## Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information contained in its standards.

The main task of ISO/IEC JTC 1 is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is called to the possibility that implementation of this standard may require the use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. ISO/IEEE is not responsible for identifying essential patents or patent claims for which a license may be required, for conducting inquiries into the legal validity or scope of patents or patent claims or determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance or a Patent Statement and Licensing Declaration Form, if any, or in any licensing agreements are reasonable or non-discriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from ISO or the IEEE Standards Association.

ISO/IEC/IEEE 9945 was prepared by The Open Group (as The Open Group Technical Standard Base Specifications, Issue 7) and the Portable Applications Standards Committee of the Computer Society of the IEEE (as IEEE Std 1003.1™-2008). It was adopted by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 22, *Programming languages, their environments and system software interfaces*, in parallel with its approval by the ISO/IEC national bodies, under the “fast-track procedure” defined in the Partner Standards Development Organization cooperation agreement between ISO and IEEE. IEEE is responsible for the maintenance of this document with participation and input from ISO/IEC national bodies.

This first edition of ISO/IEC/IEEE 9945 cancels and replaces ISO/IEC 9945-1:2003, ISO/IEC 9945-2:2003, ISO/IEC 9945-3:2003 and ISO/IEC 9945-4:2003, which have been technically revised. It also incorporates the Technical Corrigenda ISO/IEC 9945-1:2003/Cor.1:2004, ISO/IEC 9945-2:2003/Cor.1:2004, ISO/IEC 9945-3:2003/Cor.1:2004 and ISO/IEC 9945-4:2003/Cor.1:2004.

## Abstract

POSIX.1-2008 is simultaneously IEEE Std 1003.1™-2008 and The Open Group Technical Standard Base Specifications, Issue 7.

POSIX.1-2008 defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. POSIX.1-2008 is intended to be used by both application developers and system implementors and comprises four major components (each in an associated volume):

- General terms, concepts, and interfaces common to all volumes of this standard, including utility conventions and C-language header definitions, are included in the Base Definitions volume.
- Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume.
- Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume.
- Extended rationale that did not fit well into the rest of the document structure, which contains historical information concerning the contents of POSIX.1-2008 and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume.

The following areas are outside the scope of POSIX.1-2008:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

POSIX.1-2008 describes the external characteristics and facilities that are of importance to application developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

## Keywords

application program interface (API), argument, asynchronous, basic regular expression (BRE), batch job, batch system, built-in utility, byte, child, command language interpreter, CPU, extended regular expression (ERE), FIFO, file access control mechanism, input/output (I/O), job control, network, portable operating system interface (POSIX®), parent, shell, stream, string, synchronous, system, thread, X/Open System Interface (XSI)

## IEEE

IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information contained in its standards.

Use of an IEEE Standard is wholly voluntary. The IEEE disclaims liability for any personal injury, property, or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon this, or any other IEEE Standard document.

The IEEE does not warrant or represent the accuracy or content of the material contained herein, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained herein is free from patent infringement. IEEE Standards documents are supplied "AS IS".

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least every five years for revision or reaffirmation. When a document is more than five years old and has not been reaffirmed, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE Standard.

In publishing and making this document available, the IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Nor is the IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing this, and any other IEEE Standards document, should rely upon the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

Interpretations: Occasionally questions may arise regarding the meaning of portions of standards as they relate to specific applications. When the need for interpretations is brought to the attention of IEEE, the Institute will initiate action to prepare appropriate responses. Since IEEE Standards represent a consensus of concerned interests, it is important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to interpretation requests except in those cases where the matter has previously received formal consideration. At lectures, symposia, seminars, or educational courses, an individual presenting information on IEEE Standards shall make it clear that his or her views should be considered the personal views of that individual rather than the formal position, explanation, or interpretation of the IEEE.

Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation with IEEE.<sup>A</sup> Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Comments on standards and requests for interpretations should be addressed to:

Secretary, IEEE-SA Standards Board  
445 Hoes Lane  
Piscataway, NJ 08854  
USA

Authorization to photocopy portions of any individual standard for internal or personal use is granted by the Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to Copyright Clearance Center. To arrange for payment of licensing fee, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.

<sup>A</sup> For this standard please send comments via the Austin Group, as indicated on page ii.

## The Open Group

The Open Group is a vendor-neutral and technology-neutral consortium, whose vision of Boundaryless Information Flow™ will enable access to integrated information within and between enterprises based on open standards and global interoperability. The Open Group works with customers, suppliers, consortia, and other standards bodies. Its role is to capture, understand, and address current and emerging requirements, establish policies, and share best practices; to facilitate interoperability, develop consensus, and evolve and integrate specifications and Open Source technologies; to offer a comprehensive set of services to enhance the operational efficiency of consortia; and to operate the industry's premier certification service, including UNIX® certification.

Further information on The Open Group is available at [www.opengroup.org](http://www.opengroup.org).

The Open Group has over 20 years' experience in developing and operating certification programs and has extensive experience developing and facilitating industry adoption of test suites used to validate conformance to an open standard or specification.

The Open Group publishes a wide range of technical documentation, the main part of which is focused on development of Technical and Product Standards and Guides, but which also includes white papers, technical studies, branding and testing documentation, and business titles. Full details and a catalog are available at [www.opengroup.org/bookstore](http://www.opengroup.org/bookstore).

As with all *live* documents, Technical Standards and Specifications require revision to align with new developments and associated international standards. To distinguish between revised specifications which are fully backwards compatible and those which are not:

- A new *Version* indicates there is no change to the definitive information contained in the previous publication of that title, but additions/extensions are included. As such, it *replaces* the previous publication.
- A new *Issue* indicates there is substantive change to the definitive information contained in the previous publication of that title, and there may also be additions/extensions. As such, both previous and new documents are maintained as current publications.

Readers should note that Corrigenda may apply to any publication. Corrigenda information is published at [www.opengroup.org/corrigenda](http://www.opengroup.org/corrigenda).

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

## Introduction

This introduction is not part of POSIX.1-2008, Standard for Information Technology – Portable Operating System Interface (POSIX).

This standard was developed, and is maintained, by a joint working group of members of the IEEE Portable Applications Standards Committee, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1. This joint working group is known as the Austin Group.<sup>B</sup>

The Austin Group arose out of discussions amongst the parties which started in early 1998, leading to an initial meeting and formation of the group in September 1998. The purpose of the Austin Group is to develop and maintain the core open systems interfaces that are the POSIX<sup>®</sup> 1003.1 (and former 1003.2) standards, ISO/IEC 9945, and the core of the Single UNIX Specification.

The approach to specification development has been one of “write once, adopt everywhere”, with the deliverables being a set of specifications that carry the IEEE POSIX designation, The Open Group's Technical Standard designation, and an ISO/IEC designation.

This unique development has combined both the industry-led efforts and the formal standardization activities into a single initiative, and included a wide spectrum of participants. The Austin Group continues as the maintenance body for this document.

Anyone wishing to participate in the Austin Group should contact the chair with their request. There are no fees for participation or membership. You may participate as an observer or as a contributor. You do not have to attend face-to-face meetings to participate; electronic participation is most welcome. For more information on the Austin Group and how to participate, see [www.opengroup.org/austin](http://www.opengroup.org/austin).

## Background

The developers of POSIX.1-2008 represent a cross-section of hardware manufacturers, vendors of operating systems and other software development tools, software designers, consultants, academics, authors, applications programmers, and others.

Conceptually, POSIX.1-2008 describes a set of fundamental services needed for the efficient construction of application programs. Access to these services has been provided by defining an interface, using the C programming language, a command interpreter, and common utility programs that establish standard semantics and syntax. Since this interface enables application developers to write portable applications – it was developed with that goal in mind – it has been designated POSIX<sup>C</sup>, an acronym for Portable Operating System Interface.

Although originated to refer to the original IEEE Std 1003.1-1988, the name POSIX more correctly refers to a *family* of related standards: IEEE Std 1003.*n* and the parts of ISO/IEC 9945. In earlier editions of the IEEE standard, the term POSIX was used as a synonym for IEEE Std 1003.1-1988. A preferred term, POSIX.1, emerged. This maintained the advantages of readability of the symbol “POSIX” without being ambiguous with the POSIX family of standards.

## Audience

The intended audience for POSIX.1-2008 is all persons concerned with an industry-wide standard operating system based on the UNIX system. This includes at least four groups of people:

- Persons buying hardware and software systems
- Persons managing companies that are deciding on future corporate computing directions
- Persons implementing operating systems, and especially
- Persons developing applications where portability is an objective

<sup>B</sup> The Austin Group is named after the location of the inaugural meeting held at the IBM facility in Austin, Texas in September 1998.

<sup>C</sup> The Name POSIX was suggested by Richard Stallman. It is expected to be pronounced *pahz-icks*, as in *positive*, not *poh-six*, or other variations. The pronunciation has been published in an attempt to promulgate a standardized way of referring to a standard operating system interface.

**Purpose**

Several principles guided the development of POSIX.1-2008:

- Application-Oriented – The basic goal was to promote portability of application programs across UNIX system environments by developing a clear, consistent, and unambiguous standard for the interface specification of a portable operating system based on the UNIX system documentation. POSIX.1-2008 codifies the common, existing definition of the UNIX system.
- Interface, Not Implementation – POSIX.1-2008 defines an interface, not an implementation. No distinction is made between library functions and system calls; both are referred to as functions. No details of the implementation of any function are given (although historical practice is sometimes indicated in the RATIONALE section). Symbolic names are given for constants (such as signals and error numbers) rather than numbers.
- Source, Not Object, Portability – POSIX.1-2008 has been written so that a program written and translated for execution on one conforming implementation may also be translated for execution on another conforming implementation. POSIX.1-2008 does not guarantee that executable (object or binary) code will execute under a different conforming implementation than that for which it was translated, even if the underlying hardware is identical.
- The C Language – The system interfaces and header definitions are written in terms of the standard C language as specified in the ISO C standard.
- No Superuser, No System Administration – There was no intention to specify all aspects of an operating system. System administration facilities and functions are excluded from this standard, and functions usable only by the superuser have not been included. Still, an implementation of the standard interface may also implement features not in POSIX.1-2008. POSIX.1-2008 is also not concerned with hardware constraints or system maintenance.
- Minimal Interface, Minimally Defined – In keeping with the historical design principles of the UNIX system, the mandatory core facilities of POSIX.1-2008 have been kept as minimal as possible. Additional capabilities have been added as optional extensions.
- Broadly Implementable – The developers of POSIX.1-2008 endeavored to make all specified functions implementable across a wide range of existing and potential systems, including:
  - All of the current major systems that are ultimately derived from the original UNIX system code (Version 7 or later)
  - Compatible systems that are not derived from the original UNIX system code
  - Emulations hosted on entirely different operating systems
  - Networked systems
  - Distributed systems
  - Systems running on a broad range of hardware

No direct references to this goal appear in POSIX.1-2008, but some results of it are mentioned in the Rationale (Informative) volume.

- Minimal Changes to Historical Implementations – When the original version – IEEE Std 1003.1-1988 – was published, there were no known historical implementations that did not have to change. However, there was a broad consensus on a set of functions, types, definitions, and concepts that formed an interface that was common to most historical implementations.

The adoption of the 1988 and 1990 IEEE system interface standards, the 1992 IEEE shell and utilities standard, the various Open Group (formerly X/Open) specifications, and IEEE Std 1003.1-2001 and its technical corrigenda have consolidated this consensus, and this version reflects the significantly increased level of consensus arrived at since the original versions. The authors of the original versions tried, as much as possible, to follow the principles below when creating new specifications:

- By standardizing an interface like one in an historical implementation; for example, directories
- By specifying an interface that is readily implementable in terms of, and backwards-compatible with, historical implementations, such as the extended *tar* format defined in the *pax* utility
- By specifying an interface that, when added to an historical implementation, will not conflict with it; for example, the *sigaction()* function

POSIX.1-2008 is specifically not a codification of a particular vendor's product.

It should be noted that implementations will have different kinds of extensions. Some will reflect “historical usage” and will be preserved for execution of pre-existing applications. These functions should be considered “obsolescent” and the standard functions used for new applications. Some extensions will represent functions beyond the scope of POSIX.1-2008. These need to be used with careful management to be able to adapt to future extensions of POSIX.1-2008 and/or port to implementations that provide these services in a different manner.

- Minimal Changes to Existing Application Code – A goal of POSIX.1-2008 was to minimize additional work for application developers. However, because every known historical implementation will have to change at least slightly to conform, some applications will have to change.

### POSIX.1-2008

POSIX.1-2008 defines the Portable Operating System Interface (POSIX) requirements and consists of the following topics arranged as a series of volumes within the standard:

- Base Definitions
- System Interfaces
- Shell and Utilities
- Rationale (Informative)

### Base Definitions

The Base Definitions volume provides common definitions for this standard, therefore readers should be familiar with it before using the other volumes.

This volume is structured as follows:

- Chapter 1 is an introduction.
- Chapter 2 defines the conformance requirements.
- Chapter 3 defines general terms used.
- Chapter 4 describes general concepts used.
- Chapter 5 describes the notation used to specify file input and output formats in this volume and the Shell and Utilities volume.
- Chapter 6 describes the portable character set and the process of character set definition.
- Chapter 7 describes the syntax for defining internationalization locales as well as the POSIX locale provided on all systems.
- Chapter 8 describes the use of environment variables for internationalization and other purposes.
- Chapter 9 describes the syntax of pattern matching using regular expressions employed by many utilities and matched by the *regcomp()* and *regexexec()* functions.
- Chapter 10 describes files and devices found on all systems.
- Chapter 11 describes the asynchronous terminal interface for many of the functions in the System Interfaces volume and the *stty* utility in the Shell and Utilities volume.
- Chapter 12 describes the policies for command line argument construction and parsing.
- Chapter 13 defines the contents of headers which declare the functions and global variables, and define types, constants, macros, and data structures that are needed by programs using the services provided by the System Interfaces volume.

Comprehensive references are available in the index.

### System Interfaces

The System Interfaces volume describes the interfaces offered to application programs by POSIX-conformant systems. Readers are expected to be experienced C language programmers, and to be familiar with the Base Definitions volume.

This volume is structured as follows:

- Chapter 1 explains the status of this volume and its relationship to other formal standards.
- Chapter 2 contains important concepts, terms, and caveats relating to the rest of this volume.
- Chapter 3 defines the functional interfaces to the POSIX-conformant system.

Comprehensive references are available in the index.

### Shell and Utilities

The Shell and Utilities volume describes the commands and utilities offered to application programs on POSIX-conformant systems. Readers are expected to be familiar with the Base Definitions volume.

This volume is structured as follows:

- Chapter 1 explains the status of this volume and its relationship to other formal standards. It also describes the defaults used by the utility descriptions.
- Chapter 2 describes the command language used in POSIX-conformant systems, and special built-in utilities.
- Chapter 3 describes a set of services and utilities that are implemented on systems supporting the Batch Environment Services and Utilities option.
- Chapter 4 consists of reference pages for all utilities, other than the special built-in utilities described in Chapter 2, available on POSIX-conformant systems.

Comprehensive references are available in the index.

### Rationale (Informative)

The Rationale volume is published to assist in the process of review. It contains historical information concerning the contents of this standard and why features were included or discarded by the standard developers. It also contains notes of interest to application programmers on recommended programming practices, emphasizing the consequences of some aspects of POSIX.1-2008 that may not be immediately apparent.

This volume is organized in parallel to the normative volumes of this standard, with a separate part for each of the three normative volumes.

Within this volume, the following terms are used:

- Base standard – The portions of POSIX.1-2008 that are not optional, equivalent to the definitions of *classic* POSIX.1 and POSIX.2.
- POSIX.0 – Although this term is not used in the normative text of POSIX.1-2008, it is used in this volume to refer to IEEE Std 1003.0™-1995.
- POSIX.1b – Although this term is not used in the normative text of POSIX.1-2008, it is used in this volume to refer to the elements of the POSIX Realtime Extension amendment. (This was earlier referred to as POSIX.4 during the standard development process.)
- POSIX.1c – Although this term is not used in the normative text of POSIX.1-2008, it is used in this volume to refer to the POSIX Threads Extension amendment. (This was earlier referred to as POSIX.4a during the standard development process.)
- Standard developers – The individuals and companies in the development organizations responsible for POSIX.1-2008: the IEEE P1003.1 working groups, The Open Group Base working group, advised by the hundreds of individual technical experts who balloted the draft standards within the Austin Group, and the member bodies and technical experts of ISO/IEC JTC 1/SC 22.
- XSI option – The portions of POSIX.1-2008 addressing the extension added for support of the Single UNIX Specification.

### Typographical Conventions

The following typographical conventions are used throughout this standard. In the text, this standard is referred to as POSIX.1-2008, which is technically identical to The Open Group Base Specifications, Issue 7.

The typographical conventions listed here are for ease of reading only. Editorial inconsistencies in the use of typography are unintentional and have no normative meaning in POSIX.1-2008.

Reference	Example	Notes
C-Language Data Structure	<b>aiocb</b>	
C-Language Data Structure Member	<i>aio_lio_opcode</i>	
C-Language Data Type	<b>long</b>	
C-Language External Variable	<i>errno</i>	
C-Language Function	<i>system()</i>	
C-Language Function Argument	<i>arg</i>	
C-Language Function Family	<i>exec</i>	
C-Language Header	<sys/stat.h>	
C-Language Keyword	<b>return</b>	
C-Language Macro with Argument	<i>assert()</i>	
C-Language Macro with No Argument	NET_ADDRSTRLEN	
C-Language Preprocessing Directive	<b>#define</b>	
Commands within a Utility	<b>a, c</b>	
Conversion Specifier, Specifier/Modifier Character	%A, g, E	1
Environment Variable	<i>PATH</i>	
Error Number	[EINTR]	
Example Output	<b>Hello, World</b>	
Filename	<i>/tmp</i>	
Literal Character	'c', '\r'	2
Literal String	"abcde"	2
Optional Items in Utility Syntax	[ ]	
Parameter	<directory pathname>	
Special Character	<newline>	3
Symbolic Constant	_POSIX_VDISABLE	
Symbolic Limit, Configuration Value	{LINE_MAX}	4
Syntax	#include <sys/stat.h>	
User Input and Example Code	echo Hello, World	5
Utility Name	<i>awk</i>	
Utility Operand	<i>file_name</i>	
Utility Option	<b>-c</b>	
Utility Option with Option-Argument	<b>-w width</b>	

Note that:

- Conversion specifications, specifier characters, and modifier characters are used primarily in date-related functions and utilities and the *fprintf()* and *fscanf()* formatting functions.
- Unless otherwise noted, the quotes shall not be used as input or output. When used in a list item, the quotes are omitted. The literal characters <apostrophe> (also known as single-quote) and <backslash> are either shown as the C constants '\ ' and '\\ ', respectively, or as the special characters <apostrophe>, single-quote, and <backslash> depending on context.
- The style selected for some of the special characters, such as <newline>, matches the form of the input given to the *localedef* utility. Generally, the characters selected for this special treatment are those that are not visually distinct, such as the control characters <tab> or <newline>.
- Names surrounded by braces represent symbolic limits or configuration values which may be declared in appropriate headers by means of the C **#define** construct.

5. Brackets shown in this font, " [ ] ", are part of the syntax and do not indicate optional items. In syntax the ' | ' symbol is used to separate alternatives, and ellipses ( " . . . " ) are used to show that additional arguments are optional.

Shading is used to identify extensions and options.

Footnotes and notes within the body of the normative text are for information only (informative).

Informative sections (such as Rationale, Change History, Application Usage, and so on) are denoted by continuous shading bars in the margins.

Ranges of values are indicated with parentheses or brackets as follows:

1.  $(a,b)$  means the range of all values from  $a$  to  $b$ , including neither  $a$  nor  $b$ .
2.  $[a,b]$  means the range of all values from  $a$  to  $b$ , including  $a$  and  $b$ .
3.  $[a,b)$  means the range of all values from  $a$  to  $b$ , including  $a$ , but not  $b$ .
4.  $(a,b]$  means the range of all values from  $a$  to  $b$ , including  $b$ , but not  $a$ .

**Note:** A symbolic limit beginning with POSIX is treated differently, depending on context. In a C-language header, the symbol `POSIXstring` (where *string* may contain underscores) is represented by the C identifier `_POSIXstring`, with a leading underscore required to prevent ISO C standard name space pollution. However, in other contexts, such as languages other than C, the leading underscore is not used because this requirement does not exist.

## Notice to Users

### Laws and Regulations

Users of this document should consult all applicable laws and regulations. Compliance with the provisions of this standard does not imply compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. IEEE and The Open Group do not, by the publication of standards, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

### Copyrights

This document is copyrighted by the IEEE and The Open Group. It is made available for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of engineering practices and methods. By making this document available for use and adoption by public authorities and private users, the IEEE and The Open Group do not waive any rights in copyright to this document.

### Updating of IEEE Documents

Users of IEEE standards should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of amendments, corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the document together with any amendments, corrigenda, or errata then in effect. In order to determine whether a given document is the current edition and whether it has been amended through the issuance of amendments, corrigenda, or errata, visit the IEEE Standards Association web site at [ieeexplore.ieee.org/xpl/standards.jsp](http://ieeexplore.ieee.org/xpl/standards.jsp), or contact the IEEE at the address listed previously.

For more information about the IEEE Standards Association or the IEEE standards development process, visit the IEEE-SA web site at [standards.ieee.org](http://standards.ieee.org).

### Errata

Errata, if any, for this and all other standards can be accessed at the following web site: [standards.ieee.org/reading/ieee/updates/errata](http://standards.ieee.org/reading/ieee/updates/errata). Users are encouraged to check this URL for errata periodically.

### Feedback

POSIX.1-2008 has been prepared by the Austin Group. Feedback relating to the material contained in POSIX.1-2008 may be submitted using the Austin Group web site at [www.opengroup.org/austin/defectform.html](http://www.opengroup.org/austin/defectform.html).

### Interpretations

Current interpretations can be accessed at the following web site: [standards.ieee.org/reading/ieee/interp](http://standards.ieee.org/reading/ieee/interp).

### Patents

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. A patent holder or patent applicant has filed a statement of assurance that it will grant licenses under these rights without compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of any unfair discrimination to applicants desiring to obtain such licenses. Other Essential Patent Claims may exist for which a statement of assurance has not been received. The IEEE and The Open Group are not responsible for identifying Essential Patent Claims for which a license may be required, for conducting inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or conditions are reasonable or non-discriminatory. Further information may be obtained from the IEEE Standards Association and The Open Group.

## 1.1 Scope

POSIX.1-2008 defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. It is intended to be used by both application developers and system implementors.

POSIX.1-2008 comprises four major components (each in an associated volume):

1. General terms, concepts, and interfaces common to all volumes of POSIX.1-2008, including utility conventions and C-language header definitions, are included in the Base Definitions volume of POSIX.1-2008.
2. Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume of POSIX.1-2008.
3. Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume of POSIX.1-2008.
4. Extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of POSIX.1-2008 and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume of POSIX.1-2008.

The following areas are outside of the scope of POSIX.1-2008:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

POSIX.1-2008 describes the external characteristics and facilities that are of importance to application developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

The facilities provided in POSIX.1-2008 are drawn from the following base documents:

- IEEE Std 1003.1, 2004 Edition (POSIX-1) (incorporating IEEE Std 1003.1-2001, IEEE Std 1003.1-2001/Cor 1-2002, and IEEE Std 1003.1-2001/Cor 2-2004)

- 40 • The Open Group Technical Standard, 2006, Extended API Set Part 1
  - 41 • The Open Group Technical Standard, 2006, Extended API Set Part 2
  - 42 • The Open Group Technical Standard, 2006, Extended API Set Part 3
  - 43 • The Open Group Technical Standard, 2006, Extended API Set Part 4
  - 44 • ISO/IEC 9899:1999, Programming Languages — C, including ISO/IEC
  - 45 9899:1999/Cor.1:2001(E), ISO/IEC 9899:1999/Cor.2:2004(E), and ISO/IEC
  - 46 9899:1999/Cor.3
- 47 Emphasis has been placed on standardizing existing practice for existing users, with changes
- 48 and additions limited to correcting deficiencies in the following areas:
- 49 • Issues raised by Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1,
  - 50 and ISO/IEC defect reports against ISO/IEC 9945
  - 51 • Issues raised in corrigenda for The Open Group Technical Standards and working group
  - 52 resolutions from The Open Group
  - 53 • Issues arising from ISO TR 24715:2006, Conflicts between POSIX and the LSB
  - 54 • Changes to make the text self-consistent with the additional material merged
  - 55 • Features, marked Legacy or obsolescent in the base documents, have been considered for
  - 56 removal in this version
  - 57 • A review and reorganization of the options within the standard
  - 58 • Alignment with the ISO/IEC 9899:1999 standard, including ISO/IEC
  - 59 9899:1999/Cor.2:2004(E)

## 60 1.2 Conformance

61 Conformance requirements for POSIX.1-2008 are defined in [Chapter 2](#) (on page 15).

## 62 1.3 Normative References

63 The following standards contain provisions which, through references in POSIX.1-2008,

64 constitute provisions of POSIX.1-2008. At the time of publication, the editions indicated were

65 valid. All standards are subject to revision, and parties to agreements based on POSIX.1-2008 are

66 encouraged to investigate the possibility of applying the most recent editions of the standards

67 listed below. Members of IEC and ISO maintain registers of currently valid International

68 Standards.

89 **1.4 Change History**

90 Change history is described in the Rationale (Informative) volume of POSIX.1-2008, and in the  
91 CHANGE HISTORY section of reference pages.

92 **1.5 Terminology**

93 For the purposes of POSIX.1-2008, the following terminology definitions apply:

94 **can**

95 Describes a permissible optional feature or behavior available to the user or application. The  
96 feature or behavior is mandatory for an implementation that conforms to POSIX.1-2008. An  
97 application can rely on the existence of the feature or behavior.

98 **implementation-defined**

99 Describes a value or behavior that is not defined by POSIX.1-2008 but is selected by an  
100 implementor. The value or behavior may vary among implementations that conform to  
101 POSIX.1-2008. An application should not rely on the existence of the value or behavior. An  
102 application that relies on such a value or behavior cannot be assured to be portable across  
103 conforming implementations.

104 The implementor shall document such a value or behavior so that it can be used correctly  
105 by an application.

106 **legacy**

107 Describes a feature or behavior that is being retained for compatibility with older  
108 applications, but which has limitations which make it inappropriate for developing portable  
109 applications. New applications should use alternative means of obtaining equivalent  
110 functionality.

111 **may**

112 Describes a feature or behavior that is optional for an implementation that conforms to  
113 POSIX.1-2008. An application should not rely on the existence of the feature or behavior. An  
114 application that relies on such a feature or behavior cannot be assured to be portable across  
115 conforming implementations.

116 2. ISO/IEC documents can be obtained from the ISO office: 1 Rue de Varembé, Case Postale 56, CH-1211, Genève 20, Switzerland/Suisse

117 To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

118 **shall**

119 For an implementation that conforms to POSIX.1-2008, describes a feature or behavior that  
120 is mandatory. An application can rely on the existence of the feature or behavior.

121 For an application or user, describes a behavior that is mandatory.

122 **should**

123 For an implementation that conforms to POSIX.1-2008, describes a feature or behavior that  
124 is recommended but not mandatory. An application should not rely on the existence of the  
125 feature or behavior. An application that relies on such a feature or behavior cannot be  
126 assured to be portable across conforming implementations.

127 For an application, describes a feature or behavior that is recommended programming  
128 practice for optimum portability.

129 **undefined**

130 Describes the nature of a value or behavior not defined by POSIX.1-2008 which results from  
131 use of an invalid program construct or invalid data input.

132 The value or behavior may vary among implementations that conform to POSIX.1-2008. An  
133 application should not rely on the existence or validity of the value or behavior. An  
134 application that relies on any particular value or behavior cannot be assured to be portable  
135 across conforming implementations.

136 **unspecified**

137 Describes the nature of a value or behavior not specified by POSIX.1-2008 which results  
138 from use of a valid program construct or valid data input.

139 The value or behavior may vary among implementations that conform to POSIX.1-2008. An  
140 application should not rely on the existence or validity of the value or behavior. An  
141 application that relies on any particular value or behavior cannot be assured to be portable  
142 across conforming implementations.

143 **1.6 Definitions and Concepts**

144 Definitions and concepts are defined in [Chapter 3](#) (on page 33) and [Chapter 4](#) (on page 107).

145 **1.7 Portability**

146 Some of the utilities in the Shell and Utilities volume of POSIX.1-2008 and functions in the  
147 System Interfaces volume of POSIX.1-2008 describe functionality that might not be fully portable  
148 to systems meeting the requirements for POSIX conformance (see [Chapter 2](#), on page 15).

149 Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in  
150 the margin identifies the nature of the option, extension, or warning (see [Section 1.7.1](#), on page  
151 7). For maximum portability, an application should avoid such functionality.

152 Unless the primary task of a utility is to produce textual material on its standard output,  
153 application developers should not rely on the format or content of any such material that may be  
154 produced. Where the primary task *is* to provide such material, but the output format is  
155 incompletely specified, the description is marked with the OF margin code and shading.  
156 Application developers are warned not to expect that the output of such an interface on one

157 system is any guide to its behavior on another system.

### 158 1.7.1 Codes

159 The codes and their meanings are as follows. See also [Section 1.7.2](#) (on page 13).

#### 160 ADV **Advisory Information**

161 The functionality described is optional. The functionality described is also an extension to the  
162 ISO C standard.

163 Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section.  
164 Where additional semantics apply to a function, the material is identified by use of the ADV  
165 margin legend.

#### 166 BE **Batch Environment Services and Utilities**

167 The functionality described is optional.

168 Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section.  
169 Where additional semantics apply to a utility, the material is identified by use of the BE margin  
170 legend.

#### 171 CD **C-Language Development Utilities**

172 The functionality described is optional.

173 Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section.  
174 Where additional semantics apply to a utility, the material is identified by use of the CD margin  
175 legend.

#### 176 CPT **Process CPU-Time Clocks**

177 The functionality described is optional. The functionality described is also an extension to the  
178 ISO C standard.

179 Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section.  
180 Where additional semantics apply to a function, the material is identified by use of the CPT  
181 margin legend.

#### 182 CX **Extension to the ISO C standard**

183 The functionality described is an extension to the ISO C standard. Application developers may  
184 make use of an extension as it is supported on all POSIX.1-2008-conforming systems.

185 With each function or header from the ISO C standard, a statement to the effect that “any  
186 conflict is unintentional” is included. That is intended to refer to a direct conflict. POSIX.1-2008  
187 acts in part as a profile of the ISO C standard, and it may choose to further constrain behaviors  
188 allowed to vary by the ISO C standard. Such limitations and other compatible differences are not  
189 considered conflicts, even if a CX mark is missing. The markings are for information only.

190 Where additional semantics apply to a function or header, the material is identified by use of the  
191 CX margin legend.

#### 192 FD **FORTTRAN Development Utilities**

193 The functionality described is optional.

194 Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section.  
195 Where additional semantics apply to a utility, the material is identified by use of the FD margin  
196 legend.

#### 197 FR **FORTTRAN Runtime Utilities**

198 The functionality described is optional.

199 Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section.

200		Where additional semantics apply to a utility, the material is identified by use of the FR margin legend.
201		
202	FSC	<b>File Synchronization</b>
203		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
204		
205		Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section.
206		Where additional semantics apply to a function, the material is identified by use of the FSC margin legend.
207		
208	IP6	<b>IPv6</b>
209		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
210		
211		Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section.
212		Where additional semantics apply to a function, the material is identified by use of the IP6 margin legend.
213		
214	MC1	<b>Non-Robust Mutex Priority Protection or Non-Robust Mutex Priority Inheritance or Robust Mutex Priority Protection or Robust Mutex Priority Inheritance</b>
215		
216		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
217		
218		This is a shorthand notation for combinations of multiple option codes.
219		Where applicable, functions are marked with the MC1 margin legend in the SYNOPSIS section.
220		Where additional semantics apply to a function, the material is identified by use of the MC1 margin legend.
221		
222		Refer to <a href="#">Section 1.7.2</a> (on page 13).
223	ML	<b>Process Memory Locking</b>
224		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
225		
226		Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section.
227		Where additional semantics apply to a function, the material is identified by use of the ML margin legend.
228		
229	MLR	<b>Range Memory Locking</b>
230		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
231		
232		Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section.
233		Where additional semantics apply to a function, the material is identified by use of the MLR margin legend.
234		
235	MON	<b>Monotonic Clock</b>
236		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
237		
238		Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section.
239		Where additional semantics apply to a function, the material is identified by use of the MON margin legend.
240		
241	MSG	<b>Message Passing</b>
242		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
243		
244		Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section.

- 245 Where additional semantics apply to a function, the material is identified by use of the MSG  
246 margin legend.
- 247 **MX** **IEC 60559 Floating-Point**  
248 The functionality described is optional. The functionality described is also an extension to the  
249 ISO C standard.
- 250 Where applicable, functions are marked with the MX margin legend in the SYNOPSIS section.  
251 Where additional semantics apply to a function, the material is identified by use of the MX  
252 margin legend.
- 253 **OB** **Obsolescent**  
254 The functionality described may be removed in a future version of this volume of POSIX.1-2008.  
255 Strictly Conforming POSIX Applications and Strictly Conforming XSI Applications shall not use  
256 obsolescent features.
- 257 Where applicable, the material is identified by use of the OB margin legend.
- 258 **OF** **Output Format Incompletely Specified**  
259 The functionality described is an XSI extension. The format of the output produced by the  
260 utility is not fully specified. It is therefore not possible to post-process this output in a consistent  
261 fashion. Typical problems include unknown length of strings and unspecified field delimiters.
- 262 Where applicable, the material is identified by use of the OF margin legend.
- 263 **OH** **Optional Header**  
264 In the SYNOPSIS section of some interfaces in the System Interfaces volume of POSIX.1-2008 an  
265 included header is marked as in the following example:
- 266 **OH** `#include <sys/types.h>`  
267 `#include <grp.h>`  
268 `struct group *getgrnam(const char *name);`
- 269 The OH margin legend indicates that the marked header is not required on XSI-conformant  
270 systems.
- 271 **PIO** **Prioritized Input and Output**  
272 The functionality described is optional. The functionality described is also an extension to the  
273 ISO C standard.
- 274 Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section.  
275 Where additional semantics apply to a function, the material is identified by use of the PIO  
276 margin legend.
- 277 **PS** **Process Scheduling**  
278 The functionality described is optional. The functionality described is also an extension to the  
279 ISO C standard.
- 280 Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section.  
281 Where additional semantics apply to a function, the material is identified by use of the PS  
282 margin legend.
- 283 **RPI** **Robust Mutex Priority Inheritance**  
284 The functionality described is optional. The functionality described is also an extension to the  
285 ISO C standard.
- 286 Where applicable, functions are marked with the RPI margin legend in the SYNOPSIS section.  
287 Where additional semantics apply to a function, the material is identified by use of the RPI  
288 margin legend.

289	RPP	<b>Robust Mutex Priority Protection</b>
290		The functionality described is optional. The functionality described is also an extension to the
291		ISO C standard.
292		Where applicable, functions are marked with the RPP margin legend in the SYNOPSIS section.
293		Where additional semantics apply to a function, the material is identified by use of the RPP
294		margin legend.
295	RS	<b>Raw Sockets</b>
296		The functionality described is optional. The functionality described is also an extension to the
297		ISO C standard.
298		Where applicable, functions are marked with the RS margin legend in the SYNOPSIS section.
299		Where additional semantics apply to a function, the material is identified by use of the RS
300		margin legend.
301	SD	<b>Software Development Utilities</b>
302		The functionality described is optional.
303		Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section.
304		Where additional semantics apply to a utility, the material is identified by use of the SD margin
305		legend.
306	SHM	<b>Shared Memory Objects</b>
307		The functionality described is optional. The functionality described is also an extension to the
308		ISO C standard.
309		Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section.
310		Where additional semantics apply to a function, the material is identified by use of the SHM
311		margin legend.
312	SIO	<b>Synchronized Input and Output</b>
313		The functionality described is optional. The functionality described is also an extension to the
314		ISO C standard.
315		Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section.
316		Where additional semantics apply to a function, the material is identified by use of the SIO
317		margin legend.
318	SPN	<b>Spawn</b>
319		The functionality described is optional. The functionality described is also an extension to the
320		ISO C standard.
321		Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section.
322		Where additional semantics apply to a function, the material is identified by use of the SPN
323		margin legend.
324	SS	<b>Process Sporadic Server</b>
325		The functionality described is optional. The functionality described is also an extension to the
326		ISO C standard.
327		Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section.
328		Where additional semantics apply to a function, the material is identified by use of the SS
329		margin legend.
330	TCT	<b>Thread CPU-Time Clocks</b>
331		The functionality described is optional. The functionality described is also an extension to the
332		ISO C standard.
333		Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section.

334		Where additional semantics apply to a function, the material is identified by use of the TCT margin legend.
335		
336	TEF	<b>Trace Event Filter</b>
337		The functionality described is optional. This functionality is dependent on support for the Trace option. The functionality described is also an extension to the ISO C standard.
338		
339		Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section.
340		Where additional semantics apply to a function, the material is identified by use of the TEF margin legend.
341		
342	TPI	<b>Non-Robust Mutex Priority Inheritance</b>
343		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
344		
345		Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section.
346		Where additional semantics apply to a function, the material is identified by use of the TPI margin legend.
347		
348	TPP	<b>Non-Robust Mutex Priority Protection</b>
349		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
350		
351		Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section.
352		Where additional semantics apply to a function, the material is identified by use of the TPP margin legend.
353		
354	TPS	<b>Thread Execution Scheduling</b>
355		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
356		
357		Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section.
358		Where additional semantics apply to a function, the material is identified by use of the TPS margin legend.
359		
360	TRC	<b>Trace</b>
361		The functionality described is optional. The functionality described is also an extension to the ISO C standard.
362		
363		Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section.
364		Where additional semantics apply to a function, the material is identified by use of the TRC margin legend.
365		
366	TRI	<b>Trace Inherit</b>
367		The functionality described is optional. This functionality is dependent on support for the Trace option. The functionality described is also an extension to the ISO C standard.
368		
369		Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section.
370		Where additional semantics apply to a function, the material is identified by use of the TRI margin legend.
371		
372	TRL	<b>Trace Log</b>
373		The functionality described is optional. This functionality is dependent on support for the Trace option. The functionality described is also an extension to the ISO C standard.
374		
375		Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section.
376		Where additional semantics apply to a function, the material is identified by use of the TRL margin legend.
377		

378	TSA	<b>Thread Stack Address Attribute</b>
379		The functionality described is optional. The functionality described is also an extension to the
380		ISO C standard.
381		Where applicable, functions are marked with the TSA margin legend for the SYNOPSIS section.
382		Where additional semantics apply to a function, the material is identified by use of the TSA
383		margin legend.
384	TSH	<b>Thread Process-Shared Synchronization</b>
385		The functionality described is optional. The functionality described is also an extension to the
386		ISO C standard.
387		Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section.
388		Where additional semantics apply to a function, the material is identified by use of the TSH
389		margin legend.
390	TSP	<b>Thread Sporadic Server</b>
391		The functionality described is optional. The functionality described is also an extension to the
392		ISO C standard.
393		Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section.
394		Where additional semantics apply to a function, the material is identified by use of the TSP
395		margin legend.
396	TSS	<b>Thread Stack Size Attribute</b>
397		The functionality described is optional. The functionality described is also an extension to the
398		ISO C standard.
399		Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section.
400		Where additional semantics apply to a function, the material is identified by use of the TSS
401		margin legend.
402	TYM	<b>Typed Memory Objects</b>
403		The functionality described is optional. The functionality described is also an extension to the
404		ISO C standard.
405		Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section.
406		Where additional semantics apply to a function, the material is identified by use of the TYM
407		margin legend.
408	UP	<b>User Portability Utilities</b>
409		The functionality described is optional.
410		Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section.
411		Where additional semantics apply to a utility, the material is identified by use of the UP margin
412		legend.
413	UU	<b>UUCP Utilities</b>
414		The functionality described is optional. The functionality described is also an extension to the
415		ISO C standard.
416		Where applicable, functions are marked with the UU margin legend in the SYNOPSIS section.
417		Where additional semantics apply to a function, the material is identified by use of the UU
418		margin legend.
419	XSI	<b>X/Open System Interfaces</b>
420		The functionality described is part of the X/Open Systems Interfaces option. Functionality
421		marked XSI is an extension to the ISO C standard. Application developers may confidently
422		make use of such extensions on all systems supporting the X/Open System Interfaces option.

423 If an entire SYNOPSIS section is shaded and marked XSI, all the functionality described in that  
424 reference page is an extension. See [Section 2.1.4](#) (on page 19).

425 XSR **XSI STREAMS**  
426 The functionality described is optional. The functionality described is also an extension to the  
427 ISO C standard.

428 Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section.  
429 Where additional semantics apply to a function, the material is identified by use of the XSR  
430 margin legend.

## 431 1.7.2 Margin Code Notation

432 Some of the functionality described in POSIX.1-2008 depends on support of more than one  
433 option, or independently may depend on several options. The following notation for margin  
434 codes is used to denote the following cases.

### 435 A Feature Dependent on One or Two Options

436 In this case, margin codes have a <space> separator; for example:

437 SHM This feature requires support for only the Shared Memory Objects option.

438 SHM TYM This feature requires support for both the Shared Memory Objects option and the Typed  
439 Memory Objects option; that is, an application which uses this feature is portable only between  
440 implementations that provide both options.

### 441 A Feature Dependent on Either of the Options Denoted

442 In this case, margin codes have a ' | ' separator to denote the logical OR; for example:

443 SHM | TYM This feature is dependent on support for either the Shared Memory Objects option or the Typed  
444 Memory Objects option; that is, an application which uses this feature is portable between  
445 implementations that provide any (or all) of the options.

### 446 A Feature Dependent on More than Two Options

447 The following shorthand notations are used:

448 MC1 The MC1 margin code is shorthand for TPP | TPI | RPP | RPI. Features which are shaded with this  
449 margin code require support of either the Non-Robust Mutex Priority Protection option or the  
450 Non-Robust Mutex Priority Inheritance option or the Robust Mutex Priority Protection option or  
451 the Robust Mutex Priority Inheritance option.

### 452 Large Sections Dependent on an Option

453 Where large sections of text are dependent on support for an option, a lead-in text block is  
454 provided and shaded accordingly; for example:

455 XSI This section describes extensions to support interprocess communication. The functionality  
456 described in this section shall be provided on implementations that support the XSI option (and  
457 the rest of this section is not further shaded).

## 2.1 Implementation Conformance

For the purposes of POSIX.1-2008, the implementation conformance requirements given in this section apply.

### 2.1.1 Requirements

A *conforming implementation* shall meet all of the following criteria:

1. The system shall support all utilities, functions, and facilities defined within POSIX.1-2008 that are required for POSIX conformance (see Section 2.1.3, on page 16). These interfaces shall support the functional behavior described herein.
2. The system may support the X/Open System Interfaces (XSI) option as described in Section 2.1.4 (on page 19).
3. The system may support one or more options as described under Section 2.1.5 (on page 20). When an implementation claims that an option is supported, all of its constituent parts shall be provided.
4. The system may provide non-standard extensions. These are features not required by POSIX.1-2008 and may include, but are not limited to:
  - Additional functions
  - Additional headers
  - Additional symbols in standard headers
  - Additional utilities
  - Additional options for standard utilities
  - Additional environment variables
  - Additional file types
  - Non-conforming file systems (for example, legacy file systems for which `_POSIX_NO_TRUNC` is false, case-insensitive file systems, or network file systems)
  - Dynamically populated file systems (for example, `/proc`)
  - Additional character special files with special properties (for example, `/dev/stdin`, `/dev/stdout`, and `/dev/stderr`)

Non-standard extensions of the utilities, functions, or facilities specified in POSIX.1-2008 should be identified as such in the system documentation. Non-standard extensions, when used, may change the behavior of utilities, functions, or facilities defined by POSIX.1-2008. The conformance document shall define an environment in which an application can be run with the behavior specified by POSIX.1-2008. In no case shall such

492 an environment require modification of a Strictly Conforming POSIX Application (see  
493 [Section 2.2.1](#), on page 29).

## 494 2.1.2 Documentation

495 A conformance document with the following information shall be available for an  
496 implementation claiming conformance to POSIX.1-2008. The conformance document shall have  
497 the same structure as POSIX.1-2008, with the information presented in the appropriate sections  
498 and subsections. Sections and subsections that consist solely of subordinate section titles, with  
499 no other information, are not required. The conformance document shall not contain  
500 information about extended facilities or capabilities outside the scope of POSIX.1-2008.

501 The conformance document shall contain a statement that indicates the full name, number, and  
502 date of the standard that applies. The conformance document may also list international  
503 software standards that are available for use by a Conforming POSIX Application. Applicable  
504 characteristics where documentation is required by one of these standards, or by standards of  
505 government bodies, may also be included.

506 The conformance document shall describe the limit values found in the headers `<limits.h>` (on  
507 page 268) and `<unistd.h>` (on page 430), stating values, the conditions under which those values  
508 may change, and the limits of such variations, if any.

509 The conformance document shall describe the behavior of the implementation for all  
510 implementation-defined features defined in POSIX.1-2008. This requirement shall be met by  
511 listing these features and providing either a specific reference to the system documentation or  
512 providing full syntax and semantics of these features. When the value or behavior in the  
513 implementation is designed to be variable or customized on each instantiation of the system, the  
514 implementation provider shall document the nature and permissible ranges of this variation.

515 The conformance document may specify the behavior of the implementation for those features  
516 where POSIX.1-2008 states that implementations may vary or where features are identified as  
517 undefined or unspecified.

518 The conformance document shall not contain documentation other than that specified in the  
519 preceding paragraphs except where such documentation is specifically allowed or required by  
520 other provisions of POSIX.1-2008.

521 The phrases “shall document” or “shall be documented” in POSIX.1-2008 mean that  
522 documentation of the feature shall appear in the conformance document, as described  
523 previously, unless there is an explicit reference in the conformance document to show where the  
524 information can be found in the system documentation.

525 The system documentation should also contain the information found in the conformance  
526 document.

## 527 2.1.3 POSIX Conformance

528 A conforming implementation shall meet the following criteria for POSIX conformance.

## Conformance

## Implementation Conformance

## 529 2.1.3.1 POSIX System Interfaces

530 The following requirements apply to the system interfaces (functions and headers):

- 531 • The system shall support all the mandatory functions and headers defined in
- 532 POSIX.1-2008, and shall set the symbolic constant `_POSIX_VERSION` to the value 200809L.
- 533 • Although all implementations conforming to POSIX.1-2008 support all the features
- 534 described below, there may be system-dependent or file system-dependent configuration
- 535 procedures that can remove or modify any or all of these features. Such configurations
- 536 should not be made if strict compliance is required.

537 The following symbolic constants shall be defined with a value other than `-1`. If a constant

538 is defined with the value zero, applications should use the `sysconf()`, `pathconf()`, or

539 `fpathconf()` functions, or the `getconf` utility, to determine which features are present on the

540 system at that time or for the particular pathname in question.

541 — `_POSIX_CHOWN_RESTRICTED`

542 The use of `chown()` is restricted to a process with appropriate privileges, and to

543 changing the group ID of a file only to the effective group ID of the process or to one

544 of its supplementary group IDs.

545 — `_POSIX_NO_TRUNC`

546 Pathname components longer than `{NAME_MAX}` generate an error.

- 547 • The following symbolic constants shall be defined by the implementation as follows:

548 — Symbolic constants defined with the value 200809L:

549 `_POSIX_ASYNCHRONOUS_IO`

550 `_POSIX_BARRIERS`

551 `_POSIX_CLOCK_SELECTION`

552 `_POSIX_MAPPED_FILES`

553 `_POSIX_MEMORY_PROTECTION`

554 `_POSIX_READER_WRITER_LOCKS`

555 `_POSIX_REALTIME_SIGNALS`

556 `_POSIX_SEMAPHORES`

557 `_POSIX_SPIN_LOCKS`

558 `_POSIX_THREAD_SAFE_FUNCTIONS`

559 `_POSIX_THREADS`

560 `_POSIX_TIMEOUTS`

561 `_POSIX_TIMERS`

562 — Symbolic constants defined with a value greater than zero:

563 `_POSIX_JOB_CONTROL`

564 `_POSIX_SAVED_IDS`

565 — Symbolic constants defined with a value other than `-1`.

566 `_POSIX_VDISABLE`

567 **Note:** The symbols above represent historical options that are no longer allowed as options, but

568 are retained here for backwards-compatibility of applications.

- 569 • The system may support one or more options (see [Section 2.1.6](#), on page 26) denoted by the  
570 following symbolic constants:

571            \_POSIX\_ADVISORY\_INFO  
572            \_POSIX\_CPUTIME  
573            \_POSIX\_FSYNC  
574            \_POSIX\_IPV6  
575            \_POSIX\_MEMLOCK  
576            \_POSIX\_MEMLOCK\_RANGE  
577            \_POSIX\_MESSAGE\_PASSING  
578            \_POSIX\_MONOTONIC\_CLOCK  
579            \_POSIX\_PRIORITIZED\_IO  
580            \_POSIX\_PRIORITY\_SCHEDULING  
581            \_POSIX\_RAW\_SOCKETS  
582            \_POSIX\_SHARED\_MEMORY\_OBJECTS  
583            \_POSIX\_SPAWN  
584            \_POSIX\_SPORADIC\_SERVER  
585            \_POSIX\_SYNCHRONIZED\_IO  
586            \_POSIX\_THREAD\_ATTR\_STACKADDR  
587            \_POSIX\_THREAD\_CPUTIME  
588            \_POSIX\_THREAD\_ATTR\_STACKSIZE  
589            \_POSIX\_THREAD\_PRIO\_INHERIT  
590            \_POSIX\_THREAD\_PRIO\_PROTECT  
591            \_POSIX\_THREAD\_PRIORITY\_SCHEDULING  
592            \_POSIX\_THREAD\_PROCESS\_SHARED  
593            \_POSIX\_THREAD\_SPORADIC\_SERVER  
594            \_POSIX\_TRACE  
595            \_POSIX\_TRACE\_EVENT\_FILTER  
596            \_POSIX\_TRACE\_INHERIT  
597            \_POSIX\_TRACE\_LOG  
598            \_POSIX\_TYPED\_MEMORY\_OBJECTS  
599            \_XOPEN\_CRYPT  
600            \_XOPEN\_REALTIME  
601            \_XOPEN\_REALTIME\_THREADS  
602            \_XOPEN\_STREAMS  
603            \_XOPEN\_UNIX

604            If any of the symbolic constants `_POSIX_TRACE_EVENT_FILTER`, `_POSIX_TRACE_LOG`,  
605            or `_POSIX_TRACE_INHERIT` is defined to have a value other than `-1`, then the symbolic  
606            constant `_POSIX_TRACE` shall also be defined to have a value other than `-1`.

607            If the Advisory Information option is supported, there shall be at least one file system that  
608            supports the functionality.

### 609 2.1.3.2 POSIX Shell and Utilities

610            The following requirements apply to the shell and utilities:

- 611            • The system shall provide all the mandatory utilities in the Shell and Utilities volume of  
612            POSIX.1-2008 with all the functional behavior described therein.
- 613            • The system shall support the Large File capabilities described in the Shell and Utilities  
614            volume of POSIX.1-2008.

## Conformance

## Implementation Conformance

- 615 • The system may support one or more options (see [Section 2.1.6](#), on page 26) denoted by the  
616 following symbolic constants. (The literal names below apply to the *getconf* utility.)

617 POSIX2\_C\_DEV  
618 POSIX2\_CHAR\_TERM  
619 POSIX2\_FORT\_DEV  
620 POSIX2\_FORT\_RUN  
621 POSIX2\_LOCALEDEF  
622 POSIX2\_PBS  
623 POSIX2\_PBS\_ACCOUNTING  
624 POSIX2\_PBS\_LOCATE  
625 POSIX2\_PBS\_MESSAGE  
626 POSIX2\_PBS\_TRACK  
627 POSIX2\_SW\_DEV  
628 POSIX2\_UPE  
629 XOPEN\_UNIX  
630 XOPEN\_UUCP

631 Additional language bindings and development utility options may be provided in other related  
632 standards or in a future version of this standard. In the former case, additional symbolic  
633 constants of the same general form as shown in this subsection should be defined by the related  
634 standard document and made available to the application without requiring POSIX.1-2008 to be  
635 updated.

## 636 2.1.4 XSI Conformance

637 XSI This section describes the criteria for implementations providing conformance to the X/Open  
638 System Interfaces (XSI) option (see [Section 3.442](#), on page 104). The functionality described in  
639 this section shall be provided on implementations that support the XSI option (and the rest of  
640 this section is not further shaded).

641 POSIX.1-2008 describes utilities, functions, and facilities offered to application programs by the  
642 X/Open System Interfaces (XSI) option. An XSI-conforming implementation shall meet the  
643 criteria for POSIX conformance and the following requirements listed in this section.

644 XSI-conforming implementations shall set the symbolic constant `_XOPEN_UNIX` to a value  
645 other than `-1` and shall set the symbolic constant `_XOPEN_VERSION` to the value 700.

### 646 2.1.4.1 XSI System Interfaces

647 The following requirements apply to the system interfaces when the XSI option is supported:

- 648 • The system shall support all the functions and headers defined in POSIX.1-2008 as part of  
649 the XSI option denoted by the XSI marking in the SYNOPSIS section, and any extensions  
650 marked with the XSI option marking (see [Section 1.7.1](#), on page 7) within the text.
- 651 • The system shall support the following options defined within POSIX.1-2008 (see [Section](#)  
652 [2.1.6](#), on page 26):

653 `_POSIX_FSYNC`  
654 `_POSIX_THREAD_ATTR_STACKADDR`  
655 `_POSIX_THREAD_ATTR_STACKSIZE`  
656 `_POSIX_THREAD_PROCESS_SHARED`

- 657 • The system may support the following XSI Option Groups (see [Section 2.1.5.2](#), on page 22)
- 658 defined within POSIX.1-2008:
- 659 — Encryption
- 660 — Realtime
- 661 — Advanced Realtime
- 662 — Realtime Threads
- 663 — Advanced Realtime Threads
- 664 — Tracing
- 665 — XSI STREAMS

666 2.1.4.2 XSI Shell and Utilities Conformance

667 The following requirements apply to the shell and utilities when the XSI option is supported:

- 668 • The system shall support all the utilities defined in the Shell and Utilities volume of
- 669 POSIX.1-2008 as part of the XSI option denoted by the XSI marking in the SYNOPSIS
- 670 section, and any extensions marked with the XSI option marking (see [Section 1.7.1](#), on
- 671 page 7) within the text.
- 672 • The system shall support the User Portability Utilities option and the Terminal
- 673 Characteristics option.
- 674 • The system shall support creation of locales (see [Chapter 7](#), on page 135).
- 675 • The C-language Development utility `c99` shall be supported.
- 676 • The XSI Development Utilities option may be supported. It consists of the following
- 677 software development utilities:

678	<i>admin</i>	<i>delta</i>	<i>rmdel</i>	<i>val</i>
679	<i>cflow</i>	<i>get</i>	<i>sact</i>	<i>what</i>
680	<i>ctags</i>	<i>nm</i>	<i>secs</i>	
681	<i>cxref</i>	<i>prs</i>	<i>unget</i>	

682 2.1.5 Option Groups

683 An Option Group is a group of related functions or options defined within the System Interfaces

684 volume of POSIX.1-2008.

685 If an implementation supports an Option Group, then the system shall support the functional

686 behavior described herein.

687 If an implementation does not support an Option Group, then the system need not support the

688 functional behavior described herein.

689 2.1.5.1 Subprofiling Considerations

690 Profiling standards supporting functional requirements less than that required in POSIX.1-2008

691 may subset both mandatory and optional functionality required for POSIX Conformance (see

692 [Section 2.1.3](#), on page 16) or XSI Conformance (see [Section 2.1.4](#), on page 19). Such profiles shall

693 organize the subsets into Subprofiling Option Groups.

694 XRAT Appendix E (on page 3711) describes a representative set of such Subprofiling Option  
 695 Groups for use by profiles applicable to specialized realtime systems. POSIX.1-2008 does not  
 696 require that the presence of Subprofiling Option Groups be testable at compile-time (as symbols  
 697 defined in any header) or at runtime (via *sysconf()* or *getconf()*).

698 A Subprofiling Option Group may provide basic system functionality that other Subprofiling  
 699 Option Groups and other options depend upon.<sup>3</sup> If a profile of POSIX.1-2008 does not require an  
 700 implementation to provide a Subprofiling Option Group that provides features utilized by a  
 701 required Subprofiling Option Group (or option),<sup>4</sup> the profile shall specify<sup>5</sup> all of the following:

- 702 • Restricted or altered behavior of interfaces defined in POSIX.1-2008 that may differ on an  
 703 implementation of the profile
- 704 • Additional behaviors that may produce undefined or unspecified results
- 705 • Additional implementation-defined behavior that implementations shall be required to  
 706 document in the profile's conformance document

707 if any of the above is a result of the profile not requiring an interface required by POSIX.1-2008.

708 The following additional rules shall apply to all profiles of POSIX.1-2008:

- 709 • Any application that conforms to that profile shall also conform to POSIX.1-2008, unless  
 710 the application depends on the definition of a profile support indicator macro in  
 711 `<unistd.h>` (that is, a profile shall not require restricted, altered, or extended behaviors of  
 712 an implementation of POSIX.1-2008).
- 713 • Profiles are permitted to require the definition of a *profile support indicator macro* with a  
 714 name beginning `_POSIX_AEP_` in `<unistd.h>`.
- 715 • Profiles shall require the definition of the macro `_POSIX_SUBPROFILE` in `<unistd.h>` on  
 716 implementations that do not meet all of the requirements of a POSIX.1-conforming  
 717 implementation.
- 718 • Profiles are permitted to add additional requirements to the limits defined in `<limits.h>`  
 719 and `<stdint.h>`, subject to the following:

720 For the limits in `<limits.h>` and `<stdint.h>`:

- 721 — If the limit is specified as having a fixed value, it shall not be changed by a profile.
- 722 — If a limit is specified as having a minimum or maximum acceptable value, it may be  
 723 changed by a profile as follows:

724 A profile may increase a minimum acceptable value, but shall not make a  
 725 minimum acceptable value smaller.

---

726 3. As an example, the File System profiling option group provides underlying support for pathname resolution and file creation which are  
 727 needed by any interface in POSIX.1-2008 that parses a *path* argument. If a profile requires support for the Device Input and Output  
 728 profiling option group but does not require support for the File System profiling option group, the profile must specify how pathname  
 729 resolution is to behave in that profile, how the `O_CREAT` flag to *open()* is to be handled (and the use of the character 'a' in the *mode*  
 730 argument of  *fopen()* when a filename argument names a file that does not exist), and specify lots of other details.

731 4. As an example, POSIX.1-2008 requires that implementations claiming to support the Range Memory Locking option also support the  
 732 Process Memory Locking option. A profile could require that the Range Memory Locking option had to be supplied without requiring that  
 733 the Process Memory Locking option be supplied as long as the profile specifies everything an application developer or system implementor  
 734 would have to know to build an application or implementation conforming to the profile.

735 5. Note that the profile could just specify that any use of the features not specified by the profile would produce undefined or unspecified  
 736 results.

- 737 — A profile may reduce a maximum acceptable value, but shall not make a  
738 maximum acceptable value larger.
- 739 • A profile shall not change a limit specified as having a minimum or maximum value into a  
740 limit specified as having a fixed value.
  - 741 • A profile shall not create new limits.
  - 742 • Any implementation that conforms to POSIX.1-2008 (including all options and extended  
743 limits required by the profile) shall also conform to that profile, except for the possible  
744 omission from `<unistd.h>` of a profile support indicator macro required by the profile.

#### 745 2.1.5.2 XSI Option Groups

746 XSI This section describes Option Groups to support the definition of XSI conformance within the  
747 System Interfaces volume of POSIX.1-2008. The functionality described in this section shall be  
748 provided on implementations that support the XSI option and the appropriate Option Group  
749 (and the rest of this section is not further shaded).

750 The following Option Groups are defined.

#### 751 Encryption

752 The Encryption Option Group is denoted by the symbolic constant `_XOPEN_CRYPT`. It includes  
753 the following functions:

754 `crypt()`, `encrypt()`, `setkey()`

755 These functions are marked CRYPT.

756 Due to export restrictions on the decoding algorithm in some countries, implementations may  
757 be restricted in making these functions available. All the functions in the Encryption Option  
758 Group may therefore return `[ENOSYS]` or, alternatively, `encrypt()` shall return `[ENOSYS]` for the  
759 decryption operation.

760 An implementation that claims conformance to this Option Group shall set `_XOPEN_CRYPT` to  
761 a value other than `-1`.

#### 762 Realtime

763 The Realtime Option Group is denoted by the symbolic constant `_XOPEN_REALTIME`.

764 This Option Group includes a set of realtime functions drawn from options within POSIX.1-2008  
765 (see Section 2.1.6, on page 26).

766 Where entire functions are included in the Option Group, the NAME section is marked with  
767 REALTIME. Where additional semantics have been added to existing pages, the new material is  
768 identified by use of the appropriate margin legend for the underlying option defined within  
769 POSIX.1-2008.

770 An implementation that claims conformance to this Option Group shall set  
771 `_XOPEN_REALTIME` to a value other than `-1`.

772 This Option Group consists of the set of the following options from within POSIX.1-2008 (see  
773 Section 2.1.6, on page 26):

## Conformance

## Implementation Conformance

774            \_POSIX\_FSYNC  
 775            \_POSIX\_MEMLOCK  
 776            \_POSIX\_MEMLOCK\_RANGE  
 777            \_POSIX\_MESSAGE\_PASSING  
 778            \_POSIX\_PRIORITIZED\_IO  
 779            \_POSIX\_PRIORITY\_SCHEDULING  
 780            \_POSIX\_SHARED\_MEMORY\_OBJECTS  
 781            \_POSIX\_SYNCHRONIZED\_IO

782            If the symbolic constant `_XOPEN_REALTIME` is defined to have a value other than `-1`, then the  
 783            following symbolic constants shall be defined by the implementation to have the value 200809L:

784            \_POSIX\_MEMLOCK  
 785            \_POSIX\_MEMLOCK\_RANGE  
 786            \_POSIX\_MESSAGE\_PASSING  
 787            \_POSIX\_PRIORITY\_SCHEDULING  
 788            \_POSIX\_SHARED\_MEMORY\_OBJECTS  
 789            \_POSIX\_SYNCHRONIZED\_IO

790            The functionality associated with `_POSIX_FSYNC` shall always be supported on XSI-conformant  
 791            systems.

792            Support of `_POSIX_PRIORITIZED_IO` on XSI-conformant systems is optional. If  
 793            `_POSIX_PRIORITIZED_IO` is supported, then asynchronous I/O operations performed by  
 794            `aio_read()`, `aio_write()`, and `lio_listio()` shall be submitted at a priority equal to the scheduling  
 795            priority equal to a base scheduling priority minus `aiocbp->aio_reqprio`. If Thread Execution  
 796            Scheduling is not supported, then the base scheduling priority is that of the calling process;  
 797            otherwise, the base scheduling priority is that of the calling thread. The implementation shall  
 798            also document for which files I/O prioritization is supported.

### 799            Advanced Realtime

800            An implementation that claims conformance to this Option Group shall also support the  
 801            Realtime Option Group.

802            Where entire functions are included in the Option Group, the NAME section is marked with  
 803            ADVANCED REALTIME. Where additional semantics have been added to existing pages, the  
 804            new material is identified by use of the appropriate margin legend for the underlying option  
 805            defined within POSIX.1-2008.

806            This Option Group consists of the set of the following options from within POSIX.1-2008 (see  
 807            Section 2.1.6, on page 26):

808            \_POSIX\_ADVISORY\_INFO  
 809            \_POSIX\_CPUTIME  
 810            \_POSIX\_MONOTONIC\_CLOCK  
 811            \_POSIX\_SPAWN  
 812            \_POSIX\_SPORADIC\_SERVER  
 813            \_POSIX\_TYPED\_MEMORY\_OBJECTS

814            If the implementation supports the Advanced Realtime Option Group, then the following  
 815            symbolic constants shall be defined by the implementation to have the value 200809L:

816            \_POSIX\_ADVISORY\_INFO  
 817            \_POSIX\_CPUTIME  
 818            \_POSIX\_MONOTONIC\_CLOCK  
 819            \_POSIX\_SPAWN  
 820            \_POSIX\_SPORADIC\_SERVER  
 821            \_POSIX\_TYPED\_MEMORY\_OBJECTS

822            If the symbolic constant `_POSIX_SPORADIC_SERVER` is defined, then the symbolic constant  
 823            `_POSIX_PRIORITY_SCHEDULING` shall also be defined by the implementation to have the  
 824            value 200809L.

### 825            **Realtime Threads**

826            The Realtime Threads Option Group is denoted by the symbolic constant  
 827            `_XOPEN_REALTIME_THREADS`.

828            This Option Group consists of the set of the following options from within POSIX.1-2008 (see  
 829            Section 2.1.6, on page 26):

830            \_POSIX\_THREAD\_PRIO\_INHERIT  
 831            \_POSIX\_THREAD\_PRIO\_PROTECT  
 832            \_POSIX\_THREAD\_PRIORITY\_SCHEDULING

833            Where applicable, whole pages are marked `REALTIME THREADS`, together with the  
 834            appropriate option margin legend for the SYNOPSIS section (see Section 1.7.1, on page 7).

835            An implementation that claims conformance to this Option Group shall set  
 836            `_XOPEN_REALTIME_THREADS` to a value other than `-1`.

837            If the symbol `_XOPEN_REALTIME_THREADS` is defined to have a value other than `-1`, then the  
 838            following options shall also be defined by the implementation to have the value 200809L:

839            \_POSIX\_THREAD\_PRIO\_INHERIT  
 840            \_POSIX\_THREAD\_PRIO\_PROTECT  
 841            \_POSIX\_THREAD\_PRIORITY\_SCHEDULING

### 842            **Advanced Realtime Threads**

843            An implementation that claims conformance to this Option Group shall also support the  
 844            Realtime Threads Option Group.

845            Where entire functions are included in the Option Group, the NAME section is marked with  
 846            `ADVANCED_REALTIME_THREADS`. Where additional semantics have been added to existing  
 847            pages, the new material is identified by use of the appropriate margin legend for the underlying  
 848            option defined within POSIX.1-2008.

849            This Option Group consists of the set of the following options from within POSIX.1-2008 (see  
 850            Section 2.1.6, on page 26):

851            \_POSIX\_THREAD\_CPUTIME  
 852            \_POSIX\_THREAD\_SPORADIC\_SERVER

853            If the symbolic constant `_POSIX_THREAD_SPORADIC_SERVER` is defined to have the value  
 854            200809L, then the symbolic constant `_POSIX_THREAD_PRIORITY_SCHEDULING` shall also be  
 855            defined by the implementation to have the value 200809L.

856            If the implementation supports the Advanced Realtime Threads Option Group, then the  
 857            following symbolic constants shall be defined by the implementation to have the value 200809L:

858            \_POSIX\_THREAD\_CPUTIME  
859            \_POSIX\_THREAD\_SPORADIC\_SERVER

## 860            **Tracing**

861            This Option Group includes a set of tracing functions drawn from options within POSIX.1-2008  
862            (see [Section 2.1.6](#), on page 26).

863            Where entire functions are included in the Option Group, the NAME section is marked with  
864            TRACING. Where additional semantics have been added to existing pages, the new material is  
865            identified by use of the appropriate margin legend for the underlying option defined within  
866            POSIX.1-2008.

867            This Option Group consists of the set of the following options from within POSIX.1-2008 (see  
868            [Section 2.1.6](#), on page 26):

869            \_POSIX\_TRACE  
870            \_POSIX\_TRACE\_EVENT\_FILTER  
871            \_POSIX\_TRACE\_LOG  
872            \_POSIX\_TRACE\_INHERIT

873            If the implementation supports the Tracing Option Group, then the following symbolic  
874            constants shall be defined by the implementation to have the value 200809L:

875            \_POSIX\_TRACE  
876            \_POSIX\_TRACE\_EVENT\_FILTER  
877            \_POSIX\_TRACE\_LOG  
878            \_POSIX\_TRACE\_INHERIT

## 879            **XSI STREAMS**

880    OB XSR    This section describes the XSI STREAMS Option Group, denoted by the symbolic constant  
881            \_XOPEN\_STREAMS. The functionality described in this section shall be provided on  
882            implementations that support the XSI STREAMS option (and the rest of this section is not  
883            further shaded).

884            This Option Group includes functionality related to STREAMS, a uniform mechanism for  
885            implementing networking services and other character-based I/O as described in XSH [Section](#)  
886            2.6 (on page 494).

887            It includes the following functions:

888            *fattach()*        *ioctl()*  
889            *fdetach()*       *isastream()*  
890            *getmsg()*        *putmsg()*  
891            *getpmsg()*       *putpmsg()*

892            and the `<stropts.h>` header.

893            Where applicable, whole pages are marked STREAMS, together with the appropriate option  
894            margin legend for the SYNOPSIS section (see [Section 1.7.1](#), on page 7). Where additional  
895            semantics have been added to existing pages, the new material is identified by use of the  
896            appropriate margin legend for the underlying option defined within POSIX.1-2008.

897            An implementation that claims conformance to this Option Group shall set `_XOPEN_STREAMS`  
898            to a value other than `-1`.

899 **2.1.6 Options**

900 The symbolic constants defined in `<unistd.h>`, [Constants for Options and Option Groups](#) (on  
 901 page 430) reflect implementation options for POSIX.1-2008. These symbols can be used by the  
 902 application to determine which of three categories of support for optional facilities are provided  
 903 by the implementation.

## 904 1. Option not supported for compilation.

905 The implementation advertises at compile time (by defining the constant in `<unistd.h>`  
 906 with value `-1`, or by leaving it undefined) that the option is not supported for compilation  
 907 and, at the time of compilation, is not supported for runtime use. In this case, the headers,  
 908 data types, function interfaces, and utilities required only for the option need not be  
 909 present. A later runtime check using the `fpathconf()`, `pathconf()`, or `sysconf` functions  
 910 defined in the System Interfaces volume of POSIX.1-2008 or the `getconf` utility defined in  
 911 the Shell and Utilities volume of POSIX.1-2008 can in some circumstances indicate that  
 912 the option is supported at runtime. (For example, an old application binary might be run  
 913 on a newer implementation to which support for the option has been added.)

## 914 2. Option always supported.

915 The implementation advertises at compile time (by defining the constant in `<unistd.h>`  
 916 with a value greater than zero) that the option is supported both for compilation and for  
 917 use at runtime. In this case, all headers, data types, function interfaces, and utilities  
 918 required only for the option shall be available and shall operate as specified. Runtime  
 919 checks with `fpathconf()`, `pathconf()`, or `sysconf` shall indicate that the option is supported.

## 920 3. Option might or might not be supported at runtime.

921 The implementation advertises at compile time (by defining the constant in `<unistd.h>`  
 922 with value zero) that the option is supported for compilation and might or might not be  
 923 supported at runtime. In this case, the `fpathconf()`, `pathconf()`, or `sysconf()` functions  
 924 defined in the System Interfaces volume of POSIX.1-2008 or the `getconf` utility defined in  
 925 the Shell and Utilities volume of POSIX.1-2008 can be used to retrieve the value of each  
 926 symbol on each specific implementation to determine whether the option is supported at  
 927 runtime. All headers, data types, and function interfaces required to compile and execute  
 928 applications which use the option at runtime (after checking at runtime that the option is  
 929 supported) shall be provided, but if the option is not supported at runtime they need not  
 930 operate as specified. Utilities or other facilities required only for the option, but not  
 931 needed to compile and execute such applications, need not be present.

932 If an option is not supported for compilation, an application that attempts to use anything  
 933 associated only with the option is considered to be requiring an extension. Unless explicitly  
 934 specified otherwise, the behavior of functions associated with an option that is not supported at  
 935 runtime is unspecified, and an application that uses such functions without first checking  
 936 `fpathconf()`, `pathconf()`, or `sysconf` is considered to be requiring an extension.

937 Margin codes are defined for each option (see [Section 1.7.1](#), on page 7).

938 **2.1.6.1 System Interfaces**

939 Refer to `<unistd.h>`, [Constants for Options and Option Groups](#) (on page 430) for the list of  
 940 options.

## Conformance

## Implementation Conformance

## 941 2.1.6.2 Shell and Utilities

942 Each of these symbols shall be considered valid names by the implementation. Refer to  
943 **<unistd.h>**, **Constants for Options and Option Groups** (on page 430).

944 The literal names shown below apply only to the *getconf* utility.

## 945 CD POSIX2\_C\_DEV

946 The system supports the C-Language Development Utilities option.

947 The utilities in the C-Language Development Utilities option are used for the development  
948 of C-language applications, including compilation or translation of C source code and  
949 complex program generators for simple lexical tasks and processing of context-free  
950 grammars.

951 The utilities listed below may be provided by a conforming system; however, any system  
952 claiming conformance to the C-Language Development Utilities option shall provide all of  
953 the utilities listed.

954 *c99*

955 *lex*

956 *yacc*

## 957 POSIX2\_CHAR\_TERM

958 The system supports the Terminal Characteristics option. This value need not be present on  
959 a system not supporting the User Portability Utilities option.

960 Where applicable, the dependency is noted within the description of the utility.

961 This option applies only to systems supporting the User Portability Utilities option. If  
962 supported, then the system supports at least one terminal type capable of all operations  
963 described in POSIX.1-2008; see **Section 10.2** (on page 198).

## 964 FD POSIX2\_FORT\_DEV

965 The system supports the FORTRAN Development Utilities option.

966 The *fort77* FORTRAN compiler is the only utility in the FORTRAN Development Utilities  
967 option. This is used for the development of FORTRAN language applications, including  
968 compilation or translation of FORTRAN source code.

969 The *fort77* utility may be provided by a conforming system; however, any system claiming  
970 conformance to the FORTRAN Development Utilities option shall provide the *fort77* utility.

## 971 FR POSIX2\_FORT\_RUN

972 The system supports the FORTRAN Runtime Utilities option.

973 The *asa* utility is the only utility in the FORTRAN Runtime Utilities option.

974 The *asa* utility may be provided by a conforming system; however, any system claiming  
975 conformance to the FORTRAN Runtime Utilities option shall provide the *asa* utility.

## 976 POSIX2\_LOCALEDEF

977 The system supports the Locale Creation Utilities option.

978 If supported, the system supports the creation of locales as described in the *localedef* utility.

979 The *localedef* utility may be provided by a conforming system; however, any system  
980 claiming conformance to the Locale Creation Utilities option shall provide the *localedef*  
981 utility.

982	OB BE	<b>POSIX2_PBS</b>
983		The system supports the Batch Environment Services and Utilities option (see XCU <a href="#">Chapter 3</a> , on page 2375).
984		
985		<b>Note:</b> The Batch Environment Services and Utilities option is a combination of mandatory and optional batch services and utilities. The POSIX_PBS symbolic constant implies the system supports all the mandatory batch services and utilities.
986		
987		
988		<b>POSIX2_PBS_ACCOUNTING</b>
989		The system supports the Batch Accounting option.
990		<b>POSIX2_PBS_CHECKPOINT</b>
991		The system supports the Batch Checkpoint/Restart option.
992		<b>POSIX2_PBS_LOCATE</b>
993		The system supports the Locate Batch Job Request option.
994		<b>POSIX2_PBS_MESSAGE</b>
995		The system supports the Batch Job Message Request option.
996		<b>POSIX2_PBS_TRACK</b>
997		The system supports the Track Batch Job Request option.
998	SD	<b>POSIX2_SW_DEV</b>
999		The system supports the Software Development Utilities option.
1000		The utilities in the Software Development Utilities option are used for the development of applications, including compilation or translation of source code, the creation and maintenance of library archives, and the maintenance of groups of inter-dependent programs.
1001		
1002		
1003		
1004		The utilities listed below may be provided by the conforming system; however, any system claiming conformance to the Software Development Utilities option shall provide all of the utilities listed here.
1005		
1006		
1007		<i>ar</i>
1008		<i>make</i>
1009		<i>nm</i>
1010		<i>strip</i>
1011	UP	<b>POSIX2_UPE</b>
1012		The system supports the User Portability Utilities option.
1013		The utilities in the User Portability Utilities option shall be implemented on all systems that claim conformance to this option, except for the <i>vi</i> utility which is noted as having features that cannot be implemented on all terminal types; if the POSIX2_CHAR_TERM option is supported, the system shall support all such features on at least one terminal type; see <a href="#">Section 10.2</a> (on page 198).
1014		
1015		
1016		
1017		
1018		The list of utilities in the User Portability Utilities option is as follows:
1019		<i>bg fc jobs talk</i>
1020		<i>ex fg more vi</i>
1021	XSI	<b>XOPEN_UNIX</b>
1022		The system supports the X/Open System Interfaces (XSI) option (see <a href="#">Section 2.1.4</a> , on page 19).
1023		

## Conformance

## Implementation Conformance

1024 UU XOPEN\_UUCP  
 1025 The system supports the UUCP Utilities option.  
 1026 The list of utilities in the UUCP Utilities option is as follows:  
 1027 *uucp*  
 1028 *uustat*  
 1029 *uux*

## 1030 2.2 Application Conformance

1031 For the purposes of POSIX.1-2008, the application conformance requirements given in this  
 1032 section apply.

1033 All applications claiming conformance to POSIX.1-2008 shall use only language-dependent  
 1034 services for the C programming language described in Section 2.3 (on page 31), shall use only  
 1035 the utilities and facilities defined in the Shell and Utilities volume of POSIX.1-2008, and shall fall  
 1036 within one of the following categories.

### 1037 2.2.1 Strictly Conforming POSIX Application

1038 A Strictly Conforming POSIX Application is an application that requires only the facilities  
 1039 described in POSIX.1-2008. Such an application:

- 1040 1. Shall accept any implementation behavior that results from actions it takes in areas  
 1041 described in POSIX.1-2008 as *implementation-defined* or *unspecified*, or where POSIX.1-2008  
 1042 indicates that implementations may vary
- 1043 2. Shall not perform any actions that are described as producing *undefined* results
- 1044 3. For symbolic constants, shall accept any value in the range permitted by POSIX.1-2008,  
 1045 but shall not rely on any value in the range being greater than the minimums listed or  
 1046 being less than the maximums listed in POSIX.1-2008
- 1047 4. Shall not use facilities designated as *obsolescent*
- 1048 5. Is required to tolerate and permitted to adapt to the presence or absence of optional  
 1049 facilities whose availability is indicated by Section 2.1.3 (on page 16)
- 1050 6. For the C programming language, shall not produce any output dependent on any  
 1051 behavior described in the ISO/IEC 9899:1999 standard as *unspecified*, *undefined*, or  
 1052 *implementation-defined*, unless the System Interfaces volume of POSIX.1-2008 specifies the  
 1053 behavior
- 1054 7. For the C programming language, shall not exceed any minimum implementation limit  
 1055 defined in the ISO/IEC 9899:1999 standard, unless the System Interfaces volume of  
 1056 POSIX.1-2008 specifies a higher minimum implementation limit
- 1057 8. For the C programming language, shall define `_POSIX_C_SOURCE` to be 200809L before  
 1058 any header is included

1059 Within POSIX.1-2008, any restrictions placed upon a Conforming POSIX Application shall  
 1060 restrict a Strictly Conforming POSIX Application.

1061 **2.2.2 Conforming POSIX Application**1062 2.2.2.1 *ISO/IEC Conforming POSIX Application*

1063 An ISO/IEC Conforming POSIX Application is an application that uses only the facilities  
 1064 described in POSIX.1-2008 and approved Conforming Language bindings for any ISO or IEC  
 1065 standard. Such an application shall include a statement of conformance that documents all  
 1066 options and limit dependencies, and all other ISO or IEC standards used.

1067 2.2.2.2 *<National Body> Conforming POSIX Application*

1068 A <National Body> Conforming POSIX Application differs from an ISO/IEC Conforming  
 1069 POSIX Application in that it also may use specific standards of a single ISO/IEC member body  
 1070 referred to here as <National Body>. Such an application shall include a statement of  
 1071 conformance that documents all options and limit dependencies, and all other <National Body>  
 1072 standards used.

1073 **2.2.3 Conforming POSIX Application Using Extensions**

1074 A Conforming POSIX Application Using Extensions is an application that differs from a  
 1075 Conforming POSIX Application only in that it uses non-standard facilities that are consistent  
 1076 with POSIX.1-2008. Such an application shall fully document its requirements for these extended  
 1077 facilities, in addition to the documentation required of a Conforming POSIX Application. A  
 1078 Conforming POSIX Application Using Extensions shall be either an ISO/IEC Conforming  
 1079 POSIX Application Using Extensions or a <National Body> Conforming POSIX Application  
 1080 Using Extensions (see [Section 2.2.2.1](#) and [Section 2.2.2.2](#)).

1081 **2.2.4 Strictly Conforming XSI Application**

1082 A Strictly Conforming XSI Application is an application that requires only the facilities  
 1083 described in POSIX.1-2008. Such an application:

- 1084 1. Shall accept any implementation behavior that results from actions it takes in areas  
 1085 described in POSIX.1-2008 as *implementation-defined* or *unspecified*, or where POSIX.1-2008  
 1086 indicates that implementations may vary
- 1087 2. Shall not perform any actions that are described as producing *undefined* results
- 1088 3. For symbolic constants, shall accept any value in the range permitted by POSIX.1-2008,  
 1089 but shall not rely on any value in the range being greater than the minimums listed or  
 1090 being less than the maximums listed in POSIX.1-2008
- 1091 4. Shall not use facilities designated as *obsolescent*
- 1092 5. Is required to tolerate and permitted to adapt to the presence or absence of optional  
 1093 facilities whose availability is indicated by [Section 2.1.4](#) (on page 19)
- 1094 6. For the C programming language, shall not produce any output dependent on any  
 1095 behavior described in the ISO C standard as *unspecified*, *undefined*, or *implementation-*  
 1096 *defined*, unless the System Interfaces volume of POSIX.1-2008 specifies the behavior

*Conformance**Application Conformance*

1097 7. For the C programming language, shall not exceed any minimum implementation limit  
 1098 defined in the ISO C standard, unless the System Interfaces volume of POSIX.1-2008  
 1099 specifies a higher minimum implementation limit

1100 8. For the C programming language, shall define `_XOPEN_SOURCE` to be 700 before any  
 1101 header is included

1102 Within POSIX.1-2008, any restrictions placed upon a Conforming POSIX Application shall  
 1103 restrict a Strictly Conforming XSI Application.

#### 1104 **2.2.5 Conforming XSI Application Using Extensions**

1105 A Conforming XSI Application Using Extensions is an application that differs from a Strictly  
 1106 Conforming XSI Application only in that it uses non-standard facilities that are consistent with  
 1107 POSIX.1-2008. Such an application shall fully document its requirements for these extended  
 1108 facilities, in addition to the documentation required of a Strictly Conforming XSI Application.

### 1109 **2.3 Language-Dependent Services for the C Programming Language**

1110 Implementors seeking to claim conformance using the ISO C standard shall claim POSIX  
 1111 conformance as described in [Section 2.1.3](#) (on page 16).

### 1112 **2.4 Other Language-Related Specifications**

1113 POSIX.1-2008 is currently specified in terms of the shell command language and ISO C. Bindings  
 1114 to other programming languages are being developed.

1115 If conformance to POSIX.1-2008 is claimed for implementation of any programming language,  
 1116 the implementation of that language shall support the use of external symbols distinct to at least  
 1117 31 bytes in length in the source program text. (That is, identifiers that differ at or before the  
 1118 thirty-first byte shall be distinct.) If a national or international standard governing a language  
 1119 defines a maximum length that is less than this value, the language-defined maximum shall be  
 1120 supported. External symbols that differ only by case shall be distinct when the character set in  
 1121 use distinguishes uppercase and lowercase characters and the language permits (or requires)  
 1122 uppercase and lowercase characters to be distinct in external symbols.

## Definitions

1123

1124

1125

1126

1127

For the purposes of POSIX.1-2008, the following terms and definitions apply. The Authoritative Dictionary of IEEE Standards Terms, Seventh Edition should be referenced for terms not defined in this section.

1128

1129

1130

**Note:** No shading to denote extensions or options occurs in this chapter. Where the terms and definitions given in this chapter are used elsewhere in text related to extensions and options, they are shaded as appropriate.

1131

### 3.1 Abortive Release

1132

An abrupt termination of a network connection that may result in the loss of data.

1133

### 3.2 Absolute Pathname

1134

1135

A pathname beginning with a single or more than two <slash> characters; see also [Section 3.266](#) (on page 75).

1136

**Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).

1137

### 3.3 Access Mode

1138

A particular form of access permitted to a file.

1139

### 3.4 Additional File Access Control Mechanism

1140

1141

1142

An implementation-defined mechanism that is layered upon the access control mechanisms defined here, but which do not grant permissions beyond those defined herein, although they may further restrict them.

1143

**Note:** File Access Permissions are defined in detail in [Section 4.4](#) (on page 108).

1144

### 3.5 Address Space

1145

The memory locations that can be referenced by a process or the threads of a process.

### 1146 3.6 Advisory Information

1147 An interface that advises the implementation on (portable) application behavior so that it can  
1148 optimize the system.

### 1149 3.7 Affirmative Response

1150 An input string that matches one of the responses acceptable to the *LC\_MESSAGES* category  
1151 keyword **yesexpr**, matching an extended regular expression in the current locale.

1152 **Note:** The *LC\_MESSAGES* category is defined in detail in [Section 7.3.6](#) (on page 164).

### 1153 3.8 Alert

1154 To cause the user's terminal to give some audible or visual indication that an error or some other  
1155 event has occurred. When the standard output is directed to a terminal device, the method for  
1156 alerting the terminal user is unspecified. When the standard output is not directed to a terminal  
1157 device, the alert is accomplished by writing the alert to standard output (unless the utility  
1158 description indicates that the use of standard output produces undefined results in this case).

### 1159 3.9 Alert Character (<alert>)

1160 A character that in the output stream should cause a terminal to alert its user via a visual or  
1161 audible notification. It is the character designated by '`\a`' in the C language. It is unspecified  
1162 whether this character is the exact sequence transmitted to an output device by the system to  
1163 accomplish the alert function.

### 1164 3.10 Alias Name

1165 In the shell command language, a word consisting solely of underscores, digits, and alphabets  
1166 from the portable character set and any of the following characters: '`!`', '`%`', '`'`', '`,`', '`@`'.

1167 Implementations may allow other characters within alias names as an extension.

1168 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

### 1169 3.11 Alignment

1170 A requirement that objects of a particular type be located on storage boundaries with addresses  
1171 that are particular multiples of a byte address.

1172 **Note:** See also the ISO C standard, Section B3.

### 1173 3.12 Alternate File Access Control Mechanism

1174 An implementation-defined mechanism that is independent of the access control mechanisms  
1175 defined herein, and which if enabled on a file may either restrict or extend the permissions of a  
1176 given user. POSIX.1-2008 defines when such mechanisms can be enabled and when they are  
1177 disabled.

