The %C conversion specification was introduced to allow a fallback for the %EC (alternative year  
83026 format base year); it can be viewed as the base of the current subdivision in the Gregorian  
83027 calendar. The century number is calculated as the year divided by 100 and truncated to an  
83028 integer; it should not be confused with the use of ordinal numbers for centuries (for example,  
83029 "twenty-first century".) Both the %EY and %y can then be viewed as the offset from %EC and %C,  
83030 respectively.

83031 The E and O modifiers modify the traditional conversion specifiers, so that they can always be  
83032 used, even if the implementation (or the current locale) does not support the modifier.

83033 The E modifier supports alternative date formats, such as the Japanese Emperor's Era, as long as  
83034 these are based on the Gregorian calendar system. Extending the E modifiers to other date  
83035 elements may provide an implementation-defined extension capable of supporting other  
83036 calendar systems, especially in combination with the O modifier.

83037 The O modifier supports time and date formats using the locale's alternative numerical symbols,  
83038 such as Kanji or Hindi digits or ordinal number representation.

83039 Non-European locales, whether they use Latin digits in computational items or not, often have  
83040 local forms of the digits for use in date formats. This is not totally unknown even in Europe; a  
83041 variant of dates uses Roman numerals for the months: the third day of September 1991 would be  
83042 written as 3.IX.1991. In Japan, Kanji digits are regularly used for dates; in Arabic-speaking  
83043 countries, Hindi digits are used. The %d, %e, %H, %I, %m, %S, %U, %w, %W, and %y conversion  
83044 specifications always return the date and time field in Latin digits (that is, 0 to 9). The %O  
83045 modifier was introduced to support the use for display purposes of non-Latin digits. In the  
83046 LC\_TIME category in *localedef*, the optional **alt\_digits** keyword is intended for this purpose. As  
83047 an example, assume the following (partial) *localedef* source:

```
83048 alt_digits  "";"I";"II";"III";"IV";"V";"VI";"VII";"VIII" \
83049            "IX";"X";"XI";"XII"
83050 d_fmt      "%e.%Om.%Y"
```

83051 With the above date, the command:

```
83052 date "+%x"
```

83053 would yield 3.IX.1991. With the same **d\_fmt**, but without the **alt\_digits**, the command would  
83054 yield 3.9.1991.

## 83055 EXAMPLES

83056 1. The following are input/output examples of *date* used at arbitrary times in the POSIX  
83057 locale:

```
83058 $ date
83059 Tue Jun 26 09:58:10 PDT 1990

83060 $ date "+DATE: %m/%d/%y%nTIME: %H:%M:%S"
83061 DATE: 11/02/91
83062 TIME: 13:36:16
```

```
83063 $ date "+TIME: %r"
83064 TIME: 01:36:32 PM
```

83065 2. Examples for Denmark, where the default date and time format is `%a %d %b %Y %T %Z`:

```
83066 $ LANG=da_DK.iso_8859-1 date
83067 ons 02 okt 1991 15:03:32 CET

83068 $ LANG=da_DK.iso_8859-1 \
83069 date "+DATO: %A den %e. %B %Y%nKLOKKEN: %H:%M:%S"
83070 DATO: onsdag den 2. oktober 1991
83071 KLOKKEN: 15:03:56
```

83072 3. Examples for Germany, where the default date and time format is `%a %d.%h.%Y, %T %Z`:

```
83073 $ LANG=De_DE.88591 date
83074 Mi 02.Okt.1991, 15:01:21 MEZ

83075 $ LANG=De_DE.88591 date "+DATUM: %A, %d. %B %Y%nZEIT: %H:%M:%S"
83076 DATUM: Mittwoch, 02. Oktober 1991
83077 ZEIT: 15:02:02
```

83078 4. Examples for France, where the default date and time format is `%a %d %h %Y %Z %T`:

```
83079 $ LANG=Fr_FR.88591 date
83080 Mer 02 oct 1991 MET 15:03:32

83081 $ LANG=Fr_FR.88591 date "+JOUR: %A %d %B %Y%nHEURE: %H:%M:%S"
83082 JOUR: Mercredi 02 octobre 1991
83083 HEURE: 15:03:56
```

## 83084 RATIONALE

83085 Some of the new options for formatting are from the ISO C standard. The `-u` option was  
83086 introduced to allow portable access to Coordinated Universal Time (UTC). The string "GMT0" is  
83087 allowed as an equivalent TZ value to be compatible with all of the systems using the BSD  
83088 implementation, where this option originated.

83089 The `%e` format conversion specification (adopted from System V) was added because the ISO C  
83090 standard conversion specifications did not provide any way to produce the historical default  
83091 *date* output during the first nine days of any month.

83092 There are two varieties of day and week numbering supported (in addition to any others created  
83093 with the locale-dependent `%E` and `%O` modifier characters):

- 83094 • The historical variety in which Sunday is the first day of the week and the weekdays  
83095 preceding the first Sunday of the year are considered week 0. These are represented by `%w`  
83096 and `%U`. A variant of this is `%W`, using Monday as the first day of the week, but still  
83097 referring to week 0. This view of the calendar was retained because so many historical

- 83098 applications depend on it and the ISO C standard *strftime()* function, on which many *date*  
83099 implementations are based, was defined in this way.
- 83100 • The international standard, based on the ISO 8601:2004 standard where Monday is the first  
83101 weekday and the algorithm for the first week number is more complex: If the week  
83102 (Monday to Sunday) containing January 1 has four or more days in the new year, then it is  
83103 week 1; otherwise, it is week 53 of the previous year, and the next week is week 1. These  
83104 are represented by the new conversion specifications %u and %V, added as a result of  
83105 international comments.
- 83106 **FUTURE DIRECTIONS**
- 83107 None.
- 83108 **SEE ALSO**

- 83111 **CHANGE HISTORY**
- 83112 First released in Issue 2.
- 83113 **Issue 5**
- 83114 Changes are made for Year 2000 alignment.
- 83115 **Issue 6**
- 83116 The following new requirements on POSIX implementations derive from alignment with the  
83117 Single UNIX Specification:
- 83118 • The %EX modified conversion specification is added.
- 83119 The Open Group Corrigendum U048/2 is applied, correcting the examples.
- 83120 The DESCRIPTION is updated to refer to conversion specifications, instead of field descriptors  
83121 for consistency with the *LC\_TIME* category.
- 83122 A clarification is made such that the current year is the default if the *yy* argument is omitted  
83123 when setting the system date and time.
- 83124 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/19 is applied, correcting the CHANGE  
83125 HISTORY section.

**dd**

Utilities

83126 **NAME**

83127 dd — convert and copy a file

83128 **SYNOPSIS**83129 dd [*operand*. . .]83130 **DESCRIPTION**

83131 The *dd* utility shall copy the specified input file to the specified output file with possible  
 83132 conversions using specific input and output block sizes. It shall read the input one block at a  
 83133 time, using the specified input block size; it shall then process the block of data actually  
 83134 returned, which could be smaller than the requested block size. It shall apply any conversions  
 83135 that have been specified and write the resulting data to the output in blocks of the specified  
 83136 output block size. If the **bs=expr** operand is specified and no conversions other than **sync**,  
 83137 **noerror**, or **notrunc** are requested, the data returned from each input block shall be written as a  
 83138 separate output block; if the read returns less than a full block and the **sync** conversion is not  
 83139 specified, the resulting output block shall be the same size as the input block. If the **bs=expr**  
 83140 operand is not specified, or a conversion other than **sync**, **noerror**, or **notrunc** is requested, the  
 83141 input shall be processed and collected into full-sized output blocks until the end of the input is  
 83142 reached.