1178 **Note:** File Access Permissions are defined in detail in [Section 4.4](#) (on page 108).

### 1179 3.13 Alternate Signal Stack

1180 Memory associated with a thread, established upon request by the implementation for a thread,  
1181 separate from the thread signal stack, in which signal handlers responding to signals sent to that  
1182 thread may be executed.

### 1183 3.14 Ancillary Data

1184 Protocol-specific, local system-specific, or optional information. The information can be both  
1185 local or end-to-end significant, header information, part of a data portion, protocol-specific, and  
1186 implementation or system-specific.

### 1187 3.15 Angle Brackets

1188 The characters '`<`' (left-angle-bracket) and '`>`' (right-angle-bracket). When used in the phrase  
1189 "enclosed in angle brackets", the symbol '`<`' immediately precedes the object to be enclosed,  
1190 and '`>`' immediately follows it. When describing these characters in the portable character set,  
1191 the names `<less-than-sign>` and `<greater-than-sign>` are used.

### 1192 3.16 Apostrophe Character (`<apostrophe>`)

1193 The character designated by '`\'`' in the C language, also known as the single-quote character.

### 1194 3.17 Application

1195 A computer program that performs some desired function.

1196 **3.18 Application Address**

1197 Endpoint address of a specific application.

1198 **3.19 Application Program Interface (API)**

1199 The definition of syntax and semantics for providing computer system services.

1200 **3.20 Appropriate Privileges**

1201 An implementation-defined means of associating privileges with a process with regard to the  
 1202 function calls, function call options, and the commands that need special privileges. There may  
 1203 be zero or more such means. These means (or lack thereof) are described in the conformance  
 1204 document.

1205 **Note:** Function calls are defined in the System Interfaces volume of POSIX.1-2008, and commands are  
 1206 defined in the Shell and Utilities volume of POSIX.1-2008.

1207 **3.21 Argument**

1208 In the shell command language, a parameter passed to a utility as the equivalent of a single  
 1209 string in the *argv* array created by one of the *exec* functions. An argument is one of the options,  
 1210 option-arguments, or operands following the command name.

1211 **Note:** The Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213) and XCU [Section](#)  
 1212 [2.9.1.1](#) (on page 2317).

1213 In the C language, an expression in a function call expression or a sequence of preprocessing  
 1214 tokens in a function-like macro invocation.

1215 **3.22 Arm (a Timer)**

1216 To start a timer measuring the passage of time, enabling notifying a process when the specified  
 1217 time or time interval has passed.

1218 **3.23 Asterisk Character (<asterisk>)**

1219 The character ' \* '.

1220 **3.24 Async-Cancel-Safe Function**

1221 A function that may be safely invoked by an application while the asynchronous form of  
 1222 cancellation is enabled. No function is async-cancel-safe unless explicitly described as such.

### 1223 3.25 Asynchronous Events

1224 Events that occur independently of the execution of the application.

### 1225 3.26 Asynchronous Input and Output

1226 A functionality enhancement to allow an application process to queue data input and output  
1227 commands with asynchronous notification of completion.

### 1228 3.27 Async-Signal-Safe Function

1229 A function that may be invoked, without restriction, from signal-catching functions. No function  
1230 is async-signal-safe unless explicitly described as such.

### 1231 3.28 Asynchronously-Generated Signal

1232 A signal that is not attributable to a specific thread. Examples are signals sent via *kill()*, signals  
1233 sent from the keyboard, and signals delivered to process groups. Being asynchronous is a  
1234 property of how the signal was generated and not a property of the signal number. All signals  
1235 may be generated asynchronously.

1236 **Note:** The *kill()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

### 1237 3.29 Asynchronous I/O Completion

1238 For an asynchronous read or write operation, when a corresponding synchronous read or write  
1239 would have completed and when any associated status fields have been updated.

### 1240 3.30 Asynchronous I/O Operation

1241 An I/O operation that does not of itself cause the thread requesting the I/O to be blocked from  
1242 further use of the processor.

1243 This implies that the process and the I/O operation may be running concurrently.

### 1244 3.31 Authentication

1245 The process of validating a user or process to verify that the user or process is not a counterfeit.

1246 **3.32 Authorization**

1247 The process of verifying that a user or process has permission to use a resource in the manner  
1248 requested.

1249 To ensure security, the user or process would also need to be authenticated before granting  
1250 access.

1251 **3.33 Background Job**

1252 See *Background Process Group* in [Section 3.35](#).

1253 **3.34 Background Process**

1254 A process that is a member of a background process group.

1255 **3.35 Background Process Group (or Background Job)**

1256 Any process group, other than a foreground process group, that is a member of a session that  
1257 has established a connection with a controlling terminal.

1258 **3.36 Backquote Character**

1259 The character ' ` ', also known as <grave-accent>.

1260 **3.37 Backslash Character (<backslash>)**

1261 The character designated by ' \ ' in the C language, also known as reverse solidus.

1262 **3.38 Backspace Character (<backspace>)**

1263 A character that, in the output stream, should cause printing (or displaying) to occur one  
1264 column position previous to the position about to be printed. If the position about to be printed  
1265 is at the beginning of the current line, the behavior is unspecified. It is the character designated  
1266 by ' \b ' in the C language. It is unspecified whether this character is the exact sequence  
1267 transmitted to an output device by the system to accomplish the backspace function. The  
1268 backspace defined here is not necessarily the ERASE special character.

1269 **Note:** Special Characters are defined in detail in [Section 11.1.9](#) (on page 203).

1270 **3.39 Barrier**

1271 A synchronization object that allows multiple threads to synchronize at a particular point in  
1272 their execution.

1273 **3.40 Basename**

1274 The final, or only, filename in a pathname.

1275 **3.41 Basic Regular Expression (BRE)**

1276 A regular expression (see [Section 3.315](#), on page 84) used by the majority of utilities that select  
1277 strings from a set of character strings.

1278 **Note:** Basic Regular Expressions are described in detail in [Section 9.3](#) (on page 183).

1279 **3.42 Batch Access List**

1280 A list of user IDs and group IDs of those users and groups authorized to place batch jobs in a  
1281 batch queue.

1282 A batch access list is associated with a batch queue. A batch server uses the batch access list of a  
1283 batch queue as one of the criteria in deciding to put a batch job in a batch queue.

1284 **3.43 Batch Administrator**

1285 A user that is authorized to modify all the attributes of queues and jobs and to change the status  
1286 of a batch server.

1287 **3.44 Batch Client**

1288 A computational entity that utilizes batch services by making requests of batch servers.

1289 Batch clients often provide the means by which users access batch services, although a batch  
1290 server may act as a batch client by virtue of making requests of another batch server.

**1291 3.45 Batch Destination**

1292 The batch server in a batch system to which a batch job should be sent for processing.

1293 Acceptance of a batch job at a batch destination is the responsibility of a receiving batch server.  
1294 A batch destination may consist of a batch server-specific portion, a network-wide portion, or  
1295 both. The batch server-specific portion is referred to as the “batch queue”. The network-wide  
1296 portion is referred to as a “batch server name”.

**1297 3.46 Batch Destination Identifier**

1298 A string that identifies a specific batch destination.

1299 A string of characters in the portable character set used to specify a particular batch destination.

1300 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

**1301 3.47 Batch Directive**

1302 A line from a file that is interpreted by the batch server. The line is usually in the form of a  
1303 comment and is an additional means of passing options to the *qsub* utility.

1304 **Note:** The *qsub* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

**1305 3.48 Batch Job**

1306 A set of computational tasks for a computing system.

1307 Batch jobs are managed by batch servers.

1308 Once created, a batch job may be executing or pending execution. A batch job that is executing  
1309 has an associated session leader (a process) that initiates and monitors the computational tasks  
1310 of the batch job.

**1311 3.49 Batch Job Attribute**

1312 A named data type whose value affects the processing of a batch job.

1313 The values of the attributes of a batch job affect the processing of that job by the batch server that  
1314 manages the batch job.

**1315 3.50 Batch Job Identifier**

1316 A unique name for a batch job. A name that is unique among all other batch job identifiers in a  
1317 batch system and that identifies the batch server to which the batch job was originally  
1318 submitted.

1319 **3.51 Batch Job Name**

1320 A label that is an attribute of a batch job. The batch job name is not necessarily unique.

1321 **3.52 Batch Job Owner**1322 The *username@hostname* of the user submitting the batch job, where *username* is a user name (see  
1323 also [Section 3.429](#), on page 102) and *hostname* is a network host name.1324 **3.53 Batch Job Priority**1325 A value specified by the user that may be used by an implementation to determine the order in  
1326 which batch jobs are selected to be executed. Job priority has a numeric value in the range  
1327 -1 024 to 1 023.1328 **Note:** The batch job priority is not the execution priority (nice value) of the batch job.1329 **3.54 Batch Job State**1330 An attribute of a batch job which determines the types of requests that the batch server that  
1331 manages the batch job can accept for the batch job. Valid states include QUEUED, RUNNING,  
1332 HELD, WAITING, EXITING, and TRANSFERRING.1333 **3.55 Batch Name Service**1334 A service that assigns batch names that are unique within the batch name space, and that can  
1335 translate a unique batch name into the location of the named batch entity.1336 **3.56 Batch Name Space**

1337 The environment within which a batch name is known to be unique.

1338 **3.57 Batch Node**

1339 A host containing part or all of a batch system.

1340 A batch node is a host meeting at least one of the following conditions:

- 1341 • Capable of executing a batch client
- 1342 • Contains a routing batch queue
- 1343 • Contains an execution batch queue

1344 **3.58 Batch Operator**

1345 A user that is authorized to modify some, but not all, of the attributes of jobs and queues, and  
 1346 may change the status of the batch server.

1347 **3.59 Batch Queue**

1348 A manageable object that represents a set of batch jobs and is managed by a single batch server.

1349 **Note:** A set of batch jobs is called a batch queue largely for historical reasons. Jobs are selected from  
 1350 the batch queue for execution based on attributes such as priority, resource requirements, and  
 1351 hold conditions.

1352 See also XCU [Section 3.1.2](#) (on page 2376).1353 **3.60 Batch Queue Attribute**

1354 A named data type whose value affects the processing of all batch jobs that are members of the  
 1355 batch queue.

1356 A batch queue has attributes that affect the processing of batch jobs that are members of the  
 1357 batch queue.

1358 **3.61 Batch Queue Position**

1359 The place, relative to other jobs in the batch queue, occupied by a particular job in a batch queue.  
 1360 This is defined in part by submission time and priority; see also [Section 3.62](#).

1361 **3.62 Batch Queue Priority**

1362 The maximum job priority allowed for any batch job in a given batch queue.

1363 The batch queue priority is set and may be changed by users with appropriate privileges. The  
 1364 priority is bounded in an implementation-defined manner.

### 1365 3.63 Batch Rerunability

1366 An attribute of a batch job indicating that it may be rerun after an abnormal termination from  
1367 the beginning without affecting the validity of the results.

### 1368 3.64 Batch Restart

1369 The action of resuming the processing of a batch job from the point of the last checkpoint.  
1370 Typically, this is done if the batch job has been interrupted because of a system failure.

### 1371 3.65 Batch Server

1372 A computational entity that provides batch services.

### 1373 3.66 Batch Server Name

1374 A string of characters in the portable character set used to specify a particular server in a  
1375 network.

1376 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

### 1377 3.67 Batch Service

1378 Computational and organizational services performed by a batch system on behalf of batch jobs.

1379 Batch services are of two types: requested and deferred.

1380 **Note:** Batch Services are listed in XCU [Table 3-5](#) (on page 2390).

### 1381 3.68 Batch Service Request

1382 A solicitation of services from a batch client to a batch server.

1383 A batch service request may entail the exchange of any number of messages between the batch  
1384 client and the batch server.

1385 When naming specific types of service requests, the term "request" is qualified by the type of  
1386 request, as in *Queue Batch Job Request* and *Delete Batch Job Request*.

### 1387 3.69 Batch Submission

1388 The process by which a batch client requests that a batch server create a batch job via a *Queue Job*  
1389 *Request* to perform a specified computational task.

1390 **3.70 Batch System**

1391 A collection of one or more batch servers.

1392 **3.71 Batch Target User**

1393 The name of a user on the batch destination batch server.

1394 The target user is the user name under whose account the batch job is to execute on the  
1395 destination batch server.

1396 **3.72 Batch User**

1397 A user who is authorized to make use of batch services.

1398 **3.73 Bind**

1399 The process of assigning a network address to an endpoint.

1400 **3.74 Blank Character (<blank>)**

1401 One of the characters that belong to the **blank** character class as defined via the *LC\_CTYPE*  
1402 category in the current locale. In the POSIX locale, a <blank> character is either a <tab> or a  
1403 <space>.

1404 **3.75 Blank Line**

1405 A line consisting solely of zero or more <blank> characters terminated by a <newline>; see also  
1406 [Section 3.145](#) (on page 56).

1407 **3.76 Blocked Process (or Thread)**

1408 A process (or thread) that is waiting for some condition (other than the availability of a  
1409 processor) to be satisfied before it can continue execution.

1410 **3.77 Blocking**

1411 A property of an open file description that causes function calls associated with it to wait for the  
1412 requested action to be performed before returning.

1413 **3.78 Block-Mode Terminal**

1414 A terminal device operating in a mode incapable of the character-at-a-time input and output  
 1415 operations described by some of the standard utilities.

1416 **Note:** Output Devices and Terminal Types are defined in detail in [Section 10.2](#) (on page 198).

1417 **3.79 Block Special File**

1418 A file that refers to a device. A block special file is normally distinguished from a character  
 1419 special file by providing access to the device in a manner such that the hardware characteristics  
 1420 of the device are not visible.

1421 **3.80 Braces**

1422 The characters ' {' (left-curly-bracket) and ' }' (right-curly-bracket). When used in the phrase  
 1423 "enclosed in (curly) braces" the symbol ' {' immediately precedes the object to be enclosed, and  
 1424 ' }' immediately follows it. When describing these characters in the portable character set, the  
 1425 names <left-curly-bracket> and <right-curly-bracket> are used for ' {' and ' }', and <left-brace> and  
 1426 <right-brace> are used for ' {' and ' }'.

1427 **3.81 Brackets**

1428 The characters ' [' (left-square-bracket) and ' ]' (right-square-bracket). When used in the  
 1429 phrase "enclosed in (square) brackets" the symbol ' [' immediately precedes the object to be  
 1430 enclosed, and ' ]' immediately follows it. When describing these characters in the portable  
 1431 character set, the names <left-square-bracket> and <right-square-bracket> are used.

1432 **3.82 Broadcast**

1433 The transfer of data from one endpoint to several endpoints, as described in RFC 919 and  
 1434 RFC 922.

1435 **3.83 Built-In Utility (or Built-In)**

1436 A utility implemented within a shell. The utilities referred to as special built-ins have special  
 1437 qualities. Unless qualified, the term “built-in” includes the special built-in utilities. Regular  
 1438 built-ins are not required to be actually built into the shell on the implementation, but they do  
 1439 have special command-search qualities.

1440 **Note:** Special Built-In Utilities are defined in detail in XCU [Section 2.14](#) (on page 2334).

1441 Regular Built-In Utilities are defined in detail in XCU [Section 2.9.1.1](#) (on page 2317).

1442 **3.84 Byte**

1443 An individually addressable unit of data storage that is exactly an octet, used to store a character  
 1444 or a portion of a character; see also [Section 3.87](#) (on page 47). A byte is composed of a  
 1445 contiguous sequence of 8 bits. The least significant bit is called the “low-order” bit; the most  
 1446 significant is called the “high-order” bit.

1447 **Note:** The definition of byte from the ISO C standard is broader than the above and might  
 1448 accommodate hardware architectures with different sized addressable units than octets.

1449 **3.85 Byte Input/Output Functions**

1450 The functions that perform byte-oriented input from streams or byte-oriented output to streams:  
 1451 *fgetc()*, *fgets()*, *fprintf()*, *fputc()*, *fputs()*, *fread()*, *fscanf()*, *fwrite()*, *getc()*, *getchar()*, *getdelim()*,  
 1452 *getline()*, *gets()*, *printf()*, *putc()*, *putchar()*, *puts()*, *scanf()*, *ungetc()*, *vfprintf()*, and *vprintf()*.

1453 **Note:** Functions are defined in detail in the System Interfaces volume of POSIX.1-2008.

1454 **3.86 Carriage-Return Character (<carriage-return>)**

1455 A character that in the output stream indicates that printing should start at the beginning of the  
 1456 same physical line in which the carriage-return occurred. It is the character designated by ‘\r’  
 1457 in the C language. It is unspecified whether this character is the exact sequence transmitted to an  
 1458 output device by the system to accomplish the movement to the beginning of the line.

1459 **3.87 Character**

1460 A sequence of one or more bytes representing a single graphic symbol or control code.

1461 **Note:** This term corresponds to the ISO C standard term multi-byte character, where a single-byte  
 1462 character is a special case of a multi-byte character. Unlike the usage in the ISO C standard,  
 1463 *character* here has no necessary relationship with storage space, and *byte* is used when storage  
 1464 space is discussed.

1465 See the definition of the portable character set in [Section 6.1](#) (on page 125) for a further  
 1466 explanation of the graphical representations of (abstract) characters, as opposed to character  
 1467 encodings.

1468 **3.88 Character Array**1469 An array of elements of type **char**.1470 **3.89 Character Class**

1471 A named set of characters sharing an attribute associated with the name of the class. The classes  
 1472 and the characters that they contain are dependent on the value of the *LC\_CTYPE* category in  
 1473 the current locale.

1474 **Note:** The *LC\_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 139).

1475 **3.90 Character Set**

1476 A finite set of different characters used for the representation, organization, or control of data.

1477 **3.91 Character Special File**

1478 A file that refers to a device (such as a terminal device file) or that has special properties (such as  
 1479 **/dev/null**).

1480 **Note:** The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 199).

1481 **3.92 Character String**

1482 A contiguous sequence of characters terminated by and including the first null byte.

1483 **3.93 Child Process**

1484 A new process created (by *fork()*, *posix\_spawn()*, or *posix\_spawnp()*) by a given process. A child  
1485 process remains the child of the creating process as long as both processes continue to exist.

1486 **Note:** The *fork()*, *posix\_spawn()*, and *posix\_spawnp()* functions are defined in detail in the System  
1487 Interfaces volume of POSIX.1-2008.

1488 **3.94 Circumflex Character (<circumflex>)**

1489 The character ' ^ '.

1490 **3.95 Clock**

1491 A software or hardware object that can be used to measure the apparent or actual passage of  
1492 time.

1493 The current value of the time measured by a clock can be queried and, possibly, set to a value  
1494 within the legal range of the clock.

1495 **3.96 Clock Jump**

1496 The difference between two successive distinct values of a clock, as observed from the  
1497 application via one of the "get time" operations.

1498 **3.97 Clock Tick**

1499 An interval of time; an implementation-defined number of these occur each second. Clock ticks  
1500 are one of the units that may be used to express a value found in type **clock\_t**.

1501 **3.98 Coded Character Set**

1502 A set of unambiguous rules that establishes a character set and the one-to-one relationship  
1503 between each character of the set and its bit representation.

### 1504 3.99 Codeset

1505 The result of applying rules that map a numeric code value to each element of a character set.  
 1506 An element of a character set may be related to more than one numeric code value but the  
 1507 reverse is not true. However, for state-dependent encodings the relationship between numeric  
 1508 code values and elements of a character set may be further controlled by state information. The  
 1509 character set may contain fewer elements than the total number of possible numeric code values;  
 1510 that is, some code values may be unassigned.

1511 **Note:** Character Encoding is defined in detail in [Section 6.2](#) (on page 128).

### 1512 3.100 Collating Element

1513 The smallest entity used to determine the logical ordering of character or wide-character strings;  
 1514 see also [Section 3.102](#). A collating element consists of either a single character, or two or more  
 1515 characters collating as a single entity. The value of the *LC\_COLLATE* category in the current  
 1516 locale determines the current set of collating elements.

### 1517 3.101 Collation

1518 The logical ordering of character or wide-character strings according to defined precedence  
 1519 rules. These rules identify a collation sequence between the collating elements, and such  
 1520 additional rules that can be used to order strings consisting of multiple collating elements.

### 1521 3.102 Collation Sequence

1522 The relative order of collating elements as determined by the setting of the *LC\_COLLATE*  
 1523 category in the current locale. The collation sequence is used for sorting and is determined from  
 1524 the collating weights assigned to each collating element. In the absence of weights, the collation  
 1525 sequence is the order in which collating elements are specified between **order\_start** and  
 1526 **order\_end** keywords in the *LC\_COLLATE* category.

1527 Multi-level sorting is accomplished by assigning elements one or more collation weights, up to  
 1528 the limit {*COLL\_WEIGHTS\_MAX*}. On each level, elements may be given the same weight (at  
 1529 the primary level, called an equivalence class; see also [Section 3.151](#), on page 57) or be omitted  
 1530 from the sequence. Strings that collate equally using the first assigned weight (primary ordering)  
 1531 are then compared using the next assigned weight (secondary ordering), and so on.

1532 **Note:** {*COLL\_WEIGHTS\_MAX*} is defined in detail in [<limits.h>](#).

1533 **3.103 Column Position**

1534 A unit of horizontal measure related to characters in a line.

1535 It is assumed that each character in a character set has an intrinsic column width independent of  
 1536 any output device. Each printable character in the portable character set has a column width of  
 1537 one. The standard utilities, when used as described in POSIX.1-2008, assume that all characters  
 1538 have integral column widths. The column width of a character is not necessarily related to the  
 1539 internal representation of the character (numbers of bits or bytes).

1540 The column position of a character in a line is defined as one plus the sum of the column widths  
 1541 of the preceding characters in the line. Column positions are numbered starting from 1.

1542 **3.104 Command**

1543 A directive to the shell to perform a particular task.

1544 **Note:** Shell Commands are defined in detail in XCU Section 2.9 (on page 2316).1545 **3.105 Command Language Interpreter**

1546 An interface that interprets sequences of text input as commands. It may operate on an input  
 1547 stream or it may interactively prompt and read commands from a terminal. It is possible for  
 1548 applications to invoke utilities through a number of interfaces, which are collectively considered  
 1549 to act as command interpreters. The most obvious of these are the *sh* utility and the *system()*  
 1550 function, although *popen()* and the various forms of *exec* may also be considered to behave as  
 1551 interpreters.

1552 **Note:** The *sh* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

1553 The *system()*, *popen()*, and *exec* functions are defined in detail in the System Interfaces volume  
 1554 of POSIX.1-2008.

1555 **3.106 Composite Graphic Symbol**

1556 A graphic symbol consisting of a combination of two or more other graphic symbols in a single  
 1557 character position, such as a diacritical mark and a base character.

1558 **3.107 Condition Variable**

1559 A synchronization object which allows a thread to suspend execution, repeatedly, until some  
 1560 associated predicate becomes true. A thread whose execution is suspended on a condition  
 1561 variable is said to be blocked on the condition variable.

1562 **3.108 Connected Socket**

1563 A connection-mode socket for which a connection has been established, or a connectionless-  
 1564 mode socket for which a peer address has been set. See also [Section 3.109](#), [Section 3.110](#), [Section](#)  
 1565 [3.111](#), and [Section 3.348](#) (on page 89).

1566 **3.109 Connection**

1567 An association established between two or more endpoints for the transfer of data

1568 **3.110 Connection Mode**

1569 The transfer of data in the context of a connection; see also [Section 3.111](#).

1570 **3.111 Connectionless Mode**

1571 The transfer of data other than in the context of a connection; see also [Section 3.110](#) and [Section](#)  
 1572 [3.124](#) (on page 53).

1573 **3.112 Control Character**

1574 A character, other than a graphic character, that affects the recording, processing, transmission,  
 1575 or interpretation of text.

1576 **3.113 Control Operator**

1577 In the shell command language, a token that performs a control function. It is one of the  
 1578 following symbols:

1579 & && ( ) ; ;; newline | ||

1580 The end-of-input indicator used internally by the shell is also considered a control operator.

1581 **Note:** Token Recognition is defined in detail in XCU [Section 2.3](#) (on page 2299).

1582 **3.114 Controlling Process**

1583 The session leader that established the connection to the controlling terminal. If the terminal  
 1584 subsequently ceases to be a controlling terminal for this session, the session leader ceases to be  
 1585 the controlling process.

**1586 3.115 Controlling Terminal**

1587 A terminal that is associated with a session. Each session may have at most one controlling  
1588 terminal associated with it, and a controlling terminal is associated with exactly one session.  
1589 Certain input sequences from the controlling terminal cause signals to be sent to all processes in  
1590 the foreground process group associated with the controlling terminal.

1591 **Note:** The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 199).

**1592 3.116 Conversion Descriptor**

1593 A per-process unique value used to identify an open codeset conversion.

**1594 3.117 Core File**

1595 A file of unspecified format that may be generated when a process terminates abnormally.

**1596 3.118 CPU Time (Execution Time)**

1597 The time spent executing a process or thread, including the time spent executing system services  
1598 on behalf of that process or thread. If the Threads option is supported, then the value of the  
1599 CPU-time clock for a process is implementation-defined. With this definition the sum of all the  
1600 execution times of all the threads in a process might not equal the process execution time, even  
1601 in a single-threaded process, because implementations may differ in how they account for time  
1602 during context switches or for other reasons.

**1603 3.119 CPU-Time Clock**

1604 A clock that measures the execution time of a particular process or thread.

**1605 3.120 CPU-Time Timer**

1606 A timer attached to a CPU-time clock.

**1607 3.121 Current Job**

1608 In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities. There  
1609 is at most one current job; see also [Section 3.203](#) (on page 65).

1610 **3.122 Current Working Directory**

1611 See *Working Directory* in [Section 3.439](#) (on page 104).

1612 **3.123 Cursor Position**

1613 The line and column position on the screen denoted by the terminal's cursor.

1614 **3.124 Datagram**

1615 A unit of data transferred from one endpoint to another in connectionless mode service.

1616 **3.125 Data Segment**

1617 Memory associated with a process, that can contain dynamically allocated data.

1618 **3.126 Deferred Batch Service**

1619 A service that is performed as a result of events that are asynchronous with respect to requests.

1620 **Note:** Once a batch job has been created it is subject to deferred services.

1621 **3.127 Device**

1622 A computer peripheral or an object that appears to the application as such.

1623 **3.128 Device ID**

1624 A non-negative integer used to identify a device.

1625 **3.129 Directory**

1626 A file that contains directory entries. No two directory entries in the same directory have the  
1627 same name.

1628 **3.130 Directory Entry (or Link)**

1629 An object that associates a filename with a file. Several directory entries can associate names

1630 with the same file.

### 1631 3.131 Directory Stream

1632 A sequence of all the directory entries in a particular directory. An open directory stream may be  
1633 implemented using a file descriptor.

### 1634 3.132 Disarm (a Timer)

1635 To stop a timer from measuring the passage of time, disabling any future process notifications  
1636 (until the timer is armed again).

### 1637 3.133 Display

1638 To output to the user's terminal. If the output is not directed to a terminal, the results are  
1639 undefined.

### 1640 3.134 Display Line

1641 A line of text on a physical device or an emulation thereof. Such a line will have a maximum  
1642 number of characters which can be presented.

1643 **Note:** This may also be written as "line on the display".

### 1644 3.135 Dollar-Sign Character (<dollar-sign>)

1645 The character '\$'.

### 1646 3.136 Dot

1647 In the context of naming files, the filename consisting of a single dot character ('.').

1648 **Note:** In the context of shell special built-in utilities, see *dot* in XCU Section 2.14 (on page 2334).

1649 Pathname Resolution is defined in detail in Section 4.12 (on page 111).

1650 **3.137 Dot-Dot**

1651 The filename consisting solely of two dot characters (" . . ").

1652 **Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).

1653 **3.138 Double-Quote Character**

1654 The character ' " ', also known as <quotation-mark>.

1655 **Note:** The "double" adjective in this term refers to the two strokes in the character glyph.  
1656 POSIX.1-2008 never uses the term "double-quote" to refer to two apostrophes or quotation-  
1657 marks.

1658 **3.139 Downshifting**

1659 The conversion of an uppercase character that has a single character lowercase representation  
1660 into this lowercase representation.

1661 **3.140 Driver**

1662 A module that controls data transferred to and received from devices.

1663 **Note:** Drivers are traditionally written to be a part of the system implementation, although they are  
1664 frequently written separately from the writing of the implementation. A driver may contain  
1665 processor-specific code, and therefore be non-portable.

1666 **3.141 Effective Group ID**

1667 An attribute of a process that is used in determining various permissions, including file access  
1668 permissions; see also [Section 3.188](#) (on page 63).

1669 **3.142 Effective User ID**

1670 An attribute of a process that is used in determining various permissions, including file access  
1671 permissions; see also [Section 3.428](#) (on page 102).

1672 **3.143 Eight-Bit Transparency**

1673 The ability of a software component to process 8-bit characters without modifying or utilizing  
1674 any part of the character in a way that is inconsistent with the rules of the current coded  
1675 character set.

**1676 3.144 Empty Directory**

1677 A directory that contains, at most, directory entries for dot and dot-dot, and has exactly one link  
1678 to it (other than its own dot entry, if one exists), in dot-dot. No other links to the directory may  
1679 exist. It is unspecified whether an implementation can ever consider the root directory to be  
1680 empty.

**1681 3.145 Empty Line**

1682 A line consisting of only a <newline>; see also [Section 3.75](#) (on page 44).

**1683 3.146 Empty String (or Null String)**

1684 A string whose first byte is a null byte.

**1685 3.147 Empty Wide-Character String**

1686 A wide-character string whose first element is a null wide-character code.

**1687 3.148 Encoding Rule**

1688 The rules used to convert between wide-character codes and multi-byte character codes.

1689 **Note:** Stream Orientation and Encoding Rules are defined in detail in XSH [Section 2.5.2](#) (on page 493).

**1690 3.149 Entire Regular Expression**

1691 The concatenated set of one or more basic regular expressions or extended regular expressions  
1692 that make up the pattern specified for string selection.

1693 **Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 181).

1694 **3.150 Epoch**

1695 The time zero hours, zero minutes, zero seconds, on January 1, 1970 Coordinated Universal Time  
 1696 (UTC).

1697 **Note:** See also *Seconds Since the Epoch* defined in [Section 4.15](#) (on page 113).

1698 **3.151 Equivalence Class**

1699 A set of collating elements with the same primary collation weight.

1700 Elements in an equivalence class are typically elements that naturally group together, such as all  
 1701 accented letters based on the same base letter.

1702 The collation order of elements within an equivalence class is determined by the weights  
 1703 assigned on any subsequent levels after the primary weight.

1704 **3.152 Era**

1705 A locale-specific method for counting and displaying years.

1706 **Note:** The *LC\_TIME* category is defined in detail in [Section 7.3.5](#) (on page 158).

1707 **3.153 Event Management**

1708 The mechanism that enables applications to register for and be made aware of external events  
 1709 such as data becoming available for reading.

1710 **3.154 Executable File**

1711 A regular file acceptable as a new process image file by the equivalent of the *exec* family of  
 1712 functions, and thus usable as one form of a utility. The standard utilities described as compilers  
 1713 can produce executable files, but other unspecified methods of producing executable files may  
 1714 also be provided. The internal format of an executable file is unspecified, but a conforming  
 1715 application cannot assume an executable file is a text file.

1716 **3.155 Execute**

1717 To perform command search and execution actions, as defined in the Shell and Utilities volume  
 1718 of POSIX.1-2008; see also [Section 3.200](#) (on page 65).

1719 **Note:** Command Search and Execution is defined in detail in XCU [Section 2.9.1.1](#) (on page 2317).

1720 **3.156 Execution Time**

1721 See *CPU Time* in [Section 3.118](#) (on page 52).

1722 **3.157 Execution Time Monitoring**

1723 A set of execution time monitoring primitives that allow online measuring of thread and process  
 1724 execution times.

1725 **3.158 Expand**

1726 In the shell command language, when not qualified, the act of applying word expansions.

1727 **Note:** Word Expansions are defined in detail in XCU [Section 2.6](#) (on page 2305).

1728 **3.159 Extended Regular Expression (ERE)**

1729 A regular expression (see also [Section 3.315](#), on page 84) that is an alternative to the Basic  
 1730 Regular Expression using a more extensive syntax, occasionally used by some utilities.

1731 **Note:** Extended Regular Expressions are described in detail in [Section 9.4](#) (on page 188).

1732 **3.160 Extended Security Controls**

1733 Implementation-defined security controls allowed by the file access permission and appropriate  
 1734 privileges (see also [Section 3.20](#), on page 36) mechanisms, through which an implementation can  
 1735 support different security policies from those described in POSIX.1-2008.

1736 **Note:** See also *Extended Security Controls* defined in [Section 4.3](#) (on page 107).

1737 File Access Permissions are defined in detail in [Section 4.4](#) (on page 108).

1738 **3.161 Feature Test Macro**

1739 A macro used to determine whether a particular set of features is included from a header.

1740 **Note:** See also XSH [Section 2.2](#) (on page 468).1741 **3.162 Field**1742 In the shell command language, a unit of text that is the result of parameter expansion,  
1743 arithmetic expansion, command substitution, or field splitting. During command processing, the  
1744 resulting fields are used as the command name and its arguments.1745 **Note:** Parameter Expansion is defined in detail in XCU [Section 2.6.2](#) (on page 2306).1746 Arithmetic Expansion is defined in detail in XCU [Section 2.6.4](#) (on page 2310).1747 Command Substitution is defined in detail in XCU [Section 2.6.3](#) (on page 2309).1748 Field Splitting is defined in detail in XCU [Section 2.6.5](#) (on page 2311).1749 For further information on command processing, see XCU [Section 2.9.1](#) (on page 2316).1750 **3.163 FIFO Special File (or FIFO)**

1751 A type of file with the property that data written to such a file is read on a first-in-first-out basis.

1752 **Note:** Other characteristics of FIFOs are described in the System Interfaces volume of POSIX.1-2008,  
1753 *lseek()*, *open()*, *read()*, and *write()*.1754 **3.164 File**1755 An object that can be written to, or read from, or both. A file has certain attributes, including  
1756 access permissions and type. File types include regular file, character special file, block special  
1757 file, FIFO special file, symbolic link, socket, and directory. Other types of files may be supported  
1758 by the implementation.1759 **3.165 File Description**1760 See *Open File Description* in [Section 3.253](#) (on page 73).

1761 **3.166 File Descriptor**

1762 A per-process unique, non-negative integer used to identify an open file for the purpose of file  
 1763 access. The value of a file descriptor is from zero to {OPEN\_MAX}. A process can have no more  
 1764 than {OPEN\_MAX} file descriptors open simultaneously. File descriptors may also be used to  
 1765 implement message catalog descriptors and directory streams; see also [Section 3.253](#) (on page  
 1766 73).

1767 **Note:** {OPEN\_MAX} is defined in detail in [<limits.h>](#).

1768 **3.167 File Group Class**

1769 The property of a file indicating access permissions for a process related to the group  
 1770 identification of a process. A process is in the file group class of a file if the process is not in the  
 1771 file owner class and if the effective group ID or one of the supplementary group IDs of the  
 1772 process matches the group ID associated with the file. Other members of the class may be  
 1773 implementation-defined.

1774 **3.168 File Mode**

1775 An object containing the file mode bits and file type of a file.

1776 **Note:** File mode bits and file types are defined in detail in [<sys/stat.h>](#).

1777 **3.169 File Mode Bits**

1778 A file's file permission bits, set-user-ID-on-execution bit (S\_ISUID), set-group-ID-on-execution  
 1779 bit (S\_ISGID), and, on directories, the restricted deletion flag bit (S\_ISVTX).

1780 **Note:** File Mode Bits are defined in detail in [<sys/stat.h>](#).

1781 **3.170 Filename**

1782 A name consisting of 1 to {NAME\_MAX} bytes used to name a file. The characters composing  
 1783 the name may be selected from the set of all character values excluding the <slash> character  
 1784 and the null byte. The filenames dot and dot-dot have special meaning. A filename is sometimes  
 1785 referred to as a "pathname component".

1786 **Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).

1787 **3.171 File Offset**

1788 The byte position in the file where the next I/O operation begins. Each open file description  
 1789 associated with a regular file, block special file, or directory has a file offset. A character special

1790 file that does not refer to a terminal device may have a file offset. There is no file offset specified  
1791 for a pipe or FIFO.

### 1792 **3.172 File Other Class**

1793 The property of a file indicating access permissions for a process related to the user and group  
1794 identification of a process. A process is in the file other class of a file if the process is not in the  
1795 file owner class or file group class.

### 1796 **3.173 File Owner Class**

1797 The property of a file indicating access permissions for a process related to the user  
1798 identification of a process. A process is in the file owner class of a file if the effective user ID of  
1799 the process matches the user ID of the file.

### 1800 **3.174 File Permission Bits**

1801 Information about a file that is used, along with other information, to determine whether a  
1802 process has read, write, or execute/search permission to a file. The bits are divided into three  
1803 parts: owner, group, and other. Each part is used with the corresponding file class of processes.  
1804 These bits are contained in the file mode.

1805 **Note:** File modes are defined in detail in [<sys/stat.h>](#).

1806 File Access Permissions are defined in detail in [Section 4.4](#) (on page 108).

### 1807 **3.175 File Serial Number**

1808 A per-file system unique identifier for a file.

### 1809 **3.176 File System**

1810 A collection of files and certain of their attributes. It provides a name space for file serial  
1811 numbers referring to those files.

### 1812 **3.177 File Type**

1813 See *File* in [Section 3.164](#) (on page 59).

1814 **3.178 Filter**

1815 A command whose operation consists of reading data from standard input or a list of input files  
 1816 and writing data to standard output. Typically, its function is to perform some transformation  
 1817 on the data stream.

1818 **3.179 First Open (of a File)**

1819 When a process opens a file that is not currently an open file within any process.

1820 **3.180 Flow Control**

1821 The mechanism employed by a communications provider that constrains a sending entity to  
 1822 wait until the receiving entities can safely receive additional data without loss.

1823 **3.181 Foreground Job**

1824 See *Foreground Process Group* in [Section 3.183](#).

1825 **3.182 Foreground Process**

1826 A process that is a member of a foreground process group.

1827 **3.183 Foreground Process Group (or Foreground Job)**

1828 A process group whose member processes have certain privileges, denied to processes in  
 1829 background process groups, when accessing their controlling terminal. Each session that has  
 1830 established a connection with a controlling terminal has at most one process group of the session  
 1831 as the foreground process group of that controlling terminal.

1832 **Note:** The General Terminal Interface is defined in detail in [Chapter 11](#).

1833 **3.184 Foreground Process Group ID**

1834 The process group ID of the foreground process group.

1835 **3.185 Form-Feed Character (<form-feed>)**

1836 A character that in the output stream indicates that printing should start on the next page of an  
 1837 output device. It is the character designated by '`\f`' in the C language. If the form-feed is not  
 1838 the first character of an output line, the result is unspecified. It is unspecified whether this  
 1839 character is the exact sequence transmitted to an output device by the system to accomplish the  
 1840 movement to the next page.

1841 **3.186 Graphic Character**

1842 A member of the **graph** character class of the current locale.

1843 **Note:** The **graph** character class is defined in detail in [Section 7.3.1](#) (on page 139).

1844 **3.187 Group Database**

1845 A system database that contains at least the following information for each group ID:

- 1846 • Group name
- 1847 • Numerical group ID
- 1848 • List of users allowed in the group

1849 The list of users allowed in the group is used by the *newgrp* utility.

1850 **Note:** The *newgrp* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

1851 **3.188 Group ID**

1852 A non-negative integer, which can be contained in an object of type **gid\_t**, that is used to identify  
 1853 a group of system users. Each system user is a member of at least one group. When the identity  
 1854 of a group is associated with a process, a group ID value is referred to as a real group ID, an  
 1855 effective group ID, one of the supplementary group IDs, or a saved set-group-ID.

1856 **3.189 Group Name**

1857 A string that is used to identify a group; see also [Section 3.187](#). To be portable across conforming  
 1858 systems, the value is composed of characters from the portable filename character set. The  
 1859 `<hyphen>` should not be used as the first character of a portable group name.

1860 **3.190 Hard Limit**

1861 A system resource limitation that may be reset to a lesser or greater limit by a privileged process.  
 1862 A non-privileged process is restricted to only lowering its hard limit.

**1863 3.191 Hard Link**

1864 The relationship between two directory entries that represent the same file; see also [Section 3.130](#)  
1865 (on page 53). The result of an execution of the *ln* utility (without the *-s* option) or the *link()*  
1866 function. This term is contrasted against symbolic link; see also [Section 3.373](#) (on page 94).

**1867 3.192 Home Directory**

1868 The directory specified by the *HOME* environment variable.

**1869 3.193 Host Byte Order**

1870 The arrangement of bytes in any integer type when using a specific machine architecture.

1871 **Note:** Two common methods of byte ordering are big-endian and little-endian. Big-endian is a format  
1872 for storage of binary data in which the most significant byte is placed first, with the rest in  
1873 descending order. Little-endian is a format for storage or transmission of binary data in which  
1874 the least significant byte is placed first, with the rest in ascending order. See also [Section 4.9](#) (on  
1875 page 110).

**1876 3.194 Incomplete Line**

1877 A sequence of one or more non-`<newline>` characters at the end of the file.

**1878 3.195 Inf**

1879 A value representing `+infinity` or a value representing `-infinity` that can be stored in a floating  
1880 type. Not all systems support the *Inf* values.

**1881 3.196 Instrumented Application**

1882 An application that contains at least one call to the trace point function *posix\_trace\_event()*. Each  
1883 process of an instrumented application has a mapping of trace event names to trace event type  
1884 identifiers. This mapping is used by the trace stream that is created for that process.

**1885 3.197 Interactive Shell**

1886 A processing mode of the shell that is suitable for direct user interaction.

1887 **3.198 Internationalization**

1888 The provision within a computer program of the capability of making itself adaptable to the  
1889 requirements of different native languages, local customs, and coded character sets.

1890 **3.199 Interprocess Communication**

1891 A functionality enhancement to add a high-performance, deterministic interprocess  
1892 communication facility for local communication.

1893 **3.200 Invoke**

1894 To perform command search and execution actions, except that searching for shell functions and  
1895 special built-in utilities is suppressed; see also [Section 3.155](#) (on page 58).

1896 **Note:** Command Search and Execution is defined in detail in XCU [Section 2.9.1.1](#) (on page 2317).

1897 **3.201 Job**

1898 A set of processes, comprising a shell pipeline, and any processes descended from it, that are all  
1899 in the same process group.

1900 **Note:** See also XCU [Section 2.9.2](#) (on page 2318).

1901 **3.202 Job Control**

1902 A facility that allows users selectively to stop (suspend) the execution of processes and continue  
1903 (resume) their execution at a later point. The user typically employs this facility via the  
1904 interactive interface jointly supplied by the terminal I/O driver and a command interpreter.

1905 **3.203 Job Control Job ID**

1906 A handle that is used to refer to a job. The job control job ID can be any of the forms shown in  
1907 the following table:

1908  
1909  
1910  
1911  
1912  
1913  
1914  
1915  
1916

**Table 3-1** Job Control Job ID Formats

Job Control Job ID	Meaning
%%	Current job.
%+	Current job.
%-	Previous job.
%n	Job number <i>n</i> .
%string	Job whose command begins with <i>string</i> .
%?string	Job whose command contains <i>string</i> .

1917 **3.204 Last Close (of a File)**

1918 When a process closes a file, resulting in the file not being an open file within any process.

1919 **3.205 Line**

1920 A sequence of zero or more non-`<newline>` characters plus a terminating `<newline>` character.

1921 **3.206 Linger**

1922 The period of time before terminating a connection, to allow outstanding data to be transferred.

1923 **3.207 Link**

1924 See *Directory Entry* in [Section 3.130](#) (on page 53).

1925 **3.208 Link Count**

1926 The number of directory entries that refer to a particular file.

1927 **3.209 Local Customs**

1928 The conventions of a geographical area or territory for such things as date, time, and currency  
1929 formats.

1930 **3.210 Local Interprocess Communication (Local IPC)**

1931 The transfer of data between processes in the same system.

1932 **3.211 Locale**

1933 The definition of the subset of a user's environment that depends on language and cultural  
 1934 conventions.

1935 **Note:** Locales are defined in detail in [Chapter 7](#) (on page 135).

1936 **3.212 Localization**

1937 The process of establishing information within a computer system specific to the operation of  
 1938 particular native languages, local customs, and coded character sets.

1939 **3.213 Login**

1940 The unspecified activity by which a user gains access to the system. Each login is associated  
 1941 with exactly one login name.

1942 **3.214 Login Name**

1943 A user name that is associated with a login.

1944 **3.215 Map**

1945 To create an association between a page-aligned range of the address space of a process and  
 1946 some memory object, such that a reference to an address in that range of the address space  
 1947 results in a reference to the associated memory object. The mapped memory object is not  
 1948 necessarily memory-resident.

1949 **3.216 Marked Message**

1950 A STREAMS message on which a certain flag is set. Marking a message gives the application  
 1951 protocol-specific information. An application can use *ioctl()* to determine whether a given  
 1952 message is marked.

1953 **Note:** The *ioctl()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

1954 **3.217 Matched**

1955 A state applying to a sequence of zero or more characters when the characters in the sequence  
 1956 correspond to a sequence of characters defined by a basic regular expression or extended regular  
 1957 expression pattern.

1958 **Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 181).

1959 **3.218 Memory Mapped Files**

1960 A facility to allow applications to access files as part of the address space.

1961 **3.219 Memory Object**

1962 One of:

- 1963 • A file (see [Section 3.164](#), on page 59)
- 1964 • A shared memory object (see [Section 3.340](#), on page 88)
- 1965 • A typed memory object (see [Section 3.421](#), on page 101)

1966 When used in conjunction with *mmap()*, a memory object appears in the address space of the  
 1967 calling process.

1968 **Note:** The *mmap()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

1969 **3.220 Memory-Resident**

1970 The process of managing the implementation in such a way as to provide an upper bound on  
 1971 memory access times.

1972 **3.221 Message**

1973 In the context of programmatic message passing, information that can be transferred between  
 1974 processes or threads by being added to and removed from a message queue. A message consists  
 1975 of a fixed-size message buffer.

1976 **3.222 Message Catalog**

1977 In the context of providing natural language messages to the user, a file or storage area  
 1978 containing program messages, command prompts, and responses to prompts for a particular  
 1979 native language, territory, and codeset.

1980 **3.223 Message Catalog Descriptor**

1981 In the context of providing natural language messages to the user, a per-process unique value  
 1982 used to identify an open message catalog. A message catalog descriptor may be implemented  
 1983 using a file descriptor.

1984 **3.224 Message Queue**

1985 In the context of programmatic message passing, an object to which messages can be added and  
 1986 removed. Messages may be removed in the order in which they were added or in priority order.

1987 **3.225 Mode**

1988 A collection of attributes that specifies a file's type and its access permissions.

1989 **Note:** File Access Permissions are defined in detail in [Section 4.4](#) (on page 108).

1990 **3.226 Monotonic Clock**

1991 A clock measuring real time, whose value cannot be set via `clock_settime()` and which cannot  
 1992 have negative clock jumps.

1993 **3.227 Mount Point**

1994 Either the system root directory or a directory for which the `st_dev` field of structure `stat` differs  
 1995 from that of its parent directory.

1996 **Note:** The `stat` structure is defined in detail in [<sys/stat.h>](#).

1997 **3.228 Multi-Character Collating Element**

1998 A sequence of two or more characters that collate as an entity. For example, in some coded  
 1999 character sets, an accented character is represented by a non-spacing accent, followed by the  
 2000 letter. Other examples are the Spanish elements *ch* and *ll*.

2001 **3.229 Mutex**

2002 A synchronization object used to allow multiple threads to serialize their access to shared data.  
 2003 The name derives from the capability it provides; namely, mutual-exclusion. The thread that has  
 2004 locked a mutex becomes its owner and remains the owner until that same thread unlocks the  
 2005 mutex.

2006 **3.230 Name**

2007 In the shell command language, a word consisting solely of underscores, digits, and alphabets  
 2008 from the portable character set. The first character of a name is not a digit.

2009 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

2010 **3.231 Named STREAM**

2011 A STREAMS-based file descriptor that is attached to a name in the file system name space. All  
 2012 subsequent operations on the named STREAM act on the STREAM that was associated with the  
 2013 file descriptor until the name is disassociated from the STREAM.

2014 **3.232 NaN (Not a Number)**

2015 A set of values that may be stored in a floating type but that are neither Inf nor valid floating-  
 2016 point numbers. Not all systems support NaN values.

2017 **3.233 Native Language**

2018 A computer user's spoken or written language, such as American English, British English,  
 2019 Danish, Dutch, French, German, Italian, Japanese, Norwegian, or Swedish.

2020 **3.234 Negative Response**

2021 An input string that matches one of the responses acceptable to the *LC\_MESSAGES* category  
 2022 keyword **noexpr**, matching an extended regular expression in the current locale.

2023 **Note:** The *LC\_MESSAGES* category is defined in detail in [Section 7.3.6](#) (on page 164).

2024 **3.235 Network**

2025 A collection of interconnected hosts.

2026 **Note:** The term "network" in POSIX.1-2008 is used to refer to the network of hosts. The term "batch  
 2027 system" is used to refer to the network of batch servers.

2028 **3.236 Network Address**

2029 A network-visible identifier used to designate specific endpoints in a network. Specific  
 2030 endpoints on host systems have addresses, and host systems may also have addresses.

2031 **3.237 Network Byte Order**

2032 The way of representing any integer type such that, when transmitted over a network via a  
 2033 network endpoint, the **int** type is transmitted as an appropriate number of octets with the most  
 2034 significant octet first, followed by any other octets in descending order of significance.

2035 **Note:** This order is more commonly known as big-endian ordering. See also [Section 4.9](#) (on page 110).

2036 **3.238 Newline Character (<newline>)**

2037 A character that in the output stream indicates that printing should start at the beginning of the  
 2038 next line. It is the character designated by '`\n`' in the C language. It is unspecified whether this  
 2039 character is the exact sequence transmitted to an output device by the system to accomplish the  
 2040 movement to the next line.

2041 **3.239 Nice Value**

2042 A number used as advice to the system to alter process scheduling. Numerically smaller values  
 2043 give a process additional preference when scheduling a process to run. Numerically larger  
 2044 values reduce the preference and make a process less likely to run. Typically, a process with a  
 2045 smaller nice value runs to completion more quickly than an equivalent process with a higher  
 2046 nice value. The symbol {NZERO} specifies the default nice value of the system.

2047 **3.240 Non-Blocking**

2048 A property of an open file description that causes function calls involving it to return without  
 2049 delay when it is detected that the requested action associated with the function call cannot be  
 2050 completed without unknown delay.

2051 **Note:** The exact semantics are dependent on the type of file associated with the open file description.  
 2052 For data reads from devices such as ttys and FIFOs, this property causes the read to return  
 2053 immediately when no data was available. Similarly, for writes, it causes the call to return  
 2054 immediately when the thread would otherwise be delayed in the write operation; for example,  
 2055 because no space was available. For networking, it causes functions not to await protocol events  
 2056 (for example, acknowledgements) to occur. See also XSH [Section 2.10.7](#) (on page 519).

2057 **3.241 Non-Spacing Characters**

2058 A character, such as a character representing a diacritical mark in the ISO/IEC 6937:2001  
 2059 standard coded graphic character set, which is used in combination with other characters to  
 2060 form composite graphic symbols.

2061 **3.242 NUL**

2062 A character with all bits set to zero.

2063 **3.243 Null Byte**

2064 A byte with all bits set to zero.

2065 **3.244 Null Pointer**

2066 A pointer obtained by converting an integer constant expression with the value 0, or such an  
2067 expression cast to type **void \***, to a pointer type; for example, **(char \*)0**. The C language  
2068 guarantees that a null pointer compares unequal to a pointer to any object or function, so it is  
2069 used by many functions that return pointers to indicate an error.

2070 **3.245 Null String**2071 See *Empty String* in [Section 3.146](#) (on page 56).2072 **3.246 Null Wide-Character Code**

2073 A wide-character code with all bits set to zero.

2074 **3.247 Number-Sign Character (<number-sign>)**

2075 The character ' # ', also known as hash sign.

2076 **3.248 Object File**

2077 A regular file containing the output of a compiler, formatted as input to a linkage editor for  
2078 linking with other object files into an executable form. The methods of linking are unspecified  
2079 and may involve the dynamic linking of objects at runtime. The internal format of an object file  
2080 is unspecified, but a conforming application cannot assume an object file is a text file.

2081 **3.249 Octet**

2082 Unit of data representation that consists of eight contiguous bits.

2083 **3.250 Offset Maximum**

2084 An attribute of an open file description representing the largest value that can be used as a file  
2085 offset.

2086 **3.251 Opaque Address**

2087 An address such that the entity making use of it requires no details about its contents or format.

2088 **3.252 Open File**

2089 A file that is currently associated with a file descriptor.

2090 **3.253 Open File Description**

2091 A record of how a process or group of processes is accessing a file. Each file descriptor refers to  
2092 exactly one open file description, but an open file description can be referred to by more than  
2093 one file descriptor. The file offset, file status, and file access modes are attributes of an open file  
2094 description.

2095 **3.254 Operand**

2096 An argument to a command that is generally used as an object supplying information to a utility  
2097 necessary to complete its processing. Operands generally follow the options in a command line.

2098 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213).

2099 **3.255 Operator**

2100 In the shell command language, either a control operator or a redirection operator.

2101 **3.256 Option**

2102 An argument to a command that is generally used to specify changes in the utility's default  
2103 behavior.

2104 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213).

2105 **3.257 Option-Argument**

2106 A parameter that follows certain options. In some cases an option-argument is included within  
2107 the same argument string as the option—in most cases it is the next argument.

2108 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 213).

2109 **3.258 Orientation**

2110 A stream has one of three orientations: unoriented, byte-oriented, or wide-oriented.

2111 **Note:** For further information, see XSH [Section 2.5.2](#) (on page 493).

2112 **3.259 Orphaned Process Group**

2113 A process group in which the parent of every member is either itself a member of the group or is  
2114 not a member of the group's session.

2115 **3.260 Page**

2116 The granularity of process memory mapping or locking.

2117 Physical memory and memory objects can be mapped into the address space of a process on  
2118 page boundaries and in integral multiples of pages. Process address space can be locked into  
2119 memory (made memory-resident) on page boundaries and in integral multiples of pages.

2120 **3.261 Page Size**

2121 The size, in bytes, of the system unit of memory allocation, protection, and mapping. On  
2122 systems that have segment rather than page-based memory architectures, the term "page"  
2123 means a segment.

2124 **3.262 Parameter**

2125 In the shell command language, an entity that stores values. There are three types of parameters:  
 2126 variables (named parameters), positional parameters, and special parameters. Parameter  
 2127 expansion is accomplished by introducing a parameter with the '\$' character.

2128 **Note:** See also XCU [Section 2.5](#) (on page 2301).

2129 In the C language, an object declared as part of a function declaration or definition that acquires  
 2130 a value on entry to the function, or an identifier following the macro name in a function-like  
 2131 macro definition.

2132 **3.263 Parent Directory**

2133 When discussing a given directory, the directory that both contains a directory entry for the  
 2134 given directory and is represented by the pathname dot-dot in the given directory.

2135 When discussing other types of files, a directory containing a directory entry for the file under  
 2136 discussion.

2137 This concept does not apply to dot and dot-dot.

2138 **3.264 Parent Process**

2139 The process which created (or inherited) the process under discussion.

2140 **3.265 Parent Process ID**

2141 An attribute of a new process identifying the parent of the process. The parent process ID of a  
 2142 process is the process ID of its creator, for the lifetime of the creator. After the creator's lifetime  
 2143 has ended, the parent process ID is the process ID of an implementation-defined system process.

2144 **3.266 Pathname**

2145 A character string that is used to identify a file. In the context of POSIX.1-2008, a pathname may  
 2146 be limited to {PATH\_MAX} bytes, including the terminating null byte. It has an optional  
 2147 beginning <slash>, followed by zero or more filenames separated by <slash> characters. A  
 2148 pathname may optionally contain one or more trailing <slash> characters. Multiple successive  
 2149 <slash> characters are considered to be the same as one <slash>, except for the case of exactly  
 2150 two leading <slash> characters.

2151 **Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).

2152 **3.267 Pathname Component**2153 See *Filename* in [Section 3.170](#) (on page 60).2154 **3.268 Path Prefix**

2155 The part of a pathname up to, but not including, the last component and any trailing <slash>  
 2156 characters, unless the pathname consists entirely of <slash> characters, in which case the path  
 2157 prefix is '/' for a pathname containing either a single <slash> or three or more <slash>  
 2158 characters, and '//' for the pathname //. The path prefix of a pathname containing no <slash>  
 2159 characters is empty, but is treated as referring to the current working directory.

2160 **Note:** The term is used both in the sense of identifying part of a pathname that forms the prefix and of  
 2161 joining a non-empty path prefix to a filename to form a pathname. In the latter case, the path  
 2162 prefix need not have a trailing <slash> (in which case the joining is done with a <slash>  
 2163 character).

2164 **3.269 Pattern**

2165 A sequence of characters used either with regular expression notation or for pathname  
 2166 expansion, as a means of selecting various character strings or pathnames, respectively.

2167 **Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 181).

2168 See also XCU [Section 2.6.6](#) (on page 2311).

2169 The syntaxes of the two types of patterns are similar, but not identical; POSIX.1-2008 always  
 2170 indicates the type of pattern being referred to in the immediate context of the use of the term.

2171 **3.270 Period Character (<period>)**

2172 The character '.'. The term "period" is contrasted with dot (see also [Section 3.136](#), on page 54),  
 2173 which is used to describe a specific directory entry.

2174 **3.271 Permissions**

2175 Attributes of an object that determine the privilege necessary to access or manipulate the object.

2176 **Note:** File Access Permissions are defined in detail in [Section 4.4](#) (on page 108).

2177 **3.272 Persistence**

2178 A mode for semaphores, shared memory, and message queues requiring that the object and its  
 2179 state (including data, if any) are preserved after the object is no longer referenced by any  
 2180 process.

2181 Persistence of an object does not imply that the state of the object is maintained across a system  
2182 crash or a system reboot.

### 2183 3.273 Pipe

2184 An object identical to a FIFO which has no links in the file hierarchy.

2185 **Note:** The *pipe()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

### 2186 3.274 Polling

2187 A scheduling scheme whereby the local process periodically checks until the pre-specified  
2188 events (for example, read, write) have occurred.

### 2189 3.275 Portable Character Set

2190 The collection of characters that are required to be present in all locales supported by  
2191 conforming systems.

2192 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 125).

2193 This term is contrasted against the smaller portable filename character set; see also [Section 3.276](#).

### 2194 3.276 Portable Filename Character Set

2195 The set of characters from which portable filenames are constructed.

2196 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z  
2197 a b c d e f g h i j k l m n o p q r s t u v w x y z  
2198 0 1 2 3 4 5 6 7 8 9 . \_ -

2199 The last three characters are the <period>, <underscore>, and <hyphen> characters, respectively.

2200 **3.277 Positional Parameter**

2201 In the shell command language, a parameter denoted by a single digit or one or more digits in  
2202 curly braces.

2203 **Note:** For further information, see XCU [Section 2.5.1](#) (on page 2301).

2204 **3.278 Preallocation**

2205 The reservation of resources in a system for a particular use.

2206 Preallocation does not imply that the resources are immediately allocated to that use, but merely  
2207 indicates that they are guaranteed to be available in bounded time when needed.

2208 **3.279 Preempted Process (or Thread)**

2209 A running thread whose execution is suspended due to another thread becoming runnable at a  
2210 higher priority.

2211 **3.280 Previous Job**

2212 In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities if the  
2213 current job exits. There is at most one previous job; see also [Section 3.203](#) (on page 65).

2214 **3.281 Printable Character**

2215 One of the characters included in the **print** character classification of the *LC\_CTYPE* category in  
2216 the current locale.

2217 **Note:** The *LC\_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 139).

2218 **3.282 Printable File**

2219 A text file consisting only of the characters included in the **print** and **space** character  
2220 classifications of the *LC\_CTYPE* category and the <backspace>, all in the current locale.

2221 **Note:** The *LC\_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 139).

2222 **3.283 Priority**

2223 A non-negative integer associated with processes or threads whose value is constrained to a  
 2224 range defined by the applicable scheduling policy. Numerically higher values represent higher  
 2225 priorities.

2226 **3.284 Priority Band**

2227 The queuing order applied to normal priority STREAMS messages. High priority STREAMS  
 2228 messages are not grouped by priority bands. The only differentiation made by the STREAMS  
 2229 mechanism is between zero and non-zero bands, but specific protocol modules may differentiate  
 2230 between priority bands.

2231 **3.285 Priority Inversion**

2232 A condition in which a thread that is not voluntarily suspended (waiting for an event or time  
 2233 delay) is not running while a lower priority thread is running. Such blocking of the higher  
 2234 priority thread is often caused by contention for a shared resource.

2235 **3.286 Priority Scheduling**

2236 A performance and determinism improvement facility to allow applications to determine the  
 2237 order in which threads that are ready to run are granted access to processor resources.

2238 **3.287 Priority-Based Scheduling**

2239 Scheduling in which the selection of a running thread is determined by the priorities of the  
 2240 runnable processes or threads.

2241 **3.288 Privilege**

2242 See *Appropriate Privileges* in [Section 3.20](#) (on page 36).

2243 **3.289 Process**

2244 An address space with one or more threads executing within that address space, and the  
2245 required system resources for those threads.

2246 **Note:** Many of the system resources defined by POSIX.1-2008 are shared among all of the threads  
2247 within a process. These include the process ID, the parent process ID, process group ID, session  
2248 membership, real, effective, and saved set-user-ID, real, effective, and saved set-group-ID,  
2249 supplementary group IDs, current working directory, root directory, file mode creation mask  
2250 and file descriptors.

2251 **3.290 Process Group**

2252 A collection of processes that permits the signaling of related processes. Each process in the  
2253 system is a member of a process group that is identified by a process group ID. A newly created  
2254 process joins the process group of its creator.

2255 **3.291 Process Group ID**

2256 The unique positive integer identifier representing a process group during its lifetime.

2257 **Note:** See also *Process Group ID Reuse* defined in [Section 4.13](#) (on page 112).

2258 **3.292 Process Group Leader**

2259 A process whose process ID is the same as its process group ID.

2260 **3.293 Process Group Lifetime**

2261 The period of time that begins when a process group is created and ends when the last  
2262 remaining process in the group leaves the group, due either to the end of the lifetime of the last  
2263 process or to the last remaining process calling the *setsid()* or *setpgid()* functions.

2264 **Note:** The *setsid()* and *setpgid()* functions are defined in detail in the System Interfaces volume of  
2265 POSIX.1-2008.

2266 **3.294 Process ID**

2267 The unique positive integer identifier representing a process during its lifetime.

2268 **Note:** See also *Process ID Reuse* defined in [Section 4.13](#) (on page 112).2269 **3.295 Process Lifetime**

2270 The period of time that begins when a process is created and ends when its process ID is  
 2271 returned to the system. After a process is created by *fork()*, *posix\_spawn()*, or *posix\_spawnp()*, it is  
 2272 considered active. At least one thread of control and address space exist until it terminates. It  
 2273 then enters an inactive state where certain resources may be returned to the system, although  
 2274 some resources, such as the process ID, are still in use. When another process executes a *wait()*,  
 2275 *waitid()*, or *waitpid()* function for an inactive process, the remaining resources are returned to  
 2276 the system. The last resource to be returned to the system is the process ID. At this time, the  
 2277 lifetime of the process ends.

2278 **Note:** The *fork()*, *posix\_spawn()*, *posix\_spawnp()*, *wait()*, *waitid()*, and *waitpid()* functions are defined in  
 2279 detail in the System Interfaces volume of POSIX.1-2008.

2280 **3.296 Process Memory Locking**

2281 A performance improvement facility to bind application programs into the high-performance  
 2282 random access memory of a computer system. This avoids potential latencies introduced by the  
 2283 operating system in storing parts of a program that were not recently referenced on secondary  
 2284 memory devices.

2285 **3.297 Process Termination**

2286 There are two kinds of process termination:

2287 1. Normal termination occurs by a return from *main()*, when requested with the *exit()*,  
 2288 *\_exit()*, or *\_Exit()* functions; or when the last thread in the process terminates by  
 2289 returning from its start function, by calling the *pthread\_exit()* function, or through  
 2290 cancellation.

2291 2. Abnormal termination occurs when requested by the *abort()* function or when some  
 2292 signals are received.

2293 **Note:** The *\_exit()*, *\_Exit()*, *abort()*, and *exit()* functions are defined in detail in the System Interfaces  
 2294 volume of POSIX.1-2008.

2295 **3.298 Process-To-Process Communication**

2296 The transfer of data between processes.

2297 **3.299 Process Virtual Time**

2298 The measurement of time in units elapsed by the system clock while a process is executing.

2299 **3.300 Program**2300 A prepared sequence of instructions to the system to accomplish a defined task. The term  
2301 “program” in POSIX.1-2008 encompasses applications written in the Shell Command Language,  
2302 complex utility input languages (for example, *awk*, *lex*, *sed*, and so on), and high-level languages.2303 **3.301 Protocol**

2304 A set of semantic and syntactic rules for exchanging information.

2305 **3.302 Pseudo-Terminal**2306 A facility that provides an interface that is identical to the terminal subsystem, except where  
2307 noted otherwise in POSIX.1-2008. A pseudo-terminal is composed of two devices: the “master  
2308 device” and a “slave device”. The slave device provides processes with an interface that is  
2309 identical to the terminal interface, although there need not be hardware behind that interface.  
2310 Anything written on the master device is presented to the slave as an input and anything  
2311 written on the slave device is presented as an input on the master side.2312 **3.303 Radix Character**

2313 The character that separates the integer part of a number from the fractional part.

2314 **3.304 Read-Only File System**

2315 A file system that has implementation-defined characteristics restricting modifications.

2316 **Note:** File Times Update is described in detail in [Section 4.8](#) (on page 109).2317 **3.305 Read-Write Lock**2318 Multiple readers, single writer (read-write) locks allow many threads to have simultaneous  
2319 read-only access to data while allowing only one thread to have write access at any given time.  
2320 They are typically used to protect data that is read-only more frequently than it is changed.2321 Read-write locks can be used to synchronize threads in the current process and other processes if  
2322 they are allocated in memory that is writable and shared among the cooperating processes and  
2323 have been initialized for this behavior.

2324 **3.306 Real Group ID**

2325 The attribute of a process that, at the time of process creation, identifies the group of the user  
2326 who created the process; see also [Section 3.188](#) (on page 63).

2327 **3.307 Real Time**

2328 Time measured as total units elapsed by the system clock without regard to which thread is  
2329 executing.

2330 **3.308 Realtime Signal Extension**

2331 A determinism improvement facility to enable asynchronous signal notifications to an  
2332 application to be queued without impacting compatibility with the existing signal functions.

2333 **3.309 Real User ID**

2334 The attribute of a process that, at the time of process creation, identifies the user who created the  
2335 process; see also [Section 3.428](#) (on page 102).

2336 **3.310 Record**

2337 A collection of related data units or words which is treated as a unit.

2338 **3.311 Redirection**

2339 In the shell command language, a method of associating files with the input or output of  
2340 commands.

2341 **Note:** For further information, see XCU [Section 2.7](#) (on page 2312).

2342 **3.312 Redirection Operator**

2343 In the shell command language, a token that performs a redirection function. It is one of the  
 2344 following symbols:

2345 < > >| << >> <& >& <<- >>

2346 **3.313 Referenced Shared Memory Object**

2347 A shared memory object that is open or has one or more mappings defined on it.

2348 **3.314 Refresh**

2349 To ensure that the information on the user's terminal screen is up-to-date.

2350 **3.315 Regular Expression**

2351 A pattern that selects specific strings from a set of character strings.

2352 **Note:** Regular Expressions are described in detail in [Chapter 9](#) (on page 181).

2353 **3.316 Region**

2354 In the context of the address space of a process, a sequence of addresses.

2355 In the context of a file, a sequence of offsets.

2356 **3.317 Regular File**

2357 A file that is a randomly accessible sequence of bytes, with no further structure imposed by the  
 2358 system.

2359 **3.318 Relative Pathname**

2360 A pathname not beginning with a &lt;slash&gt; character.

2361 **Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).2362 **3.319 Relocatable File**2363 A file holding code or data suitable for linking with other object files to create an executable or a  
2364 shared object file.2365 **3.320 Relocation**2366 The process of connecting symbolic references with symbolic definitions. For example, when a  
2367 program calls a function, the associated call instruction transfers control to the proper  
2368 destination address at execution.2369 **3.321 Requested Batch Service**2370 A service that is either rejected or performed prior to a response from the service to the  
2371 requester.2372 **3.322 (Time) Resolution**

2373 The minimum time interval that a clock can measure or whose passage a timer can detect.

2374 **3.323 Robust Mutex**2375 A mutex with the *robust* attribute set.2376 **Note:** The *robust* attribute is defined in detail by the `pthread_mutexattr_getrobust()` function.2377 **3.324 Root Directory**2378 A directory, associated with a process, that is used in pathname resolution for pathnames that  
2379 begin with a <slash> character.2380 **3.325 Runnable Process (or Thread)**

2381 A thread that is capable of being a running thread, but for which no processor is available.

2382 **3.326 Running Process (or Thread)**

2383 A thread currently executing on a processor. On multi-processor systems there may be more  
2384 than one such thread in a system at a time.

2385 **3.327 Saved Resource Limits**

2386 An attribute of a process that provides some flexibility in the handling of unrepresentable  
2387 resource limits, as described in the *exec* family of functions and *setrlimit()*.

2388 **Note:** The *exec* and *setrlimit()* functions are defined in detail in the System Interfaces volume of  
2389 POSIX.1-2008.

2390 **3.328 Saved Set-Group-ID**

2391 An attribute of a process that allows some flexibility in the assignment of the effective group ID  
2392 attribute, as described in the *exec* family of functions and *setgid()*.

2393 **Note:** The *exec* and *setgid()* functions are defined in detail in the System Interfaces volume of  
2394 POSIX.1-2008.

2395 **3.329 Saved Set-User-ID**

2396 An attribute of a process that allows some flexibility in the assignment of the effective user ID  
2397 attribute, as described in the *exec* family of functions and *setuid()*.

2398 **Note:** The *exec* and *setuid()* functions are defined in detail in the System Interfaces volume of  
2399 POSIX.1-2008.

2400 **3.330 Scheduling**

2401 The application of a policy to select a runnable process or thread to become a running process or  
2402 thread, or to alter one or more of the thread lists.

2403 **3.331 Scheduling Allocation Domain**

2404 The set of processors on which an individual thread can be scheduled at any given time.

2405 **3.332 Scheduling Contention Scope**

2406 A property of a thread that defines the set of threads against which that thread competes for  
2407 resources.

2408 For example, in a scheduling decision, threads sharing scheduling contention scope compete for  
 2409 processor resources. In POSIX.1-2008, a thread has scheduling contention scope of either  
 2410 PTHREAD\_SCOPE\_SYSTEM or PTHREAD\_SCOPE\_PROCESS.

### 2411 3.333 Scheduling Policy

2412 A set of rules that is used to determine the order of execution of processes or threads to achieve  
 2413 some goal.

2414 **Note:** Scheduling Policy is defined in detail in [Section 4.14](#) (on page 112).

### 2415 3.334 Screen

2416 A rectangular region of columns and lines on a terminal display. A screen may be a portion of a  
 2417 physical display device or may occupy the entire physical area of the display device.

### 2418 3.335 Scroll

2419 To move the representation of data vertically or horizontally relative to the terminal screen.  
 2420 There are two types of scrolling:

- 2421 1. The cursor moves with the data.
- 2422 2. The cursor remains stationary while the data moves.

### 2423 3.336 Semaphore

2424 A minimum synchronization primitive to serve as a basis for more complex synchronization  
 2425 mechanisms to be defined by the application program.

2426 **Note:** Semaphores are defined in detail in [Section 4.16](#) (on page 113).

2427 **3.337 Session**

2428 A collection of process groups established for job control purposes. Each process group is a  
 2429 member of a session. A process is considered to be a member of the session of which its process  
 2430 group is a member. A newly created process joins the session of its creator. A process can alter  
 2431 its session membership; see *setsid()*. There can be multiple process groups in the same session.

2432 **Note:** The *setsid()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

2433 **3.338 Session Leader**

2434 A process that has created a session.

2435 **Note:** For further information, see the *setsid()* function defined in the System Interfaces volume of  
 2436 POSIX.1-2008.

2437 **3.339 Session Lifetime**

2438 The period between when a session is created and the end of the lifetime of all the process  
 2439 groups that remain as members of the session.

2440 **3.340 Shared Memory Object**

2441 An object that represents memory that can be mapped concurrently into the address space of  
 2442 more than one process.

2443 **3.341 Shell**

2444 A program that interprets sequences of text input as commands. It may operate on an input  
 2445 stream or it may interactively prompt and read commands from a terminal.

2446 **3.342 Shell, the**

2447 The Shell Command Language Interpreter; a specific instance of a shell.

2448 **Note:** For further information, see the *sh* utility defined in the Shell and Utilities volume of  
 2449 POSIX.1-2008.

**2450 3.343 Shell Script**

2451 A file containing shell commands. If the file is made executable, it can be executed by specifying  
2452 its name as a simple command. Execution of a shell script causes a shell to execute the  
2453 commands within the script. Alternatively, a shell can be requested to execute the commands in  
2454 a shell script by specifying the name of the shell script as the operand to the *sh* utility.

2455 **Note:** Simple Commands are defined in detail in XCU Section 2.9.1 (on page 2316).

2456 The *sh* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

**2457 3.344 Signal**

2458 A mechanism by which a process or thread may be notified of, or affected by, an event occurring  
2459 in the system. Examples of such events include hardware exceptions and specific actions by  
2460 processes. The term signal is also used to refer to the event itself.

**2461 3.345 Signal Stack**

2462 Memory established for a thread, in which signal handlers catching signals sent to that thread  
2463 are executed.

**2464 3.346 Single-Quote Character**

2465 The character designated by ' \ ' in the C language, also known as <apostrophe>.

**2466 3.347 Slash Character (<slash>)**

2467 The character ' / ', also known as solidus.

**2468 3.348 Socket**

2469 A file of a particular type that is used as a communications endpoint for process-to-process  
2470 communication as described in the System Interfaces volume of POSIX.1-2008.

**2471 3.349 Socket Address**

2472 An address associated with a socket or remote endpoint, including an address family identifier  
2473 and addressing information specific to that address family. The address may include multiple  
2474 parts, such as a network address associated with a host system and an identifier for a specific  
2475 endpoint.

2476 **3.350 Soft Limit**

2477 A resource limitation established for each process that the process may set to any value less than  
2478 or equal to the hard limit.

2479 **3.351 Source Code**

2480 When dealing with the Shell Command Language, input to the command language interpreter.  
2481 The term “shell script” is synonymous with this meaning.

2482 When dealing with an ISO/IEC-conforming programming language, source code is input to a  
2483 compiler conforming to that ISO/IEC standard.

2484 Source code also refers to the input statements prepared for the following standard utilities: *awk*,  
2485 *bc*, *ed*, *lex*, *localedef*, *make*, *sed*, and *yacc*.

2486 Source code can also refer to a collection of sources meeting any or all of these meanings.

2487 **Note:** The *awk*, *bc*, *ed*, *lex*, *localedef*, *make*, *sed*, and *yacc* utilities are defined in detail in the Shell and  
2488 Utilities volume of POSIX.1-2008.

2489 **3.352 Space Character (<space>)**

2490 The character defined in the portable character set as <space>. The <space> character is a  
2491 member of the **space** character class of the current locale, but represents the single character, and  
2492 not all of the possible members of the class; see also [Section 3.434](#) (on page 103).

2493 **3.353 Spawn**

2494 A process creation primitive useful for systems that have difficulty with *fork()* and as an efficient  
2495 replacement for *fork()/exec*.

2496 **3.354 Special Built-In**

2497 See *Built-In Utility* in [Section 3.83](#) (on page 46).

2498 **3.355 Special Parameter**

2499 In the shell command language, a parameter named by a single character from the following list:

2500 \* @ # ? ! - \$ 0

2501 **Note:** For further information, see XCU [Section 2.5.2](#) (on page 2302).2502 **3.356 Spin Lock**

2503 A synchronization object used to allow multiple threads to serialize their access to shared data.

2504 **3.357 Sporadic Server**2505 A scheduling policy for threads and processes that reserves a certain amount of execution  
2506 capacity for processing aperiodic events at a given priority level.2507 **3.358 Standard Error**

2508 An output stream usually intended to be used for diagnostic messages.

2509 **3.359 Standard Input**

2510 An input stream usually intended to be used for primary data input.

2511 **3.360 Standard Output**

2512 An output stream usually intended to be used for primary data output.

2513 **3.361 Standard Utilities**

2514 The utilities described in the Shell and Utilities volume of POSIX.1-2008.

2515 **3.362 Stream**

2516           Appearing in lowercase, a stream is a file access object that allows access to an ordered sequence  
 2517           of characters, as described by the ISO C standard. Such objects can be created by the *fdopen()*,  
 2518           *fmemopen()*, *fopen()*, *open\_memstream()*, or *popen()* functions, and are associated with a file  
 2519           descriptor. A stream provides the additional services of user-selectable buffering and formatted  
 2520           input and output; see also [Section 3.363](#).

2521           **Note:**       For further information, see XSH [Section 2.5](#) (on page 490).

2522                       The *fdopen()*, *fmemopen()*, *fopen()*, *open\_memstream()*, and *popen()* functions are defined in detail  
 2523                       in the System Interfaces volume of POSIX.1-2008.

2524 **3.363 STREAM**

2525           Appearing in uppercase, STREAM refers to a full-duplex connection between a process and an  
 2526           open device or pseudo-device. It optionally includes one or more intermediate processing  
 2527           modules that are interposed between the process end of the STREAM and the device driver (or  
 2528           pseudo-device driver) end of the STREAM; see also [Section 3.362](#).

2529           **Note:**       For further information, see XSH [Section 2.6](#) (on page 494).

2530 **3.364 STREAM End**

2531           The STREAM end is the driver end of the STREAM and is also known as the downstream end of  
 2532           the STREAM.

2533 **3.365 STREAM Head**

2534           The STREAM head is the beginning of the STREAM and is at the boundary between the system  
 2535           and the application process. This is also known as the upstream end of the STREAM.

2536 **3.366 STREAMS Multiplexor**

2537           A driver with multiple STREAMS connected to it. Multiplexing with STREAMS connected  
 2538           above is referred to as N-to-1, or “upper multiplexing”. Multiplexing with STREAMS connected  
 2539           below is referred to as 1-to-N or “lower multiplexing”.

2540 **3.367 String**

2541           A contiguous sequence of bytes terminated by and including the first null byte.

2542 **3.368 Subshell**

2543 A shell execution environment, distinguished from the main or current shell execution  
2544 environment.

2545 **Note:** For further information, see XCU [Section 2.12](#) (on page 2331).

2546 **3.369 Successfully Transferred**

2547 For a write operation to a regular file, when the system ensures that all data written is readable  
2548 on any subsequent open of the file (even one that follows a system or power failure) in the  
2549 absence of a failure of the physical storage medium.

2550 For a read operation, when an image of the data on the physical storage medium is available to  
2551 the requesting process.

2552 **3.370 Supplementary Group ID**

2553 An attribute of a process used in determining file access permissions. A process has up to  
2554 {NGROUPS\_MAX} supplementary group IDs in addition to the effective group ID. The  
2555 supplementary group IDs of a process are set to the supplementary group IDs of the parent  
2556 process when the process is created.

2557 **3.371 Suspended Job**

2558 A job that has received a SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU signal that caused the  
2559 process group to stop. A suspended job is a background job, but a background job is not  
2560 necessarily a suspended job.

2561 **3.372 Symbolic Constant**

2562 An object-like macro defined with a constant value.

2563 Unless stated otherwise, the following shall apply to every symbolic constant:

- 2564 • It expands to a compile-time constant expression with an integer type.
- 2565 • It may be defined as another type of constant—e.g., an enumeration constant—as well as  
2566 being a macro.
- 2567 • It need not be usable in **#if** preprocessing directives.

2568 **3.373 Symbolic Link**

2569 A type of file with the property that when the file is encountered during pathname resolution, a  
 2570 string stored by the file is used to modify the pathname resolution. The stored string has a  
 2571 length of {SYMLINK\_MAX} bytes or fewer.

2572 **Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 111).

2573 **3.374 Synchronized Input and Output**

2574 A determinism and robustness improvement mechanism to enhance the data input and output  
 2575 mechanisms, so that an application can ensure that the data being manipulated is physically  
 2576 present on secondary mass storage devices.

2577 **3.375 Synchronized I/O Completion**

2578 The state of an I/O operation that has either been successfully transferred or diagnosed as  
 2579 unsuccessful.

2580 **3.376 Synchronized I/O Data Integrity Completion**

2581 For read, when the operation has been completed or diagnosed if unsuccessful. The read is  
 2582 complete only when an image of the data has been successfully transferred to the requesting  
 2583 process. If there were any pending write requests affecting the data to be read at the time that  
 2584 the synchronized read operation was requested, these write requests are successfully transferred  
 2585 prior to reading the data.

2586 For write, when the operation has been completed or diagnosed if unsuccessful. The write is  
 2587 complete only when the data specified in the write request is successfully transferred and all file  
 2588 system information required to retrieve the data is successfully transferred.

2589 File attributes that are not necessary for data retrieval (access time, modification time, status  
 2590 change time) need not be successfully transferred prior to returning to the calling process.

2591 **3.377 Synchronized I/O File Integrity Completion**

2592 Identical to a synchronized I/O data integrity completion with the addition that all file  
 2593 attributes relative to the I/O operation (including access time, modification time, status change  
 2594 time) are successfully transferred prior to returning to the calling process.

2595 **3.378 Synchronized I/O Operation**

2596 An I/O operation performed on a file that provides the application assurance of the integrity of  
 2597 its data and files.

### 2598 3.379 Synchronous I/O Operation

2599 An I/O operation that causes the thread requesting the I/O to be blocked from further use of the  
2600 processor until that I/O operation completes.

2601 **Note:** A synchronous I/O operation does not imply synchronized I/O data integrity completion or  
2602 synchronized I/O file integrity completion.

### 2603 3.380 Synchronously-Generated Signal

2604 A signal that is attributable to a specific thread.

2605 For example, a thread executing an illegal instruction or touching invalid memory causes a  
2606 synchronously-generated signal. Being synchronous is a property of how the signal was  
2607 generated and not a property of the signal number.

### 2608 3.381 System

2609 An implementation of POSIX.1-2008.

### 2610 3.382 System Boot

2611 An unspecified sequence of events that may result in the loss of transitory data; that is, data that  
2612 is not saved in permanent storage. For example, message queues, shared memory, semaphores,  
2613 and processes.

### 2614 3.383 System Clock

2615 A clock with at least one second resolution that contains seconds since the Epoch.

### 2616 3.384 System Console

2617 A device that receives messages sent by the *syslog()* function, and the *fntmsg()* function when  
2618 the MM\_CONSOLE flag is set.

2619 **Note:** The *syslog()* and *fntmsg()* functions are defined in detail in the System Interfaces volume of  
2620 POSIX.1-2008.

### 2621 3.385 System Crash

2622 An interval initiated by an unspecified circumstance that causes all processes (possibly other  
2623 than special system processes) to be terminated in an undefined manner, after which any

2624 changes to the state and contents of files created or written to by an application prior to the  
2625 interval are undefined, except as required elsewhere in POSIX.1-2008.

### 2626 **3.386 System Databases**

2627 An implementation provides two system databases: the “group database” (see also [Section](#)  
2628 [3.187](#), on page 63) and the “user database” (see also [Section 3.427](#), on page 101).

### 2629 **3.387 System Documentation**

2630 All documentation provided with an implementation except for the conformance document.  
2631 Electronically distributed documents for an implementation are considered part of the system  
2632 documentation.

### 2633 **3.388 System Process**

2634 An object other than a process executing an application, that is provided by the system and has a  
2635 process ID.

### 2636 **3.389 System Reboot**

2637 See *System Boot* defined in [Section 3.382](#) (on page 95).

### 2638 **3.390 System Trace Event**

2639 A trace event that is generated by the implementation, in response either to a system-initiated  
2640 action or to an application-requested action, except for a call to *posix\_trace\_event()*. When  
2641 supported by the implementation, a system-initiated action generates a process-independent  
2642 system trace event and an application-requested action generates a process-dependent system  
2643 trace event. For a system trace event not defined by POSIX.1-2008, the associated trace event  
2644 type identifier is derived from the implementation-defined name for this trace event, and the  
2645 associated data is of implementation-defined content and length.

### 2646 **3.391 System-Wide**

2647 Pertaining to events occurring in all processes existing in an implementation at a given point in  
2648 time.

2649 **3.392 Tab Character (<tab>)**

2650 A character that in the output stream indicates that printing or displaying should start at the  
 2651 next horizontal tabulation position on the current line. It is the character designated by '`\t`' in  
 2652 the C language. If the current position is at or past the last defined horizontal tabulation  
 2653 position, the behavior is unspecified. It is unspecified whether this character is the exact  
 2654 sequence transmitted to an output device by the system to accomplish the tabulation.

2655 **3.393 Terminal (or Terminal Device)**

2656 A character special file that obeys the specifications of the general terminal interface.

2657 **Note:** The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 199).

2658 **3.394 Text Column**

2659 A roughly rectangular block of characters capable of being laid out side-by-side next to other  
 2660 text columns on an output page or terminal screen. The widths of text columns are measured in  
 2661 column positions.

2662 **3.395 Text File**

2663 A file that contains characters organized into zero or more lines. The lines do not contain NUL  
 2664 characters and none can exceed {`LINE_MAX`} bytes in length, including the <newline>  
 2665 character. Although POSIX.1-2008 does not distinguish between text files and binary files (see  
 2666 the ISO C standard), many utilities only produce predictable or meaningful output when  
 2667 operating on text files. The standard utilities that have such restrictions always specify "text  
 2668 files" in their STDIN or INPUT FILES sections.

2669 **3.396 Thread**

2670 A single flow of control within a process. Each thread has its own thread ID, scheduling priority  
 2671 and policy, *errno* value, thread-specific key/value bindings, and the required system resources to  
 2672 support a flow of control. Anything whose address may be determined by a thread, including  
 2673 but not limited to static variables, storage obtained via *malloc()*, directly addressable storage  
 2674 obtained through implementation-defined functions, and automatic variables, are accessible to  
 2675 all threads in the same process.

2676 **Note:** The *malloc()* function is defined in detail in the System Interfaces volume of POSIX.1-2008.