83143 The processing order shall be as follows:

- 83144 1. An input block is read.
- 83145 2. If the input block is shorter than the specified input block size and the **sync** conversion is  
 83146 specified, null bytes shall be appended to the input data up to the specified size. (If either  
 83147 **block** or **unblock** is also specified, <space> characters shall be appended instead of null  
 83148 bytes.) The remaining conversions and output shall include the pad characters as if they  
 83149 had been read from the input.
- 83150 3. If the **bs=expr** operand is specified and no conversion other than **sync** or **noerror** is  
 83151 requested, the resulting data shall be written to the output as a single block, and the  
 83152 remaining steps are omitted.
- 83153 4. If the **swab** conversion is specified, each pair of input data bytes shall be swapped. If  
 83154 there is an odd number of bytes in the input block, the last byte in the input record shall  
 83155 not be swapped.
- 83156 5. Any remaining conversions (**block**, **unblock**, **lcase**, and **ucase**) shall be performed. These  
 83157 conversions shall operate on the input data independently of the input blocking; an input  
 83158 or output fixed-length record may span block boundaries.
- 83159 6. The data resulting from input or conversion or both shall be aggregated into output  
 83160 blocks of the specified size. After the end of input is reached, any remaining output shall  
 83161 be written as a block without padding if **conv=sync** is not specified; thus, the final output  
 83162 block may be shorter than the output block size.

83163 **OPTIONS**

83164 None.

83165 **OPERANDS**83166 All of the operands shall be processed before any input is read. The following operands shall be  
 83167 supported:

- 83168 **if=file** Specify the input pathname; the default is standard input.
- 83169 **of=file** Specify the output pathname; the default is standard output. If the **seek=expr**  
 83170 conversion is not also specified, the output file shall be truncated before the copy  
 83171 begins if an explicit **of=file** operand is specified, unless **conv=notrunc** is specified.

|       |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 83172 |                               | If <b>seek=expr</b> is specified, but <b>conv=notrunc</b> is not, the effect of the copy shall be to preserve the blocks in the output file over which <i>dd</i> seeks, but no other portion of the output file shall be preserved. (If the size of the seek plus the size of the input file is less than the previous size of the output file, the output file shall be shortened by the copy. If the input file is empty and either the size of the seek is greater than the previous size of the output file or the output file did not previously exist, the size of the output file shall be set to the file offset after the seek.)                          |

A positive decimal number followed by <i>k</i> , specifying multiplication by 1 024                                                                                                                                                                                                                                                                                                                                                                                                              |
| 83251 |                | 3. A positive decimal number followed by <i>b</i> , specifying multiplication by 512                                                                                                                                                                                                                                                                                                                                                                                                                |
| 83252 |                | 4. Two or more positive decimal numbers (with or without <i>k</i> or <i>b</i> ) separated by <i>x</i> , specifying the product of the indicated values                                                                                                                                                                                                                                                                                                                                              |
| 83253 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 83254 |                | All of the operands are processed before any input is read.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 83255 | XSI            | The following two tables display the octal number character values used for the <b>ascii</b> and <b>ebcdic</b> conversions (first table) and for the <b>ibm</b> conversion (second table). In both tables, the ASCII values are the row and column headers and the EBCDIC values are found at their intersections. For example, ASCII 0012 (LF) is the second row, third column, yielding 0045 in EBCDIC. The inverted tables (for EBCDIC to ASCII conversion) are not shown, but are in one-to-one |
| 83256 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 83257 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 0370 | 0356     | 0357     | 0372     | 0373     | 0374     | 0375     | 0376     | 0377 EO  |

83264 **STDIN**

83265 If no **if=** operand is specified, the standard input shall be used. See the INPUT FILES section.

83266 **INPUT FILES**

83267 The input file can be any file type.

83268 **ENVIRONMENT VARIABLES**

83269 The following environment variables shall affect the execution of *dd*:

83270 **LANG** Provide a default value for the internationalization variables that are unset or null.  
83271 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
83272 variables used to determine the values of locale categories.)

83273 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
83274 internationalization variables.

83275 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
83276 characters (for example, single-byte as opposed to multi-byte characters in  
83277 arguments and input files), the classification of characters as uppercase or  
83278 lowercase, and the mapping of characters from one case to the other.

83279 **LC\_MESSAGES**

83280 Determine the locale that should be used to affect the format and contents of  
83281 diagnostic messages written to standard error and informative messages written to  
83282 standard output.

83283 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

83284 **ASYNCHRONOUS EVENTS**

83285 For **SIGINT**, the *dd* utility shall interrupt its current processing, write status information to  
83286 standard error, and exit as though terminated by **SIGINT**. It shall take the standard action for all  
83287 other signals; see the ASYNCHRONOUS EVENTS section in Section 1.4 (on page 2288).

83288 **STDOUT**

83289 If no **of=** operand is specified, the standard output shall be used. The nature of the output  
83290 depends on the operands selected.

83291 **STDERR**

83292 On completion, *dd* shall write the number of input and output blocks to standard error. In the  
83293 POSIX locale the following formats shall be used:

83294 "%u+%u records in\n", <number of whole input blocks>,  
83295 <number of partial input blocks>

83296 "%u+%u records out\n", <number of whole output blocks>,  
83297 <number of partial output blocks>

83298 A partial input block is one for which *read()* returned less than the input block size. A partial  
83299 output block is one that was written with fewer bytes than specified by the output block size.

83300 In addition, when there is at least one truncated block, the number of truncated blocks shall be  
83301 written to standard error. In the POSIX locale, the format shall be:

83302 "%u truncated %s\n", <number of truncated blocks>, "record" (if  
83303 <number of truncated blocks> is one) "records" (otherwise)

83304 Diagnostic messages may also be written to standard error.

83305 **OUTPUT FILES**

83306 If the **of=** operand is used, the output shall be the same as described in the **STDOUT** section.

83307 **EXTENDED DESCRIPTION**

83308 None.

83309 **EXIT STATUS**

83310 The following exit values shall be returned:

83311 0 The input file was copied successfully.

83312 >0 An error occurred.

83313 **CONSEQUENCES OF ERRORS**

83314 If an input error is detected and the **noerror** conversion has not been specified, any partial  
83315 output block shall be written to the output file, a diagnostic message shall be written, and the  
83316 copy operation shall be discontinued. If some other error is detected, a diagnostic message shall  
83317 be written and the copy operation shall be discontinued.

83318 **APPLICATION USAGE**

83319 The input and output block size can be specified to take advantage of raw physical I/O.

83320 There are many different versions of the EBCDIC codesets. The ASCII and EBCDIC conversions  
83321 specified for the *dd* utility perform conversions for the version specified by the tables.

83322 **EXAMPLES**

83323 The following command:

```
83324 dd if=/dev/rmt0h of=/dev/rmt1h
```

83325 copies from tape drive 0 to tape drive 1, using a common historical device naming convention.

83326 The following command:

```
83327 dd ibs=10 skip=1
```

83328 strips the first 10 bytes from standard input.

83329 This example reads an EBCDIC tape blocked ten 80-byte EBCDIC card images per block into the  
83330 ASCII file *x*:

```
83331 dd if=/dev/tape of=x ibs=800 cbs=80 conv=ascii,lcase
```

83332 **RATIONALE**

83333 The **OPTIONS** section is listed as “None” because there are no options recognized by historical  
83334 *dd* utilities. Certainly, many of the operands could have been designed to use the Utility Syntax  
83335 Guidelines, which would have resulted in the classic hyphenated option letters. In this version  
83336 of this volume of POSIX.1-2008, *dd* retains its curious JCL-like syntax due to the large number of  
83337 applications that depend on the historical implementation.

83338 A suggested implementation technique for **conv=noerror,sync** is to zero (or <space>-fill, if  
83339 **blocking** or **unblocking**) the input buffer before each read and to write the contents of the input  
83340 buffer to the output even after an error. In this manner, any data transferred to the input buffer  
83341 before the error was detected is preserved. Another point is that a failed read on a regular file or  
83342 a disk generally does not increment the file offset, and *dd* must then seek past the block on which  
83343 the error occurred; otherwise, the input error occurs repetitively. When the input is a magnetic  
83344 tape, however, the tape normally has passed the block containing the error when the error is  
83345 reported, and thus no seek is necessary.