2677 **3.397 Thread ID**

2678 Each thread in a process is uniquely identified during its lifetime by a value of type `pthread_t`  
 2679 called a thread ID.

2680 **3.398 Thread List**

2681 An ordered set of runnable threads that all have the same ordinal value for their priority.

2682 The ordering of threads on the list is determined by a scheduling policy or policies. The set of  
2683 thread lists includes all runnable threads in the system.2684 **3.399 Thread-Safe**2685 A function that may be safely invoked concurrently by multiple threads. Each function defined  
2686 in the System Interfaces volume of POSIX.1-2008 is thread-safe unless explicitly stated  
2687 otherwise. Examples are any “pure” function, a function which holds a mutex locked while it is  
2688 accessing static storage, or objects shared among threads.2689 **3.400 Thread-Specific Data Key**2690 A process global handle of type `pthread_key_t` which is used for naming thread-specific data.2691 Although the same key value may be used by different threads, the values bound to the key by  
2692 `pthread_setspecific()` and accessed by `pthread_getspecific()` are maintained on a per-thread basis  
2693 and persist for the life of the calling thread.2694 **Note:** The `pthread_getspecific()` and `pthread_setspecific()` functions are defined in detail in the System  
2695 Interfaces volume of POSIX.1-2008.2696 **3.401 Tilde Character (<tilde>)**

2697 The character '~'.

2698 **3.402 Timeouts**2699 A method of limiting the length of time an interface will block; see also [Section 3.76](#) (on page 44).2700 **3.403 Timer**2701 A mechanism that can notify a thread when the time as measured by a particular clock has  
2702 reached or passed a specified value, or when a specified amount of time has passed.2703 **3.404 Timer Overrun**2704 A condition that occurs each time a timer, for which there is already an expiration signal queued  
2705 to the process, expires.

2706 **3.405 Token**

2707 In the shell command language, a sequence of characters that the shell considers as a single unit  
2708 when reading input. A token is either an operator or a word.

2709 **Note:** The rules for reading input are defined in detail in XCU [Section 2.3](#) (on page 2299).

2710 **3.406 Trace Analyzer Process**

2711 A process that extracts trace events from a trace stream to retrieve information about the  
2712 behavior of an application.

2713 **3.407 Trace Controller Process**

2714 A process that creates a trace stream for tracing a process.

2715 **3.408 Trace Event**

2716 A data object that represents an action executed by the system, and that is recorded in a trace  
2717 stream.

2718 **3.409 Trace Event Type**

2719 A data object type that defines a class of trace event.

2720 **3.410 Trace Event Type Mapping**

2721 A one-to-one mapping between trace event types and trace event names.

2722 **3.411 Trace Filter**

2723 A filter that allows the trace controller process to specify those trace event types that are to be  
2724 ignored; that is, not generated.

2725 **3.412 Trace Generation Version**

2726 A data object that is an implementation-defined character string, generated by the trace system  
2727 and describing the origin and version of the trace system.

2728 **3.413 Trace Log**

2729 The flushed image of a trace stream, if the trace stream is created with a trace log.

2730 **3.414 Trace Point**

2731 An action that may cause a trace event to be generated.

2732 **3.415 Trace Stream**2733 An opaque object that contains trace events plus internal data needed to interpret those trace  
2734 events.2735 **3.416 Trace Stream Identifier**

2736 A handle to manage tracing operations in a trace stream.

2737 **3.417 Trace System**2738 A system that allows both system and user trace events to be generated into a trace stream.  
2739 These trace events can be retrieved later.2740 **3.418 Traced Process**2741 A process for which at least one trace stream has been created. A traced process is also called a  
2742 target process.2743 **3.419 Tracing Status of a Trace Stream**2744 A status that describes the state of an active trace stream. The tracing status of a trace stream can  
2745 be retrieved from the trace stream attributes. An active trace stream can be in one of two states:  
2746 running or suspended.2747 **3.420 Typed Memory Name Space**2748 A system-wide name space that contains the names of the typed memory objects present in the  
2749 system. It is configurable for a given implementation.

2750 **3.421 Typed Memory Object**

2751 A combination of a typed memory pool and a typed memory port. The entire contents of the  
 2752 pool are accessible from the port. The typed memory object is identified through a name that  
 2753 belongs to the typed memory name space.

2754 **3.422 Typed Memory Pool**

2755 An extent of memory with the same operational characteristics. Typed memory pools may be  
 2756 contained within each other.

2757 **3.423 Typed Memory Port**

2758 A hardware access path to one or more typed memory pools.

2759 **3.424 Unbind**

2760 Remove the association between a network address and an endpoint.

2761 **3.425 Unit Data**

2762 See *Datagram* in [Section 3.124](#) (on page 53).

2763 **3.426 Upshifting**

2764 The conversion of a lowercase character that has a single-character uppercase representation into  
 2765 this uppercase representation.

2766 **3.427 User Database**

2767 A system database that contains at least the following information for each user ID:

- 2768 • User name
- 2769 • Numerical user ID
- 2770 • Initial numerical group ID
- 2771 • Initial working directory
- 2772 • Initial user program

2773 The initial numerical group ID is used by the *newgrp* utility. Any other circumstances under  
 2774 which the initial values are operative are implementation-defined.

- 2775 If the initial user program field is null, an implementation-defined program is used.
- 2776 If the initial working directory field is null, the interpretation of that field is implementation-defined.
- 2777
- 2778 **Note:** The *newgrp* utility is defined in detail in the Shell and Utilities volume of POSIX.1-2008.

### 2779 3.428 User ID

- 2780 A non-negative integer that is used to identify a system user. When the identity of a user is associated with a process, a user ID value is referred to as a real user ID, an effective user ID, or a saved set-user-ID.
- 2781
- 2782

### 2783 3.429 User Name

- 2784 A string that is used to identify a user; see also [Section 3.427](#) (on page 101). To be portable across systems conforming to POSIX.1-2008, the value is composed of characters from the portable filename character set. The <hyphen> character should not be used as the first character of a portable user name.
- 2785
- 2786
- 2787

### 2788 3.430 User Trace Event

- 2789 A trace event that is generated explicitly by the application as a result of a call to *posix\_trace\_event()*.
- 2790

### 2791 3.431 Utility

- 2792 A program, excluding special built-in utilities provided as part of the Shell Command Language, that can be called by name from a shell to perform a specific task, or related set of tasks.
- 2793
- 2794 **Note:** For further information on special built-in utilities, see XCU [Section 2.14](#) (on page 2334).

2795 **3.432 Variable**

2796 In the shell command language, a named parameter.

2797 **Note:** For further information, see XCU [Section 2.5](#) (on page 2301).2798 **3.433 Vertical-Tab Character (<vertical-tab>)**

2799 A character that in the output stream indicates that printing should start at the next vertical  
 2800 tabulation position. It is the character designated by '`\v`' in the C language. If the current  
 2801 position is at or past the last defined vertical tabulation position, the behavior is unspecified. It is  
 2802 unspecified whether this character is the exact sequence transmitted to an output device by the  
 2803 system to accomplish the tabulation.

2804 **3.434 White Space**

2805 A sequence of one or more characters that belong to the **space** character class as defined via the  
 2806 `LC_CTYPE` category in the current locale.

2807 In the POSIX locale, white space consists of one or more `<blank>` (`<space>` and `<tab>`  
 2808 characters), `<newline>`, `<carriage-return>`, `<form-feed>`, and `<vertical-tab>` characters.

2809 **3.435 Wide-Character Code (C Language)**

2810 An integer value corresponding to a single graphic symbol or control code.

2811 **Note:** C Language Wide-Character Codes are defined in detail in [Section 6.3](#) (on page 129).2812 **3.436 Wide-Character Input/Output Functions**

2813 The functions that perform wide-oriented input from streams or wide-oriented output to  
 2814 streams: `fgetwc()`, `fgetwts()`, `fputwc()`, `fputwts()`, `fwprintf()`, `fwscanf()`, `getwc()`, `getwchar()`, `putwc()`,  
 2815 `putwchar()`, `ungetwc()`, `vwprintf()`, `vwscanf()`, `vwprintf()`, `vwscanf()`, `wprintf()`, and `wscanf()`.

2816 **Note:** These functions are defined in detail in the System Interfaces volume of POSIX.1-2008.2817 **3.437 Wide-Character String**

2818 A contiguous sequence of wide-character codes terminated by and including the first null wide-  
 2819 character code.

2820 **3.438 Word**

2821 In the shell command language, a token other than an operator. In some cases a word is also a  
2822 portion of a word token: in the various forms of parameter expansion, such as  $\{name-word\}$ ,  
2823 and variable assignment, such as  $name=word$ , the word is the portion of the token depicted by  
2824 *word*. The concept of a word is no longer applicable following word expansions—only fields  
2825 remain.

2826 **Note:** For further information, see XCU [Section 2.6.2](#) (on page 2306) and [Section 2.6](#) (on page 2305).

2827 **3.439 Working Directory (or Current Working Directory)**

2828 A directory, associated with a process, that is used in pathname resolution for pathnames that do  
2829 not begin with a <slash> character.

2830 **3.440 Worldwide Portability Interface**

2831 Functions for handling characters in a codeset-independent manner.

2832 **3.441 Write**

2833 To output characters to a file, such as standard output or standard error. Unless otherwise stated,  
2834 standard output is the default output destination for all uses of the term “write”; see the  
2835 distinction between display and write in [Section 3.133](#) (on page 54).

2836 **3.442 XSI**

2837 The X/Open System Interfaces (XSI) option is the core application programming interface for C  
2838 and *sh* programming for systems conforming to the Single UNIX Specification. This is a  
2839 superset of the mandatory requirements for conformance to POSIX.1-2008.

2840 **3.443 XSI-Conformant**

2841 A system which allows an application to be built using a set of services that are consistent across  
2842 all systems that conform to POSIX.1-2008 and that support the XSI option.

2843 **Note:** See also [Chapter 2](#) (on page 15).

2844 **3.444 Zombie Process**

2845 A process that has terminated and that is deleted when its exit status has been reported to  
2846 another process which is waiting for that process to terminate.

2847 **3.445  $\pm 0$** 

2848 The algebraic sign provides additional information about any variable that has the value zero  
2849 when the representation allows the sign to be determined.

Chapter 4

2851

## General Concepts

2852

For the purposes of POSIX.1-2008, the general concepts given in [Chapter 4](#) apply.

2853

2854

2855

**Note:** No shading to denote extensions or options occurs in this chapter. Where the terms and definitions given in this chapter are used elsewhere in text related to extensions and options, they are shaded as appropriate.

2856

### 4.1 Concurrent Execution

2857

2858

Functions that suspend the execution of the calling thread shall not cause the execution of other threads to be indefinitely suspended.

2859

### 4.2 Directory Protection

2860

2861

If a directory is writable and the mode bit `S_ISVTX` is set on the directory, a process may remove or rename files within that directory only if one or more of the following is true:

2862

2863

2864

2865

2866

2867

- The effective user ID of the process is the same as that of the owner ID of the file.
- The effective user ID of the process is the same as that of the owner ID of the directory.
- The process has appropriate privileges.
- Optionally, the file is writable by the process. Whether or not files that are writable by the process can be removed or renamed is implementation-defined.

If the `S_ISVTX` bit is set on a non-directory file, the behavior is unspecified.

2868

### 4.3 Extended Security Controls

2869

2870

2871

2872

An implementation may provide implementation-defined extended security controls (see [Section 3.160](#), on page 58). These permit an implementation to provide security mechanisms to implement different security policies than those described in POSIX.1-2008. These mechanisms shall not alter or override the defined semantics of any of the interfaces in POSIX.1-2008.

#### 2873 4.4 File Access Permissions

2874 The standard file access control mechanism uses the file permission bits, as described below.

2875 Implementations may provide *additional* or *alternate* file access control mechanisms, or both. An  
2876 additional access control mechanism shall only further restrict the access permissions defined by  
2877 the file permission bits. An alternate file access control mechanism shall:

- 2878 • Specify file permission bits for the file owner class, file group class, and file other class of  
2879 that file, corresponding to the access permissions.
- 2880 • Be enabled only by explicit user action, on a per-file basis by the file owner or a user with  
2881 appropriate privileges.
- 2882 • Be disabled for a file after the file permission bits are changed for that file with *chmod()*.  
2883 The disabling of the alternate mechanism need not disable any additional mechanisms  
2884 supported by an implementation.

2885 Whenever a process requests file access permission for read, write, or execute/search, if no  
2886 additional mechanism denies access, access shall be determined as follows:

- 2887 • If a process has appropriate privileges:
  - 2888 — If read, write, or directory search permission is requested, access shall be granted.
  - 2889 — If execute permission is requested, access shall be granted if execute permission is  
2890 granted to at least one user by the file permission bits or by an alternate access  
2891 control mechanism; otherwise, access shall be denied.
- 2892 • Otherwise:
  - 2893 — The file permission bits of a file contain read, write, and execute/search permissions  
2894 for the file owner class, file group class, and file other class.
  - 2895 — Access shall be granted if an alternate access control mechanism is not enabled and  
2896 the requested access permission bit is set for the class (file owner class, file group  
2897 class, or file other class) to which the process belongs, or if an alternate access control  
2898 mechanism is enabled and it allows the requested access; otherwise, access shall be  
2899 denied.

2900 POSIX.1-2008 does not provide a way to open a directory for searching. It is unspecified  
2901 whether directory search permission is granted based on the file access modes of the directory's  
2902 file descriptor or on the mode of the directory at the time the directory is searched.

#### 2903 4.5 File Hierarchy

2904 Files in the system are organized in a hierarchical structure in which all of the non-terminal  
2905 nodes are directories and all of the terminal nodes are any other type of file. Since multiple  
2906 directory entries may refer to the same file, the hierarchy is properly described as a “directed  
2907 graph”.

## 2908 4.6 Filenames

2909 Uppercase and lowercase letters shall retain their unique identities between conforming  
2910 implementations.

## 2911 4.7 Filename Portability

2912 For a filename to be portable across implementations conforming to POSIX.1-2008, it shall  
2913 consist only of the portable filename character set as defined in Section 3.276 (on page 77).

2914 Portable filenames shall not have the <hyphen> character as the first character since this may  
2915 cause problems when filenames are passed as command line arguments.

## 2916 4.8 File Times Update

2917 Each file has three distinct associated timestamps: the time of last data access, the time of last  
2918 data modification, and the time the file status last changed. These values are returned in the file  
2919 characteristics structure **struct stat**, as described in <sys/stat.h> (on page 388).

2920 Each function or utility in POSIX.1-2008 that reads or writes data (even if the data does not  
2921 change) or performs an operation to change file status (even if the file status does not change)  
2922 indicates which of the appropriate timestamps shall be marked for update. If an implementation  
2923 of such a function or utility marks for update one of these timestamps in a place or time not  
2924 specified by POSIX.1-2008, this shall be documented, except that any changes caused by  
2925 pathname resolution need not be documented. For the other functions or utilities in  
2926 POSIX.1-2008 (those that are not explicitly required to read or write file data or change file  
2927 status, but that in some implementations happen to do so), the effect is unspecified.

2928 An implementation may update timestamps that are marked for update immediately, or it may  
2929 update such timestamps periodically. At the point in time when an update occurs, any marked  
2930 timestamps shall be set to the current time and the update marks shall be cleared. All  
2931 timestamps that are marked for update shall be updated when the file ceases to be open by any  
2932 process or before a *fstat()*, *fstatat()*, *fsync()*, *futimens()*, *lstat()*, *stat()*, *utime()*, *utimensat()*, or  
2933 *utimes()* is successfully performed on the file. Other times at which updates are done are  
2934 unspecified. Marks for update, and updates themselves, shall not be done for files on read-only  
2935 file systems; see Section 3.304 (on page 82).

2936 The resolution of timestamps of files in a file system is implementation-defined, but shall be no  
2937 coarser than one-second resolution. The three timestamps shall always have values that are  
2938 supported by the file system. Whenever any of a file's timestamps are to be set to a value *V*  
2939 according to the rules of the preceding paragraphs of this section, the implementation shall  
2940 immediately set the timestamp to the greatest value supported by the file system that is not  
2941 greater than *V*.

## 2942 4.9 Host and Network Byte Orders

2943 When data is transmitted over the network, it is sent as a sequence of octets (8-bit unsigned  
2944 values). If an entity (such as an address or a port number) can be larger than 8 bits, it needs to be  
2945 stored in several octets. The convention is that all such values are stored with 8 bits in each octet,  
2946 and with the first (lowest-addressed) octet holding the most-significant bits. This is called  
2947 “network byte order”.

2948 Network byte order may not be convenient for processing actual values. For this, it is more  
2949 sensible for values to be stored as ordinary integers. This is known as “host byte order”. In host  
2950 byte order:

- 2951 • The most significant bit might not be stored in the first byte in address order.
- 2952 • Bits might not be allocated to bytes in any obvious order at all.

2953 8-bit values stored in `uint8_t` objects do not require conversion to or from host byte order, as  
2954 they have the same representation. 16 and 32-bit values can be converted using the `htonl()`,  
2955 `htons()`, `ntohl()`, and `ntohs()` functions. When reading data that is to be converted to host byte  
2956 order, it should either be received directly into a `uint16_t` or `uint32_t` object or should be copied  
2957 from an array of bytes using `memcpy()` or similar. Passing the data through other types could  
2958 cause the byte order to be changed. Similar considerations apply when sending data.

## 2959 4.10 Measurement of Execution Time

2960 The mechanism used to measure execution time shall be implementation-defined. The  
2961 implementation shall also define to whom the CPU time that is consumed by interrupt handlers  
2962 and system services on behalf of the operating system will be charged. See [Section 3.118](#) (on  
2963 page 52).

## 2964 4.11 Memory Synchronization

2965 Applications shall ensure that access to any memory location by more than one thread of control  
2966 (threads or processes) is restricted such that no thread of control can read or modify a memory  
2967 location while another thread of control may be modifying it. Such access is restricted using  
2968 functions that synchronize thread execution and also synchronize memory with respect to other  
2969 threads. The following functions synchronize memory with respect to other threads:

2970 <code>fork()</code>	<code>pthread_mutex_trylock()</code>	<code>pthread_rwlock_unlock()</code>
2971 <code>pthread_barrier_wait()</code>	<code>pthread_mutex_unlock()</code>	<code>pthread_rwlock_wrlock()</code>
2972 <code>pthread_cond_broadcast()</code>	<code>pthread_spin_lock()</code>	<code>sem_post()</code>
2973 <code>pthread_cond_signal()</code>	<code>pthread_spin_trylock()</code>	<code>sem_timedwait()</code>
2974 <code>pthread_cond_timedwait()</code>	<code>pthread_spin_unlock()</code>	<code>sem_trywait()</code>
2975 <code>pthread_cond_wait()</code>	<code>pthread_rwlock_rdlock()</code>	<code>sem_wait()</code>
2976 <code>pthread_create()</code>	<code>pthread_rwlock_timedrdlock()</code>	<code>semctl()</code>
2977 <code>pthread_join()</code>	<code>pthread_rwlock_timedwrlock()</code>	<code>semop()</code>
2978 <code>pthread_mutex_lock()</code>	<code>pthread_rwlock_tryrdlock()</code>	<code>wait()</code>
2979 <code>pthread_mutex_timedlock()</code>	<code>pthread_rwlock_trywrlock()</code>	<code>waitpid()</code>

2980 The `pthread_once()` function shall synchronize memory for the first call in each thread for a given  
2981 `pthread_once_t` object.

2982 The `pthread_mutex_lock()` function need not synchronize memory if the mutex type if  
 2983 PTHREAD\_MUTEX\_RECURSIVE and the calling thread already owns the mutex. The  
 2984 `pthread_mutex_unlock()` function need not synchronize memory if the mutex type is  
 2985 PTHREAD\_MUTEX\_RECURSIVE and the mutex has a lock count greater than one.

2986 Unless explicitly stated otherwise, if one of the above functions returns an error, it is unspecified  
 2987 whether the invocation causes memory to be synchronized.

2988 Applications may allow more than one thread of control to read a memory location  
 2989 simultaneously.

## 2990 4.12 Pathname Resolution

2991 Pathname resolution is performed for a process to resolve a pathname to a particular directory  
 2992 entry for a file in the file hierarchy. There may be multiple pathnames that resolve to the same  
 2993 directory entry, and multiple directory entries for the same file. When a process resolves a  
 2994 pathname of an existing directory entry, the entire pathname shall be resolved as described  
 2995 below. When a process resolves a pathname of a directory entry that is to be created immediately  
 2996 after the pathname is resolved, pathname resolution terminates when all components of the path  
 2997 prefix of the last component have been resolved. It is then the responsibility of the process to  
 2998 create the final component.

2999 Each filename in the pathname is located in the directory specified by its predecessor (for  
 3000 example, in the pathname fragment `a/b`, file `b` is located in directory `a`). Pathname resolution  
 3001 shall fail if this cannot be accomplished. If the pathname begins with a `<slash>`, the predecessor  
 3002 of the first filename in the pathname shall be taken to be the root directory of the process (such  
 3003 pathnames are referred to as “absolute pathnames”). If the pathname does not begin with a  
 3004 `<slash>`, the predecessor of the first filename of the pathname shall be taken to be either the  
 3005 current working directory of the process or for certain interfaces the directory identified by a file  
 3006 descriptor passed to the interface (such pathnames are referred to as “relative pathnames”).

3007 The interpretation of a pathname component is dependent on the value of `{NAME_MAX}` and  
 3008 `_POSIX_NO_TRUNC` associated with the path prefix of that component. If any pathname  
 3009 component is longer than `{NAME_MAX}`, the implementation shall consider this an error.

3010 A pathname that contains at least one non-`<slash>` character and that ends with one or more  
 3011 trailing `<slash>` characters shall not be resolved successfully unless the last pathname  
 3012 component before the trailing `<slash>` characters names an existing directory or a directory  
 3013 entry that is to be created for a directory immediately after the pathname is resolved. Interfaces  
 3014 using pathname resolution may specify additional constraints<sup>6</sup> when a pathname that does not  
 3015 name an existing directory contains at least one non-`<slash>` character and contains one or more  
 3016 trailing `<slash>` characters.

3017 If a symbolic link is encountered during pathname resolution, the behavior shall depend on  
 3018 whether the pathname component is at the end of the pathname and on the function being  
 3019 performed. If all of the following are true, then pathname resolution is complete:

- 3020 1. This is the last pathname component of the pathname.
- 3021 2. The pathname has no trailing `<slash>`.

---

3022 6. The only interfaces that further constrain pathnames in POSIX.1-2008 are the `rename()` and `renameat()` functions (see XSH `rename()`)  
 3023 and the `mv` utility (see XCU `mv`).

3024 3. The function is required to act on the symbolic link itself, or certain arguments direct that  
3025 the function act on the symbolic link itself.

3026 In all other cases, the system shall prefix the remaining pathname, if any, with the contents of the  
3027 symbolic link. If the combined length exceeds {PATH\_MAX}, and the implementation considers  
3028 this to be an error, *errno* shall be set to [ENAMETOOLONG] and an error indication shall be  
3029 returned. Otherwise, the resolved pathname shall be the resolution of the pathname just created.  
3030 If the resulting pathname does not begin with a <slash>, the predecessor of the first filename of  
3031 the pathname is taken to be the directory containing the symbolic link.

3032 If the system detects a loop in the pathname resolution process, it shall set *errno* to [ELOOP] and  
3033 return an error indication. The same may happen if during the resolution process more symbolic  
3034 links were followed than the implementation allows. This implementation-defined limit shall  
3035 not be smaller than {SYMLOOP\_MAX}.

3036 The special filename dot shall refer to the directory specified by its predecessor. The special  
3037 filename dot-dot shall refer to the parent directory of its predecessor directory. As a special case,  
3038 in the root directory, dot-dot may refer to the root directory itself.

3039 A pathname consisting of a single <slash> shall resolve to the root directory of the process. A  
3040 null pathname shall not be successfully resolved. A pathname that begins with two successive  
3041 <slash> characters may be interpreted in an implementation-defined manner, although more  
3042 than two leading <slash> characters shall be treated as a single <slash> character.

3043 Pathname resolution for a given pathname shall yield the same results when used by any  
3044 interface in POSIX.1-2008 as long as there are no changes to any files evaluated during pathname  
3045 resolution for the given pathname between resolutions.

### 3046 4.13 Process ID Reuse

3047 A process group ID shall not be reused by the system until the process group lifetime ends.

3048 A process ID shall not be reused by the system until the process lifetime ends. In addition, if  
3049 there exists a process group whose process group ID is equal to that process ID, the process ID  
3050 shall not be reused by the system until the process group lifetime ends. A process that is not a  
3051 system process shall not have a process ID of 1.

### 3052 4.14 Scheduling Policy

3053 A scheduling policy affects process or thread ordering:

- 3054 • When a process or thread is a running thread and it becomes a blocked thread
- 3055 • When a process or thread is a running thread and it becomes a preempted thread
- 3056 • When a process or thread is a blocked thread and it becomes a runnable thread
- 3057 • When a running thread calls a function that can change the priority or scheduling policy of  
3058 a process or thread
- 3059 • In other scheduling policy-defined circumstances

3060 Conforming implementations shall define the manner in which each of the scheduling policies  
3061 may modify the priorities or otherwise affect the ordering of processes or threads at each of the  
3062 occurrences listed above. Additionally, conforming implementations shall define in what other

3063 circumstances and in what manner each scheduling policy may modify the priorities or affect  
3064 the ordering of processes or threads.

#### 3065 4.15 Seconds Since the Epoch

3066 A value that approximates the number of seconds that have elapsed since the Epoch. A  
3067 Coordinated Universal Time name (specified in terms of seconds (*tm\_sec*), minutes (*tm\_min*),  
3068 hours (*tm\_hour*), days since January 1 of the year (*tm\_yday*), and calendar year minus 1900  
3069 (*tm\_year*)) is related to a time represented as seconds since the Epoch, according to the  
3070 expression below.

3071 If the year is <1970 or the value is negative, the relationship is undefined. If the year is ≥1970 and  
3072 the value is non-negative, the value is related to a Coordinated Universal Time name according  
3073 to the C-language expression, where *tm\_sec*, *tm\_min*, *tm\_hour*, *tm\_yday*, and *tm\_year* are all  
3074 integer types:

$$3075 \quad tm\_sec + tm\_min*60 + tm\_hour*3600 + tm\_yday*86400 +$$

$$3076 \quad (tm\_year-70)*31536000 + ((tm\_year-69)/4)*86400 -$$

$$3077 \quad ((tm\_year-1)/100)*86400 + ((tm\_year+299)/400)*86400$$

3078 The relationship between the actual time of day and the current value for seconds since the  
3079 Epoch is unspecified.

3080 How any changes to the value of seconds since the Epoch are made to align to a desired  
3081 relationship with the current actual time is implementation-defined. As represented in seconds  
3082 since the Epoch, each and every day shall be accounted for by exactly 86 400 seconds.

3083 **Note:** The last three terms of the expression add in a day for each year that follows a leap year starting  
3084 with the first leap year since the Epoch. The first term adds a day every 4 years starting in 1973,  
3085 the second subtracts a day back out every 100 years starting in 2001, and the third adds a day  
3086 back in every 400 years starting in 2001. The divisions in the formula are integer divisions; that  
3087 is, the remainder is discarded leaving only the integer quotient.

#### 3088 4.16 Semaphore

3089 A minimum synchronization primitive to serve as a basis for more complex synchronization  
3090 mechanisms to be defined by the application program.

3091 For the semaphores associated with the Semaphores option, a semaphore is represented as a  
3092 shareable resource that has a non-negative integer value. When the value is zero, there is a  
3093 (possibly empty) set of threads awaiting the availability of the semaphore.

3094 For the semaphores associated with the X/Open System Interfaces (XSI) option, a semaphore is  
3095 a positive integer (0 through 32767). The *semget()* function can be called to create a set or array of  
3096 semaphores. A semaphore set can contain one or more semaphores up to an implementation-  
3097 defined value.

3098 **Semaphore Lock Operation**

3099 An operation that is applied to a semaphore. If, prior to the operation, the value of the  
 3100 semaphore is zero, the semaphore lock operation shall cause the calling thread to be blocked and  
 3101 added to the set of threads awaiting the semaphore; otherwise, the value shall be decremented.

3102 **Semaphore Unlock Operation**

3103 An operation that is applied to a semaphore. If, prior to the operation, there are any threads in  
 3104 the set of threads awaiting the semaphore, then some thread from that set shall be removed from  
 3105 the set and becomes unblocked; otherwise, the semaphore value shall be incremented.

3106 **4.17 Thread-Safety**

3107 Refer to XSH [Section 2.9](#) (on page 507).

3108 **4.18 Tracing**

3109 The trace system allows a traced process to have a selection of events created for it. Traces  
 3110 consist of streams of trace event types.

3111 A trace event type is identified on the one hand by a trace event type name, also referenced as a  
 3112 trace event name, and on the other hand by a trace event type identifier. A trace event name is a  
 3113 human-readable string. A trace event type identifier is an opaque identifier used by the trace  
 3114 system. There shall be a one-to-one relationship between trace event type identifiers and trace  
 3115 event names for a given trace stream and also for a given traced process. The trace event type  
 3116 identifier shall be generated automatically from a trace event name by the trace system either  
 3117 when a trace controller process invokes `posix_trace_trid_eventid_open()` or when an instrumented  
 3118 application process invokes `posix_trace_eventid_open()`. Trace event type identifiers are used to  
 3119 filter trace event types, to allow interpretation of user data, and to identify the kind of trace  
 3120 point that generated a trace event.

3121 Each trace event shall be of a particular trace event type, and associated with a trace event type  
 3122 identifier. The execution of a trace point shall generate a trace event if a trace stream has been  
 3123 created and started for the process that executed the trace point and if the corresponding trace  
 3124 event type identifier is not ignored by filtering.

3125 A generated trace event shall be recorded in a trace stream, and optionally also in a trace log if a  
 3126 trace log is associated with the trace stream, except that:

- 3127 • For a trace stream, if no resources are available for the event, the event is lost.
- 3128 • For a trace log, if no resources are available for the event, or a flush operation does not  
 3129 succeed, the event is lost.

3130 A trace event recorded in an active trace stream may be retrieved by an application having  
 3131 appropriate privileges.

3132 A trace event recorded in a trace log may be retrieved by an application having appropriate  
 3133 privileges after opening the trace log as a pre-recorded trace stream, with the function  
 3134 `posix_trace_open()`.

3135 When a trace event is reported it is possible to retrieve the following:

- 3136 • A trace event type identifier
- 3137 • A timestamp
- 3138 • The process ID of the traced process, if the trace event is process-dependent
- 3139 • Any optional trace event data including its length
- 3140 • If the Threads option is supported, the thread ID, if the trace event is process-dependent
- 3141 • The program address at which the trace point was invoked

3142 Trace events may be mapped from trace event types to trace event names. One such mapping  
 3143 shall be associated with each trace stream. An active trace stream is associated with a traced  
 3144 process, and also with its children if the Trace Inherit option is supported and also the  
 3145 inheritance policy is set to `_POSIX_TRACE_INHERIT`. Therefore each traced process has a  
 3146 mapping of the trace event names to trace event type identifiers that have been defined for that  
 3147 process.

3148 Traces can be recorded into either trace streams or trace logs.

3149 The implementation and format of a trace stream are unspecified. A trace stream need not be  
 3150 and generally is not persistent. A trace stream may be either active or pre-recorded:

- 3151 • An active trace stream is a trace stream that has been created and has not yet been shut  
 3152 down. It can be of one of the two following classes:
  - 3153 1. An active trace stream without a trace log that was created with the  
 3154 `posix_trace_create()` function
  - 3155 2. If the Trace Log option is supported, an active trace stream with a trace log that was  
 3156 created with the `posix_trace_create_withlog()` function
- 3157 • A pre-recorded trace stream is a trace stream that was opened from a trace log object using  
 3158 the `posix_trace_open()` function.

3159 An active trace stream can loop. This behavior means that when the resources allocated by the  
 3160 trace system for the trace stream are exhausted, the trace system reuses the resources associated  
 3161 with the oldest recorded trace events to record new trace events.

3162 If the Trace Log option is supported, an active trace stream with a trace log can be flushed. This  
 3163 operation causes the trace system to write trace events from the trace stream to the associated  
 3164 trace log, following the defined policies or using an explicit function call. After this operation,  
 3165 the trace system may reuse the resources associated with the flushed trace events.

3166 An active trace stream with or without a trace log can be cleared. This operation shall cause all  
 3167 the resources associated with this trace stream to be reinitialized. The trace stream shall behave  
 3168 as if it was returning from its creation, except that the mapping of trace event type identifiers to  
 3169 trace event names shall not be cleared. If a trace log was associated with this trace stream, the  
 3170 trace log shall also be reinitialized.

3171 A trace log shall be recorded when the `posix_trace_shutdown()` operation is invoked or during  
 3172 tracing, depending on the tracing strategy which is defined by a log policy. After the trace  
 3173 stream has been shut down, the trace information can be retrieved from the associated trace log  
 3174 using the same interface used to retrieve information from an active trace stream.

3175 For a traced process, if the Trace Inherit option is supported and the trace stream's inheritance  
 3176 attribute is `_POSIX_TRACE_INHERIT`, the initial targeted traced process shall be traced together  
 3177 with all of its future children. The `posix_pid` member of each trace event in a trace stream shall be  
 3178 the process ID of the traced process.

3179 Each trace point may be an implementation-defined action such as a context switch, or an  
 3180 application-programmed action such as a call to a specific operating system service (for  
 3181 example, *fork()*) or a call to *posix\_trace\_event()*.

3182 Trace points may be filtered. The operation of the filter is to filter out (ignore) selected trace  
 3183 events. By default, no trace events are filtered.

3184 The results of the tracing operations can be analyzed and monitored by a trace controller process  
 3185 or a trace analyzer process.

3186 Only the trace controller process has control of the trace stream it has created. The control of the  
 3187 operation of a trace stream is done using its corresponding trace stream identifier. The trace  
 3188 controller process is able to:

- 3189 • Initialize the attributes of a trace stream
- 3190 • Create the trace stream
- 3191 • Start and stop tracing
- 3192 • Know the mapping of the traced process
- 3193 • If the Trace Event Filter option is supported, filter the type of trace events to be recorded
- 3194 • Shut the trace stream down

3195 A traced process may also be a trace controller process. Only the trace controller process can  
 3196 control its trace stream(s). A trace stream created by a trace controller process shall be shut down  
 3197 if its controller process terminates or executes another file.

3198 A trace controller process may also be a trace analyzer process. Trace analysis can be done  
 3199 concurrently with the traced process or can be done off-line, in the same or in a different  
 3200 platform.

## 3201 4.19 Treatment of Error Conditions for Mathematical Functions

3202 For all the functions in the `<math.h>` header, an application wishing to check for error situations  
 3203 should set *errno* to 0 and call *feclearexcept*(FE\_ALL\_EXCEPT) before calling the function. On  
 3204 return, if *errno* is non-zero or *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW |  
 3205 FE\_UNDERFLOW) is non-zero, an error has occurred.

3206 The following error conditions are defined for all functions in the `<math.h>` header.

### 3207 4.19.1 Domain Error

3208 A "domain error" shall occur if an input argument is outside the domain over which the  
 3209 mathematical function is defined. The description of each function lists any required domain  
 3210 errors; an implementation may define additional domain errors, provided that such errors are  
 3211 consistent with the mathematical definition of the function.

3212 On a domain error, the function shall return an implementation-defined value; if the integer  
 3213 expression (*math\_errhandling* & MATH\_ERRNO) is non-zero, *errno* shall be set to [EDOM]; if  
 3214 the integer expression (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, the "invalid"  
 3215 floating-point exception shall be raised.

3216 **4.19.2 Pole Error**

3217 A “pole error” occurs if the mathematical result of the function is an exact infinity (for example,  
3218  $\log(0.0)$ ).

3219 On a pole error, the function shall return the value of the macro HUGE\_VAL, HUGE\_VALF, or  
3220 HUGE\_VALL according to the return type, with the same sign as the correct value of the  
3221 function; if the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero, *errno* shall  
3222 be set to [ERANGE]; if the integer expression (math\_errhandling & MATH\_ERREXCEPT) is non-  
3223 zero, the “divide-by-zero” floating-point exception shall be raised.

3224 **4.19.3 Range Error**

3225 A “range error” shall occur if the finite mathematical result of the function cannot be  
3226 represented in an object of the specified type, due to extreme magnitude.

3227 **4.19.3.1 Result Overflows**

3228 A floating result overflows if the magnitude of the mathematical result is finite but so large that  
3229 the mathematical result cannot be represented without extraordinary roundoff error in an object  
3230 of the specified type. If a floating result overflows and default rounding is in effect, then the  
3231 function shall return the value of the macro HUGE\_VAL, HUGE\_VALF, or HUGE\_VALL  
3232 according to the return type, with the same sign as the correct value of the function; if the integer  
3233 expression (math\_errhandling & MATH\_ERRNO) is non-zero, *errno* shall be set to [ERANGE]; if  
3234 the integer expression (math\_errhandling & MATH\_ERREXCEPT) is non-zero, the “overflow”  
3235 floating-point exception shall be raised.

3236 **4.19.3.2 Result Underflows**

3237 The result underflows if the magnitude of the mathematical result is so small that the  
3238 mathematical result cannot be represented, without extraordinary roundoff error, in an object of  
3239 the specified type. If the result underflows, the function shall return an implementation-defined  
3240 value whose magnitude is no greater than the smallest normalized positive number in the  
3241 specified type; if the integer expression (math\_errhandling & MATH\_ERRNO) is non-zero,  
3242 whether *errno* is set to [ERANGE] is implementation-defined; if the integer expression  
3243 (math\_errhandling & MATH\_ERREXCEPT) is non-zero, whether the “underflow” floating-point  
3244 exception is raised is implementation-defined.

## 3245 4.20 Treatment of NaN Arguments for the Mathematical Functions

3246 For functions called with a NaN argument, no errors shall occur and a NaN shall be returned,  
3247 except where stated otherwise.

3248 If a function with one or more NaN arguments returns a NaN result, the result should be the  
3249 same as one of the NaN arguments (after possible type conversion), except perhaps for the sign.

3250 On implementations that support the IEC 60559:1989 standard floating point, functions with  
3251 signaling NaN argument(s) shall be treated as if the function were called with an argument that  
3252 is a required domain error and shall return a quiet NaN result, except where stated otherwise.

3253 **Note:** The function might never see the signaling NaN, since it might trigger when the arguments are  
3254 evaluated during the function call.

3255 On implementations that support the IEC 60559:1989 standard floating point, for those  
3256 functions that do not have a documented domain error, the following shall apply:

3257 These functions shall fail if:

3258 Domain Error Any argument is a signaling NaN.

3259 Either, the integer expression (`math_errhandling & MATH_ERRNO`) is non-zero and `errno`  
3260 shall be set to `[EDOM]`, or the integer expression (`math_errhandling &`  
3261 `MATH_ERREXCEPT`) is non-zero and the invalid floating-point exception shall be raised.

## 3262 4.21 Utility

3263 A utility program shall be either an executable file, such as might be produced by a compiler or  
3264 linker system from computer source code, or a file of shell source code, directly interpreted by  
3265 the shell. The program may have been produced by the user, provided by the system  
3266 implementor, or acquired from an independent distributor.

3267 The system may implement certain utilities as shell functions (see XCU Section 2.9.5, on page  
3268 2324) or built-in utilities, but only an application that is aware of the command search order (as  
3269 described in XCU Section 2.9.1.1, on page 2317) or of performance characteristics can discern  
3270 differences between the behavior of such a function or built-in utility and that of an executable  
3271 file.

## 3272 4.22 Variable Assignment

3273 In the shell command language, a word consisting of the following parts:

3274 `varname=value`

3275 When used in a context where assignment is defined to occur and at no other time, the `value`  
3276 (representing a word or field) shall be assigned as the value of the variable denoted by `varname`.

3277 **Note:** For further information, see XCU Section 2.9.1 (on page 2316).

3278 The `varname` and `value` parts shall meet the requirements for a name and a word, respectively,  
3279 except that they are delimited by the embedded unquoted `<equals-sign>`, in addition to other  
3280 delimiters.

## General Concepts

## Variable Assignment

- 3281           **Note:**     Additional delimiters are described in XCU [Section 2.3](#) (on page 2299).
- 3282           When a variable assignment is done, the variable shall be created if it did not already exist. If
- 3283           *value* is not specified, the variable shall be given a null value.
- 3284           **Note:**     An alternative form of variable assignment:
- 3285                     *symbol=value*
- 3286           (where *symbol* is a valid word delimited by an <equals-sign>, but not a valid name) produces
- 3287           unspecified results. The form *symbol=value* is used by the KornShell *name[expression]=value*
- 3288           syntax.

Chapter 5

3290

## File Format Notation

3291 The STDIN, STDOUT, STDERR, INPUT FILES, and OUTPUT FILES sections of the utility  
 3292 descriptions use a syntax to describe the data organization within the files, when that  
 3293 organization is not otherwise obvious. The syntax is similar to that used by the System Interfaces  
 3294 volume of POSIX.1-2008 *printf()* function, as described in this chapter. When used in STDIN or  
 3295 INPUT FILES sections of the utility descriptions, this syntax describes the format that could  
 3296 have been used to write the text to be read, not a format that could be used by the System  
 3297 Interfaces volume of POSIX.1-2008 *scanf()* function to read the input file.

3298 The description of an individual record is as follows:

3299 "<format>", [<arg1>, <arg2>, ..., <argn>]

3300 The *format* is a character string that contains three types of objects defined below:

- 3301 1. *Characters* that are not "escape sequences" or "conversion specifications", as described  
 3302 below, shall be copied to the output.
- 3303 2. *Escape Sequences* represent non-graphic characters.
- 3304 3. *Conversion Specifications* specify the output format of each argument; see below.

3305 The following characters have the following special meaning in the format string:

3306 ' ' (An empty character position.) Represents one or more <blank> characters.

3307 Δ Represents exactly one <space> character.

3308 [Table 5-1](#) lists escape sequences and associated actions on display devices capable of the action.

3309 **Table 5-1** Escape Sequences and Associated Actions

3310	3311	3312	3313	3314	3315	3316	3317	3318	3319	3320	3321	3322	3323	3324	3325
Escape Sequence	Represents Character	Terminal Action													
\\	<backslash>	Print the <backslash> character.													
\a	<alert>	Attempt to alert the user through audible or visible notification.													
\b	<backspace>	Move the printing position to one column before the current position, unless the current position is the start of a line.													
\f	<form-feed>	Move the printing position to the initial printing position of the next logical page.													
\n	<newline>	Move the printing position to the start of the next line.													
\r	<carriage-return>	Move the printing position to the start of the current line.													
\t	<tab>	Move the printing position to the next tab position on the current line. If there are no more tab positions remaining on the line, the behavior is undefined.													
\v	<vertical-tab>	Move the printing position to the start of the next <vertical-tab> position. If there are no more <vertical-tab> positions left on the page, the behavior is undefined.													

3326		Each conversion specification is introduced by the <percent-sign> character ('%'). After the
3327		character '%', the following shall appear in sequence:
3328	<i>flags</i>	Zero or more <i>flags</i> , in any order, that modify the meaning of the conversion
3329		specification.
3330	<i>field width</i>	An optional string of decimal digits to specify a minimum field width. For an
3331		output field, if the converted value has fewer bytes than the field width, it shall be
3332		padded on the left (or right, if the left-adjustment flag ('-'), described below, has
3333		been given) to the field width.
3334	<i>precision</i>	Gives the minimum number of digits to appear for the <i>d</i> , <i>o</i> , <i>i</i> , <i>u</i> , <i>x</i> , or <i>X</i> conversion
3335		specifiers (the field is padded with leading zeros), the number of digits to appear
3336		after the radix character for the <i>e</i> and <i>f</i> conversion specifiers; the maximum
3337		number of significant digits for the <i>g</i> conversion specifier; or the maximum
3338		number of bytes to be written from a string in the <i>s</i> conversion specifier. The
3339		precision shall take the form of a <period> ('.') followed by a decimal digit
3340		string; a null digit string is treated as zero.
3341	<i>conversion specifier characters</i>	
3342		A conversion specifier character (see below) that indicates the type of conversion
3343		to be applied.
3344		The <i>flag</i> characters and their meanings are:
3345	-	The result of the conversion shall be left-justified within the field.
3346	+	The result of a signed conversion shall always begin with a sign ('+' or '-').
3347	<space>	If the first character of a signed conversion is not a sign, a <space> shall be
3348		prefixed to the result. This means that if the <space> and '+' flags both appear,
3349		the <space> flag shall be ignored.
3350	#	The value shall be converted to an alternative form. For <i>c</i> , <i>d</i> , <i>i</i> , <i>u</i> , and <i>s</i>
3351		conversion specifiers, the behavior is undefined. For the <i>o</i> conversion specifier, it
3352		shall increase the precision to force the first digit of the result to be a zero. For <i>x</i> or
3353		<i>X</i> conversion specifiers, a non-zero result has 0x or 0X prefixed to it, respectively.
3354		For <i>a</i> , <i>A</i> , <i>e</i> , <i>E</i> , <i>f</i> , <i>F</i> , <i>g</i> , and <i>G</i> conversion specifiers, the result shall always contain a
3355		radix character, even if no digits follow the radix character. For <i>g</i> and <i>G</i> conversion
3356		specifiers, trailing zeros shall not be removed from the result as they usually are.
3357	0	For <i>a</i> , <i>A</i> , <i>d</i> , <i>e</i> , <i>E</i> , <i>f</i> , <i>F</i> , <i>g</i> , <i>G</i> , <i>i</i> , <i>o</i> , <i>u</i> , <i>x</i> , and <i>X</i> conversion specifiers, leading zeros
3358		(following any indication of sign or base) shall be used to pad to the field width
3359		rather than performing space padding, except when converting an infinity or NaN.
3360		If the '0' and '-' flags both appear, the '0' flag shall be ignored. For <i>d</i> , <i>i</i> , <i>o</i> , <i>u</i> ,
3361		<i>x</i> , and <i>X</i> conversion specifiers, if a precision is specified, the '0' flag shall be
3362		ignored. For other conversion specifiers, the behavior is undefined.
3363		Each conversion specifier character shall result in fetching zero or more arguments. The results
3364		are undefined if there are insufficient arguments for the format. If the format is exhausted while
3365		arguments remain, the excess arguments shall be ignored.
3366		The conversion specifiers and their meanings are:
3367	<i>a,A</i>	The floating-point number argument representing a floating-point number shall be
3368		converted in the style "[ - ] 0x <i>h</i> . <i>hhhhp</i> ± <i>d</i> ", where there is one hexadecimal digit
3369		(which shall be non-zero if the argument is a normalized floating-point number
3370		and is otherwise unspecified) before the decimal-point character and the number
3371		of hexadecimal digits after it is equal to the precision; if the precision is missing

## File Format Notation

3372		and FLT_RADIX is a power of 2, then the precision shall be sufficient for an exact
3373		representation of the value; if the precision is missing and FLT_RADIX is not a
3374		power of 2, then the precision shall be sufficient to distinguish different floating-
3375		point values in the internal representation used by the utility, except that trailing
3376		zeros may be omitted; if the precision is zero and the # flag is not specified, no
3377		decimal-point character shall appear. The letters "abcdef" shall be used for a
3378		conversion and the letters "ABCDEF" for A conversion. The A conversion specifier
3379		produces a number with X and P instead of x and p. The exponent shall always
3380		contain at least one digit, and only as many more digits as necessary to represent
3381		the decimal exponent of 2. If the value is zero, the exponent shall be zero. A
3382		floating-point number argument representing an infinity or NaN shall be
3383		converted in the style of an f or F conversion specifier.
3384	d,i,o,u,x,X	The integer argument shall be written as signed decimal (d or i), unsigned octal
3385		(o), unsigned decimal (u), or unsigned hexadecimal notation (x and X). The d and
3386		i specifiers shall convert to signed decimal in the style "[-]dddd". The x
3387		conversion specifier shall use the numbers and letters "0123456789abcdef" and
3388		the X conversion specifier shall use the numbers and letters
3389		"0123456789ABCDEF". The <i>precision</i> component of the argument shall specify
3390		the minimum number of digits to appear. If the value being converted can be
3391		represented in fewer digits than the specified minimum, it shall be expanded with
3392		leading zeros. The default precision shall be 1. The result of converting a zero
3393		value with a precision of 0 shall be no characters. If both the field width and
3394		precision are omitted, the implementation may precede, follow, or precede and
3395		follow numeric arguments of types o, i, and u with <blank> characters; arguments
3396		of type o (octal) may be preceded with leading zeros.
3397	f,F	The floating-point number argument shall be written in decimal notation in the
3398		style [-]ddd.ddd, where the number of digits after the radix character (shown here
3399		as a decimal point) shall be equal to the <i>precision</i> specification. The LC_NUMERIC
3400		locale category shall determine the radix character to use in this format. If the
3401		<i>precision</i> is omitted from the argument, six digits shall be written after the radix
3402		character; if the <i>precision</i> is explicitly 0, no radix character shall appear.
3403		A floating-point number argument representing an infinity shall be converted in
3404		one of the styles "[-]inf" or "[-]infinity"; which style is implementation-
3405		defined. A floating-point number argument representing a NaN shall be converted
3406		in one of the styles "[-]nan( <i>n-char-sequence</i> )" or "[-]nan"; which style,
3407		and the meaning of any <i>n-char-sequence</i> , is implementation-defined. The F
3408		conversion specifier produces "INF", "INFINITY", or "NAN" instead of "inf",
3409		"infinity", or "nan", respectively.
3410	e,E	The floating-point number argument shall be written in the style [-]d.ddde±dd (the
3411		symbol '±' indicates either a <plus-sign> or minus-sign), where there is one digit
3412		before the radix character (shown here as a decimal point) and the number of
3413		digits after it is equal to the precision. The LC_NUMERIC locale category shall
3414		determine the radix character to use in this format. When the precision is missing,
3415		six digits shall be written after the radix character; if the precision is 0, no radix
3416		character shall appear. The E conversion specifier shall produce a number with E
3417		instead of e introducing the exponent. The exponent shall always contain at least
3418		two digits. However, if the value to be written requires an exponent greater than
3419		two digits, additional exponent digits shall be written as necessary.
3420		A floating-point number argument representing an infinity or NaN shall be
3421		converted in the style of an f or F conversion specifier.

3422	<i>g,G</i>	The floating-point number argument shall be written in style <i>f</i> or <i>e</i> (or in style <i>F</i> or <i>E</i> in the case of a <i>G</i> conversion specifier), with the precision specifying the number of significant digits. The style used depends on the value converted: style <i>e</i> (or <i>E</i> ) shall be used only if the exponent resulting from the conversion is less than $-4$ or greater than or equal to the precision. Trailing zeros are removed from the result. A radix character shall appear only if it is followed by a digit.
3423		
3424		
3425		
3426		
3427		
3428		A floating-point number argument representing an infinity or NaN shall be converted in the style of an <i>f</i> or <i>F</i> conversion specifier.
3429		
3430	<i>c</i>	The single-byte character argument shall be written.
3431	<i>s</i>	The argument shall be taken to be a string and bytes from the string shall be written until the end of the string or the number of bytes indicated by the <i>precision</i> specification of the argument is reached. If the precision is omitted from the argument, it shall be taken to be infinite, so all bytes up to the end of the string shall be written.
3432		
3433		
3434		
3435		
3436	<i>%</i>	Write a ' <i>%</i> ' character; no argument is converted.
3437		In no case does a nonexistent or insufficient field width cause truncation of a field; if the result of a conversion is wider than the field width, the field is simply expanded to contain the conversion result. The term "field width" should not be confused with the term "precision" used in the description of <i>%s</i> .
3438		
3439		
3440		

#### 3441 Examples

3442	To represent the output of a program that prints a date and time in the form Sunday, July 3, 10:02, where <i>weekday</i> and <i>month</i> are strings:
3443	
3444	<code>"%s,Δ%sΔ%d,Δ%d:%.2d\n" &lt;weekday&gt;, &lt;month&gt;, &lt;day&gt;, &lt;hour&gt;, &lt;min&gt;</code>
3445	To show ' <i>π</i> ' written to 5 decimal places:
3446	<code>"piΔ=Δ%.5f\n", &lt;value of π&gt;</code>
3447	To show an input file format consisting of five <colon>-separated fields:
3448	<code>"%s:%s:%s:%s:%s\n", &lt;arg1&gt;, &lt;arg2&gt;, &lt;arg3&gt;, &lt;arg4&gt;, &lt;arg5&gt;</code>

3449

Chapter 6

3450

## Character Set

### 6.1 Portable Character Set

Conforming implementations shall support one or more coded character sets. Each supported locale shall include the *portable character set*, which is the set of symbolic names for characters in Table 6-1. This is used to describe characters within the text of POSIX.1-2008. The first eight entries in Table 6-1 are defined in the ISO/IEC 6429:1992 standard and the rest of the characters are defined in the ISO/IEC 10646-1:2000 standard.

3571	<tilde>	~	<U007E>	TILDE

3572 POSIX.1-2008 uses character names other than the above, but only in an informative way; for  
 3573 example, in examples to illustrate the use of characters beyond the portable character set with  
 3574 the facilities of POSIX.1-2008.

3575 **Table 6-1** (on page 125) defines the characters in the portable character set and the corresponding  
 3576 symbolic character names used to identify each character in a character set description file. The  
 3577 table contains more than one symbolic character name for characters whose traditional name  
 3578 differs from the chosen name. Characters defined in **Table 6-2** (on page 130) may also be used in  
 3579 character set description files.

3580 POSIX.1-2008 places only the following requirements on the encoded values of the characters in  
 3581 the portable character set:

- 3582 • If the encoded values associated with each member of the portable character set are not  
 3583 invariant across all locales supported by the implementation, if an application accesses any  
 3584 pair of locales where the character encodings differ, or accesses data from an application  
 3585 running in a locale which has different encodings from the application's current locale, the  
 3586 results are unspecified.
- 3587 • The encoded values associated with the digits 0 to 9 shall be such that the value of each  
 3588 character after 0 shall be one greater than the value of the previous character.

- 3589
- A null character, NUL, which has all bits set to zero, shall be in the set of characters.
- 3590
- The encoded values associated with the members of the portable character set are each represented in a single byte. Moreover, if the value is stored in an object of C-language type `char`, it is guaranteed to be positive (except the NUL, which is always zero).
- 3591
- 3592
- 3593 Conforming implementations shall support certain character and character set attributes, as defined in [Section 7.2](#) (on page 136).
- 3594

## 3595 6.2 Character Encoding

3596 The POSIX locale contains the characters in [Table 6-1](#) (on page 125), which have the properties listed in [Section 7.3.1](#) (on page 139). In other locales, the presence, meaning, and representation of any additional characters are locale-specific.

3597

3598

3599 In locales other than the POSIX locale, a character may have a state-dependent encoding. There are two types of these encodings:

3600

- 3601 • A single-shift encoding (where each character not in the initial shift state is preceded by a shift code) can be defined if each shift-code and character sequence is considered a multi-byte character. This is done using the concatenated-constant format in a character set description file, as described in [Section 6.4](#) (on page 129). If the implementation supports a character encoding of this type, all of the standard utilities in the Shell and Utilities volume of POSIX.1-2008 shall support it. Use of a single-shift encoding with any of the functions in the System Interfaces volume of POSIX.1-2008 that do not specifically mention the effects of state-dependent encoding is implementation-defined.
- 3602
- 3603
- 3604
- 3605
- 3606
- 3607
- 3608
- 3609 • A locking-shift encoding (where the state of the character is determined by a shift code that may affect more than the single character following it) cannot be defined with the current character set description file format. Use of a locking-shift encoding with any of the standard utilities in the Shell and Utilities volume of POSIX.1-2008 or with any of the functions in the System Interfaces volume of POSIX.1-2008 that do not specifically mention the effects of state-dependent encoding is implementation-defined.
- 3610
- 3611
- 3612
- 3613
- 3614

3615 While in the initial shift state, all characters in the portable character set shall retain their usual interpretation and shall not alter the shift state. The interpretation for subsequent bytes in the sequence shall be a function of the current shift state. A byte with all bits zero shall be interpreted as the null character independent of shift state. Such a byte shall not occur as part of any other character.

3616

3617

3618

3619

3620 The maximum allowable number of bytes in a character in the current locale shall be indicated by `{MB_CUR_MAX}`, defined in the `<stdlib.h>` header and by the `<mb_cur_max>` value in a character set description file; see [Section 6.4](#) (on page 129). The implementation's maximum number of bytes in a character shall be defined by the C-language macro `{MB_LEN_MAX}`.

3621

3622

3623

### 6.3 C Language Wide-Character Codes

In the shell, the standard utilities are written so that the encodings of characters are described by the locale's `LC_CTYPE` definition (see Section 7.3.1, on page 139) and there is no differentiation between characters consisting of single octets (8-bit bytes) or multiple bytes. However, in the C language, a differentiation is made. To ease the handling of variable length characters, the C language has introduced the concept of wide-character codes.

All wide-character codes in a given process consist of an equal number of bits. This is in contrast to characters, which can consist of a variable number of bytes. The byte or byte sequence that represents a character can also be represented as a wide-character code. Wide-character codes thus provide a uniform size for manipulating text data. A wide-character code having all bits zero is the null wide-character code (see Section 3.246, on page 72), and terminates wide-character strings (see Section 3.435, on page 103). The wide-character value for each member of the portable character set shall equal its value when used as the lone character in an integer character constant. Wide-character codes for other characters are locale and implementation-defined. State shift bytes shall not have a wide-character code representation. POSIX.1-2008 provides no means of defining a wide-character codeset.

### 6.4 Character Set Description File

Implementations shall provide a character set description file for at least one coded character set supported by the implementation. These files are referred to elsewhere in POSIX.1-2008 as *charmap* files. It is implementation-defined whether or not users or applications can provide additional character set description files.

POSIX.1-2008 does not require that multiple character sets or codesets be supported. Although multiple *charmap* files are supported, it is the responsibility of the implementation to provide the file or files; if only one is provided, only that one is accessible using the *localedef* utility's `-f` option.

Each character set description file, except those that use the ISO/IEC 10646-1:2000 standard position values as the encoding values, shall define characteristics for the coded character set and the encoding for the characters specified in Table 6-1 (on page 125), and may define encoding for additional characters supported by the implementation. Other information about the coded character set may also be in the file. Coded character set character values shall be defined using symbolic character names followed by character encoding values.

Each symbolic name specified in Table 6-1 (on page 125) shall be included in the file and shall be mapped to a unique coding value, except as noted below. The glyphs represented by the C character constants `'{', '}', '_, '-, '/, '\\", '., and '^'` have more than one symbolic name; all symbolic names for each such glyph shall be included, each with identical encoding. If some or all of the control characters identified in Table 6-2 (on page 130) are supported by the implementation, the symbolic names and their corresponding encoding values shall be included in the file. Some of the encodings associated with the symbolic names in Table 6-2 (on page 130) may be the same as characters found in Table 6-1 (on page 125); both names shall be provided for each encoding.

3664

**Table 6-2** Control Character Set

3665	<ACK>	<DC2>	<ENQ>	<FS>	<IS4>	<SOH>
3666	<BEL>	<DC3>	<EOT>	<GS>	<LF>	<STX>
3667	<BS>	<DC4>	<ESC>	<HT>	<NAK>	<SUB>
3668	<CAN>	<DEL>	<ETB>	<IS1>	<RS>	<SYN>
3669	<CR>	<DLE>	<ETX>	<IS2>	<SI>	<US>
3670	<DC1>	<EM>	<FF>	<IS3>	<SO>	<VT>

3671 The following declarations can precede the character definitions. Each shall consist of the  
 3672 symbol shown in the following list, starting in column 1, including the surrounding brackets,  
 3673 followed by one or more <blank> characters, followed by the value to be assigned to the symbol.

- 3674 **<code\_set\_name>** The name of the coded character set for which the character set  
 3675 description file is defined. The characters of the name shall be taken from  
 3676 the set of characters with visible glyphs defined in Table 6-1 (on page  
 3677 125).
- 3678 **<mb\_cur\_max>** The maximum number of bytes in a multi-byte character. This shall  
 3679 default to 1.
- 3680 **<mb\_cur\_min>** An unsigned positive integer value that defines the minimum number of  
 3681 XSI bytes in a character for the encoded character set. On XSI-conformant  
 3682 systems, <mb\_cur\_min> shall always be 1.
- 3683 **<escape\_char>** The character used to indicate that the characters following shall be  
 3684 interpreted in a special way, as defined later in this section. This shall  
 3685 default to <backslash> ('\\'), which is the character used in all the  
 3686 following text and examples, unless otherwise noted.
- 3687 **<comment\_char>** The character that, when placed in column 1 of a charmap line, is used to  
 3688 indicate that the line shall be ignored. The default character shall be the  
 3689 <number-sign> ('#').

3690 The character set mapping definitions shall be all the lines immediately following an identifier  
 3691 line containing the string "CHARMAP" starting in column 1, and preceding a trailer line  
 3692 containing the string "END CHARMAP" starting in column 1. Empty lines and lines containing a  
 3693 <comment\_char> in the first column shall be ignored. Each non-comment line of the character  
 3694 set mapping definition (that is, between the "CHARMAP" and "END CHARMAP" lines of the file)  
 3695 shall be in either of two forms:

```
3696 "%s %s %s\n", <symbolic-name>, <encoding>, <comments>
```

3697 or:

```
3698 "%s...%s %s %s\n", <symbolic-name>, <symbolic-name>,  
3699 <encoding>, <comments>
```

3700 In the first format, the line in the character set mapping definition shall define a single symbolic  
 3701 name and a corresponding encoding. A symbolic name is one or more characters from the set  
 3702 shown with visible glyphs in Table 6-1 (on page 125), enclosed between angle brackets. A  
 3703 character following an escape character is interpreted as itself; for example, the sequence  
 3704 "<\\>>" represents the symbolic name ">" enclosed between angle brackets.

3705 In the second format, the line in the character set mapping definition shall define a range of one  
 3706 or more symbolic names. In this form, the symbolic names shall consist of zero or more non-  
 3707 numeric characters from the set shown with visible glyphs in Table 6-1 (on page 125), followed  
 3708 by an integer formed by one or more decimal digits. Both integers shall contain the same

3709 number of digits. The characters preceding the integer shall be identical in the two symbolic  
 3710 names, and the integer formed by the digits in the second symbolic name shall be equal to or  
 3711 greater than the integer formed by the digits in the first name. This shall be interpreted as a  
 3712 series of symbolic names formed from the common part and each of the integers between the  
 3713 first and the second integer, inclusive. As an example, <j0101>...<j0104> is interpreted as the  
 3714 symbolic names <j0101>, <j0102>, <j0103>, and <j0104>, in that order.

3715 A character set mapping definition line shall exist for all symbolic names specified in Table 6-1  
 3716 (on page 125), and shall define the coded character value that corresponds to the character  
 3717 indicated in the table, or the coded character value that corresponds to the control character  
 3718 symbolic name. If the control characters commonly associated with the symbolic names in Table  
 3719 6-2 (on page 130) are supported by the implementation, the symbolic name and the  
 3720 corresponding encoding value shall be included in the file. Additional unique symbolic names  
 3721 may be included. A coded character value can be represented by more than one symbolic name.

3722 The encoding part is expressed as one (for single-byte character values) or more concatenated  
 3723 decimal, octal, or hexadecimal constants in the following formats:

```
3724 "%cd%u", <escape_char>, <decimal byte value>
3725 "%cx%x", <escape_char>, <hexadecimal byte value>
3726 "%co", <escape_char>, <octal byte value>
```

3727 Decimal constants shall be represented by two or three decimal digits, preceded by the escape  
 3728 character and the lowercase letter 'd'; for example, "\d05", "\d97", or "\d143".  
 3729 Hexadecimal constants shall be represented by two hexadecimal digits, preceded by the escape  
 3730 character and the lowercase letter 'x'; for example, "\x05", "\x61", or "\x8f". Octal  
 3731 constants shall be represented by two or three octal digits, preceded by the escape character; for  
 3732 example, "\05", "\141", or "\217". In a portable charmap file, each constant represents an  
 3733 8-bit byte. When constants are concatenated for multi-byte character values, they shall be of the  
 3734 same type, and interpreted in sequence from first to last with the first byte of the multi-  
 3735 byte character specified by the first byte in the sequence. The manner in which these constants  
 3736 are represented in the character stored in the system is implementation-defined. (This notation  
 3737 was chosen for reasons of portability. There is no requirement that the internal representation in  
 3738 the computer memory be in this same order.) Omitting bytes from a multi-byte character  
 3739 definition produces undefined results.

3740 In lines defining ranges of symbolic names, the encoded value shall be the value for the first  
 3741 symbolic name in the range (the symbolic name preceding the ellipsis). Subsequent symbolic  
 3742 names defined by the range shall have encoding values in increasing order. Bytes shall be  
 3743 treated as unsigned octets, and carry shall be propagated between the bytes as necessary to  
 3744 represent the range. However, because this causes a null byte in the second or subsequent bytes  
 3745 of a character, such a declaration should not be specified. For example, the line:

```
3746 <j0101>...<j0104> \d129\d254
```

3747 is interpreted as:

```
3748 <j0101> \d129\d254
3749 <j0102> \d129\d255
3750 <j0103> \d130\d00
3751 <j0104> \d130\d01
```

3752 The expanded declaration of the symbol <j0103> in the above example is an invalid  
 3753 specification, because it contains a null byte in the second byte of a character.

3754 The comment is optional.

3755 POSIX.1-2008 provides no means of defining a wide-character codeset.

3756 The following declarations can follow the character set mapping definitions (after the "END  
3757 CHARMAP" statement). Each shall consist of the keyword shown in the following list, starting in  
3758 column 1, followed by the value(s) to be associated to the keyword, as defined below.

3759 **WIDTH** A non-negative integer value defining the column width (see [Section 3.103](#), on  
3760 page 50) for the printable characters in the coded character set specified in [Table](#)  
3761 [6-1](#) (on page 125) and [Table 6-2](#) (on page 130). Coded character set character values  
3762 shall be defined using symbolic character names followed by column width  
3763 values. Defining a character with more than one **WIDTH** produces undefined  
3764 results. The **END WIDTH** keyword shall be used to terminate the **WIDTH**  
3765 definitions. Specifying the width of a non-printable character in a **WIDTH**  
3766 declaration produces undefined results.

3767 **WIDTH\_DEFAULT**  
3768 A non-negative integer value defining the default column width for any printable  
3769 character not listed by one of the **WIDTH** keywords. If no **WIDTH\_DEFAULT**  
3770 keyword is included in the charmap, the default character width shall be 1.

### 3771 Example

3772 After the "END CHARMAP" statement, a syntax for a width definition would be:

```
3773 WIDTH
3774 <A> 1
3775 <B> 1
3776 <C>...<Z> 1
3777 ...
3778 <fool>...<foon> 2
3779 ...
3780 END WIDTH
```

3781 In this example, the numerical code point values represented by the symbols **<A>** and **<B>** are  
3782 assigned a width of 1. The code point values **<C>** to **<Z>** inclusive (**<C>**, **<D>**, **<E>**, and so on)  
3783 are also assigned a width of 1. Using **<A>...<Z>** would have required fewer lines, but the  
3784 alternative was shown to demonstrate flexibility. The keyword **WIDTH\_DEFAULT** could have  
3785 been added as appropriate.

## 3786 6.4.1 State-Dependent Character Encodings

3787 This section addresses the use of state-dependent character encodings (that is, those in which the  
3788 encoding of a character is dependent on one or more shift codes that may precede it).

3789 A single-shift encoding (where each character not in the initial shift state is preceded by a shift  
3790 code) can be defined in the charmap format if each shift-code/character sequence is considered  
3791 a multi-byte character, defined using the concatenated-constant format described in [Section 6.4](#)  
3792 (on page 129). If the implementation supports a character encoding of this type, all of the  
3793 standard utilities shall support it. A locking-shift encoding (where the state of the character is  
3794 determined by a shift code that may affect more than the single character following it) could be  
3795 defined with an extension to the charmap format described in [Section 6.4](#) (on page 129).

- 3796 If the implementation supports a character encoding of this type, any of the standard utilities  
3797 that describe character (*versus* byte) or text-file manipulation shall have the following  
3798 characteristics:
- 3799 1. The utility shall process the statefully encoded data as a concatenation of state-  
3800 independent characters. The presence of redundant locking shifts shall not affect the  
3801 comparison of two statefully encoded strings.
  - 3802 2. A utility that divides, truncates, or extracts substrings from statefully encoded data shall  
3803 produce output that contains locking shifts at the beginning or end of the resulting data,  
3804 if appropriate, to retain correct state information.

## 7.1 General

A locale is the definition of the subset of a user's environment that depends on language and cultural conventions. It is made up from one or more categories. Each category is identified by its name and controls specific aspects of the behavior of components of the system. Category names correspond to the following environment variable names:

*LC\_CTYPE* Character classification and case conversion.

*LC\_COLLATE* Collation order.

*LC\_MONETARY* Monetary formatting.

*LC\_NUMERIC* Numeric, non-monetary formatting.

*LC\_TIME* Date and time formats.

*LC\_MESSAGES* Formats of informative and diagnostic messages and interactive responses.

The standard utilities in the Shell and Utilities volume of POSIX.1-2008 shall base their behavior on the current locale, as defined in the ENVIRONMENT VARIABLES section for each utility. The behavior of some of the C-language functions defined in the System Interfaces volume of POSIX.1-2008 shall also be modified based on the current locale, as defined by the last call to *setlocale()*.

Locales other than those supplied by the implementation can be created via the *localedef* utility, provided that the *\_POSIX2\_LOCALEDEF* symbol is defined on the system. Even if *localedef* is not provided, all implementations conforming to the System Interfaces volume of POSIX.1-2008 shall provide one or more locales that behave as described in this chapter. The input to the utility is described in Section 7.3 (on page 136). The value that is used to specify a locale when using environment variables shall be the string specified as the *name* operand to the *localedef* utility when the locale was created. The strings "C" and "POSIX" are reserved as identifiers for the POSIX locale (see Section 7.2, on page 136). When the value of a locale environment variable begins with a <slash> ('/'), it shall be interpreted as the pathname of the locale definition; the type of file (regular, directory, and so on) used to store the locale definition is implementation-defined. If the value does not begin with a <slash>, the mechanism used to locate the locale is implementation-defined.

If different character sets are used by the locale categories, the results achieved by an application utilizing these categories are undefined. Likewise, if different codesets are used for the data being processed by interfaces whose behavior is dependent on the current locale, or the codeset is different from the codeset assumed when the locale was created, the result is also undefined.

Applications can select the desired locale by invoking the *setlocale()* function (or equivalent) with the appropriate value. If the function is invoked with an empty string, such as:

```
setlocale(LC_ALL, "");
```

the value of the corresponding environment variable is used. If the environment variable is

3843 unset or is set to the empty string, the implementation shall set the appropriate environment as  
 3844 defined in [Chapter 8](#) (on page 173).

## 3845 7.2 POSIX Locale

3846 Conforming systems shall provide a POSIX locale, also known as the C locale. The behavior of  
 3847 standard utilities and functions in the POSIX locale shall be as if the locale was defined via the  
 3848 *localedef* utility with input data from the POSIX locale tables in [Section 7.3](#).

3849 The tables in [Section 7.3](#) describe the characteristics and behavior of the POSIX locale for data  
 3850 consisting entirely of characters from the portable character set and the control character set. For  
 3851 other characters, the behavior is unspecified. For C-language programs, the POSIX locale shall  
 3852 be the default locale when the *setlocale()* function is not called.

3853 The POSIX locale can be specified by assigning to the appropriate environment variables the  
 3854 values "C" or "POSIX".

3855 All implementations shall define a locale as the default locale, to be invoked when no  
 3856 environment variables are set, or set to the empty string. This default locale can be the POSIX  
 3857 locale or any other implementation-defined locale. Some implementations may provide facilities  
 3858 for local installation administrators to set the default locale, customizing it for each location.  
 3859 POSIX.1-2008 does not require such a facility.

## 3860 7.3 Locale Definition

3861 The capability to specify additional locales to those provided by an implementation is optional,  
 3862 denoted by the `_POSIX2_LOCALEDEF` symbol. If the option is not supported, only  
 3863 implementation-supplied locales are available. Such locales shall be documented using the  
 3864 format specified in this section.

3865 Locales can be described with the file format presented in this section. The file format is that  
 3866 accepted by the *localedef* utility. For the purposes of this section, the file is referred to as the  
 3867 "locale definition file" but no locales shall be affected by this file unless it is processed by  
 3868 *localedef* or some similar mechanism. Any requirements in this section imposed upon the utility  
 3869 shall apply to *localedef* or to any other similar utility used to install locale information using the  
 3870 locale definition file format described here.

3871 The locale definition file shall contain one or more locale category source definitions, and shall  
 3872 not contain more than one definition for the same locale category. If the file contains source  
 3873 definitions for more than one category, implementation-defined categories, if present, shall  
 3874 appear after the categories defined by [Section 7.1](#) (on page 135). A category source definition  
 3875 contains either the definition of a category or a **copy** directive. For a description of the **copy**  
 3876 directive, see *localedef*. In the event that some of the information for a locale category, as  
 3877 specified in this volume of POSIX.1-2008, is missing from the locale source definition, the  
 3878 behavior of that category, if it is referenced, is unspecified.

3879 A category source definition shall consist of a category header, a category body, and a category  
 3880 trailer. A category header shall consist of the character string naming of the category, beginning  
 3881 with the characters `LC_`. The category trailer shall consist of the string "END", followed by one  
 3882 or more <blank> characters and the string used in the corresponding category header.

3883 The category body shall consist of one or more lines of text. Each line shall contain an identifier,  
 3884 optionally followed by one or more operands. Identifiers shall be either keywords, identifying a

3885 particular locale element, or collating elements. In addition to the keywords defined in this  
 3886 volume of POSIX.1-2008, the source can contain implementation-defined keywords. Each  
 3887 keyword within a locale shall have a unique name (that is, two categories cannot have a  
 3888 commonly-named keyword); no keyword shall start with the characters *LC\_*. Identifiers shall be  
 3889 separated from the operands by one or more <blank> characters.

3890 Operands shall be characters, collating elements, or strings of characters. Strings shall be  
 3891 enclosed in double-quotes. Literal double-quotes within strings shall be preceded by the <escape  
 3892 character>, described below. When a keyword is followed by more than one operand, the  
 3893 operands shall be separated by <semicolon> characters; <blank> characters shall be allowed  
 3894 both before and after a <semicolon>.

3895 The first category header in the file can be preceded by a line modifying the comment character.  
 3896 It shall have the following format, starting in column 1:

```
3897 "comment_char %c\n", <comment character>
```

3898 The comment character shall default to the <number-sign> ('#'). Blank lines and lines  
 3899 containing the <comment character> in the first position shall be ignored.

3900 The first category header in the file can be preceded by a line modifying the escape character to  
 3901 be used in the file. It shall have the following format, starting in column 1:

```
3902 "escape_char %c\n", <escape character>
```

3903 The escape character shall default to <backslash>, which is the character used in all examples  
 3904 shown in this volume of POSIX.1-2008.

3905 A line can be continued by placing an escape character as the last character on the line; this  
 3906 continuation character shall be discarded from the input. Although the implementation need not  
 3907 accept any one portion of a continued line with a length exceeding {LINE\_MAX} bytes, it shall  
 3908 place no limits on the accumulated length of the continued line. Comment lines shall not be  
 3909 continued on a subsequent line using an escaped <newline>.

3910 Individual characters, characters in strings, and collating elements shall be represented using  
 3911 symbolic names, as defined below. In addition, characters can be represented using the  
 3912 characters themselves or as octal, hexadecimal, or decimal constants. When non-symbolic  
 3913 notation is used, the resultant locale definitions are in many cases not portable between systems.  
 3914 The left angle bracket ('<') is a reserved symbol, denoting the start of a symbolic name; when  
 3915 used to represent itself it shall be preceded by the escape character. The following rules apply to  
 3916 character representation:

- 3917 1. A character can be represented via a symbolic name, enclosed within angle brackets '<'>  
 3918 and '>'. The symbolic name, including the angle brackets, shall exactly match a  
 3919 symbolic name defined in the charmap file specified via the *localedef* -f option, and it shall  
 3920 be replaced by a character value determined from the value associated with the symbolic  
 3921 name in the charmap file. The use of a symbolic name not found in the charmap file shall  
 3922 constitute an error, unless the category is *LC\_CTYPE* or *LC\_COLLATE*, in which case it  
 3923 shall constitute a warning condition (see *localedef* for a description of actions resulting  
 3924 from errors and warnings). The specification of a symbolic name in a **collating-element**  
 3925 or **collating-symbol** section that duplicates a symbolic name in the charmap file (if  
 3926 present) shall be an error. Use of the escape character or a right angle bracket within a  
 3927 symbolic name is invalid unless the character is preceded by the escape character.

3928 For example:

```
3929 <c>;<c-cedilla> "<M><a><y>"
```

3930 2. A character in the portable character set can be represented by the character itself, in  
 3931 which case the value of the character is implementation-defined. (Implementations may  
 3932 allow other characters to be represented as themselves, but such locale definitions are not  
 3933 portable.) Within a string, the double-quote character, the escape character, and the right  
 3934 angle bracket character shall be escaped (preceded by the escape character) to be  
 3935 interpreted as the character itself. Outside strings, the characters:

3936 `, ; < > escape_char`

3937 shall be escaped to be interpreted as the character itself.

3938 For example:

3939 `c "May"`

3940 3. A character can be represented as an octal constant. An octal constant shall be specified as  
 3941 the escape character followed by two or three octal digits. Each constant shall represent a  
 3942 byte value. Multi-byte values can be represented by concatenated constants specified in  
 3943 byte order with the last constant specifying the least significant byte of the character.

3944 For example:

3945 `\143;\347;\143\150 "\115\141\171"`

3946 4. A character can be represented as a hexadecimal constant. A hexadecimal constant shall  
 3947 be specified as the escape character followed by an 'x' followed by two hexadecimal  
 3948 digits. Each constant shall represent a byte value. Multi-byte values can be represented by  
 3949 concatenated constants specified in byte order with the last constant specifying the least  
 3950 significant byte of the character.

3951 For example:

3952 `\x63;\xe7;\x63\x68 "\x4d\x61\x79"`

3953 5. A character can be represented as a decimal constant. A decimal constant shall be  
 3954 specified as the escape character followed by a 'd' followed by two or three decimal  
 3955 digits. Each constant represents a byte value. Multi-byte values can be represented by  
 3956 concatenated constants specified in byte order with the last constant specifying the least  
 3957 significant byte of the character.

3958 For example:

3959 `\d99;\d231;\d99\d104 "\d77\d97\d121"`

3960 Implementations may accept single-digit octal, decimal, or hexadecimal constants following the  
 3961 escape character. Only characters existing in the character set for which the locale definition is  
 3962 created shall be specified, whether using symbolic names, the characters themselves, or octal,  
 3963 decimal, or hexadecimal constants. If a charmap file is present, only characters defined in the  
 3964 charmap can be specified using octal, decimal, or hexadecimal constants. Symbolic names not  
 3965 present in the charmap file can be specified and shall be ignored, as specified under item 1  
 3966 above.

3967 **7.3.1 LC\_CTYPE**

3968 The *LC\_CTYPE* category shall define character classification, case conversion, and other  
 3969 character attributes. In addition, a series of characters can be represented by three adjacent  
 3970 <period> characters representing an ellipsis symbol (" . . . "). The ellipsis specification shall be  
 3971 interpreted as meaning that all values between the values preceding and following it represent  
 3972 valid characters. The ellipsis specification shall be valid only within a single encoded character  
 3973 set; that is, within a group of characters of the same size. An ellipsis shall be interpreted as  
 3974 including in the list all characters with an encoded value higher than the encoded value of the  
 3975 character preceding the ellipsis and lower than the encoded value of the character following the  
 3976 ellipsis.

3977 For example:

3978 `\x30; . . . ; \x39;`

3979 includes in the character class all characters with encoded values between the endpoints.

3980 The following keywords shall be recognized. In the descriptions, the term "automatically  
 3981 included" means that it shall not be an error either to include or omit any of the referenced  
 3982 characters; the implementation provides them if missing (even if the entire keyword is missing)  
 3983 and accepts them silently if present. When the implementation automatically includes a missing  
 3984 character, it shall have an encoded value dependent on the charmap file in effect (see the  
 3985 description of the *localedef* -f option); otherwise, it shall have a value derived from an  
 3986 implementation-defined character mapping.

3987 The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included  
 3988 characters. These only need to be specified if the character values (that is, encoding) differ from  
 3989 the implementation default values. It is not possible to define a locale without these  
 3990 automatically included characters unless some implementation extension is used to prevent  
 3991 their inclusion. Such a definition would not be a proper superset of the C or POSIX locale and,  
 3992 thus, it might not be possible for conforming applications to work properly.

3993 **copy** Specify the name of an existing locale which shall be used as the definition of  
 3994 this category. If this keyword is specified, no other keyword shall be specified.

3995 **upper** Define characters to be classified as uppercase letters.

3996 In the POSIX locale, the 26 uppercase letters shall be included:

3997 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

3998 In a locale definition file, no character specified for the keywords **cntrl**, **digit**,  
 3999 **punct**, or **space** shall be specified. The uppercase letters <A> to <Z>, as  
 4000 defined in Section 6.4 (on page 129) (the portable character set), are  
 4001 automatically included in this class.

4002 **lower** Define characters to be classified as lowercase letters.

4003 In the POSIX locale, the 26 lowercase letters shall be included:

4004 a b c d e f g h i j k l m n o p q r s t u v w x y z

4005 In a locale definition file, no character specified for the keywords **cntrl**, **digit**,  
 4006 **punct**, or **space** shall be specified. The lowercase letters <a> to <z> of the  
 4007 portable character set are automatically included in this class.

4008 **alpha** Define characters to be classified as letters.

4009 In the POSIX locale, all characters in the classes **upper** and **lower** shall be  
 4010 included.

4011		In a locale definition file, no character specified for the keywords <b>cntrl</b> , <b>digit</b> ,
4012		<b>punct</b> , or <b>space</b> shall be specified. Characters classified as either <b>upper</b> or
4013		<b>lower</b> are automatically included in this class.
4014	<b>digit</b>	Define the characters to be classified as numeric digits.
4015		In the POSIX locale, only:
4016		0 1 2 3 4 5 6 7 8 9
4017		shall be included.
4018		In a locale definition file, only the digits <zero>, <one>, <two>, <three>,
4019		<four>, <five>, <six>, <seven>, <eight>, and <nine> shall be specified, and in
4020		contiguous ascending sequence by numerical value. The digits <zero> to
4021		<nine> of the portable character set are automatically included in this class.
4022	<b>alnum</b>	Define characters to be classified as letters and numeric digits. Only the
4023		characters specified for the <b>alpha</b> and <b>digit</b> keywords shall be specified.
4024		Characters specified for the keywords <b>alpha</b> and <b>digit</b> are automatically
4025		included in this class.
4026	<b>space</b>	Define characters to be classified as white-space characters.
4027		In the POSIX locale, exactly <space>, <form-feed>, <newline>, <carriage-
4028		return>, <tab>, and <vertical-tab> shall be included.
4029		In a locale definition file, no character specified for the keywords <b>upper</b> ,
4030		<b>lower</b> , <b>alpha</b> , <b>digit</b> , <b>graph</b> , or <b>xdigit</b> shall be specified. The <space>, <form-
4031		feed>, <newline>, <carriage-return>, <tab>, and <vertical-tab> of the portable
4032		character set, and any characters included in the class <b>blank</b> are automatically
4033		included in this class.
4034	<b>cntrl</b>	Define characters to be classified as control characters.
4035		In the POSIX locale, no characters in classes <b>alpha</b> or <b>print</b> shall be included.
4036		In a locale definition file, no character specified for the keywords <b>upper</b> ,
4037		<b>lower</b> , <b>alpha</b> , <b>digit</b> , <b>punct</b> , <b>graph</b> , <b>print</b> , or <b>xdigit</b> shall be specified.
4038	<b>punct</b>	Define characters to be classified as punctuation characters.
4039		In the POSIX locale, neither the <space> nor any characters in classes <b>alpha</b> ,
4040		<b>digit</b> , or <b>cntrl</b> shall be included.
4041		In a locale definition file, no character specified for the keywords <b>upper</b> ,
4042		<b>lower</b> , <b>alpha</b> , <b>digit</b> , <b>cntrl</b> , <b>xdigit</b> , or as the <space> shall be specified.
4043	<b>graph</b>	Define characters to be classified as printable characters, not including the
4044		<space>.
4045		In the POSIX locale, all characters in classes <b>alpha</b> , <b>digit</b> , and <b>punct</b> shall be
4046		included; no characters in class <b>cntrl</b> shall be included.
4047		In a locale definition file, characters specified for the keywords <b>upper</b> , <b>lower</b> ,
4048		<b>alpha</b> , <b>digit</b> , <b>xdigit</b> , and <b>punct</b> are automatically included in this class. No
4049		character specified for the keyword <b>cntrl</b> shall be specified.
4050	<b>print</b>	Define characters to be classified as printable characters, including the
4051		<space>.
4052		In the POSIX locale, all characters in class <b>graph</b> shall be included; no
4053		characters in class <b>cntrl</b> shall be included.

4054		In a locale definition file, characters specified for the keywords <b>upper</b> , <b>lower</b> ,
4055		<b>alpha</b> , <b>digit</b> , <b>xdigit</b> , <b>punct</b> , <b>graph</b> , and the <space> are automatically included
4056		in this class. No character specified for the keyword <b>cntrl</b> shall be specified.
4057	<b>xdigit</b>	Define the characters to be classified as hexadecimal digits.
4058		In the POSIX locale, only:
4059		0 1 2 3 4 5 6 7 8 9 A B C D E F a b c d e f
4060		shall be included.
4061		In a locale definition file, only the characters defined for the class <b>digit</b> shall be
4062		specified, in contiguous ascending sequence by numerical value, followed by
4063		one or more sets of six characters representing the hexadecimal digits 10 to 15
4064		inclusive, with each set in ascending order (for example, <A>, <B>, <C>, <D>,
4065		<E>, <F>, <a>, <b>, <c>, <d>, <e>, <f>). The digits <zero> to <nine>, the
4066		uppercase letters <A> to <F>, and the lowercase letters <a> to <f> of the
4067		portable character set are automatically included in this class.
4068	<b>blank</b>	Define characters to be classified as <blank> characters.
4069		In the POSIX locale, only the <space> and <tab> shall be included.
4070		In a locale definition file, the <space> and <tab> are automatically included in
4071		this class.
4072	<b>charclass</b>	Define one or more locale-specific character class names as strings separated
4073		by <semicolon> characters. Each named character class can then be defined
4074		subsequently in the <i>LC_CTYPE</i> definition. A character class name shall consist
4075		of at least one and at most {CHARCLASS_NAME_MAX} bytes of
4076		alphanumeric characters from the portable filename character set. The first
4077		character of a character class name shall not be a digit. The name shall not
4078		match any of the <i>LC_CTYPE</i> keywords defined in this volume of
4079		POSIX.1-2008. Future versions of this standard will not specify any <i>LC_CTYPE</i>
4080		keywords containing uppercase letters.
4081	<i>charclass-name</i>	Define characters to be classified as belonging to the named locale-specific
4082		character class. In the POSIX locale, locale-specific named character classes
4083		need not exist.
4084		If a class name is defined by a <b>charclass</b> keyword, but no characters are
4085		subsequently assigned to it, this is not an error; it represents a class without
4086		any characters belonging to it.
4087		The <i>charclass-name</i> can be used as the <i>property</i> argument to the <i>wctype()</i>
4088		function, in regular expression and shell pattern-matching bracket
4089		expressions, and by the <i>tr</i> command.
4090	<b>toupper</b>	Define the mapping of lowercase letters to uppercase letters.
4091		In the POSIX locale, at a minimum, the 26 lowercase characters:
4092		a b c d e f g h i j k l m n o p q r s t u v w x y z
4093		shall be mapped to the corresponding 26 uppercase characters:
4094		A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
4095		In a locale definition file, the operand shall consist of character pairs,
4096		separated by <semicolon> characters. The characters in each character pair
4097		shall be separated by a <comma> and the pair enclosed by parentheses. The

4098 first character in each pair is the lowercase letter, the second the corresponding  
 4099 uppercase letter. Only characters specified for the keywords **lower** and **upper**  
 4100 shall be specified. The lowercase letters <a> to <z>, and their corresponding  
 4101 uppercase letters <A> to <Z>, of the portable character set are automatically  
 4102 included in this mapping, but only when the **toupper** keyword is omitted  
 4103 from the locale definition.