83346 The default **ibs=** and **obs=** sizes are specified as 512 bytes because there are historical (largely  
83347 portable) scripts that assume these values. If they were left unspecified, unusual results could

- 83348 occur if an implementation chose an odd block size.
- 83349 Historical implementations of *dd* used *creat()* when processing **of=file**. This makes the **seek=**  
83350 operand unusable except on special files. The **conv=notrunc** feature was added because more  
83351 recent BSD-based implementations use *open()* (without `O_TRUNC`) instead of *creat()*, but they  
83352 fail to delete output file contents after the data copied.
- 83353 The *w* multiplier (historically meaning *word*), is used in System V to mean 2 and in 4.2 BSD to  
83354 mean 4. Since *word* is inherently non-portable, its use is not supported by this volume of  
83355 POSIX.1-2008.
- 83356 Standard EBCDIC does not have the characters '[' and ']'. The values used in the table are  
83357 taken from a common print train that does contain them. Other than those characters, the print  
83358 train values are not filled in, but appear to provide some of the motivation for the historical  
83359 choice of translations reflected here.
- 83360 The Standard EBCDIC table provides a 1:1 translation for all 256 bytes.
- 83361 The IBM EBCDIC table does not provide such a translation. The marked cells in the tables differ  
83362 in such a way that:
- 83363 1. EBCDIC 0112 ('ϕ') and 0152 (broken pipe) do not appear in the table.
  - 83364 2. EBCDIC 0137 ('↵') translates to/from ASCII 0236 ('^'). In the standard table, EBCDIC  
83365 0232 (no graphic) is used.
  - 83366 3. EBCDIC 0241 ('~') translates to/from ASCII 0176 ('~'). In the standard table, EBCDIC  
83367 0137 ('↵') is used.
  - 83368 4. 0255 ('[') and 0275 (']') appear twice, once in the same place as for the standard table  
83369 and once in place of 0112 ('ϕ') and 0241 ('~').
- 83370 In net result:
- 83371 EBCDIC 0275 (']') displaced EBCDIC 0241 ('~') in cell 0345.
- 83372 That displaced EBCDIC 0137 ('↵') in cell 0176.
- 83373 That displaced EBCDIC 0232 (no graphic) in cell 0136.
- 83374 That replaced EBCDIC 0152 (broken pipe) in cell 0313.
- 83375 EBCDIC 0255 ('[') replaced EBCDIC 0112 ('ϕ').
- 83376 This translation, however, reflects historical practice that (ASCII) '^' and '↵' were often  
83377 mapped to each other, as were '[' and 'ϕ'; and ']' and (EBCDIC) '~'.
- 83378 The **cbs** operand is required if any of the **ascii**, **ebcdic**, or **ibm** operands are specified. For the  
83379 **ascii** operand, the input is handled as described for the **unblock** operand except that characters  
83380 are converted to ASCII before the trailing <space> characters are deleted. For the **ebcdic** and  
83381 **ibm** operands, the input is handled as described for the **block** operand except that the characters  
83382 are converted to EBCDIC or IBM EBCDIC after the trailing <space> characters are added.
- 83383 The **block** and **unblock** keywords are from historical BSD practice.
- 83384 The consistent use of the word **record** in standard error messages matches most historical  
83385 practice. An earlier version of System V used **block**, but this has been updated in more recent  
83386 releases.
- 83387 Early proposals only allowed two numbers separated by **x** to be used in a product when  
83388 specifying **bs=**, **cbs=**, **ibs=**, and **obs=** sizes. This was changed to reflect the historical practice of

- 83389 allowing multiple numbers in the product as provided by Version 7 and all releases of System V  
83390 and BSD.
- 83391 A change to the **swab** conversion is required to match historical practice and is the result of IEEE  
83392 PASC Interpretations 1003.2 #03 and #04, submitted for the ISO POSIX-2: 1993 standard.
- 83393 A change to the handling of SIGINT is required to match historical practice and is the result of  
83394 IEEE PASC Interpretation 1003.2 #06 submitted for the ISO POSIX-2: 1993 standard.
- 83395 **FUTURE DIRECTIONS**
- 83396 None.
- 83397 **SEE ALSO**
- 83398 [Section 1.4](#) (on page 2288), *sed*, *tr*
- 83399 [XBD Chapter 8](#) (on page 173)
- 83400 **CHANGE HISTORY**
- 83401 First released in Issue 2.
- 83402 **Issue 5**
- 83403 The second paragraph of the **cbs=** description is reworded and marked EX.
- 83404 The FUTURE DIRECTIONS section is added.
- 83405 **Issue 6**
- 83406 Changes are made to **swab** conversion and SIGINT handling to align with the IEEE P1003.2b  
83407 draft standard.
- 83408 The normative text is reworded to avoid use of the term “must” for application requirements.
- 83409 IEEE PASC Interpretation 1003.2 #209 is applied, clarifying the interaction between **dd of=file** and  
83410 **conv=notrunc**.
- 83411 **Issue 7**
- 83412 Austin Group Interpretation 1003.1-2001 #102 is applied.
- 83413 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

## 83414 NAME

83415 delta — make a delta (change) to an SCCS file (DEVELOPMENT)

## 83416 SYNOPSIS

83417 xSI delta [-nps] [-g list] [-m mrlist] [-r SID] [-y[comment]] file...

## 83418 DESCRIPTION

83419 The *delta* utility shall be used to permanently introduce into the named SCCS files changes that  
83420 were made to the files retrieved by *get* (called the *g-files*, or generated files).

## 83421 OPTIONS

83422 The *delta* utility shall conform to XBD Section 12.2 (on page 215), except that the *-y* option has an  
83423 optional option-argument. This optional option-argument shall not be presented as a separate  
83424 argument.

83425 The following options shall be supported:

83426 **-r SID** Uniquely identify which delta is to be made to the SCCS file. The use of this option  
83427 shall be necessary only if two or more outstanding *get* commands for editing (*get*  
83428 *-e*) on the same SCCS file were done by the same person (login name). The SID  
83429 value specified with the *-r* option can be either the SID specified on the *get*  
83430 command line or the SID to be made as reported by the *get* utility; see *get* (on page  
83431 2764).83432 **-s** Suppress the report to standard output of the activity associated with each *file*. See  
83433 the STDOUT section.83434 **-n** Specify retention of the edited *g-file* (normally removed at completion of delta  
83435 processing).83436 **-g list** Specify a *list* (see *get* for the definition of *list*) of deltas that shall be ignored when  
83437 the file is accessed at the change level (SID) created by this delta.83438 **-m mrlist** Specify a modification request (MR) number that the application shall supply as  
83439 the reason for creating the new delta. This shall be used if the SCCS file has the *v*  
83440 flag set; see *admin*.83441 If *-m* is not used and *'-'* is not specified as a file argument, and the standard  
83442 input is a terminal, the prompt described in the STDOUT section shall be written  
83443 to standard output before the standard input is read; if the standard input is not a  
83444 terminal, no prompt shall be issued.83445 MRs in a list shall be separated by <blank> characters or escaped <newline>  
83446 characters. An unescaped <newline> shall terminate the MR list. The escape  
83447 character is <backslash>.83448 If the *v* flag has a value, it shall be taken to be the name of a program which  
83449 validates the correctness of the MR numbers. If a non-zero exit status is returned  
83450 from the MR number validation program, the *delta* utility shall terminate. (It is  
83451 assumed that the MR numbers were not all valid.)83452 **-y[comment]** Describe the reason for making the delta. The *comment* shall be an arbitrary group  
83453 of lines that would meet the definition of a text file. Implementations shall support  
83454 *comments* from zero to 512 bytes and may support longer values. A null string  
83455 (specified as either *-y*, *-y" "*, or in response to a prompt for a comment) shall be  
83456 considered a valid *comment*.83457 If *-y* is not specified and *'-'* is not specified as a file argument, and the standard

**delta**

Utilities

83458 input is a terminal, the prompt described in the STDOUT section shall be written  
 83459 to standard output before the standard input is read; if the standard input is not a  
 83460 terminal, no prompt shall be issued. An unescaped <newline> shall terminate the  
 83461 comment text. The escape character is <backslash>.