4104 **tolower**

Define the mapping of uppercase letters to lowercase letters.

4105 In the POSIX locale, at a minimum, the 26 uppercase characters:

4106 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

4107 shall be mapped to the corresponding 26 lowercase characters:

4108 a b c d e f g h i j k l m n o p q r s t u v w x y z

4109 In a locale definition file, the operand shall consist of character pairs,  
 4110 separated by <semicolon> characters. The characters in each character pair  
 4111 shall be separated by a <comma> and the pair enclosed by parentheses. The  
 4112 first character in each pair is the uppercase letter, the second the  
 4113 corresponding lowercase letter. Only characters specified for the keywords  
 4114 **lower** and **upper** shall be specified. If the **tolower** keyword is omitted from  
 4115 the locale definition, the mapping is the reverse mapping of the one specified  
 4116 for **toupper**.

4117 The following table shows the character class combinations allowed:

4118 **Table 7-1** Valid Character Class Combinations

In Class	Can Also Belong To										
	upper	lower	alpha	digit	space	cntrl	punct	graph	print	xdigit	blank
4121 <b>upper</b>	—	—	A	x	x	x	x	A	A	—	x
4122 <b>lower</b>	—	—	A	x	x	x	x	A	A	—	x
4123 <b>alpha</b>	—	—	—	x	x	x	x	A	A	—	x
4124 <b>digit</b>	x	x	x	—	x	x	x	A	A	A	x
4125 <b>space</b>	x	x	x	x	—	*	*	*	*	x	—
4126 <b>cntrl</b>	x	x	x	x	—	—	x	x	x	x	—
4127 <b>punct</b>	x	x	x	x	—	x	—	A	A	x	—
4128 <b>graph</b>	—	—	—	—	—	x	—	—	A	—	—
4129 <b>print</b>	—	—	—	—	—	x	—	—	—	—	—
4130 <b>xdigit</b>	—	—	—	—	x	x	x	A	A	—	x
4131 <b>blank</b>	x	x	x	x	A	—	*	*	*	x	—

4132 **Notes:**

- 4133 1. Explanation of codes:
- 4134 A Automatically included; see text.
- 4135 — Permitted.
- 4136 x Mutually-exclusive.
- 4137 \* See note 2.
- 4138 2. The <space>, which is part of the **space** and **blank** classes, cannot belong to **punct** or
- 4139 **graph**, but shall automatically belong to the **print** class. Other **space** or **blank** characters
- 4140 can be classified as any of **punct**, **graph**, or **print**.

## Locale

## Locale Definition

## 4141 7.3.1.1 LC\_CTYPE Category in the POSIX Locale

4142 The character classifications for the POSIX locale follow; the code listing depicts the *localedef*  
4143 input, and the table represents the same information, sorted by character.

```

4144 LC_CTYPE
4145 # The following is the POSIX locale LC_CTYPE.
4146 # "alpha" is by default "upper" and "lower"
4147 # "alnum" is by definition "alpha" and "digit"
4148 # "print" is by default "alnum", "punct", and the <space>
4149 # "graph" is by default "alnum" and "punct"
4150 #
4151 upper <A>;<B>;<C>;<D>;<E>;<F>;<G>;<H>;<I>;<J>;<K>;<L>;<M>;\
4152 <N>;<O>;<P>;<Q>;<R>;<S>;<T>;<U>;<V>;<W>;<X>;<Y>;<Z>
4153 #
4154 lower <a>;<b>;<c>;<d>;<e>;<f>;<g>;<h>;<i>;<j>;<k>;<l>;<m>;\
4155 <n>;<o>;<p>;<q>;<r>;<s>;<t>;<u>;<v>;<w>;<x>;<y>;<z>
4156 #
4157 digit <zero>;<one>;<two>;<three>;<four>;<five>;<six>;\
4158 <seven>;<eight>;<nine>
4159 #
4160 space <tab>;<newline>;<vertical-tab>;<form-feed>;\
4161 <carriage-return>;<space>
4162 #
4163 cntrl <alert>;<backspace>;<tab>;<newline>;<vertical-tab>;\
4164 <form-feed>;<carriage-return>;\
4165 <NUL>;<SOH>;<STX>;<ETX>;<EOT>;<ENQ>;<ACK>;<SO>;\

4328 **7.3.2 LC\_COLLATE**

4329 The *LC\_COLLATE* category provides a collation sequence definition for numerous utilities in the  
 4330 Shell and Utilities volume of POSIX.1-2008 (*sort*, *uniq*, and so on), regular expression matching  
 4331 (see Chapter 9, on page 181), and the *strcoll()*, *strxfrm()*, *wscoll()*, and *wcsxfrm()* functions in the  
 4332 System Interfaces volume of POSIX.1-2008.

4333 A collation sequence definition shall define the relative order between collating elements  
 4334 (characters and multi-character collating elements) in the locale. This order is expressed in terms  
 4335 of collation values; that is, by assigning each element one or more collation values (also known  
 4336 as collation weights). This does not imply that implementations shall assign such values, but  
 4337 that ordering of strings using the resultant collation definition in the locale behaves as if such  
 4338 assignment is done and used in the collation process. At least the following capabilities are  
 4339 provided:

- 4340 1. **Multi-character collating elements.** Specification of multi-character collating elements  
 4341 (that is, sequences of two or more characters to be collated as an entity).

- 4342 2. **User-defined ordering of collating elements.** Each collating element shall be assigned a  
 4343 collation value defining its order in the character (or basic) collation sequence. This  
 4344 ordering is used by regular expressions and pattern matching and, unless collation  
 4345 weights are explicitly specified, also as the collation weight to be used in sorting.
- 4346 3. **Multiple weights and equivalence classes.** Collating elements can be assigned one or  
 4347 more (up to the limit {COLL\_WEIGHTS\_MAX}, as defined in `<limits.h>`) collating  
 4348 weights for use in sorting. The first weight is hereafter referred to as the primary weight.
- 4349 4. **One-to-many mapping.** A single character is mapped into a string of collating elements.
- 4350 5. **Equivalence class definition.** Two or more collating elements have the same collation  
 4351 value (primary weight).
- 4352 6. **Ordering by weights.** When two strings are compared to determine their relative order,  
 4353 the two strings are first broken up into a series of collating elements; the elements in each  
 4354 successive pair of elements are then compared according to the relative primary weights  
 4355 for the elements. If equal, and more than one weight has been assigned, then the pairs of  
 4356 collating elements are re-compared according to the relative subsequent weights, until  
 4357 either a pair of collating elements compare unequal or the weights are exhausted.

4358 The following keywords shall be recognized in a collation sequence definition. They are  
 4359 described in detail in the following sections.

4360	<b>copy</b>	Specify the name of an existing locale which shall be used as the
4361		definition of this category. If this keyword is specified, no other keyword
4362		shall be specified.
4363	<b>collating-element</b>	Define a collating-element symbol representing a multi-character
4364		collating element. This keyword is optional.
4365	<b>collating-symbol</b>	Define a collating symbol for use in collation order statements. This
4366		keyword is optional.
4367	<b>order_start</b>	Define collation rules. This statement shall be followed by one or more
4368		collation order statements, assigning character collation values and
4369		collation weights to collating elements.
4370	<b>order_end</b>	Specify the end of the collation-order statements.

#### 4371 7.3.2.1 The collating-element Keyword

4372 In addition to the collating elements in the character set, the **collating-element** keyword can be  
 4373 used to define multi-character collating elements. The syntax is as follows:

```
4374 "collating-element %s from \"%s\"\\n", <collating-symbol>, <string>
```

4375 The `<collating-symbol>` operand shall be a symbolic name, enclosed between angle brackets ('<' and '>'), and shall not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition. The string operand is a string of two or more characters that collates as an entity. A `<collating-element>` defined via this keyword is only recognized with the `LC_COLLATE` category.

4380 For example:

```
4381 collating-element <ch> from "<c><h>"
4382 collating-element <e-acute> from "<acute><e>"
4383 collating-element <ll> from "ll"
```

4384 7.3.2.2 *The collating-symbol Keyword*

4385 This keyword shall be used to define symbols for use in collation sequence statements; that is,  
4386 between the **order\_start** and the **order\_end** keywords. The syntax is as follows:

4387 `"collating-symbol %s\n", <collating-symbol>`

4388 The `<collating-symbol>` shall be a symbolic name, enclosed between angle brackets ('<' and  
4389 '>'), and shall not duplicate any symbolic name in the current charmap file (if any), or any  
4390 other symbolic name defined in this collation definition. A `<collating-symbol>` defined via this  
4391 keyword is only recognized within the `LC_COLLATE` category.

4392 For example:

4393 `collating-symbol <UPPER_CASE>`

4394 `collating-symbol <HIGH>`

4395 The **collating-symbol** keyword defines a symbolic name that can be associated with a relative  
4396 position in the character order sequence. While such a symbolic name does not represent any  
4397 collating element, it can be used as a weight.

4398 7.3.2.3 *The order\_start Keyword*

4399 The **order\_start** keyword shall precede collation order entries and also define the number of  
4400 weights for this collation sequence definition and other collation rules. The syntax is as follows:

4401 `"order_start %s;%s;...;%s\n", <sort-rules>, <sort-rules> ...`

4402 The operands to the **order\_start** keyword are optional. If present, the operands define rules to be  
4403 applied when strings are compared. The number of operands define how many weights each  
4404 element is assigned; if no operands are present, one **forward** operand is assumed. If present, the  
4405 first operand defines rules to be applied when comparing strings using the first (primary)  
4406 weight; the second when comparing strings using the second weight, and so on. Operands shall  
4407 be separated by `<semicolon>` characters (';'). Each operand shall consist of one or more  
4408 collation directives, separated by `<comma>` characters (',' ). If the number of operands exceeds  
4409 the `{COLL_WEIGHTS_MAX}` limit, the utility shall issue a warning message. The following  
4410 directives shall be supported:

4411 **forward** Specifies that comparison operations for the weight level shall proceed from start  
4412 of string towards the end of string.

4413 **backward** Specifies that comparison operations for the weight level shall proceed from end of  
4414 string towards the beginning of string.

4415 **position** Specifies that comparison operations for the weight level shall consider the relative  
4416 position of elements in the strings not subject to **IGNORE**. The string containing  
4417 an element not subject to **IGNORE** after the fewest collating elements subject to  
4418 **IGNORE** from the start of the compare shall collate first. If both strings contain a  
4419 character not subject to **IGNORE** in the same relative position, the collating values  
4420 assigned to the elements shall determine the ordering. In case of equality,  
4421 subsequent characters not subject to **IGNORE** shall be considered in the same  
4422 manner.

4423 The directives **forward** and **backward** are mutually-exclusive.

4424 If no operands are specified, a single **forward** operand shall be assumed.

4425 For example:

4426 `order_start forward;backward`

#### 4427 7.3.2.4 Collation Order

4428 The **order\_start** keyword shall be followed by collating identifier entries. The syntax for the  
4429 collating element entries is as follows:

4430 `"%s %s;%s;...;%s\n", <collating-identifier>, <weight>, <weight>, ...`

4431 Each *collating-identifier* shall consist of either a character (in any of the forms defined in Section  
4432 7.3, on page 136), a *collating-element*, a *collating-symbol*, an ellipsis, or the special symbol  
4433 UNDEFINED. The order in which collating elements are specified determines the character  
4434 order sequence, such that each collating element shall compare less than the elements following  
4435 it.

4436 A *collating-element* shall be used to specify multi-character collating elements, and indicates  
4437 that the character sequence specified via the *collating-element* is to be collated as a unit and in  
4438 the relative order specified by its place.

4439 A *collating-symbol* can be used to define a position in the relative order for use in weights. No  
4440 weights shall be specified with a *collating-symbol*.

4441 The ellipsis symbol specifies that a sequence of characters shall collate according to their  
4442 encoded character values. It shall be interpreted as indicating that all characters with a coded  
4443 character set value higher than the value of the character in the preceding line, and lower than  
4444 the coded character set value for the character in the following line, in the current coded  
4445 character set, shall be placed in the character collation order between the previous and the  
4446 following character in ascending order according to their coded character set values. An initial  
4447 ellipsis shall be interpreted as if the preceding line specified the NUL character, and a trailing  
4448 ellipsis as if the following line specified the highest coded character set value in the current  
4449 coded character set. An ellipsis shall be treated as invalid if the preceding or following lines do  
4450 not specify characters in the current coded character set. The use of the ellipsis symbol ties the  
4451 definition to a specific coded character set and may preclude the definition from being portable  
4452 between implementations.

4453 The symbol UNDEFINED shall be interpreted as including all coded character set values not  
4454 specified explicitly, or via the ellipsis symbol. Such characters shall be inserted in the character  
4455 collation order at the point indicated by the symbol, and in ascending order according to their  
4456 coded character set values. If no UNDEFINED symbol is specified, and the current coded  
4457 character set contains characters not specified in this section, the utility shall issue a warning  
4458 message and place such characters at the end of the character collation order.

4459 The optional operands for each collation-element shall be used to define the primary, secondary,  
4460 or subsequent weights for the collating element. The first operand specifies the relative primary  
4461 weight, the second the relative secondary weight, and so on. Two or more collation-elements can  
4462 be assigned the same weight; they belong to the same "equivalence class" if they have the same  
4463 primary weight. Collation shall behave as if, for each weight level, elements subject to IGNORE  
4464 are removed, unless the **position** collation directive is specified for the corresponding level with  
4465 the **order\_start** keyword. Then each successive pair of elements shall be compared according to  
4466 the relative weights for the elements. If the two strings compare equal, the process shall be  
4467 repeated for the next weight level, up to the limit {COLL\_WEIGHTS\_MAX}.

4468 Weights shall be expressed as characters (in any of the forms specified in Section 7.3, on page  
4469 136), *collating-symbol*s, *collating-element*s, an ellipsis, or the special symbol IGNORE. A  
4470 single character, a *collating-symbol*, or a *collating-element* shall represent the relative position

4471 in the character collating sequence of the character or symbol, rather than the character or  
 4472 characters themselves. Thus, rather than assigning absolute values to weights, a particular  
 4473 weight is expressed using the relative order value assigned to a collating element based on its  
 4474 order in the character collation sequence.

4475 One-to-many mapping is indicated by specifying two or more concatenated characters or  
 4476 symbolic names. For example, if the <eszt> is given the string "<s><s>" as a weight,  
 4477 comparisons are performed as if all occurrences of the <eszt> are replaced by "<s><s>"  
 4478 (assuming that "<s>" has the collating weight "<s>"). If it is necessary to define <eszt> and  
 4479 "<s><s>" as an equivalence class, then a collating element must be defined for the string "ss".

4480 All characters specified via an ellipsis shall by default be assigned unique weights, equal to the  
 4481 relative order of characters. Characters specified via an explicit or implicit **UNDEFINED** special  
 4482 symbol shall by default be assigned the same primary weight (that is, they belong to the same  
 4483 equivalence class). An ellipsis symbol as a weight shall be interpreted to mean that each  
 4484 character in the sequence shall have unique weights, equal to the relative order of their character  
 4485 in the character collation sequence. The use of the ellipsis as a weight shall be treated as an error  
 4486 if the collating element is neither an ellipsis nor the special symbol **UNDEFINED**.

4487 The special keyword **IGNORE** as a weight shall indicate that when strings are compared using  
 4488 the weights at the level where **IGNORE** is specified, the collating element shall be ignored; that  
 4489 is, as if the string did not contain the collating element. In regular expressions and pattern  
 4490 matching, all characters that are subject to **IGNORE** in their primary weight form an  
 4491 equivalence class.

4492 An empty operand shall be interpreted as the collating element itself.

4493 For example, the order statement:

4494 <a> <a>;<a>

4495 is equal to:

4496 <a>

4497 An ellipsis can be used as an operand if the collating element was an ellipsis, and shall be  
 4498 interpreted as the value of each character defined by the ellipsis.

4499 The collation order as defined in this section affects the interpretation of bracket expressions in  
 4500 regular expressions (see Section 9.3.5, on page 184).

4501 For example:

4502	order_start	forward;backward
4503	UNDEFINED	IGNORE; IGNORE
4504	<LOW>	
4505	<space>	<LOW>;<space>
4506		<LOW>;...
4507	<a>	<a>;<a>
4508	<a-acute>	<a>;<a-acute>
4509	<a-grave>	<a>;<a-grave>
4510	<A>	<a>;<A>
4511	<A-acute>	<a>;<A-acute>
4512	<A-grave>	<a>;<A-grave>
4513	<ch>	<ch>;<ch>
4514	<Ch>	<ch>;<Ch>
4515	<s>	<s>;<s>
4516	<eszt>	"<s><s>"; "<eszt><eszt>"
4517	order_end	

4518 This example is interpreted as follows:

- 4519 1. The **UNDEFINED** means that all characters not specified in this definition (explicitly or  
4520 via the ellipsis) shall be ignored for collation purposes.
- 4521 2. All characters between <space> and ' a ' shall have the same primary equivalence class  
4522 and individual secondary weights based on their ordinal encoded values.
- 4523 3. All characters based on the uppercase or lowercase character ' a ' belong to the same  
4524 primary equivalence class.
- 4525 4. The multi-character collating element <ch> is represented by the collating symbol <ch>  
4526 and belongs to the same primary equivalence class as the multi-character collating  
4527 element <Ch>.

4528 7.3.2.5 *The order\_end Keyword*

4529 The collating order entries shall be terminated with an **order\_end** keyword.

4530 7.3.2.6 *LC\_COLLATE Category in the POSIX Locale*

4531 The collation sequence definition of the POSIX locale follows; the code listing depicts the  
4532 *localedef* input.

```
4533 LC_COLLATE
4534 # This is the POSIX locale definition for the LC_COLLATE category.
4535 # The order is the same as in the ASCII codeset.

4668 **7.3.3 LC\_MONETARY**

4669 The *LC\_MONETARY* category shall define the rules and symbols that are used to format  
4670 monetary numeric information.

4671 This information is available through the *localeconv()* function and is used by the *strfmon()*  
4672 function.

4673 Some of the information is also available in an alternative form via the *nl\_langinfo()* function  
4674 (see CRNCYSTR in [<langinfo.h>](#)).

4675 The following items are defined in this category of the locale. The item names are the keywords  
4676 recognized by the *localedef* utility when defining a locale. They are also similar to the member  
4677 names of the *lconv* structure defined in [<locale.h>](#); see [<locale.h>](#) for the exact symbols in the  
4678 header. The *localeconv()* function returns {CHAR\_MAX} for unspecified integer items and the  
4679 empty string (" ") for unspecified or size zero string items.

4680 In a locale definition file, the operands are strings, formatted as indicated by the grammar in  
4681 [Section 7.4](#) (on page 165). For some keywords, the strings can contain only integers. Keywords  
4682 that are not provided, string values set to the empty string (" "), or integer keywords set to -1,  
4683 are used to indicate that the value is not available in the locale. The following keywords shall be  
4684 recognized:

4685 **copy** Specify the name of an existing locale which shall be used as the  
4686 definition of this category. If this keyword is specified, no other keyword  
4687 shall be specified.

4688 **Note:** This is a *localedef* utility keyword, unavailable through *localeconv()*.

4689 **int\_curr\_symbol** The international currency symbol. The operand shall be a four-character  
4690 string, with the first three characters containing the alphabetic  
4691 international currency symbol. The international currency symbol should  
4692 be chosen in accordance with those specified in the ISO 4217 standard.  
4693 The fourth character shall be the character used to separate the  
4694 international currency symbol from the monetary quantity.

4695 **currency\_symbol** The string that shall be used as the local currency symbol.

4696 **mon\_decimal\_point** The operand is a string containing the symbol that shall be used as the  
4697 decimal delimiter (radix character) in monetary formatted quantities.

4698 **mon\_thousands\_sep** The operand is a string containing the symbol that shall be used as a  
4699 separator for groups of digits to the left of the decimal delimiter in  
4700 formatted monetary quantities.

4701 **mon\_grouping** Define the size of each group of digits in formatted monetary quantities.  
4702 The operand is a sequence of integers separated by [<semicolon>](#)  
4703 characters. Each integer specifies the number of digits in each group, with  
4704 the initial integer defining the size of the group immediately preceding  
4705 the decimal delimiter, and the following integers defining the preceding  
4706 groups. If the last integer is not -1, then the size of the previous group (if  
4707 any) shall be repeatedly used for the remainder of the digits. If the last  
4708 integer is -1, then no further grouping shall be performed.

4709 **positive\_sign** A string that shall be used to indicate a non-negative-valued formatted  
4710 monetary quantity.

4711 **negative\_sign** A string that shall be used to indicate a negative-valued formatted  
4712 monetary quantity.

## Locale

## Locale Definition

4713	<b>int_frac_digits</b>	An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using <b>int_curr_symbol</b> .
4714		
4715		
4716	<b>frac_digits</b>	An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using <b>currency_symbol</b> .
4717		
4718		
4719	<b>p_cs_precedes</b>	An integer set to 1 if the <b>currency_symbol</b> precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.
4720		
4721		
4722	<b>p_sep_by_space</b>	Set to a value indicating the separation of the <b>currency_symbol</b> , the sign string, and the value for a non-negative formatted monetary quantity.
4723		
4724		The values of <b>p_sep_by_space</b> , <b>n_sep_by_space</b> , <b>int_p_sep_by_space</b> , and <b>int_n_sep_by_space</b> are interpreted according to the following:
4725		
4726		0 No <space> separates the currency symbol and value.
4727		1 If the currency symbol and sign string are adjacent, a <space> separates them from the value; otherwise, a <space> separates the currency symbol from the value.
4728		
4729		
4730		2 If the currency symbol and sign string are adjacent, a <space> separates them; otherwise, a <space> separates the sign string from the value.
4731		
4732		
4733	<b>n_cs_precedes</b>	An integer set to 1 if the <b>currency_symbol</b> precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
4734		
4735		
4736	<b>n_sep_by_space</b>	Set to a value indicating the separation of the <b>currency_symbol</b> , the sign string, and the value for a negative formatted monetary quantity.
4737		
4738	<b>p_sign_posn</b>	An integer set to a value indicating the positioning of the <b>positive_sign</b> for a monetary quantity with a non-negative value. The following integer values shall be recognized for <b>int_n_sign_posn</b> , <b>int_p_sign_posn</b> , <b>n_sign_posn</b> , and <b>p_sign_posn</b> :
4739		
4740		
4741		
4742		0 Parentheses enclose the quantity and the <b>currency_symbol</b> .
4743		1 The sign string precedes the quantity and the <b>currency_symbol</b> .
4744		2 The sign string succeeds the quantity and the <b>currency_symbol</b> .
4745		3 The sign string precedes the <b>currency_symbol</b> .
4746		4 The sign string succeeds the <b>currency_symbol</b> .
4747	<b>n_sign_posn</b>	An integer set to a value indicating the positioning of the <b>negative_sign</b> for a negative formatted monetary quantity.
4748		
4749	<b>int_p_cs_precedes</b>	An integer set to 1 if the <b>int_curr_symbol</b> precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.
4750		
4751		
4752	<b>int_n_cs_precedes</b>	An integer set to 1 if the <b>int_curr_symbol</b> precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
4753		
4754		

4755	<b>int_p_sep_by_space</b>	Set to a value indicating the separation of the <b>int_curr_symbol</b> , the sign string, and the value for a non-negative internationally formatted monetary quantity.
4756		
4757		
4758	<b>int_n_sep_by_space</b>	Set to a value indicating the separation of the <b>int_curr_symbol</b> , the sign string, and the value for a negative internationally formatted monetary quantity.
4759		
4760		
4761	<b>int_p_sign_posn</b>	An integer set to a value indicating the positioning of the <b>positive_sign</b> for a positive monetary quantity formatted with the international format.
4762		
4763	<b>int_n_sign_posn</b>	An integer set to a value indicating the positioning of the <b>negative_sign</b> for a negative monetary quantity formatted with the international format.
4764		

### 4765 7.3.3.1 LC\_MONETARY Category in the POSIX Locale

4766 The monetary formatting definitions for the POSIX locale follow; the code listing depicting the  
 4767 *localedef* input, the table representing the same information with the addition of *localeconv()* and  
 4768 *nl\_langinfo()* formats. All values are unspecified in the POSIX locale.

```

4769 LC_MONETARY
4770 # This is the POSIX locale definition for
4771 # the LC_MONETARY category.

4817	<b>int_n_sign_posn</b>	—	N/A	{CHAR_MAX}	-1

4819 The entry N/A indicates that the value is not available in the POSIX locale.

### 4820 7.3.4 LC\_NUMERIC

4821 The *LC\_NUMERIC* category shall define the rules and symbols that are used to format non-  
4822 monetary numeric information. This information is available through the *localeconv()* function.

4823 Some of the information is also available in an alternative form via the *nl\_langinfo()* function.

4824 The following items are defined in this category of the locale. The item names are the keywords  
4825 recognized by the *localedef* utility when defining a locale. They are also similar to the member  
4826 names of the *lconv* structure defined in **<locale.h>**; see **<locale.h>** for the exact symbols in the  
4827 header. The *localeconv()* function returns {CHAR\_MAX} for unspecified integer items and the  
4828 empty string (" ") for unspecified or size zero string items.

4829 In a locale definition file, the operands are strings, formatted as indicated by the grammar in  
4830 Section 7.4 (on page 165). For some keywords, the strings can only contain integers. Keywords  
4831 that are not provided, string values set to the empty string (" "), or integer keywords set to -1,  
4832 shall be used to indicate that the value is not available in the locale. The following keywords  
4833 shall be recognized:

4834 **copy** Specify the name of an existing locale which shall be used as the definition of  
4835 this category. If this keyword is specified, no other keyword shall be specified.

4836 **Note:** This is a *localedef* utility keyword, unavailable through *localeconv()*.

4837 **decimal\_point** The operand is a string containing the symbol that shall be used as the  
4838 decimal delimiter (radix character) in numeric, non-monetary formatted  
4839 quantities. This keyword cannot be omitted and cannot be set to the empty  
4840 string. In contexts where standards limit the **decimal\_point** to a single byte,  
4841 the result of specifying a multi-byte operand shall be unspecified.

4842        **thousands\_sep**    The operand is a string containing the symbol that shall be used as a separator  
 4843        for groups of digits to the left of the decimal delimiter in numeric, non-  
 4844        monetary formatted monetary quantities. In contexts where standards limit  
 4845        the **thousands\_sep** to a single byte, the result of specifying a multi-byte  
 4846        operand shall be unspecified.

4847        **grouping**            Define the size of each group of digits in formatted non-monetary quantities.  
 4848        The operand is a sequence of integers separated by <semicolon> characters.  
 4849        Each integer specifies the number of digits in each group, with the initial  
 4850        integer defining the size of the group immediately preceding the decimal  
 4851        delimiter, and the following integers defining the preceding groups. If the last  
 4852        integer is not -1, then the size of the previous group (if any) shall be  
 4853        repeatedly used for the remainder of the digits. If the last integer is -1, then no  
 4854        further grouping shall be performed.

4855    7.3.4.1    *LC\_NUMERIC Category in the POSIX Locale*

4856        The non-monetary numeric formatting definitions for the POSIX locale follow; the code listing  
 4857        depicting the *localedef* input, the table representing the same information with the addition of  
 4858        *localeconv()* values, and *nl\_langinfo()* constants.

```

4859    LC_NUMERIC
4860    # This is the POSIX locale definition for
4861    # the LC_NUMERIC category.
4862    #
4863    decimal_point        "<period>"
4864    thousands_sep        ""
4865    grouping             -1
4866    #
4867    END LC_NUMERIC
    
```

Item	langinfo Constant	POSIX Locale Value	localeconv() Value	localedef Value
<b>decimal_point</b>	RADIXCHAR	."	."	.
<b>thousands_sep</b>	THOUSEP	N/A	""	""
<b>grouping</b>	—	N/A	""	-1

4873        The entry N/A indicates that the value is not available in the POSIX locale.

4874    7.3.5    **LC\_TIME**

4875        The *LC\_TIME* category shall define the interpretation of the conversion specifications supported  
 4876        by the *date* utility and shall affect the behavior of the *strftime()*, *wcsftime()*, *strptime()*, and  
 4877        *nl\_langinfo()* functions. Since the interfaces for C-language access and locale definition differ  
 4878        significantly, they are described separately.

4879    7.3.5.1    *LC\_TIME Locale Definition*

4880        In a locale definition, the following mandatory keywords shall be recognized:

4881        **copy**                Specify the name of an existing locale which shall be used as the definition of  
 4882        this category. If this keyword is specified, no other keyword shall be specified.

## Locale

## Locale Definition

4883	<b>abday</b>	Define the abbreviated weekday names, corresponding to the %a conversion specification (conversion specification in the <i>strftime()</i> , <i>wcsftime()</i> , and <i>strptime()</i> functions). The operand shall consist of seven <semicolon>-separated strings, each surrounded by double-quotes. The first string shall be the abbreviated name of the day corresponding to Sunday, the second the abbreviated name of the day corresponding to Monday, and so on.
4884		
4885		
4886		
4887		
4888		
4889	<b>day</b>	Define the full weekday names, corresponding to the %A conversion specification. The operand shall consist of seven <semicolon>-separated strings, each surrounded by double-quotes. The first string is the full name of the day corresponding to Sunday, the second the full name of the day corresponding to Monday, and so on.
4890		
4891		
4892		
4893		
4894	<b>abmon</b>	Define the abbreviated month names, corresponding to the %b conversion specification. The operand shall consist of twelve <semicolon>-separated strings, each surrounded by double-quotes. The first string shall be the abbreviated name of the first month of the year (January), the second the abbreviated name of the second month, and so on.
4895		
4896		
4897		
4898		
4899	<b>mon</b>	Define the full month names, corresponding to the %B conversion specification. The operand shall consist of twelve <semicolon>-separated strings, each surrounded by double-quotes. The first string shall be the full name of the first month of the year (January), the second the full name of the second month, and so on.
4900		
4901		
4902		
4903		
4904	<b>d_t_fmt</b>	Define the appropriate date and time representation, corresponding to the %c conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in the table in Table 5-1 (on page 121) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').
4905		
4906		
4907		
4908		
4909	<b>d_fmt</b>	Define the appropriate date representation, corresponding to the %x conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in Table 5-1 (on page 121).
4910		
4911		
4912		
4913	<b>t_fmt</b>	Define the appropriate time representation, corresponding to the %X conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in Table 5-1 (on page 121).
4914		
4915		
4916		
4917	<b>am_pm</b>	Define the appropriate representation of the <i>ante-meridiem</i> and <i>post-meridiem</i> strings, corresponding to the %p conversion specification. The operand shall consist of two strings, separated by a <semicolon>, each surrounded by double-quotes. The first string shall represent the <i>ante-meridiem</i> designation, the last string the <i>post-meridiem</i> designation.
4918		
4919		
4920		
4921		
4922	<b>t_fmt_ampm</b>	Define the appropriate time representation in the 12-hour clock format with <b>am_pm</b> , corresponding to the %r conversion specification. The operand shall consist of a string and can contain any combination of characters and conversion specifications. If the string is empty, the 12-hour format is not supported in the locale.
4923		
4924		
4925		
4926		
4927	<b>era</b>	Define how years are counted and displayed for each era in a locale. The operand shall consist of <semicolon>-separated strings. Each string shall be an era description segment with the format:
4928		
4929		
4930		<i>direction:offset:start_date:end_date:era_name:era_format</i>

4931		according to the definitions below. There can be as many era description
4932		segments as are necessary to describe the different eras.
4933	<b>Note:</b>	The start of an era might not be the earliest point in the era—it may be the
4934		latest. For example, the Christian era BC starts on the day before January 1,
4935		AD 1, and increases with earlier time.
4936	<i>direction</i>	Either a '+' or a '-' character. The '+' character shall indicate
4937		that years closer to the <i>start_date</i> have lower numbers than those
4938		closer to the <i>end_date</i> . The '-' character shall indicate that years
4939		closer to the <i>start_date</i> have higher numbers than those closer to
4940		the <i>end_date</i> .
4941	<i>offset</i>	The number of the year closest to the <i>start_date</i> in the era,
4942		corresponding to the %EY conversion specification.
4943	<i>start_date</i>	A date in the form <i>yyyy/mm/dd</i> , where <i>yyyy</i> , <i>mm</i> , and <i>dd</i> are the
4944		year, month, and day numbers respectively of the start of the era.
4945		Years prior to AD 1 shall be represented as negative numbers.
4946	<i>end_date</i>	The ending date of the era, in the same format as the <i>start_date</i> ,
4947		or one of the two special values "-*" or "+*". The value "-*"
4948		shall indicate that the ending date is the beginning of time. The
4949		value "+*" shall indicate that the ending date is the end of time.
4950	<i>era_name</i>	A string representing the name of the era, corresponding to the
4951		%EC conversion specification.
4952	<i>era_format</i>	A string for formatting the year in the era, corresponding to the
4953		%EY conversion specification.
4954	<b>era_d_fmt</b>	Define the format of the date in alternative era notation, corresponding to the
4955		%Ex conversion specification.
4956	<b>era_t_fmt</b>	Define the locale's appropriate alternative time format, corresponding to the
4957		%EX conversion specification.
4958	<b>era_d_t_fmt</b>	Define the locale's appropriate alternative date and time format,
4959		corresponding to the %Ec conversion specification.
4960	<b>alt_digits</b>	Define alternative symbols for digits, corresponding to the %O modified
4961		conversion specification. The operand shall consist of <semicolon>-separated
4962		strings, each surrounded by double-quotes. The first string shall be the
4963		alternative symbol corresponding with zero, the second string the symbol
4964		corresponding with one, and so on. Up to 100 alternative symbol strings can
4965		be specified. The %O modifier shall indicate that the string corresponding to
4966		the value specified via the conversion specification shall be used instead of the
4967		value.
4968	7.3.5.2	<i>LC_TIME</i> C-Language Access
4969		The following constants used to identify items of <i>langinfo</i> data can be used as arguments to the
4970		<i>nl_langinfo()</i> function to access information in the <i>LC_TIME</i> category. These constants are
4971		defined in the < <i>langinfo.h</i> > header.
4972	ABDAY_x	The abbreviated weekday names (for example, Sun), where <i>x</i> is a number
4973		from 1 to 7.

## Locale

## Locale Definition

4974	DAY_x	The full weekday names (for example, Sunday), where <i>x</i> is a number from 1 to 7.
4975		
4976	ABMON_x	The abbreviated month names (for example, Jan), where <i>x</i> is a number from 1 to 12.
4977		
4978	MON_x	The full month names (for example, January), where <i>x</i> is a number from 1 to 12.
4979		
4980	D_T_FMT	The appropriate date and time representation.
4981	D_FMT	The appropriate date representation.
4982	T_FMT	The appropriate time representation.
4983	AM_STR	The appropriate ante-meridiem affix.
4984	PM_STR	The appropriate post-meridiem affix.
4985	T_FMT_AMPM	The appropriate time representation in the 12-hour clock format with AM_STR and PM_STR.
4986		
4987	ERA	The era description segments, which describe how years are counted and displayed for each era in a locale. Each era description segment shall have the format:
4988		
4989		
4990		<i>direction:offset:start_date:end_date:era_name:era_format</i>
4991		according to the definitions below. There can be as many era description segments as are necessary to describe the different eras. Era description segments are separated by <semicolon> characters.
4992		
4993		
4994		<i>direction</i> Either a '+' or a '-' character. The '+' character shall indicate that years closer to the <i>start_date</i> have lower numbers than those closer to the <i>end_date</i> . The '-' character shall indicate that years closer to the <i>start_date</i> have higher numbers than those closer to the <i>end_date</i> .
4995		
4996		
4997		
4998		
4999		<i>offset</i> The number of the year closest to the <i>start_date</i> in the era.
5000		<i>start_date</i> A date in the form <i>yyyy/mm/dd</i> , where <i>yyyy</i> , <i>mm</i> , and <i>dd</i> are the year, month, and day numbers respectively of the start of the era. Years prior to AD 1 shall be represented as negative numbers.
5001		
5002		
5003		<i>end_date</i> The ending date of the era, in the same format as the <i>start_date</i> , or one of the two special values "-*" or "+*". The value "-*" shall indicate that the ending date is the beginning of time. The value "+*" shall indicate that the ending date is the end of time.
5004		
5005		
5006		
5007		<i>era_name</i> The era, corresponding to the %EC conversion specification.
5008		<i>era_format</i> The format of the year in the era, corresponding to the %EY conversion specification.
5009		
5010	ERA_D_FMT	The era date format.
5011	ERA_T_FMT	The locale's appropriate alternative time format, corresponding to the %EX conversion specification.
5012		
5013	ERA_D_T_FMT	The locale's appropriate alternative date and time format, corresponding to the %EC conversion specification.
5014		

5015 ALT\_DIGITS The alternative symbols for digits, corresponding to the %0 conversion  
 5016 specification modifier. The value consists of <semicolon>-separated symbols.  
 5017 The first is the alternative symbol corresponding to zero, the second is the  
 5018 symbol corresponding to one, and so on. Up to 100 alternative symbols may  
 5019 be specified.

5020 7.3.5.3 LC\_TIME Category in the POSIX Locale

5021 The LC\_TIME category definition of the POSIX locale follows; the code listing depicts the  
 5022 *localedef* input; the table represents the same information with the addition of *localedef* keywords,  
 5023 conversion specifiers used by the *date* utility and the *strftime()*, *wcsftime()*, and *strptime()*  
 5024 functions, and *nl\_langinfo()* constants.

```

5025 LC_TIME
5026 # This is the POSIX locale definition for
5027 # the LC_TIME category.
5028 #
5029 # Abbreviated weekday names (%a)
5030 abday      "<S><u><n>"; "<M><o><n>"; "<T><u><e>"; "<W><e><d>"; \
5031           "<T><h><u>"; "<F><r><i>"; "<S><a><t>"
5032 #
5033 # Full weekday names (%A)
5034 day        "<S><u><n><d><a><y>"; "<M><o><n><d><a><y>"; \
5035           "<T><u><e><s><d><a><y>"; "<W><e><d><n><e><s><d><a><y>"; \

5127 The entry N/A indicates the value is not available in the POSIX locale.

5130 **7.3.6 LC\_MESSAGES**

5131 The *LC\_MESSAGES* category shall define the format and values used by various utilities for  
 5132 affirmative and negative responses. This information is available through the *nl\_langinfo()*  
 5133 function.

5134 The message catalog used by the standard utilities and selected by the *catopen()* function shall be  
 5135 determined by the setting of *NLSPATH*; see Chapter 8 (on page 173). The *LC\_MESSAGES*  
 5136 category can be specified as part of an *NLSPATH* substitution field.

5137 The following keywords shall be recognized as part of the locale definition file.

5138 **copy** Specify the name of an existing locale which shall be used as the definition of this  
 5139 category. If this keyword is specified, no other keyword shall be specified.

5140 **Note:** This is a *localedef* keyword, unavailable through *nl\_langinfo()*.

5141 **yesexpr** The operand consists of an extended regular expression (see Section 9.4, on page  
 5142 188) that describes the acceptable affirmative response to a question expecting an  
 5143 affirmative or negative response.

5144 **noexpr** The operand consists of an extended regular expression that describes the  
 5145 acceptable negative response to a question expecting an affirmative or negative  
 5146 response.

5147 **7.3.6.1 LC\_MESSAGES Category in the POSIX Locale**

5148 The format and values for affirmative and negative responses of the POSIX locale follow; the  
 5149 code listing depicting the *localedef* input, the table representing the same information with the  
 5150 addition of *nl\_langinfo()* constants.

```

5151 LC_MESSAGES
5152 # This is the POSIX locale definition for
5153 # the LC_MESSAGES category.
5154 #
5155 yesexpr "<circumflex><left-square-bracket><y><Y><right-square-bracket>"
5156 #
5157 noexpr "<circumflex><left-square-bracket><n><N><right-square-bracket>"
5158 #
5159 END LC_MESSAGES
    
```

	localedef Keyword	langinfo Constant	POSIX Locale Value
5160			
5161	<b>yesexpr</b>	YESEXPR	"^[yY]"
5162	<b>noexpr</b>	NOEXPR	"^[nN]"

## 5163 7.4 Locale Definition Grammar

5164 The grammar and lexical conventions in this section shall together describe the syntax for the  
 5165 locale definition source. The general conventions for this style of grammar are described in XCU  
 5166 [Section 1.3](#) (on page 2287). The grammar shall take precedence over the text in this chapter.

### 5167 7.4.1 Locale Lexical Conventions

5168 The lexical conventions for the locale definition grammar are described in this section.

5169 The following tokens shall be processed (in addition to those string constants shown in the  
 5170 grammar):

5171	<b>LOC_NAME</b>	A string of characters representing the name of a locale.
5172	<b>CHAR</b>	Any single character.
5173	<b>NUMBER</b>	A decimal number, represented by one or more decimal digits.
5174	<b>COLLSYMBOL</b>	A symbolic name, enclosed between angle brackets. The string cannot duplicate any charmap symbol defined in the current charmap (if any), or a <b>COLLELEMENT</b> symbol.
5177	<b>COLLELEMENT</b>	A symbolic name, enclosed between angle brackets, which cannot duplicate either any charmap symbol or a <b>COLLSYMBOL</b> symbol.
5179	<b>CHARCLASS</b>	A string of alphanumeric characters from the portable character set, the first of which is not a digit, consisting of at least one and at most {CHARCLASS_NAME_MAX} bytes, and optionally surrounded by double-quotes.
5183	<b>CHARSYMBOL</b>	A symbolic name, enclosed between angle brackets, from the current charmap (if any).
5185	<b>OCTAL_CHAR</b>	One or more octal representations of the encoding of each byte in a single character. The octal representation consists of an escape character (normally a <backslash>) followed by two or more octal digits.
5189	<b>HEX_CHAR</b>	One or more hexadecimal representations of the encoding of each byte in a single character. The hexadecimal representation consists of an escape character followed by the constant <i>x</i> and two or more hexadecimal digits.
5193	<b>DECIMAL_CHAR</b>	One or more decimal representations of the encoding of each byte in a single character. The decimal representation consists of an escape character followed by a character 'd' and two or more decimal digits.

5197	<b>ELLIPSIS</b>	The string "...".
5198	<b>EXTENDED_REG_EXP</b>	An extended regular expression as defined in the grammar in <a href="#">Section 9.5</a> (on page 191).
5199		
5200	<b>EOL</b>	The line termination character <newline>.

## 5201 7.4.2 Locale Grammar

Chapter 8

5447

## Environment Variables

### 8.1 Environment Variable Definition

Environment variables defined in this chapter affect the operation of multiple utilities, functions, and applications. There are other environment variables that are of interest only to specific utilities. Environment variables that apply to a single utility only are defined as part of the utility description. See the ENVIRONMENT VARIABLES section of the utility descriptions in the Shell and Utilities volume of POSIX.1-2008 for information on environment variable usage.

The value of an environment variable is a string of characters. For a C-language program, an array of strings called the environment shall be made available when a process begins. The array is pointed to by the external variable *environ*, which is defined as:

```
extern char **environ;
```

These strings have the form *name=value*; *names* shall not contain the character '='. For values to be portable across systems conforming to POSIX.1-2008, the value shall be composed of characters from the portable character set (except NUL and as indicated below). There is no meaning associated with the order of strings in the environment. If more than one string in an environment of a process has the same *name*, the consequences are undefined.

Environment variable names used by the utilities in the Shell and Utilities volume of POSIX.1-2008 consist solely of uppercase letters, digits, and the <underscore> ('\_') from the characters defined in Table 6-1 (on page 125) and do not begin with a digit. Other characters may be permitted by an implementation; applications shall tolerate the presence of such names. Uppercase and lowercase letters shall retain their unique identities and shall not be folded together. The name space of environment variable names containing lowercase letters is reserved for applications. Applications can define any environment variables with names from this name space without modifying the behavior of the standard utilities.

**Note:** Other applications may have difficulty dealing with environment variable names that start with a digit. For this reason, use of such names is not recommended anywhere.

The *values* that the environment variables may be assigned are not restricted except that they are considered to end with a null byte and the total space used to store the environment and the arguments to the process is limited to {ARG\_MAX} bytes.

Other *name=value* pairs may be placed in the environment by, for example, calling any of the *setenv()*, *unsetenv()*, or *putenv()* functions, manipulating the *environ* variable, or by using *envp* arguments when creating a process; see *exec* in the System Interfaces volume of POSIX.1-2008.

It is unwise to conflict with certain variables that are frequently exported by widely used command interpreters and applications:

*Environment Variable Definition*

*Environment Variables*

5481	ARFLAGS	IFS	MAILPATH	PS1
5482	CC	LANG	MAILRC	PS2
5483	CDPATH	LC_ALL	MAKEFLAGS	PS3
5484	CFLAGS	LC_COLLATE	MAKESHELL	PS4
5485	CHARSET	LC_CTYPE	MANPATH	PWD
5486	COLUMNS	LC_MESSAGES	MBOX	RANDOM
5487	DATMSK	LC_MONETARY	MORE	SECONDS
5488	DEAD	LC_NUMERIC	MSGVERB	SHELL

5500	HOME	MAILER	PROJECTDIR	

5501 If the variables in the following two sections are present in the environment during the  
 5502 execution of an application or utility, they shall be given the meaning described below. Some are  
 5503 placed into the environment by the implementation at the time the user logs in; all can be added  
 5504 or changed by the user or any ancestor of the current process. The implementation adds or  
 5505 changes environment variables named in POSIX.1-2008 only as specified in POSIX.1-2008. If  
 5506 they are defined in the application's environment, the utilities in the Shell and Utilities volume  
 5507 of POSIX.1-2008 and the functions in the System Interfaces volume of POSIX.1-2008 assume they  
 5508 have the specified meaning. Conforming applications shall not set these environment variables  
 5509 to have meanings other than as described. See *getenv()* (on page 1008) and XCU Section 2.12 (on  
 5510 page 2331) for methods of accessing these variables.

5511 **8.2 Internationalization Variables**

5512 This section describes environment variables that are relevant to the operation of  
 5513 internationalized interfaces described in POSIX.1-2008.

5514 Users may use the following environment variables to announce specific localization  
 5515 requirements to applications. Applications can retrieve this information using the *setlocale()*  
 5516 function to initialize the correct behavior of the internationalized interfaces. The descriptions of  
 5517 the internationalization environment variables describe the resulting behavior only when the  
 5518 application locale is initialized in this way. The use of the internationalization variables by  
 5519 utilities described in the Shell and Utilities volume of POSIX.1-2008 is described in the  
 5520 ENVIRONMENT VARIABLES section for those utilities in addition to the global effects  
 5521 described in this section.

5522 **LANG** This variable shall determine the locale category for native language, local  
 5523 customs, and coded character set in the absence of the *LC\_ALL* and other *LC\_\**  
 5524 (*LC\_COLLATE*, *LC\_CTYPE*, *LC\_MESSAGES*, *LC\_MONETARY*, *LC\_NUMERIC*,  
 5525 *LC\_TIME*) environment variables. This can be used by applications to  
 5526 determine the language to use for error messages and instructions, collating  
 5527 sequences, date formats, and so on.

## Environment Variables

## Internationalization Variables

5528	<i>LC_ALL</i>	This variable shall determine the values for all locale categories. The value of the <i>LC_ALL</i> environment variable has precedence over any of the other environment variables starting with <i>LC_</i> ( <i>LC_COLLATE</i> , <i>LC_CTYPE</i> , <i>LC_MESSAGES</i> , <i>LC_MONETARY</i> , <i>LC_NUMERIC</i> , <i>LC_TIME</i> ) and the <i>LANG</i> environment variable.
5529		
5530		
5531		
5532		
5533	<i>LC_COLLATE</i>	This variable shall determine the locale category for character collation. It determines collation information for regular expressions and sorting, including equivalence classes and multi-character collating elements, in various utilities and the <i>strcoll()</i> and <i>strxfrm()</i> functions. Additional semantics of this variable, if any, are implementation-defined.
5534		
5535		
5536		
5537		
5538	<i>LC_CTYPE</i>	This variable shall determine the locale category for character handling functions, such as <i>tolower()</i> , <i>toupper()</i> , and <i>isalpha()</i> . This environment variable determines the interpretation of sequences of bytes of text data as characters (for example, single as opposed to multi-byte characters), the classification of characters (for example, alpha, digit, graph), and the behavior of character classes. Additional semantics of this variable, if any, are implementation-defined.
5539		
5540		
5541		
5542		
5543		
5544		
5545	<i>LC_MESSAGES</i>	This variable shall determine the locale category for processing affirmative and negative responses and the language and cultural conventions in which messages should be written. It also affects the behavior of the <i>catopen()</i> function in determining the message catalog. Additional semantics of this variable, if any, are implementation-defined. The language and cultural conventions of diagnostic and informative messages whose format is unspecified by POSIX.1-2008 should be affected by the setting of <i>LC_MESSAGES</i> .
5546		
5547		
5548		
5549		
5550		
5551		
5552		
5553	<i>LC_MONETARY</i>	This variable shall determine the locale category for monetary-related numeric formatting information. Additional semantics of this variable, if any, are implementation-defined.
5554		
5555		
5556	<i>LC_NUMERIC</i>	This variable shall determine the locale category for numeric formatting (for example, thousands separator and radix character) information in various utilities as well as the formatted I/O operations in <i>printf()</i> and <i>scanf()</i> and the string conversion functions in <i>strtod()</i> . Additional semantics of this variable, if any, are implementation-defined.
5557		
5558		
5559		
5560		
5561	<i>LC_TIME</i>	This variable shall determine the locale category for date and time formatting information. It affects the behavior of the time functions in <i>strftime()</i> . Additional semantics of this variable, if any, are implementation-defined.
5562		
5563		
5564	<i>NLSPATH</i>	This variable shall contain a sequence of templates that the <i>catopen()</i> function uses when attempting to locate message catalogs. Each template consists of an optional prefix, one or more conversion specifications, a filename, and an optional suffix.
5565		
5566		
5567		
5568		For example:
5569		<code>NLSPATH="/system/nlslib/%N.cat"</code>
5570		defines that <i>catopen()</i> should look for all message catalogs in the directory <b>/system/nlslib</b> , where the catalog name should be constructed from the <i>name</i> parameter passed to <i>catopen()</i> ( <i>%N</i> ), with the suffix <b>.cat</b> .
5571		
5572		
5573		Conversion specifications consist of a ' <i>%</i> ' symbol, followed by a single-letter keyword. The following keywords are currently defined:
5574		

5575	%N	The value of the <i>name</i> parameter passed to <i>catopen</i> ().
5576	%L	The value of the <i>LC_MESSAGES</i> category.
5577	%l	The <i>language</i> element from the <i>LC_MESSAGES</i> category.
5578	%t	The <i>territory</i> element from the <i>LC_MESSAGES</i> category.
5579	%c	The <i>codeset</i> element from the <i>LC_MESSAGES</i> category.
5580	%%	A single ' % ' character.
5581		An empty string is substituted if the specified value is not currently defined.
5582		The separators <underscore> ('_') and <period> ('.') are not included in
5583		the %t and %c conversion specifications.
5584		Templates defined in <i>NLSPATH</i> are separated by <colon> characters (':'). A
5585		leading or two adjacent <colon> characters ("::") is equivalent to specifying
5586		%N. For example:
5587		<code>NLSPATH=":%N.cat:/nlslib/%L/%N.cat"</code>
5588		indicates to <i>catopen</i> () that it should look for the requested message catalog in
5589		<i>name</i> , <i>name.cat</i> , and <i>/nlslib/category/name.cat</i> , where <i>category</i> is the value of the
5590		<i>LC_MESSAGES</i> category of the current locale.
5591		Users should not set the <i>NLSPATH</i> variable unless they have a specific reason
5592		to override the default system path. Setting <i>NLSPATH</i> to override the default
5593		system path produces undefined results in the standard utilities and in
5594		applications with appropriate privileges.
5595		The environment variables <i>LANG</i> , <i>LC_ALL</i> , <i>LC_COLLATE</i> , <i>LC_CTYPE</i> , <i>LC_MESSAGES</i> ,
5596		<i>LC_MONETARY</i> , <i>LC_NUMERIC</i> , <i>LC_TIME</i> , and <i>NLSPATH</i> provide for the support of
5597		internationalized applications. The standard utilities shall make use of these environment
5598		variables as described in this section and the individual ENVIRONMENT VARIABLES sections
5599		for the utilities. If these variables specify locale categories that are not based upon the same
5600		underlying codeset, the results are unspecified.
5601		The values of locale categories shall be determined by a precedence order; the first condition met
5602		below determines the value:
5603	1.	If the <i>LC_ALL</i> environment variable is defined and is not null, the value of <i>LC_ALL</i> shall
5604		be used.
5605	2.	If the <i>LC_*</i> environment variable ( <i>LC_COLLATE</i> , <i>LC_CTYPE</i> , <i>LC_MESSAGES</i> ,
5606		<i>LC_MONETARY</i> , <i>LC_NUMERIC</i> , <i>LC_TIME</i> ) is defined and is not null, the value of the
5607		environment variable shall be used to initialize the category that corresponds to the
5608		environment variable.
5609	3.	If the <i>LANG</i> environment variable is defined and is not null, the value of the <i>LANG</i>
5610		environment variable shall be used.
5611	4.	If the <i>LANG</i> environment variable is not set or is set to the empty string, the
5612		implementation-defined default locale shall be used.
5613		If the locale value is "C" or "POSIX", the POSIX locale shall be used and the standard utilities
5614		behave in accordance with the rules in <a href="#">Section 7.2</a> (on page 136) for the associated category.
5615		If the locale value begins with a <slash>, it shall be interpreted as the pathname of a file that was
5616		created in the output format used by the <i>localedef</i> utility; see OUTPUT FILES under <i>localedef</i> .
5617		Referencing such a pathname shall result in that locale being used for the indicated category.

5618 XSI If the locale value has the form:

5619 `language[_territory] [.codeset]`

5620 it refers to an implementation-provided locale, where settings of language, territory, and codeset  
5621 are implementation-defined.

5622 `LC_COLLATE`, `LC_CTYPE`, `LC_MESSAGES`, `LC_MONETARY`, `LC_NUMERIC`, and `LC_TIME` are  
5623 defined to accept an additional field `@modifier`, which allows the user to select a specific instance  
5624 of localization data within a single category (for example, for selecting the dictionary as opposed  
5625 to the character ordering of data). The syntax for these environment variables is thus defined as:

5626 `[language[_territory] [.codeset] [@modifier]]`

5627 For example, if a user wanted to interact with the system in French, but required to sort German  
5628 text files, `LANG` and `LC_COLLATE` could be defined as:

5629 `LANG=Fr_FR`  
5630 `LC_COLLATE=De_DE`

5631 This could be extended to select dictionary collation (say) by use of the `@modifier` field; for  
5632 example:

5633 `LC_COLLATE=De_DE@dict`

5634 An implementation may support other formats.

5635 If the locale value is not recognized by the implementation, the behavior is unspecified.

5636 At runtime, these values are bound to the locale of a process by calling the `setlocale()` function.

5637 Additional criteria for determining a valid locale name are implementation-defined.

### 5638 8.3 Other Environment Variables

5639 `COLUMNS` This variable shall represent a decimal integer >0 used to indicate the user's  
5640 preferred width in column positions for the terminal screen or window; see  
5641 Section 3.103 (on page 50). If this variable is unset or null, the implementation  
5642 determines the number of columns, appropriate for the terminal or window,  
5643 in an unspecified manner. When `COLUMNS` is set, any terminal-width  
5644 information implied by `TERM` is overridden. Users and conforming  
5645 applications should not set `COLUMNS` unless they wish to override the  
5646 system selection and produce output unrelated to the terminal characteristics.

5647 Users should not need to set this variable in the environment unless there is a  
5648 specific reason to override the implementation's default behavior, such as to  
5649 display data in an area arbitrarily smaller than the terminal or window.

5650 XSI `DATMSK` Indicates the pathname of the template file used by `getdate()`.

5651 `HOME` The system shall initialize this variable at the time of login to be a pathname of  
5652 the user's home directory. See `<pwd.h>`.

5653 `LINES` This variable shall represent a decimal integer >0 used to indicate the user's  
5654 preferred number of lines on a page or the vertical screen or window size in  
5655 lines. A line in this case is a vertical measure large enough to hold the tallest  
5656 character in the character set being displayed. If this variable is unset or null,  
5657 the implementation determines the number of lines, appropriate for the

5658		terminal or window (size, terminal baud rate, and so on), in an unspecified manner. When <i>LINES</i> is set, any terminal-height information implied by <i>TERM</i> is overridden. Users and conforming applications should not set <i>LINES</i> unless they wish to override the system selection and produce output unrelated to the terminal characteristics.
5659		
5660		
5661		
5662		
5663		Users should not need to set this variable in the environment unless there is a specific reason to override the implementation's default behavior, such as to display data in an area arbitrarily smaller than the terminal or window.
5664		
5665		
5666	<i>LOGNAME</i>	The system shall initialize this variable at the time of login to be the user's login name. See <a href="#">&lt;pwd.h&gt;</a> . For a value of <i>LOGNAME</i> to be portable across implementations of POSIX.1-2008, the value should be composed of characters from the portable filename character set.
5667		
5668		
5669		
5670	XSI <i>MSGVERB</i>	Describes which message components shall be used in writing messages by <i>fmtmsg()</i> .
5671		
5672	<i>PATH</i>	This variable shall represent the sequence of path prefixes that certain functions and utilities apply in searching for an executable file known only by a filename. The prefixes shall be separated by a <colon> (' : '). When a non-zero-length prefix is applied to this filename, a <slash> shall be inserted between the prefix and the filename. A zero-length prefix is a legacy feature that indicates the current working directory. It appears as two adjacent <colon> characters (" : : "), as an initial <colon> preceding the rest of the list, or as a trailing <colon> following the rest of the list. A strictly conforming application shall use an actual pathname (such as <i>.</i> ) to represent the current working directory in <i>PATH</i> . The list shall be searched from beginning to end, applying the filename to each prefix, until an executable file with the specified name and appropriate execution permissions is found. If the pathname being sought contains a <slash>, the search through the path prefixes shall not be performed. If the pathname begins with a <slash>, the specified path is resolved (see <a href="#">Section 4.12</a> , on page 111). If <i>PATH</i> is unset or is set to null, the path search is implementation-defined.
5673		
5674		
5675		
5676		
5677		
5678		
5679		
5680		
5681		
5682		
5683		
5684		
5685		
5686		
5687		
5688	<i>PWD</i>	This variable shall represent an absolute pathname of the current working directory. It shall not contain any components that are dot or dot-dot. The value is set by the <i>cd</i> utility, and by the <i>sh</i> utility during initialization.
5689		
5690		
5691	<i>SHELL</i>	This variable shall represent a pathname of the user's preferred command language interpreter. If this interpreter does not conform to the Shell Command Language in XCU <a href="#">Chapter 2</a> (on page 2297), utilities may behave differently from those described in POSIX.1-2008.
5692		
5693		
5694		
5695	<i>TMPDIR</i>	This variable shall represent a pathname of a directory made available for programs that need a place to create temporary files.
5696		
5697	<i>TERM</i>	This variable shall represent the terminal type for which output is to be prepared. This information is used by utilities and application programs wishing to exploit special capabilities specific to a terminal. The format and allowable values of this environment variable are unspecified.
5698		
5699		
5700		
5701	<i>TZ</i>	This variable shall represent timezone information. The contents of the environment variable named <i>TZ</i> shall be used by the <i>ctime()</i> , <i>ctime_r()</i> , <i>localtime()</i> , <i>localtime_r()</i> , <i>strftime()</i> , <i>mktime()</i> , functions, and by various utilities, to override the default timezone. The value of <i>TZ</i> has one of the two forms (spaces inserted for clarity):
5702		
5703		
5704		
5705		

## Environment Variables

## Other Environment Variables

5706 : *characters*

5707 or:

5708 *std offset dst offset, rule*

5709 If *TZ* is of the first format (that is, if the first character is a <colon>), the  
5710 characters following the <colon> are handled in an implementation-defined  
5711 manner.

5712 The expanded format (for all *TZ*s whose value does not have a <colon> as the  
5713 first character) is as follows:

5714 *stdoffset* [*dst* [*offset*] [, *start* [/time], *end* [/time]]]

5715 Where:

5716 *std* and *dst* Indicate no less than three, nor more than {TZNAME\_MAX},  
5717 bytes that are the designation for the standard (*std*) or the  
5718 alternative (*dst*—such as Daylight Savings Time) timezone. Only  
5719 *std* is required; if *dst* is missing, then the alternative time does  
5720 not apply in this locale.

5721 Each of these fields may occur in either of two formats quoted or  
5722 unquoted:

5723 — In the quoted form, the first character shall be the <less-  
5724 than-sign> ('<') character and the last character shall be  
5725 the <greater-than-sign> ('>') character. All characters  
5726 between these quoting characters shall be alphanumeric  
5727 characters from the portable character set in the current  
5728 locale, the <plus-sign> ('+') character, or the minus-sign  
5729 ('-') character. The *std* and *dst* fields in this case shall not  
5730 include the quoting characters.

5731 — In the unquoted form, all characters in these fields shall be  
5732 alphabetic characters from the portable character set in the  
5733 current locale.

5734 The interpretation of these fields is unspecified if either field is  
5735 less than three bytes (except for the case when *dst* is missing),  
5736 more than {TZNAME\_MAX} bytes, or if they contain characters  
5737 other than those specified.

5738 *offset* Indicates the value added to the local time to arrive at  
5739 Coordinated Universal Time. The *offset* has the form:

5740 *hh* [: *mm* [: *ss* ]]

5741 The minutes (*mm*) and seconds (*ss*) are optional. The hour (*hh*)  
5742 shall be required and may be a single digit. The *offset* following  
5743 *std* shall be required. If no *offset* follows *dst*, the alternative time  
5744 is assumed to be one hour ahead of standard time. One or more  
5745 digits may be used; the value is always interpreted as a decimal  
5746 number. The hour shall be between zero and 24, and the minutes  
5747 (and seconds)—if present—between zero and 59. The result of  
5748 using values outside of this range is unspecified. If preceded by  
5749 a '-', the timezone shall be east of the Prime Meridian;  
5750 otherwise, it shall be west (which may be indicated by an  
5751 optional preceding '+').

5752 5753 5754 5755 5756 5757 5758 5759 5760 5761 5762 5763 5764 5765 5766 5767 5768 5769 5770 5771 5772 5773 5774	<i>rule</i>	<p>Indicates when to change to and back from the alternative time. The <i>rule</i> has the form:</p> <p><i>date</i>[/<i>time</i>], <i>date</i>[/<i>time</i>]</p> <p>where the first <i>date</i> describes when the change from standard to alternative time occurs and the second <i>date</i> describes when the change back happens. Each <i>time</i> field describes when, in current local time, the change to the other time is made.</p> <p>The format of <i>date</i> is one of the following:</p> <p><i>Jn</i> The Julian day <i>n</i> (<math>1 \leq n \leq 365</math>). Leap days shall not be counted. That is, in all years—including leap years—February 28 is day 59 and March 1 is day 60. It is impossible to refer explicitly to the occasional February 29.</p> <p><i>n</i> The zero-based Julian day (<math>0 \leq n \leq 365</math>). Leap days shall be counted, and it is possible to refer to February 29.</p> <p><i>Mm.n.d</i> The <i>d</i>'th day (<math>0 \leq d \leq 6</math>) of week <i>n</i> of month <i>m</i> of the year (<math>1 \leq n \leq 5</math>, <math>1 \leq m \leq 12</math>, where week 5 means “the last <i>d</i> day in month <i>m</i>” which may occur in either the fourth or the fifth week). Week 1 is the first week in which the <i>d</i>'th day occurs. Day zero is Sunday.</p> <p>The <i>time</i> has the same format as <i>offset</i> except that no leading sign ('-' or '+') is allowed. The default, if <i>time</i> is not given, shall be 02:00:00.</p>
--	-------------	---

5775

Chapter 9

5776

## Regular Expressions

5777  
5778

Regular Expressions (REs) provide a mechanism to select specific strings from a set of character strings.

5779  
5780  
5781  
5782  
5783

Regular expressions are a context-independent syntax that can represent a wide variety of character sets and character set orderings, where these character sets are interpreted according to the current locale. While many regular expressions can be interpreted differently depending on the current locale, many features, such as character class expressions, provide for contextual invariance across locales.

5784  
5785  
5786  
5787  
5788  
5789

The Basic Regular Expression (BRE) notation and construction rules in Section 9.3 (on page 183) shall apply to most utilities supporting regular expressions. Some utilities, instead, support the Extended Regular Expressions (ERE) described in Section 9.4 (on page 188); any exceptions for both cases are noted in the descriptions of the specific utilities using regular expressions. Both BREs and EREs are supported by the Regular Expression Matching interface in the System Interfaces volume of POSIX.1-2008 under *regcomp()*, *regex()*, and related functions.

### 9.1 Regular Expression Definitions

5790

For the purposes of this section, the following definitions shall apply:

5791

#### entire regular expression

5792  
5793  
5794

The concatenated set of one or more BREs or EREs that make up the pattern specified for string selection.

5795

#### matched

5796  
5797  
5798

A sequence of zero or more characters shall be said to be matched by a BRE or ERE when the characters in the sequence correspond to a sequence of characters defined by the pattern.

5799  
5800  
5801  
5802  
5803  
5804

Matching shall be based on the bit pattern used for encoding the character, not on the graphic representation of the character. This means that if a character set contains two or more encodings for a graphic symbol, or if the strings searched contain text encoded in more than one codeset, no attempt is made to search for any other representation of the encoded symbol. If that is required, the user can specify equivalence classes containing all variations of the desired graphic symbol.

5805  
5806  
5807  
5808  
5809  
5810  
5811

The search for a matching sequence starts at the beginning of a string and stops when the first sequence matching the expression is found, where "first" is defined to mean "begins earliest in the string". If the pattern permits a variable number of matching characters and thus there is more than one such sequence starting at that point, the longest such sequence is matched. For example, the BRE "bb\*" matches the second to fourth characters of the string "abbbc", and the ERE "(wee|week)(knights|night)" matches all ten characters of the string "weeknights".

5812  
5813  
5814

Consistent with the whole match being the longest of the leftmost matches, each subpattern, from left to right, shall match the longest possible string. For this purpose, a null string shall be considered to be longer than no match at all. For example, matching the BRE

5815            "\ (. \* \) . \*" against "abcdef", the subexpression " (\1) " is "abcdef", and matching  
5816            the BRE "\ (a \* \) \*" against "bc", the subexpression " (\1) " is the null string.

5817            When a multi-character collating element in a bracket expression (see Section 9.3.5, on page  
5818            184) is involved, the longest sequence shall be measured in characters consumed from the  
5819            string to be matched; that is, the collating element counts not as one element, but as the  
5820            number of characters it matches.

#### 5821            **BRE (ERE) matching a single character**

5822            A BRE or ERE that shall match either a single character or a single collating element.

5823            Only a BRE or ERE of this type that includes a bracket expression (see Section 9.3.5, on page  
5824            184) can match a collating element.

#### 5825            **BRE (ERE) matching multiple characters**

5826            A BRE or ERE that shall match a concatenation of single characters or collating elements.

5827            Such a BRE or ERE is made up from a BRE (ERE) matching a single character and BRE  
5828            (ERE) special characters.

#### 5829            **invalid**

5830            This section uses the term “invalid” for certain constructs or conditions. Invalid REs shall  
5831            cause the utility or function using the RE to generate an error condition. When invalid is not  
5832            used, violations of the specified syntax or semantics for REs produce undefined results: this  
5833            may entail an error, enabling an extended syntax for that RE, or using the construct in error  
5834            as literal characters to be matched. For example, the BRE construct "\ {1, 2, 3 \}" does not  
5835            comply with the grammar. A conforming application cannot rely on it producing an error  
5836            nor matching the literal characters "\ {1, 2, 3 \}".

## 5837            **9.2 Regular Expression General Requirements**

5838            The requirements in this section shall apply to both basic and extended regular expressions.

5839            The use of regular expressions is generally associated with text processing. REs (BREs and EREs)  
5840            operate on text strings; that is, zero or more characters followed by an end-of-string delimiter  
5841            (typically NUL). Some utilities employing regular expressions limit the processing to lines; that  
5842            is, zero or more characters followed by a <newline>. In the regular expression processing  
5843            described in POSIX.1-2008, the <newline> is regarded as an ordinary character and both a  
5844            <period> and a non-matching list can match one. The Shell and Utilities volume of  
5845            POSIX.1-2008 specifies within the individual descriptions of those standard utilities employing  
5846            regular expressions whether they permit matching of <newline> characters; if not stated  
5847            otherwise, the use of literal <newline> characters or any escape sequence equivalent produces  
5848            undefined results. Those utilities (like *grep*) that do not allow <newline> characters to match are  
5849            responsible for eliminating any <newline> from strings before matching against the RE. The  
5850            *regcomp()* function in the System Interfaces volume of POSIX.1-2008, however, can provide  
5851            support for such processing without violating the rules of this section.

5852            The interfaces specified in POSIX.1-2008 do not permit the inclusion of a NUL character in an RE  
5853            or in the string to be matched. If during the operation of a standard utility a NUL is included in  
5854            the text designated to be matched, that NUL may designate the end of the text string for the  
5855            purposes of matching.

5856            When a standard utility or function that uses regular expressions specifies that pattern matching  
5857            shall be performed without regard to the case (uppercase or lowercase) of either data or  
5858            patterns, then when each character in the string is matched against the pattern, not only the

- 5892 — As the first character of a subexpression (after an initial '<sup>^</sup>', if any); see [Section](#)  
5893 [9.3.6](#) (on page 186)
- 5894 <sup>^</sup> The <circumflex> shall be special when used as:  
5895 — An anchor (see [Section 9.3.8](#), on page 187)  
5896 — The first character of a bracket expression (see [Section 9.3.5](#))
- 5897 \$ The <dollar-sign> shall be special when used as an anchor.

### 5898 9.3.4 Periods in BREs

5899 A <period> ('.'), when used outside a bracket expression, is a BRE that shall match any  
5900 character in the supported character set except NUL.

### 5901 9.3.5 RE Bracket Expression

5902 A bracket expression (an expression enclosed in square brackets, "[ ]") is an RE that shall  
5903 match a single collating element contained in the non-empty set of collating elements  
5904 represented by the bracket expression.

5905 The following rules and definitions apply to bracket expressions:

- 5906 1. A bracket expression is either a matching list expression or a non-matching list  
5907 expression. It consists of one or more expressions: collating elements, collating symbols,  
5908 equivalence classes, character classes, or range expressions. The <right-square-bracket>  
5909 (' ] ') shall lose its special meaning and represent itself in a bracket expression if it occurs  
5910 first in the list (after an initial <circumflex> (' ^ '), if any). Otherwise, it shall terminate  
5911 the bracket expression, unless it appears in a collating symbol (such as "[ . ] . ") or is the  
5912 ending <right-square-bracket> for a collating symbol, equivalence class, or character  
5913 class. The special characters '<period>', '<asterisk>', '<left-square-bracket>', and '<backslash>'  
5914 (<period>, <asterisk>, <left-square-bracket>, and <backslash>, respectively) shall lose their special meaning within a bracket  
5915 expression.  
  
5916 The character sequences "[ . ", "[ = ", and "[ : " (<left-square-bracket> followed by a  
5917 <period>, <equals-sign>, or <colon>) shall be special inside a bracket expression and are  
5918 used to delimit collating symbols, equivalence class expressions, and character class  
5919 expressions. These symbols shall be followed by a valid expression and the matching  
5920 terminating sequence ". ] ", "= ] ", or ": ] ", as described in the following items.
- 5921 2. A matching list expression specifies a list that shall match any single-character collating  
5922 element in any of the expressions represented in the list. The first character in the list shall  
5923 not be the <circumflex>; for example, "[abc]" is an RE that matches any of the  
5924 characters 'a', 'b', or 'c'. It is unspecified whether a matching list expression matches  
5925 a multi-character collating element that is matched by one of the expressions.
- 5926 3. A non-matching list expression begins with a <circumflex> (' ^ '), and specifies a list that  
5927 shall match any single-character collating element except for the expressions represented  
5928 in the list after the leading <circumflex>. For example, "[^abc]" is an RE that matches  
5929 any character except the characters 'a', 'b', or 'c'. It is unspecified whether a non-  
5930 matching list expression matches a multi-character collating element that is not matched  
5931 by any of the expressions. The <circumflex> shall have this special meaning only when it  
5932 occurs first in the list, immediately following the <left-square-bracket>.

5933 4. A collating symbol is a collating element enclosed within bracket-period ("[" and  
 5934 ". ]") delimiters. Collating elements are defined as described in Section 7.3.2.4 (on page  
 5935 149). Conforming applications shall represent multi-character collating elements as  
 5936 collating symbols when it is necessary to distinguish them from a list of the individual  
 5937 characters that make up the multi-character collating element. For example, if the string  
 5938 "ch" is a collating element defined using the line:

```
5939 collating-element <ch-digraph> from "<c><h>"
```

5940 in the locale definition, the expression "[.ch.]" shall be treated as an RE containing  
 5941 the collating symbol 'ch', while "[ch]" shall be treated as an RE matching 'c' or 'h'.  
 5942 Collating symbols are recognized only inside bracket expressions. If the string is not a  
 5943 collating element in the current locale, the expression is invalid.

5944 5. An equivalence class expression shall represent the set of collating elements belonging to  
 5945 an equivalence class, as described in Section 7.3.2.4 (on page 149). Only primary  
 5946 equivalence classes shall be recognized. The class shall be expressed by enclosing any one  
 5947 of the collating elements in the equivalence class within bracket-equal ("[" and "=")  
 5948 delimiters. For example, if 'a', 'à', and '^' belong to the same equivalence class, then  
 5949 "[[=a=b]", "[[=à=b]", and "[[=^=b]" are each equivalent to "[aà^b]". If the  
 5950 collating element does not belong to an equivalence class, the equivalence class  
 5951 expression shall be treated as a collating symbol.

5952 6. A character class expression shall represent the union of two sets:

5953 a. The set of single-character collating elements whose characters belong to the  
 5954 character class, as defined in the LC\_CTYPE category in the current locale.

5955 b. An unspecified set of multi-character collating elements.

5956 All character classes specified in the current locale shall be recognized. A character class  
 5957 expression is expressed as a character class name enclosed within bracket-<colon> ("[:"  
 5958 and ":]") delimiters.

5959 The following character class expressions shall be supported in all locales:

```
5960 [:alnum:]    [:cntrl:]    [:lower:]    [:space:]
5961 [:alpha:]    [:digit:]    [:print:]    [:upper:]
5962 [:blank:]    [:graph:]    [:punct:]    [:xdigit:]
```

5963 In addition, character class expressions of the form:

```
5964 [:name:]
```

5965 are recognized in those locales where the *name* keyword has been given a **charclass**  
 5966 definition in the LC\_CTYPE category.

5967 7. In the POSIX locale, a range expression represents the set of collating elements that fall  
 5968 between two elements in the collation sequence, inclusive. In other locales, a range  
 5969 expression has unspecified behavior: strictly conforming applications shall not rely on  
 5970 whether the range expression is valid, or on the set of collating elements matched. A  
 5971 range expression shall be expressed as the starting point and the ending point separated  
 5972 by a <hyphen> ('-').

5973 In the following, all examples assume the POSIX locale.

5974 The starting range point and the ending range point shall be a collating element or  
 5975 collating symbol. An equivalence class expression used as a starting or ending point of a  
 5976 range expression produces unspecified results. An equivalence class can be used portably  
 5977 within a bracket expression, but only outside the range. If the represented set of collating

- 5978 elements is empty, it is unspecified whether the expression matches nothing, or is treated  
5979 as invalid.
- 5980 The interpretation of range expressions where the ending range point is also the starting  
5981 range point of a subsequent range expression (for example, "[a-m-o]") is undefined.
- 5982 The <hyphen> character shall be treated as itself if it occurs first (after an initial '^', if  
5983 any) or last in the list, or as an ending range point in a range expression. As examples, the  
5984 expressions "[ac]" and "[ac-]" are equivalent and match any of the characters 'a',  
5985 'c', or '-'; "[^ac]" and "[^ac-]" are equivalent and match any characters except  
5986 'a', 'c', or '-'; the expression "[%--]" matches any of the characters between '%'  
5987 and '-' inclusive; the expression "[--@]" matches any of the characters between '-'  
5988 and '@' inclusive; and the expression "[a--@]" is either invalid or equivalent to '@',  
5989 because the letter 'a' follows the symbol '-' in the POSIX locale. To use a <hyphen> as  
5990 the starting range point, it shall either come first in the bracket expression or be specified  
5991 as a collating symbol; for example, "[][.-.]0]", which matches either a <right-  
5992 square-bracket> or any character or collating element that collates between <hyphen>  
5993 and 0, inclusive.
- 5994 If a bracket expression specifies both '-' and ']', the ']' shall be placed first (after the  
5995 '^', if any) and the '-' last within the bracket expression.

### 5996 9.3.6 BREs Matching Multiple Characters

- 5997 The following rules can be used to construct BREs matching multiple characters from BREs  
5998 matching a single character:
- 5999 1. The concatenation of BREs shall match the concatenation of the strings matched by each  
6000 component of the BRE.
  - 6001 2. A subexpression can be defined within a BRE by enclosing it between the character pairs  
6002 "\" and "\". Such a subexpression shall match whatever it would have matched  
6003 without the "\" and "\"), except that anchoring within subexpressions is optional  
6004 behavior; see Section 9.3.8 (on page 187). Subexpressions can be arbitrarily nested.
  - 6005 3. The back-reference expression '\n' shall match the same (possibly empty) string of  
6006 characters as was matched by a subexpression enclosed between "\" and "\"  
6007 preceding the '\n'. The character 'n' shall be a digit from 1 through 9, specifying the  
6008 *n*th subexpression (the one that begins with the *n*th "\" from the beginning of the  
6009 pattern and ends with the corresponding paired "\"). The expression is invalid if less  
6010 than *n* subexpressions precede the '\n'. The string matched by a contained  
6011 subexpression shall be within the string matched by the containing subexpression. If the  
6012 containing subexpression does not match, or if there is no match for the contained  
6013 subexpression within the string matched by the containing subexpression, then back-  
6014 reference expressions corresponding to the contained subexpression shall not match.  
6015 When a subexpression matches more than one string, a back-reference expression  
6016 corresponding to the subexpression shall refer to the last matched string. For example, the  
6017 expression "^ (.\*) \\1\$" matches lines consisting of two adjacent appearances of the  
6018 same string, and the expression "(a) \* \\1" fails to match 'a', the expression  
6019 "(a(b) \*) \* \\2" fails to match 'abab', and the expression "^ (ab\*) \* \\1\$" matches  
6020 'ababbabb', but fails to match 'ababbab'.
  - 6021 4. When a BRE matching a single character, a subexpression, or a back-reference is followed  
6022 by the special character <asterisk> ('\*'), together with that <asterisk> it shall match  
6023 what zero or more consecutive occurrences of the BRE would match. For example,  
6024 "[ab] \*" and "[ab] [ab]" are equivalent when matching the string "ab".

6025 5. When a BRE matching a single character, a subexpression, or a back-reference is followed  
 6026 by an interval expression of the format " $\{m\}$ ", " $\{m,\}$ ", or " $\{m,n\}$ ", together  
 6027 with that interval expression it shall match what repeated consecutive occurrences of the  
 6028 BRE would match. The values of  $m$  and  $n$  are decimal integers in the range  $0$   
 6029  $\leq m \leq n \leq \{RE\_DUP\_MAX\}$ , where  $m$  specifies the exact or minimum number of occurrences  
 6030 and  $n$  specifies the maximum number of occurrences. The expression " $\{m\}$ " shall  
 6031 match exactly  $m$  occurrences of the preceding BRE, " $\{m,\}$ " shall match at least  $m$   
 6032 occurrences, and " $\{m,n\}$ " shall match any number of occurrences between  $m$  and  $n$   
 6033 inclusive.

6034 For example, in the string "abababcccccd" the BRE " $c\{3\}$ " is matched by  
 6035 characters seven to nine, the BRE " $\{m,\}$ " is not matched at all, and the BRE  
 6036 " $c\{1,3\}d$ " is matched by characters ten to thirteen.

6037 The behavior of multiple adjacent duplication symbols ('\*' and intervals) produces undefined  
 6038 results.

6039 A subexpression repeated by an <asterisk> ('\*') or an interval expression shall not match a null  
 6040 expression unless this is the only match for the repetition or it is necessary to satisfy the exact or  
 6041 minimum number of occurrences for the interval expression.

### 6042 9.3.7 BRE Precedence

6043 The order of precedence shall be as shown in the following table:

BRE Precedence (from high to low)	
Collation-related bracket symbols	[==] [::] [..]
Escaped characters	\<special character>
Bracket expression	[ ]
Subexpressions/back-references	\( \) \n
Single-character-BRE duplication	* \{m,n\}
Concatenation	
Anchoring	^ \$

### 6052 9.3.8 BRE Expression Anchoring

6053 A BRE can be limited to matching strings that begin or end a line; this is called "anchoring".  
 6054 The <circumflex> and <dollar-sign> special characters shall be considered BRE anchors in the  
 6055 following contexts:

6056 1. A <circumflex> ('^') shall be an anchor when used as the first character of an entire BRE.  
 6057 The implementation may treat the <circumflex> as an anchor when used as the first  
 6058 character of a subexpression. The <circumflex> shall anchor the expression (or optionally  
 6059 subexpression) to the beginning of a string; only sequences starting at the first character  
 6060 of a string shall be matched by the BRE. For example, the BRE " $^ab$ " matches "ab" in  
 6061 the string "abcdef", but fails to match in the string "cdefab". The BRE " $\{m,\}$ "  
 6062 may match the former string. A portable BRE shall escape a leading <circumflex> in a  
 6063 subexpression to match a literal circumflex.

6064 2. A <dollar-sign> ('\$') shall be an anchor when used as the last character of an entire BRE.  
 6065 The implementation may treat a <dollar-sign> as an anchor when used as the last  
 6066 character of a subexpression. The <dollar-sign> shall anchor the expression (or optionally  
 6067 subexpression) to the end of the string being matched; the <dollar-sign> can be said to  
 6068 match the end-of-string following the last character.

- 6069 3. A BRE anchored by both '^' and '\$' shall match only an entire string. For example, the  
6070 BRE "^abcdef\$" matches strings consisting only of "abcdef".

## 6071 9.4 Extended Regular Expressions

6072 The extended regular expression (ERE) notation and construction rules shall apply to utilities  
6073 defined as using extended regular expressions; any exceptions to the following rules are noted  
6074 in the descriptions of the specific utilities using EREs.

### 6075 9.4.1 EREs Matching a Single Character or Collating Element

6076 An ERE ordinary character, a special character preceded by a <backslash> or a <period> shall  
6077 match a single character. A bracket expression shall match a single character or a single collating  
6078 element. An ERE matching a single character enclosed in parentheses shall match the same as  
6079 the ERE without parentheses would have matched.

### 6080 9.4.2 ERE Ordinary Characters

6081 An ordinary character is an ERE that matches itself. An ordinary character is any character in the  
6082 supported character set, except for the ERE special characters listed in Section 9.4.3. The  
6083 interpretation of an ordinary character preceded by a <backslash> ('\\') is undefined.

### 6084 9.4.3 ERE Special Characters

6085 An ERE special character has special properties in certain contexts. Outside those contexts, or  
6086 when preceded by a <backslash>, such a character shall be an ERE that matches the special  
6087 character itself. The extended regular expression special characters and the contexts in which  
6088 they shall have their special meaning are as follows:

- 6089 . [ \ ( The <period>, <left-square-bracket>, <backslash>, and <left-parenthesis> shall be  
6090 special except when used in a bracket expression (see Section 9.3.5, on page 184).  
6091 Outside a bracket expression, a <left-parenthesis> immediately followed by a <right-  
6092 parenthesis> produces undefined results.
- 6093 ) The <right-parenthesis> shall be special when matched with a preceding <left-  
6094 parenthesis>, both outside a bracket expression.
- 6095 \* + ? | The <asterisk>, <plus-sign>, <question-mark>, and <left-brace> shall be special except  
6096 when used in a bracket expression (see Section 9.3.5, on page 184). Any of the  
6097 following uses produce undefined results:
- 6098 — If these characters appear first in an ERE, or immediately following a <vertical-  
6099 line>, <circumflex>, or <left-parenthesis>
  - 6100 — If a <left-brace> is not part of a valid interval expression (see Section 9.4.6, on  
6101 page 189)
- 6102 | The <vertical-line> is special except when used in a bracket expression (see Section  
6103 9.3.5, on page 184). A <vertical-line> appearing first or last in an ERE, or immediately  
6104 following a <vertical-line> or a <left-parenthesis>, or immediately preceding a <right-  
6105 parenthesis>, produces undefined results.

- 6106            $\wedge$        The <circumflex> shall be special when used as:
- 6107                     — An anchor (see [Section 9.4.9](#), on page 190)
- 6108                     — The first character of a bracket expression (see [Section 9.3.5](#), on page 184)
- 6109            $\$$        The <dollar-sign> shall be special when used as an anchor.

#### 6110 9.4.4 Periods in EREs

6111           A <period> ('.'), when used outside a bracket expression, is an ERE that shall match any  
6112           character in the supported character set except NUL.

#### 6113 9.4.5 ERE Bracket Expression

6114           The rules for ERE Bracket Expressions are the same as for Basic Regular Expressions; see [Section](#)  
6115           [9.3.5](#) (on page 184).

#### 6116 9.4.6 EREs Matching Multiple Characters

6117           The following rules shall be used to construct EREs matching multiple characters from EREs  
6118           matching a single character:

- 6119           1. A concatenation of EREs shall match the concatenation of the character sequences  
6120           matched by each component of the ERE. A concatenation of EREs enclosed in parentheses  
6121           shall match whatever the concatenation without the parentheses matches. For example,  
6122           both the ERE "cd" and the ERE "(cd)" are matched by the third and fourth character of  
6123           the string "abcdefabcdef".
- 6124           2. When an ERE matching a single character or an ERE enclosed in parentheses is followed  
6125           by the special character <plus-sign> ('+'), together with that <plus-sign> it shall match  
6126           what one or more consecutive occurrences of the ERE would match. For example, the  
6127           ERE "b+(bc)" matches the fourth to seventh characters in the string "acabbbbcde".  
6128           And, "[ab]+" and "[ab][ab]\*" are equivalent.
- 6129           3. When an ERE matching a single character or an ERE enclosed in parentheses is followed  
6130           by the special character <asterisk> ('\*'), together with that <asterisk> it shall match  
6131           what zero or more consecutive occurrences of the ERE would match. For example, the  
6132           ERE "b\*c" matches the first character in the string "cabbbbcde", and the ERE "b\*cd"  
6133           matches the third to seventh characters in the string "cabbbbcdebbbbbbbcdbc". And,  
6134           "[ab]\*" and "[ab][ab]" are equivalent when matching the string "ab".
- 6135           4. When an ERE matching a single character or an ERE enclosed in parentheses is followed  
6136           by the special character <question-mark> ('?'), together with that <question-mark> it  
6137           shall match what zero or one consecutive occurrences of the ERE would match. For  
6138           example, the ERE "b?c" matches the second character in the string "acabbbbcde".
- 6139           5. When an ERE matching a single character or an ERE enclosed in parentheses is followed  
6140           by an interval expression of the format "{m}", "{m,}", or "{m,n}", together with that  
6141           interval expression it shall match what repeated consecutive occurrences of the ERE  
6142           would match. The values of *m* and *n* are decimal integers in the range 0  
6143            $\leq m \leq n \leq \{RE\_DUP\_MAX\}$ , where *m* specifies the exact or minimum number of occurrences  
6144           and *n* specifies the maximum number of occurrences. The expression "{m}" matches  
6145           exactly *m* occurrences of the preceding ERE, "{m,}" matches at least *m* occurrences, and  
6146           "{m,n}" matches any number of occurrences between *m* and *n*, inclusive.

6147 For example, in the string "abababcccccccd" the ERE "c{3}" is matched by characters  
 6148 seven to nine and the ERE "(ab){2,}" is matched by characters one to six.

6149 The behavior of multiple adjacent duplication symbols ('+', '\*', '?', and intervals) produces  
 6150 undefined results.

6151 An ERE matching a single character repeated by an '\*', '?', or an interval expression shall not  
 6152 match a null expression unless this is the only match for the repetition or it is necessary to satisfy  
 6153 the exact or minimum number of occurrences for the interval expression.

6154 **9.4.7 ERE Alternation**

6155 Two EREs separated by the special character <vertical-line> ('|') shall match a string that is  
 6156 matched by either. For example, the ERE "a(bc|d)" matches the string "abc" and the  
 6157 string "ad". Single characters, or expressions matching single characters, separated by the  
 6158 <vertical-line> and enclosed in parentheses, shall be treated as an ERE matching a single  
 6159 character.

6160 **9.4.8 ERE Precedence**

6161 The order of precedence shall be as shown in the following table:

ERE Precedence (from high to low)	
Collation-related bracket symbols	[==] [::] [..]
Escaped characters	\<special character>
Bracket expression	[]
Grouping	()
Single-character-ERE duplication	* + ? {m,n}
Concatenation	
Anchoring	^ \$
Alternation	

6171 For example, the ERE "abba|cde" matches either the string "abba" or the string "cde"  
 6172 (rather than the string "abbade" or "abbcde", because concatenation has a higher order of  
 6173 precedence than alternation).

6174 **9.4.9 ERE Expression Anchoring**

6175 An ERE can be limited to matching strings that begin or end a line; this is called "anchoring".  
 6176 The <circumflex> and <dollar-sign> special characters shall be considered ERE anchors when  
 6177 used anywhere outside a bracket expression. This shall have the following effects:

- 6178 1. A <circumflex> ('^') outside a bracket expression shall anchor the expression or  
 6179 subexpression it begins to the beginning of a string; such an expression or subexpression  
 6180 can match only a sequence starting at the first character of a string. For example, the EREs  
 6181 "^ab" and "(^ab)" match "ab" in the string "abcdef", but fail to match in the string  
 6182 "cdefab", and the ERE "a^b" is valid, but can never match because the 'a' prevents  
 6183 the expression "^b" from matching starting at the first character.
- 6184 2. A <dollar-sign> ('\$') outside a bracket expression shall anchor the expression or  
 6185 subexpression it ends to the end of a string; such an expression or subexpression can  
 6186 match only a sequence ending at the last character of a string. For example, the EREs  
 6187 "ef\$" and "(ef\$)" match "ef" in the string "abcdef", but fail to match in the string

6188 "cdefab", and the ERE "e\$*f*" is valid, but can never match because the '*f*' prevents  
6189 the expression "e\$" from matching ending at the last character.

## 6190 9.5 Regular Expression Grammar

6191 Grammars describing the syntax of both basic and extended regular expressions are presented in  
6192 this section. The grammar takes precedence over the text. See XCU [Section 1.3](#) (on page 2287).

### 6193 9.5.1 BRE/ERE Grammar Lexical Conventions

6194 The lexical conventions for regular expressions are as described in this section.

6195 Except as noted, the longest possible token or delimiter beginning at a given point is recognized.

6196 The following tokens are processed (in addition to those string constants shown in the  
6197 grammar):

6198 **COLL\_ELEM\_SINGLE** Any single-character collating element, unless it is a **META\_CHAR**.

6199 **COLL\_ELEM\_MULTI** Any multi-character collating element.

6200 **BACKREF** Applicable only to basic regular expressions. The character string  
6201 consisting of a <backslash> character followed by a single-digit  
6202 numeral, '1' to '9'.

6203 **DUP\_COUNT** Represents a numeric constant. It shall be an integer in the range 0  
6204 ≤**DUP\_COUNT** ≤**RE\_DUP\_MAX**. This token is only recognized  
6205 when the context of the grammar requires it. At all other times, digits  
6206 not preceded by a <backslash> character are treated as **ORD\_CHAR**.

6207 **META\_CHAR** One of the characters:

6208 **^** When found first in a bracket expression

6209 **-** When found anywhere but first (after an initial '**^**', if any)  
6210 or last in a bracket expression, or as the ending range point  
6211 in a range expression

6212 **]** When found anywhere but first (after an initial '**^**', if any)  
6213 in a bracket expression

6214 **L\_ANCHOR** Applicable only to basic regular expressions. The character '**^**'  
6215 when it appears as the first character of a basic regular expression  
6216 and when not **QUOTED\_CHAR**. The '**^**' may be recognized as an  
6217 anchor elsewhere; see [Section 9.3.8](#) (on page 187).

6218 **ORD\_CHAR** A character, other than one of the special characters in **SPEC\_CHAR**.

6219 **QUOTED\_CHAR** In a BRE, one of the character sequences:

6220 `\^ \. \* \[ \ $ \ \`

6221 In an ERE, one of the character sequences:

6222 `\^ \. \[ \ $ \ ( \ ) \ |`

6223 `\* \+ \? \{ \ \`

6224	<b>R_ANCHOR</b>	(Applicable only to basic regular expressions.) The character '\$' when it appears as the last character of a basic regular expression and when not <b>QUOTED_CHAR</b> . The '\$' may be recognized as an anchor elsewhere; see <a href="#">Section 9.3.8</a> (on page 187).
6225		
6226		
6227		
6228	<b>SPEC_CHAR</b>	For basic regular expressions, one of the following special characters:
6229	.	Anywhere outside bracket expressions
6230	\	Anywhere outside bracket expressions
6231	[	Anywhere outside bracket expressions
6232	^	When used as an anchor (see <a href="#">Section 9.3.8</a> , on page 187) or when first in a bracket expression
6233		
6234	\$	When used as an anchor
6235	*	Anywhere except first in an entire RE, anywhere in a bracket expression, directly following "\(", directly following an anchoring '^'
6236		
6237		
6238		For extended regular expressions, shall be one of the following special characters found anywhere outside bracket expressions:
6239		
6240	^	.
6241	*	+ ? { }
6242		(The close-parenthesis shall be considered special in this context only if matched with a preceding open-parenthesis.)
6243		

## 6244 9.5.2 RE and Bracket Expression Grammar

6245 This section presents the grammar for basic regular expressions, including the bracket  
6246 expression grammar that is common to both BREs and EREs.

```

6247 %token   ORD_CHAR QUOTED_CHAR DUP_COUNT
6248 %token   BACKREF L_ANCHOR R_ANCHOR
6249 %token   Back_open_paren  Back_close_paren
6250 /*      '\('              '\)'          */
6251 %token   Back_open_brace  Back_close_brace
6252 /*      '\{'              '\}'          */
6253 /* The following tokens are for the Bracket Expression
6254    grammar common to both REs and EREs. */
6255 %token   COLL_ELEM_SINGLE COLL_ELEM_MULTI META_CHAR
6256 %token   Open_equal Equal_close Open_dot Dot_close Open_colon Colon_close
6257 /*      '['              '='          '['      '.'      ':'          ':'      */
6258 %token   class_name
6259 /* class_name is a keyword to the LC_CTYPE locale category */
6260 /* (representing a character class) in the current locale */
6261 /* and is only recognized between [: and :] */
6262 %start   basic_reg_exp
6263 %%

```

## Regular Expressions

## Regular Expression Grammar

```

6264      /* -----
6265         Basic Regular Expression
6266         -----
6267      */
6268      basic_reg_exp  :      RE_expression
6269                    | L_ANCHOR
6270                    |                                R_ANCHOR
6271                    | L_ANCHOR                    R_ANCHOR
6272                    | L_ANCHOR RE_expression
6273                    |                                RE_expression R_ANCHOR
6274                    | L_ANCHOR RE_expression R_ANCHOR
6275                    ;
6276      RE_expression :      simple_RE
6277                    | RE_expression simple_RE
6278                    ;
6279      simple_RE    : nondupl_RE
6280                    | nondupl_RE RE_dupl_symbol
6281                    ;
6282      nondupl_RE   : one_char_or_coll_elem_RE
6283                    | Back_open_paren RE_expression Back_close_paren
6284                    | BACKREF
6285                    ;
6286      one_char_or_coll_elem_RE : ORD_CHAR
6287                    | QUOTED_CHAR

6291      RE_dupl_symbol : '*'
6292                    | Back_open_brace DUP_COUNT                    Back_close_brace
6293                    | Back_open_brace DUP_COUNT ','                    Back_close_brace
6294                    | Back_open_brace DUP_COUNT ',' DUP_COUNT Back_close_brace
6295                    ;
6296      /* -----
6297         Bracket Expression
6298         -----
6299      */
6300      bracket_expression : '[' matching_list ']'
6301                    | '[' nonmatching_list ']'
6302                    ;
6303      matching_list    : bracket_list
6304                    ;
6305      nonmatching_list : '^' bracket_list
6306                    ;
6307      bracket_list     : follow_list
6308                    | follow_list '-'
6309                    ;
6310      follow_list      :      expression_term
6311                    | follow_list expression_term
6312                    ;
6313      expression_term : single_expression
6314                    | range_expression
6315                    ;

```

```

6316     single_expression : end_range
6317                          | character_class
6318                          | equivalence_class
6319                          ;
6320     range_expression : start_range end_range
6321                       | start_range '-'
6322                       ;
6323     start_range      : end_range '-'
6324                       ;
6325     end_range        : COLL_ELEM_SINGLE
6326                       | collating_symbol
6327                       ;
6328     collating_symbol : Open_dot COLL_ELEM_SINGLE Dot_close
6329                       | Open_dot COLL_ELEM_MULTI Dot_close
6330                       | Open_dot META_CHAR Dot_close
6331                       ;
6332     equivalence_class : Open_equal COLL_ELEM_SINGLE Equal_close
6333                       | Open_equal COLL_ELEM_MULTI Equal_close
6334                       ;
6335     character_class  : Open_colon class_name Colon_close
6336                       ;

```

6337 The BRE grammar does not permit **L\_ANCHOR** or **R\_ANCHOR** inside "`\(`" and "`\)`" (which  
6338 implies that '`^`' and '`$`' are ordinary characters). This reflects the semantic limits on the  
6339 application, as noted in [Section 9.3.8](#) (on page 187). Implementations are permitted to extend the  
6340 language to interpret '`^`' and '`$`' as anchors in these locations, and as such, conforming  
6341 applications cannot use unescaped '`^`' and '`$`' in positions inside "`\(`" and "`\)`" that might  
6342 be interpreted as anchors.

### 6343 9.5.3 ERE Grammar

6344 This section presents the grammar for extended regular expressions, excluding the bracket  
6345 expression grammar.

6346 **Note:** The bracket expression grammar and the associated `%token` lines are identical between BREs  
6347 and EREs. It has been omitted from the ERE section to avoid unnecessary editorial duplication.

```

6348 %token ORD_CHAR QUOTED_CHAR DUP_COUNT
6349 %start extended_reg_exp
6350 %%
6351 /* -----
6352    Extended Regular Expression
6353    ----- */
6354 extended_reg_exp      : ERE_branch
6355                       | extended_reg_exp '|' ERE_branch
6356                       ;
6357 ERE_branch            : ERE_expression
6358                       | ERE_branch ERE_expression
6359                       ;
6360 ERE_expression        : one_char_or_coll_elem_ERE
6361                       | '^'
6362                       | '$'

```

```

6364         | '(' extended_reg_exp ')'
6365         | ERE_expression ERE_dupl_symbol
6366         ;
6367 one_char_or_coll_elem_ERE : ORD_CHAR
6368         | QUOTED_CHAR
6369         | '.'
6370         | bracket_expression
6371         ;
6372 ERE_dupl_symbol : '*'
6373         | '+'
6374         | '?'
6375         | '{' DUP_COUNT '}'
6376         | '{' DUP_COUNT ',' '}'
6377         | '{' DUP_COUNT ',' DUP_COUNT '}'
6378         ;

```

6379 The ERE grammar does not permit several constructs that previous sections specify as having  
6380 undefined results:

- 6381 • **ORD\_CHAR** preceded by a <backslash> character
- 6382 • One or more *ERE\_dupl\_symbols* appearing first in an ERE, or immediately following '|',  
6383 '^^', or '('
- 6384 • '{' not part of a valid *ERE\_dupl\_symbol*
- 6385 • '|' appearing first or last in an ERE, or immediately following '|' or '(', or  
6386 immediately preceding ')'

6387 Implementations are permitted to extend the language to allow these. Conforming applications  
6388 cannot use such constructs.

## Directory Structure and Devices

### 10.1 Directory Structure and Files

The following directories shall exist on conforming systems and conforming applications shall make use of them only as described. Strictly conforming applications shall not assume the ability to create files in any of these directories, unless specified below.

**/** The root directory.

**/dev** Contains **/dev/console**, **/dev/null**, and **/dev/tty**, described below.

The following directory shall exist on conforming systems and shall be used as described:

**/tmp** A directory made available for applications that need a place to create temporary files. Applications shall be allowed to create files in this directory, but shall not assume that such files are preserved between invocations of the application.

The following files shall exist on conforming systems and shall be both readable and writable:

**/dev/null** An infinite data source and data sink. Data written to **/dev/null** shall be discarded. Reads from **/dev/null** shall always return end-of-file (EOF).

**/dev/tty** In each process, a synonym for the controlling terminal associated with the process group of that process, if any. It is useful for programs or shell procedures that wish to be sure of writing messages to or reading data from the terminal no matter how output has been redirected. It can also be used for applications that demand the name of a file for output, when typed output is desired and it is tiresome to find out what terminal is currently in use.

The following file shall exist on conforming systems and need not be readable or writable:

**/dev/console** The **/dev/console** file is a generic name given to the system console (see [Section 3.384](#), on page 95). It is usually linked to an implementation-defined special file. It shall provide an interface to the system console conforming to the requirements of [Chapter 11](#) (on page 199).

6415 **10.2 Output Devices and Terminal Types**

6416 The utilities in the Shell and Utilities volume of POSIX.1-2008 historically have been  
 6417 implemented on a wide range of terminal types, but a conforming implementation need not  
 6418 support all features of all utilities on every conceivable terminal. POSIX.1-2008 states which  
 6419 features are optional for certain classes of terminals in the individual utility description sections.  
 6420 The implementation shall document in the system documentation which terminal types it  
 6421 supports and which of these features and utilities are not supported by each terminal.

6422 When a feature or utility is not supported on a specific terminal type, as allowed by  
 6423 POSIX.1-2008, and the implementation considers such a condition to be an error preventing use  
 6424 of the feature or utility, the implementation shall indicate such conditions through diagnostic  
 6425 messages or exit status values or both (as appropriate to the specific utility description) that  
 6426 inform the user that the terminal type lacks the appropriate capability.

6427 POSIX.1-2008 uses a notational convention based on historical practice that identifies some of  
 6428 the control characters defined in Section 7.3.1 (on page 139) in a manner easily remembered by  
 6429 users on many terminals. The correspondence between this “<control>-char” notation and the  
 6430 actual control characters is shown in the following table. When POSIX.1-2008 refers to a  
 6431 character by its <control>-name, it is referring to the actual control character shown in the Value  
 6432 column of the table, which is not necessarily the exact control key sequence on all terminals.  
 6433 Some terminals have keyboards that do not allow the direct transmission of all the non-  
 6434 alphanumeric characters shown. In such cases, the system documentation shall describe which  
 6435 data sequences transmitted by the terminal are interpreted by the system as representing the  
 6436 special characters.

6437 **Table 10-1** Control Character Names

Name	Value	Symbolic Name	Name	Value	Symbolic Name
<control>-A	<SOH>	<SOH>	<control>-Q	<DC1>	<DC1>
<control>-B	<STX>	<STX>	<control>-R	<DC2>	<DC2>
<control>-C	<ETX>	<ETX>	<control>-S	<DC3>	<DC3>
<control>-D	<EOT>	<EOT>	<control>-T	<DC4>	<DC4>
<control>-E	<ENQ>	<ENQ>	<control>-U	<NAK>	<NAK>
<control>-F	<ACK>	<ACK>	<control>-V	<SYN>	<SYN>
<control>-G	<BEL>	<alert>	<control>-W	<ETB>	<ETB>
<control>-H	<BS>	<backspace>	<control>-X	<CAN>	<CAN>
<control>-I	<HT>	<tab>	<control>-Y	<EM>	<EM>
<control>-J	<LF>	<linefeed>	<control>-Z	<SUB>	<SUB>
<control>-K	<VT>	<vertical-tab>	<control>-[	<ESC>	<ESC>
<control>-L	<FF>	<form-feed>	<control>-\ <control>-]	<FS>	<FS>
<control>-M	<CR>	<carriage-return>	<control>-^	<GS>	<GS>
<control>-N	<SO>	<SO>	<control>-_	<RS>	<RS>
<control>-O	<SI>	<SI>	<control>-?	<US>	<US>
<control>-P	<DLE>	<DLE>		<DEL>	<DEL>

6455 **Note:** The notation uses uppercase letters for arbitrary editorial reasons. There is no implication that  
 6456 the keystrokes represent control-shift-letter sequences.

6457

Chapter 11

6458

## General Terminal Interface

6459

6460

6461

6462

This chapter describes a general terminal interface that shall be provided. It shall be supported on any asynchronous communications ports if the implementation provides them. It is implementation-defined whether it supports network connections or synchronous ports, or both.

### 11.1 Interface Characteristics

#### 11.1.1 Opening a Terminal Device File

6465

6466

6467

When a terminal device file is opened, it normally causes the thread to wait until a connection is established. In practice, application programs seldom open these files; they are opened by special programs and become an application's standard input, output, and error files.

6468

Cases where applications do open a terminal device are as follows:

6469

6470

6471

6472

6473

6474

6475

6476

6477

6478

1. Opening `/dev/tty`, or the pathname returned by `ctermid()`, in order to obtain a file descriptor for the controlling terminal; see [Section 11.1.3](#) (on page 200).
2. Opening the slave side of a pseudo-terminal; see XSH `ptsname()`.
3. Opening a modem or similar piece of equipment connected by a serial line. In this case, the terminal parameters (see [Section 11.2](#), on page 205) may be initialized to default settings by the implementation in between the last close of the device by any process and the next open of the device, or they may persist from one use to the next. The terminal parameters can be set to values that ensure the terminal behaves in a conforming manner by means of the `O_TTY_INIT` open flag when opening a terminal device that is not already open in any process, or by executing the `stty` utility with the operand **sane**.

6479

6480

6481

6482

6483

As described in `open()`, opening a terminal device file with the `O_NONBLOCK` flag clear shall cause the thread to block until the terminal device is ready and available. If `CLOCAL` mode is not set, this means blocking until a connection is established. If `CLOCAL` mode is set in the terminal, or the `O_NONBLOCK` flag is specified in the `open()`, the `open()` function shall return a file descriptor without waiting for a connection to be established.

6484 **11.1.2 Process Groups**

6485 A terminal may have a foreground process group associated with it. This foreground process  
6486 group plays a special role in handling signal-generating input characters, as discussed in [Section](#)  
6487 [11.1.9](#) (on page 203).

6488 A command interpreter process supporting job control can allocate the terminal to different jobs,  
6489 or process groups, by placing related processes in a single process group and associating this  
6490 process group with the terminal. A terminal's foreground process group may be set or examined  
6491 by a process, assuming the permission requirements are met; see `tcgetpgrp()` and `tcsetpgrp()`.  
6492 The terminal interface aids in this allocation by restricting access to the terminal by processes  
6493 that are not in the current process group; see [Section 11.1.4](#) (on page 201).

6494 When there is no longer any process whose process ID or process group ID matches the  
6495 foreground process group ID, the terminal shall have no foreground process group. It is  
6496 unspecified whether the terminal has a foreground process group when there is a process whose  
6497 process ID matches the foreground process group ID, but whose process group ID does not. No  
6498 actions defined in POSIX.1-2008, other than allocation of a controlling terminal or a successful  
6499 call to `tcsetpgrp()`, shall cause a process group to become the foreground process group of the  
6500 terminal.

6501 **11.1.3 The Controlling Terminal**

6502 A terminal may belong to a process as its controlling terminal. Each process of a session that has  
6503 a controlling terminal has the same controlling terminal. A terminal may be the controlling  
6504 terminal for at most one session. The controlling terminal for a session is allocated by the session  
6505 leader in an implementation-defined manner. If a session leader has no controlling terminal, and  
6506 opens a terminal device file that is not already associated with a session without using the  
6507 `O_NOCTTY` option (see `open()`), it is implementation-defined whether the terminal becomes the  
6508 controlling terminal of the session leader. If a process which is not a session leader opens a  
6509 terminal file, or the `O_NOCTTY` option is used on `open()`, then that terminal shall not become  
6510 the controlling terminal of the calling process. When a controlling terminal becomes associated  
6511 with a session, its foreground process group shall be set to the process group of the session  
6512 leader.

6513 The controlling terminal is inherited by a child process during a `fork()` function call. A process  
6514 relinquishes its controlling terminal when it creates a new session with the `setsid()` function;  
6515 other processes remaining in the old session that had this terminal as their controlling terminal  
6516 continue to have it. Upon the close of the last file descriptor in the system (whether or not it is in  
6517 the current session) associated with the controlling terminal, it is unspecified whether all  
6518 processes that had that terminal as their controlling terminal cease to have any controlling  
6519 terminal. Whether and how a session leader can reacquire a controlling terminal after the  
6520 controlling terminal has been relinquished in this fashion is unspecified. A process does not  
6521 relinquish its controlling terminal simply by closing all of its file descriptors associated with the  
6522 controlling terminal if other processes continue to have it open.

6523 When a controlling process terminates, the controlling terminal is dissociated from the current  
6524 session, allowing it to be acquired by a new session leader. Subsequent access to the terminal by  
6525 other processes in the earlier session may be denied, with attempts to access the terminal treated  
6526 as if a modem disconnect had been sensed.

#### 6527 11.1.4 Terminal Access Control

6528 If a process is in the foreground process group of its controlling terminal, read operations shall  
 6529 be allowed, as described in Section 11.1.5. Any attempts by a process in a background process  
 6530 group to read from its controlling terminal cause its process group to be sent a SIGTTIN signal  
 6531 unless one of the following special cases applies: if the reading process is ignoring or blocking  
 6532 the SIGTTIN signal, or if the process group of the reading process is orphaned, the *read()* shall  
 6533 return  $-1$ , with *errno* set to [EIO] and no signal shall be sent. The default action of the SIGTTIN  
 6534 signal shall be to stop the process to which it is sent. See `<signal.h>`.

6535 If a process is in the foreground process group of its controlling terminal, write operations shall  
 6536 be allowed as described in Section 11.1.8 (on page 203). Attempts by a process in a background  
 6537 process group to write to its controlling terminal shall cause the process group to be sent a  
 6538 SIGTTOU signal unless one of the following special cases applies: if TOSTOP is not set, or if  
 6539 TOSTOP is set and the process is ignoring or blocking the SIGTTOU signal, the process is  
 6540 allowed to write to the terminal and the SIGTTOU signal is not sent. If TOSTOP is set, and the  
 6541 process group of the writing process is orphaned, and the writing process is not ignoring or  
 6542 blocking the SIGTTOU signal, the *write()* shall return  $-1$ , with *errno* set to [EIO] and no signal  
 6543 shall be sent.

6544 Certain calls that set terminal parameters are treated in the same fashion as *write()*, except that  
 6545 TOSTOP is ignored; that is, the effect is identical to that of terminal writes when TOSTOP is set  
 6546 (see Section 11.2.5 (on page 210), *tcdrain()*, *tcflow()*, *tcflush()*, *tcsendbreak()*, *tcsetattr()*, and  
 6547 *tcsetpgrp()*).

#### 6548 11.1.5 Input Processing and Reading Data

6549 A terminal device associated with a terminal device file may operate in full-duplex mode, so  
 6550 that data may arrive even while output is occurring. Each terminal device file has an input  
 6551 queue associated with it, into which incoming data is stored by the system before being read by  
 6552 a process. The system may impose a limit, {MAX\_INPUT}, on the number of bytes that may be  
 6553 stored in the input queue. The behavior of the system when this limit is exceeded is  
 6554 implementation-defined.

6555 Two general kinds of input processing are available, determined by whether the terminal device  
 6556 file is in canonical mode or non-canonical mode. These modes are described in Section 11.1.6 (on  
 6557 page 202) and Section 11.1.7 (on page 202). Additionally, input characters are processed  
 6558 according to the *c\_iflag* (see Section 11.2.2, on page 206) and *c\_lflag* (see Section 11.2.5, on page  
 6559 210) fields. Such processing can include “echoing”, which in general means transmitting input  
 6560 characters immediately back to the terminal when they are received from the terminal. This is  
 6561 useful for terminals that can operate in full-duplex mode.

6562 The manner in which data is provided to a process reading from a terminal device file is  
 6563 dependent on whether the terminal file is in canonical or non-canonical mode, and on whether  
 6564 or not the O\_NONBLOCK flag is set by *open()* or *fcntl()*.

6565 If the O\_NONBLOCK flag is clear, then the read request shall be blocked until data is available  
 6566 or a signal has been received. If the O\_NONBLOCK flag is set, then the read request shall be  
 6567 completed, without blocking, in one of three ways:

- 6568 1. If there is enough data available to satisfy the entire request, the *read()* shall complete  
 6569 successfully and shall return the number of bytes read.
- 6570 2. If there is not enough data available to satisfy the entire request, the *read()* shall complete  
 6571 successfully, having read as much data as possible, and shall return the number of bytes it  
 6572 was able to read.

6573 3. If there is no data available, the `read()` shall return `-1`, with `errno` set to `[EAGAIN]`.

6574 When data is available depends on whether the input processing mode is canonical or non-  
6575 canonical. Section 11.1.6 and Section 11.1.7 describe each of these input processing modes.

### 6576 11.1.6 Canonical Mode Input Processing

6577 In canonical mode input processing, terminal input is processed in units of lines. A line is  
6578 delimited by a <newline> character (NL), an end-of-file character (EOF), or an end-of-line (EOL)  
6579 character. See Section 11.1.9 (on page 203) for more information on EOF and EOL. This means  
6580 that a read request shall not return until an entire line has been typed or a signal has been  
6581 received. Also, no matter how many bytes are requested in the `read()` call, at most one line shall  
6582 be returned. It is not, however, necessary to read a whole line at once; any number of bytes, even  
6583 one, may be requested in a `read()` without losing information.

6584 If `{MAX_CANON}` is defined for this terminal device, it shall be a limit on the number of bytes  
6585 in a line. The behavior of the system when this limit is exceeded is implementation-defined. If  
6586 `{MAX_CANON}` is not defined, there shall be no such limit; see `pathconf()`.

6587 Erase and kill processing occur when either of two special characters, the ERASE and KILL  
6588 characters (see Section 11.1.9, on page 203), is received. This processing shall affect data in the  
6589 input queue that has not yet been delimited by an NL, EOF, or EOL character. This un-delimited  
6590 data makes up the current line. The ERASE character shall delete the last character in the current  
6591 line, if there is one. The KILL character shall delete all data in the current line, if there is any.  
6592 The ERASE and KILL characters shall have no effect if there is no data in the current line. The  
6593 ERASE and KILL characters themselves shall not be placed in the input queue.

### 6594 11.1.7 Non-Canonical Mode Input Processing

6595 In non-canonical mode input processing, input bytes are not assembled into lines, and erase and  
6596 kill processing shall not occur. The values of the MIN and TIME members of the `c_cc` array are  
6597 used to determine how to process the bytes received. POSIX.1-2008 does not specify whether  
6598 the setting of `O_NONBLOCK` takes precedence over MIN or TIME settings. Therefore, if  
6599 `O_NONBLOCK` is set, `read()` may return immediately, regardless of the setting of MIN or TIME.  
6600 Also, if no data is available, `read()` may either return 0, or return `-1` with `errno` set to `[EAGAIN]`.

6601 MIN represents the minimum number of bytes that should be received when the `read()` function  
6602 returns successfully. TIME is a timer of 0.1 second granularity that is used to time out bursty and  
6603 short-term data transmissions. If MIN is greater than `{MAX_INPUT}`, the response to the request  
6604 is undefined. The four possible values for MIN and TIME and their interactions are described  
6605 below.

#### 6606 Case A: MIN>0, TIME>0

6607 In case A, TIME serves as an inter-byte timer which shall be activated after the first byte is  
6608 received. Since it is an inter-byte timer, it shall be reset after a byte is received. The interaction  
6609 between MIN and TIME is as follows. As soon as one byte is received, the inter-byte timer shall  
6610 be started. If MIN bytes are received before the inter-byte timer expires (remember that the timer  
6611 is reset upon receipt of each byte), the read shall be satisfied. If the timer expires before MIN  
6612 bytes are received, the characters received to that point shall be returned to the user. Note that if  
6613 TIME expires at least one byte shall be returned because the timer would not have been enabled  
6614 unless a byte was received. In this case (MIN>0, TIME>0) the read shall block until the MIN and  
6615 TIME mechanisms are activated by the receipt of the first byte, or a signal is received. If data is  
6616 in the buffer at the time of the `read()`, the result shall be as if data has been received immediately

6617 after the *read()*.

6618 **Case B: MIN>0, TIME=0**

6619 In case B, since the value of TIME is zero, the timer plays no role and only MIN is significant. A  
6620 pending read shall not be satisfied until MIN bytes are received (that is, the pending read shall  
6621 block until MIN bytes are received), or a signal is received. A program that uses case B to read  
6622 record-based terminal I/O may block indefinitely in the read operation.

6623 **Case C: MIN=0, TIME>0**

6624 In case C, since MIN=0, TIME no longer represents an inter-byte timer. It now serves as a read  
6625 timer that shall be activated as soon as the *read()* function is processed. A read shall be satisfied  
6626 as soon as a single byte is received or the read timer expires. Note that in case C if the timer  
6627 expires, no bytes shall be returned. If the timer does not expire, the only way the read can be  
6628 satisfied is if a byte is received. If bytes are not received, the read shall not block indefinitely  
6629 waiting for a byte; if no byte is received within TIME\*0.1 seconds after the read is initiated, the  
6630 *read()* shall return a value of zero, having read no data. If data is in the buffer at the time of the  
6631 *read()*, the timer shall be started as if data has been received immediately after the *read()*.

6632 **Case D: MIN=0, TIME=0**

6633 The minimum of either the number of bytes requested or the number of bytes currently  
6634 available shall be returned without waiting for more bytes to be input. If no characters are  
6635 available, *read()* shall return a value of zero, having read no data.

6636 **11.1.8 Writing Data and Output Processing**

6637 When a process writes one or more bytes to a terminal device file, they are processed according  
6638 to the *c\_flag* field (see Section 11.2.3, on page 207). The implementation may provide a  
6639 buffering mechanism; as such, when a call to *write()* completes, all of the bytes written have  
6640 been scheduled for transmission to the device, but the transmission has not necessarily  
6641 completed. See *write()* for the effects of O\_NONBLOCK on *write()*.

6642 **11.1.9 Special Characters**

6643 Certain characters have special functions on input or output or both. These functions are  
6644 summarized as follows:

6645 **INTR** Special character on input, which is recognized if the ISIG flag is set. Generates a  
6646 SIGINT signal which is sent to all processes in the foreground process group for which  
6647 the terminal is the controlling terminal. If ISIG is set, the INTR character shall be  
6648 discarded when processed.

6649 **QUIT** Special character on input, which is recognized if the ISIG flag is set. Generates a  
6650 SIGQUIT signal which is sent to all processes in the foreground process group for  
6651 which the terminal is the controlling terminal. If ISIG is set, the QUIT character shall be  
6652 discarded when processed.

6653 **ERASE** Special character on input, which is recognized if the ICANON flag is set. Erases the  
6654 last character in the current line; see Section 11.1.6 (on page 202). It shall not erase  
6655 beyond the start of a line, as delimited by an NL, EOF, or EOL character. If ICANON is  
6656 set, the ERASE character shall be discarded when processed.

6657	KILL	Special character on input, which is recognized if the ICANON flag is set. Deletes the entire line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the KILL character shall be discarded when processed.
6658		
6659		
6660	EOF	Special character on input, which is recognized if the ICANON flag is set. When received, all the bytes waiting to be read are immediately passed to the process without waiting for a <newline>, and the EOF is discarded. Thus, if there are no bytes waiting (that is, the EOF occurred at the beginning of a line), a byte count of zero shall be returned from the <i>read()</i> , representing an end-of-file indication. If ICANON is set, the EOF character shall be discarded when processed.
6661		
6662		
6663		
6664		
6665		
6666	NL	Special character on input, which is recognized if the ICANON flag is set. It is the line delimiter <newline>. It cannot be changed.
6667		
6668	EOL	Special character on input, which is recognized if the ICANON flag is set. It is an additional line delimiter, like NL.
6669		
6670	SUSP	If the ISIG flag is set, receipt of the SUSP character shall cause a SIGTSTP signal to be sent to all processes in the foreground process group for which the terminal is the controlling terminal, and the SUSP character shall be discarded when processed.
6671		
6672		
6673	STOP	Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to suspend output temporarily. It is useful with CRT terminals to prevent output from disappearing before it can be read. If IXON is set, the STOP character shall be discarded when processed.
6674		
6675		
6676		
6677	START	Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to resume output that has been suspended by a STOP character. If IXON is set, the START character shall be discarded when processed.
6678		
6679		
6680		
6681	CR	Special character on input, which is recognized if the ICANON flag is set; it is the carriage-return character. When ICANON and ICRNL are set and IGNCR is not set, this character shall be translated into an NL, and shall have the same effect as an NL character.
6682		
6683		
6684		
6685		The NL and CR characters cannot be changed. It is implementation-defined whether the START and STOP characters can be changed. The values for INTR, QUIT, ERASE, KILL, EOF, EOL, and SUSP shall be changeable to suit individual tastes. Special character functions associated with changeable special control characters can be disabled individually.
6686		
6687		
6688		
6689		If two or more special characters have the same value, the function performed when that character is received is undefined.
6690		
6691		A special character is recognized not only by its value, but also by its context; for example, an implementation may support multi-byte sequences that have a meaning different from the meaning of the bytes when considered individually. Implementations may also support additional single-byte functions. These implementation-defined multi-byte or single-byte functions shall be recognized only if the IEXTEN flag is set; otherwise, data is received without interpretation, except as required to recognize the special characters defined in this section.
6692		
6693		
6694		
6695		
6696		
6697	XSI	If IEXTEN is set, the ERASE, KILL, and EOF characters can be escaped by a preceding <backslash> character, in which case no special function shall occur.
6698		

6699 **11.1.10 Modem Disconnect**

6700 If a modem disconnect is detected by the terminal interface for a controlling terminal, and if  
 6701 CLOCAL is not set in the *c\_cflag* field for the terminal (see Section 11.2.4, on page 209), the  
 6702 SIGHUP signal shall be sent to the controlling process for which the terminal is the controlling  
 6703 terminal. Unless other arrangements have been made, this shall cause the controlling process to  
 6704 terminate (see *exit()*). Any subsequent read from the terminal device shall return the value of  
 6705 zero, indicating end-of-file; see *read()*. Thus, processes that read a terminal file and test for end-  
 6706 of-file can terminate appropriately after a disconnect. If the EIO condition as specified in *read()*  
 6707 also exists, it is unspecified whether on EOF condition or [EIO] is returned. Any subsequent  
 6708 *write()* to the terminal device shall return  $-1$ , with *errno* set to [EIO], until the device is closed.

6709 **11.1.11 Closing a Terminal Device File**

6710 The last process to close a terminal device file shall cause any output to be sent to the device and  
 6711 any input to be discarded. If HUPCL is set in the control modes and the communications port  
 6712 supports a disconnect function, the terminal device shall perform a disconnect.

6713 **11.2 Parameters that Can be Set**6714 **11.2.1 The termios Structure**

6715 Routines that need to control certain terminal I/O characteristics shall do so by using the  
 6716 **termios** structure as defined in the `<termios.h>` header.

6717 Since the **termios** structure may include additional members, and the standard members may  
 6718 include both standard and non-standard modes, the structure should never be initialized  
 6719 directly by the application as this may cause the terminal to behave in a non-conforming  
 6720 manner. When opening a terminal device (other than a pseudo-terminal) that is not already open  
 6721 in any process, it should be opened with the `O_TTY_INIT` flag before initializing the structure  
 6722 using *tcgetattr()* to ensure that any non-standard elements of the **termios** structure are set to  
 6723 values that result in conforming behavior of the terminal interface.

6724 The members of the **termios** structure include (but are not limited to):

Member Type	Array Size	Member Name	Description
<code>tcflag_t</code>		<i>c_iflag</i>	Input modes.
<code>tcflag_t</code>		<i>c_oflag</i>	Output modes.
<code>tcflag_t</code>		<i>c_cflag</i>	Control modes.
<code>tcflag_t</code>		<i>c_lflag</i>	Local modes.
<code>cc_t</code>	NCCS	<i>c_cc[ ]</i>	Control characters.

6732 The `tcflag_t` and `cc_t` types are defined in the `<termios.h>` header. They shall be unsigned  
 6733 integer types.

6734 **11.2.2 Input Modes**

6735 Values of the *c\_flag* field describe the basic terminal input control, and are composed of the  
 6736 bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name  
 6737 symbols in this table are defined in [<termios.h>](#):

Mask Name	Description
BRKINT	Signal interrupt on break.
ICRNL	Map CR to NL on input.
IGNBRK	Ignore break condition.
IGNCR	Ignore CR.
IGNPAR	Ignore characters with parity errors.
INLCR	Map NL to CR on input.
INPCK	Enable input parity check.
ISTRIP	Strip character.
IXANY	Enable any character to restart output.
IXOFF	Enable start/stop input control.
IXON	Enable start/stop output control.
PARMRK	Mark parity errors.

6751 In the context of asynchronous serial data transmission, a break condition shall be defined as a  
 6752 sequence of zero-valued bits that continues for more than the time to send one byte. The entire  
 6753 sequence of zero-valued bits is interpreted as a single break condition, even if it continues for a  
 6754 time equivalent to more than one byte. In contexts other than asynchronous serial data  
 6755 transmission, the definition of a break condition is implementation-defined.

6756 If IGNBRK is set, a break condition detected on input shall be ignored; that is, not put on the  
 6757 input queue and therefore not read by any process. If IGNBRK is not set and BRKINT is set, the  
 6758 break condition shall flush the input and output queues, and if the terminal is the controlling  
 6759 terminal of a foreground process group, the break condition shall generate a single SIGINT  
 6760 signal to that foreground process group. If neither IGNBRK nor BRKINT is set, a break  
 6761 condition shall be read as a single 0x00, or if PARMRK is set, as 0xff 0x00 0x00.

6762 If IGNPAR is set, a byte with a framing or parity error (other than break) shall be ignored.

6763 If PARMRK is set, and IGNPAR is not set, a byte with a framing or parity error (other than  
 6764 break) shall be given to the application as the three-byte sequence 0xff 0x00 X, where 0xff 0x00 is  
 6765 a two-byte flag preceding each sequence and X is the data of the byte received in error. To avoid  
 6766 ambiguity in this case, if ISTRIP is not set, a valid byte of 0xff is given to the application as 0xff  
 6767 0xff. If neither PARMRK nor IGNPAR is set, a framing or parity error (other than break) shall be  
 6768 given to the application as a single byte 0x00.

6769 If INPCK is set, input parity checking shall be enabled. If INPCK is not set, input parity checking  
 6770 shall be disabled, allowing output parity generation without input parity errors. Note that  
 6771 whether input parity checking is enabled or disabled is independent of whether parity detection  
 6772 is enabled or disabled (see [Section 11.2.4](#), on page 209). If parity detection is enabled but input  
 6773 parity checking is disabled, the hardware to which the terminal is connected shall recognize the  
 6774 parity bit, but the terminal special file shall not check whether or not this bit is correctly set.

6775 If ISTRIP is set, valid input bytes shall first be stripped to seven bits; otherwise, all eight bits  
 6776 shall be processed.

6777 If INLCR is set, a received NL character shall be translated into a CR character. If IGNCR is set, a  
 6778 received CR character shall be ignored (not read). If IGNCR is not set and ICRNL is set, a  
 6779 received CR character shall be translated into an NL character.

6780 If IXANY is set, any input character shall restart output that has been suspended.

6781 If IXON is set, start/stop output control shall be enabled. A received STOP character shall  
 6782 suspend output and a received START character shall restart output. When IXON is set, START  
 6783 and STOP characters are not read, but merely perform flow control functions. When IXON is not  
 6784 set, the START and STOP characters shall be read.

6785 If IXOFF is set, start/stop input control shall be enabled. The system shall transmit STOP  
 6786 characters, which are intended to cause the terminal device to stop transmitting data, as needed  
 6787 to prevent the input queue from overflowing and causing implementation-defined behavior,  
 6788 and shall transmit START characters, which are intended to cause the terminal device to resume  
 6789 transmitting data, as soon as the device can continue transmitting data without risk of  
 6790 overflowing the input queue. The precise conditions under which STOP and START characters  
 6791 are transmitted are implementation-defined.

6792 The initial input control value after *open()* is implementation-defined.

### 6793 11.2.3 Output Modes

6794 The *c\_oflag* field specifies the terminal interface's treatment of output, and is composed of the  
 6795 bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name  
 6796 symbols in the following table are defined in `<termios.h>`:

Mask Name	Description
OPOST	Perform output processing.
XSI ONLCR	Map NL to CR-NL on output.
OCRNL	Map CR to NL on output.
ONOCR	No CR output at column 0.
ONLRET	NL performs CR function.
OFILL	Use fill characters for delay.
OFDEL	Fill is DEL, else NUL.
NLDLY	Select newline delays:
NL0	Newline character type 0.
NL1	Newline character type 1.
CRDLY	Select carriage-return delays:
CR0	Carriage-return delay type 0.
CR1	Carriage-return delay type 1.
CR2	Carriage-return delay type 2.
CR3	Carriage-return delay type 3.
TABDLY	Select horizontal-tab delays:
TAB0	Horizontal-tab delay type 0.
TAB1	Horizontal-tab delay type 1.
TAB2	Horizontal-tab delay type 2.
TAB3	Expand tabs to spaces.
BSDLY	Select backspace delays:
BS0	Backspace-delay type 0.
BS1	Backspace-delay type 1.
VTDLY	Select vertical-tab delays:
VT0	Vertical-tab delay type 0.
VT1	Vertical-tab delay type 1.
FFDLY	Select form-feed delays:
FF0	Form-feed delay type 0.
FF1	Form-feed delay type 1.

6827 If OPOST is set, output data shall be post-processed as described below, so that lines of text are  
 6828 modified to appear appropriately on the terminal device; otherwise, characters shall be  
 6829 transmitted without change.

6830 XSI If ONLCR is set, the NL character shall be transmitted as the CR-NL character pair. If OCRNL is  
 6831 set, the CR character shall be transmitted as the NL character. If ONOCR is set, no CR character  
 6832 shall be transmitted when at column 0 (first position). If ONLRET is set, the NL character is  
 6833 assumed to do the carriage-return function; the column pointer shall be set to 0 and the delays  
 6834 specified for CR shall be used. Otherwise, the NL character is assumed to do just the line-feed  
 6835 function; the column pointer remains unchanged. The column pointer shall also be set to 0 if the  
 6836 CR character is actually transmitted.

6837 The delay bits specify how long transmission stops to allow for mechanical or other movement  
 6838 when certain characters are sent to the terminal. In all cases a value of 0 shall indicate no delay. If  
 6839 OFILL is set, fill characters shall be transmitted for delay instead of a timed delay. This is useful  
 6840 for high baud rate terminals which need only a minimal delay. If OFDEL is set, the fill character  
 6841 shall be DEL; otherwise, NUL.

6842 If a <form-feed> or <vertical-tab> delay is specified, it shall last for about 2 seconds.

6843 Newline delay shall last about 0.10 seconds. If ONLRET is set, the carriage-return delays shall be  
 6844 used instead of the newline delays. If OFILL is set, two fill characters shall be transmitted.

6845 Carriage-return delay type 1 shall be dependent on the current column position, type 2 shall be

6846 about 0.10 seconds, and type 3 shall be about 0.15 seconds. If OFILL is set, delay type 1 shall  
 6847 transmit two fill characters, and type 2 four fill characters.

6848 Horizontal-tab delay type 1 shall be dependent on the current column position. Type 2 shall be  
 6849 about 0.10 seconds. Type 3 specifies that <tab> characters shall be expanded into <space>  
 6850 characters. If OFILL is set, two fill characters shall be transmitted for any delay.

6851 Backspace delay shall last about 0.05 seconds. If OFILL is set, one fill character shall be  
 6852 transmitted.

6853 The actual delays depend on line speed and system load.

6854 The initial output control value after *open()* is implementation-defined.

#### 6855 11.2.4 Control Modes

6856 The *c\_cflag* field describes the hardware control of the terminal, and is composed of the bitwise-  
 6857 inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in  
 6858 this table are defined in <*termios.h*>; not all values specified are required to be supported by the  
 6859 underlying hardware (if any). If the terminal is a pseudo-terminal, it is unspecified whether non-  
 6860 default values are unsupported, or are supported and emulated in software, or are handled by  
 6861 *tcsetattr()*, *tcgetattr()*, and the *stty* utility as if they are supported but have no effect on the  
 6862 behavior of the terminal interface.

Mask Name	Description
CLOCAL	Ignore modem status lines.
CREAD	Enable receiver.
CSIZE	Number of bits transmitted or received per byte:
CS5	5 bits
CS6	6 bits
CS7	7 bits
CS8	8 bits.
CSTOPB	Send two stop bits, else one.
HUPCL	Hang up on last close.
PARENB	Parity enable.
PARODD	Odd parity, else even.

6875 In addition, the input and output baud rates are stored in the **termios** structure. The symbols in  
 6876 the following table are defined in <*termios.h*>. Not all values specified are required to be  
 6877 supported by the underlying hardware (if any). For pseudo-terminals, the input and output  
 6878 baud rates set in the **termios** structure need not affect the speed of data transmission through the  
 6879 terminal interface.

6880 **Note.** The term “baud” is used historically here, but is not technically correct. This is properly “bits  
 6881 per second”, which may not be the same as baud. However, the term is used because of the  
 6882 historical usage and understanding.

6883  
6884  
6885  
6886  
6887  
6888  
6889  
6890  
6891

Name	Description	Name	Description
B0	Hang up	B600	600 baud
B50	50 baud	B1200	1200 baud
B75	75 baud	B1800	1800 baud
B110	110 baud	B2400	2400 baud
B134	134.5 baud	B4800	4800 baud
B150	150 baud	B9600	9600 baud
B200	200 baud	B19200	19200 baud
B300	300 baud	B38400	38400 baud

6892 The following functions are provided for getting and setting the values of the input and output  
6893 baud rates in the **termios** structure: *cfgetispeed()*, *cfgetospeed()*, *cfsetispeed()*, and *cfsetospeed()*.  
6894 The effects on the terminal device shall not become effective and not all errors need be detected  
6895 until the *tcsetattr()* function is successfully called.

6896 The CSIZE bits shall specify the number of transmitted or received bits per byte. If ISTRIP is not  
6897 set, the value of all the other bits is unspecified. If ISTRIP is set, the value of all but the 7 low-  
6898 order bits shall be zero, but the value of any other bits beyond CSIZE is unspecified when read.  
6899 CSIZE shall not include the parity bit, if any. If CSTOPB is set, two stop bits shall be used;  
6900 otherwise, one stop bit. For example, at 110 baud, two stop bits are normally used.

6901 If CREAD is set, the receiver shall be enabled; otherwise, no characters shall be received.

6902 If PARENB is set, parity generation and detection shall be enabled and a parity bit is added to  
6903 each byte. If parity is enabled, PARODD shall specify odd parity if set; otherwise, even parity  
6904 shall be used.

6905 If HUPCL is set, the modem control lines for the port shall be lowered when the last process  
6906 with the port open closes the port or the process terminates. The modem connection shall be  
6907 broken.

6908 If CLOCAL is set, a connection shall not depend on the state of the modem status lines. If  
6909 CLOCAL is clear, the modem status lines shall be monitored.

6910 Under normal circumstances, a call to the *open()* function shall wait for the modem connection  
6911 to complete. However, if the O\_NONBLOCK flag is set (see *open()*) or if CLOCAL has been set,  
6912 the *open()* function shall return immediately without waiting for the connection.

6913 If the object for which the control modes are set is not an asynchronous serial connection, some  
6914 of the modes may be ignored; for example, if an attempt is made to set the baud rate on a  
6915 network connection to a terminal on another host, the baud rate need not be set on the  
6916 connection between that terminal and the machine to which it is directly connected.

6917 The initial hardware control value after *open()* is implementation-defined.

6918 **11.2.5 Local Modes**

6919 The *c\_lflag* field of the argument structure is used to control various functions. It is composed of  
6920 the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name  
6921 symbols in this table are defined in [<termios.h>](#).

6922  
6923  
6924  
6925  
6926  
6927  
6928  
6929  
6930  
6931

Mask Name	Description
ECHO	Enable echo.
ECHOE	Echo ERASE as an error correcting backspace.
ECHOK	Echo KILL.
ECHONL	Echo <newline>.
ICANON	Canonical input (erase and kill processing).
IEXTEN	Enable extended (implementation-defined) functions.
ISIG	Enable signals.
NOFLSH	Disable flush after interrupt, quit, or suspend.
TOSTOP	Send SIGTTOU for background output.

6932 If ECHO is set, input characters shall be echoed back to the terminal. If ECHO is clear, input  
6933 characters shall not be echoed.

6934 If ECHOE and ICANON are set, the ERASE character shall cause the terminal to erase, if  
6935 possible, the last character in the current line from the display. If there is no character to erase, an  
6936 implementation may echo an indication that this was the case, or do nothing.

6937 If ECHOK and ICANON are set, the KILL character shall either cause the terminal to erase the  
6938 line from the display or shall echo the <newline> character after the KILL character.

6939 If ECHONL and ICANON are set, the <newline> character shall be echoed even if ECHO is not  
6940 set.

6941 If ICANON is set, canonical processing shall be enabled. This enables the erase and kill edit  
6942 functions, and the assembly of input characters into lines delimited by NL, EOF, and EOL, as  
6943 described in [Section 11.1.6](#) (on page 202).

6944 If ICANON is not set, read requests shall be satisfied directly from the input queue. A read shall  
6945 not be satisfied until at least MIN bytes have been received or the timeout value TIME expired  
6946 between bytes. The time value represents tenths of a second. See [Section 11.1.7](#) (on page 202) for  
6947 more details.

6948 If IEXTEN is set, implementation-defined functions shall be recognized from the input data. It is  
6949 implementation-defined how IEXTEN being set interacts with ICANON, ISIG, IXON, or IXOFF.  
6950 If IEXTEN is not set, implementation-defined functions shall not be recognized and the  
6951 corresponding input characters are processed as described for ICANON, ISIG, IXON, and  
6952 IXOFF.

6953 If ISIG is set, each input character shall be checked against the special control characters INTR,  
6954 QUIT, and SUSP. If an input character matches one of these control characters, the function  
6955 associated with that character shall be performed. If ISIG is not set, no checking shall be done.  
6956 Thus these special input functions are possible only if ISIG is set.

6957 If NOFLSH is set, the normal flush of the input and output queues associated with the INTR,  
6958 QUIT, and SUSP characters shall not be done.

6959 If TOSTOP is set, the signal SIGTTOU shall be sent to the process group of a process that tries to  
6960 write to its controlling terminal if it is not in the foreground process group for that terminal. This  
6961 signal, by default, stops the members of the process group. Otherwise, the output generated by  
6962 that process shall be output to the current output stream. Processes that are blocking or ignoring  
6963 SIGTTOU signals are excepted and allowed to produce output, and the SIGTTOU signal shall  
6964 not be sent.

6965 The initial local control value after *open()* is implementation-defined.

6966 **11.2.6 Special Control Characters**

6967 The special control character values shall be defined by the array *c\_cc*. The subscript name and  
 6968 description for each element in both canonical and non-canonical modes are as follows:

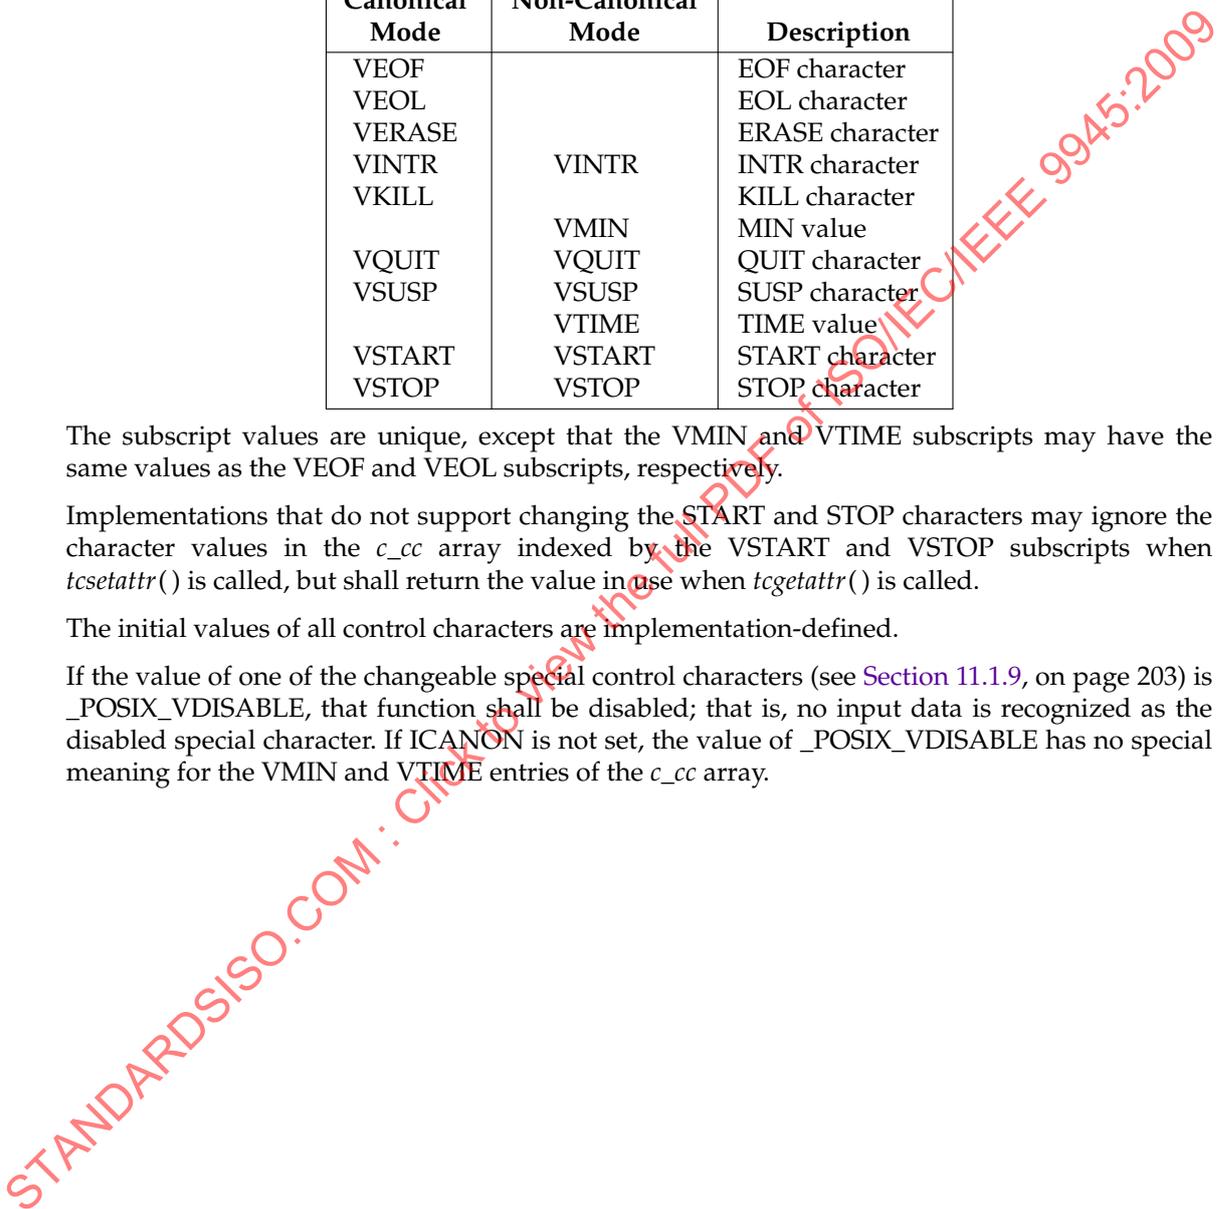

Subscript Usage		Description
Canonical Mode	Non-Canonical Mode	
VEOF		EOF character
VEOL		EOL character
VERASE		ERASE character
VINTR	VINTR	INTR character
VKILL		KILL character
	VMIN	MIN value
VQUIT	VQUIT	QUIT character
VSUSP	VSUSP	SUSP character
	VTIME	TIME value
VSTART	VSTART	START character
VSTOP	VSTOP	STOP character

6983 The subscript values are unique, except that the VMIN and VTIME subscripts may have the  
 6984 same values as the VEOF and VEOL subscripts, respectively.

6985 Implementations that do not support changing the START and STOP characters may ignore the  
 6986 character values in the *c\_cc* array indexed by the VSTART and VSTOP subscripts when  
 6987 *tcsetattr()* is called, but shall return the value in use when *tcgetattr()* is called.

6988 The initial values of all control characters are implementation-defined.

6989 If the value of one of the changeable special control characters (see Section 11.1.9, on page 203) is  
 6990 `_POSIX_VDISABLE`, that function shall be disabled; that is, no input data is recognized as the  
 6991 disabled special character. If ICANON is not set, the value of `_POSIX_VDISABLE` has no special  
 6992 meaning for the VMIN and VTIME entries of the *c\_cc* array.

## 12.1 Utility Argument Syntax

This section describes the argument syntax of the standard utilities and introduces terminology used throughout POSIX.1-2008 for describing the arguments processed by the utilities.

Within POSIX.1-2008, a special notation is used for describing the syntax of a utility's arguments. Unless otherwise noted, all utility descriptions use this notation, which is illustrated by this example (see XCU Section 2.9.1, on page 2316):

```
utility_name [-a] [-b] [-c option_argument]
             [-d|-e] [-f [option_argument]] [operand...]
```

The notation used for the SYNOPSIS sections imposes requirements on the implementors of the standard utilities and provides a simple reference for the application developer or system user.

1. The utility in the example is named *utility\_name*. It is followed by options, option-arguments, and operands. The arguments that consist of <hyphen> characters and single letters or digits, such as 'a', are known as "options" (or, historically, "flags"). Certain options are followed by an "option-argument", as shown with [-c *option\_argument*]. The arguments following the last options and option-arguments are named "operands".
2. Option-arguments are shown separated from their options by <blank> characters, except when the option-argument is enclosed in the '[' and ']' notation to indicate that it is optional. This reflects the situation in which an optional option-argument (if present) is included within the same argument string as the option; for a mandatory option-argument, it is the next argument. The Utility Syntax Guidelines in Section 12.2 (on page 215) require that the option be a separate argument from its option-argument and that option-arguments not be optional, but there are some exceptions in POSIX.1-2008 to ensure continued operation of historical applications:
  - a. If the SYNOPSIS of a standard utility shows an option with a mandatory option-argument (as with [-c *option\_argument*] in the example), a conforming application shall use separate arguments for that option and its option-argument. However, a conforming implementation shall also permit applications to specify the option and option-argument in the same argument string without intervening <blank> characters.
  - b. If the SYNOPSIS shows an optional option-argument (as with [-f[*option\_argument*]] in the example), a conforming application shall place any option-argument for that option directly adjacent to the option in the same argument string, without intervening <blank> characters. If the utility receives an argument containing only the option, it shall behave as specified in its description for an omitted option-argument; it shall not treat the next argument (if any) as the option-argument for that option.

- 7031 3. Options are usually listed in alphabetical order unless this would make the utility  
 7032 description more confusing. There are no implied relationships between the options  
 7033 based upon the order in which they appear, unless otherwise stated in the OPTIONS  
 7034 section, or unless the exception in Guideline 11 of Section 12.2 (on page 215) applies. If an  
 7035 option that does not have option-arguments is repeated, the results are undefined, unless  
 7036 otherwise stated.
- 7037 4. Frequently, names of parameters that require substitution by actual values are shown  
 7038 with embedded <underscore> characters. Alternatively, parameters are shown as follows:  
 7039  
 <parameter name>
- 7040 The angle brackets are used for the symbolic grouping of a phrase representing a single  
 7041 parameter and conforming applications shall not include them in data submitted to the  
 7042 utility.
- 7043 5. When a utility has only a few permissible options, they are sometimes shown  
 7044 individually, as in the example. Utilities with many flags generally show all of the  
 7045 individual flags (that do not take option-arguments) grouped, as in:  
 7046  
 utility\_name [-abcDxyz] [-p arg] [operand]
- 7047 Utilities with very complex arguments may be shown as follows:  
 7048  
 utility\_name [options] [operands]
- 7049 6. Unless otherwise specified, whenever an operand or option-argument is, or contains, a  
 7050 numeric value:
- 7051 • The number is interpreted as a decimal integer.
  - 7052 • Numerals in the range 0 to 2147483647 are syntactically recognized as numeric  
 7053 values.
  - 7054 • When the utility description states that it accepts negative numbers as operands or  
 7055 option-arguments, numerals in the range -2147483647 to 2147483647 are  
 7056 syntactically recognized as numeric values.
  - 7057 • Ranges greater than those listed here are allowed.
- 7058 This does not mean that all numbers within the allowable range are necessarily  
 7059 semantically correct. A standard utility that accepts an option-argument or operand that  
 7060 is to be interpreted as a number, and for which a range of values smaller than that shown  
 7061 above is permitted by the POSIX.1-2008, describes that smaller range along with the  
 7062 description of the option-argument or operand. If an error is generated, the utility's  
 7063 diagnostic message shall indicate that the value is out of the supported range, not that it  
 7064 is syntactically incorrect.
- 7065 7. Arguments or option-arguments enclosed in the ' [ ' and ' ] ' notation are optional and  
 7066 can be omitted. Conforming applications shall not include the ' [ ' and ' ] ' symbols in  
 7067 data submitted to the utility.
- 7068 8. Arguments separated by the ' | ' (<vertical-line>) bar notation are mutually-exclusive.  
 7069 Conforming applications shall not include the ' | ' symbol in data submitted to the utility.  
 7070 Alternatively, mutually-exclusive options and operands may be listed with multiple  
 7071 synopsis lines.

7072 For example:

```
7073 utility_name -d[-a] [-c option_argument] [operand...]
7074 utility_name [-a] [-b] [operand...]
```

7075 When multiple synopsis lines are given for a utility, it is an indication that the utility has  
 7076 mutually-exclusive arguments. These mutually-exclusive arguments alter the  
 7077 functionality of the utility so that only certain other arguments are valid in combination  
 7078 with one of the mutually-exclusive arguments. Only one of the mutually-exclusive  
 7079 arguments is allowed for invocation of the utility. Unless otherwise stated in an  
 7080 accompanying OPTIONS section, the relationships between arguments depicted in the  
 7081 SYNOPSIS sections are mandatory requirements placed on conforming applications. The  
 7082 use of conflicting mutually-exclusive arguments produces undefined results, unless a  
 7083 utility description specifies otherwise. When an option is shown without the '[' and  
 7084 ']' brackets, it means that option is required for that version of the SYNOPSIS. However,  
 7085 it is not required to be the first argument, as shown in the example above, unless  
 7086 otherwise stated.

7087 9. Ellipses ("...") are used to denote that one or more occurrences of an operand are  
 7088 allowed. When an option or an operand followed by ellipses is enclosed in brackets, zero  
 7089 or more options or operands can be specified. The form:

```
7090 utility_name [-g option_argument]... [operand...]
```

7091 indicates that multiple occurrences of the option and its option-argument preceding the  
 7092 ellipses are valid, with semantics as indicated in the OPTIONS section of the utility. (See  
 7093 also Guideline 11 in Section 12.2.)

7094 The form:

```
7095 utility_name -f option_argument [-f option_argument]... [operand...]
```

7096 indicates that the `-f` option is required to appear at least once and may appear multiple  
 7097 times.

7098 10. When the synopsis line is too long to be printed on a single line in the Shell and Utilities  
 7099 volume of POSIX.1-2008, the indented lines following the initial line are continuation  
 7100 lines. An actual use of the command would appear on a single logical line.

## 7101 12.2 Utility Syntax Guidelines

7102 The following guidelines are established for the naming of utilities and for the specification of  
 7103 options, option-arguments, and operands. The `getopt()` function in the System Interfaces  
 7104 volume of POSIX.1-2008 assists utilities in handling options and operands that conform to these  
 7105 guidelines.

7106 Operands and option-arguments can contain characters not specified in the portable character  
 7107 set.

7108 The guidelines are intended to provide guidance to the authors of future utilities, such as those  
 7109 written specific to a local system or that are components of a larger application. Some of the  
 7110 standard utilities do not conform to all of these guidelines; in those cases, the OPTIONS sections  
 7111 describe the deviations.

*Utility Conventions**Utility Syntax Guidelines*

7156 It is recommended that all future utilities and applications use these guidelines to enhance user  
7157 portability. The fact that some historical utilities could not be changed (to avoid breaking  
7158 existing applications) should not deter this future goal.

Chapter 13

7160

**Headers**

7161

This chapter describes the contents of headers.

7162

7163

7164

7165

7166

Headers contain function prototypes, the definition of symbolic constants, common structures, preprocessor macros, and defined types. Each function in the System Interfaces volume of POSIX.1-2008 specifies the headers that an application shall include in order to use that function. In most cases, only one header is required. These headers are present on an application development system; they need not be present on the target execution system.

7167

**Format of Entries**

7168

7169

The entries in this chapter are based on a common format as follows. The only sections relating to conformance are the SYNOPSIS and DESCRIPTION.

7170

**NAME**

7171

This section gives the name or names of the entry and briefly states its purpose.

7172

**SYNOPSIS**

7173

This section summarizes the use of the entry being described.

7174

**DESCRIPTION**

7175

This section describes the functionality of the header.

7176

**APPLICATION USAGE**

7177

7178

7179

7180

This section is informative. This section gives warnings and advice to application developers about the entry. In the event of conflict between warnings and advice and a normative part of this volume of POSIX.1-2008, the normative material is to be taken as correct.

7181

**RATIONALE**

7182

7183

7184

This section is informative. This section contains historical information concerning the contents of this volume of POSIX.1-2008 and why features were included or discarded by the standard developers.

7185

**FUTURE DIRECTIONS**

7186

7187

7188

This section is informative. This section provides comments which should be used as a guide to current thinking; there is not necessarily a commitment to adopt these future directions.

7189

**SEE ALSO**

7190

This section is informative. This section gives references to related information.

7191

**CHANGE HISTORY**

7192

7193

This section is informative. This section shows the derivation of the entry and any significant changes that have been made to it.

## 7194 NAME

7195 aio.h — asynchronous input and output

## 7196 SYNOPSIS

7197 #include &lt;aio.h&gt;

## 7198 DESCRIPTION

7199 The <aio.h> header shall define the **aio\_cb** structure, which shall include at least the following  
7200 members:

7201	int	aio_fildes	File descriptor.
7202	off_t	aio_offset	File offset.
7203	volatile void *	aio_buf	Location of buffer.
7204	size_t	aio_nbytes	Length of transfer.
7205	int	aio_reqprio	Request priority offset.
7206	struct sigevent	aio_sigevent	Signal number and value.
7207	int	aio_lio_opcode	Operation to be performed.

7208 The <aio.h> header shall define the **off\_t**, **pthread\_attr\_t**, **size\_t**, and **ssize\_t** types as described  
7209 in <sys/types.h>.7210 The <aio.h> header shall define the **struct timespec** structure as described in <time.h>.7211 The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which  
7212 are described in the <signal.h> header.

7213 The &lt;aio.h&gt; header shall define the following symbolic constants:

7214 AIO\_ALLDONE A return value indicating that none of the requested operations could be  
7215 canceled since they are already complete.7216 AIO\_CANCELED A return value indicating that all requested operations have been  
7217 canceled.

7218 AIO\_NOTCANCELED

7219 A return value indicating that some of the requested operations could not  
7220 be canceled since they are in progress.7221 LIO\_NOP A *lio\_listio()* element operation option indicating that no transfer is  
7222 requested.7223 LIO\_NOWAIT A *lio\_listio()* synchronization operation indicating that the calling thread  
7224 is to continue execution while the *lio\_listio()* operation is being  
7225 performed, and no notification is given when the operation is complete.7226 LIO\_READ A *lio\_listio()* element operation option requesting a read.7227 LIO\_WAIT A *lio\_listio()* synchronization operation indicating that the calling thread  
7228 is to suspend until the *lio\_listio()* operation is complete.7229 LIO\_WRITE A *lio\_listio()* element operation option requesting a write.7230 The following shall be declared as functions and may also be defined as macros. Function  
7231 prototypes shall be provided.

```

7232 int aio_cancel(int, struct aiocb *);
7233 int aio_error(const struct aiocb *);
7234 int aio_fsync(int, struct aiocb *);
7235 int aio_read(struct aiocb *);
7236 ssize_t aio_return(struct aiocb *);
7237 int aio_suspend(const struct aiocb *const [], int,
```

```

7238             const struct timespec *);
7239 int         aio_write(struct aiocb *);
7240 int         lio_listio(int, struct aiocb *restrict const [restrict], int,
7241             struct sigevent *restrict);

```

7242 Inclusion of the <aio.h> header may make visible symbols defined in the headers <fcntl.h>, <signal.h>, and <time.h>.

#### 7244 APPLICATION USAGE

7245 None.

#### 7246 RATIONALE

7247 None.

#### 7248 FUTURE DIRECTIONS

7249 None.

#### 7250 SEE ALSO

7251 <fcntl.h>, <signal.h>, <sys/types.h>, <time.h>

7252 XSH *aio\_cancel()*, *aio\_error()*, *aio\_fsync()*, *aio\_read()*, *aio\_return()*, *aio\_suspend()*, *aio\_write()*,  
7253 *fsync()*, *lio\_listio()*, *lseek()*, *read()*, *write()*

#### 7254 CHANGE HISTORY

7255 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

#### 7256 Issue 6

7257 The <aio.h> header is marked as part of the Asynchronous Input and Output option.

7258 The description of the constants is expanded.

7259 The **restrict** keyword is added to the prototype for *lio\_listio()*.

#### 7260 Issue 7

7261 The <aio.h> header is moved from the Asynchronous Input and Output option to the Base.

7262 This reference page is clarified with respect to macros and symbolic constants, and type and  
7263 structure declarations are added.

**<arpa/inet.h>**

Headers

7264 **NAME**

7265 arpa/inet.h — definitions for internet operations

7266 **SYNOPSIS**

7267 #include &lt;arpa/inet.h&gt;

7268 **DESCRIPTION**7269 The **<arpa/inet.h>** header shall define the **in\_port\_t** and **in\_addr\_t** types as described in  
7270 **<netinet/in.h>**.7271 The **<arpa/inet.h>** header shall define the **in\_addr** structure as described in **<netinet/in.h>**.7272 IP6 The **<arpa/inet.h>** header shall define the **INET\_ADDRSTRLEN** and **INET6\_ADDRSTRLEN**  
7273 macros as described in **<netinet/in.h>**.7274 The following shall be declared as functions, or defined as macros, or both. If functions are  
7275 declared, function prototypes shall be provided.7276 uint32\_t htonl(uint32\_t);  
7277 uint16\_t htons(uint16\_t);  
7278 uint32\_t ntohl(uint32\_t);  
7279 uint16\_t ntohs(uint16\_t);7280 The **<arpa/inet.h>** header shall define the **uint32\_t** and **uint16\_t** types as described in  
7281 **<inttypes.h>**.7282 The following shall be declared as functions and may also be defined as macros. Function  
7283 prototypes shall be provided.7284 in\_addr\_t inet\_addr(const char \*);  
7285 char \*inet\_ntoa(struct in\_addr);  
7286 const char \*inet\_ntop(int, const void \*restrict, char \*restrict,  
7287 socklen\_t);  
7288 int inet\_pton(int, const char \*restrict, void \*restrict);7289 Inclusion of the **<arpa/inet.h>** header may also make visible all symbols from **<netinet/in.h>**  
7290 and **<inttypes.h>**.7291 **APPLICATION USAGE**

7292 None.

7293 **RATIONALE**

7294 None.

7295 **FUTURE DIRECTIONS**

7296 None.

7297 **SEE ALSO**7298 **<inttypes.h>**, **<netinet/in.h>**7299 XSH **htonl()**, **inet\_addr()**, **inet\_ntop()**7300 **CHANGE HISTORY**

7301 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

7302 The **restrict** keyword is added to the prototypes for **inet\_ntop()** and **inet\_pton()**.7303 **Issue 7**

7304 SD5-XBD-ERN-6 is applied.

7305 **NAME**

7306           assert.h — verify program assertion

7307 **SYNOPSIS**

7308           #include &lt;assert.h&gt;

7309 **DESCRIPTION**7310 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
7311 conflict between the requirements described here and the ISO C standard is unintentional. This  
7312 volume of POSIX.1-2008 defers to the ISO C standard.7313           The <assert.h> header shall define the *assert()* macro. It refers to the macro NDEBUG which is  
7314 not defined in the header. If NDEBUG is defined as a macro name before the inclusion of this  
7315 header, the *assert()* macro shall be defined simply as:

7316           #define assert(ignore) ((void) 0)

7317           Otherwise, the macro behaves as described in *assert()*.7318           The *assert()* macro shall be redefined according to the current state of NDEBUG each time  
7319 <assert.h> is included.7320           The *assert()* macro shall be implemented as a macro, not as a function. If the macro definition is  
7321 suppressed in order to access an actual function, the behavior is undefined.7322 **APPLICATION USAGE**

7323           None.

7324 **RATIONALE**

7325           None.

7326 **FUTURE DIRECTIONS**

7327           None.

7328 **SEE ALSO**7329           XSH *assert()*7330 **CHANGE HISTORY**

7331           First released in Issue 1. Derived from Issue 1 of the SVID.

7332 **Issue 6**7333           The definition of the *assert()* macro is changed for alignment with the ISO/IEC 9899:1999  
7334 standard.

**<complex.h>**7335 **NAME**7336 `complex.h` — complex arithmetic7337 **SYNOPSIS**7338 `#include <complex.h>`7339 **DESCRIPTION**

7340 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 7341 conflict between the requirements described here and the ISO C standard is unintentional. This  
 7342 volume of POSIX.1-2008 defers to the ISO C standard.

7343 The **<complex.h>** header shall define the following macros:7344 `complex` Expands to `_Complex`.7345 `_Complex_I` Expands to a constant expression of type `const float _Complex`, with the value  
7346 of the imaginary unit (that is, a number  $i$  such that  $i^2 = -1$ ).7347 `imaginary` Expands to `_Imaginary`.7348 `_Imaginary_I` Expands to a constant expression of type `const float _Imaginary` with the  
7349 value of the imaginary unit.7350 `I` Expands to either `_Imaginary_I` or `_Complex_I`. If `_Imaginary_I` is not defined,  
7351 `I` expands to `_Complex_I`.7352 The macros `imaginary` and `_Imaginary_I` shall be defined if and only if the implementation  
7353 supports imaginary types.7354 An application may undefine and then, perhaps, redefine the `complex`, `imaginary`, and `I` macros.7355 The following shall be declared as functions and may also be defined as macros. Function  
7356 prototypes shall be provided.

```

7357 double          cabs(double complex);
7358 float           cabsf(float complex);
7359 long double     cabsl(long double complex);
7360 double complex cacos(double complex);
7361 float complex  cacosf(float complex);
7362 double complex cacosh(double complex);
7363 float complex  cacoshf(float complex);
7364 long double complex cacoshl(long double complex);
7365 long double complex cacosl(long double complex);
7366 double         carg(double complex);
7367 float          cargf(float complex);
7368 long double    cargl(long double complex);
7369 double complex casin(double complex);
7370 float complex casinf(float complex);
7371 double complex casinh(double complex);
7372 float complex casinhf(float complex);
7373 long double complex casinhl(long double complex);
7374 long double complex casinl(long double complex);
7375 double complex catan(double complex);
7376 float complex  catanf(float complex);
7377 double complex catanh(double complex);
7378 float complex  catanhf(float complex);
7379 long double complex catanhl(long double complex);
7380 long double complex catanl(long double complex);

```

7409	float complex	csinf(float complex);
7410	double complex	csinh(double complex);
7411	float complex	csinhf(float complex);
7412	long double complex	csinhl(long double complex);
7413	long double complex	csinl(long double complex);
7414	double complex	csqrt(double complex);
7415	float complex	csqrtf(float complex);
7416	long double complex	csqrtl(long double complex);
7417	double complex	ctan(double complex);
7418	float complex	ctanf(float complex);
7419	double complex	ctanh(double complex);
7420	float complex	ctanhf(float complex);
7421	long double complex	ctanhl(long double complex);
7422	long double complex	ctanl(long double complex);

**<complex.h>**7423 **APPLICATION USAGE**

7424 Values are interpreted as radians, not degrees.

7425 **RATIONALE**7426 The choice of *I* instead of *i* for the imaginary unit concedes to the widespread use of the  
7427 identifier *i* for other purposes. The application can use a different identifier, say *j*, for the  
7428 imaginary unit by following the inclusion of the **<complex.h>** header with:7429 

```
#undef I
7430 #define j _Imaginary_I
```

7431 An *I* suffix to designate imaginary constants is not required, as multiplication by *I* provides a  
7432 sufficiently convenient and more generally useful notation for imaginary terms. The  
7433 corresponding real type for the imaginary unit is **float**, so that use of *I* for algorithmic or  
7434 notational convenience will not result in widening types.7435 On systems with imaginary types, the application has the ability to control whether use of the  
7436 macro *I* introduces an imaginary type, by explicitly defining *I* to be `_Imaginary_I` or `_Complex_I`.  
7437 Disallowing imaginary types is useful for some applications intended to run on  
7438 implementations without support for such types.7439 The macro `_Imaginary_I` provides a test for whether imaginary types are supported.7440 The `cis()` function ( $\cos(x) + I*\sin(x)$ ) was considered but rejected because its implementation is  
7441 easy and straightforward, even though some implementations could compute sine and cosine  
7442 more efficiently in tandem.7443 **FUTURE DIRECTIONS**7444 The following function names and the same names suffixed with *f* or *l* are reserved for future  
7445 use, and may be added to the declarations in the **<complex.h>** header.7446 

<code>cerf()</code>	<code>cexpm1()</code>	<code>clog2()</code>
<code>cerfc()</code>	<code>clog10()</code>	<code>clgamma()</code>
<code>cexp2()</code>	<code>clog1p()</code>	<code>ctgamma()</code>

7451 `cimag()`, `clog()`, `conj()`, `cpow()`, `cproj()`, `creal()`, `csin()`, `csinh()`, `csqrt()`, `ctan()`, `ctanh()`7452 **CHANGE HISTORY**

7453 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

## Headers

## &lt;cpio.h&gt;

7454 **NAME**

7455 cpio.h — cpio archive values

7456 **SYNOPSIS**

7457 #include &lt;cpio.h&gt;

7458 **DESCRIPTION**7459 The <cpio.h> header shall define the symbolic constants needed by the *c\_mode* field of the *cpio*  
7460 archive format, with the names and values given in the following table:

Name	Description	Value (Octal)
C_IRUSR	Read by owner.	0000400
C_IWUSR	Write by owner.	0000200
C_IXUSR	Execute by owner.	0000100
C_IRGRP	Read by group.	0000040
C_IWGRP	Write by group.	0000020
C_IXGRP	Execute by group.	0000010
C_IROTH	Read by others.	0000004
C_IWOTH	Write by others.	0000002
C_IXOTH	Execute by others.	0000001
C_ISUID	Set user ID.	0004000
C_ISGID	Set group ID.	0002000
C_ISVTX	On directories, restricted deletion flag.	0001000
C_ISDIR	Directory.	0040000
C_ISFIFO	FIFO.	0010000
C_ISREG	Regular file.	0100000
C_ISBLK	Block special.	0060000
C_ISCHR	Character special.	0020000
C_ISCTG	Reserved.	0110000
C_ISLNK	Symbolic link.	0120000
C_ISSOCK	Socket.	0140000

7482 The &lt;cpio.h&gt; header shall define the following symbolic constant as a string:

7483 MAGIC "070707"

7484 **APPLICATION USAGE**

7485 None.

7486 **RATIONALE**

7487 None.

7488 **FUTURE DIRECTIONS**

7489 None.

7490 **SEE ALSO**7491 XCU *pax*7492 **CHANGE HISTORY**7493 First released in the Headers Interface, Issue 3 specification. Derived from the POSIX.1-1988  
7494 standard.7495 **Issue 6**7496 The SEE ALSO is updated to refer to *pax*.

**<pio.h>**

*Headers*

7497 **Issue 7**

7498 The **<pio.h>** header is moved from the XSI option to the Base.

7499 This reference page is clarified with respect to macros and symbolic constants.

## Headers

## &lt;ctype.h&gt;

## 7500 NAME

7501           ctype.h — character types

## 7502 SYNOPSIS

7503           #include &lt;ctype.h&gt;

## 7504 DESCRIPTION

7505 CX       Some of the functionality described on this reference page extends the ISO C standard.  
 7506       Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 7507       enable the visibility of these symbols in this header.

7508       The <ctype.h> header shall define the **locale\_t** type as described in <locale.h>, representing a  
 7509       locale object.

7510       The following shall be declared as functions and may also be defined as macros. Function  
 7511       prototypes shall be provided for use with ISO C standard compilers.

```

7512       int    isalnum(int);
7513 CX       int    isalnum_l(int, locale_t);
7514       int    isalpha(int);
7515 CX       int    isalpha_l(int, locale_t);
7516 OB XSI   int    isascii(int);
7517       int    isblank(int);
7518 CX       int    isblank_l(int, locale_t);
7519       int    iscntrl(int);
7520 CX       int    iscntrl_l(int, locale_t);
7521       int    isdigit(int);
7522 CX       int    isdigit_l(int, locale_t);
7523       int    isgraph(int);
7524 CX       int    isgraph_l(int, locale_t);
7525       int    islower(int);
7526 CX       int    islower_l(int, locale_t);
7527       int    isprint(int);
7528 CX       int    isprint_l(int, locale_t);
7529       int    ispunct(int);
7530 CX       int    ispunct_l(int, locale_t);
7531       int    isspace(int);
7532 CX       int    isspace_l(int, locale_t);
7533       int    isupper(int);
7534 CX       int    isupper_l(int, locale_t);
7535       int    isxdigit(int);
7536 CX       int    isxdigit_l(int, locale_t);
7537 OB XSI   int    toascii(int);
7538       int    tolower(int);
7539 CX       int    tolower_l(int, locale_t);
7540       int    toupper(int);
7541 CX       int    toupper_l(int, locale_t);
  
```

7542       The <ctype.h> header shall define the following as macros:

```

7543 OB XSI   int    __toupper(int);
7544       int    __tolower(int);
  
```

## &lt;ctype.h&gt;

7556 **CHANGE HISTORY**

7557 First released in Issue 1. Derived from Issue 1 of the SVID.

7558 **Issue 6**

7559 Extensions beyond the ISO C standard are marked.

7560 **Issue 7**

7561 SD5-XBD-ERN-6 is applied, updating the wording regarding the function declarations for  
 7562 consistency.

7563 The \*\_l() functions are added from The Open Group Technical Standard, 2006, Extended API Set  
 7564 Part 4.

7565 **NAME**7566 `dirent.h` — format of directory entries7567 **SYNOPSIS**7568 `#include <dirent.h>`7569 **DESCRIPTION**

7570 The internal format of directories is unspecified.

7571 The <**dirent.h**> header shall define the following type:7572 **DIR** A type representing a directory stream. The **DIR** type may be an incomplete type:7573 It shall also define the structure **dirent** which shall include the following members:7574 XSI `ino_t d_ino` File serial number.7575 `char d_name[]` Name of entry.7576 XSI The <**dirent.h**> header shall define the `ino_t` type as described in <**sys/types.h**>.7577 The character array `d_name` is of unspecified size, but the number of bytes preceding the terminating null byte shall not exceed `{NAME_MAX}`.