83462 The `-y` option shall be required if the *file* operand is specified as `'-'`.

83463 **-p** Write (to standard output) the SCCS file differences before and after the delta is  
 83464 applied in *diff* format; see *diff*.

**OPERANDS**

83465 The following operand shall be supported:

83466 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *delta*  
 83467 utility shall behave as though each file in the directory were specified as a named  
 83468 file, except that non-SCCS files (last component of the pathname does not begin  
 83469 with `s.`) and unreadable files shall be silently ignored.  
 83470

83471 If exactly one *file* operand appears, and it is `'-'`, the standard input shall be read;  
 83472 each line of the standard input shall be taken to be the name of an SCCS file to be  
 83473 processed. Non-SCCS files and unreadable files shall be silently ignored.

**STDIN**

83474 The standard input shall be a text file used only in the following cases:

- 83475 • To read an *mrlist* or a *comment* (see the `-m` and `-y` options).
- 83476 • A *file* operand shall be specified as `'-'`. In this case, the `-y` option must be used to specify  
 83477 the comment, and if the SCCS file has the `v` flag set, the `-m` option must also be used to  
 83478 specify the MR list.  
 83479

**INPUT FILES**

83480 Input files shall be text files whose data is to be included in the SCCS files. If the first character of  
 83481 any line of an input file is <SOH> in the POSIX locale, the results are unspecified. If this file  
 83482 contains more than 99 999 lines, the number of lines recorded in the header for this file shall be  
 83483 99 999 for this delta.  
 83484

**ENVIRONMENT VARIABLES**

83485 The following environment variables shall affect the execution of *delta*:

83486 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 83487 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 83488 variables used to determine the values of locale categories.)  
 83489

83490 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 83491 internationalization variables.

83492 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 83493 characters (for example, single-byte as opposed to multi-byte characters in  
 83494 arguments and input files).

83495 *LC\_MESSAGES*

83496 Determine the locale that should be used to affect the format and contents of  
 83497 diagnostic messages written to standard error, and informative messages written  
 83498 to standard output.

83499 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

83500 **TZ** Determine the timezone in which the time and date are written in the SCCS file. If  
83501 the *TZ* variable is unset or NULL, an unspecified system default timezone is used.

### 83502 **ASYNCHRONOUS EVENTS**

83503 If SIGINT is caught, temporary files shall be cleaned up and *delta* shall exit with a non-zero exit  
83504 code. The standard action shall be taken for all other signals; see [Section 1.4](#) (on page 2288).

### 83505 **STDOUT**

83506 The standard output shall be used only for the following messages in the POSIX locale:

- 83507 • Prompts (see the *-m* and *-y* options) in the following formats:

83508 "MRs? "

83509 "comments? "

83510 The MR prompt, if written, shall always precede the comments prompt.

- 83511 • A report of each file's activities (unless the *-s* option is specified) in the following format:

83512 "%s\n%d inserted\n%d deleted\n%d unchanged\n", <New SID>,  
83513 <number of lines inserted>, <number of lines deleted>,  
83514 <number of lines unchanged>

### 83515 **STDERR**

83516 The standard error shall be used only for diagnostic messages.

### 83517 **OUTPUT FILES**

83518 Any SCCS files updated shall be files of an unspecified format.

### 83519 **EXTENDED DESCRIPTION**

#### 83520 **System Date and Time**

83521 When a *delta* is added to an SCCS file, the system date and time shall be recorded for the new  
83522 delta. If a *get* is performed using an SCCS file with a date recorded apparently in the future, the  
83523 behavior is unspecified.

### 83524 **EXIT STATUS**

83525 The following exit values shall be returned:

83526 0 Successful completion.

83527 >0 An error occurred.

### 83528 **CONSEQUENCES OF ERRORS**

83529 Default.

### 83530 **APPLICATION USAGE**

83531 Problems can arise if the system date and time have been modified (for example, put forward  
83532 and then back again, or unsynchronized clocks across a network) and can also arise when  
83533 different values of the *TZ* environment variable are used.

83534 Problems of a similar nature can also arise for the operation of the *get* utility, which records the  
83535 date and time in the file body.

### 83536 **EXAMPLES**

83537 None.

|       |                                                                                                                                                                                                                                                                                 |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 83538 | <b>RATIONALE</b>                                                                                                                                                                                                                                                                |
| 83539 | None.                                                                                                                                                                                                                                                                           |
| 83540 | <b>FUTURE DIRECTIONS</b>                                                                                                                                                                                                                                                        |
| 83541 | None.                                                                                                                                                                                                                                                                           |
| 83542 | <b>SEE ALSO</b>                                                                                                                                                                                                                                                                 |

| 83544 | XBD Chapter 8 (on page 173), Section 12.2 (on page 215)                                                                                                                                                                                                                         |
| 83545 | <b>CHANGE HISTORY</b>                                                                                                                                                                                                                                                           |
| 83546 | First released in Issue 2.                                                                                                                                                                                                                                                      |
| 83547 | <b>Issue 5</b>                                                                                                                                                                                                                                                                  |
| 83548 | The output format description in the STDOUT section is corrected.                                                                                                                                                                                                               |
| 83549 | <b>Issue 6</b>                                                                                                                                                                                                                                                                  |
| 83550 | The APPLICATION USAGE section is added.                                                                                                                                                                                                                                         |
| 83551 | The normative text is reworded to avoid use of the term “must” for application requirements.                                                                                                                                                                                    |
| 83552 | The Open Group Base Resolution bwg2001-007 is applied as follows:                                                                                                                                                                                                               |
| 83553 | • The use of ‘-’ as a file argument is clarified.                                                                                                                                                                                                                               |
| 83554 | • The use of STDIN is added.                                                                                                                                                                                                                                                    |
| 83555 | • The ASYNCHRONOUS EVENTS section is updated to remove the implicit requirement that implementations re-signal themselves when catching a normally fatal signal.                                                                                                                |
| 83556 |                                                                                                                                                                                                                                                                                 |
| 83557 | • New text is added to the INPUT FILES section warning that the maximum lines recorded in the file is 99 999.                                                                                                                                                                   |
| 83558 |                                                                                                                                                                                                                                                                                 |
| 83559 | New text is added to the EXTENDED DESCRIPTION and APPLICATION USAGE sections regarding how the system date and time may be taken into account, and the TZ environment variable is added to the ENVIRONMENT VARIABLES section as per The Open Group Base Resolution bwg2001-007. |
| 83560 |                                                                                                                                                                                                                                                                                 |
| 83561 |                                                                                                                                                                                                                                                                                 |
| 83562 |                                                                                                                                                                                                                                                                                 |
| 83563 | <b>Issue 7</b>                                                                                                                                                                                                                                                                  |
| 83564 | SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.                                                                                                                                                                                                                               |

83565 **NAME**

83566 df — report free disk space

83567 **SYNOPSIS**83568 XSI df [-k] [-P|-t] [*file*...]83569 **DESCRIPTION**

83570 XSI The *df* utility shall write the amount of available space and file slots for file systems on which  
 83571 the invoking user has appropriate read access. File systems shall be specified by the *file*  
 83572 operands; when none are specified, information shall be written for all file systems. The format  
 83573 of the default output from *df* is unspecified, but all space figures are reported in 512-byte units,  
 83574 unless the *-k* option is specified. This output shall contain at least the file system names, amount  
 83575 XSI of available space on each of these file systems, and the number of free file slots, or *inodes*,  
 83576 available; when *-t* is specified, the output shall contain the total allocated space as well.