7579 The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```

7581 int      alphasort(const struct dirent **, const struct dirent **);
7582 int      closedir(DIR *);
7583 int      dirfd(DIR *);
7584 DIR      *fdopendir(int);
7585 DIR      *opendir(const char *);
7586 struct dirent *readdir(DIR *);
7587 int      readdir_r(DIR *restrict, struct dirent *restrict,
7588                struct dirent **restrict);
7589 void     rewinddir(DIR *);
7590 int      scandir(const char *, struct dirent ***,
7591                int (*)(const struct dirent *),
7592                int (*)(const struct dirent **),
7593                const struct dirent **);
7594 XSI     void seekdir(DIR *, long);
7595 long     telldir(DIR *);

```

7596 **APPLICATION USAGE**

7597 None.

7598 **RATIONALE**

7599 Information similar to that in the <**dirent.h**> header is contained in a file <**sys/dir.h**> in 4.2 BSD  
7600 and 4.3 BSD. The equivalent in these implementations of **struct dirent** from this volume of  
7601 POSIX.1-2008 is **struct direct**. The filename was changed because the name <**sys/dir.h**> was also  
7602 used in earlier implementations to refer to definitions related to the older access method; this  
7603 produced name conflicts. The name of the structure was changed because this volume of  
7604 POSIX.1-2008 does not completely define what is in the structure, so it could be different on  
7605 some implementations from **struct direct**.

7606 The name of an array of **char** of an unspecified size should not be used as an lvalue. Use of:7607 `sizeof(d_name)`

7608 is incorrect; use:

## &lt;dirent.h&gt;

Headers

7609            `strlen(d_name)`

7610            instead.

7611            The array of **char** *d\_name* is not a fixed size. Implementations may need to declare **struct dirent** with an array size for *d\_name* of 1, but the actual number of characters provided matches (or only slightly exceeds) the length of the filename.

7614    **FUTURE DIRECTIONS**

7615            None.

7616    **SEE ALSO**

7617            [<sys/types.h>](#)

7618            XSH *alphasort()*, *closedir()*, *dirfd()*, *fdopendir()*, *readdir()*, *rewinddir()*, *seekdir()*, *telldir()*

7619    **CHANGE HISTORY**

7620            First released in Issue 2.

7621    **Issue 5**

7622            The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

7623    **Issue 6**

7624            The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir\_r()*.

7625            The **restrict** keyword is added to the prototype for *readdir\_r()*.

7626    **Issue 7**

7627            The *alphasort()*, *dirfd()*, and *scandir()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

7629            The *fopendir()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

7631            Austin Group Interpretation 1003.1-2001 #110 is applied, clarifying the definition of the **DIR** type.

## Headers

## &lt;dlfcn.h&gt;

7633 **NAME**7634 `dlfcn.h` — dynamic linking7635 **SYNOPSIS**7636 `#include <dlfcn.h>`7637 **DESCRIPTION**7638 The `<dlfcn.h>` header shall define at least the following symbolic constants for use in the  
7639 construction of a `dlopen()` *mode* argument:7640 `RTLD_LAZY` Relocations are performed at an implementation-defined time.7641 `RTLD_NOW` Relocations are performed when the object is loaded.7642 `RTLD_GLOBAL` All symbols are available for relocation processing of other modules.7643 `RTLD_LOCAL` All symbols are not made available for relocation processing by other  
7644 modules.7645 The following shall be declared as functions and may also be defined as macros. Function  
7646 prototypes shall be provided.7647 `int dlclose(void *);`  
7648 `char *dlerror(void);`  
7649 `void *dlopen(const char *, int);`  
7650 `void *dlsym(void *restrict, const char *restrict);`7651 **APPLICATION USAGE**

7652 None.

7653 **RATIONALE**

7654 None.

7655 **FUTURE DIRECTIONS**

7656 None.

7657 **SEE ALSO**7658 XSH `dlclose()`, `dlerror()`, `dlopen()`, `dlsym()`7659 **CHANGE HISTORY**

7660 First released in Issue 5.

7661 **Issue 6**7662 The `restrict` keyword is added to the prototype for `dlsym()`.7663 **Issue 7**7664 The `<dlfcn.h>` header is moved from the XSI option to the Base.

7665 This reference page is clarified with respect to macros and symbolic constants.

**<errno.h>**7666 **NAME**7667 `errno.h` — system error numbers7668 **SYNOPSIS**7669 `#include <errno.h>`7670 **DESCRIPTION**7671 **CX** Some of the functionality described on this reference page extends the ISO C standard. Any  
7672 conflict between the requirements described here and the ISO C standard is unintentional. This  
7673 volume of POSIX.1-2008 defers to the ISO C standard.

7674 The ISO C standard only requires the symbols [EDOM], [EILSEQ], and [ERANGE] to be defined.

7675 The **<errno.h>** header shall provide a declaration or definition for *errno*. The symbol *errno* shall  
7676 expand to a modifiable lvalue of type **int**. It is unspecified whether *errno* is a macro or an  
7677 identifier declared with external linkage. If a macro definition is suppressed in order to access an  
7678 actual object, or a program defines an identifier with the name *errno*, the behavior is undefined.7679 The **<errno.h>** header shall define the following macros which shall expand to integer constant  
7680 expressions with type **int**, distinct positive values (except as noted below), and which shall be  
7681 suitable for use in **#if** preprocessing directives:

7682 [E2BIG] Argument list too long.

7683 [EACCES] Permission denied.

7684 [EADDRINUSE] Address in use.

7685 [EADDRNOTAVAIL] Address not available.

7686 [EAFNOSUPPORT] Address family not supported.

7687 [EAGAIN] Resource unavailable, try again (may be the same value as  
7688 [EWOULDBLOCK]).

7689 [EALREADY] Connection already in progress.

7690 [EBADF] Bad file descriptor.

7691 [EBADMSG] Bad message.

7692 [EBUSY] Device or resource busy.

7693 [ECANCELED] Operation canceled.

7694 [ECHILD] No child processes.

7695 [ECONNABORTED] Connection aborted.

7696 [ECONNREFUSED] Connection refused.

7697 [ECONNRESET] Connection reset.

7698 [EDEADLK] Resource deadlock would occur.

7699 [EDESTADDRREQ] Destination address required.

7700 [EDOM] Mathematics argument out of domain of function.

7701 [EDQUOT] Reserved.

7702 [EEXIST] File exists.

## Headers

## &lt;errno.h&gt;

7703	[EFAULT]	Bad address.
7704	[EFBIG]	File too large.
7705	[EHOSTUNREACH]	Host is unreachable.
7706	[EIDRM]	Identifier removed.
7707	[EILSEQ]	Illegal byte sequence.
7708	[EINPROGRESS]	Operation in progress.
7709	[EINTR]	Interrupted function.
7710	[EINVAL]	Invalid argument.
7711	[EIO]	I/O error.
7712	[EISCONN]	Socket is connected.
7713	[EISDIR]	Is a directory.
7714	[ELOOP]	Too many levels of symbolic links.
7715	[EMFILE]	File descriptor value too large.
7716	[EMLINK]	Too many links.
7717	[EMSGSIZE]	Message too large.
7718	[EMULTIHOP]	Reserved.
7719	[ENAMETOOLONG]	Filename too long.
7720	[ENETDOWN]	Network is down.
7721	[ENETRESET]	Connection aborted by network.
7722	[ENETUNREACH]	Network unreachable.
7723	[ENFILE]	Too many files open in system.
7724	[ENOBUFS]	No buffer space available.
7725	OB XSR [ENODATA]	No message is available on the STREAM head read queue.
7726	[ENODEV]	No such device.
7727	[ENOENT]	No such file or directory.
7728	[ENOEXEC]	Executable file format error.
7729	[ENOLCK]	No locks available.
7730	[ENOLINK]	Reserved.
7731	[ENOMEM]	Not enough space.
7732	[ENOMSG]	No message of the desired type.
7733	[ENOPROTOPT]	Protocol not available.
7734	[ENOSPC]	No space left on device.
7735	OB XSR [ENOSR]	No STREAM resources.

## &lt;errno.h&gt;

Headers

7736	OB XSR	[ENOSTR]	Not a STREAM.
7737		[ENOSYS]	Function not supported.
7738		[ENOTCONN]	The socket is not connected.
7739		[ENOTDIR]	Not a directory.
7740		[ENOTEMPTY]	Directory not empty.
7741		[ENOTRECOVERABLE]	
7742			State not recoverable.
7743		[ENOTSOCK]	Not a socket.
7744		[ENOTSUP]	Not supported (may be the same value as [EOPNOTSUPP]).
7745		[ENOTTY]	Inappropriate I/O control operation.
7746		[ENXIO]	No such device or address.
7747		[EOPNOTSUPP]	Operation not supported on socket (may be the same value as
7748			[ENOTSUP]).
7749		[EOVERFLOW]	Value too large to be stored in data type.
7750		[EOWNERDEAD]	Previous owner died.
7751		[EPERM]	Operation not permitted.
7752		[EPIPE]	Broken pipe.
7753		[EPROTO]	Protocol error.
7754		[EPROTONOSUPPORT]	
7755			Protocol not supported.
7756		[EPROTOTYPE]	Protocol wrong type for socket.
7757		[ERANGE]	Result too large.
7758		[EROFS]	Read-only file system.
7759		[ESPIPE]	Invalid seek.
7760		[ESRCH]	No such process.
7761		[ESTALE]	Reserved.
7762	OB XSR	[ETIME]	Stream <i>ioctl()</i> timeout.
7763		[ETIMEDOUT]	Connection timed out.
7764		[ETXTBSY]	Text file busy.
7765		[EWOULDBLOCK]	Operation would block (may be the same value as [EAGAIN]).
7766		[EXDEV]	Cross-device link.

- 7767 **APPLICATION USAGE**  
 7768 Additional error numbers may be defined on conforming systems; see the System Interfaces  
 7769 volume of POSIX.1-2008.
- 7770 **RATIONALE**  
 7771 None.
- 7772 **FUTURE DIRECTIONS**  
 7773 None.
- 7774 **SEE ALSO**  
 7775 XSH Section 2.3 (on page 477)
- 7776 **CHANGE HISTORY**  
 7777 First released in Issue 1. Derived from Issue 1 of the SVID.
- 7778 **Issue 5**  
 7779 Updated for alignment with the POSIX Realtime Extension.
- 7780 **Issue 6**  
 7781 The following new requirements on POSIX implementations derive from alignment with the  
 7782 Single UNIX Specification:  
 7783 • The majority of the error conditions previously marked as extensions are now mandatory,  
 7784 except for the STREAMS-related error conditions.  
 7785 Values for *errno* are now required to be distinct positive values rather than non-zero values. This  
 7786 change is for alignment with the ISO/IEC 9899:1999 standard.
- 7787 **Issue 7**  
 7788 Austin Group Interpretation 1003.1-2001 #050 is applied, allowing [ENOTSUP] and  
 7789 [EOPNOTSUPP] to be the same values.  
 7790 The [ENOTRECOVERABLE] and [EOWNERDEAD] errors are added from The Open Group  
 7791 Technical Standard, 2006, Extended API Set Part 2.  
 7792 Functionality relating to the XSI STREAMS option is marked obsolescent.  
 7793 Functionality relating to the Threads option is moved to the Base.  
 7794 This reference page is clarified with respect to macros and symbolic constants.

**<fcntl.h>**

Headers

7795 **NAME**7796 `fcntl.h` — file control options7797 **SYNOPSIS**7798 `#include <fcntl.h>`7799 **DESCRIPTION**7800 The **<fcntl.h>** header shall define the following symbolic constants for the *cmd* argument used  
7801 by *fcntl()*. The values shall be unique and shall be suitable for use in **#if** preprocessing  
7802 directives.7803 `F_DUPFD` Duplicate file descriptor.7804 `F_DUPFD_CLOEXEC`7805 Duplicate file descriptor with the close-on-exec flag `FD_CLOEXEC` set.7806 `F_GETFD` Get file descriptor flags.7807 `F_SETFD` Set file descriptor flags.7808 `F_GETFL` Get file status flags and file access modes.7809 `F_SETFL` Set file status flags.7810 `F_GETLK` Get record locking information.7811 `F_SETLK` Set record locking information.7812 `F_SETLKW` Set record locking information; wait if blocked.7813 `F_GETOWN` Get process or process group ID to receive SIGURG signals.7814 `F_SETOWN` Set process or process group ID to receive SIGURG signals.7815 The **<fcntl.h>** header shall define the following symbolic constant used for the *fcntl()* file  
7816 descriptor flags, which shall be suitable for use in **#if** preprocessing directives.7817 `FD_CLOEXEC` Close the file descriptor upon execution of an *exec* family function.7818 The **<fcntl.h>** header shall also define the following symbolic constants for the *l\_type* argument  
7819 used for record locking with *fcntl()*. The values shall be unique and shall be suitable for use in  
7820 **#if** preprocessing directives.7821 `F_RDLCK` Shared or read lock.7822 `F_UNLCK` Unlock.7823 `F_WRLCK` Exclusive or write lock.7824 The **<fcntl.h>** header shall define the values used for *l\_whence*, `SEEK_SET`, `SEEK_CUR`, and  
7825 `SEEK_END` as described in **<stdio.h>**.7826 The **<fcntl.h>** header shall define the following symbolic constants as file creation flags for use  
7827 in the *oflag* value to *open()* and *openat()*. The values shall be bitwise-distinct and shall be  
7828 suitable for use in **#if** preprocessing directives.7829 `O_CREAT` Create file if it does not exist.7830 `O_EXCL` Exclusive use flag.7831 `O_NOCTTY` Do not assign controlling terminal.7832 `O_TRUNC` Truncate flag.

## Headers

## &lt;fcntl.h&gt;

7833		O_TTY_INIT	Set the <b>termios</b> structure terminal parameters to a state that provides conforming behavior; see <a href="#">Section 11.2</a> (on page 205).
7834			
7835			The O_TTY_INIT flag can have the value zero and in this case it need not be bitwise-distinct from the other flags.
7836			
7837			The <fcntl.h> header shall define the following symbolic constants for use as file status flags for <i>open()</i> , <i>openat()</i> , and <i>fcntl()</i> . The values shall be suitable for use in <b>#if</b> preprocessing directives.
7838			
7839		O_APPEND	Set append mode.
7840	SIO	O_DSYNC	Write according to synchronized I/O data integrity completion.
7841		O_NONBLOCK	Non-blocking mode.
7842	SIO	O_RSYNC	Synchronized read I/O operations.
7843		O_SYNC	Write according to synchronized I/O file integrity completion.
7844			The <fcntl.h> header shall define the following symbolic constant for use as the mask for file access modes. The value shall be suitable for use in <b>#if</b> preprocessing directives.
7845			
7846		O_ACCMODE	Mask for file access modes.
7847			The <fcntl.h> header shall define the following symbolic constants for use as the file access modes for <i>open()</i> , <i>openat()</i> , and <i>fcntl()</i> . The values shall be suitable for use in <b>#if</b> preprocessing directives.
7848			
7849			
7850		O_EXEC	Open for execute only (non-directory files). The result is unspecified if this flag is applied to a directory.
7851			
7852		O_RDONLY	Open for reading only.
7853		O_RDWR	Open for reading and writing.
7854		O_SEARCH	Open directory for search only. The result is unspecified if this flag is applied to a non-directory file.
7855			
7856		O_WRONLY	Open for writing only.
7857			The <fcntl.h> header shall define the symbolic constants for file modes for use as values of <b>mode_t</b> as described in <sys/stat.h>.
7858			
7859			The <fcntl.h> header shall define the following symbolic constant as a special value used in place of a file descriptor for the <i>*at()</i> functions which take a directory file descriptor as a parameter:
7860			
7861			
7862		AT_FDCWD	Use the current working directory to determine the target of relative file paths.
7863			The <fcntl.h> header shall define the following symbolic constant as a value for the <i>flag</i> used by <i>faccessat()</i> :
7864			
7865		AT_EACCESS	Check access using effective user and group ID.
7866			The <fcntl.h> header shall define the following symbolic constant as a value for the <i>flag</i> used by <i>fstatat()</i> , <i>fchmodat()</i> , <i>fchownat()</i> , and <i>utimensat()</i> :
7867			
7868		AT_SYMLINK_NOFOLLOW	
7869			Do not follow symbolic links.
7870			The <fcntl.h> header shall define the following symbolic constant as a value for the flag used by <i>linkat()</i> :
7871			

## &lt;fcntl.h&gt;

7872 AT\_SYMLINK\_FOLLOW  
7873 Follow symbolic link.

7874 The <fcntl.h> header shall define the following symbolic constants as values for the flag used by  
7875 *open()* and *openat()*:

7876 O\_CLOEXEC The FD\_CLOEXEC flag associated with the new descriptor shall be set to close  
7877 the file descriptor upon execution of an *exec* family function.

7878 O\_DIRECTORY Fail if not a directory.

7879 O\_NOFOLLOW Do not follow symbolic links.

7880 The <fcntl.h> header shall define the following symbolic constant as a value for the flag used by  
7881 *unlinkat()*:

7882 AT\_REMOVEDIR  
7883 Remove directory instead of file.

7884 ADV The <fcntl.h> header shall define the following symbolic constants for the *advise* argument used  
7885 by *posix\_fadvise()*:

7886 POSIX\_FADV\_DONTNEED  
7887 The application expects that it will not access the specified data in the near future.

7888 POSIX\_FADV\_NOREUSE  
7889 The application expects to access the specified data once and then not reuse it thereafter.

7890 POSIX\_FADV\_NORMAL  
7891 The application has no advice to give on its behavior with respect to the specified data. It is  
7892 the default characteristic if no advice is given for an open file.

7893 POSIX\_FADV\_RANDOM  
7894 The application expects to access the specified data in a random order.

7895 POSIX\_FADV\_SEQUENTIAL  
7896 The application expects to access the specified data sequentially from lower offsets to higher  
7897 offsets.

7898 POSIX\_FADV\_WILLNEED  
7899 The application expects to access the specified data in the near future.

7900 The <fcntl.h> header shall define the **flock** structure describing a file lock. It shall include the  
7901 following members:

7902 short l\_type Type of lock; F\_RDLCK, F\_WRLCK, F\_UNLCK.  
7903 short l\_whence Flag for starting offset.  
7904 off\_t l\_start Relative offset in bytes.  
7905 off\_t l\_len Size; if 0 then until EOF.  
7906 pid\_t l\_pid Process ID of the process holding the lock; returned with F\_GETLK.

7907 The <fcntl.h> header shall define the **mode\_t**, **off\_t**, and **pid\_t** types as described in  
7908 <sys/types.h>.

7909 The following shall be declared as functions and may also be defined as macros. Function  
7910 prototypes shall be provided.

7911 int creat(const char \*, mode\_t);  
7912 int fcntl(int, int, ...);  
7913 int open(const char \*, int, ...);

```

7914 int openat(int, const char *, int, ...);
7915 ADV int posix_fadvise(int, off_t, off_t, int);
7916 int posix_fallocate(int, off_t, off_t);

```

7917 Inclusion of the <fcntl.h> header may also make visible all symbols from <sys/stat.h> and  
 7918 <unistd.h>.

#### 7919 APPLICATION USAGE

7920 Although no existing implementation defines `AT_SYMLINK_FOLLOW` and  
 7921 `AT_SYMLINK_NOFOLLOW` as the same numeric value, POSIX.1-2008 does not prohibit that as  
 7922 the two constants are not used with the same interfaces.

#### 7923 RATIONALE

7924 While many of the symbolic constants introduced in the <fcntl.h> header do not strictly need to  
 7925 be used in `#if` preprocessor directives, widespread historic practice has defined them as macros  
 7926 that are usable in such constructs, and examination of existing applications has shown that they  
 7927 are occasionally used in such a way. Therefore it was decided to retain this requirement on an  
 7928 implementation in POSIX.1-2008.

#### 7929 FUTURE DIRECTIONS

7930 None.

#### 7931 SEE ALSO

7932 [<stdio.h>](#), [<sys/stat.h>](#), [<sys/types.h>](#), [<unistd.h>](#)

7933 XSH [creat\(\)](#), [exec](#), [fcntl\(\)](#), [futimens\(\)](#), [open\(\)](#), [posix\\_fadvise\(\)](#), [posix\\_fallocate\(\)](#), [posix\\_madvise\(\)](#)

#### 7934 CHANGE HISTORY

7935 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 7936 Issue 5

7937 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

#### 7938 Issue 6

7939 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 7940 • `O_DSYNC` and `O_RSYNC` are marked as part of the Synchronized Input and Output  
 7941 option.

7942 The following new requirements on POSIX implementations derive from alignment with the  
 7943 Single UNIX Specification:

- 7944 • The definition of the `mode_t`, `off_t`, and `pid_t` types is mandated.

7945 The `F_GETOWN` and `F_SETOWN` values are added for sockets.

7946 The `posix_fadvise()`, `posix_fallocate()`, and `posix_madvise()` functions are added for alignment with  
 7947 IEEE Std 1003.1d-1999.

7948 IEEE PASC Interpretation 1003.1 #102 is applied, moving the prototype for `posix_madvise()` to  
 7949 <sys/mman.h>.

7950 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/18 is applied, updating the prototypes for  
 7951 `posix_fadvise()` and `posix_fallocate()` to be large file-aware, using `off_t` instead of `size_t`.

#### 7952 Issue 7

7953 Austin Group Interpretation 1003.1-2001 #144 is applied, adding the `O_TTY_INIT` flag.

7954 Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the  
 7955 `FD_CLOEXEC` flag atomically at `open()`, and adding the `F_DUPFD_CLOEXEC` flag.

- 7956 The *openat()* function is added from The Open Group Technical Standard, 2006, Extended API  
7957 Set Part 2.
- 7958 Additional flags are added to support *faccessat()*, *fchmodat()*, *fchownat()*, *fstatat()*, *linkat()*,  
7959 *open()*, *openat()*, and *unlinkat()*.
- 7960 This reference page is clarified with respect to macros and symbolic constants.
- 7961 Changes are made related to support for finegrained timestamps.
- 7962 Changes are made to allow a directory to be opened for searching.

## Headers

## &lt;fenv.h&gt;

## 7963 NAME

7964 fenv.h — floating-point environment

## 7965 SYNOPSIS

7966 #include &lt;fenv.h&gt;

## 7967 DESCRIPTION

7968 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 7969 conflict between the requirements described here and the ISO C standard is unintentional. This  
 7970 volume of POSIX.1-2008 defers to the ISO C standard.

7971 The <fenv.h> header shall define the following data types through **typedef**:

7972 **fenv\_t** Represents the entire floating-point environment. The floating-point environment  
 7973 refers collectively to any floating-point status flags and control modes supported  
 7974 by the implementation.

7975 **feexcept\_t** Represents the floating-point status flags collectively, including any status the  
 7976 implementation associates with the flags. A floating-point status flag is a system  
 7977 variable whose value is set (but never cleared) when a floating-point exception is  
 7978 raised, which occurs as a side-effect of exceptional floating-point arithmetic to  
 7979 provide auxiliary information. A floating-point control mode is a system variable  
 7980 whose value may be set by the user to affect the subsequent behavior of floating-  
 7981 point arithmetic.

7982 The <fenv.h> header shall define each of the following macros if and only if the implementation  
 7983 supports the floating-point exception by means of the floating-point functions *feclearexcept()*,  
 7984 *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, and *fetestexcept()*. The defined macros shall  
 7985 expand to integer constant expressions with values that are bitwise-distinct.

7986 FE\_DIVBYZERO  
 7987 FE\_INEXACT  
 7988 FE\_INVALID  
 7989 FE\_OVERFLOW  
 7990 FE\_UNDERFLOW

7991 MX If the implementation supports the IEC 60559 Floating-Point option, all five macros shall be  
 7992 defined. Additional implementation-defined floating-point exceptions with macros beginning  
 7993 with FE\_ and an uppercase letter may also be specified by the implementation.

7994 The <fenv.h> header shall define the macro FE\_ALL\_EXCEPT as the bitwise-inclusive OR of all  
 7995 floating-point exception macros defined by the implementation, if any. If no such macros are  
 7996 defined, then the macro FE\_ALL\_EXCEPT shall be defined as zero.

7997 The <fenv.h> header shall define each of the following macros if and only if the implementation  
 7998 supports getting and setting the represented rounding direction by means of the *fegetround()*  
 7999 and *fesetround()* functions. The defined macros shall expand to integer constant expressions  
 8000 whose values are distinct non-negative values.

8001 FE\_DOWNWARD  
 8002 FE\_TONEAREST  
 8003 FE\_TOWARDZERO  
 8004 FE\_UPWARD

8005 MX If the implementation supports the IEC 60559 Floating-Point option, all four macros shall be  
 8006 defined. Additional implementation-defined rounding directions with macros beginning with  
 8007 FE\_ and an uppercase letter may also be specified by the implementation.

8008 The <fenv.h> header shall define the following macro, which represents the default floating-  
 8009 point environment (that is, the one installed at program startup) and has type pointer to const-  
 8010 qualified `fenv_t`. It can be used as an argument to the functions within the <fenv.h> header that  
 8011 manage the floating-point environment.

8012 `FE_DFL_ENV`

8013 The following shall be declared as functions and may also be defined as macros. Function  
 8014 prototypes shall be provided.

```
8015 int feenableexcept(int);
8016 int fegetenv(fenv_t *);
8017 int fegetexceptflag(fexcept_t *, int);
8018 int fegetround(void);
8019 int feholdexcept(fenv_t *);
8020 int feraiseexcept(int);
8021 int fesetenv(const fenv_t *);
8022 int fesetexceptflag(const fexcept_t *, int);
8023 int fesetround(int);
8024 int fetestexcept(int);
8025 int feupdateenv(const fenv_t *);
```

8026 The `FENV_ACCESS` pragma provides a means to inform the implementation when an  
 8027 application might access the floating-point environment to test floating-point status flags or run  
 8028 under non-default floating-point control modes. The pragma shall occur either outside external  
 8029 declarations or preceding all explicit declarations and statements inside a compound statement.  
 8030 When outside external declarations, the pragma takes effect from its occurrence until another  
 8031 `FENV_ACCESS` pragma is encountered, or until the end of the translation unit. When inside a  
 8032 compound statement, the pragma takes effect from its occurrence until another `FENV_ACCESS`  
 8033 pragma is encountered (including within a nested compound statement), or until the end of the  
 8034 compound statement; at the end of a compound statement the state for the pragma is restored to  
 8035 its condition just before the compound statement. If this pragma is used in any other context, the  
 8036 behavior is undefined. If part of an application tests floating-point status flags, sets floating-  
 8037 point control modes, or runs under non-default mode settings, but was translated with the state  
 8038 for the `FENV_ACCESS` pragma off, the behavior is undefined. The default state (on or off) for  
 8039 the pragma is implementation-defined. (When execution passes from a part of the application  
 8040 translated with `FENV_ACCESS` off to a part translated with `FENV_ACCESS` on, the state of the  
 8041 floating-point status flags is unspecified and the floating-point control modes have their default  
 8042 settings.)

#### 8043 APPLICATION USAGE

8044 This header is designed to support the floating-point exception status flags and directed-  
 8045 rounding control modes required by the IEC 60559:1989 standard, and other similar floating-  
 8046 point state information. Also it is designed to facilitate code portability among all systems.

8047 Certain application programming conventions support the intended model of use for the  
 8048 floating-point environment:

- 8049 • A function call does not alter its caller's floating-point control modes, clear its caller's  
 8050 floating-point status flags, nor depend on the state of its caller's floating-point status flags  
 8051 unless the function is so documented.
- 8052 • A function call is assumed to require default floating-point control modes, unless its  
 8053 documentation promises otherwise.

- 8054 • A function call is assumed to have the potential for raising floating-point exceptions,  
8055 unless its documentation promises otherwise.

8056 With these conventions, an application can safely assume default floating-point control modes  
8057 (or be unaware of them). The responsibilities associated with accessing the floating-point  
8058 environment fall on the application that does so explicitly.

8059 Even though the rounding direction macros may expand to constants corresponding to the  
8060 values of FLT\_ROUNDS, they are not required to do so.

8061 For example:

```
8062 #include <fenv.h>
8063 void f(double x)
8064 {
8065     #pragma STDC FENV_ACCESS ON
8066     void g(double);
8067     void h(double);
8068     /* ... */
8069     g(x + 1);
8070     h(x + 1);
8071     /* ... */
8072 }
```

8073 If the function *g()* might depend on status flags set as a side-effect of the first *x+1*, or if the  
8074 second *x+1* might depend on control modes set as a side-effect of the call to function *g()*, then  
8075 the application shall contain an appropriately placed invocation as follows:

```
8076 #pragma STDC FENV_ACCESS ON
```

## 8077 RATIONALE

### 8078 The `fexcept_t` Type

8079 `fexcept_t` does not have to be an integer type. Its values must be obtained by a call to  
8080 `fegetexceptflag()`, and cannot be created by logical operations from the exception macros. An  
8081 implementation might simply implement `fexcept_t` as an `int` and use the representations  
8082 reflected by the exception macros, but is not required to; other representations might contain  
8083 extra information about the exceptions. `fexcept_t` might be a `struct` with a member for each  
8084 exception (that might hold the address of the first or last floating-point instruction that caused  
8085 that exception). The ISO/IEC 9899:1999 standard makes no claims about the internals of an  
8086 `fexcept_t`, and so the user cannot inspect it.

### 8087 Exception and Rounding Macros

8088 Macros corresponding to unsupported modes and rounding directions are not defined by the  
8089 implementation and must not be defined by the application. An application might use `#ifdef`  
8090 test for this.

## 8091 FUTURE DIRECTIONS

8092 None.

## 8093 SEE ALSO

8094 XSH `feclearexcept()`, `fegetenv()`, `fegetexceptflag()`, `fegetround()`, `feholdexcept()`, `feraiseexcept()`,  
8095 `fetestexcept()`, `feupdateenv()`

8096 **CHANGE HISTORY**

8097 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

8098 The return types for *feclearexcept()*, *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, *fegetenv()*,  
8099 *fesetenv()*, and *feupdateenv()* are changed from **void** to **int** for alignment with the  
8100 ISO/IEC 9899:1999 standard, Defect Report 202.

8101 **Issue 7**

8102 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #37 (SD5-XBD-ERN-49) is applied.

8103 ISO/IEC 9899:1999 standard, Technical Corrigendum 3 #36 is applied.

8104 SD5-XBD-ERN-48 and SD5-XBD-ERN-69 are applied.

8105 This reference page is clarified with respect to macros and symbolic constants.

8106 **NAME**

8107 float.h — floating types

8108 **SYNOPSIS**

8109 #include &lt;float.h&gt;

8110 **DESCRIPTION**

8111 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 8112 conflict between the requirements described here and the ISO C standard is unintentional. This  
 8113 volume of POSIX.1-2008 defers to the ISO C standard.

8114 The characteristics of floating types are defined in terms of a model that describes a  
 8115 representation of floating-point numbers and values that provide information about an  
 8116 implementation's floating-point arithmetic.

8117 The following parameters are used to define the model for each floating-point type:

8118 *s* Sign ( $\pm 1$ ).8119 *b* Base or radix of exponent representation (an integer  $> 1$ ).8120 *e* Exponent (an integer between a minimum  $e_{\min}$  and a maximum  $e_{\max}$ ).8121 *p* Precision (the number of base-*b* digits in the significand).8122  $f_k$  Non-negative integers less than *b* (the significand digits).8123 A floating-point number *x* is defined by the following model:

$$x = sb^e \sum_{k=1}^p f_k b^{-k}, e_{\min} \leq e \leq e_{\max}$$

8124 In addition to normalized floating-point numbers ( $f_1 > 0$  if  $x \neq 0$ ), floating types may be able to  
 8125 contain other kinds of floating-point numbers, such as subnormal floating-point numbers ( $x \neq 0$ ,  
 8126  $e = e_{\min}$ ,  $f_1 = 0$ ) and unnormalized floating-point numbers ( $x \neq 0$ ,  $e > e_{\min}$ ,  $f_1 = 0$ ), and values that are  
 8127 not floating-point numbers, such as infinities and NaNs. A NaN is an encoding signifying Not-a-  
 8128 Number. A *quiet NaN* propagates through almost every arithmetic operation without raising a  
 8129 floating-point exception; a *signaling NaN* generally raises a floating-point exception when  
 8130 occurring as an arithmetic operand.

8131 An implementation may give zero and non-numeric values, such as infinities and NaNs, a sign,  
 8132 or may leave them unsigned. Wherever such values are unsigned, any requirement in  
 8133 POSIX.1-2008 to retrieve the sign shall produce an unspecified sign and any requirement to set  
 8134 the sign shall be ignored.

8135 The accuracy of the floating-point operations ('+', '-', '\*', '/') and of the functions in  
 8136 <math.h> and <complex.h> that return floating-point results is implementation-defined, as is  
 8137 the accuracy of the conversion between floating-point internal representations and string  
 8138 representations performed by the functions in <stdio.h>, <stdlib.h>, and <wchar.h>. The  
 8139 implementation may state that the accuracy is unknown.

8140 All integer values in the <float.h> header, except FLT\_ROUNDS, shall be constant expressions  
 8141 suitable for use in #if preprocessing directives; all floating values shall be constant expressions.  
 8142 All except DECIMAL\_DIG, FLT\_EVAL\_METHOD, FLT\_RADIX, and FLT\_ROUNDS have  
 8143 separate names for all three floating-point types. The floating-point model representation is  
 8144 provided for all values except FLT\_EVAL\_METHOD and FLT\_ROUNDS.

8145 The rounding mode for floating-point addition is characterized by the implementation-defined

**<float.h>**

Headers

8146 value of FLT\_ROUNDS:

8147 -1 Indeterminable.

8148 0 Toward zero.

8149 1 To nearest.

8150 2 Toward positive infinity.

8151 3 Toward negative infinity.

8152 All other values for FLT\_ROUNDS characterize implementation-defined rounding behavior.

8153 The values of operations with floating operands and values subject to the usual arithmetic

8154 conversions and of floating constants are evaluated to a format whose range and precision may

8155 be greater than required by the type. The use of evaluation formats is characterized by the

8156 implementation-defined value of FLT\_EVAL\_METHOD:

8157 -1 Indeterminable.

8158 0 Evaluate all operations and constants just to the range and precision of the type.

8159 1 Evaluate operations and constants of type **float** and **double** to the range and precision of

8160 the **double** type; evaluate **long double** operations and constants to the range and precision

8161 of the **long double** type.

8162 2 Evaluate all operations and constants to the range and precision of the **long double** type.

8163 All other negative values for FLT\_EVAL\_METHOD characterize implementation-defined

8164 behavior.

8165 The **<float.h>** header shall define the following values as constant expressions with

8166 implementation-defined values that are greater or equal in magnitude (absolute value) to those

8167 shown, with the same sign.

- 8168 • Radix of exponent representation,  $b$ .

8169 FLT\_RADIX 2

- 8170 • Number of base-FLT\_RADIX digits in the floating-point significand,  $p$ .

8171 FLT\_MANT\_DIG

8172 DBL\_MANT\_DIG

8173 LDBL\_MANT\_DIG

- 8174 • Number of decimal digits,  $n$ , such that any floating-point number in the widest supported
- 8175 floating type with  $p_{\max}$  radix  $b$  digits can be rounded to a floating-point number with  $n$
- 8176 decimal digits and back again without change to the value.

$$\left\{ \begin{array}{ll} p_{\max} \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \left\lceil 1 + p_{\max} \log_{10} b \right\rceil & \text{otherwise} \end{array} \right.$$

8177 DECIMAL\_DIG 10

## Headers

## &lt;float.h&gt;

- 8178 • Number of decimal digits,  $q$ , such that any floating-point number with  $q$  decimal digits can  
8179 be rounded into a floating-point number with  $p$  radix  $b$  digits and back again without  
8180 change to the  $q$  decimal digits.

$$\begin{cases} p \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \lfloor (p-1) \log_{10} b \rfloor & \text{otherwise} \end{cases}$$

8181 FLT\_DIG 6

8182 DBL\_DIG 10

8183 LDBL\_DIG 10

- 8184 • Minimum negative integer such that FLT\_RADIX raised to that power minus 1 is a  
8185 normalized floating-point number,  $e_{\min}$ .

8186 FLT\_MIN\_EXP

8187 DBL\_MIN\_EXP

8188 LDBL\_MIN\_EXP

- 8189 • Minimum negative integer such that 10 raised to that power is in the range of normalized  
8190 floating-point numbers.

$$\left\lceil \log_{10} b^{e_{\min} - 1} \right\rceil$$

8191 FLT\_MIN\_10\_EXP -37

8192 DBL\_MIN\_10\_EXP -37

8193 LDBL\_MIN\_10\_EXP -37

- 8194 • Maximum integer such that FLT\_RADIX raised to that power minus 1 is a representable  
8195 finite floating-point number,  $e_{\max}$ .

8196 FLT\_MAX\_EXP

8197 DBL\_MAX\_EXP

8198 LDBL\_MAX\_EXP

- 8199 • Maximum integer such that 10 raised to that power is in the range of representable finite  
8200 floating-point numbers.

$$\left\lceil \log_{10} ((1 - b^{-p}) b^{e_{\max}}) \right\rceil$$

8201 FLT\_MAX\_10\_EXP +37

8202 DBL\_MAX\_10\_EXP +37

**<float.h>**

Headers

8203 LDBL\_MAX\_10\_EXP +37

8204 The **<float.h>** header shall define the following values as constant expressions with  
8205 implementation-defined values that are greater than or equal to those shown:

- 8206
- Maximum representable finite floating-point number.

$$(1 - b^{-p}) b^{e_{\max}}$$

8207 FLT\_MAX 1E+37

8208 DBL\_MAX 1E+37

8209 LDBL\_MAX 1E+37

8210 The **<float.h>** header shall define the following values as constant expressions with  
8211 implementation-defined (positive) values that are less than or equal to those shown:

- 8212
- The difference between 1 and the least value greater than 1 that is representable in the  
8213 given floating-point type,  $b^{1-p}$ .

8214 FLT\_EPSILON 1E-5

8215 DBL\_EPSILON 1E-9

8216 LDBL\_EPSILON 1E-9

- 8217
- Minimum normalized positive floating-point number,  $b^{e_{\min}-1}$ .

8218 FLT\_MIN 1E-37

8219 DBL\_MIN 1E-37

8220 LDBL\_MIN 1E-37

## &lt;fmtmsg.h&gt;

8237 **NAME**8238 `fmtmsg.h` — message display structures8239 **SYNOPSIS**8240 XSI `#include <fmtmsg.h>`8241 **DESCRIPTION**

8242 The &lt;fmtmsg.h&gt; header shall define the following symbolic constants:

8243	MM_HARD	Source of the condition is hardware.
8244	MM_SOFT	Source of the condition is software.
8245	MM_FIRM	Source of the condition is firmware.
8246	MM_APPL	Condition detected by application.
8247	MM_UTIL	Condition detected by utility.
8248	MM_OPSYS	Condition detected by operating system.
8249	MM_RECOVER	Recoverable error.
8250	MM_NRECOV	Non-recoverable error.
8251	MM_HALT	Error causing application to halt.
8252	MM_ERROR	Application has encountered a non-fatal fault.
8253	MM_WARNING	Application has detected unusual non-error condition.
8254	MM_INFO	Informative message.
8255	MM_NOSEV	No severity level provided for the message.
8256	MM_PRINT	Display message on standard error.
8257	MM_CONSOLE	Display message on system console.

8258 The table below indicates the null values and identifiers for *fmtmsg()* arguments. The  
 8259 <fmtmsg.h> header shall define the symbolic constants in the **Identifier** column, which shall  
 8260 have the type indicated in the **Type** column:

Argument	Type	Null-Value	Identifier
<i>label</i>	char *	(char*)0	MM_NULLLBL
<i>severity</i>	int	0	MM_NULLSEV
<i>class</i>	long	0L	MM_NULLMC
<i>text</i>	char *	(char*)0	MM_NULLTXT
<i>action</i>	char *	(char*)0	MM_NULLACT
<i>tag</i>	char *	(char*)0	MM_NULLTAG

8268 The <fmtmsg.h> header shall also define the following symbolic constants for use as return  
 8269 values for *fmtmsg()*:

8270	MM_OK	The function succeeded.
8271	MM_NOTOK	The function failed completely.
8272	MM_NOMSG	The function was unable to generate a message on standard error, but 8273 otherwise succeeded.

## &lt;fmtmsg.h&gt;

Headers

8274 MM\_NOCON The function was unable to generate a console message, but otherwise  
8275 succeeded.

8276 The following shall be declared as a function and may also be defined as a macro. A function  
8277 prototype shall be provided.

```
8278 int fmtmsg(long, const char *, int,  
8279           const char *, const char *, const char *);
```

## &lt;ftw.h&gt;

Headers

## 8321 NAME

8322 ftw.h — file tree traversal

## 8323 SYNOPSIS

8324 xSI `#include <ftw.h>`

## 8325 DESCRIPTION

8326 The <ftw.h> header shall define the **FTW** structure, which shall include at least the following  
8327 members:8328 `int base`  
8329 `int level`8330 The <ftw.h> header shall define the following symbolic constants for use as values of the third  
8331 argument to the application-supplied function that is passed as the second argument to *ftw()*  
8332 and *nftw()*:8333 **FTW\_F** File.  
8334 **FTW\_D** Directory.  
8335 **FTW\_DNR** Directory without read permission.  
8336 **FTW\_DP** Directory with subdirectories visited.  
8337 **FTW\_NS** Unknown type; *stat()* failed.  
8338 **FTW\_SL** Symbolic link.  
8339 **FTW\_SLN** Symbolic link that names a nonexistent file.8340 The <ftw.h> header shall define the following symbolic constants for use as values of the fourth  
8341 argument to *nftw()*:8342 **FTW\_PHYS** Physical walk, does not follow symbolic links. Otherwise, *nftw()* follows  
8343 links but does not walk down any path that crosses itself.  
8344 **FTW\_MOUNT** The walk does not cross a mount point.  
8345 **FTW\_DEPTH** All subdirectories are visited before the directory itself.  
8346 **FTW\_CHDIR** The walk changes to each directory before reading it.8347 The following shall be declared as functions and may also be defined as macros. Function  
8348 prototypes shall be provided.8349 OB `int ftw(const char *, int (*)(const char *, const struct stat *,`  
8350 `int), int);`  
8351 `int nftw(const char *, int (*)(const char *, const struct stat *,`  
8352 `int, struct FTW *), int, int);`8353 The <ftw.h> header shall define the **stat** structure and the symbolic names for *st\_mode* and the  
8354 file type test macros as described in <sys/stat.h>.

8355 Inclusion of the &lt;ftw.h&gt; header may also make visible all symbols from &lt;sys/stat.h&gt;.

**<glob.h>**

Headers

8372 **NAME**

8373 glob.h — pathname pattern-matching types

8374 **SYNOPSIS**

8375 #include &lt;glob.h&gt;

8376 **DESCRIPTION**8377 The **<glob.h>** header shall define the structures and symbolic constants used by the *glob()*  
8378 function.8379 The **<glob.h>** header shall define the **glob\_t** structure type, which shall include at least the  
8380 following members:

8381 `size_t gl_pathc` Count of paths matched by *pattern*.  
 8382 `char **gl_pathv` Pointer to a list of matched pathnames.  
 8383 `size_t gl_offs` Slots to reserve at the beginning of *gl\_pathv*.

8384 The **<glob.h>** header shall define the **size\_t** type as described in **<sys/types.h>**.8385 The **<glob.h>** header shall define the following symbolic constants as values for the *flags*  
8386 argument:

8387 **GLOB\_APPEND** Append generated pathnames to those previously obtained.  
 8388 **GLOB\_DOOFFS** Specify how many null pointers to add to the beginning of *gl\_pathv*.  
 8389 **GLOB\_ERR** Cause *glob()* to return on error.  
 8390 **GLOB\_MARK** Each pathname that is a directory that matches *pattern* has a <slash>  
 8391 appended.  
 8392 **GLOB\_NOCHECK** If *pattern* does not match any pathname, then return a list consisting of  
 8393 only *pattern*.  
 8394 **GLOB\_NOESCAPE** Disable backslash escaping.  
 8395 **GLOB\_NOSORT** Do not sort the pathnames returned.  
 8396 The **<glob.h>** header shall define the following symbolic constants as error return values:  
 8397 **GLOB\_ABORTED** The scan was stopped because **GLOB\_ERR** was set or *(\*errfunc)()*  
 8398 returned non-zero.  
 8399 **GLOB\_NOMATCH** The pattern does not match any existing pathname, and  
 8400 **GLOB\_NOCHECK** was not set in *flags*.  
 8401 **GLOB\_NOSPACE** An attempt to allocate memory failed.

8402 The following shall be declared as functions and may also be defined as macros. Function  
8403 prototypes shall be provided.

8404 `int glob(const char *restrict, int, int (*)(const char *, int),`  
 8405 `glob_t *restrict);`  
 8406 `void globfree(glob_t *);`

8407 **APPLICATION USAGE**

8408 None.

8409 **RATIONALE**

8410 None.

8414 &lt;sys/types.h&gt;

8415 XSH *glob()*8416 **CHANGE HISTORY**

8417 First released in Issue 4. Derived from the ISO POSIX-2 standard.

8418 **Issue 6**8419 The **restrict** keyword is added to the prototype for *glob()*.

8420 The GLOB\_NOSYS constant is marked obsolescent.

8421 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/8 is applied, correcting the *glob()*  
8422 prototype definition by removing the **restrict** qualifier from the function pointer argument.8423 **Issue 7**8424 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size\_t**

8425 The obsolescent GLOB\_NOSYS constant is removed.

8426 This reference page is clarified with respect to macros and symbolic constants.

**<grp.h>**

Headers

8427 **NAME**

8428           grp.h — group structure

8429 **SYNOPSIS**

8430           #include &lt;grp.h&gt;

8431 **DESCRIPTION**8432           The **<grp.h>** header shall declare the **group** structure, which shall include the following  
8433 members:

8434           char     \*gr\_name   The name of the group.  
 8435           gid\_t    gr\_gid     Numerical group ID.  
 8436           char    \*\*gr\_mem    Pointer to a null-terminated array of character  
 8437                               pointers to member names.

8438           The **<grp.h>** header shall define the **gid\_t** and **size\_t** types as described in **<sys/types.h>**.8439           The following shall be declared as functions and may also be defined as macros. Function  
8440 prototypes shall be provided.

```

8441           void            endgrent(void);
8442           struct group    *getgrent(void);
8443           struct group    *getgrgid(gid_t);
8444           int             getgrgid_r(gid_t, struct group *, char *,
8445                           size_t, struct group **);
8446           struct group    *getgrnam(const char *);
8447           int             getgrnam_r(const char *, struct group *, char *,
8448                           size_t, struct group **);
8449 XSI        void            setgrent(void);

```

8450 **APPLICATION USAGE**

8493 XSH *iconv()*, *iconv\_close()*, *iconv\_open()*8494 **CHANGE HISTORY**

8495 First released in Issue 4.

8496 **Issue 6**8497 The **restrict** keyword is added to the prototype for *iconv()*.8498 **Issue 7**8499 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size\_t** type.

8500 The &lt;iconv.h&gt; header is moved from the XSI option to the Base.

## Headers

## &lt;inttypes.h&gt;

## 8501 NAME

8502 inttypes.h — fixed size integer types

## 8503 SYNOPSIS

8504 #include &lt;inttypes.h&gt;

## 8505 DESCRIPTION

8506 CX Some of the functionality described on this reference page extends the ISO C standard.  
 8507 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 8508 enable the visibility of these symbols in this header.

8509 The &lt;inttypes.h&gt; header shall include the &lt;stdint.h&gt; header.

8510 The &lt;inttypes.h&gt; header shall define at least the following type:

8511 **imaxdiv\_t** Structure type that is the type of the value returned by the *imaxdiv()* function.

8512 The <inttypes.h> header shall define the following macros. Each expands to a character string  
 8513 literal containing a conversion specifier, possibly modified by a length modifier, suitable for use  
 8514 within the *format* argument of a formatted input/output function when converting the  
 8515 corresponding integer type. These macros have the general form of PRI (character string literals  
 8516 for the *fprintf()* and *fwprintf()* family of functions) or SCN (character string literals for the  
 8517 *fscanf()* and *fwscanf()* family of functions), followed by the conversion specifier, followed by a  
 8518 name corresponding to a similar type name in <stdint.h>. In these names, *N* represents the  
 8519 width of the type as described in <stdint.h>. For example, *PRIdFAST32* can be used in a format  
 8520 string to print the value of an integer of type *int\_fast32\_t*.

8521 The *fprintf()* macros for signed integers are:

8522	<i>PRIdN</i>	<i>PRIdLEASTN</i>	<i>PRIdFASTN</i>	<i>PRIdMAX</i>	<i>PRIdPTR</i>
8523	<i>PRiN</i>	<i>PRiLEASTN</i>	<i>PRiFASTN</i>	<i>PRiMAX</i>	<i>PRiPTR</i>

8524 The *fprintf()* macros for unsigned integers are:

8525	<i>PRIoN</i>	<i>PRIoLEASTN</i>	<i>PRIoFASTN</i>	<i>PRIoMAX</i>	<i>PRIoPTR</i>
8526	<i>PRiuN</i>	<i>PRiuLEASTN</i>	<i>PRiuFASTN</i>	<i>PRiuMAX</i>	<i>PRiuPTR</i>
8527	<i>PRIxN</i>	<i>PRIxLEASTN</i>	<i>PRIxFASTN</i>	<i>PRIxMAX</i>	<i>PRIxPTR</i>
8528	<i>PRIXN</i>	<i>PRIXLEASTN</i>	<i>PRIXFASTN</i>	<i>PRIXMAX</i>	<i>PRIXPTR</i>

8529 The *fscanf()* macros for signed integers are:

8530	<i>SCNdN</i>	<i>SCNdLEASTN</i>	<i>SCNdFASTN</i>	<i>SCNdMAX</i>	<i>SCNdPTR</i>
8531	<i>SCNiN</i>	<i>SCNiLEASTN</i>	<i>SCNiFASTN</i>	<i>SCNiMAX</i>	<i>SCNiPTR</i>

8532 The *fscanf()* macros for unsigned integers are:

8533	<i>SCNoN</i>	<i>SCNoLEASTN</i>	<i>SCNoFASTN</i>	<i>SCNoMAX</i>	<i>SCNoPTR</i>
8534	<i>SCNuN</i>	<i>SCNuLEASTN</i>	<i>SCNuFASTN</i>	<i>SCNuMAX</i>	<i>SCNuPTR</i>
8535	<i>SCNxN</i>	<i>SCNxLEASTN</i>	<i>SCNxFASTN</i>	<i>SCNxMAX</i>	<i>SCNxPTR</i>

8536 For each type that the implementation provides in <stdint.h>, the corresponding *fprintf()* and  
 8537 *fwprintf()* macros shall be defined and the corresponding *fscanf()* and *fwscanf()* macros shall be  
 8538 defined unless the implementation does not have a suitable modifier for the type.

8539 The following shall be declared as functions and may also be defined as macros. Function  
 8540 prototypes shall be provided.

```
8541 intmax_t imaxabs(intmax_t);
8542 imaxdiv_t imaxdiv(intmax_t, intmax_t);
```

**<inttypes.h>**

Headers

```

8543     intmax_t  strtoumax(const char *restrict, char **restrict, int);
8544     uintmax_t strtoumax(const char *restrict, char **restrict, int);
8545     intmax_t  wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);
8546     uintmax_t wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);

```

**EXAMPLES**

```

8547     #include <inttypes.h>
8548     #include <wchar.h>
8549     int main(void)
8550     {
8551         uintmax_t i = UINTMAX_MAX; // This type always exists.
8552         wprintf(L"The largest integer value is %020"
8553             PRIxMAX "\n", i);
8554         return 0;
8555     }
8556

```

**APPLICATION USAGE**

8557 The purpose of **<inttypes.h>** is to provide a set of integer types whose definitions are consistent  
8558 across machines and independent of operating systems and other implementation  
8559 idiosyncrasies. It defines, through **typedef**, integer types of various sizes. Implementations are  
8560 free to **typedef** them as ISO C standard integer types or extensions that they support. Consistent  
8561 use of this header will greatly increase the portability of applications across platforms.

**RATIONALE**

8562 The ISO/IEC 9899:1990 standard specified that the language should support four signed and  
8563 unsigned integer data types—**char**, **short**, **int**, and **long**—but placed very little requirement on  
8564 their size other than that **int** and **short** be at least 16 bits and **long** be at least as long as **int**  
8565 and not smaller than 32 bits. For 16-bit systems, most implementations assigned 8, 16, 16, and 32 bits  
8566 to **char**, **short**, **int**, and **long**, respectively. For 32-bit systems, the common practice has been to  
8567 assign 8, 16, 32, and 32 bits to these types. This difference in **int** size can create some problems  
8568 for users who migrate from one system to another which assigns different sizes to integer types,  
8569 because the ISO C standard integer promotion rule can produce silent changes unexpectedly.  
8570 The need for defining an extended integer type increased with the introduction of 64-bit  
8571 systems.

**FUTURE DIRECTIONS**

8572 Macro names beginning with PRI or SCN followed by any lowercase letter or 'X' may be added  
8573 to the macros defined in the **<inttypes.h>** header.

**SEE ALSO**

8574 XSH Section 2.2 (on page 468), *imaxabs()*, *imaxdiv()*, *strtoumax()*, *wcstoumax()*

**CHANGE HISTORY**

8575 First released in Issue 5.

**Issue 6**

8576 The Open Group Base Resolution bwg97-006 is applied.

8577 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

## Headers

## &lt;iso646.h&gt;

8584 **NAME**

8585           iso646.h — alternative spellings

8586 **SYNOPSIS**

8587           #include &lt;iso646.h&gt;

8588 **DESCRIPTION**

8589 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 8590 conflict between the requirements described here and the ISO C standard is unintentional. This  
 8591 volume of POSIX.1-2008 defers to the ISO C standard.

8592           The <iso646.h> header shall define the following eleven macros (on the left) that expand to the  
 8593 corresponding tokens (on the right):

8594           and           &amp;&amp;

8595           and\_eq        &amp;=

8596           bitand       &amp;

8597           bitor         |

8598           compl        ~

8599           not           !

8600           not\_eq       !=

8601           or           ||

8602           or\_eq       |=

8603           xor          ^

8604           xor\_eq       ^=

8610           None.

8611 **SEE ALSO**

8612           None.

8613 **CHANGE HISTORY**

8614           First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

<langinfo.h>

8615 **NAME**  
 8616 langinfo.h — language information constants

8617 **SYNOPSIS**  
 8618 #include <langinfo.h>

8619 **DESCRIPTION**  
 8620 The <langinfo.h> header shall define the symbolic constants used to identify items of *langinfo*  
 8621 data (see *nl\_langinfo()*).

8622 The <langinfo.h> header shall define the **locale\_t** type as described in <locale.h>.

8623 The <langinfo.h> header shall define the **nl\_item** type as described in <nl/types.h>.

8624 The <langinfo.h> header shall define the following symbolic constants with type **nl\_item**. The  
 8625 entries under **Category** indicate in which *setlocale()* category each item is defined.

Constant	Category	Meaning
CODESET	LC_CTYPE	Codeset name.
D_T_FMT	LC_TIME	String for formatting date and time.
D_FMT	LC_TIME	Date format string.
T_FMT	LC_TIME	Time format string.
T_FMT_AMPM	LC_TIME	a.m. or p.m. time format string.
AM_STR	LC_TIME	Ante-meridiem affix.
PM_STR	LC_TIME	Post-meridiem affix.
DAY_1	LC_TIME	Name of the first day of the week (for example, Sunday).
DAY_2	LC_TIME	Name of the second day of the week (for example, Monday).
DAY_3	LC_TIME	Name of the third day of the week (for example, Tuesday).
DAY_4	LC_TIME	Name of the fourth day of the week (for example, Wednesday).
DAY_5	LC_TIME	Name of the fifth day of the week (for example, Thursday).
DAY_6	LC_TIME	Name of the sixth day of the week (for example, Friday).
DAY_7	LC_TIME	Name of the seventh day of the week (for example, Saturday).
ABDAY_1	LC_TIME	Abbreviated name of the first day of the week.
ABDAY_2	LC_TIME	Abbreviated name of the second day of the week.
ABDAY_3	LC_TIME	Abbreviated name of the third day of the week.
ABDAY_4	LC_TIME	Abbreviated name of the fourth day of the week.
ABDAY_5	LC_TIME	Abbreviated name of the fifth day of the week.
ABDAY_6	LC_TIME	Abbreviated name of the sixth day of the week.
ABDAY_7	LC_TIME	Abbreviated name of the seventh day of the week.
MON_1	LC_TIME	Name of the first month of the year.
MON_2	LC_TIME	Name of the second month.
MON_3	LC_TIME	Name of the third month.
MON_4	LC_TIME	Name of the fourth month.
MON_5	LC_TIME	Name of the fifth month.
MON_6	LC_TIME	Name of the sixth month.
MON_7	LC_TIME	Name of the seventh month.
MON_8	LC_TIME	Name of the eighth month.
MON_9	LC_TIME	Name of the ninth month.
MON_10	LC_TIME	Name of the tenth month.
MON_11	LC_TIME	Name of the eleventh month.
MON_12	LC_TIME	Name of the twelfth month.
ABMON_1	LC_TIME	Abbreviated name of the first month.

	Constant	Category	Meaning
8663			
8664	ABMON_2	LC_TIME	Abbreviated name of the second month.
8665	ABMON_3	LC_TIME	Abbreviated name of the third month.
8666	ABMON_4	LC_TIME	Abbreviated name of the fourth month.
8667	ABMON_5	LC_TIME	Abbreviated name of the fifth month.
8668	ABMON_6	LC_TIME	Abbreviated name of the sixth month.
8669	ABMON_7	LC_TIME	Abbreviated name of the seventh month.
8670	ABMON_8	LC_TIME	Abbreviated name of the eighth month.
8671	ABMON_9	LC_TIME	Abbreviated name of the ninth month.
8672	ABMON_10	LC_TIME	Abbreviated name of the tenth month.
8673	ABMON_11	LC_TIME	Abbreviated name of the eleventh month.
8674	ABMON_12	LC_TIME	Abbreviated name of the twelfth month.
8675	ERA	LC_TIME	Era description segments.
8676	ERA_D_FMT	LC_TIME	Era date format string.
8677	ERA_D_T_FMT	LC_TIME	Era date and time format string.
8678	ERA_T_FMT	LC_TIME	Era time format string.
8679	ALT_DIGITS	LC_TIME	Alternative symbols for digits.
8680	RADIXCHAR	LC_NUMERIC	Radix character.
8681	THOUSEP	LC_NUMERIC	Separator for thousands.
8682	YESEXPR	LC_MESSAGES	Affirmative response expression.
8683	NOEXPR	LC_MESSAGES	Negative response expression.
8684	CRNCYSTR	LC_MONETARY	Local currency symbol, preceded by '-' if the symbol should appear before the value, '+' if the symbol should appear after the value, or '.' if the symbol should replace the radix character. If the local currency symbol is the empty string, implementations may return the empty string ("").
8685			
8686			
8687			
8688			

8689 If the locale's values for **p\_cs\_precedes** and **n\_cs\_precedes** do not match, the value of  
8690 *nl\_langinfo*(CRNCYSTR) and *nl\_langinfo\_l*(CRNCYSTR,loc) is unspecified.

8691 The following shall be declared as a function and may also be defined as a macro. A function  
8692 prototype shall be provided:

```
8693 char *nl_langinfo(nl_item);
8694 char *nl_langinfo_l(nl_item, locale_t);
```

8695 Inclusion of the <langinfo.h> header may also make visible all symbols from <nl\_types.h>.

## 8696 APPLICATION USAGE

8697 Wherever possible, users are advised to use functions compatible with those in the ISO C  
8698 standard to access items of *langinfo* data. In particular, the *strftime*() function should be used to  
8699 access date and time information defined in category *LC\_TIME*. The *localeconv*() function  
8700 should be used to access information corresponding to *RADIXCHAR*, *THOUSEP*, and  
8701 *CRNCYSTR*.

## 8702 RATIONALE

8703 None.

## 8704 FUTURE DIRECTIONS

8705 None.

## 8706 SEE ALSO

## &lt;langinfo.h&gt;

Headers

8709 **CHANGE HISTORY**

8710 First released in Issue 2.

8711 **Issue 5**

8712 The constants YESSTR and NOSTR are marked LEGACY.

8713 **Issue 6**

8714 The constants YESSTR and NOSTR are removed.

8715 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/9 is applied, adding a sentence to  
8716 the "Meaning" column entry for the CRNCYSTR constant. This change is to accommodate  
8717 historic practice.

8718 **Issue 7**

8719 The &lt;langinfo.h&gt; header is moved from the XSI option to the Base.

8720 The *nl\_langinfo\_l()* function is added from The Open Group Technical Standard, 2006, Extended  
8721 API Set Part 4.

8722 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
8723 for the *locale\_t* type is added.

8742 First released in Issue 4, Version 2.

8743 **Issue 5**8744 The function prototypes for *basename()* and *dirname()* are changed to indicate that the first  
8745 argument is of type **char \*** rather than **const char \***.8746 **Issue 6**8747 The `__loc1` symbol and the *regcmp()* and *regex()* functions are removed.

**<limits.h>**

Headers

8748 **NAME**

8749 limits.h — implementation-defined constants

8750 **SYNOPSIS**

8751 #include &lt;limits.h&gt;

8752 **DESCRIPTION**

8753 CX Some of the functionality described on this reference page extends the ISO C standard.  
 8754 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 8755 enable the visibility of these symbols in this header.

8756 Many of the symbols listed here are not defined by the ISO/IEC 9899:1999 standard. Such  
 8757 symbols are not shown as CX shaded.

8758 The **<limits.h>** header shall define macros and symbolic constants for various limits. Different  
 8759 categories of limits are described below, representing various limits on resources that the  
 8760 implementation imposes on applications. All macros and symbolic constants defined in this  
 8761 header shall be suitable for use in **#if** preprocessing directives.

8762 Implementations may choose any appropriate value for each limit, provided it is not more  
 8763 restrictive than the Minimum Acceptable Values listed below. Symbolic constant names  
 8764 beginning with **\_POSIX** may be found in **<unistd.h>**.

8765 Applications should not assume any particular value for a limit. To achieve maximum  
 8766 portability, an application should not require more resource than the Minimum Acceptable  
 8767 Value quantity. However, an application wishing to avail itself of the full amount of a resource  
 8768 available on an implementation may make use of the value given in **<limits.h>** on that  
 8769 particular implementation, by using the macros and symbolic constants listed below. It should  
 8770 be noted, however, that many of the listed limits are not invariant, and at runtime, the value of  
 8771 the limit may differ from those given in this header, for the following reasons:

- 8772 • The limit is pathname-dependent.
- 8773 • The limit differs between the compile and runtime machines.

8774 For these reasons, an application may use the *fpathconf()*, *pathconf()*, and *sysconf()* functions to  
 8775 determine the actual value of a limit at runtime.

8776 The items in the list ending in **\_MIN** give the most negative values that the mathematical types  
 8777 are guaranteed to be capable of representing. Numbers of a more negative value may be  
 8778 supported on some implementations, as indicated by the **<limits.h>** header on the  
 8779 implementation, but applications requiring such numbers are not guaranteed to be portable to  
 8780 all implementations. For positive constants ending in **\_MIN**, this indicates the minimum  
 8781 acceptable value.

8782 **Runtime Invariant Values (Possibly Indeterminate)**

8783 A definition of one of the symbolic constants in the following list shall be omitted from  
 8784 **<limits.h>** on specific implementations where the corresponding value is equal to or greater  
 8785 than the stated minimum, but is unspecified.

8786 This indetermination might depend on the amount of available memory space on a specific  
 8787 instance of a specific implementation. The actual value supported by a specific instance shall be  
 8788 provided by the *sysconf()* function.

8789 {AIO\_LISTIO\_MAX}

8790 Maximum number of I/O operations in a single list I/O call supported by the  
 8791 implementation.

8792 Minimum Acceptable Value: {\_POSIX\_AIO\_LISTIO\_MAX}

## Headers

## &lt;limits.h&gt;

8793		{AIO_MAX}
8794		Maximum number of outstanding asynchronous I/O operations supported by the implementation.
8795		Minimum Acceptable Value: {_POSIX_AIO_MAX}
8796		
8797		{AIO_PRIO_DELTA_MAX}
8798		The maximum amount by which a process can decrease its asynchronous I/O priority level from its own scheduling priority.
8799		Minimum Acceptable Value: 0
8800		
8801		{ARG_MAX}
8802		Maximum length of argument to the <i>exec</i> functions including environment data.
8803		Minimum Acceptable Value: {_POSIX_ARG_MAX}
8804		{ATEXIT_MAX}
8805		Maximum number of functions that may be registered with <i>atexit</i> ().
8806		Minimum Acceptable Value: 32
8807		{CHILD_MAX}
8808		Maximum number of simultaneous processes per real user ID.
8809		Minimum Acceptable Value: {_POSIX_CHILD_MAX}
8810		{DELAYTIMER_MAX}
8811		Maximum number of timer expiration overruns.
8812		Minimum Acceptable Value: {_POSIX_DELAYTIMER_MAX}
8813		{HOST_NAME_MAX}
8814		Maximum length of a host name (not including the terminating null) as returned from the <i>gethostname</i> () function.
8815		Minimum Acceptable Value: {_POSIX_HOST_NAME_MAX}
8816		
8817	XSI	{IOV_MAX}
8818		Maximum number of <i>iovec</i> structures that one process has available for use with <i>readv</i> () or <i>writev</i> ().
8819		Minimum Acceptable Value: {_XOPEN_IOV_MAX}
8820		
8821		{LOGIN_NAME_MAX}
8822		Maximum length of a login name.
8823		Minimum Acceptable Value: {_POSIX_LOGIN_NAME_MAX}
8824	MSG	{MQ_OPEN_MAX}
8825		The maximum number of open message queue descriptors a process may hold.
8826		Minimum Acceptable Value: {_POSIX_MQ_OPEN_MAX}
8827	MSG	{MQ_PRIO_MAX}
8828		The maximum number of message priorities supported by the implementation.
8829		Minimum Acceptable Value: {_POSIX_MQ_PRIO_MAX}
8830		{OPEN_MAX}
8831		A value one greater than the maximum value that the system may assign to a newly-created file descriptor.
8832		Minimum Acceptable Value: {_POSIX_OPEN_MAX}
8833		
8834		{PAGESIZE}
8835		Size in bytes of a page.
8836		Minimum Acceptable Value: 1

8837	XSI	<b>{PAGE_SIZE}</b>
8838		Equivalent to {PAGESIZE}. If either {PAGESIZE} or {PAGE_SIZE} is defined, the other is
8839		defined with the same value.
8840		<b>{PTHREAD_DESTRUCTOR_ITERATIONS}</b>
8841		Maximum number of attempts made to destroy a thread's thread-specific data values on
8842		thread exit.
8843		Minimum Acceptable Value: {_POSIX_THREAD_DESTRUCTOR_ITERATIONS}
8844		<b>{PTHREAD_KEYS_MAX}</b>
8845		Maximum number of data keys that can be created by a process.
8846		Minimum Acceptable Value: {_POSIX_THREAD_KEYS_MAX}
8847		<b>{PTHREAD_STACK_MIN}</b>
8848		Minimum size in bytes of thread stack storage.
8849		Minimum Acceptable Value: 0
8850		<b>{PTHREAD_THREADS_MAX}</b>
8851		Maximum number of threads that can be created per process.
8852		Minimum Acceptable Value: {_POSIX_THREAD_THREADS_MAX}
8853		<b>{RE_DUP_MAX}</b>
8854		Maximum number of repeated occurrences of a BRE or ERE interval expression; see <a href="#">Section</a>
8855		<a href="#">9.3.6</a> (on page 186) and <a href="#">Section 9.4.6</a> (on page 189).
8856		Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}
8857		<b>{RTSIG_MAX}</b>
8858		Maximum number of realtime signals reserved for application use in this implementation.
8859		Minimum Acceptable Value: {_POSIX_RTSIG_MAX}
8860		<b>{SEM_NSEMS_MAX}</b>
8861		Maximum number of semaphores that a process may have.
8862		Minimum Acceptable Value: {_POSIX_SEM_NSEMS_MAX}
8863		<b>{SEM_VALUE_MAX}</b>
8864		The maximum value a semaphore may have.
8865		Minimum Acceptable Value: {_POSIX_SEM_VALUE_MAX}
8866		<b>{SIGQUEUE_MAX}</b>
8867		Maximum number of queued signals that a process may send and have pending at the
8868		receiver(s) at any time.
8869		Minimum Acceptable Value: {_POSIX_SIGQUEUE_MAX}
8870	SSI TSP	<b>{SS_REPL_MAX}</b>
8871		The maximum number of replenishment operations that may be simultaneously pending
8872		for a particular sporadic server scheduler.
8873		Minimum Acceptable Value: {_POSIX_SS_REPL_MAX}
8874		<b>{STREAM_MAX}</b>
8875		Maximum number of streams that one process can have open at one time. If defined, it has
8876		the same value as {FOPEN_MAX} (see <stdio.h>).
8877		Minimum Acceptable Value: {_POSIX_STREAM_MAX}
8878		<b>{SYMLOOP_MAX}</b>
8879		Maximum number of symbolic links that can be reliably traversed in the resolution of a
8880		pathname in the absence of a loop.
8881		Minimum Acceptable Value: {_POSIX_SYMLOOP_MAX}

8882 {TIMER\_MAX}  
 8883 Maximum number of timers per process supported by the implementation.  
 8884 Minimum Acceptable Value: {\_POSIX\_TIMER\_MAX}

8885 OB TRC {TRACE\_EVENT\_NAME\_MAX}  
 8886 Maximum length of the trace event name (not including the terminating null).  
 8887 Minimum Acceptable Value: {\_POSIX\_TRACE\_EVENT\_NAME\_MAX}

8888 OB TRC {TRACE\_NAME\_MAX}  
 8889 Maximum length of the trace generation version string or of the trace stream name (not  
 8890 including the terminating null).  
 8891 Minimum Acceptable Value: {\_POSIX\_TRACE\_NAME\_MAX}

8892 OB TRC {TRACE\_SYS\_MAX}  
 8893 Maximum number of trace streams that may simultaneously exist in the system.  
 8894 Minimum Acceptable Value: {\_POSIX\_TRACE\_SYS\_MAX}

8895 OB TRC {TRACE\_USER\_EVENT\_MAX}  
 8896 Maximum number of user trace event type identifiers that may simultaneously exist in a  
 8897 traced process, including the predefined user trace event  
 8898 POSIX\_TRACE\_UNNAMED\_USER\_EVENT.  
 8899 Minimum Acceptable Value: {\_POSIX\_TRACE\_USER\_EVENT\_MAX}

8900 {TTY\_NAME\_MAX}  
 8901 Maximum length of terminal device name.  
 8902 Minimum Acceptable Value: {\_POSIX\_TTY\_NAME\_MAX}

8903 {TZNAME\_MAX}  
 8904 Maximum number of bytes supported for the name of a timezone (not of the TZ variable).  
 8905 Minimum Acceptable Value: {\_POSIX\_TZNAME\_MAX}

8906 **Note:** The length given by {TZNAME\_MAX} does not include the quoting characters mentioned in  
 8907 [Section 8.3](#) (on page 177).

#### 8908 Pathname Variable Values

8909 The values in the following list may be constants within an implementation or may vary from  
 8910 one pathname to another. For example, file systems or directories may have different  
 8911 characteristics.

8912 A definition of one of the symbolic constants in the following list shall be omitted from the  
 8913 <limits.h> header on specific implementations where the corresponding value is equal to or  
 8914 greater than the stated minimum, but where the value can vary depending on the file to which it  
 8915 is applied. The actual value supported for a specific pathname shall be provided by the  
 8916 *pathconf()* function.

8917 {FILESIZEBITS}  
 8918 Minimum number of bits needed to represent, as a signed integer value, the maximum size  
 8919 of a regular file allowed in the specified directory.  
 8920 Minimum Acceptable Value: 32

8921 {LINK\_MAX}  
 8922 Maximum number of links to a single file.  
 8923 Minimum Acceptable Value: {\_POSIX\_LINK\_MAX}

8924 {MAX\_CANON}  
 8925 Maximum number of bytes in a terminal canonical input line.  
 8926 Minimum Acceptable Value: {\_POSIX\_MAX\_CANON}

8927		{MAX_INPUT}
8928		Minimum number of bytes for which space is available in a terminal input queue; therefore,
8929		the maximum number of bytes a conforming application may require to be typed as input
8930		before reading them.
8931		Minimum Acceptable Value: {_POSIX_MAX_INPUT}
8932		{NAME_MAX}
8933		Maximum number of bytes in a filename (not including the terminating null).
8934		Minimum Acceptable Value: {_POSIX_NAME_MAX}
8935	XSI	Minimum Acceptable Value: {_XOPEN_NAME_MAX}
8936		{PATH_MAX}
8937		Maximum number of bytes the implementation will store as a pathname in a user-supplied
8938		buffer of unspecified size, including the terminating null character. Minimum number the
8939		implementation will accept as the maximum number of bytes in a pathname.
8940		Minimum Acceptable Value: {_POSIX_PATH_MAX}
8941	XSI	Minimum Acceptable Value: {_XOPEN_PATH_MAX}
8942		{PIPE_BUF}
8943		Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
8944		Minimum Acceptable Value: {_POSIX_PIPE_BUF}
8945	ADV	{POSIX_ALLOC_SIZE_MIN}
8946		Minimum number of bytes of storage actually allocated for any portion of a file.
8947		Minimum Acceptable Value: Not specified.
8948	ADV	{POSIX_REC_INCR_XFER_SIZE}
8949		Recommended increment for file transfer sizes between the
8950		{POSIX_REC_MIN_XFER_SIZE} and {POSIX_REC_MAX_XFER_SIZE} values.
8951		Minimum Acceptable Value: Not specified.
8952	ADV	{POSIX_REC_MAX_XFER_SIZE}
8953		Maximum recommended file transfer size.
8954		Minimum Acceptable Value: Not specified.
8955	ADV	{POSIX_REC_MIN_XFER_SIZE}
8956		Minimum recommended file transfer size.
8957		Minimum Acceptable Value: Not specified.
8958	ADV	{POSIX_REC_XFER_ALIGN}
8959		Recommended file transfer buffer alignment.
8960		Minimum Acceptable Value: Not specified.
8961		{SYMLINK_MAX}
8962		Maximum number of bytes in a symbolic link.
8963		Minimum Acceptable Value: {_POSIX_SYMLINK_MAX}

#### 8964 Runtime Inceasable Values

8965 The magnitude limitations in the following list shall be fixed by specific implementations. An  
 8966 application should assume that the value of the symbolic constant defined by <limits.h> in a  
 8967 specific implementation is the minimum that pertains whenever the application is run under  
 8968 that implementation. A specific instance of a specific implementation may increase the value  
 8969 relative to that supplied by <limits.h> for that implementation. The actual value supported by a  
 8970 specific instance shall be provided by the *sysconf()* function.

8971	{BC_BASE_MAX}	
8972		Maximum <i>obase</i> values allowed by the <i>bc</i> utility.
8973		Minimum Acceptable Value: {_POSIX2_BC_BASE_MAX}
8974	{BC_DIM_MAX}	
8975		Maximum number of elements permitted in an array by the <i>bc</i> utility.
8976		Minimum Acceptable Value: {_POSIX2_BC_DIM_MAX}
8977	{BC_SCALE_MAX}	
8978		Maximum <i>scale</i> value allowed by the <i>bc</i> utility.
8979		Minimum Acceptable Value: {_POSIX2_BC_SCALE_MAX}
8980	{BC_STRING_MAX}	
8981		Maximum length of a string constant accepted by the <i>bc</i> utility.
8982		Minimum Acceptable Value: {_POSIX2_BC_STRING_MAX}
8983	{CHARCLASS_NAME_MAX}	
8984		Maximum number of bytes in a character class name.
8985		Minimum Acceptable Value: {_POSIX2_CHARCLASS_NAME_MAX}
8986	{COLL_WEIGHTS_MAX}	
8987		Maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> <b>order</b> keyword in the locale definition file; see <a href="#">Chapter 7</a> (on page 135).
8988		
8989		Minimum Acceptable Value: {_POSIX2_COLL_WEIGHTS_MAX}
8990	{EXPR_NEST_MAX}	
8991		Maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.
8992		Minimum Acceptable Value: {_POSIX2_EXPR_NEST_MAX}
8993	{LINE_MAX}	
8994		Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.
8995		
8996		Minimum Acceptable Value: {_POSIX2_LINE_MAX}
8997		
8998	{NGROUPS_MAX}	
8999		Maximum number of simultaneous supplementary group IDs per process.
9000		Minimum Acceptable Value: {_POSIX2_NGROUPS_MAX}
9001	{RE_DUP_MAX}	
9002		Maximum number of repeated occurrences of a regular expression permitted when using the interval notation $\{m,n\}$ ; see <a href="#">Chapter 9</a> (on page 181).
9003		
9004		Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}
9005		
9005	<b>Maximum Values</b>	
9006		The <limits.h> header shall define the following symbolic constants with the values shown.
9007		These are the most restrictive values for certain features on an implementation. A conforming implementation shall provide values no larger than these values. A conforming application must not require a smaller value for correct operation.
9008		
9009		
9010	{_POSIX_CLOCKRES_MIN}	
9011		The resolution of the CLOCK_REALTIME clock, in nanoseconds.
9012		Value: 20 000 000
9013	MON	If the Monotonic Clock option is supported, the resolution of the CLOCK_MONOTONIC
9014		clock, in nanoseconds, is represented by {_POSIX_CLOCKRES_MIN}.

9015 **Minimum Values**

9016 The <limits.h> header shall define the following symbolic constants with the values shown.  
 9017 These are the most restrictive values for certain features on an implementation conforming to  
 9018 this volume of POSIX.1-2008. Related symbolic constants are defined elsewhere in this volume  
 9019 of POSIX.1-2008 which reflect the actual implementation and which need not be as restrictive. A  
 9020 conforming implementation shall provide values at least this large. A strictly conforming  
 9021 application must not require a larger value for correct operation.

9022 `{_POSIX_AIO_LISTIO_MAX}`

9023 The number of I/O operations that can be specified in a list I/O call.

9024 Value: 2

9025 `{_POSIX_AIO_MAX}`

9026 The number of outstanding asynchronous I/O operations.

9027 Value: 1

9028 `{_POSIX_ARG_MAX}`

9029 Maximum length of argument to the *exec* functions including environment data.

9030 Value: 4 096

9031 `{_POSIX_CHILD_MAX}`

9032 Maximum number of simultaneous processes per real user ID.

9033 Value: 25

9034 `{_POSIX_DELAYTIMER_MAX}`

9035 The number of timer expiration overruns.

9036 Value: 32

9037 `{_POSIX_HOST_NAME_MAX}`

9038 Maximum length of a host name (not including the terminating null) as returned from the  
 9039 *gethostname()* function.

9040 Value: 255

9041 `{_POSIX_LINK_MAX}`

9042 Maximum number of links to a single file.

9043 Value: 8

9044 `{_POSIX_LOGIN_NAME_MAX}`

9045 The size of the storage required for a login name, in bytes (including the terminating null).

9046 Value: 9

9047 `{_POSIX_MAX_CANON}`

9048 Maximum number of bytes in a terminal canonical input queue.

9049 Value: 255

9050 `{_POSIX_MAX_INPUT}`

9051 Maximum number of bytes allowed in a terminal input queue.

9052 Value: 255

9053 MSG `{_POSIX_MQ_OPEN_MAX}`

9054 The number of message queues that can be open for a single process.

9055 Value: 8

9056 MSG `{_POSIX_MQ_PRIO_MAX}`

9057 The maximum number of message priorities supported by the implementation.

9058 Value: 32

## Headers

## &lt;limits.h&gt;

9059	{_POSIX_NAME_MAX}	
9060		Maximum number of bytes in a filename (not including the terminating null).
9061		Value: 14
9062	{_POSIX_NGROUPS_MAX}	
9063		Maximum number of simultaneous supplementary group IDs per process.
9064		Value: 8
9065	{_POSIX_OPEN_MAX}	
9066		Maximum number of files that one process can have open at any one time.
9067		Value: 20
9068	{_POSIX_PATH_MAX}	
9069		Minimum number the implementation will accept as the maximum number of bytes in a
9070		pathname.
9071		Value: 256
9072	{_POSIX_PIPE_BUF}	
9073		Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
9074		Value: 512
9075	{_POSIX_RE_DUP_MAX}	
9076		The number of repeated occurrences of a BRE permitted by the <i>regex</i> ( <i>re</i> ) and <i>regcomp</i> ( <i>re</i> )
9077		functions when using the interval notation $\{m,n\}$ ; see Section 9.3.6 (on page 186).
9078		Value: 255
9079	{_POSIX_RTSIG_MAX}	
9080		The number of realtime signal numbers reserved for application use.
9081		Value: 8
9082	{_POSIX_SEM_NSEMS_MAX}	
9083		The number of semaphores that a process may have.
9084		Value: 256
9085	{_POSIX_SEM_VALUE_MAX}	
9086		The maximum value a semaphore may have.
9087		Value: 32 767
9088	{_POSIX_SIGQUEUE_MAX}	
9089		The number of queued signals that a process may send and have pending at the receiver(s)
9090		at any time.
9091		Value: 32
9092	{_POSIX_SSIZE_MAX}	
9093		The value that can be stored in an object of type <i>ssize_t</i> .
9094		Value: 32 767
9095	SS TSP {_POSIX_SS_REPL_MAX}	
9096		The number of replenishment operations that may be simultaneously pending for a
9097		particular sporadic server scheduler.
9098		Value: 4
9099	{_POSIX_STREAM_MAX}	
9100		The number of streams that one process can have open at one time.
9101		Value: 8

9102		{_POSIX_SYMLINK_MAX}
9103		The number of bytes in a symbolic link.
9104		Value: 255
9105		{_POSIX_SYMLOOP_MAX}
9106		The number of symbolic links that can be traversed in the resolution of a pathname in the absence of a loop.
9107		Value: 8
9108		
9109		{_POSIX_THREAD_DESTRUCTOR_ITERATIONS}
9110		The number of attempts made to destroy a thread's thread-specific data values on thread exit.
9111		Value: 4
9112		
9113		{_POSIX_THREAD_KEYS_MAX}
9114		The number of data keys per process.
9115		Value: 128
9116		{_POSIX_THREAD_THREADS_MAX}
9117		The number of threads per process.
9118		Value: 64
9119		{_POSIX_TIMER_MAX}
9120		The per-process number of timers.
9121		Value: 32
9122	OB TRC	{_POSIX_TRACE_EVENT_NAME_MAX}
9123		The length in bytes of a trace event name (not including the terminating null).
9124		Value: 30
9125	OB TRC	{_POSIX_TRACE_NAME_MAX}
9126		The length in bytes of a trace generation version string or a trace stream name (not including the terminating null).
9127		Value: 8
9128		
9129	OB TRC	{_POSIX_TRACE_SYS_MAX}
9130		The number of trace streams that may simultaneously exist in the system.
9131		Value: 8
9132	OB TRC	{_POSIX_TRACE_USER_EVENT_MAX}
9133		The number of user trace event type identifiers that may simultaneously exist in a traced process, including the predefined user trace event
9134		POSIX_TRACE_UNNAMED_USER_EVENT.
9135		Value: 32
9136		
9137		{_POSIX_TTY_NAME_MAX}
9138		The size of the storage required for a terminal device name, in bytes (including the terminating null).
9139		Value: 9
9140		
9141		{_POSIX_TZNAME_MAX}
9142		Maximum number of bytes supported for the name of a timezone (not of the TZ variable).
9143		Value: 6
9144		<b>Note:</b> The length given by {_POSIX_TZNAME_MAX} does not include the quoting characters mentioned in <a href="#">Section 8.3</a> (on page 177).
9145		

## Headers

## &lt;limits.h&gt;

9146		<code>{_POSIX2_BC_BASE_MAX}</code>
9147		Maximum <i>obase</i> values allowed by the <i>bc</i> utility.
9148		Value: 99
9149		<code>{_POSIX2_BC_DIM_MAX}</code>
9150		Maximum number of elements permitted in an array by the <i>bc</i> utility.
9151		Value: 2 048
9152		<code>{_POSIX2_BC_SCALE_MAX}</code>
9153		Maximum <i>scale</i> value allowed by the <i>bc</i> utility.
9154		Value: 99
9155		<code>{_POSIX2_BC_STRING_MAX}</code>
9156		Maximum length of a string constant accepted by the <i>bc</i> utility.
9157		Value: 1 000
9158		<code>{_POSIX2_CHARCLASS_NAME_MAX}</code>
9159		Maximum number of bytes in a character class name.
9160		Value: 14
9161		<code>{_POSIX2_COLL_WEIGHTS_MAX}</code>
9162		Maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> <b>order</b> keyword in the locale definition file; see <a href="#">Chapter 7</a> (on page 135).
9163		Value: 2
9164		
9165		<code>{_POSIX2_EXPR_NEST_MAX}</code>
9166		Maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.
9167		Value: 32
9168		<code>{_POSIX2_LINE_MAX}</code>
9169		Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.
9170		Value: 2 048
9171		
9172		
9173		<code>{_POSIX2_RE_DUP_MAX}</code>
9174		Maximum number of repeated occurrences of a regular expression permitted when using the interval notation <code>\{m,n\}</code> ; see <a href="#">Chapter 9</a> (on page 181).
9175		Value: 255
9176		
9177	XSI	<code>{_XOPEN_IOV_MAX}</code>
9178		Maximum number of <b>iovec</b> structures that one process has available for use with <i>readv()</i> or <i>writev()</i> .
9179		Value: 16
9180		
9181	XSI	<code>{_XOPEN_NAME_MAX}</code>
9182		Maximum number of bytes in a filename (not including the terminating null).
9183		Value: 255
9184	XSI	<code>{_XOPEN_PATH_MAX}</code>
9185		Minimum number the implementation will accept as the maximum number of bytes in a pathname.
9186		Value: 1 024
9187		

## 9188 Numerical Limits

9189 The <limits.h> header shall define the following macros and, except for {CHAR\_BIT},  
 9190 {LONG\_BIT}, {MB\_LEN\_MAX}, and {WORD\_BIT}, they shall be replaced by expressions that  
 9191 have the same type as would an expression that is an object of the corresponding type converted  
 9192 according to the integer promotions.

9193 If the value of an object of type **char** is treated as a signed integer when used in an expression,  
 9194 the value of {CHAR\_MIN} is the same as that of {SCHAR\_MIN} and the value of {CHAR\_MAX}  
 9195 is the same as that of {SCHAR\_MAX}. Otherwise, the value of {CHAR\_MIN} is 0 and the value  
 9196 of {CHAR\_MAX} is the same as that of {UCHAR\_MAX}.

9197 {CHAR\_BIT}

9198 Number of bits in a type **char**.

9199 CX Value: 8

9200 {CHAR\_MAX}

9201 Maximum value for an object of type **char**.

9202 Value: {UCHAR\_MAX} or {SCHAR\_MAX}

9203 {CHAR\_MIN}

9204 Minimum value for an object of type **char**.

9205 Value: {SCHAR\_MIN} or 0

9206 {INT\_MAX}

9207 Maximum value for an object of type **int**.

9208 CX Minimum Acceptable Value: 2 147 483 647

9209 {INT\_MIN}

9210 Minimum value for an object of type **int**.

9211 CX Maximum Acceptable Value: -2 147 483 647

9212 {LLONG\_MAX}

9213 Maximum value for an object of type **long long**.

9214 Minimum Acceptable Value: +9 223 372 036 854 775 807

9215 {LLONG\_MIN}

9216 Minimum value for an object of type **long long**.

9217 Maximum Acceptable Value: -9 223 372 036 854 775 807

9218 {LONG\_BIT}

9219 Number of bits in an object of type **long**.

9220 Minimum Acceptable Value: 32

9221 {LONG\_MAX}

9222 Maximum value for an object of type **long**.

9223 Minimum Acceptable Value: +2 147 483 647

9224 {LONG\_MIN}

9225 Minimum value for an object of type **long**.

9226 Maximum Acceptable Value: -2 147 483 647

9227 {MB\_LEN\_MAX}

9228 Maximum number of bytes in a character, for any supported locale.

9229 Minimum Acceptable Value: 1

9230 {SCHAR\_MAX}

9231 Maximum value for an object of type **signed char**.

9232	CX	Value: +127
9233		{SCHAR_MIN}
9234		Minimum value for an object of type <b>signed char</b> .
9235	CX	Value: -128
9236		{SHRT_MAX}
9237		Maximum value for an object of type <b>short</b> .
9238		Minimum Acceptable Value: +32 767
9239		{SHRT_MIN}
9240		Minimum value for an object of type <b>short</b> .
9241		Maximum Acceptable Value: -32 767
9242		{SSIZE_MAX}
9243		Maximum value for an object of type <b>ssize_t</b> .
9244		Minimum Acceptable Value: {_POSIX_SSIZE_MAX}
9245		{UCHAR_MAX}
9246		Maximum value for an object of type <b>unsigned char</b> .
9247	CX	Value: 255
9248		{UINT_MAX}
9249		Maximum value for an object of type <b>unsigned</b> .
9250	CX	Minimum Acceptable Value: 4 294 967 295
9251		{ULLONG_MAX}
9252		Maximum value for an object of type <b>unsigned long long</b> .
9253		Minimum Acceptable Value: 18 446 744 073 709 551 615
9254		{ULONG_MAX}
9255		Maximum value for an object of type <b>unsigned long</b> .
9256		Minimum Acceptable Value: 4 294 967 295
9257		{USHRT_MAX}
9258		Maximum value for an object of type <b>unsigned short</b> .
9259		Minimum Acceptable Value: 65 535
9260		{WORD_BIT}
9261		Number of bits in an object of type <b>int</b> .
9262		Minimum Acceptable Value: 32
9263		<b>Other Invariant Values</b>
9264		The <limits.h> header shall define the following symbolic constants:
9265		{NL_ARGMAX}
9266		Maximum value of <i>n</i> in conversion specifications using the "%n\$" sequence in calls to the <i>printf()</i> and <i>scanf()</i> families of functions.
9267		Minimum Acceptable Value: 9
9269	XSI	{NL_LANGMAX}
9270		Maximum number of bytes in a <i>LANG</i> name.
9271		Minimum Acceptable Value: 14
9272		{NL_MSGMAX}
9273		Maximum message number.
9274		Minimum Acceptable Value: 32 767

9275 {NL\_SETMAX}  
 9276 Maximum set number.  
 9277 Minimum Acceptable Value: 255

9278 {NL\_TEXTMAX}  
 9279 Maximum number of bytes in a message string.  
 9280 Minimum Acceptable Value: {\_POSIX2\_LINE\_MAX}

9281 XSI {NZERO}  
 9282 Default process priority.  
 9283 Minimum Acceptable Value: 20

**9284 APPLICATION USAGE**

9285 None.

**9286 RATIONALE**

9287 A request was made to reduce the value of {\_POSIX\_LINK\_MAX} from the value of 8 specified  
 9288 for it in the POSIX.1-1990 standard to 2. The standard developers decided to deny this request  
 9289 for several reasons:

- 9290 • They wanted to avoid making any changes to the standard that could break conforming  
 9291 applications, and the requested change could have that effect.
- 9292 • The use of multiple hard links to a file cannot always be replaced with use of symbolic  
 9293 links. Symbolic links are semantically different from hard links in that they associate a  
 9294 pathname with another pathname rather than a pathname with a file. This has  
 9295 implications for access control, file permanence, and transparency.
- 9296 • The original standard developers had considered the issue of allowing for  
 9297 implementations that did not in general support hard links, and decided that this would  
 9298 reduce consensus on the standard.

9299 Systems that support historical versions of the development option of the ISO POSIX-2 standard  
 9300 retain the name {\_POSIX2\_RE\_DUP\_MAX} as an alias for {\_POSIX\_RE\_DUP\_MAX}.

9301 {PATH\_MAX}  
 9302 IEEE PASC Interpretation 1003.1 #15 addressed the inconsistency in the standard with the  
 9303 definition of pathname and the description of {PATH\_MAX}, allowing application  
 9304 developers to allocate either {PATH\_MAX} or {PATH\_MAX}+1 bytes. The inconsistency has  
 9305 been removed by correction to the {PATH\_MAX} definition to include the null character.  
 9306 With this change, applications that previously allocated {PATH\_MAX} bytes will continue to  
 9307 succeed.

9308 {SYMLINK\_MAX}  
 9309 This symbol refers to space for data that is stored in the file system, as opposed to  
 9310 {PATH\_MAX} which is the length of a name that can be passed to a function. In some  
 9311 existing implementations, the filenames pointed to by symbolic links are stored in the *inodes*  
 9312 of the links, so it is important that {SYMLINK\_MAX} not be constrained to be as large as  
 9313 {PATH\_MAX}.

**9314 FUTURE DIRECTIONS**

9315 None.

**9316 SEE ALSO**

9317 Chapter 7 (on page 135), <stdio.h>, <unistd.h>  
 9318 XSH Section 2.2 (on page 468), *fpathconf()*, *sysconf()*

9319 **CHANGE HISTORY**

9320 First released in Issue 1.

9321 **Issue 5**9322 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
9323 Threads Extension.

9324 {FILESIZEBITS} is added for the Large File Summit extensions.

9325 The minimum acceptable values for {INT\_MAX}, {INT\_MIN}, and {UINT\_MAX} are changed to  
9326 make 32-bit values the minimum requirement.

9327 The entry is restructured to improve readability.

9328 **Issue 6**9329 The Open Group Corrigendum U033/4 is applied. The wording is made clear for {CHAR\_MIN},  
9330 {INT\_MIN}, {LONG\_MIN}, {SCHAR\_MIN}, and {SHRT\_MIN} that these are maximum  
9331 acceptable values.9332 The following new requirements on POSIX implementations derive from alignment with the  
9333 Single UNIX Specification:

- 9334 • The minimum value for {CHILD\_MAX} is 25. This is a FIPS requirement.
- 9335 • The minimum value for {OPEN\_MAX} is 20. This is a FIPS requirement.
- 9336 • The minimum value for {NGROUPS\_MAX} is 8. This is also a FIPS requirement.

9337 Symbolic constants are added for {\_POSIX\_SYMLINK\_MAX}, {\_POSIX\_SYMLOOP\_MAX},  
9338 {\_POSIX\_RE\_DUP\_MAX}, {RE\_DUP\_MAX}, {SYMLOOP\_MAX}, and {SYMLINK\_MAX}.

9339 The following values are added for alignment with IEEE Std 1003.1d-1999:

9340 {\_POSIX\_SS\_REPL\_MAX}  
 9341 {SS\_REPL\_MAX}  
 9342 {POSIX\_ALLOC\_SIZE\_MIN}  
 9343 {POSIX\_REC\_INCR\_XFER\_SIZE}  
 9344 {POSIX\_REC\_MAX\_XFER\_SIZE}  
 9345 {POSIX\_REC\_MIN\_XFER\_SIZE}  
 9346 {POSIX\_REC\_XFER\_ALIGN}

9347 Reference to CLOCK\_MONOTONIC is added in the description of {\_POSIX\_CLOCKRES\_MIN}  
9348 for alignment with IEEE Std 1003.1j-2000.9349 The constants {LLONG\_MIN}, {LLONG\_MAX}, and {ULLONG\_MAX} are added for alignment  
9350 with the ISO/IEC 9899:1999 standard.

9351 The following values are added for alignment with IEEE Std 1003.1q-2000:

9352 {\_POSIX\_TRACE\_EVENT\_NAME\_MAX}  
 9353 {\_POSIX\_TRACE\_NAME\_MAX}  
 9354 {\_POSIX\_TRACE\_SYS\_MAX}  
 9355 {\_POSIX\_TRACE\_USER\_EVENT\_MAX}  
 9356 {TRACE\_EVENT\_NAME\_MAX}  
 9357 {TRACE\_NAME\_MAX}  
 9358 {TRACE\_SYS\_MAX}  
 9359 {TRACE\_USER\_EVENT\_MAX}

9360 The new limits {\_XOPEN\_NAME\_MAX} and {\_XOPEN\_PATH\_MAX} are added as minimum

- 9361 values for {PATH\_MAX} and {NAME\_MAX} limits on XSI-conformant systems.
- 9362 The LEGACY symbols {PASS\_MAX} and {TMP\_MAX} are removed.
- 9363 The values for the limits {CHAR\_BIT}, {SCHAR\_MAX}, and {UCHAR\_MAX} are now required  
9364 to be 8, +127, and 255, respectively.
- 9365 The value for the limit {CHAR\_MAX} is now {UCHAR\_MAX} or {SCHAR\_MAX}.
- 9366 The value for the limit {CHAR\_MIN} is now {SCHAR\_MIN} or zero.
- 9367 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/10 is applied, correcting the value of  
9368 {\_POSIX\_CHILD\_MAX} from 6 to 25. This is for FIPS 151-2 alignment.
- 9369 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/19 is applied, updating the values for  
9370 {INT\_MAX}, {UINT\_MAX}, and {INT\_MIN} to be CX extensions over the ISO C standard, and  
9371 correcting {WORD\_BIT} from 16 to 32.
- 9372 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/20 is applied, removing  
9373 {CHARCLASS\_NAME\_MAX} from the “Other Invariant Values” section (it also occurs under  
9374 “Runtime Inceasable Values”).
- 9375 **Issue 7**
- 9376 Austin Group Interpretations 1003.1-2001 #143 and #160 are applied.
- 9377 Austin Group Interpretation 1003.1-2001 #173 is applied, updating the descriptions of  
9378 {TRACE\_EVENT\_NAME\_MAX} and {TRACE\_NAME\_MAX} to not include the terminating  
9379 null.
- 9380 SD5-XBD-ERN-36 is applied, changing the description of {RE\_DUP\_MAX}.
- 9381 SD5-XBD-ERN-90 is applied.
- 9382 {NL\_NMAX} is removed; it should have been removed in Issue 6.
- 9383 The Trace option values are marked obsolescent.
- 9384 The {ATEXIT\_MAX}, {LONG\_BIT}, {NL\_MSGMAX}, {NL\_SETMAX}, {NL\_TEXTMAX}, and  
9385 {WORD\_BIT} values are moved from the XSI option to the Base.
- 9386 The AIO\_\* and \_POSIX\_AIO\_\* values are moved from the Asynchronous Input and Output  
9387 option to the Base.
- 9388 The {\_POSIX\_RTSIG\_MAX}, {\_POSIX\_SIGQUEUE\_MAX}, {RTSIG\_MAX}, and  
9389 {SIGQUEUE\_MAX} values are moved from the Realtime Signals Extension option to the Base.
- 9390 Functionality relating to the Threads and Timers options is moved to the Base.
- 9391 This reference page is clarified with respect to macros and symbolic constants.

## Headers

## &lt;locale.h&gt;

## 9392 NAME

9393 locale.h — category macros

## 9394 SYNOPSIS

9395 #include &lt;locale.h&gt;

## 9396 DESCRIPTION

9397 CX Some of the functionality described on this reference page extends the ISO C standard.  
 9398 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 9399 enable the visibility of these symbols in this header.

9400 The <locale.h> header shall define the **lconv** structure, which shall include at least the following  
 9401 members. (See the definitions of *LC\_MONETARY* in Section 7.3.3 (on page 154) and Section 7.3.4  
 9402 (on page 157).)

9403 char \*currency\_symbol  
 9404 char \*decimal\_point  
 9405 char frac\_digits  
 9406 char \*grouping  
 9407 char \*int\_curr\_symbol  
 9408 char int\_frac\_digits  
 9409 char int\_n\_cs\_precedes  
 9410 char int\_n\_sep\_by\_space  
 9411 char int\_n\_sign\_posn  
 9412 char int\_p\_cs\_precedes  
 9413 char int\_p\_sep\_by\_space  
 9414 char int\_p\_sign\_posn  
 9415 char \*mon\_decimal\_point  
 9416 char \*mon\_grouping  
 9417 char \*mon\_thousands\_sep  
 9418 char \*negative\_sign  
 9419 char n\_cs\_precedes  
 9420 char n\_sep\_by\_space  
 9421 char n\_sign\_posn  
 9422 char \*positive\_sign  
 9423 char p\_cs\_precedes  
 9424 char p\_sep\_by\_space  
 9425 char p\_sign\_posn  
 9426 char \*thousands\_sep

9427 The <locale.h> header shall define NULL (as described in <stddef.h>) and at least the following  
 9428 as macros:

9429 *LC\_ALL*9430 *LC\_COLLATE*9431 *LC\_CTYPE*9432 CX *LC\_MESSAGES*9433 *LC\_MONETARY*9434 *LC\_NUMERIC*9435 *LC\_TIME*

9436 which shall expand to integer constant expressions with distinct values for use as the first  
 9437 argument to the *setlocale()* function.

9438 Implementations may add additional masks using the form *LC\_\** and an uppercase letter.

9439 CX The <locale.h> header shall contain at least the following macros representing bitmasks for use  
 9440 with the *newlocale()* function for each supported locale category:

9441 LC\_COLLATE\_MASK  
 9442 LC\_CTYPE\_MASK  
 9443 LC\_MESSAGES\_MASK  
 9444 LC\_MONETARY\_MASK  
 9445 LC\_NUMERIC\_MASK  
 9446 LC\_TIME\_MASK

9447 Implementations may add additional masks using the form LC\_\*\_MASK.

9448 In addition, a macro to set the bits for all categories set shall be defined:

9449 LC\_ALL\_MASK

9450 The <locale.h> header shall define LC\_GLOBAL\_LOCALE, a special locale object descriptor  
 9451 used by the *uselocale()* function.

9452 The <locale.h> header shall define the **locale\_t** type, representing a locale object.

9453 The following shall be declared as functions and may also be defined as macros. Function  
 9454 prototypes shall be provided for use with ISO C standard compilers.

9455 CX locale\_t duplocale(locale\_t);  
 9456 void freelocale(locale\_t);  
 9457 struct lconv \*localeconv(void);

9458 CX locale\_t newlocale(int, const char \*, locale\_t);  
 9459 char \*setlocale(int, const char \*);

9460 CX locale\_t uselocale(locale\_t);

**9461 APPLICATION USAGE**

9462 None.

**9463 RATIONALE**

9464 None.

**<math.h>**9482 **NAME**9483 `math.h` — mathematical declarations9484 **SYNOPSIS**9485 `#include <math.h>`9486 **DESCRIPTION**

9487 CX Some of the functionality described on this reference page extends the ISO C standard.  
 9488 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 9489 enable the visibility of these symbols in this header.

9490 The **<math.h>** header shall define at least the following types:9491 **float\_t** A real-floating type at least as wide as **float**.9492 **double\_t** A real-floating type at least as wide as **double**, and at least as wide as **float\_t**.

9493 If FLT\_EVAL\_METHOD equals 0, **float\_t** and **double\_t** shall be **float** and **double**, respectively; if  
 9494 FLT\_EVAL\_METHOD equals 1, they shall both be **double**; if FLT\_EVAL\_METHOD equals 2,  
 9495 they shall both be **long double**; for other values of FLT\_EVAL\_METHOD, they are otherwise  
 9496 implementation-defined.

9497 The **<math.h>** header shall define the following macros, where real-floating indicates that the  
 9498 argument shall be an expression of real-floating type:

```
9499 int fpclassify(real-floating x);
9500 int isfinite(real-floating x);
9501 int isgreater(real-floating x, real-floating y);
9502 int isgreaterequal(real-floating x, real-floating y);
9503 int isinf(real-floating x);
9504 int isless(real-floating x, real-floating y);
9505 int islessequal(real-floating x, real-floating y);
9506 int islessgreater(real-floating x, real-floating y);
9507 int isnan(real-floating x);
9508 int isnormal(real-floating x);
9509 int isunordered(real-floating x, real-floating y);
9510 int signbit(real-floating x);
```

9511 The **<math.h>** header shall define the following symbolic constants. The values shall have type  
 9512 **double** and shall be accurate within the precision of the **double** type.

9513	XSI	<b>M_E</b>	Value of $e$
9514	XSI	<b>M_LOG2E</b>	Value of $\log_2 e$
9515	XSI	<b>M_LOG10E</b>	Value of $\log_{10} e$
9516	XSI	<b>M_LN2</b>	Value of $\log_e 2$
9517	XSI	<b>M_LN10</b>	Value of $\log_e 10$
9518	XSI	<b>M_PI</b>	Value of $\pi$
9519	XSI	<b>M_PI_2</b>	Value of $\pi/2$
9520	XSI	<b>M_PI_4</b>	Value of $\pi/4$
9521	XSI	<b>M_1_PI</b>	Value of $1/\pi$
9522	XSI	<b>M_2_PI</b>	Value of $2/\pi$

## Headers

## &lt;math.h&gt;

9523 XSI `M_2_SQRTPI` Value of  $2/\sqrt{\pi}$

9524 XSI `M_SQRT2` Value of  $\sqrt{2}$

9525 XSI `M_SQRT1_2` Value of  $1/\sqrt{2}$

9526 The <math.h> header shall define the following symbolic constant:

9527 OB XSI `MAXFLOAT` Same value as `FLT_MAX` in <float.h>.

9528 The <math.h> header shall define the following macros:

9529 `HUGE_VAL` A positive **double** constant expression, not necessarily representable as a  
9530 **float**. Used as an error value returned by the mathematics library.  
9531 `HUGE_VAL` evaluates to +infinity on systems supporting IEEE Std 754-1985.

9532 `HUGE_VALF` A positive **float** constant expression. Used as an error value returned by the  
9533 mathematics library. `HUGE_VALF` evaluates to +infinity on systems  
9534 supporting IEEE Std 754-1985.

9535 `HUGE_VALL` A positive **long double** constant expression. Used as an error value returned  
9536 by the mathematics library. `HUGE_VALL` evaluates to +infinity on systems  
9537 supporting IEEE Std 754-1985.

9538 `INFINITY` A constant expression of type **float** representing positive or unsigned infinity,  
9539 if available; else a positive constant of type **float** that overflows at translation  
9540 time.

9541 `NAN` A constant expression of type **float** representing a quiet NaN. This macro is  
9542 only defined if the implementation supports quiet NaNs for the **float** type.

9543 The following macros shall be defined for number classification. They represent the mutually-  
9544 exclusive kinds of floating-point values. They expand to integer constant expressions with  
9545 distinct values. Additional implementation-defined floating-point classifications, with macro  
9546 definitions beginning with `FP_` and an uppercase letter, may also be specified by the  
9547 implementation.

9548 `FP_INFINITE`  
9549 `FP_NAN`  
9550 `FP_NORMAL`  
9551 `FP_SUBNORMAL`  
9552 `FP_ZERO`

9553 The following optional macros indicate whether the `fma()` family of functions are fast compared  
9554 with direct code:

9555 `FP_FAST_FMA`  
9556 `FP_FAST_FMAF`  
9557 `FP_FAST_FMAL`

9558 If defined, the `FP_FAST_FMA` macro shall expand to the integer constant 1 and shall indicate  
9559 that the `fma()` function generally executes about as fast as, or faster than, a multiply and an add  
9560 of **double** operands. If undefined, the speed of execution is unspecified. The other macros have  
9561 the equivalent meaning for the **float** and **long double** versions.

9562 The following macros shall expand to integer constant expressions whose values are returned by  
9563 `ilogb(x)` if  $x$  is zero or NaN, respectively. The value of `FP_ILOGB0` shall be either `{INT_MIN}` or  
9564 `-{INT_MAX}`. The value of `FP_ILOGBNAN` shall be either `{INT_MAX}` or `{INT_MIN}`.

9565 FP\_ILOGB0  
 9566 FP\_ILOGBNAN

9567 The following macros shall expand to the integer constants 1 and 2, respectively;

9568 MATH\_ERRNO  
 9569 MATH\_ERREXCEPT

9570 The following macro shall expand to an expression that has type **int** and the value  
 9571 MATH\_ERRNO, MATH\_ERREXCEPT, or the bitwise-inclusive OR of both:

9572 math\_errhandling

9573 The value of math\_errhandling is constant for the duration of the program. It is unspecified  
 9574 whether math\_errhandling is a macro or an identifier with external linkage. If a macro definition  
 9575 is suppressed or a program defines an identifier with the name math\_errhandling, the behavior  
 9576 is undefined. If the expression (math\_errhandling & MATH\_ERREXCEPT) can be non-zero, the  
 9577 implementation shall define the macros FE\_DIVBYZERO, FE\_INVALID, and FE\_OVERFLOW in  
 9578 <fenv.h>.

9579 The following shall be declared as functions and may also be defined as macros. Function  
 9580 prototypes shall be provided.

9581 double acos(double);  
 9582 float acosf(float);  
 9583 double acosh(double);  
 9584 float acoshf(float);  
 9585 long double acoshl(long double);  
 9586 long double acosl(long double);  
 9587 double asin(double);  
 9588 float asinf(float);  
 9589 double asinh(double);  
 9590 float asinhf(float);  
 9591 long double asinhl(long double);  
 9592 long double asinl(long double);  
 9593 double atan(double);  
 9594 double atan2(double, double);  
 9595 float atan2f(float, float);  
 9596 long double atan2l(long double, long double);  
 9597 float atanf(float);  
 9598 double atanh(double);  
 9599 float atanhf(float);  
 9600 long double atanh1(long double);  
 9601 long double atanl(long double);  
 9602 double cbrt(double);  
 9603 float cbrtf(float);  
 9604 long double cbrtl(long double);  
 9605 double ceil(double);  
 9606 float ceilf(float);  
 9607 long double ceill(long double);  
 9608 double copysign(double, double);  
 9609 float copysignf(float, float);  
 9610 long double copysignl(long double, long double);  
 9611 double cos(double);

9736     double     sinh(double);
9737     float      sinhf(float);
9738     long double sinhl(long double);
9739     long double sinl(long double);
9740     double     sqrt(double);
9741     float      sqrtf(float);
9742     long double sqrtl(long double);
9743     double     tan(double);
9744     float      tanf(float);
9745     double     tanh(double);
9746     float      tanhf(float);
9747     long double tanhl(long double);
9748     long double tanl(long double);
9749     double     tgamma(double);
9750     float      tgammaf(float);
9751     long double tgamma_l(long double);
9752     double     trunc(double);
9753     float      truncf(float);
9754     long double trunc_l(long double);
9755     double     y0(double);
9756     double     y1(double);
9757     double     yn(int, double);

```

9758 The following external variable shall be defined:

```

9759     extern int signgam;

```

9760 The behavior of each of the functions defined in <math.h> is specified in the System Interfaces  
9761 volume of POSIX.1-2008 for all representable values of its input arguments, except where stated  
9762 otherwise. Each function shall execute as if it were a single operation without generating any  
9763 externally visible exceptional conditions.

9764 **APPLICATION USAGE**

9765 The FP\_CONTRACT pragma can be used to allow (if the state is on) or disallow (if the state is  
 9766 off) the implementation to contract expressions. Each pragma can occur either outside external  
 9767 declarations or preceding all explicit declarations and statements inside a compound statement.  
 9768 When outside external declarations, the pragma takes effect from its occurrence until another  
 9769 FP\_CONTRACT pragma is encountered, or until the end of the translation unit. When inside a  
 9770 compound statement, the pragma takes effect from its occurrence until another FP\_CONTRACT  
 9771 pragma is encountered (including within a nested compound statement), or until the end of the  
 9772 compound statement; at the end of a compound statement the state for the pragma is restored to  
 9773 its condition just before the compound statement. If this pragma is used in any other context, the  
 9774 behavior is undefined. The default state (on or off) for the pragma is implementation-defined.

9775 Applications should use FLT\_MAX as described in the <float.h> header instead of the  
 9776 obsolescent MAXFLOAT.

9777 **RATIONALE**

9778 Before the ISO/IEC 9899:1999 standard, the math library was defined only for the floating type  
 9779 **double**. All the names formed by appending 'f' or 'l' to a name in <math.h> were reserved  
 9780 to allow for the definition of **float** and **long double** libraries; and the ISO/IEC 9899:1999  
 9781 standard provides for all three versions of math functions.

9782 The functions *ecvt()*, *fcvt()*, and *gcvt()* have been dropped from the ISO C standard since their  
 9783 capability is available through *sprintf()*.

9784 **FUTURE DIRECTIONS**

9785 None.

9786 **SEE ALSO**

9795 **CHANGE HISTORY**

9796 First released in Issue 1.

9797 **Issue 6**

9798 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

9799 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/21 is applied, making it clear that the  
 9800 meaning of the FP\_FAST\_FMA macro is unspecified if the macro is undefined.

9801 **Issue 7**

9802 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #47 (SD5-XBD-ERN-52) is applied,  
 9803 clarifying the wording of the FP\_FAST\_FMA macro.

9804 The MAXFLOAT constant is marked obsolescent.

9805 This reference page is clarified with respect to macros and symbolic constants.

9827           XSH *strfmon()*9828 **CHANGE HISTORY**

9829           First released in Issue 4.

9830 **Issue 6**9831           The **restrict** keyword is added to the prototype for *strfmon()*.9832 **Issue 7**

9833           The &lt;monetary.h&gt; header is moved from the XSI option to the Base.

9834           The *strmon\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
9835           Set Part 4.9836           A declaration for the **locale\_t** type is added.

**<mqueue.h>**9837 **NAME**9838 mqueue.h — message queues (**REALTIME**)9839 **SYNOPSIS**

9840 MSG #include &lt;mqueue.h&gt;

9841 **DESCRIPTION**9842 The **<mqueue.h>** header shall define the **mqd\_t** type, which is used for message queue  
9843 descriptors. This is not an array type.9844 The **<mqueue.h>** header shall define the **pthread\_attr\_t**, **size\_t**, and **ssize\_t** types as described  
9845 in **<sys/types.h>**.9846 The **<mqueue.h>** header shall define the **struct timespec** structure as described in **<time.h>**.9847 The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which  
9848 are described in the **<signal.h>** header.9849 The **<mqueue.h>** header shall define the **mq\_attr** structure, which is used in getting and setting  
9850 the attributes of a message queue. Attributes are initially set when the message queue is created.  
9851 An **mq\_attr** structure shall have at least the following fields:

9852	long	mq_flags	Message queue flags.
9853	long	mq_maxmsg	Maximum number of messages.
9854	long	mq_msgsize	Maximum message size.
9855	long	mq_curmsgs	Number of messages currently queued.

9856 The following shall be declared as functions and may also be defined as macros. Function  
9857 prototypes shall be provided.

```

9858 int      mq_close(mqd_t);
9859 int      mq_getattr(mqd_t, struct mq_attr *);
9860 int      mq_notify(mqd_t, const struct sigevent *);
9861 mqd_t    mq_open(const char *, int, ...);
9862 ssize_t  mq_receive(mqd_t, char *, size_t, unsigned *);
9863 int      mq_send(mqd_t, const char *, size_t, unsigned);
9864 int      mq_setattr(mqd_t, const struct mq_attr *restrict,
9865                    struct mq_attr *restrict);
9866 ssize_t  mq_timedreceive(mqd_t, char *restrict, size_t,
9867                        unsigned *restrict, const struct timespec *restrict);
9868 int      mq_timedsend(mqd_t, const char *, size_t, unsigned,
9869                     const struct timespec *);
9870 int      mq_unlink(const char *);

```

9871 Inclusion of the **<mqueue.h>** header may make visible symbols defined in the headers  
9872 **<fcntl.h>**, **<signal.h>**, and **<time.h>**.9873 **APPLICATION USAGE**

9874 None.

9875 **RATIONALE**

9876 None.

9877 **FUTURE DIRECTIONS**

9878 None.

9879 **SEE ALSO**9880 [<fcntl.h>](#), [<signal.h>](#), [<sys/types.h>](#), [<time.h>](#)9881 XSH [mq\\_close\(\)](#), [mq\\_getattr\(\)](#), [mq\\_notify\(\)](#), [mq\\_open\(\)](#), [mq\\_receive\(\)](#), [mq\\_send\(\)](#), [mq\\_setattr\(\)](#),  
9882 [mq\\_unlink\(\)](#)9883 **CHANGE HISTORY**

9884 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

9885 **Issue 6**

9886 The &lt;mqqueue.h&gt; header is marked as part of the Message Passing option.

9887 The [mq\\_timedreceive\(\)](#) and [mq\\_timedsend\(\)](#) functions are added for alignment with IEEE Std  
9888 1003.1d-1999.9889 The **restrict** keyword is added to the prototypes for [mq\\_setattr\(\)](#) and [mq\\_timedreceive\(\)](#).9890 **Issue 7**

9891 Type and structure declarations are added.

9965 **NAME**

9966 netdb.h — definitions for network database operations

9967 **SYNOPSIS**

9968 #include &lt;netdb.h&gt;

9969 **DESCRIPTION**9970 The <netdb.h> header may define the **in\_port\_t** type and the **in\_addr\_t** type as described in  
9971 <netinet/in.h>.9972 The <netdb.h> header shall define the **hostent** structure, which shall include at least the  
9973 following members:

9974	char	*h_name	Official name of the host.
9975	char	**h_aliases	A pointer to an array of pointers to 9976 alternative host names, terminated by a 9977 null pointer.
9978	int	h_addrtype	Address type.
9979	int	h_length	The length, in bytes, of the address.
9980	char	**h_addr_list	A pointer to an array of pointers to network 9981 addresses (in network byte order) for the host, 9982 terminated by a null pointer.

9983 The <netdb.h> header shall define the **netent** structure, which shall include at least the  
9984 following members:

9985	char	*n_name	Official, fully-qualified (including the 9986 domain) name of the host.
9987	char	**n_aliases	A pointer to an array of pointers to 9988 alternative network names, terminated by a 9989 null pointer.
9990	int	n_addrtype	The address type of the network.
9991	uint32_t	n_net	The network number, in host byte order.

9992 The <netdb.h> header shall define the **uint32\_t** type as described in <inttypes.h>.9993 The <netdb.h> header shall define the **protoent** structure, which shall include at least the  
9994 following members:

9995	char	*p_name	Official name of the protocol.
9996	char	**p_aliases	A pointer to an array of pointers to 9997 alternative protocol names, terminated by 9998 a null pointer.
9999	int	p_proto	The protocol number.

10000 The <netdb.h> header shall define the **servent** structure, which shall include at least the  
10001 following members:

10002	char	*s_name	Official name of the service.
10003	char	**s_aliases	A pointer to an array of pointers to 10004 alternative service names, terminated by 10005 a null pointer.
10006	int	s_port	A value which, when converted to <b>uint16_t</b> , 10007 yields the port number in network byte order 10008 at which the service resides.
10009	char	*s_proto	The name of the protocol to use when 10010 contacting the service.

10011 The <netdb.h> header shall define the IPPORT\_RESERVED symbolic constant with the value of  
10012 the highest reserved Internet port number.

### 10013 Address Information Structure

10014 The <netdb.h> header shall define the **addrinfo** structure, which shall include at least the  
10015 following members:

10016	int	ai_flags	Input flags.
10017	int	ai_family	Address family of socket.
10018	int	ai_socktype	Socket type.
10019	int	ai_protocol	Protocol of socket.
10020	socklen_t	ai_addrlen	Length of socket address.
10021	struct sockaddr	*ai_addr	Socket address of socket.
10022	char	*ai_canonname	Canonical name of service location.
10023	struct addrinfo	*ai_next	Pointer to next in list.

10024 The <netdb.h> header shall define the following symbolic constants that evaluate to bitwise-  
10025 distinct integer constants for use in the *flags* field of the **addrinfo** structure:

10026	AI_PASSIVE	Socket address is intended for <i>bind()</i> .
10027	AI_CANONNAME	Request for canonical name.
10028	AI_NUMERICHOST	Return numeric host address as name.
10029	AI_NUMERICSERV	Inhibit service name resolution.
10030	AI_V4MAPPED	If no IPv6 addresses are found, query for IPv4 addresses and return them 10031 to the caller as IPv4-mapped IPv6 addresses.
10032	AI_ALL	Query for both IPv4 and IPv6 addresses.
10033	AI_ADDRCONFIG	Query for IPv4 addresses only when an IPv4 address is configured; query 10034 for IPv6 addresses only when an IPv6 address is configured.

10035 The <netdb.h> header shall define the following symbolic constants that evaluate to bitwise-  
10036 distinct integer constants for use in the *flags* argument to *getnameinfo()*:

10037	NI_NOFQDN	Only the nodename portion of the FQDN is returned for local hosts.
10038	NI_NUMERICHOST	The numeric form of the node's address is returned instead of its name.
10039	NI_NAMEREQD	Return an error if the node's name cannot be located in the database.
10040	NI_NUMERICSERV	The numeric form of the service address is returned instead of its name.
10041	NI_NUMERICSCOPE	
10042		For IPv6 addresses, the numeric form of the scope identifier is returned 10043 instead of its name.
10044	NI_DGRAM	Indicates that the service is a datagram service (SOCK_DGRAM).

10045 **Address Information Errors**

10046 The <netdb.h> header shall define the following symbolic constants for use as error values for  
 10047 *getaddrinfo()* and *getnameinfo()*. The values shall be suitable for use in *#if* preprocessing  
 10048 directives.

10049 EAI\_AGAIN The name could not be resolved at this time. Future attempts may  
 10050 succeed.

10051 EAI\_BADFLAGS The flags had an invalid value.

10052 EAI\_FAIL A non-recoverable error occurred.

10053 EAI\_FAMILY The address family was not recognized or the address length was invalid  
 10054 for the specified family.

10055 EAI\_MEMORY There was a memory allocation failure.

10056 EAI\_NONAME The name does not resolve for the supplied parameters.

10057 NI\_NAMEREQD is set and the host's name cannot be located, or both  
 10058 *nodename* and *servname* were null.

10059 EAI\_SERVICE The service passed was not recognized for the specified socket type.

10060 EAI\_SOCKTYPE The intended socket type was not recognized.

10061 EAI\_SYSTEM A system error occurred. The error code can be found in *errno*.

10062 EAI\_OVERFLOW An argument buffer overflowed.

10063 The following shall be declared as functions and may also be defined as macros. Function  
 10064 prototypes shall be provided.

10065 void *endhostent*(void);  
 10066 void *endnetent*(void);  
 10067 void *endprotoent*(void);  
 10068 void *endservent*(void);  
 10069 void *freeaddrinfo*(struct *addrinfo* \*);  
 10070 const char \**gai\_strerror*(int);  
 10071 int *getaddrinfo*(const char \*restrict, const char \*restrict,  
 10072 const struct *addrinfo* \*restrict,  
 10073 struct *addrinfo* \*\*restrict);  
 10074 struct *hostent* \**gethostent*(void);  
 10075 int *getnameinfo*(const struct *sockaddr* \*restrict, *socklen\_t*,  
 10076 char \*restrict, *socklen\_t*, char \*restrict,  
 10077 *socklen\_t*, int);  
 10078 struct *netent* \**getnetbyaddr*(uint32\_t, int);  
 10079 struct *netent* \**getnetbyname*(const char \*);  
 10080 struct *netent* \**getnetent*(void);  
 10081 struct *protoent* \**getprotobyname*(const char \*);  
 10082 struct *protoent* \**getprotobynumber*(int);  
 10083 struct *protoent* \**getprotoent*(void);  
 10084 struct *servent* \**getservbyname*(const char \*, const char \*);  
 10085 struct *servent* \**getservbyport*(int, const char \*);  
 10086 struct *servent* \**getservent*(void);  
 10087 void *sethostent*(int);  
 10088 void *setnetent*(int);  
 10089 void *setprotoent*(int);

## &lt;netdb.h&gt;

Headers

10090           void                           setservent(int);

10091           The <netdb.h> header shall define the **socklen\_t** type through **typedef**, as described in  
10092           <sys/socket.h>.

10093           Inclusion of the <netdb.h> header may also make visible all symbols from <netinet/in.h>,  
10094           <sys/socket.h>, and <inttypes.h>.

10095   **APPLICATION USAGE**

10096           None.

10097   **RATIONALE**

10098           None.

10099   **FUTURE DIRECTIONS**

10100           None.

10101   **SEE ALSO**

10102           <inttypes.h>, <netinet/in.h>, <sys/socket.h>

10103           XSH *bind()*, *endhostent()*, *endnetent()*, *endprotoent()*, *endservent()*, *freeaddrinfo()*, *gai\_strerror()*,  
10104           *getnameinfo()*

10105   **CHANGE HISTORY**

10106           First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

10107           The Open Group Base Resolution bwg2001-009 is applied, which changes the return type for  
10108           *gai\_strerror()* from **char \*** to **const char \***. This is for coordination with the IPnG Working Group.

10109           IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/11 is applied, adding a description of the  
10110           NI\_NUMERICSCOPE macro and correcting the *getnameinfo()* function prototype. These changes  
10111           are for alignment with IPv6.

10112   **Issue 7**

10113           SD5-XBD-ERN-14 is applied, changing the description of the *s\_port* member of the **servent**  
10114           structure.

10115           The obsolescent *h\_errno* external integer, and the obsolescent *gethostbyaddr()*, and  
10116           *gethostbyname()* functions are removed, along with the HOST\_NOT\_FOUND, NO\_DATA,  
10117           NO\_RECOVERY, and TRY\_AGAIN macros.

10118           This reference page is clarified with respect to macros and symbolic constants.

## Headers

## &lt;netinet/in.h&gt;

## 10119 NAME

10120           netinet/in.h — Internet address family

## 10121 SYNOPSIS

10122           #include <netinet/in.h>

## 10123 DESCRIPTION

10124           The <netinet/in.h> header shall define the following types:

10125           **in\_port\_t**   Equivalent to the type **uint16\_t** as described in <inttypes.h>.

10126           **in\_addr\_t**   Equivalent to the type **uint32\_t** as described in <inttypes.h>.

10127           The <netinet\_in.h> header shall define the **sa\_family\_t** type as described in <sys/socket.h>.

10128           The <netinet\_in.h> header shall define the **uint8\_t** and **uint32\_t** types as described in <inttypes.h>. Inclusion of the <netinet/in.h> header may also make visible all symbols from <inttypes.h> and <sys/socket.h>.

10131           The <netinet/in.h> header shall define the **in\_addr** structure, which shall include at least the following member:

10133           in\_addr\_t   s\_addr

10134           The <netinet/in.h> header shall define the **sockaddr\_in** structure, which shall include at least the following members:

10136           sa\_family\_t    sin\_family    AF\_INET.  
10137           in\_port\_t       sin\_port     Port number.  
10138           struct in\_addr  sin\_addr     IP address.

10139           The *sin\_port* and *sin\_addr* members shall be in network byte order.

10140           The **sockaddr\_in** structure is used to store addresses for the Internet address family. Values of this type shall be cast by applications to **struct sockaddr** for use with socket functions.

10142 IP6       The <netinet/in.h> header shall define the **in6\_addr** structure, which shall include at least the following member:

10144           uint8\_t   s6\_addr[16]

10145           This array is used to contain a 128-bit IPv6 address, stored in network byte order.

10146           The <netinet/in.h> header shall define the **sockaddr\_in6** structure, which shall include at least the following members:

10148           sa\_family\_t       sin6\_family    AF\_INET6.  
10149           in\_port\_t         sin6\_port     Port number.  
10150           uint32\_t          sin6\_flowinfo  IPv6 traffic class and flow information.  
10151           struct in6\_addr    sin6\_addr     IPv6 address.  
10152           uint32\_t          sin6\_scope\_id  Set of interfaces for a scope.

10153           The *sin6\_port* and *sin6\_addr* members shall be in network byte order.

10154           The **sockaddr\_in6** structure shall be set to zero by an application prior to using it, since implementations are free to have additional, implementation-defined fields in **sockaddr\_in6**.

10156           The *sin6\_scope\_id* field is a 32-bit integer that identifies a set of interfaces as appropriate for the scope of the address carried in the *sin6\_addr* field. For a link scope *sin6\_addr*, the application shall ensure that *sin6\_scope\_id* is a link index. For a site scope *sin6\_addr*, the application shall ensure that *sin6\_scope\_id* is a site index. The mapping of *sin6\_scope\_id* to an interface or set of interfaces is implementation-defined.

## &lt;netinet/in.h&gt;

Headers

10161		The <netinet/in.h> header shall declare the following external variable:
10162		<code>const struct in6_addr in6addr_any</code>
10163		This variable is initialized by the system to contain the wildcard IPv6 address. The
10164		<netinet/in.h> header also defines the IN6ADDR_ANY_INIT macro. This macro must be
10165		constant at compile time and can be used to initialize a variable of type <b>struct in6_addr</b> to the
10166		IPv6 wildcard address.
10167		The <netinet/in.h> header shall declare the following external variable:
10168		<code>const struct in6_addr in6addr_loopback</code>
10169		This variable is initialized by the system to contain the loopback IPv6 address. The
10170		<netinet/in.h> header also defines the IN6ADDR_LOOPBACK_INIT macro. This macro must be
10171		constant at compile time and can be used to initialize a variable of type <b>struct in6_addr</b> to the
10172		IPv6 loopback address.
10173		The <netinet/in.h> header shall define the <b>ipv6_mreq</b> structure, which shall include at least the
10174		following members:
10175		<code>struct in6_addr ipv6mr_multiaddr</code> IPv6 multicast address.
10176		<code>unsigned ipv6mr_interface</code> Interface index
10177		The <netinet/in.h> header shall define the following symbolic constants for use as values of the
10178		<i>level</i> argument of <i>getsockopt()</i> and <i>setsockopt()</i> :
10179		IPPROTO_IP Internet protocol.
10180	IP6	IPPROTO_IPV6 Internet Protocol Version 6.
10181		IPPROTO_ICMP Control message protocol.
10182	RS	IPPROTO_RAW Raw IP Packets Protocol.
10183		IPPROTO_TCP Transmission control protocol.
10184		IPPROTO_UDP User datagram protocol.
10185		The <netinet/in.h> header shall define the following symbolic constants for use as destination
10186		addresses for <i>connect()</i> , <i>sendmsg()</i> , and <i>sendto()</i> :
10187		INADDR_ANY IPv4 local host address.
10188		INADDR_BROADCAST IPv4 broadcast address.
10189		The <netinet/in.h> header shall define the following symbolic constant, with the value
10190		specified, to help applications declare buffers of the proper size to store IPv4 addresses in string
10191		form:
10192		INET_ADDRSTRLEN 16. Length of the string form for IP.
10193		The <i>htonl()</i> , <i>htons()</i> , <i>ntohl()</i> , and <i>ntohs()</i> functions shall be available as described in
10194		<arpa/inet.h>. Inclusion of the <netinet/in.h> header may also make visible all symbols from
10195		<arpa/inet.h>.
10196	IP6	The <netinet/in.h> header shall define the following symbolic constant, with the value
10197		specified, to help applications declare buffers of the proper size to store IPv6 addresses in string
10198		form:

10199		INET6_ADDRSTRLEN	46. Length of the string form for IPv6.
10200	IP6	The <netinet/in.h> header shall define the following symbolic constants, with distinct integer values, for use in the <i>option_name</i> argument in the <i>getsockopt()</i> or <i>setsockopt()</i> functions at protocol level IPPROTO_IPV6:	
10201			
10202			
10203		IPV6_JOIN_GROUP	Join a multicast group.
10204		IPV6_LEAVE_GROUP	Quit a multicast group.
10205		IPV6_MULTICAST_HOPS	
10206			Multicast hop limit.
10207		IPV6_MULTICAST_IF	Interface to use for outgoing multicast packets.
10208		IPV6_MULTICAST_LOOP	
10209			Multicast packets are delivered back to the local application.
10210		IPV6_UNICAST_HOPS	Unicast hop limit.
10211		IPV6_V6ONLY	Restrict AF_INET6 socket to IPv6 communications only.
10212		The <netinet/in.h> header shall define the following macros that test for special IPv6 addresses. Each macro is of type <b>int</b> and takes a single argument of type <b>const struct in6_addr *</b> :	
10213			
10214		IN6_IS_ADDR_UNSPECIFIED	
10215			Unspecified address.
10216		IN6_IS_ADDR_LOOPBACK	
10217			Loopback address.
10218		IN6_IS_ADDR_MULTICAST	
10219			Multicast address.
10220		IN6_IS_ADDR_LINKLOCAL	
10221			Unicast link-local address.
10222		IN6_IS_ADDR_SITELOCAL	
10223			Unicast site-local address.
10224		IN6_IS_ADDR_V4MAPPED	
10225			IPv4 mapped address.
10226		IN6_IS_ADDR_V4COMPAT	
10227			IPv4-compatible address.
10228		IN6_IS_ADDR_MC_NODELOCAL	
10229			Multicast node-local address.

## 10247 CHANGE HISTORY

10248 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

10249 The *sin\_zero* member was removed from the `sockaddr_in` structure as per The Open Group Base  
10250 Resolution bwg2001-004.10251 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/12 is applied, adding `const` qualifiers to  
10252 the *in6addr\_any* and *in6addr\_loopback* external variables.10253 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/22 is applied, making it clear which  
10254 structure members are in network byte order.

## 10255 Issue 7

10256 This reference page is clarified with respect to macros and symbolic constants.

10257 **NAME**

10258           netinet/tcp.h — definitions for the Internet Transmission Control Protocol (TCP)

10259 **SYNOPSIS**

10260           #include <netinet/tcp.h>

10261 **DESCRIPTION**

10262           The <netinet/tcp.h> header shall define the following symbolic constant for use as a socket  
10263           option at the IPPROTO\_TCP level:

10264           TCP\_NODELAY   Avoid coalescing of small segments.

10265           The implementation need not allow the value of the option to be set via *setsockopt()* or retrieved  
10266           via *getsockopt()*.

10267 **APPLICATION USAGE**

10268           None.

10269 **RATIONALE**

10270           None.

10271 **FUTURE DIRECTIONS**

10272           None.

10273 **SEE ALSO**

10274           <sys/socket.h>

10275           XSH *getsockopt()*, *setsockopt()*

10276 **CHANGE HISTORY**

10277           First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

10278 **Issue 7**

10279           This reference page is clarified with respect to macros and symbolic constants.

**<nl\_types.h>**

Headers

10280 **NAME**

10281 nl\_types.h — data types

10282 **SYNOPSIS**

10283 #include &lt;nl\_types.h&gt;

10284 **DESCRIPTION**

10285 The &lt;nl\_types.h&gt; header shall define at least the following types:

10286 **nl\_catd** Used by the message catalog functions *catopen()*, *catgets()*, and *catclose()*  
 10287 to identify a catalog descriptor.

10288 **nl\_item** Used by *nl\_langinfo()* to identify items of *langinfo* data. Values of objects  
 10289 of type **nl\_item** are defined in <langinfo.h>.

10290 The &lt;nl\_types.h&gt; header shall define at least the following symbolic constants:

10291 **NL\_SETD** Used by *gencat* when no *\$set* directive is specified in a message text source  
 10292 file. This constant can be passed as the value of *set\_id* on subsequent calls  
 10293 to *catgets()* (that is, to retrieve messages from the default message set).  
 10294 The value of **NL\_SETD** is implementation-defined.

10295 **NL\_CAT\_LOCALE** Value that must be passed as the *oflag* argument to *catopen()* to ensure that  
 10296 message catalog selection depends on the *LC\_MESSAGES* locale category,  
 10297 rather than directly on the *LANG* environment variable.

10298 The following shall be declared as functions and may also be defined as macros. Function  
10299 prototypes shall be provided.

```
10300 int      catclose(nl_catd);
10301 char    *catgets(nl_catd, int, int, const char *);
10302 nl_catd  catopen(const char *, int);
```

10303 **APPLICATION USAGE**

10304 None.

10305 **RATIONALE**

10306 None.

10307 **FUTURE DIRECTIONS**

10308 None.

10309 **SEE ALSO**

10310 &lt;langinfo.h&gt;

10311 XSH *catclose()*, *catgets()*, *catopen()*, *nl\_langinfo()*10312 XCU *gencat*10313 **CHANGE HISTORY**

10314 First released in Issue 2.

10315 **Issue 7**

10316 The &lt;nl\_types.h&gt; header is moved from the XSI option to the Base.

10317 This reference page is clarified with respect to macros and symbolic constants.

10318 **NAME**

10319 poll.h — definitions for the poll() function

10320 **SYNOPSIS**

10321 #include &lt;poll.h&gt;

10322 **DESCRIPTION**10323 The <poll.h> header shall define the **pollfd** structure, which shall include at least the following  
10324 members:

10325 int fd The following descriptor being polled.

10326 short events The input event flags (see below).

10327 short revents The output event flags (see below).

10328 The <poll.h> header shall define the following type through **typedef**:10329 **nfds\_t** An unsigned integer type used for the number of file descriptors.10330 The implementation shall support one or more programming environments in which the width  
10331 of **nfds\_t** is no greater than the width of type **long**. The names of these programming  
10332 environments can be obtained using the *confstr()* function or the *getconf* utility.10333 The <poll.h> header shall define the following symbolic constants, zero or more of which may  
10334 be OR'ed together to form the *events* or *revents* members in the **pollfd** structure:

10335 POLLIN Data other than high-priority data may be read without blocking.

10336 POLLRDNORM Normal data may be read without blocking.

10337 POLLRDBAND Priority data may be read without blocking.

10338 POLLPRI High priority data may be read without blocking.

10339 POLLOUT Normal data may be written without blocking.

10340 POLLWRNORM Equivalent to POLLOUT.

10341 POLLWRBAND Priority data may be written.

10342 POLLERR An error has occurred (*revents* only).10343 POLLHUP Device has been disconnected (*revents* only).10344 POLLNVAL Invalid *fd* member (*revents* only).10345 The significance and semantics of normal, priority, and high-priority data are file and device-  
10346 specific.10347 The following shall be declared as a function and may also be defined as a macro. A function  
10348 prototype shall be provided.

10349 int poll(struct pollfd [], nfds\_t, int);

10350 **APPLICATION USAGE**

10351 None.

10352 **RATIONALE**

10353 None.

10354 **FUTURE DIRECTIONS**

10355 None.

## &lt;poll.h&gt;

Headers

10356 **SEE ALSO**10357 XSH *confstr()*, *poll()*10358 XCU *getconf*10359 **CHANGE HISTORY**

10360 First released in Issue 4, Version 2.

10361 **Issue 6**10362 The description of the symbolic constants is updated to match the *poll()* function.10363 Text related to STREAMS has been moved to the *poll()* reference page.10364 A note is added to the DESCRIPTION regarding the significance and semantics of normal,  
10365 priority, and high-priority data.10366 **Issue 7**

10367 The &lt;poll.h&gt; header is moved from the XSI option to the Base.

## &lt;pthread.h&gt;

10368 **NAME**

10369 pthread.h — threads

10370 **SYNOPSIS**

10371 #include &lt;pthread.h&gt;

10372 **DESCRIPTION**

10373 The &lt;pthread.h&gt; header shall define the following symbolic constants:

10374 PTHREAD\_BARRIER\_SERIAL\_THREAD  
 10375 PTHREAD\_CANCEL\_ASYNCHRONOUS  
 10376 PTHREAD\_CANCEL\_ENABLE  
 10377 PTHREAD\_CANCEL\_DEFERRED  
 10378 PTHREAD\_CANCEL\_DISABLE  
 10379 PTHREAD\_CANCELED  
 10380 PTHREAD\_CREATE\_DETACHED  
 10381 PTHREAD\_CREATE\_JOINABLE  
 10382 TPS PTHREAD\_EXPLICIT\_SCHED  
 10383 PTHREAD\_INHERIT\_SCHED  
 10384 PTHREAD\_MUTEX\_DEFAULT  
 10385 PTHREAD\_MUTEX\_ERRORCHECK  
 10386 PTHREAD\_MUTEX\_NORMAL  
 10387 PTHREAD\_MUTEX\_RECURSIVE  
 10388 PTHREAD\_MUTEX\_ROBUST  
 10389 PTHREAD\_MUTEX\_STALLED  
 10390 PTHREAD\_ONCE\_INIT  
 10391 RPI|TPI PTHREAD\_PRIO\_INHERIT  
 10392 MC1 PTHREAD\_PRIO\_NONE  
 10393 RPP|TPP PTHREAD\_PRIO\_PROTECT  
 10394 PTHREAD\_PROCESS\_SHARED  
 10395 PTHREAD\_PROCESS\_PRIVATE  
 10396 TPS PTHREAD\_SCOPE\_PROCESS  
 10397 PTHREAD\_SCOPE\_SYSTEM

10398 The <pthread.h> header shall define the following compile-time constant expressions valid as  
 10399 initializers for the following types:

Name	Initializer for Type
PTHREAD_COND_INITIALIZER	pthread_cond_t
PTHREAD_MUTEX_INITIALIZER	pthread_mutex_t
PTHREAD_RWLOCK_INITIALIZER	pthread_rwlock_t

10404 The <pthread.h> header shall define the pthread\_attr\_t, pthread\_barrier\_t,  
 10405 pthread\_barrierattr\_t, pthread\_cond\_t, pthread\_condattr\_t, pthread\_key\_t, pthread\_mutex\_t,  
 10406 pthread\_mutexattr\_t, pthread\_once\_t, pthread\_rwlock\_t, pthread\_rwlockattr\_t,  
 10407 pthread\_spinlock\_t, and pthread\_t types as described in <sys/types.h>.

10408 The following shall be declared as functions and may also be defined as macros. Function  
 10409 prototypes shall be provided.

```
10410 int pthread_atfork(void (*)(void), void (*)(void),
10411                  void (*)(void));
10412 int pthread_attr_destroy(pthread_attr_t *);
10413 int pthread_attr_getdetachstate(const pthread_attr_t *, int *);
10414 int pthread_attr_getguardsize(const pthread_attr_t *restrict,

10565 *pthread\_mutexattr\_getpshared()*, *pthread\_mutexattr\_getrobust()*, *pthread\_mutexattr\_gettype()*,  
10566 *pthread\_once()*, *pthread\_rwlock\_destroy()*, *pthread\_rwlock\_rdlock()*, *pthread\_rwlock\_timedrdlock()*,

10567 *pthread\_rwlock\_timedwrlock()*, *pthread\_rwlock\_trywrlock()*, *pthread\_rwlock\_unlock()*,  
 10568 *pthread\_rwlockattr\_destroy()*, *pthread\_rwlockattr\_getpshared()*, *pthread\_self()*,  
 10569 *pthread\_setcancelstate()*, *pthread\_setschedprio()*, *pthread\_spin\_destroy()*, *pthread\_spin\_lock()*,  
 10570 *pthread\_spin\_unlock()*

#### 10571 CHANGE HISTORY

10572 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

#### 10573 Issue 6

10574 The RTT margin markers are broken out into their POSIX options.

10575 The Open Group Corrigendum U021/9 is applied, correcting the prototype for the  
 10576 *pthread\_cond\_wait()* function.

10577 The Open Group Corrigendum U026/2 is applied, correcting the prototype for the  
 10578 *pthread\_setschedparam()* function so that its second argument is of type **int**.

10579 The *pthread\_getcpuclockid()* and *pthread\_mutex\_timedlock()* functions are added for alignment  
 10580 with IEEE Std 1003.1d-1999.

10581 The following functions are added for alignment with IEEE Std 1003.1j-2000:

10582 *pthread\_barrier\_destroy()*, *pthread\_barrier\_init()*, *pthread\_barrier\_wait()*,  
 10583 *pthread\_barrierattr\_destroy()*, *pthread\_barrierattr\_getpshared()*, *pthread\_barrierattr\_init()*,  
 10584 *pthread\_barrierattr\_setpshared()*, *pthread\_condattr\_getclock()*, *pthread\_condattr\_setclock()*,  
 10585 *pthread\_rwlock\_timedrdlock()*, *pthread\_rwlock\_timedwrlock()*, *pthread\_spin\_destroy()*,  
 10586 *pthread\_spin\_init()*, *pthread\_spin\_lock()*, *pthread\_spin\_trylock()*, and *pthread\_spin\_unlock()*.

10587 PTHREAD\_RWLOCK\_INITIALIZER is removed for alignment with IEEE Std 1003.1j-2000.

10588 Functions previously marked as part of the Read-Write Locks option are now moved to the  
 10589 Threads option.

10590 The **restrict** keyword is added to the prototypes for *pthread\_attr\_getguardsize()*,  
 10591 *pthread\_attr\_getinheritsched()*, *pthread\_attr\_getschedparam()*, *pthread\_attr\_getschedpolicy()*,  
 10592 *pthread\_attr\_getscope()*, *pthread\_attr\_getstackaddr()*, *pthread\_attr\_getstacksize()*,  
 10593 *pthread\_attr\_setschedparam()*, *pthread\_barrier\_init()*, *pthread\_barrierattr\_getpshared()*,  
 10594 *pthread\_cond\_init()*, *pthread\_cond\_signal()*, *pthread\_cond\_timedwait()*, *pthread\_cond\_wait()*,  
 10595 *pthread\_condattr\_getclock()*, *pthread\_condattr\_getpshared()*, *pthread\_create()*,  
 10596 *pthread\_getschedparam()*, *pthread\_mutex\_getprioceiling()*, *pthread\_mutex\_init()*,  
 10597 *pthread\_mutex\_setprioceiling()*, *pthread\_mutexattr\_getprioceiling()*, *pthread\_mutexattr\_getprotocol()*,  
 10598 *pthread\_mutexattr\_getpshared()*, *pthread\_mutexattr\_gettype()*, *pthread\_rwlock\_init()*,  
 10599 *pthread\_rwlock\_timedrdlock()*, *pthread\_rwlock\_timedwrlock()*, *pthread\_rwlockattr\_getpshared()*, and  
 10600 *pthread\_sigmask()*.

10601 IEEE PASC Interpretation 1003.1 #86 is applied, allowing the symbols from <sched.h> and  
 10602 <time.h> to be made visible when <pthread.h> is included. Previously this was an XSI option.

10603 IEEE PASC Interpretation 1003.1c #42 is applied, removing the requirement for prototypes for  
 10604 the *pthread\_kill()* and *pthread\_sigmask()* functions. These are required to be in the <signal.h>  
 10605 header. They are allowed here through the name space rules.

10606 IEEE PASC Interpretation 1003.1 #96 is applied, adding the *pthread\_setschedprio()* function.

10607 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/13 is applied, correcting shading errors  
 10608 that were in contradiction with the System Interfaces volume of POSIX.1-2008.

## &lt;pthread.h&gt;

Headers

10609 **Issue 7**

10610 SD5-XBD-ERN-55 is applied, adding the **restrict** keyword to the *pthread\_mutex\_timedlock()*  
10611 function prototype.

10612 SD5-XBD-ERN-62 is applied.

10613 Austin Group Interpretation 1003.1-2001 #048 is applied, reinstating the  
10614 PTHREAD\_RWLOCK\_INITIALIZER symbol.

10615 The <pthread.h> header is moved from the Threads option to the Base.

10616 The following extended mutex types are moved from the XSI option to the Base:

10617 PTHREAD\_MUTEX\_NORMAL  
10618 PTHREAD\_MUTEX\_ERRORCHECK  
10619 PTHREAD\_MUTEX\_RECURSIVE  
10620 PTHREAD\_MUTEX\_DEFAULT

10621 The PTHREAD\_MUTEX\_ROBUST and PTHREAD\_MUTEX\_STALLED symbols and the  
10622 *pthread\_mutex\_consistent()*, *pthread\_mutexattr\_getrobust()*, and *pthread\_mutexattr\_setrobust()*  
10623 functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

10624 Functionality relating to the Thread Priority Protection and Thread Priority Inheritance options  
10625 is changed to be Non-Robust Mutex or Robust Mutex Priority Protection and Non-Robust Mutex  
10626 or Robust Mutex Priority Inheritance, respectively.

10627 This reference page is clarified with respect to macros and symbolic constants.

## Headers

## &lt;pwd.h&gt;

10628 **NAME**

10629           pwd.h — password structure

10630 **SYNOPSIS**

10631           #include &lt;pwd.h&gt;

10632 **DESCRIPTION**10633           The <pwd.h> header shall define the **struct passwd**, structure, which shall include at least the  
10634           following members:

10635	char	*pw_name	User's login name.
10636	uid_t	pw_uid	Numerical user ID.
10637	gid_t	pw_gid	Numerical group ID.
10638	char	*pw_dir	Initial working directory.
10639	char	*pw_shell	Program to use as shell.

10640           The <pwd.h> header shall define the **gid\_t**, **uid\_t**, and **size\_t** types as described in  
10641           <sys/types.h>.10642           The following shall be declared as functions and may also be defined as macros. Function  
10643           prototypes shall be provided.

```

10644 XSI void      endpwent(void);
10645 struct passwd *getpwent(void);
10646 struct passwd *getpwnam(const char *);
10647 int      getpwnam_r(const char *, struct passwd *, char *,
10648                  size_t, struct passwd **);
10649 struct passwd *getpwuid(uid_t);
10650 int      getpwuid_r(uid_t, struct passwd *, char *,
10651                  size_t, struct passwd **);
10652 XSI void      setpwent(void);

```

10653 **APPLICATION USAGE**

10654           None.

10655 **RATIONALE**

10656           None.

10657 **FUTURE DIRECTIONS**

10658           None.

10659 **SEE ALSO**

10660           &lt;sys/types.h&gt;

10661           XSH *endpwent()*, *getpwnam()*, *getpwuid()*10662 **CHANGE HISTORY**

10663           First released in Issue 1.

10664 **Issue 5**

10665           The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

10666 **Issue 6**10667           The following new requirements on POSIX implementations derive from alignment with the  
10668           Single UNIX Specification:

- 10669
- The **gid\_t** and **uid\_t** types are mandated.

**<pwd.h>***Headers*

10670                   • The *getpwnam\_r()* and *getpwuid\_r()* functions are marked as part of the Thread-Safe  
10671                    Functions option.

10672 **Issue 7**

10673                   SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **size\_t** type.

10674 **NAME**

10675 regex.h — regular expression matching types

10676 **SYNOPSIS**

10677 #include &lt;regex.h&gt;

10678 **DESCRIPTION**10679 The <regex.h> header shall define the structures and symbolic constants used by the *regcomp()*,  
10680 *regex()*, *regerror()*, and *regfree()* functions.10681 The <regex.h> header shall define the **regex\_t** structure type, which shall include at least the  
10682 following member:

10683 size\_t re\_nsub Number of parenthesized subexpressions.

10684 The <regex.h> header shall define the **size\_t** type as described in <sys/types.h>.10685 The <regex.h> header shall define the **regoff\_t** type as a signed integer type that can hold the  
10686 largest value that can be stored in either a **ptrdiff\_t** type or a **ssize\_t** type.10687 The <regex.h> header shall define the **regmatch\_t** structure type, which shall include at least the  
10688 following members:10689 regoff\_t rm\_so Byte offset from start of string  
10690 to start of substring.10691 regoff\_t rm\_eo Byte offset from start of string of the  
10692 first character after the end of substring.10693 The <regex.h> header shall define the following symbolic constants for the *cflags* parameter to  
10694 the *regcomp()* function:

10695 REG\_EXTENDED Use Extended Regular Expressions.

10696 REG\_ICASE Ignore case in match.

10697 REG\_NOSUB Report only success or fail in *regex()*.

10698 REG\_NEWLINE Change the handling of &lt;newline&gt;.

10699 The <regex.h> header shall define the following symbolic constants for the *eflags* parameter to  
10700 the *regex()* function:10701 REG\_NOTBOL The <circumflex> character ('^'), when taken as a special character, does  
10702 not match the beginning of *string*.10703 REG\_NOTEOL The <dollar-sign> ('\$'), when taken as a special character, does not  
10704 match the end of *string*.

10705 The &lt;regex.h&gt; header shall define the following symbolic constants as error return values:

10706 REG\_NOMATCH *regex()* failed to match.

10707 REG\_BADPAT Invalid regular expression.

10708 REG\_ECOLLATE Invalid collating element referenced.

10709 REG\_ETYPE Invalid character class type referenced.

10710 REG\_ESCAPE Trailing &lt;backslash&gt; character in pattern.

10711 REG\_ESUBREG Number in *\digit* invalid or in error.

**<regex.h>**

Headers

10712	REG_EBRACK	"[]" imbalance.
10713	REG_EPAREN	"\(\)" or "()" imbalance.
10714	REG_EBRACE	"\{\}" imbalance.
10715	REG_BADBR	Content of "\{\}" invalid: not a number, number too large, more than two numbers, first larger than second.
10716		
10717	REG_ERANGE	Invalid endpoint in range expression.
10718	REG_ESPACE	Out of memory.
10719	REG_BADRPT	'?', '*', or '+' not preceded by valid regular expression.
10720		The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.
10721		
10722		<code>int regcomp(regex_t *restrict, const char *restrict, int);</code>
10723		<code>size_t regerror(int, const regex_t *restrict, char *restrict, size_t);</code>
10724		<code>int regexec(const regex_t *restrict, const char *restrict, size_t, regmatch_t [restrict], int);</code>
10725		<code>regmatch_t [restrict], int);</code>
10726		<code>void regfree(regex_t *);</code>
10727		The implementation may define additional macros or constants using names beginning with REG_.
10728		
10729	<b>APPLICATION USAGE</b>	
10730		None.
10731	<b>RATIONALE</b>	
10732		None.
10733	<b>FUTURE DIRECTIONS</b>	
10734		None.
10735	<b>SEE ALSO</b>	
10736		<a href="#">&lt;sys/types.h&gt;</a>
10737		XSH <code>regcomp()</code>
10738	<b>CHANGE HISTORY</b>	
10739		First released in Issue 4.
10740		Originally derived from the ISO POSIX-2 standard.
10741	<b>Issue 6</b>	
10742		The REG_ENOSYS constant is marked obsolescent.
10743		The <b>restrict</b> keyword is added to the prototypes for <code>regcomp()</code> , <code>regerror()</code> , and <code>regexec()</code> .
10744		A statement is added that the <b>size_t</b> type is defined as described in <a href="#">&lt;sys/types.h&gt;</a> .
10745	<b>Issue 7</b>	
10746		SD5-XBD-ERN-60 is applied.
10747		The obsolescent REG_ENOSYS constant is removed.
10748		This reference page is clarified with respect to macros and symbolic constants.

## Headers

## &lt;sched.h&gt;

10749 **NAME**

10750 sched.h — execution scheduling

10751 **SYNOPSIS**

10752 #include <sched.h>

10753 **DESCRIPTION**

10754 PS The <sched.h> header shall define the **pid\_t** type as described in <sys/types.h>.

10755 SS|TSP The <sched.h> header shall define the **time\_t** type as described in <sys/types.h>.

10756 The <sched.h> header shall define the **timespec** structure as described in <time.h>.

10757 The <sched.h> header shall define the **sched\_param** structure, which shall include the scheduling parameters required for implementation of each supported scheduling policy. This structure shall include at least the following member:

10760 int sched\_priority Process or thread execution scheduling priority.

10761 SS|TSP The **sched\_param** structure defined in <sched.h> shall include the following members in addition to those specified above:

10763 int sched\_ss\_low\_priority Low scheduling priority for sporadic server.

10764 struct timespec sched\_ss\_repl\_period Replenishment period for sporadic server.

10765 struct timespec sched\_ss\_init\_budget Initial budget for sporadic server.

10766 int sched\_ss\_max\_repl Maximum pending replenishments for sporadic server.

10770 Each process or thread is controlled by an associated scheduling policy and priority. Associated with each policy is a priority range. Each policy definition specifies the minimum priority range for that policy. The priority ranges for each policy may overlap the priority ranges of other policies.

10774 Four scheduling policies are defined; others may be defined by the implementation. The four standard policies are indicated by the values of the following symbolic constants:

10776 PS|TPS **SCHED\_FIFO** First in-first out (FIFO) scheduling policy.

10777 PS|TPS **SCHED\_RR** Round robin scheduling policy.

10778 SS|TSP **SCHED\_SPORADIC** Sporadic server scheduling policy.

10779 PS|TPS **SCHED\_OTHER** Another scheduling policy.

10780 The values of these constants are distinct.

10781 The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

10783 PS|TPS int sched\_get\_priority\_max(int);

10784 int sched\_get\_priority\_min(int);

10785 PS int sched\_getparam(pid\_t, struct sched\_param \*);

10786 int sched\_getscheduler(pid\_t);

10787 PS|TPS int sched\_rr\_get\_interval(pid\_t, struct timespec \*);

10788 PS int sched\_setparam(pid\_t, const struct sched\_param \*);

10789 int sched\_setscheduler(pid\_t, int, const struct sched\_param \*);

10790 int sched\_yield(void);

## &lt;sched.h&gt;

Headers

- 10791 Inclusion of the <sched.h> header may make visible all symbols from the <time.h> header.

10864 **CHANGE HISTORY**

10865 First released in Issue 1. Derived from Issue 1 of the SVID.

10866 **Issue 6**

10867 The Open Group Corrigendum U021/6 is applied, updating the prototypes for *tdelete()* and *tsearch()*.

10869 The **restrict** keyword is added to the prototype for *tdelete()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

10870 **NAME**

10871 semaphore.h — semaphores

10872 **SYNOPSIS**

10873 #include &lt;semaphore.h&gt;

10874 **DESCRIPTION**

10875 The <semaphore.h> header shall define the **sem\_t** type, used in performing semaphore  
 10876 operations. The semaphore may be implemented using a file descriptor, in which case  
 10877 applications are able to open up at least a total of {OPEN\_MAX} files and semaphores.

10878 The <semaphore.h> header shall define the symbolic constant SEM\_FAILED which shall have  
 10879 type **sem\_t\***.

10880 The following shall be declared as functions and may also be defined as macros. Function  
 10881 prototypes shall be provided.

```
10882 int sem_close(sem_t *);
10883 int sem_destroy(sem_t *);
10884 int sem_getvalue(sem_t *restrict, int *restrict);
10885 int sem_init(sem_t *, int, unsigned);
10886 sem_t *sem_open(const char *, int, ...);
10887 int sem_post(sem_t *);
10888 int sem_timedwait(sem_t *restrict, const struct timespec *restrict);
10889 int sem_trywait(sem_t *);
10890 int sem_unlink(const char *);
10891 int sem_wait(sem_t *);
```

10892 Inclusion of the <semaphore.h> header may make visible symbols defined in the <fcntl.h> and  
 10893 <time.h> headers.

10894 **APPLICATION USAGE**

10895 None.

10896 **RATIONALE**

10897 None.

10898 **FUTURE DIRECTIONS**

10899 None.

10900 **SEE ALSO**

10901 &lt;fcntl.h&gt;, &lt;sys/types.h&gt;, &lt;time.h&gt;

10902 XSH *sem\_close()*, *sem\_destroy()*, *sem\_getvalue()*, *sem\_init()*, *sem\_open()*, *sem\_post()*,  
 10903 *sem\_timedwait()*, *sem\_trywait()*, *sem\_unlink()*

10904 **CHANGE HISTORY**

10905 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

10906 **Issue 6**

10907 The &lt;semaphore.h&gt; header is marked as part of the Semaphores option.

10908 The Open Group Corrigendum U021/3 is applied, adding a description of SEM\_FAILED.

10909 The *sem\_timedwait()* function is added for alignment with IEEE Std 1003.1d-1999.10910 The **restrict** keyword is added to the prototypes for *sem\_getvalue()* and *sem\_timedwait()*.

**<semaphore.h>***Headers*10911 **Issue 7**

10912 SD5-XBD-ERN-57 is applied, allowing the header to make visible symbols from the **<time.h>**  
10913 header.

10914 The **<semaphore.h>** header is moved from the Semaphores option to the Base.

10915 This reference page is clarified with respect to macros and symbolic constants.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

## Headers

## &lt;setjmp.h&gt;

10916 **NAME**

10917 setjmp.h — stack environment declarations

10918 **SYNOPSIS**

10919 #include <setjmp.h>

10920 **DESCRIPTION**

10921 CX Some of the functionality described on this reference page extends the ISO C standard.  
 10922 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 10923 enable the visibility of these symbols in this header.

10924 CX The <setjmp.h> header shall define the array types **jmp\_buf** and **sigjmp\_buf**.

10925 The following shall be declared as functions and may also be defined as macros. Function  
 10926 prototypes shall be provided.

10927 OB XSI void \_longjmp(jmp\_buf, int);

10928 void longjmp(jmp\_buf, int);

10929 CX void siglongjmp(sigjmp\_buf, int);

10930 The following may be declared as functions, or defined as macros, or both. If functions are  
 10931 declared, function prototypes shall be provided.

10932 OB XSI int \_setjmp(jmp\_buf);

10933 int setjmp(jmp\_buf);

10934 CX int sigsetjmp(sigjmp\_buf, int);

10935 **APPLICATION USAGE**

10936 None.

10937 **RATIONALE**

10938 None.

10939 **FUTURE DIRECTIONS**

10940 None.

10941 **SEE ALSO**

10942 XSH Section 2.2 (on page 468), *\_longjmp()*, *longjmp()*, *setjmp()*, *siglongjmp()*, *sigsetjmp()*

10943 **CHANGE HISTORY**

10944 First released in Issue 1.

10945 **Issue 6**

10946 Extensions beyond the ISO C standard are marked.

10947 **Issue 7**

10948 SD5-XBD-ERN-6 is applied.

## &lt;signal.h&gt;

## 10949 NAME

10950 signal.h — signals

## 10951 SYNOPSIS

10952 #include &lt;signal.h&gt;

## 10953 DESCRIPTION

10954 CX Some of the functionality described on this reference page extends the ISO C standard.  
 10955 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 10956 enable the visibility of these symbols in this header.

10957 The <signal.h> header shall define the following macros, which shall expand to constant  
 10958 expressions with distinct values that have a type compatible with the second argument to, and  
 10959 the return value of, the *signal()* function, and whose values shall compare unequal to the  
 10960 address of any declarable function.

10961 SIG\_DFL Request for default signal handling.

10962 SIG\_ERR Return value from *signal()* in case of error.

10963 OB CX SIG\_HOLD Request that signal be held.

10964 SIG\_IGN Request that signal be ignored.

10965 CX The <signal.h> header shall define the **pthread\_t**, **size\_t**, and **uid\_t** types as described in  
 10966 <sys/types.h>.

10967 The <signal.h> header shall define the **timespec** structure as described in <time.h>.

10968 The <signal.h> header shall define the following data types:

10969 **sig\_atomic\_t** Possibly volatile-qualified integer type of an object that can be accessed as  
 10970 an atomic entity, even in the presence of asynchronous interrupts.

10971 CX **sigset\_t** Integer or structure type of an object used to represent sets of signals.

10972 CX **pid\_t** As described in <sys/types.h>.

10973 CX The <signal.h> header shall define the **pthread\_attr\_t** type as described in <sys/types.h>.

10974 The <signal.h> header shall define the **sigevent** structure, which shall include at least the  
 10975 following members:

10976	int	sigev_notify	Notification type.
10977	int	sigev_signo	Signal number.
10978	union sigval	sigev_value	Signal value.
10979	void	(*sigev_notify_function)(union sigval)	Notification function.
10980			Notification function.
10981	pthread_attr_t	*sigev_notify_attributes	Notification attributes.

10982 The <signal.h> header shall define the following symbolic constants for the values of  
 10983 *sigev\_notify*:

10984 SIGEV\_NONE No asynchronous notification is delivered when the event of interest  
 10985 occurs.

10986 SIGEV\_SIGNAL A queued signal, with an application-defined value, is generated when  
 10987 the event of interest occurs.

10988 SIGEV\_THREAD A notification function is called to perform notification.

10989 The **signal** union shall be defined as:

10990 `int sival_int` Integer signal value.

10991 `void *sival_ptr` Pointer signal value.

10992 The <**signal.h**> header shall declare the SIGRTMIN and SIGRTMAX macros, which shall expand to positive integer expressions with type **int**, but which need not be constant expressions. These macros specify a range of signal numbers that are reserved for application use and for which the realtime signal behavior specified in this volume of POSIX.1-2008 is supported. The signal numbers in this range do not overlap any of the signals specified in the following table.

10997 The range SIGRTMIN through SIGRTMAX inclusive shall include at least {RTSIG\_MAX} signal numbers.

10999 It is implementation-defined whether realtime signal behavior is supported for other signals.

11000 The <**signal.h**> header shall define the following macros that are used to refer to the signals that occur in the system. Signals defined here begin with the letters SIG followed by an uppercase letter. The macros shall expand to positive integer constant expressions with type **int** and distinct values. The value 0 is reserved for use as the null signal (see *kill()*). Additional implementation-defined signals may occur in the system.

11005 CX The ISO C standard only requires the signal names SIGABRT, SIGFPE, SIGILL, SIGINT, SIGSEGV, and SIGTERM to be defined.

11007 The following signals shall be supported on all implementations (default actions are explained below the table):

11008

<signal.h>

	Signal	Default Action	Description
11009			
11010	SIGABRT	A	Process abort signal.
11011	SIGALRM	T	Alarm clock.
11012	SIGBUS	A	Access to an undefined portion of a memory object.
11013	SIGCHLD	I	Child process terminated, stopped,
11014	XSI		or continued.
11015	SIGCONT	C	Continue executing, if stopped.
11016	SIGFPE	A	Erroneous arithmetic operation.
11017	SIGHUP	T	Hangup.
11018	SIGILL	A	Illegal instruction.
11019	SIGINT	T	Terminal interrupt signal.
11020	SIGKILL	T	Kill (cannot be caught or ignored).
11021	SIGPIPE	T	Write on a pipe with no one to read it.
11022	SIGQUIT	A	Terminal quit signal.
11023	SIGSEGV	A	Invalid memory reference.
11024	SIGSTOP	S	Stop executing (cannot be caught or ignored).
11025	SIGTERM	T	Termination signal.
11026	SIGTSTP	S	Terminal stop signal.
11027	SIGTTIN	S	Background process attempting read.
11028	SIGTTOU	S	Background process attempting write.
11029	SIGUSR1	T	User-defined signal 1.
11030	SIGUSR2	T	User-defined signal 2.
11031	OB XSR	T	Pollable event.
11032	OB XSR	T	Profiling timer expired.
11033	XSI	A	Bad system call.
11034		A	Trace/breakpoint trap.
11035		I	High bandwidth data is available at a socket.
11036	XSI	T	Virtual timer expired.
11037		A	CPU time limit exceeded.
11038		A	File size limit exceeded.

11039 The default actions are as follows:

- 11040 T Abnormal termination of the process.
- 11041 XSI A Abnormal termination of the process with additional actions.
- 11042 I Ignore the signal.
- 11043 S Stop the process.
- 11044 C Continue the process, if it is stopped; otherwise, ignore the signal.

11045 The effects on the process in each case are described in XSH Section 2.4.3 (on page 486).

11046 CX The <signal.h> header shall declare the **sigaction** structure, which shall include at least the  
11047 following members:

11048	void (*sa_handler) (int)	Pointer to a signal-catching function
11049		or one of the SIG_IGN or SIG_DFL.
11050	sigset_t sa_mask	Set of signals to be blocked during execution
11051		of the signal handling function.
11052	int sa_flags	Special flags.
11053	void (*sa_sigaction) (int, siginfo_t *, void *)	
11054		Pointer to a signal-catching function.

## Headers

## &lt;signal.h&gt;

11055	XSI	The storage occupied by <i>sa_handler</i> and <i>sa_sigaction</i> may overlap, and a conforming application shall not use both simultaneously.	
11056			
11057		The <signal.h> header shall define the following macros which shall expand to integer constant expressions that need not be usable in #if preprocessing directives:	
11058			
11059	CX	<b>SIG_BLOCK</b>	The resulting set is the union of the current set and the signal set pointed to by the argument <i>set</i> .
11060			
11061	CX	<b>SIG_UNBLOCK</b>	The resulting set is the intersection of the current set and the complement of the signal set pointed to by the argument <i>set</i> .
11062			
11063	CX	<b>SIG_SETMASK</b>	The resulting set is the signal set pointed to by the argument <i>set</i> .
11064		The <signal.h> header shall also define the following symbolic constants:	
11065	CX	<b>SA_NOCLDSTOP</b>	Do not generate SIGCHLD when children stop or stopped children continue.
11066	XSI		
11067	XSI	<b>SA_ONSTACK</b>	Causes signal delivery to occur on an alternate stack.
11068	CX	<b>SA_RESETHAND</b>	Causes signal dispositions to be set to SIG_DFL on entry to signal handlers.
11069			
11070	CX	<b>SA_RESTART</b>	Causes certain functions to become restartable.
11071	CX	<b>SA_SIGINFO</b>	Causes extra information to be passed to signal handlers at the time of receipt of a signal.
11072			
11073	CX	<b>SA_NOCLDWAIT</b>	Causes implementations not to create zombie processes on child death.
11074	CX	<b>SA_NODEFER</b>	Causes signal not to be automatically blocked on entry to signal handler.
11075	XSI	<b>SS_ONSTACK</b>	Process is executing on an alternate signal stack.
11076	XSI	<b>SS_DISABLE</b>	Alternate signal stack is disabled.
11077	XSI	<b>MINSIGSTKSZ</b>	Minimum stack size for a signal handler.
11078	XSI	<b>SIGSTKSZ</b>	Default size in bytes for the alternate signal stack.
11079	CX	The <signal.h> header shall define the <b>mcontext_t</b> type through <b>typedef</b> .	
11080	CX	The <signal.h> header shall define the <b>ucontext_t</b> type as a structure that shall include at least the following members:	
11081			
11082		<code>ucontext_t *uc_link</code>	Pointer to the context that is resumed when this context returns.
11083			
11084		<code>sigset_t uc_sigmask</code>	The set of signals that are blocked when this context is active.
11085			
11086		<code>stack_t uc_stack</code>	The stack used by this context.
11087		<code>mcontext_t uc_mcontext</code>	A machine-specific representation of the saved context.
11088			
11089		The <signal.h> header shall define the <b>stack_t</b> type as a structure, which shall include at least the following members:	
11090			
11091		<code>void *ss_sp</code>	Stack base or pointer.
11092		<code>size_t ss_size</code>	Stack size.
11093		<code>int ss_flags</code>	Flags.

<signal.h>

11094 CX The <signal.h> header shall define the **siginfo\_t** type as a structure, which shall include at least  
 11095 the following members:

11096	CX	int	si_signo	Signal number.
11097		int	si_code	Signal code.
11098	XSI	int	si_errno	If non-zero, an <i>errno</i> value associated with 11099 this signal, as described in <errno.h>.
11100	CX	pid_t	si_pid	Sending process ID.
11101		uid_t	si_uid	Real user ID of sending process.
11102		void	*si_addr	Address of faulting instruction.
11103		int	si_status	Exit value or signal.
11104	OB XSR	long	si_band	Band event for SIGPOLL.
11105	CX	union sigval	si_value	Signal value.

11106 CX The <signal.h> header shall define the symbolic constants in the **Code** column of the following  
 11107 table for use as values of *si\_code* that are signal-specific or non-signal-specific reasons why the  
 11108 signal was generated.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

Headers

&lt;signal.h&gt;

	Signal	Code	Reason
11109	SIGILL CX	ILL_ILLOPC	Illegal opcode.
11110		ILL_ILLOPN	Illegal operand.
11111		ILL_ILLADR	Illegal addressing mode.
11112		ILL_ILLTRP	Illegal trap.
11113		ILL_PRVOPC	Privileged opcode.
11114		ILL_PRVREG	Privileged register.
11115		ILL_COPROC	Coprocessor error.
11116		ILL_BADSTK	Internal stack error.
11117	SIGFPE	FPE_INTDIV	Integer divide by zero.
11118		FPE_INTOVF	Integer overflow.
11119		FPE_FLTDIV	Floating-point divide by zero.
11120		FPE_FLTOVF	Floating-point overflow.
11121		FPE_FLTUND	Floating-point underflow.
11122		FPE_FLTRES	Floating-point inexact result.
11123		FPE_FLTINV	Invalid floating-point operation.
11124	SIGSEGV	SEGV_MAPERR	Address not mapped to object.
11125		SEGV_ACCERR	Invalid permissions for mapped object.
11126	SIGBUS	BUS_ADRALN	Invalid address alignment.
11127		BUS_ADRERR	Nonexistent physical address.
11128		BUS_OBJERR	Object-specific hardware error.
11129	SIGTRAP	TRAP_BRKPT	Process breakpoint.
11130		TRAP_TRACE	Process trace trap.
11131	SIGCHLD CX	CLD_EXITED	Child has exited.
11132		CLD_KILLED	Child has terminated abnormally and did not create a <b>core</b> file.
11133		CLD_DUMPED	Child has terminated abnormally and created a <b>core</b> file.
11134		CLD_TRAPPED	Traced child has trapped.
11135		CLD_STOPPED	Child has stopped.
11136		CLD_CONTINUED	Stopped child has continued.
11137	SIGPOLL OB XSR	POLL_IN	Data input available.
11138		POLL_OUT	Output buffers available.
11139		POLL_MSG	Input message available.
11140		POLL_ERR	I/O error.
11141		POLL_PRI	High priority input available.
11142		POLL_HUP	Device disconnected.
11143	Any CX	SI_USER	Signal sent by <i>kill()</i> .
11144		SI_QUEUE	Signal sent by the <i>sigqueue()</i> .
11145		SI_TIMER	Signal generated by expiration of a timer set by <i>timer_settime()</i> .
11146		SI_ASYNCIO	Signal generated by completion of an asynchronous I/O request.
11147		SI_MESGQ	Signal generated by arrival of a message on an empty message queue
11148	CX	Implementations may support additional <i>si_code</i> values not included in this list, may generate values included in this list under circumstances other than those described in this list, and may contain extensions or limitations that prevent some values from being generated. Implementations do not generate a different value from the ones described in this list for circumstances described in this list.	
11149			
11150			
11151			

## &lt;signal.h&gt;

11157 CX In addition, the following signal-specific information shall be available:

Signal	Member	Value
11158 11159 11160 SIGILL SIGFPE	<b>void</b> * <i>si_addr</i>	Address of faulting instruction.
11161 11162 SIGSEGV SIGBUS	<b>void</b> * <i>si_addr</i>	Address of faulting memory reference.
11163 11164 11165 SIGCHLD	<b>pid_t</b> <i>si_pid</i> <b>int</b> <i>si_status</i> <b>uid_t</b> <i>si_uid</i>	Child process ID. Exit value or signal. Real user ID of the process that sent the signal.
11166 OB XSR SIGPOLL	<b>long</b> <i>si_band</i>	Band event for POLL_IN, POLL_OUT, or POLL_MSG

11167 For some implementations, the value of *si\_addr* may be inaccurate.

11168 The following shall be declared as functions and may also be defined as macros. Function  
11169 prototypes shall be provided.