83577 **OPTIONS**83578 The *df* utility shall conform to XBD Section 12.2 (on page 215).

83579 The following options shall be supported:

83580 *-k* Use 1 024-byte units, instead of the default 512-byte units, when writing space  
 83581 figures.83582 *-P* Produce output in the format described in the STDOUT section.83583 XSI *-t* Include total allocated-space figures in the output.83584 **OPERANDS**

83585 The following operand shall be supported:

83586 *file* A pathname of a file within the hierarchy of the desired file system. If a file other than a FIFO, a regular file, a directory, or a special file representing the device  
 83587 XSI containing the file system (for example, */dev/dsk/0s1*) is specified, the results are  
 83588 unspecified. If the *file* operand names a file other than a special file containing a file  
 83589 system, *df* shall write the amount of free space in the file system containing the  
 83590 specified *file* operand. Otherwise, *df* shall write the amount of free space in that  
 83591 XSI file system.  
 83592

83593 **STDIN**

83594 Not used.

83595 **INPUT FILES**

83596 None.

83597 **ENVIRONMENT VARIABLES**83598 The following environment variables shall affect the execution of *df*:

83599 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 83600 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 83601 variables used to determine the values of locale categories.)

83602 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 83603 internationalization variables.

83604 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 83605 characters (for example, single-byte as opposed to multi-byte characters in  
 83606 arguments).

- 83607 *LC\_MESSAGES*
- 83608 Determine the locale that should be used to affect the format and contents of
- 83609 diagnostic messages written to standard error and informative messages written to
- 83610 standard output.
- 83611 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 83612 **ASYNCHRONOUS EVENTS**
- 83613 Default.
- 83614 **STDOUT**
- 83615 When both the *-k* and *-P* options are specified, the following header line shall be written (in the
- 83616 POSIX locale):
- 83617 "Filesystem 1024-blocks Used Available Capacity Mounted on\n"
- 83618 When the *-P* option is specified without the *-k* option, the following header line shall be written
- 83619 (in the POSIX locale):
- 83620 "Filesystem 512-blocks Used Available Capacity Mounted on\n"
- 83621 The implementation may adjust the spacing of the header line and the individual data lines so
- 83622 that the information is presented in orderly columns.
- 83623 The remaining output with *-P* shall consist of one line of information for each specified file
- 83624 system. These lines shall be formatted as follows:
- 83625 "%s %d %d %d %d%% %s\n", *<file system name>*, *<total space>*,
- 83626 *<space used>*, *<space free>*, *<percentage used>*,
- 83627 *<file system root>*
- 83628 In the following list, all quantities expressed in 512-byte units (1 024-byte when *-k* is specified)
- 83629 shall be rounded up to the next higher unit. The fields are:
- 83630 *<file system name>*
- 83631 The name of the file system, in an implementation-defined format.
- 83632 *<total space>* The total size of the file system in 512-byte units. The exact meaning of this figure
- 83633 is implementation-defined, but should include *<space used>*, *<space free>*, plus any
- 83634 space reserved by the system not normally available to a user.
- 83635 *<space used>* The total amount of space allocated to existing files in the file system, in 512-byte
- 83636 units.
- 83637 *<space free>* The total amount of space available within the file system for the creation of new
- 83638 files by unprivileged users, in 512-byte units. When this figure is less than or equal
- 83639 to zero, it shall not be possible to create any new files on the file system without
- 83640 first deleting others, unless the process has appropriate privileges. The figure
- 83641 written may be less than zero.
- 83642 *<percentage used>*
- 83643 The percentage of the normally available space that is currently allocated to all files
- 83644 on the file system. This shall be calculated using the fraction:
- 83645 
$$\frac{\textit{<space used>}}{\textit{<space used> + <space free>}}$$
- 83646 expressed as a percentage. This percentage may be greater than 100 if *<space free>*
- 83647 is less than zero. The percentage value shall be expressed as a positive integer, with
- 83648 any fractional result causing it to be rounded to the next highest integer.

- 83649 <*file system root*>  
 83650 The directory below which the file system hierarchy appears.
- 83651 XSI The output format is unspecified when `-t` is used.
- 83652 **STDERR**  
 83653 The standard error shall be used only for diagnostic messages.
- 83654 **OUTPUT FILES**  
 83655 None.
- 83656 **EXTENDED DESCRIPTION**  
 83657 None.
- 83658 **EXIT STATUS**  
 83659 The following exit values shall be returned:
- 83660 0 Successful completion.  
 83661 >0 An error occurred.
- 83662 **CONSEQUENCES OF ERRORS**  
 83663 Default.
- 83664 **APPLICATION USAGE**  
 83665 On most systems, the “name of the file system, in an implementation-defined format” is the  
 83666 special file on which the file system is mounted.
- 83667 On large file systems, the calculation specified for percentage used can create huge rounding  
 83668 errors.
- 83669 **EXAMPLES**
- 83670 1. The following example writes portable information about the `/usr` file system:  
 83671 `df -P /usr`
- 83672 2. Assuming that `/usr/src` is part of the `/usr` file system, the following produces the same  
 83673 output as the previous example:  
 83674 `df -P /usr/src`
- 83675 **RATIONALE**  
 83676 The behavior of `df` with the `-P` option is the default action of the 4.2 BSD `df` utility. The uppercase  
 83677 `-P` was selected to avoid collision with a known industry extension using `-p`.
- 83678 Historical `df` implementations vary considerably in their default output. It was therefore  
 83679 necessary to describe the default output in a loose manner to accommodate all known historical  
 83680 implementations and to add a portable option (`-P`) to provide information in a portable format.
- 83681 The use of 512-byte units is historical practice and maintains compatibility with `ls` and other  
 83682 utilities in this volume of POSIX.1-2008. This does not mandate that the file system itself be  
 83683 based on 512-byte blocks. The `-k` option was added as a compromise measure. It was agreed by  
 83684 the standard developers that 512 bytes was the best default unit because of its complete  
 83685 historical consistency on System V (*versus* the mixed 512/1 024-byte usage on BSD systems), and  
 83686 that a `-k` option to switch to 1 024-byte units was a good compromise. Users who prefer the  
 83687 more logical 1 024-byte quantity can easily alias `df` to `df -k` without breaking many historical  
 83688 scripts relying on the 512-byte units.
- 83689 It was suggested that `df` and the various related utilities be modified to access a `BLOCKSIZE`  
 83690 environment variable to achieve consistency and user acceptance. Since this is not historical

**df**

- 83691 practice on any system, it is left as a possible area for system extensions and will be re-evaluated  
83692 in a future version if it is widely implemented.
- 83693 **FUTURE DIRECTIONS**  
83694 None.
- 83695 **SEE ALSO**  
83696 *find*  
83697 XBD [Chapter 8](#) (on page 173), [Section 12.2](#) (on page 215)
- 83698 **CHANGE HISTORY**  
83699 First released in Issue 2.
- 83700 **Issue 6**  
83701 This utility is marked as part of the User Portability Utilities option.
- 83702 **Issue 7**  
83703 Austin Group Interpretation 1003.1-2001 #099 is applied.  
83704 The *df* utility is removed from the User Portability Utilities option. User Portability Utilities is  
83705 now an option for interactive utilities.  
83706 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83707 **NAME**

83708 diff — compare two files

83709 **SYNOPSIS**

83710 diff [-c|-e|-f|-u|-C n|-U n] [-br] file1 file2

83711 **DESCRIPTION**

83712 The *diff* utility shall compare the contents of *file1* and *file2* and write to standard output a list of  
 83713 changes necessary to convert *file1* into *file2*. This list should be minimal. No output shall be  
 83714 produced if the files are identical.

83715 **OPTIONS**83716 The *diff* utility shall conform to XBD Section 12.2 (on page 215).

83717 The following options shall be supported:

83718 **-b** Cause any amount of white space at the end of a line to be treated as a single  
 83719 <newline> (that is, the white-space characters preceding the <newline> are  
 83720 ignored) and other strings of white-space characters, not including <newline>  
 83721 characters, to compare equal.

83722 **-c** Produce output in a form that provides three lines of copied context.

83723 **-C n** Produce output in a form that provides *n* lines of copied context (where *n* shall be  
 83724 interpreted as a positive decimal integer).

83725 **-e** Produce output in a form suitable as input for the *ed* utility, which can then be used  
 83726 to convert *file1* into *file2*.

83727 **-f** Produce output in an alternative form, similar in format to **-e**, but not intended to  
 83728 be suitable as input for the *ed* utility, and in the opposite order.

83729 **-r** Apply *diff* recursively to files and directories of the same name when *file1* and *file2*  
 83730 are both directories.

83731 The *diff* utility shall detect infinite loops; that is, entering a previously visited  
 83732 directory that is an ancestor of the last file encountered. When it detects an infinite  
 83733 loop, *diff* shall write a diagnostic message to standard error and shall either recover  
 83734 its position in the hierarchy or terminate.

83735 **-u** Produce output in a form that provides three lines of unified context.

83736 **-U n** Produce output in a form that provides *n* lines of unified context (where *n* shall be  
 83737 interpreted as a non-negative decimal integer).

83738 **OPERANDS**

83739 The following operands shall be supported:

83740 *file1, file2* A pathname of a file to be compared. If either the *file1* or *file2* operand is '-', the  
 83741 standard input shall be used in its place.

83742 If both *file1* and *file2* are directories, *diff* shall not compare block special files, character special  
 83743 files, or FIFO special files to any files and shall not compare regular files to directories. Further  
 83744 details are as specified in Diff Directory Comparison Format (on page 2600). The behavior of *diff*  
 83745 on other file types is implementation-defined when found in directories.

83746 If only one of *file1* and *file2* is a directory, *diff* shall be applied to the non-directory file and the file  
 83747 contained in the directory file with a filename that is the same as the last component of the non-  
 83748 directory file.

**diff**

- 83749 **STDIN**  
 83750 The standard input shall be used only if one of the *file1* or *file2* operands references standard  
 83751 input. See the INPUT FILES section.
- 83752 **INPUT FILES**  
 83753 The input files may be of any type.
- 83754 **ENVIRONMENT VARIABLES**  
 83755 The following environment variables shall affect the execution of *diff*:
- 83756 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 83757 (See XBD Section 8.2 (on page 174) for the precedence of internationalization  
 83758 variables used to determine the values of locale categories.)
- 83759 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 83760 internationalization variables.
- 83761 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 83762 characters (for example, single-byte as opposed to multi-byte characters in  
 83763 arguments and input files).
- 83764 *LC\_MESSAGES*  
 83765 Determine the locale that should be used to affect the format and contents of  
 83766 diagnostic messages written to standard error and informative messages written to  
 83767 standard output.
- 83768 *LC\_TIME* Determine the locale for affecting the format of file timestamps written with the *-C*  
 83769 and *-c* options.
- 83770 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 83771 *TZ* Determine the timezone used for calculating file timestamps written with a context  
 83772 format. If *TZ* is unset or null, an unspecified default timezone shall be used.
- 83773 **ASYNCHRONOUS EVENTS**  
 83774 Default.
- 83775 **STDOUT**
- 83776 **Diff Directory Comparison Format**  
 83777 If both *file1* and *file2* are directories, the following output formats shall be used.  
 83778 In the POSIX locale, each file that is present in only one directory shall be reported using the  
 83779 following format:  
 83780 "Only in %s: %s\n", <directory pathname>, <filename>  
 83781 In the POSIX locale, subdirectories that are common to the two directories may be reported with  
 83782 the following format:  
 83783 "Common subdirectories: %s and %s\n", <directory1 pathname>,  
 83784 <directory2 pathname>  
 83785 For each file common to the two directories, if the two files are not to be compared: if the two  
 83786 files have the same device ID and file serial number, or are both block special files that refer to  
 83787 the same device, or are both character special files that refer to the same device, in the POSIX  
 83788 locale the output format is unspecified. Otherwise, in the POSIX locale an unspecified format  
 83789 shall be used that contains the pathnames of the two files.  
 83790 For each file common to the two directories, if the files are compared and are identical, no

83791 output shall be written. If the two files differ, the following format is written:

83792 "diff %s %s %s\n", <diff\_options>, <filename1>, <filename2>

83793 where <diff\_options> are the options as specified on the command line.

83794 All directory pathnames listed in this section shall be relative to the original command line  
83795 arguments. All other names of files listed in this section shall be filenames (pathname  
83796 components).

#### 83797 **Diff Binary Output Format**

83798 In the POSIX locale, if one or both of the files being compared are not text files, it is  
83799 implementation-defined whether *diff* uses the binary file output format or the other formats as  
83800 specified below. The binary file output format shall contain the pathnames of two files being  
83801 compared and the string "differ".

83802 If both files being compared are text files, depending on the options specified, one of the  
83803 following formats shall be used to write the differences.

#### 83804 **Diff Default Output Format**

83805 The default (without *-e*, *-f*, *-c*, *-C*, *-u*, or *-U* options) *diff* utility output shall contain lines of  
83806 these forms:

83807 "%da%d\n", <num1>, <num2>

83808 "%da%d,%d\n", <num1>, <num2>, <num3>

83809 "%dd%d\n", <num1>, <num2>

83810 "%d,%dd%d\n", <num1>, <num2>, <num3>

83811 "%dc%d\n", <num1>, <num2>

83812 "%d,%dc%d\n", <num1>, <num2>, <num3>

83813 "%dc%d,%d\n", <num1>, <num2>, <num3>

83814 "%d,%dc%d,%d\n", <num1>, <num2>, <num3>, <num4>

83815 These lines resemble *ed* subcommands to convert *file1* into *file2*. The line numbers before the  
83816 action letters shall pertain to *file1*; those after shall pertain to *file2*. Thus, by exchanging *a* for *d*  
83817 and reading the line in reverse order, one can also determine how to convert *file2* into *file1*. As in  
83818 *ed*, identical pairs (where *num1*=*num2*) are abbreviated as a single number.

83819 Following each of these lines, *diff* shall write to standard output all lines affected in the first file  
83820 using the format:

83821 "<Δ%s", <line>

83822 and all lines affected in the second file using the format:

83823 ">Δ%s", <line>

83824 If there are lines affected in both *file1* and *file2* (as with the *c* subcommand), the changes are  
83825 separated with a line consisting of three <hyphen> characters:

83826 "---\n"

83827 **Diff -e Output Format**

83828 With the `-e` option, a script shall be produced that shall, when provided as input to `ed`, along  
 83829 with an appended `w` (write) command, convert *file1* into *file2*. Only the `a` (append), `c` (change), `d`  
 83830 (delete), `i` (insert), and `s` (substitute) commands of `ed` shall be used in this script. Text lines,  
 83831 except those consisting of the single character <period> (`'.'`), shall be output as they appear in  
 83832 the file.

83833 **Diff -f Output Format**

83834 With the `-f` option, an alternative format of script shall be produced. It is similar to that  
 83835 produced by `-e`, with the following differences:

- 83836 1. It is expressed in reverse sequence; the output of `-e` orders changes from the end of the  
 83837 file to the beginning; the `-f` from beginning to end.
- 83838 2. The command form `<lines> <command-letter>` used by `-e` is reversed. For example,  
 83839 `10c` with `-e` would be `c10` with `-f`.
- 83840 3. The form used for ranges of line numbers is `<space>`-separated, rather than  
 83841 `<comma>`-separated.

83842 **Diff -c or -C Output Format**

83843 With the `-c` or `-C` option, the output format shall consist of affected lines along with  
 83844 surrounding lines of context. The affected lines shall show which ones need to be deleted or  
 83845 changed in *file1*, and those added from *file2*. With the `-c` option, three lines of context, if  
 83846 available, shall be written before and after the affected lines. With the `-C` option, the user can  
 83847 specify how many lines of context are written. The exact format follows.

83848 The name and last modification time of each file shall be output in the following format:

```
83849 "*** %s %s\n", file1, <file1 timestamp>
83850 "--- %s %s\n", file2, <file2 timestamp>
```

83851 Each `<file>` field shall be the pathname of the corresponding file being compared. The pathname  
 83852 written for standard input is unspecified.

83853 In the POSIX locale, each `<timestamp>` field shall be equivalent to the output from the following  
 83854 command:

```
83855 date "+%a %b %e %T %Y"
```

83856 without the trailing `<newline>`, executed at the time of last modification of the corresponding  
 83857 file (or the current time, if the file is standard input).

83858 Then, the following output formats shall be applied for every set of changes.

83859 First, a line shall be written in the following format:

```
83860 "*****\n"
```

83861 Next, the range of lines in *file1* shall be written in the following format if the range contains two  
 83862 or more lines:

```
83863 "*** %d,%d ****\n", <beginning line number>, <ending line number>
```

83864 and the following format otherwise:

```
83865 "*** %d ****\n", <ending line number>
```

83866 The ending line number of an empty range shall be the number of the preceding line, or 0 if the

83867 range is at the start of the file.

83868 Next, the affected lines along with lines of context (unaffected lines) shall be written. Unaffected  
83869 lines shall be written in the following format:

83870 " $\Delta\Delta\%s$ ", <unaffected\_line>

83871 Deleted lines shall be written as:

83872 " $-\Delta\%s$ ", <deleted\_line>

83873 Changed lines shall be written as:

83874 " $!\Delta\%s$ ", <changed\_line>

83875 Next, the range of lines in *file2* shall be written in the following format if the range contains two  
83876 or more lines:

83877 " $---\ %d,\%d\ ----\ \backslash n$ ", <beginning line number>, <ending line number>

83878 and the following format otherwise:

83879 " $---\ %d\ ----\ \backslash n$ ", <ending line number>

83880 Then, lines of context and changed lines shall be written as described in the previous formats.  
83881 Lines added from *file2* shall be written in the following format:

83882 " $+\Delta\%s$ ", <added\_line>

83883 **Diff  $-u$  or  $-U$  Output Format**

83884 The  $-u$  or  $-U$  options behave like the  $-c$  or  $-C$  options, except that the context lines are not  
83885 repeated; instead, the context, deleted, and added lines are shown together, interleaved. The  
83886 exact format follows.

83887 The name and last modification time of each file shall be output in the following format:

83888 " $---\ \Delta\%s\%s\%s\ \Delta\%s0$ , *file1*, <file1 timestamp>, <file1 frac>, <file1 zone>  
83889 " $+++ \Delta\%s\%s\%s\ \Delta\%s0$ , *file2*, <file2 timestamp>, <file2 frac>, <file2 zone>

83890 Each <*file*> field shall be the pathname of the corresponding file being compared, or the single  
83891 character ' $-$ ' if standard input is being compared. However, if the pathname contains a <tab>  
83892 or a <newline> or if it does not consist entirely of characters taken from the portable character  
83893 set, the behavior is implementation-defined.

83894 Each <*timestamp*> field shall be equivalent to the output from the following command:

83895 `date '+%Y-%m-%d\ \Delta\%H:\%M:\%S'`

83896 without the trailing <newline>, executed at the time of last modification of the corresponding  
83897 file (or the current time, if the file is standard input).

83898 Each <*frac*> field shall be either empty, or a decimal point followed by at least one decimal digit,  
83899 indicating the fractional-seconds part (if any) of the file timestamp. The number of fractional  
83900 digits shall be at least the number needed to represent the file's timestamp without loss of  
83901 information.

83902 Each <*zone*> field shall be of the form "*shhmm*", where "*shh*" is a signed two-digit decimal  
83903 number in the range  $-24$  through  $+25$ , and "*mm*" is an unsigned two-digit decimal number in the  
83904 range 00 through 59. It represents the timezone of the timestamp as the number of hours (hh)  
83905 and minutes (mm) east (+) or west ( $-$ ) of UTC for the timestamp. If the hours and minutes are  
83906 both zero, the sign shall be ' $+$ '. However, if the timezone is not an integral number of minutes

**diff**

- 83907 away from UTC, the `<zone>` field is implementation-defined.
- 83908 Then, the following output formats shall be applied for every set of changes.
- 83909 First, the range of lines in each file shall be written in the following format:
- 83910 "@@Δ-%sΔ+%sΔ@@", `<file1 range>`, `<file2 range>`
- 83911 Each `<range>` field shall be of the form:
- 83912 "%ld", `<beginning line number>`
- 83913 if the range contains exactly one line, and:
- 83914 "%ld,%ld", `<beginning line number>`, `<number of lines>`
- 83915 otherwise. If a range is empty, its beginning line number shall be the number of the line just before the range, or 0 if the empty range starts the file.
- 83917 Next, the affected lines along with lines of context shall be written. Each non-empty unaffected line shall be written in the following format:
- 83918 "Δ%s", `<unaffected_line>`
- 83919 where the contents of the unaffected line shall be taken from `file1`. It is implementation-defined whether an empty unaffected line is written as an empty line or a line containing a single `<space>` character. This line also represents the same line of `file2`, even though `file2`'s line may contain different contents due to the `-b`. Deleted lines shall be written as:
- 83924 "-%s", `<deleted_line>`
- 83925 Added lines shall be written as:
- 83926 "+%s", `<added_line>`
- 83927 The order of lines written shall be the same as that of the corresponding file. A deleted line shall never be written immediately after an added line.
- 83929 If `-U n` is specified, the output shall contain no more than `n` consecutive unaffected lines; and if the output contains an affected line and this line is adjacent to up to `n` consecutive unaffected lines in the corresponding file, the output shall contain these unaffected lines. `-u` shall act like `-U3`.
- 83933 **STDERR**
- 83934 The standard error shall be used only for diagnostic messages.
- 83935 **OUTPUT FILES**
- 83936 None.
- 83937 **EXTENDED DESCRIPTION**
- 83938 None.
- 83939 **EXIT STATUS**
- 83940 The following exit values shall be returned:
- 83941 0 No differences were found.
- 83942 1 Differences were found.
- 83943 >1 An error occurred.

83944 **CONSEQUENCES OF ERRORS**

83945 Default.

83946 **APPLICATION USAGE**

83947 If lines at the end of a file are changed and other lines are added, *diff* output may show this as a  
 83948 delete and add, as a change, or as a change and add; *diff* is not expected to know which  
 83949 happened and users should not care about the difference in output as long as it clearly shows  
 83950 the differences between the files.

83951 **EXAMPLES**

83952 If **dir1** is a directory containing a directory named **x**, **dir2** is a directory containing a directory  
 83953 named **x**, **dir1/x** and **dir2/x** both contain files named **date.out**, and **dir2/x** contains a file named **y**,  
 83954 the command:

83955 `diff -r dir1 dir2`

83956 could produce output similar to:

```
83957 Common subdirectories: dir1/x and dir2/x
83958 Only in dir2/x: y
83959 diff -r dir1/x/date.out dir2/x/date.out
83960 1c1
83961 < Mon Jul 2 13:12:16 PDT 1990
83962 ----
83963 > Tue Jun 19 21:41:39 PDT 1990
```

83964 **RATIONALE**

83965 The **-h** option was omitted because it was insufficiently specified and does not add to  
 83966 applications portability.

83967 Historical implementations employ algorithms that do not always produce a minimum list of  
 83968 differences; the current language about making every effort is the best this volume of  
 83969 POSIX.1-2008 can do, as there is no metric that could be employed to judge the quality of  
 83970 implementations against any and all file contents. The statement “This list should be minimal”  
 83971 clearly implies that implementations are not expected to provide the following output when  
 83972 comparing two 100-line files that differ in only one character on a single line:

```
83973 1,100c1,100
83974 all 100 lines from file1 preceded with "< "
83975 ----
83976 all 100 lines from file2 preceded with "> "
```

83977 The “Only in” messages required when the **-r** option is specified are not used by most historical  
 83978 implementations if the **-e** option is also specified. It is required here because it provides useful  
 83979 information that must be provided to update a target directory hierarchy to match a source  
 83980 hierarchy. The “Common subdirectories” messages are written by System V and 4.3 BSD when  
 83981 the **-r** option is specified. They are allowed here but are not required because they are reporting  
 83982 on something that is the same, not reporting a difference, and are not needed to update a target  
 83983 hierarchy.

83984 The **-c** option, which writes output in a format using lines of context, has been included. The  
 83985 format is useful for a variety of reasons, among them being much improved readability and the  
 83986 ability to understand difference changes when the target file has line numbers that differ from  
 83987 another similar, but slightly different, copy. The *patch* utility is most valuable when working  
 83988 with difference listings using a context format. The BSD version of **-c** takes an optional  
 83989 argument specifying the amount of context. Rather than overloading **-c** and breaking the Utility  
 83990 Syntax Guidelines for *diff*, the standard developers decided to add a separate option for

83991 specifying a context diff with a specified amount of context (`-C`). Also, the format for context  
 83992 *diffs* was extended slightly in 4.3 BSD to allow multiple changes that are within context lines  
 83993 from each other to be merged together. The output format contains an additional four `<asterisk>`  
 83994 characters after the range of affected lines in the first filename. This was to provide a flag for old  
 83995 programs (like old versions of *patch*) that only understand the old context format. The version of  
 83996 context described here does not require that multiple changes within context lines be merged,  
 83997 but it does not prohibit it either. The extension is upwards-compatible, so any vendors that wish  
 83998 to retain the old version of *diff* can do so by adding the extra four `<asterisk>` characters (that is,  
 83999 utilities that currently use *diff* and understand the new merged format will also understand the  
 84000 old unmerged format, but not *vice versa*).

84001 The `-u` and `-U` options of GNU *diff* have been included. Their output format, designed by  
 84002 Wayne Davison, takes up less space than `-c` and `-C` format, and in many cases is easier to read.  
 84003 The format's timestamps do not vary by locale, so `LC_TIME` does not affect it. The format's line  
 84004 numbers are rendered with the `%1d` format, not `%d`, because the file format notation rules would  
 84005 allow extra `<blank>` characters to appear around the numbers.

84006 The substitute command was added as an additional format for the `-e` option. This was added  
 84007 to provide implementations with a way to fix the classic "dot alone on a line" bug present in  
 84008 many versions of *diff*. Since many implementations have fixed this bug, the standard developers  
 84009 decided not to standardize broken behavior, but rather to provide the necessary tool for fixing  
 84010 the bug. One way to fix this bug is to output two periods whenever a lone period is needed, then  
 84011 terminate the append command with a period, and then use the substitute command to convert  
 84012 the two periods into one period.

84013 The BSD-derived `-r` option was added to provide a mechanism for using *diff* to compare two file  
 84014 system trees. This behavior is useful, is standard practice on all BSD-derived systems, and is not  
 84015 easily reproducible with the *find* utility.

84016 The requirement that *diff* not compare files in some circumstances, even though they have the  
 84017 same name, is based on the actual output of historical implementations. The specified behavior  
 84018 precludes the problems arising from running into FIFOs and other files that would cause *diff* to  
 84019 hang waiting for input with no indication to the user that *diff* was hung. An earlier version of  
 84020 this standard specified the output format more precisely, but in practice this requirement was  
 84021 widely ignored and the benefit of standardization seemed small, so it is now unspecified. In  
 84022 most common usage, *diff -r* should indicate differences in the file hierarchies, not the difference  
 84023 of contents of devices pointed to by the hierarchies.

84024 Many early implementations of *diff* require seekable files. Since the System Interfaces volume of  
 84025 POSIX.1-2008 supports named pipes, the standard developers decided that such a restriction  
 84026 was unreasonable. Note also that the allowed filename – almost always refers to a pipe.

84027 No directory search order is specified for *diff*. The historical ordering is, in fact, not optimal, in  
 84028 that it prints out all of the differences at the current level, including the statements about all  
 84029 common subdirectories before recursing into those subdirectories.

84030 The message:

84031 `"diff %s %s %s\n", <diff_options>, <filename1>, <filename2>`

84032 does not vary by locale because it is the representation of a command, not an English sentence.

#### 84033 FUTURE DIRECTIONS

84034 None.

84035 **SEE ALSO**84036 *cmp, comm, ed, find*

84037 XBD Chapter 8 (on page 173), Section 12.2 (on page 215)

84038 **CHANGE HISTORY**

84039 First released in Issue 2.

84040 **Issue 5**

84041 The FUTURE DIRECTIONS section is added.

84042 **Issue 6**84043 The following new requirements on POSIX implementations derive from alignment with the  
84044 Single UNIX Specification:

- 84045
- The `-f` option is added.

84046 The output format for `-c` or `-C` format is changed to align with changes to the IEEE P1003.2b  
84047 draft standard resulting from IEEE PASC Interpretation 1003.2 #71.

84048 The normative text is reworded to avoid use of the term “must” for application requirements.

84049 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/20 is applied, changing the STDOUT  
84050 section. This changes the specification of *diff -c* so that it agrees with existing practice when  
84051 contexts contain zero lines or one line.84052 **Issue 7**

84053 Austin Group Interpretations 1003.1-2001 #115 and #114 are applied.

84054 Austin Group Interpretation 1003.1-2001 #192 is applied, clarifying the behavior if both files are  
84055 non-text files.

84056 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

84057 SD5-XCU-ERN-103 and SD5-XCU-ERN-120 are applied, adding the `-u` option.

**dirname**

Utilities

84058 **NAME**

84059           dirname — return the directory portion of a pathname

84060 **SYNOPSIS**84061           dirname *string*84062 **DESCRIPTION**

84063           The *string* operand shall be treated as a pathname, as defined in XBD Section 3.266 (on page 75).  
 84064           The string *string* shall be converted to the name of the directory containing the filename  
 84065           corresponding to the last pathname component in *string*, performing actions equivalent to the  
 84066           following steps in order:

- 84067           1. If *string* is //, skip steps 2 to 5.
- 84068           2. If *string* consists entirely of <slash> characters, *string* shall be set to a single <slash>  
 84069           character. In this case, skip steps 3 to 8.
- 84070           3. If there are any trailing <slash> characters in *string*, they shall be removed.
- 84071           4. If there are no <slash> characters remaining in *string*, *string* shall be set to a single  
 84072           <period> character. In this case, skip steps 5 to 8.
- 84073           5. If there are any trailing non-<slash> characters in *string*, they shall be removed.
- 84074           6. If the remaining *string* is //, it is implementation-defined whether steps 7 and 8 are  
 84075           skipped or processed.
- 84076           7. If there are any trailing <slash> characters in *string*, they shall be removed.
- 84077           8. If the remaining *string* is empty, *string* shall be set to a single <slash> character.

84078           The resulting string shall be written to standard output.

84079 **OPTIONS**

84080           None.

84081 **OPERANDS**

84082           The following operand shall be supported:

84083           *string*           A string.84084 **STDIN**

84085           Not used.

84086 **INPUT FILES**

84087           None.

84088 **ENVIRONMENT VARIABLES**84089           The following environment variables shall affect the execution of *dirname*:

- |       |                 |                                                                                                                                                                                                                                          |
|-------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 84090 | <i>LANG</i>     | Provide a default value for the internationalization variables that are unset or null.<br>(See XBD Section 8.2 (on page 174) for the precedence of internationalization<br>variables used to determine the values of locale categories.) |