```

11170 CX int kill(pid_t, int);
11171 XSI int killpg(pid_t, int);
11172 CX void psiginfo(const siginfo_t *, const char *);
11173 void psignal(int, const char *);
11174 int pthread_kill(pthread_t, int);
11175 int pthread_sigmask(int, const sigset_t *restrict,
11176 sigset_t *restrict);
11177 int raise(int);
11178 CX int sigaction(int, const struct sigaction *restrict,
11179 struct sigaction *restrict);
11180 int sigaddset(sigset_t *, int);
11181 XSI int sigaltstack(const stack_t *restrict, stack_t *restrict);
11182 CX int sigdelset(sigset_t *, int);
11183 int sigemptyset(sigset_t *);
11184 int sigfillset(sigset_t *);
11185 OB XSI int sighold(int);
11186 int sigignore(int);
11187 int siginterrupt(int, int);
11188 CX int sigismember(const sigset_t *, int);
11189 void (*signal(int, void (*)(int)))(int);
11190 OB XSI int sigpause(int);
11191 CX int sigpending(sigset_t *);
11192 int sigprocmask(int, const sigset_t *restrict, sigset_t *restrict);
11193 int sigqueue(pid_t, int, const union sigval);
11194 OB XSI int sigrelse(int);
11195 void (*sigset(int, void (*)(int)))(int);
11196 CX int sigsuspend(const sigset_t *);
11197 int sigtimedwait(const sigset_t *restrict, siginfo_t *restrict,
11198 const struct timespec *restrict);
11199 int sigwait(const sigset_t *restrict, int *restrict);
11200 int sigwaitinfo(const sigset_t *restrict, siginfo_t *restrict);

```

11201 CX Inclusion of the <signal.h> header may make visible all symbols from the <time.h> header.

11202 **APPLICATION USAGE**

11203 On systems not supporting the XSI option, the *si\_pid* and *si\_uid* members of **siginfo\_t** are only  
 11204 required to be valid when *si\_code* is SI\_USER or SI\_QUEUE. On XSI-conforming systems, they  
 11205 are also valid for all *si\_code* values less than or equal to 0; however, it is unspecified whether  
 11206 SI\_USER and SI\_QUEUE have values less than or equal to zero, and therefore XSI applications  
 11207 should check whether *si\_code* has the value SI\_USER or SI\_QUEUE or is less than or equal to 0 to  
 11208 tell whether *si\_pid* and *si\_uid* are valid.

11209 **RATIONALE**

11210 None.

11211 **FUTURE DIRECTIONS**

11212 The SIGPOLL and SIGPROF signals may be removed in a future version.

11213 **SEE ALSO**

11214 <errno.h>, <stropts.h>, <sys/types.h>, <time.h>

11215 XSH Section 2.2 (on page 468), *alarm()*, *ioctl()*, *kill()*, *killpg()*, *psiginfo()*, *pthread\_kill()*,  
 11216 *pthread\_sigmask()*, *raise()*, *sigaction()*, *sigaddset()*, *sigaltstack()*, *sigdelset()*, *sigemptyset()*,  
 11217 *sigfillset()*, *sighold()*, *siginterrupt()*, *sigismember()*, *signal()*, *sigpending()*, *sigqueue()*, *sigsuspend()*,  
 11218 *sigtimedwait()*, *sigwait()*, *timer\_create()*, *wait()*, *waitid()*

11219 **CHANGE HISTORY**

11220 First released in Issue 1.

11221 **Issue 5**

11222 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 11223 Threads Extension.

11224 The default action for SIGURG is changed from i to iii. The function prototype for *sigmask()* is  
 11225 removed.

11226 **Issue 6**

11227 The Open Group Corrigendum U035/2 is applied. In the DESCRIPTION, the wording for  
 11228 abnormal termination is clarified.

11229 The Open Group Corrigendum U028/8 is applied, correcting the prototype for the *sigset()*  
 11230 function.

11231 The Open Group Corrigendum U026/3 is applied, correcting the type of the *sigev\_notify\_function*  
 11232 function member of the **sigevent** structure.

11233 The following new requirements on POSIX implementations derive from alignment with the  
 11234 Single UNIX Specification:

- 11235 • The SIGCHLD, SIGCONT, SIGSTOP, SIGTSTP, SIGTTIN, and SIGTTOU signals are now  
 11236 mandated. This is also a FIPS requirement.
- 11237 • The **pid\_t** definition is mandated.

11238 The RT markings are changed to RTS to denote that the semantics are part of the Realtime  
 11239 Signals Extension option.

11240 The **restrict** keyword is added to the prototypes for *sigaction()*, *sigaltstack()*, *sigprocmask()*,  
 11241 *sigtimedwait()*, *sigwait()*, and *sigwaitinfo()*.

11242 IEEE PASC Interpretation 1003.1 #85 is applied, adding the statement that symbols from  
 11243 <time.h> may be made visible when <signal.h> is included.

11244 Extensions beyond the ISO C standard are marked.

- 11245 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/14 is applied, changing the descriptive  
11246 text for members of the **sigaction** structure.
- 11247 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/15 is applied, correcting the definition of  
11248 the *sa\_sigaction* member of the **sigaction** structure.
- 11249 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/24 is applied, reworking the ordering of  
11250 the **siginfo\_t** type structure in the DESCRIPTION. This is an editorial change and no normative  
11251 change is intended.
- 11252 **Issue 7**
- 11253 SD5-XBD-ERN-5 is applied.
- 11254 SD5-XBD-ERN-39 is applied, removing the **sigstack** structure which should have been removed  
11255 at the same time as the LEGACY *sigstack()* function.
- 11256 SD5-XBD-ERN-56 is applied, adding a reference to <**sys/types.h**> for the **size\_t** type.
- 11257 Austin Group Interpretation 1003.1-2001 #034 is applied.
- 11258 The **ucontext\_t** and **mcontext\_t** structures are added here from the obsolescent <**ucontext.h**>  
11259 header.
- 11260 The *psiginfo()* and *psignal()* functions are added from The Open Group Technical Standard, 2006,  
11261 Extended API Set Part 1.
- 11262 The SIGPOLL and SIGPROF signals and text relating to the XSI STREAMS option are marked  
11263 obsolescent.
- 11264 The SA\_RESETHAND, SA\_RESTART, SA\_SIGINFO, SA\_NOCLDWAIT, and SA\_NODEFER  
11265 constants are moved from the XSI option to the Base.
- 11266 Functionality relating to the Realtime Signals Extension option is moved to the Base.
- 11267 This reference page is clarified with respect to macros and symbolic constants, and declarations  
11268 for the **pthread\_attr\_t**, **pthread\_t**, and **uid\_t** types and the **timespec** structure are added.
- 11269 SIGRTMIN and SIGRTMAX are required to be positive integer expressions.
- 11270 The APPLICATION USAGE section is updated to describe the *si\_pid* and *si\_uid* members of  
11271 **siginfo\_t**.

## 11272 NAME

11273 spawn.h — spawn (ADVANCED REALTIME)

## 11274 SYNOPSIS

11275 SPN #include &lt;spawn.h&gt;

## 11276 DESCRIPTION

11277 The <spawn.h> header shall define the **posix\_spawnattr\_t** and **posix\_spawn\_file\_actions\_t**  
11278 types used in performing spawn operations.11279 The <spawn.h> header shall define the **mode\_t** and **pid\_t** types as described in <sys/types.h>.11280 The <spawn.h> header shall define the **sigset\_t** type as described in <signal.h>.11281 The tag **sched\_param** shall be declared as naming an incomplete structure type, the contents of  
11282 which are described in the <sched.h> header.11283 The <spawn.h> header shall define the following symbolic constants for use as the flags that  
11284 may be set in a **posix\_spawnattr\_t** object using the *posix\_spawnattr\_setflags()* function:

11285 POSIX\_SPAWN\_RESETIDS

11286 POSIX\_SPAWN\_SETPGROUP

11287 PS POSIX\_SPAWN\_SETSCHEDPARAM

11288 POSIX\_SPAWN\_SETSCHEDULER

11289 POSIX\_SPAWN\_SETSIGDEF

11290 POSIX\_SPAWN\_SETSIGMASK

11291 The following shall be declared as functions and may also be defined as macros. Function  
11292 prototypes shall be provided.

```

11293 int  posix_spawn(pid_t *restrict, const char *restrict,
11294                const posix_spawn_file_actions_t *,
11295                const posix_spawnattr_t *restrict, char *const [restrict],
11296                char *const [restrict]);
11297 int  posix_spawn_file_actions_addclose(posix_spawn_file_actions_t *,
11298                int);
11299 int  posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t *,
11300                int, int);
11301 int  posix_spawn_file_actions_addopen(posix_spawn_file_actions_t *restrict,
11302                int, const char *restrict, int, mode_t);
11303 int  posix_spawn_file_actions_destroy(posix_spawn_file_actions_t *);
11304 int  posix_spawn_file_actions_init(posix_spawn_file_actions_t *);
11305 int  posix_spawnattr_destroy(posix_spawnattr_t *);
11306 int  posix_spawnattr_getflags(const posix_spawnattr_t *restrict,
11307                short *restrict);
11308 int  posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict,
11309                pid_t *restrict);
11310 PS  int  posix_spawnattr_getschedparam(const posix_spawnattr_t *restrict,
11311                struct sched_param *restrict);
11312 int  posix_spawnattr_getschedpolicy(const posix_spawnattr_t *restrict,
11313                int *restrict);
11314 int  posix_spawnattr_getsigdefault(const posix_spawnattr_t *restrict,
11315                sigset_t *restrict);
11316 int  posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict,
11317                sigset_t *restrict);
11318 int  posix_spawnattr_init(posix_spawnattr_t *);

```

## &lt;spawn.h&gt;

Headers

```

11319     int    posix_spawnattr_setflags(posix_spawnattr_t *, short);
11320     int    posix_spawnattr_setpgroup(posix_spawnattr_t *, pid_t);
11321 PS    int    posix_spawnattr_setschedparam(posix_spawnattr_t *restrict,
11322         const struct sched_param *restrict);
11323     int    posix_spawnattr_setschedpolicy(posix_spawnattr_t *, int);
11324     int    posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict,
11325         const sigset_t *restrict);
11326     int    posix_spawnattr_setsigmask(posix_spawnattr_t *restrict,
11327         const sigset_t *restrict);
11328     int    posix_spawn(pid_t *restrict, const char *restrict,
11329         const posix_spawn_file_actions_t *,
11330         const posix_spawnattr_t *restrict,
11331         char *const [restrict], char *const [restrict]);

```

11332 Inclusion of the <spawn.h> header may make visible symbols defined in the <sched.h> and  
 11333 <signal.h> headers.

## 11346 CHANGE HISTORY

11347 First released in Issue 6. Included for alignment with IEEE Std 1003.1d-1999.

11348 The **restrict** keyword is added to the prototypes for *posix\_spawn()*,  
 11349 *posix\_spawn\_file\_actions\_addopen()*, *posix\_spawnattr\_getsigdefault()*, *posix\_spawnattr\_getflags()*,  
 11350 *posix\_spawnattr\_getpgroup()*, *posix\_spawnattr\_getschedparam()*, *posix\_spawnattr\_getschedpolicy()*,  
 11351 *posix\_spawnattr\_getsigmask()*, *posix\_spawnattr\_setsigdefault()*, *posix\_spawnattr\_setschedparam()*,  
 11352 *posix\_spawnattr\_setsigmask()*, and *posix\_spawn()*.

## 11353 Issue 7

11354 This reference page is clarified with respect to macros and symbolic constants, and declarations  
 11355 for the **mode\_t**, **pid\_t**, and **sigset\_t** types are added.

## 11356 NAME

11357        stdarg.h — handle variable argument list

## 11358 SYNOPSIS

```
11359        #include <stdarg.h>

11360        void va_start(va_list ap, argN);
11361        void va_copy(va_list dest, va_list src);
11362        type va_arg(va_list ap, type);
11363        void va_end(va_list ap);
```

## 11364 DESCRIPTION

11365 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 11366 conflict between the requirements described here and the ISO C standard is unintentional. This  
 11367 volume of POSIX.1-2008 defers to the ISO C standard.

11368       The <stdarg.h> header shall contain a set of macros which allows portable functions that accept  
 11369 variable argument lists to be written. Functions that have variable argument lists (such as  
 11370 *printf()*) but do not use these macros are inherently non-portable, as different systems use  
 11371 different argument-passing conventions.

11372       The <stdarg.h> header shall define the **va\_list** type for variables used to traverse the list.

11373       The *va\_start()* macro is invoked to initialize *ap* to the beginning of the list before any calls to  
 11374 *va\_arg()*.

11375       The *va\_copy()* macro initializes *dest* as a copy of *src*, as if the *va\_start()* macro had been applied  
 11376 to *dest* followed by the same sequence of uses of the *va\_arg()* macro as had previously been used  
 11377 to reach the present state of *src*. Neither the *va\_copy()* nor *va\_start()* macro shall be invoked to  
 11378 reinitialize *dest* without an intervening invocation of the *va\_end()* macro for the same *dest*.

11379       The object *ap* may be passed as an argument to another function; if that function invokes the  
 11380 *va\_arg()* macro with parameter *ap*, the value of *ap* in the calling function is unspecified and shall  
 11381 be passed to the *va\_end()* macro prior to any further reference to *ap*. The parameter *argN* is the  
 11382 identifier of the rightmost parameter in the variable parameter list in the function definition (the  
 11383 one just before the ...). If the parameter *argN* is declared with the **register** storage class, with a  
 11384 function type or array type, or with a type that is not compatible with the type that results after  
 11385 application of the default argument promotions, the behavior is undefined.

11386       The *va\_arg()* macro shall return the next argument in the list pointed to by *ap*. Each invocation  
 11387 of *va\_arg()* modifies *ap* so that the values of successive arguments are returned in turn. The *type*  
 11388 parameter shall be a type name specified such that the type of a pointer to an object that has the  
 11389 specified type can be obtained simply by postfixing a '\*' to type. If there is no actual next  
 11390 argument, or if *type* is not compatible with the type of the actual next argument (as promoted  
 11391 according to the default argument promotions), the behavior is undefined, except for the  
 11392 following cases:

- 11393       • One type is a signed integer type, the other type is the corresponding unsigned integer  
 11394 type, and the value is representable in both types.
- 11395       • One type is a pointer to **void** and the other is a pointer to a character type.
- 11396 XSI     • Both types are pointers.

11397       Different types can be mixed, but it is up to the routine to know what type of argument is  
 11398 expected.

11399       The *va\_end()* macro is used to clean up; it invalidates *ap* for use (unless *va\_start()* or *va\_copy()* is  
 11400 invoked again).

## &lt;stdarg.h&gt;

11401 Each invocation of the *va\_start()* and *va\_copy()* macros shall be matched by a corresponding  
 11402 invocation of the *va\_end()* macro in the same function.

11403 Multiple traversals, each bracketed by *va\_start()* ... *va\_end()*, are possible.

11404 **EXAMPLES**

11405 This example is a possible implementation of *execl()*:

```
11406 #include <stdarg.h>
11407 #define MAXARGS 31
11408 /*
11409  * execl is called by
11410  * execl(file, arg1, arg2, ..., (char *) (0));
11411  */
11412 int execl(const char *file, const char *args, ...)
11413 {
11414     va_list ap;
11415     char *array[MAXARGS + 1];
11416     int argno = 0;
11417     va_start(ap, args);
11418     while (args != 0 && argno < MAXARGS)
11419     {
11420         array[argno++] = args;
11421         args = va_arg(ap, const char *);
11422     }
11423     array[argno] = (char *) 0;
11424     va_end(ap);
11425     return execv(file, array);
11426 }
```

11427 **APPLICATION USAGE**

11428 It is up to the calling routine to communicate to the called routine how many arguments there  
 11429 are, since it is not always possible for the called routine to determine this in any other way. For  
 11430 example, *execl()* is passed a null pointer to signal the end of the list. The *printf()* function can tell  
 11431 how many arguments are there by the *format* argument.

11432 **RATIONALE**

11433 None.

11434 **FUTURE DIRECTIONS**

11435 None.

11436 **SEE ALSO**

11437 XSH *exec*, *fprintf()*

11438 **CHANGE HISTORY**

11439 First released in Issue 4. Derived from the ANSI C standard.

11440 **Issue 6**

11441 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

11442 **NAME**

11443            stdbool.h — boolean type and values

11444 **SYNOPSIS**

11445            #include &lt;stdbool.h&gt;

11446 **DESCRIPTION**

11447 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
 11448            conflict between the requirements described here and the ISO C standard is unintentional. This  
 11449            volume of POSIX.1-2008 defers to the ISO C standard.

11450            The &lt;stdbool.h&gt; header shall define the following macros:

11451            bool     Expands to **\_Bool**.

11452            true     Expands to the integer constant 1.

11453            false    Expands to the integer constant 0.

11454            \_\_bool\_true\_false\_are\_defined

11455            Expands to the integer constant 1.

11456            An application may undefine and then possibly redefine the macros bool, true, and false.

11457 **APPLICATION USAGE**

11458            None.

11459 **RATIONALE**

11460            None.

11461 **FUTURE DIRECTIONS**

11462            The ability to undefine and redefine the macros bool, true, and false is an obsolescent feature  
 11463            and may be removed in a future version.

11464 **SEE ALSO**

11465            None.

11466 **CHANGE HISTORY**

11467            First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

**<stddef.h>**

Headers

11468 **NAME**11469           **stddef.h** — standard type definitions11470 **SYNOPSIS**

11471           #include &lt;stddef.h&gt;

11472 **DESCRIPTION**

11473 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
 11474           conflict between the requirements described here and the ISO C standard is unintentional. This  
 11475           volume of POSIX.1-2008 defers to the ISO C standard.

11476       The **<stddef.h>** header shall define the following macros:

11477 CX       **NULL**       Null pointer constant. The macro shall expand to an integer constant expression  
 11478           with the value 0 cast to type **void \***.

11479       **offsetof**(*type*, *member-designator*)

11480           Integer constant expression of type **size\_t**, the value of which is the offset in bytes  
 11481           to the structure member (*member-designator*), from the beginning of its structure  
 11482           (*type*).

11483       The **<stddef.h>** header shall define the following types:11484       **ptrdiff\_t**   Signed integer type of the result of subtracting two pointers.

11485       **wchar\_t**     Integer type whose range of values can represent distinct codes for all members of  
 11486           the largest extended character set specified among the supported locales; the null  
 11487           character shall have the code value zero. Each member of the basic character set  
 11488           shall have a code value equal to its value when used as the lone character in an  
 11489           integer character constant if an implementation does not define  
 11490           \_\_STDC\_MB\_MIGHT\_NEQ\_WC\_\_.

11491       **size\_t**       Unsigned integer type of the result of the *sizeof* operator.

11492       The implementation shall support one or more programming environments in which the widths  
 11493       of **ptrdiff\_t**, **size\_t**, and **wchar\_t** are no greater than the width of type **long**. The names of these  
 11494       programming environments can be obtained using the *confstr*() function or the *getconf* utility.

11495 **APPLICATION USAGE**

11496       None.

11497 **RATIONALE**

11498       The ISO C standard does not require the **NULL** macro to include the cast to type **void \*** and  
 11499       specifies that the **NULL** macro be implementation-defined. POSIX.1-2008 requires the cast and  
 11500       therefore need not be implementation-defined.

11501 **FUTURE DIRECTIONS**

11502       None.

11503 **SEE ALSO**11504       [<sys/types.h>](#), [<wchar.h>](#)11505       XSH *confstr*()11506       XCU *getconf*11507 **CHANGE HISTORY**

11508       First released in Issue 4. Derived from the ANSI C standard.

**<stdint.h>**

Headers

11513 **NAME**

11514           stdint.h — integer types

11515 **SYNOPSIS**

11516           #include &lt;stdint.h&gt;

11517 **DESCRIPTION**

11518 **CX**       Some of the functionality described on this reference page extends the ISO C standard.  
 11519       Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 11520       enable the visibility of these symbols in this header.

11521       The **<stdint.h>** header shall declare sets of integer types having specified widths, and shall  
 11522       define corresponding sets of macros. It shall also define macros that specify limits of integer  
 11523       types corresponding to types defined in other standard headers.

11524       **Note:**     The “width” of an integer type is the number of bits used to store its value in a pure binary  
 11525       system; the actual type may use more bits than that (for example, a 28-bit type could be stored  
 11526       in 32 bits of actual storage). An  $N$ -bit signed type has values in the range  $-2^{N-1}$  or  $1-2^{N-1}$  to  
 11527        $2^{N-1}-1$ , while an  $N$ -bit unsigned type has values in the range 0 to  $2^N-1$ .

11528       Types are defined in the following categories:

- 11529           • Integer types having certain exact widths
- 11530           • Integer types having at least certain specified widths
- 11531           • Fastest integer types having at least certain specified widths
- 11532           • Integer types wide enough to hold pointers to objects
- 11533           • Integer types having greatest width

11534       (Some of these types may denote the same type.)

11535       Corresponding macros specify limits of the declared types and construct suitable constants.

11536       For each type described herein that the implementation provides, the **<stdint.h>** header shall  
 11537       declare that **typedef** name and define the associated macros. Conversely, for each type described  
 11538       herein that the implementation does not provide, the **<stdint.h>** header shall not declare that  
 11539       **typedef** name, nor shall it define the associated macros. An implementation shall provide those  
 11540       types described as required, but need not provide any of the others (described as optional).

11541 **Integer Types**

11542       When **typedef** names differing only in the absence or presence of the initial  $u$  are defined, they  
 11543       shall denote corresponding signed and unsigned types as described in the ISO/IEC 9899:1999  
 11544       standard, Section 6.2.5; an implementation providing one of these corresponding types shall also  
 11545       provide the other.

11546       In the following descriptions, the symbol  $N$  represents an unsigned decimal integer with no  
 11547       leading zeros (for example, 8 or 24, but not 04 or 048).

- 11548           • Exact-width integer types

11549       The **typedef** name **int $N$ \_t** designates a signed integer type with width  $N$ , no padding bits,  
 11550       and a two’s-complement representation. Thus, **int8\_t** denotes a signed integer type with a  
 11551       width of exactly 8 bits.

11552       The **typedef** name **uint $N$ \_t** designates an unsigned integer type with width  $N$ . Thus,  
 11553       **uint24\_t** denotes an unsigned integer type with a width of exactly 24 bits.

11554	CX	The following types are required:
11555		<b>int8_t</b>
11556		<b>int16_t</b>
11557		<b>int32_t</b>
11558		<b>uint8_t</b>
11559		<b>uint16_t</b>
11560		<b>uint32_t</b>
11561		If an implementation provides integer types with width 64 that meet these requirements,
11562		then the following types are required:
11563		<b>int64_t</b>
11564		<b>uint64_t</b>
11565	CX	In particular, this will be the case if any of the following are true:
11566		— The implementation supports the <code>_POSIX_V7_ILP32_OFFBIG</code> programming
11567		environment and the application is being built in the <code>_POSIX_V7_ILP32_OFFBIG</code>
11568		programming environment (see the Shell and Utilities volume of POSIX.1-2008, <i>c99</i> ,
11569		Programming Environments).
11570		— The implementation supports the <code>_POSIX_V7_LP64_OFF64</code> programming
11571		environment and the application is being built in the <code>_POSIX_V7_LP64_OFF64</code>
11572		programming environment.
11573		— The implementation supports the <code>_POSIX_V7_LPBIG_OFFBIG</code> programming
11574		environment and the application is being built in the <code>_POSIX_V7_LPBIG_OFFBIG</code>
11575		programming environment.
11576		All other types of this form are optional.
11577		• Minimum-width integer types
11578		The <b>typedef</b> name <b>int_leastN_t</b> designates a signed integer type with a width of at least <i>N</i> ,
11579		such that no signed integer type with lesser size has at least the specified width. Thus,
11580		<b>int_least32_t</b> denotes a signed integer type with a width of at least 32 bits.
11581		The <b>typedef</b> name <b>uint_leastN_t</b> designates an unsigned integer type with a width of at
11582		least <i>N</i> , such that no unsigned integer type with lesser size has at least the specified width.
11583		Thus, <b>uint_least16_t</b> denotes an unsigned integer type with a width of at least 16 bits.
11584		The following types are required:
11585		<b>int_least8_t</b>
11586		<b>int_least16_t</b>
11587		<b>int_least32_t</b>
11588		<b>int_least64_t</b>
11589		<b>uint_least8_t</b>
11590		<b>uint_least16_t</b>
11591		<b>uint_least32_t</b>
11592		<b>uint_least64_t</b>
11593		All other types of this form are optional.

- 11594
- Fastest minimum-width integer types
- 11595 Each of the following types designates an integer type that is usually fastest to operate  
11596 with among all integer types that have at least the specified width.
- 11597 The designated type is not guaranteed to be fastest for all purposes; if the implementation  
11598 has no clear grounds for choosing one type over another, it will simply pick some integer  
11599 type satisfying the signedness and width requirements.
- 11600 The **typedef** name **int\_fastN\_t** designates the fastest signed integer type with a width of at  
11601 least *N*. The **typedef** name **uint\_fastN\_t** designates the fastest unsigned integer type with  
11602 a width of at least *N*.
- 11603 The following types are required:
- 11604 **int\_fast8\_t**  
11605 **int\_fast16\_t**  
11606 **int\_fast32\_t**  
11607 **int\_fast64\_t**  
11608 **uint\_fast8\_t**  
11609 **uint\_fast16\_t**  
11610 **uint\_fast32\_t**  
11611 **uint\_fast64\_t**
- 11612 All other types of this form are optional.
- Integer types capable of holding object pointers
- 11614 The following type designates a signed integer type with the property that any valid  
11615 pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and  
11616 the result will compare equal to the original pointer:
- 11617 **intptr\_t**
- 11618 The following type designates an unsigned integer type with the property that any valid  
11619 pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and  
11620 the result will compare equal to the original pointer:
- 11621 **uintptr\_t**
- 11622 XSI On XSI-conformant systems, the **intptr\_t** and **uintptr\_t** types are required; otherwise, they  
11623 are optional.
- Greatest-width integer types
- 11625 The following type designates a signed integer type capable of representing any value of  
11626 any signed integer type:
- 11627 **intmax\_t**
- 11628 The following type designates an unsigned integer type capable of representing any value  
11629 of any unsigned integer type:
- 11630 **uintmax\_t**
- 11631 These types are required.

11632 **Note:** Applications can test for optional types by using the corresponding limit macro from [Limits of](#)  
11633 [Specified-Width Integer Types](#).

### 11634 **Limits of Specified-Width Integer Types**

11635 The following macros specify the minimum and maximum limits of the types declared in the  
11636 <stdint.h> header. Each macro name corresponds to a similar type name in [Integer Types](#) (on  
11637 page 344).

11638 Each instance of any defined macro shall be replaced by a constant expression suitable for use in  
11639 #if preprocessing directives, and this expression shall have the same type as would an  
11640 expression that is an object of the corresponding type converted according to the integer  
11641 promotions. Its implementation-defined value shall be equal to or greater in magnitude  
11642 (absolute value) than the corresponding value given below, with the same sign, except where  
11643 stated to be exactly the given value.

- 11644 • Limits of exact-width integer types

- 11645 — Minimum values of exact-width signed integer types:

11646 {INTN\_MIN} Exactly  $-(2^{N-1})$

- 11647 — Maximum values of exact-width signed integer types:

11648 {INTN\_MAX} Exactly  $2^{N-1} - 1$

- 11649 — Maximum values of exact-width unsigned integer types:

11650 {UINTN\_MAX} Exactly  $2^N - 1$

- 11651 • Limits of minimum-width integer types

- 11652 — Minimum values of minimum-width signed integer types:

11653 {INT\_LEASTN\_MIN}  $-(2^{N-1} - 1)$

- 11654 — Maximum values of minimum-width signed integer types:

11655 {INT\_LEASTN\_MAX}  $2^{N-1} - 1$

- 11656 — Maximum values of minimum-width unsigned integer types:

11657 {UINT\_LEASTN\_MAX}  $2^N - 1$

- 11658 • Limits of fastest minimum-width integer types

- 11659 — Minimum values of fastest minimum-width signed integer types:

11660 {INT\_FASTN\_MIN}  $-(2^{N-1} - 1)$

- 11661 — Maximum values of fastest minimum-width signed integer types:

11662 {INT\_FASTN\_MAX}  $2^{N-1} - 1$

- 11663 — Maximum values of fastest minimum-width unsigned integer types:

11664 {UINT\_FASTN\_MAX}  $2^N - 1$

- 11665 • Limits of integer types capable of holding object pointers

- 11666 — Minimum value of pointer-holding signed integer type:

11667 {INTPTR\_MIN}  $-(2^{15} - 1)$

## &lt;stdint.h&gt;

- 11668 — Maximum value of pointer-holding signed integer type:  
 11669 {INTPTR\_MAX}  $2^{15} - 1$
- 11670 — Maximum value of pointer-holding unsigned integer type:  
 11671 {UINTPTR\_MAX}  $2^{16} - 1$
- 11672 • Limits of greatest-width integer types
    - 11673 — Minimum value of greatest-width signed integer type:  
 11674 {INTMAX\_MIN}  $-(2^{63} - 1)$
    - 11675 — Maximum value of greatest-width signed integer type:  
 11676 {INTMAX\_MAX}  $2^{63} - 1$
    - 11677 — Maximum value of greatest-width unsigned integer type:  
 11678 {UINTMAX\_MAX}  $2^{64} - 1$

**Limits of Other Integer Types**

11680 The following macros specify the minimum and maximum limits of integer types corresponding  
 11681 to types defined in other standard headers.

11682 Each instance of these macros shall be replaced by a constant expression suitable for use in #if  
 11683 preprocessing directives, and this expression shall have the same type as would an expression  
 11684 that is an object of the corresponding type converted according to the integer promotions. Its  
 11685 implementation-defined value shall be equal to or greater in magnitude (absolute value) than  
 11686 the corresponding value given below, with the same sign.

- 11687 • Limits of **ptrdiff\_t**:
  - 11688 {PTRDIFF\_MIN}  $-65\,535$
  - 11689 {PTRDIFF\_MAX}  $+65\,535$
- 11690 • Limits of **sig\_atomic\_t**:
  - 11691 {SIG\_ATOMIC\_MIN} See below.
  - 11692 {SIG\_ATOMIC\_MAX} See below.
- 11693 • Limit of **size\_t**:
  - 11694 {SIZE\_MAX}  $65\,535$
- 11695 • Limits of **wchar\_t**:
  - 11696 {WCHAR\_MIN} See below.
  - 11697 {WCHAR\_MAX} See below.
- 11698 • Limits of **wint\_t**:
  - 11699 {WINT\_MIN} See below.
  - 11700 {WINT\_MAX} See below.

11701 If **sig\_atomic\_t** (see the <signal.h> header) is defined as a signed integer type, the value of  
 11702 {SIG\_ATOMIC\_MIN} shall be no greater than  $-127$  and the value of {SIG\_ATOMIC\_MAX} shall  
 11703 be no less than  $127$ ; otherwise, **sig\_atomic\_t** shall be defined as an unsigned integer type, and  
 11704 the value of {SIG\_ATOMIC\_MIN} shall be  $0$  and the value of {SIG\_ATOMIC\_MAX} shall be no

11705 less than 255.

11706 If **wchar\_t** (see the <stddef.h> header) is defined as a signed integer type, the value of  
 11707 {WCHAR\_MIN} shall be no greater than -127 and the value of {WCHAR\_MAX} shall be no less  
 11708 than 127; otherwise, **wchar\_t** shall be defined as an unsigned integer type, and the value of  
 11709 {WCHAR\_MIN} shall be 0 and the value of {WCHAR\_MAX} shall be no less than 255.

11710 If **wint\_t** (see the <wchar.h> header) is defined as a signed integer type, the value of  
 11711 {WINT\_MIN} shall be no greater than -32767 and the value of {WINT\_MAX} shall be no less  
 11712 than 32767; otherwise, **wint\_t** shall be defined as an unsigned integer type, and the value of  
 11713 {WINT\_MIN} shall be 0 and the value of {WINT\_MAX} shall be no less than 65535.

#### 11714 **Macros for Integer Constant Expressions**

11715 The following macros expand to integer constant expressions suitable for initializing objects that  
 11716 have integer types corresponding to types defined in the <stdint.h> header. Each macro name  
 11717 corresponds to a similar type name listed under *Minimum-width integer types* and *Greatest-width*  
 11718 *integer types*.

11719 Each invocation of one of these macros shall expand to an integer constant expression suitable  
 11720 for use in **#if** preprocessing directives. The type of the expression shall have the same type as  
 11721 would an expression that is an object of the corresponding type converted according to the  
 11722 integer promotions. The value of the expression shall be that of the argument.

11723 The argument in any instance of these macros shall be an unsuffixed integer constant with a  
 11724 value that does not exceed the limits for the corresponding type.

- 11725 • Macros for minimum-width integer constant expressions

11726 The macro *INTN\_C(value)* shall expand to an integer constant expression corresponding to  
 11727 the type **int\_leastN\_t**. The macro *UINTN\_C(value)* shall expand to an integer constant  
 11728 expression corresponding to the type **uint\_leastN\_t**. For example, if **uint\_least64\_t** is a  
 11729 name for the type **unsigned long long**, then *UINT64\_C(0x123)* might expand to the integer  
 11730 constant 0x123ULL.

- 11731 • Macros for greatest-width integer constant expressions

11732 The following macro expands to an integer constant expression having the value specified  
 11733 by its argument and the type **intmax\_t**:

11734 *INTMAX\_C(value)*

11735 The following macro expands to an integer constant expression having the value specified  
 11736 by its argument and the type **uintmax\_t**:

11737 *UINTMAX\_C(value)*

#### 11738 **APPLICATION USAGE**

11739 None.

#### 11740 **RATIONALE**

11741 The <stdint.h> header is a subset of the <inttypes.h> header more suitable for use in  
 11742 freestanding environments, which might not support the formatted I/O functions. In some  
 11743 environments, if the formatted conversion support is not wanted, using this header instead of  
 11744 the <inttypes.h> header avoids defining such a large number of macros.

11745 As a consequence of adding `int8_t`, the following are true:

11746

- A byte is exactly 8 bits.
- {CHAR\_BIT} has the value 8, {SCHAR\_MAX} has the value 127, {SCHAR\_MIN} has the value -128, and {UCHAR\_MAX} has the value 255.

11747

11748

11749 (The POSIX standard explicitly requires 8-bit char and two's-complement arithmetic.)

11750 **FUTURE DIRECTIONS**

11751 `typedef` names beginning with `int` or `uint` and ending with `_t` may be added to the types defined

11752 in the `<stdint.h>` header. Macro names beginning with `INT` or `UINT` and ending with `_MAX`,

11753 `_MIN`, or `_C` may be added to the macros defined in the `<stdint.h>` header.

11757 **CHANGE HISTORY**

11758 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

11759 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is applied.

11760 **Issue 7**

11761 ISO/IEC 9899:1999 standard, Technical Corrigendum 3 #40 is applied.

11762 SD5-XBD-ERN-67 is applied.

## Headers

## &lt;stdio.h&gt;

## 11763 NAME

11764       stdio.h — standard buffered input/output

## 11765 SYNOPSIS

11766       #include &lt;stdio.h&gt;

## 11767 DESCRIPTION

11768 CX       Some of the functionality described on this reference page extends the ISO C standard.  
 11769       Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 11770       enable the visibility of these symbols in this header.

11771       The <stdio.h> header shall define the following data types through **typedef**:11772       **FILE**                A structure containing information about a file.11773       **fpos\_t**               A non-array type containing all information needed to specify uniquely  
 11774       every position within a file.11775       **off\_t**                As described in <sys/types.h>.11776       **size\_t**               As described in <stddef.h>.11777 CX       **ssize\_t**            As described in <sys/types.h>.11778 CX       **va\_list**            As described in <stdarg.h>.11779       The <stdio.h> header shall define the following macros which shall expand to integer constant  
 11780       expressions:11781 CX       **BUFSIZ**            Size of <stdio.h> buffers. This shall expand to a positive value.11782 CX       **L\_ctermid**           Maximum size of character array to hold *ctermid()* output.11783 OB       **L\_tmpnam**            Maximum size of character array to hold *tmpnam()* output.11784       The <stdio.h> header shall define the following macros which shall expand to integer constant  
 11785       expressions with distinct values:11786       **\_IOFBF**            Input/output fully buffered.11787       **\_IOLBF**            Input/output line buffered.11788       **\_IONBF**            Input/output unbuffered.11789       The <stdio.h> header shall define the following macros which shall expand to integer constant  
 11790       expressions with distinct values:11791       **SEEK\_CUR**            Seek relative to current position.11792       **SEEK\_END**            Seek relative to end-of-file.11793       **SEEK\_SET**            Seek relative to start-of-file.11794       The <stdio.h> header shall define the following macros which shall expand to integer constant  
 11795       expressions denoting implementation limits:11796       {FILENAME\_MAX}       Maximum size in bytes of the longest filename string that the  
 11797       implementation guarantees can be opened.11798       {FOPEN\_MAX}         Number of streams which the implementation guarantees can be open  
 11799       simultaneously. The value is at least eight.11800 OB       {TMP\_MAX}           Minimum number of unique filenames generated by *tmpnam()*.  
 11801       Maximum number of times an application can call *tmpnam()* reliably. The  
 11802       value of {TMP\_MAX} is at least 25.

## &lt;stdio.h&gt;

11803	OB XSI	On XSI-conformant systems, the value of {TMP_MAX} is at least 10 000.
11804		The <stdio.h> header shall define the following macro which shall expand to an integer constant expression with type <b>int</b> and a negative value:
11805		
11806		EOF                      End-of-file return value.
11807		The <stdio.h> header shall define NULL as described in <stddef.h>.
11808		The <stdio.h> header shall define the following macro which shall expand to a string constant:
11809	OB XSI	P_tmpdir                Default directory prefix for <i>tempnam()</i> .
11810		The <stdio.h> header shall define the following macros which shall expand to expressions of type "pointer to <b>FILE</b> " that point to the <b>FILE</b> objects associated, respectively, with the standard error, input, and output streams:
11811		
11812		
11813		<i>stderr</i> Standard error output stream.
11814		<i>stdin</i> Standard input stream.
11815		<i>stdout</i> Standard output stream.
11816		The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.
11817		
11818		void      clearerr(FILE *);
11819	CX	char     *ctermid(char *);
11820		int      dprintf(int, const char *restrict, ...)
11821		int      fclose(FILE *);
11822	CX	FILE    *fdopen(int, const char *);
11823		int      feof(FILE *);
11824		int      ferror(FILE *);
11825		int      fflush(FILE *);
11826		int      fgetc(FILE *);
11827		int      fgetpos(FILE *restrict, fpos_t *restrict);
11828		char    *fgets(char *restrict, int, FILE *restrict);
11829	CX	int      fileno(FILE *);
11830		void     flockfile(FILE *);
11831		FILE    *fmemopen(void *restrict, size_t, const char *restrict);
11832		FILE    *fopen(const char *restrict, const char *restrict);
11833		int      fprintf(FILE *restrict, const char *restrict, ...);
11834		int      fputc(int, FILE *);
11835		int      fputs(const char *restrict, FILE *restrict);
11836		size_t   fread(void *restrict, size_t, size_t, FILE *restrict);
11837		FILE    *freopen(const char *restrict, const char *restrict, FILE *restrict);
11838		
11839		int      fscanf(FILE *restrict, const char *restrict, ...);
11840		int      fseek(FILE *, long, int);
11841	CX	int      fseeko(FILE *, off_t, int);
11842		int      fsetpos(FILE *, const fpos_t *);
11843		long     ftell(FILE *);
11844	CX	off_t    ftello(FILE *);
11845		int      ftrylockfile(FILE *);
11846		void     funlockfile(FILE *);
11847		size_t   fwrite(const void *restrict, size_t, size_t, FILE *restrict);
11848		int      getc(FILE *);

## Headers

## &lt;stdio.h&gt;

```

11849      int      getchar(void);
11850 CX      int      getc_unlocked(FILE *);
11851      int      getchar_unlocked(void);
11852      ssize_t  getdelim(char **restrict, size_t *restrict, int,
11853                  FILE *restrict);
11854      ssize_t  getline(char **restrict, size_t *restrict, FILE *restrict);
11855 OB      char      *gets(char *);
11856 CX      FILE      *open_memstream(char **, size_t *);
11857      int      pclose(FILE *);
11858      void     perror(const char *);
11859 CX      FILE      *popen(const char *, const char *);
11860      int      printf(const char *restrict, ...);
11861      int      putc(int, FILE *);
11862      int      putchar(int);
11863 CX      int      putc_unlocked(int, FILE *);
11864      int      putchar_unlocked(int);
11865      int      puts(const char *);
11866      int      remove(const char *);
11867      int      rename(const char *, const char *);
11868 CX      int      renameat(int, const char *, int, const char *);
11869      void     rewind(FILE *);
11870      int      scanf(const char *restrict, ...);
11871      void     setbuf(FILE *restrict, char *restrict);
11872      int      setvbuf(FILE *restrict, char *restrict, int, size_t);
11873      int      snprintf(char *restrict, size_t, const char *restrict, ...);
11874      int      sprintf(char *restrict, const char *restrict, ...);
11875      int      sscanf(const char *restrict, const char *restrict, ...);
11876 OB XSI    char      *tempnam(const char *, const char *);
11877      FILE     *tmpfile(void);
11878 OB      char      *tmpnam(char *);
11879      int      ungetc(int, FILE *);
11880 CX      int      vdprintf(int, const char *restrict, va_list);
11881      int      vfprintf(FILE *restrict, const char *restrict, va_list);
11882      int      vfprintf(FILE *restrict, const char *restrict, va_list);
11883      int      vprintf(const char *restrict, va_list);
11884      int      vscanf(const char *restrict, va_list);
11885      int      vsnprintf(char *restrict, size_t, const char *restrict,
11886                  va_list);
11887      int      vsprintf(char *restrict, const char *restrict, va_list);
11888      int      vsscanf(const char *restrict, const char *restrict, va_list);
11889 CX      Inclusion of the <stdio.h> header may also make visible all symbols from <stddef.h>.

```

## 11890 APPLICATION USAGE

11891 Since standard I/O streams may use an underlying file descriptor to access the file associated  
11892 with a stream, application developers need to be aware that {FOPEN\_MAX} streams may not be  
11893 available if file descriptors are being used to access files that are not associated with streams.

## 11894 RATIONALE

11895 There is a conflict between the ISO C standard and the POSIX definition of the {TMP\_MAX}  
11896 macro that is addressed by ISO/IEC 9899:1999 standard, Defect Report 336. The POSIX standard  
11897 is in alignment with the public record of the response to the Defect Report. This change has not  
11898 yet been published as part of the ISO C standard.

11899 **FUTURE DIRECTIONS**

11900 None.

11901 **SEE ALSO**

11902 &lt;stdarg.h&gt;, &lt;stddef.h&gt;, &lt;sys/types.h&gt;

11903 XSH Section 2.2 (on page 468), *clearerr()*, *ctermid()*, *fclose()*, *fdopen()*, *feof()*, *ferror()*, *fflush()*,  
 11904 *fgetc()*, *fgetpos()*, *fgets()*, *fileno()*, *flockfile()*, *fmemopen()*, *fopen()*, *fprintf()*, *fputc()*, *fputs()*, *fread()*,  
 11905 *freopen()*, *fscanf()*, *fseek()*, *fsetpos()*, *ftell()*, *fwrite()*, *getc()*, *getchar()*, *getc\_unlocked()*, *getdelim()*,

 11907 *rename()*, *rewind()*, *setbuf()*, *setvbuf()*, *stdin*, *system()*, *tempnam()*, *tmpfile()*, *tmpnam()*, *ungetc()*,  
 11908 *vfprintf()*, *vfscanf()*

11909 **CHANGE HISTORY**

11910 First released in Issue 1. Derived from Issue 1 of the SVID.

11911 **Issue 5**

11912 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

11913 Large File System extensions are added.

11914 The constant *L\_cuserid* and the external variables *optarg*, *opterr*, *optind*, and *optopt* are marked as  
 11915 extensions and LEGACY.11916 The *cuserid()* and *getopt()* functions are marked LEGACY.11917 **Issue 6**11918 The constant *L\_cuserid* and the external variables *optarg*, *opterr*, *optind*, and *optopt* are removed  
 11919 as they were previously marked LEGACY.11920 The *cuserid()*, *getopt()*, and *getw()* functions are removed as they were previously marked  
 11921 LEGACY.

11922 Several functions are marked as part of the Thread-Safe Functions option.

11923 This reference page is updated to align with the ISO/IEC 9899:1999 standard. Note that the  
 11924 description of the *fpos\_t* type is now explicitly updated to exclude array types.

11925 Extensions beyond the ISO C standard are marked.

11926 **Issue 7**11927 Austin Group Interpretation 1003.1-2001 #172 is applied, adding rationale about a conflict for the  
 11928 definition of *{TMP\_MAX}* with the ISO C standard.

11929 SD5-XBD-ERN-99 is applied, adding APPLICATION USAGE.

11930 The *dprintf()*, *fmemopen()*, *getdelim()*, *getline()*, *open\_memstream()*, and *vdprintf()* functions are  
 11931 added from The Open Group Technical Standard, 2006, Extended API Set Part 1.11932 The *renameat()* function is added from The Open Group Technical Standard, 2006, Extended API  
 11933 Set Part 2.11934 The *gets()*, *tmpnam()*, and *tempnam()* functions and the *L\_tmpnam* macro are marked  
 11935 obsolescent.11936 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
 11937 for the *off\_t* type is added.

## Headers

## &lt;stdlib.h&gt;

## 11938 NAME

11939        **stdlib.h** — standard library definitions

## 11940 SYNOPSIS

11941        #include &lt;stdlib.h&gt;

## 11942 DESCRIPTION

11943 CX       Some of the functionality described on this reference page extends the ISO C standard.  
 11944       Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 11945       enable the visibility of these symbols in this header.

11946       The <stdlib.h> header shall define the following macros which shall expand to integer constant  
 11947       expressions:

11948       EXIT\_FAILURE   Unsuccessful termination for *exit()*; evaluates to a non-zero value.

11949       EXIT\_SUCCESS   Successful termination for *exit()*; evaluates to 0.

11950       {RAND\_MAX}     Maximum value returned by *rand()*; at least 32 767.

11951       The <stdlib.h> header shall define the following macro which shall expand to a positive integer  
 11952       expression with type **size\_t**:

11953       {MB\_CUR\_MAX}   Maximum number of bytes in a character specified by the current locale  
 11954       (category *LC\_CTYPE*).

11955       The <stdlib.h> header shall define NULL as described in <stddef.h>.

11956       The <stdlib.h> header shall define the following data types through **typedef**:

11957       **div\_t**           Structure type returned by the *div()* function.

11958       **ldiv\_t**          Structure type returned by the *ldiv()* function.

11959       **lldiv\_t**         Structure type returned by the *lldiv()* function.

11960       **size\_t**          As described in <stddef.h>.

11961       **wchar\_t**         As described in <stddef.h>.

11962 CX       In addition, the <stdlib.h> header shall define the following symbolic constants and macros as  
 11963       described in <sys/wait.h>:

11964       WEXITSTATUS

11965       WIFEXITED

11966       WIFSIGNALED

11967       WIFSTOPPED

11968       WNOHANG

11969       WSTOPSIG

11970       WTERMSIG

11971       WUNTRACED

11972       The following shall be declared as functions and may also be defined as macros. Function  
 11973       prototypes shall be provided.

11974       void            \_Exit(int);

11975 XSI       long        a64l(const char \*);

11976       void            abort(void);

11977       int             abs(int);

11978       int             atexit(void (\*) (void));

11979       double          atof(const char \*);

```

11980     int          atoi(const char *);
11981     long         atol(const char *);
11982     long long    atoll(const char *);
11983     void         *bsearch(const void *, const void *, size_t, size_t,
11984                          int (*)(const void *, const void *));
11985     void         *calloc(size_t, size_t);
11986     div_t        div(int, int);
11987 XSI     double      drand48(void);
11988     double      erand48(unsigned short [3]);
11989     void         exit(int);
11990     void         free(void *);
11991     char        *getenv(const char *);
11992     int         getsubopt(char **, char *const *, char **);
11993 XSI     int         grantpt(int);
11994     char        *initstate(unsigned, char *, size_t);
11995     long        jrand48(unsigned short [3]);
11996     char        *l64a(long);
11997     long        labs(long);
11998 XSI     void        lcong48(unsigned short [7]);
11999     ldiv_t      ldiv(long, long);
12000     long long   llabs(long long);
12001     lldiv_t     lldiv(long long, long long);
12002 XSI     long        lrand48(void);
12003     void        *malloc(size_t);
12004     int         mblen(const char *, size_t);
12005     size_t      mbstowcs(wchar_t *restrict, const char *restrict, size_t);
12006     int         mbtowlc(wchar_t *restrict, const char *restrict, size_t);
12007 CX      char        *mkdtemp(char *);
12008     int         mkstemp(char *);
12009 XSI     long        mrand48(void);
12010     long        nrand48(unsigned short [3]);
12011 ADV     int         posix_memalign(void **, size_t, size_t);
12012 XSI     int         posix_openpt(int);
12013     char        *ptname(int);
12014     int         putenv(char *);
12015     void        qsort(void *, size_t, size_t, int (*)(const void *,
12016               const void *));
12017     int         rand(void);
12018 OB CX    int         rand_r(unsigned *);
12019 XSI     long        random(void);
12020     void        *realloc(void *, size_t);
12021 XSI     char        *realpath(const char *restrict, char *restrict);
12022     unsigned short *seed48(unsigned short [3]);
12023 CX      int         setenv(const char *, const char *, int);
12024 XSI     void        setkey(const char *);
12025     char        *setstate(char *);
12026     void        srand(unsigned);
12027 XSI     void        srand48(long);
12028     void        srandom(unsigned);
12029     double      strtod(const char *restrict, char **restrict);
12030     float       strtod(const char *restrict, char **restrict);
12031     long        strtol(const char *restrict, char **restrict, int);

```

## Headers

## &lt;stdlib.h&gt;

```

12032     long double   strtold(const char *restrict, char **restrict);
12033     long long     strtoll(const char *restrict, char **restrict, int);
12034     unsigned long strtoul(const char *restrict, char **restrict, int);
12035     unsigned long long
12036                 strtoull(const char *restrict, char **restrict, int);
12037     int           system(const char *);
12038 XSI     int           unlockpt(int);
12039 CX     int           unsetenv(const char *);
12040     size_t       wcstombs(char *restrict, const wchar_t *restrict, size_t);
12041     int          wctomb(char *, wchar_t);

```

12042 CX Inclusion of the <stdlib.h> header may also make visible all symbols from <stddef.h>, <limits.h>, <math.h>, and <sys/wait.h>.

## 12057 CHANGE HISTORY

12058 First released in Issue 3.

## 12059 Issue 5

12060 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

12061 The *ttyslot()* and *valloc()* functions are marked LEGACY.

12062 The type of the third argument to *initstate()* is changed from **int** to **size\_t**. The type of the return  
12063 value from *setstate()* is changed from **char** to **char \***, and the type of the first argument is  
12064 changed from **char \*** to **const char \***.

## 12065 Issue 6

12066 The Open Group Corrigendum U021/1 is applied, correcting the prototype for *realpath()* to be  
12067 consistent with the reference page.

12068 The Open Group Corrigendum U028/13 is applied, correcting the prototype for *putenv()* to be  
12069 consistent with the reference page.

12070 The *rand\_r()* function is marked as part of the Thread-Safe Functions option.

12071 Function prototypes for *setenv()* and *unsetenv()* are added.

12072 The *posix\_memalign()* function is added for alignment with IEEE Std 1003.1d-1999.

12073 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

12074 The *ecvt()*, *fcvt()*, *gcvt()*, and *mktemp()* functions are marked LEGACY.

- 12075 The *ttyslot()* and *valloc()* functions are removed as they were previously marked LEGACY.
- 12076 Extensions beyond the ISO C standard are marked.
- 12077 **Issue 7**
- 12078 SD5-XBD-ERN-79 and SD5-XBD-ERN-105 are applied.
- 12079 The LEGACY functions are removed.
- 12080 The *mkdtemp()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.
- 12081
- 12082 The *rand\_r()* function is marked obsolescent.
- 12083 This reference page is clarified with respect to macros and symbolic constants.
- 12084 The type of the first argument to *setstate()* is changed from **const char \*** to **char \***.

## Headers

## &lt;string.h&gt;

## 12085 NAME

12086 string.h — string operations

## 12087 SYNOPSIS

12088 #include &lt;string.h&gt;

## 12089 DESCRIPTION

12090 CX Some of the functionality described on this reference page extends the ISO C standard.  
 12091 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 12092 enable the visibility of these symbols in this header.

12093 The &lt;string.h&gt; header shall define NULL and size\_t as described in &lt;stddef.h&gt;.

12094 CX The &lt;string.h&gt; header shall define the locale\_t type as described in &lt;locale.h&gt;.

12095 The following shall be declared as functions and may also be defined as macros. Function  
 12096 prototypes shall be provided for use with ISO C standard compilers.

12097 XSI void \*memcpy(void \*restrict, const void \*restrict, int, size\_t);  
 12098 void \*memchr(const void \*, int, size\_t);  
 12099 int memcmp(const void \*, const void \*, size\_t);  
 12100 void \*memcpy(void \*restrict, const void \*restrict, size\_t);  
 12101 void \*memmove(void \*, const void \*, size\_t);  
 12102 void \*memset(void \*, int, size\_t);  
 12103 CX char \*strcpy(char \*restrict, const char \*restrict);  
 12104 char \*strncpy(char \*restrict, const char \*restrict, size\_t);  
 12105 char \*strcat(char \*restrict, const char \*restrict);  
 12106 char \*strchr(const char \*, int);  
 12107 int strcmp(const char \*, const char \*);  
 12108 int strcoll(const char \*, const char \*);  
 12109 CX int strcoll\_l(const char \*, const char \*, locale\_t);  
 12110 char \*strcpy(char \*restrict, const char \*restrict);  
 12111 size\_t strcspn(const char \*, const char \*);  
 12112 CX char \*strdup(const char \*);  
 12113 char \*strerror(int);  
 12114 CX char \*strerror\_l(int, locale\_t);  
 12115 int strerror\_r(int, char \*, size\_t);  
 12116 size\_t strlen(const char \*);  
 12117 char \*strncat(char \*restrict, const char \*restrict, size\_t);  
 12118 int strncmp(const char \*, const char \*, size\_t);  
 12119 char \*strncpy(char \*restrict, const char \*restrict, size\_t);  
 12120 CX char \*strndup(const char \*, size\_t);  
 12121 size\_t strnlen(const char \*, size\_t);  
 12122 char \*strpbrk(const char \*, const char \*);  
 12123 char \*strrchr(const char \*, int);  
 12124 CX char \*strsignal(int);  
 12125 size\_t strspn(const char \*, const char \*);  
 12126 char \*strstr(const char \*, const char \*);  
 12127 char \*strtok(char \*restrict, const char \*restrict);  
 12128 CX char \*strtok\_r(char \*restrict, const char \*restrict, char \*\*restrict);  
 12129 size\_t strxfrm(char \*restrict, const char \*restrict, size\_t);  
 12130 CX size\_t strxfrm\_l(char \*restrict, const char \*restrict,  
 12131 size\_t, locale\_t);

**<string.h>**

12132 CX Inclusion of the **<string.h>** header may also make visible all symbols from **<stddef.h>**.

12133 **APPLICATION USAGE**

12134 None.

12135 **RATIONALE**

12136 None.

12144 **CHANGE HISTORY**

12145 First released in Issue 1. Derived from Issue 1 of the SVID.

12146 **Issue 5**

12147 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

12148 **Issue 6**

12149 The *strtok\_r()* function is marked as part of the Thread-Safe Functions option.

12150 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

12151 The *strerror\_r()* function is added in response to IEEE PASC Interpretation 1003.1c #39.

12152 **Issue 7**

12153 SD5-XBD-ERN-15 is applied, correcting the prototype for the *strerror\_r()* function.

12154 The *stpcpy()*, *stpncpy()*, *strndup()*, *strlen()*, and *strsignal()* functions are added from The Open  
 12155 Group Technical Standard, 2006, Extended API Set Part 1.

12156 The *strcoll\_l()*, *strerror\_l()*, and *strxfrm\_l()* functions are added from The Open Group Technical  
 12157 Standard, 2006, Extended API Set Part 4.

12158 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
 12159 for the **locale\_t** type is added.

12160 **NAME**

12161 strings.h — string operations

12162 **SYNOPSIS**

12163 #include &lt;strings.h&gt;

12164 **DESCRIPTION**12165 The following shall be declared as functions and may also be defined as macros. Function  
12166 prototypes shall be provided for use with ISO C standard compilers.

```

12167 XSI int ffs(int);
12168 int strcasecmp(const char *, const char *);
12169 int strcasecmp_l(const char *, const char *, locale_t);
12170 int strncasecmp(const char *, const char *, size_t);
12171 int strncasecmp_l(const char *, const char *, size_t, locale_t);

```

12172 The <strings.h> header shall define the **locale\_t** type as described in <locale.h>.12173 The <strings.h> header shall define the **size\_t** type as described in <sys/types.h>.12174 **APPLICATION USAGE**

12175 None.

12176 **RATIONALE**

12177 None.

12178 **FUTURE DIRECTIONS**

12179 None.

12180 **SEE ALSO**

12181 &lt;locale.h&gt;, &lt;sys/types.h&gt;

12182 XSH *ffs()*, *strcasecmp()*12183 **CHANGE HISTORY**

12184 First released in Issue 4, Version 2.

12185 **Issue 6**12186 The Open Group Corrigendum U021/2 is applied, correcting the prototype for *index()* to be  
12187 consistent with the reference page.12188 The *bcmp()*, *bcopy()*, *bzero()*, *index()*, and *rindex()* functions are marked LEGACY.12189 **Issue 7**12190 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size\_t** type.

12191 The LEGACY functions are removed.

12192 The &lt;strings.h&gt; header is moved from the XSI option to the Base.

12193 The *strcasecmp\_l()* and *strncasecmp\_l()* functions are added from The Open Group Technical  
12194 Standard, 2006, Extended API Set Part 4.12195 A declaration for the **locale\_t** type is added.

**<stropts.h>**12196 **NAME**12197           stropts.h — STREAMS interface (**STREAMS**)12198 **SYNOPSIS**12199 OB XSR `#include <stropts.h>`12200 **DESCRIPTION**12201           The **<stropts.h>** header shall define the **bandinfo** structure, which shall include at least the  
12202 following members:12203           int                bi\_flag     Flushing type.  
12204           unsigned char    bi\_pri     Priority band.12205           The **<stropts.h>** header shall define the **strpeek** structure, which shall include at least the  
12206 following members:12207           struct strbuf    ctlbuf     The control portion of the message.  
12208           struct strbuf    databuf    The data portion of the message.  
12209           t\_uscalar\_t     flags     RS\_HIPRI or 0.12210           The **<stropts.h>** header shall define the **strbuf** structure, which shall include at least the  
12211 following members:12212           char   \*buf        Pointer to buffer.  
12213           int    len         Length of data.  
12214           int    maxlen     Maximum buffer length.12215           The **<stropts.h>** header shall define the **strfdinsert** structure, which shall include at least the  
12216 following members:12217           struct strbuf    ctlbuf     The control portion of the message.  
12218           struct strbuf    databuf    The data portion of the message.  
12219           int              fildes     File descriptor of the other STREAM.  
12220           t\_uscalar\_t     flags     RS\_HIPRI or 0.  
12221           int              offset     Relative location of the stored value.12222           The **<stropts.h>** header shall define the **striocctl** structure, which shall include at least the  
12223 following members:12224           int    ic\_cmd     *ioctl()* command.  
12225           char   \*ic\_dp     Pointer to buffer.  
12226           int    ic\_len     Length of data.  
12227           int    ic\_timeout   Timeout for response.12228           The **<stropts.h>** header shall define the **strrecvfd** structure, which shall include at least the  
12229 following members:12230           int    fd         Received file descriptor.  
12231           gid\_t  gid        GID of sender.  
12232           uid\_t  uid        UID of sender.12233           The **<stropts.h>** header shall define the **uid\_t** and **gid\_t** types through **typedef**, as described in  
12234 **<sys/types.h>**.12235           The **<stropts.h>** header shall define the **t\_scalar\_t** and **t\_uscalar\_t** types, respectively, as signed  
12236 and unsigned opaque types of equal length of at least 32 bits.12237           The **<stropts.h>** header shall define the **str\_list** structure, which shall include at least the  
12238 following members:

## Headers

## &lt;stropts.h&gt;

12239	struct str_mlist	*sl_modlist	STREAMS module names.
12240	int	sl_nmods	Number of STREAMS module names.
12241	The <stropts.h> header shall define the <b>str_mlist</b> structure, which shall include at least the		
12242	following member:		
12243	char	l_name[FMNAMESZ+1]	A STREAMS module name.
12244	The <stropts.h> header shall define at least the following symbolic constants for use as the		
12245	<i>request</i> argument to <i>ioctl()</i> :		
12246	I_ATMARK		Is the top message “marked”?
12247	I_CANPUT		Is a band writable?
12248	I_CKBAND		See if any messages exist in a band.
12249	I_FDINSERT		Send implementation-defined information about another STREAM.
12250	I_FIND		Look for a STREAMS module.
12251	I_FLUSH		Flush a STREAM.
12252	I_FLUSHBAND		Flush one band of a STREAM.
12253	I_GETBAND		Get the band of the top message on a STREAM.
12254	I_GETCLTIME		Get close time delay.
12255	I_GETSIG		Retrieve current notification signals.
12256	I_GRDOPT		Get the read mode.
12257	I_GWROPT		Get the write mode.
12258	I_LINK		Connect two STREAMs.
12259	I_LIST		Get all the module names on a STREAM.
12260	I_LOOK		Get the top module name.
12261	I_NREAD		Size the top message.
12262	I_PEEK		Peek at the top message on a STREAM.
12263	I_PLINK		Persistently connect two STREAMs.
12264	I_POP		Pop a STREAMS module.
12265	I_PUNLINK		Dismantle a persistent STREAMS link.
12266	I_PUSH		Push a STREAMS module.
12267	I_RECVFD		Get a file descriptor sent via I_SENDFD.
12268	I_SENDFD		Pass a file descriptor through a STREAMS pipe.
12269	I_SETCLTIME		Set close time delay.
12270	I_SETSIG		Ask for notification signals.
12271	I_SRDOPT		Set the read mode.
12272	I_STR		Send a STREAMS <i>ioctl()</i> .

## &lt;stropts.h&gt;

## Headers

12273	I_SWROPT	Set the write mode.
12274	I_UNLINK	Disconnect two STREAMs.
12275	The <stropts.h>	header shall define at least the following symbolic constant for use with
12276	I_LOOK:	
12277	FMNAMESZ	The minimum size in bytes of the buffer referred to by the <i>arg</i> argument.
12278	The <stropts.h>	header shall define at least the following symbolic constants for use with
12279	I_FLUSH:	
12280	FLUSHR	Flush read queues.
12281	FLUSHRW	Flush read and write queues.
12282	FLUSHW	Flush write queues.
12283	The <stropts.h>	header shall define at least the following symbolic constants for use with
12284	I_SETSIG:	
12285	S_BANDURG	When used in conjunction with S_RDBAND, SIGURG is generated instead of
12286		SIGPOLL when a priority message reaches the front of the STREAM head read
12287		queue.
12288	S_ERROR	Notification of an error condition reaches the STREAM head.
12289	S_HANGUP	Notification of a hangup reaches the STREAM head.
12290	S_HIPRI	A high-priority message is present on a STREAM head read queue.
12291	S_INPUT	A message, other than a high-priority message, has arrived at the head of a
12292		STREAM head read queue.
12293	S_MSG	A STREAMS signal message that contains the SIGPOLL signal reaches the
12294		front of the STREAM head read queue.
12295	S_OUTPUT	The write queue for normal data (priority band 0) just below the STREAM
12296		head is no longer full. This notifies the process that there is room on the queue
12297		for sending (or writing) normal data downstream.
12298	S_RDBAND	A message with a non-zero priority band has arrived at the head of a
12299		STREAM head read queue.
12300	S_RDNORM	A normal (priority band set to 0) message has arrived at the head of a
12301		STREAM head read queue.
12302	S_WRBAND	The write queue for a non-zero priority band just below the STREAM head is
12303		no longer full.
12304	S_WRNORM	Equivalent to S_OUTPUT.
12305	The <stropts.h>	header shall define at least the following symbolic constant for use with
12306	I_PEEK:	
12307	RS_HIPRI	Only look for high-priority messages.
12308	The <stropts.h>	header shall define at least the following symbolic constants for use with
12309	I_SRDOPT:	
12310	RMSGD	Message-discard mode.

## Headers

## &lt;stropts.h&gt;

12311	RMSGN	Message-non-discard mode.
12312	RNORM	Byte-STREAM mode, the default.
12313	RPROTDAT	Deliver the control part of a message as data when a process issues a <i>read()</i> .
12314	RPROTDIS	Discard the control part of a message, delivering any data part, when a process issues a <i>read()</i> .
12315		
12316	RPROTNORM	Fail <i>read()</i> with [EBADMSG] if a message containing a control part is at the front of the STREAM head read queue.
12317		
12318	The <stropts.h>	header shall define at least the following symbolic constant for use with
12319	L_SWOPT:	
12320	SNDZERO	Send a zero-length message downstream when a <i>write()</i> of 0 bytes occurs.
12321	The <stropts.h>	header shall define at least the following symbolic constants for use with
12322	L_ATMARK:	
12323	ANYMARK	Check if the message is marked.
12324	LASTMARK	Check if the message is the last one marked on the queue.
12325	The <stropts.h>	header shall define at least the following symbolic constant for use with
12326	L_UNLINK:	
12327	MUXID_ALL	Unlink all STREAMs linked to the STREAM associated with <i>fildev</i> .
12328	The <stropts.h>	header shall define the following symbolic constants for <i>getmsg()</i> , <i>getpmsg()</i> ,
12329	<i>putmsg()</i> , and <i>putpmsg()</i> :	
12330	MORECTL	More control information is left in message.
12331	MOREDATA	More data is left in message.
12332	MSG_ANY	Receive any message.
12333	MSG_BAND	Receive message from specified band.
12334	MSG_HIPRI	Send/receive high-priority message.
12335	The <stropts.h>	header may make visible all of the symbols from <unistd.h>.
12336	The following shall be declared as functions and may also be defined as macros. Function	
12337	prototypes shall be provided.	
12338	int	<i>fattach</i> (int, const char *);
12339	int	<i>idetach</i> (const char *);
12340	int	<i>getmsg</i> (int, struct strbuf *restrict, struct strbuf *restrict,
12341	int	*restrict);
12342	int	<i>getpmsg</i> (int, struct strbuf *restrict, struct strbuf *restrict,
12343	int	*restrict, int *restrict);
12344	int	<i>ioctl</i> (int, int, ...);
12345	int	<i>isastream</i> (int);
12346	int	<i>putmsg</i> (int, const struct strbuf *, const struct strbuf *, int);
12347	int	<i>putpmsg</i> (int, const struct strbuf *, const struct strbuf *, int,
12348	int);

12371 **NAME**

12372 sys/ipc.h — XSI interprocess communication access structure

12373 **SYNOPSIS**12374 XSI 

```
#include <sys/ipc.h>
```

12375 **DESCRIPTION**

12376 The <sys/ipc.h> header is used by three mechanisms for XSI interprocess communication (IPC):  
 12377 messages, semaphores, and shared memory. All use a common structure type, **ipc\_perm**, to pass  
 12378 information used in determining permission to perform an IPC operation.

12379 The <sys/ipc.h> header shall define the **ipc\_perm** structure, which shall include the following  
 12380 members:

12381	uid_t	uid	Owner's user ID.
12382	gid_t	gid	Owner's group ID.
12383	uid_t	cuid	Creator's user ID.
12384	gid_t	cgid	Creator's group ID.
12385	mode_t	mode	Read/write permission.

12386 The <sys/ipc.h> header shall define the **uid\_t**, **gid\_t**, **mode\_t**, and **key\_t** types as described in  
 12387 <sys/types.h>.

12388 The <sys/ipc.h> header shall define the following symbolic constants.

12389 Mode bits:

12390	IPC_CREAT	Create entry if key does not exist.
12391	IPC_EXCL	Fail if key exists.
12392	IPC_NOWAIT	Error if request must wait.

12393 Keys:

12394	IPC_PRIVATE	Private key.
-------	-------------	--------------

12395 Control commands:

12396	IPC_RMID	Remove identifier.
12397	IPC_SET	Set options.
12398	IPC_STAT	Get options.

12399 The following shall be declared as a function and may also be defined as a macro. A function  
 12400 prototype shall be provided.

```
12401 key_t ftok(const char *, int);
```

## Headers

## &lt;sys/mman.h&gt;

## 12415 NAME

12416 sys/mman.h — memory management declarations

## 12417 SYNOPSIS

12418 #include <sys/mman.h>

## 12419 DESCRIPTION

12420 The <sys/mman.h> header shall define the following symbolic constants for use as protection  
12421 options:

12422 PROT\_EXEC Page can be executed.

12423 PROT\_NONE Page cannot be accessed.

12424 PROT\_READ Page can be read.

12425 PROT\_WRITE Page can be written.

12426 The <sys/mman.h> header shall define the following symbolic constants for use as flag options:

12427 MAP\_FIXED Interpret *addr* exactly.

12428 MAP\_PRIVATE Changes are private.

12429 MAP\_SHARED Share changes.

12430 XSI|SIO The <sys/mman.h> header shall define the following symbolic constants for the *msync()*  
12431 function:

12432 MS\_ASYNC Perform asynchronous writes.

12433 MS\_INVALIDATE Invalidate mappings.

12434 MS\_SYNC Perform synchronous writes.

12435 ML The <sys/mman.h> header shall define the following symbolic constants for the *mlockall()*  
12436 function:

12437 MCL\_CURRENT Lock currently mapped pages.

12438 MCL\_FUTURE Lock pages that become mapped.

12439 The <sys/mman.h> header shall define the symbolic constant MAP\_FAILED which shall have  
12440 type **void \*** and shall be used to indicate a failure from the *mmap()* function .

12441 ADV If the Advisory Information option is supported, the <sys/mman.h> header shall define  
12442 symbolic constants for the *advice* argument to the *posix\_madvise()* function as follows:

12443 POSIX\_MADV\_DONTNEED

12444 The application expects that it will not access the specified range in the near future.

12445 POSIX\_MADV\_NORMAL

12446 The application has no advice to give on its behavior with respect to the specified range. It  
12447 is the default characteristic if no advice is given for a range of memory.

12448 POSIX\_MADV\_RANDOM

12449 The application expects to access the specified range in a random order.

12450 POSIX\_MADV\_SEQUENTIAL

12451 The application expects to access the specified range sequentially from lower addresses to  
12452 higher addresses.

## &lt;sys/mman.h&gt;

12453		POSIX_MADV_WILLNEED	
12454			The application expects to access the specified range in the near future.
12455	TYM	The <sys/mman.h> header shall define the following symbolic constants for use as flags for the <i>posix_typed_mem_open()</i> function:	
12456			
12457		POSIX_TYPED_MEM_ALLOCATE	
12458			Allocate on <i>mmap()</i> .
12459		POSIX_TYPED_MEM_ALLOCATE_CONTIG	
12460			Allocate contiguously on <i>mmap()</i> .
12461		POSIX_TYPED_MEM_MAP_ALLOCATABLE	
12462			Map on <i>mmap()</i> , without affecting allocatability.
12463		The <sys/mman.h> header shall define the <b>mode_t</b> , <b>off_t</b> , and <b>size_t</b> types as described in <sys/types.h>.	
12464			
12465	TYM	The <sys/mman.h> header shall define the <b>posix_typed_mem_info</b> structure, which shall include at least the following member:	
12466			
12467		size_t posix_tmi_length	Maximum length which may be allocated from a typed memory object.
12468			
12469		The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.	
12470			
12471	MLR	int	mlock(const void *, size_t);
12472	ML	int	mlockall(int);
12473		void *	mmap(void *, size_t, int, int, int, off_t);
12474		int	mprotect(void *, size_t, int);
12475	XSI SIO	int	msync(void *, size_t, int);
12476	MLR	int	munlock(const void *, size_t);
12477	ML	int	munlockall(void);
12478		int	munmap(void *, size_t);
12479	ADV	int	posix_madvise(void *, size_t, int);
12480	TYM	int	posix_mem_offset(const void *restrict, size_t, off_t *restrict, size_t *restrict, int *restrict);
12481			
12482		int	posix_typed_mem_get_info(int, struct posix_typed_mem_info *);
12483		int	posix_typed_mem_open(const char *, int, int);
12484	SHM	int	shm_open(const char *, int, mode_t);
12485		int	shm_unlink(const char *);

12486 **APPLICATION USAGE**

12487 None.

12488 **RATIONALE**

12489 None.

12490 **FUTURE DIRECTIONS**

12491 None.

12492 **SEE ALSO**

12493 &lt;sys/types.h&gt;

12494 XSH *mlock()*, *mlockall()*, *mmap()*, *mprotect()*, *msync()*, *munmap()*, *posix\_madvise()*,  
 12495 *posix\_mem\_offset()*, *posix\_typed\_mem\_get\_info()*, *posix\_typed\_mem\_open()*, *shm\_open()*,  
 12496 *shm\_unlink()*

12497 **CHANGE HISTORY**

12498 First released in Issue 4, Version 2.

12499 **Issue 5**

12500 Updated for alignment with the POSIX Realtime Extension.

12501 **Issue 6**

12502 The <sys/mman.h> header is marked as dependent on support for either the Memory Mapped  
 12503 Files, Process Memory Locking, or Shared Memory Objects options.

12504 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 12505 • The TYM margin code is added to the list of margin codes for the <sys/mman.h> header  
 12506 line, as well as for other lines.
- 12507 • The POSIX\_TYPED\_MEM\_ALLOCATE, POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG,  
 12508 and POSIX\_TYPED\_MEM\_MAP\_ALLOCATABLE flags are added.
- 12509 • The **posix\_tmi\_length** structure is added.
- 12510 • The *posix\_mem\_offset()*, *posix\_typed\_mem\_get\_info()*, and *posix\_typed\_mem\_open()* functions  
 12511 are added.

12512 The **restrict** keyword is added to the prototype for *posix\_mem\_offset()*.12513 IEEE PASC Interpretation 1003.1 #102 is applied, adding the prototype for *posix\_madvise()*.

12514 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/16 is applied, correcting margin code and  
 12515 shading errors for the *mlock()* and *munlock()* functions.

12516 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code  
 12517 for the *mmap()* function from MF|SHM to MC3 (notation for MF|SHM|TYM).

12518 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code  
 12519 for the *munmap()* function from MF|SHM to MC3 (notation for MF|SHM|TYM).

12520 **Issue 7**

12521 SD5-XBD-ERN-5 is applied, rewriting the DESCRIPTION.

12522 Functionality relating to the Memory Protection and Memory Mapped Files options is moved to  
 12523 the Base.

12524 This reference page is clarified with respect to macros and symbolic constants.

**<sys/msg.h>**12525 **NAME**

12526 sys/msg.h — XSI message queue structures

12527 **SYNOPSIS**12528 XSI `#include <sys/msg.h>`12529 **DESCRIPTION**12530 The **<sys/msg.h>** header shall define the following data types through **typedef**:12531 **msgqnum\_t** Used for the number of messages in the message queue.12532 **msglen\_t** Used for the number of bytes allowed in a message queue.12533 These types shall be unsigned integer types that are able to store values at least as large as a type  
12534 **unsigned short**.12535 The **<sys/msg.h>** header shall define the following symbolic constant as a message operation  
12536 flag:12537 **MSG\_NOERROR** No error if big message.12538 The **<sys/msg.h>** header shall define the **msqid\_ds** structure, which shall include the following  
12539 members:

12540	<code>struct ipc_perm</code>	<code>msg_perm</code>	Operation permission structure.
12541	<code>msgqnum_t</code>	<code>msg_qnum</code>	Number of messages currently on queue.
12542	<code>msglen_t</code>	<code>msg_qbytes</code>	Maximum number of bytes allowed on queue.
12543	<code>pid_t</code>	<code>msg_lspid</code>	Process ID of last <code>msgsnd()</code> .
12544	<code>pid_t</code>	<code>msg_lrpid</code>	Process ID of last <code>msgrcv()</code> .
12545	<code>time_t</code>	<code>msg_stime</code>	Time of last <code>msgsnd()</code> .
12546	<code>time_t</code>	<code>msg_rtime</code>	Time of last <code>msgrcv()</code> .
12547	<code>time_t</code>	<code>msg_ctime</code>	Time of last change.

12548 The **<sys/msg.h>** header shall define the **pid\_t**, **size\_t**, **ssize\_t**, and **time\_t** types as described in  
12549 **<sys/types.h>**.12550 The following shall be declared as functions and may also be defined as macros. Function  
12551 prototypes shall be provided.

```

12552 int      msgctl(int, int, struct msqid_ds *);
12553 int      msgget(key_t, int);
12554 ssize_t  msgrcv(int, void *, size_t, long, int);
12555 int      msgsnd(int, const void *, size_t, int);

```

12556 In addition, the **<sys/msg.h>** header shall include the **<sys/ipc.h>** header.12557 **APPLICATION USAGE**

12558 None.

12559 **RATIONALE**

12560 None.

12561 **FUTURE DIRECTIONS**

12562 None.

12563 **SEE ALSO**12564 **<sys/ipc.h>**, **<sys/types.h>**12565 XSH `msgctl()`, `msgget()`, `msgrcv()`, `msgsnd()`

## &lt;sys/resource.h&gt;

## 12571 NAME

12572 sys/resource.h — definitions for XSI resource operations

## 12573 SYNOPSIS

12574 XSI `#include <sys/resource.h>`

## 12575 DESCRIPTION

12576 The <sys/resource.h> header shall define the following symbolic constants as possible values of  
12577 the *which* argument of *getpriority()* and *setpriority()*:12578 PRIO\_PROCESS Identifies the *who* argument as a process ID.12579 PRIO\_PGRP Identifies the *who* argument as a process group ID.12580 PRIO\_USER Identifies the *who* argument as a user ID.12581 The <sys/resource.h> header shall define the following type through **typedef**:12582 **rlim\_t** Unsigned integer type used for limit values.12583 The <sys/resource.h> header shall define the following symbolic constants, which shall have  
12584 values suitable for use in **#if** preprocessing directives:12585 RLIM\_INFINITY A value of **rlim\_t** indicating no limit.12586 RLIM\_SAVED\_MAX A value of type **rlim\_t** indicating an unrepresentable saved hard  
12587 limit.12588 RLIM\_SAVED\_CUR A value of type **rlim\_t** indicating an unrepresentable saved soft limit.12589 On implementations where all resource limits are representable in an object of type **rlim\_t**,  
12590 RLIM\_SAVED\_MAX and RLIM\_SAVED\_CUR need not be distinct from RLIM\_INFINITY.12591 The <sys/resource.h> header shall define the following symbolic constants as possible values of  
12592 the *who* parameter of *getrusage()*:

12593 RUSAGE\_SELF Returns information about the current process.

12594 RUSAGE\_CHILDREN Returns information about children of the current process.

12595 The <sys/resource.h> header shall define the **rlimit** structure, which shall include at least the  
12596 following members:12597 `rlim_t rlim_cur` The current (soft) limit.12598 `rlim_t rlim_max` The hard limit.12599 The <sys/resource.h> header shall define the **rusage** structure, which shall include at least the  
12600 following members:12601 `struct timeval ru_utime` User time used.12602 `struct timeval ru_stime` System time used.12603 The <sys/resource.h> header shall define the **timeval** structure as described in <sys/time.h>.12604 The <sys/resource.h> header shall define the following symbolic constants as possible values for  
12605 the *resource* argument of *getrlimit()* and *setrlimit()*:12606 RLIMIT\_CORE Limit on size of **core** file.

12607 RLIMIT\_CPU Limit on CPU time per process.

## Headers

## &lt;sys/resource.h&gt;

12608	RLIMIT_DATA	Limit on data segment size.
12609	RLIMIT_FSIZE	Limit on file size.
12610	RLIMIT_NOFILE	Limit on number of open files.
12611	RLIMIT_STACK	Limit on stack size.
12612	RLIMIT_AS	Limit on address space size.

**<sys/select.h>**12638 **NAME**

12639 sys/select.h — select types

12640 **SYNOPSIS**

12641 #include &lt;sys/select.h&gt;

12642 **DESCRIPTION**12643 The **<sys/select.h>** header shall define the **timeval** structure, which shall include at least the  
12644 following members:12645 time\_t tv\_sec Seconds.  
12646 suseconds\_t tv\_usec Microseconds.12647 The **<sys/select.h>** header shall define the **time\_t** and **suseconds\_t** types as described in  
12648 **<sys/types.h>**.12649 The **<sys/select.h>** header shall define the **sigset\_t** type as described in **<signal.h>**.12650 The **<sys/select.h>** header shall define the **timespec** structure as described in **<time.h>**.12651 The **<sys/select.h>** header shall define the **fd\_set** type as a structure.12652 The **<sys/select.h>** header shall define the following symbolic constant, which shall have a value  
12653 suitable for use in **#if** preprocessing directives:12654 **FD\_SETSIZE** Maximum number of file descriptors in an **fd\_set** structure.12655 The following shall be declared as functions, defined as macros, or both. If functions are  
12656 declared, function prototypes shall be provided.12657 void FD\_CLR(int, fd\_set \*);  
12658 int FD\_ISSET(int, fd\_set \*);  
12659 void FD\_SET(int, fd\_set \*);  
12660 void FD\_ZERO(fd\_set \*);12661 If implemented as macros, these may evaluate their arguments more than once, so applications  
12662 should ensure that the arguments they supply are never expressions with side-effects.12663 The following shall be declared as functions and may also be defined as macros. Function  
12664 prototypes shall be provided.12665 int pselect(int, fd\_set \*restrict, fd\_set \*restrict, fd\_set \*restrict,  
12666 const struct timespec \*restrict, const sigset\_t \*restrict);  
12667 int select(int, fd\_set \*restrict, fd\_set \*restrict, fd\_set \*restrict,  
12668 struct timeval \*restrict);12669 Inclusion of the **<sys/select.h>** header may make visible all symbols from the headers  
12670 **<signal.h>** and **<time.h>**.12671 **APPLICATION USAGE**

12672 None.

12673 **RATIONALE**

12674 None.

12675 **FUTURE DIRECTIONS**

## &lt;sys/sem.h&gt;

## 12687 NAME

12688 sys/sem.h — XSI semaphore facility

## 12689 SYNOPSIS

12690 XSI `#include <sys/sem.h>`

## 12691 DESCRIPTION

12692 The <sys/sem.h> header shall define the following symbolic constant for use as a semaphore  
12693 operation flag:

12694 SEM\_UNDO Set up adjust on exit entry.

12695 The <sys/sem.h> header shall define the following symbolic constants for use as commands for  
12696 the *semctl()* function:12697 GETNCNT Get *semncnt*.12698 GETPID Get *sempid*.12699 GETVAL Get *semval*.12700 GETALL Get all cases of *semval*.12701 GETZCNT Get *semzcnt*.12702 SETVAL Set *semval*.12703 SETALL Set all cases of *semval*.12704 The <sys/sem.h> header shall define the **semid\_ds** structure, which shall include the following  
12705 members:

12706	<code>struct ipc_perm</code>	<code>sem_perm</code>	Operation permission structure.
12707	<code>unsigned short</code>	<code>sem_nsems</code>	Number of semaphores in set.
12708	<code>time_t</code>	<code>sem_otime</code>	Last <i>semop()</i> time.
12709	<code>time_t</code>	<code>sem_ctime</code>	Last time changed by <i>semctl()</i> .

12710 The <sys/sem.h> header shall define the **pid\_t**, **size\_t**, and **time\_t** types as described in  
12711 <sys/types.h>.12712 A semaphore shall be represented by an anonymous structure, which shall include the following  
12713 members:

12714	<code>unsigned short</code>	<code>semval</code>	Semaphore value.
12715	<code>pid_t</code>	<code>sempid</code>	Process ID of last operation.
12716	<code>unsigned short</code>	<code>semncnt</code>	Number of processes waiting for <i>semval</i> to become greater than current value.
12717			
12718	<code>unsigned short</code>	<code>semzcnt</code>	Number of processes waiting for <i>semval</i> to become 0.
12719			

12720 The <sys/sem.h> header shall define the **sembuf** structure, which shall include the following  
12721 members:

12722	<code>unsigned short</code>	<code>sem_num</code>	Semaphore number.
12723	<code>short</code>	<code>sem_op</code>	Semaphore operation.
12724	<code>short</code>	<code>sem_flg</code>	Operation flags.

12725 The following shall be declared as functions and may also be defined as macros. Function  
12726 prototypes shall be provided.12727 `int semctl(int, int, int, ...);`

*Headers***<sys/sem.h>**

12728           int     semget(key\_t, int, int);  
12729           int     semop(int, struct sembuf \*, size\_t);

12730           In addition, the **<sys/sem.h>** header shall include the **<sys/ipc.h>** header.

**12731 APPLICATION USAGE**

12732           None.

**12733 RATIONALE**

12734           None.

**12735 FUTURE DIRECTIONS**

12736           None.

**<sys/shm.h>**12745 **NAME**

12746 sys/shm.h — XSI shared memory facility

12747 **SYNOPSIS**12748 XSI `#include <sys/shm.h>`12749 **DESCRIPTION**12750 The **<sys/shm.h>** header shall define the following symbolic constants:

12751 SHM\_RDONLY Attach read-only (else read-write).

12752 SHM\_RND Round attach address to SHMLBA.

12753 SHMLBA Segment low boundary address multiple.

12754 The **<sys/shm.h>** header shall define the following data types through **typedef**:12755 **shmatt\_t** Unsigned integer used for the number of current attaches that must be able to  
12756 store values at least as large as a type **unsigned short**.12757 The **<sys/shm.h>** header shall define the **shmid\_ds** structure, which shall include the following  
12758 members:

12759	<code>struct ipc_perm</code>	<code>shm_perm</code>	Operation permission structure.
12760	<code>size_t</code>	<code>shm_segsz</code>	Size of segment in bytes.
12761	<code>pid_t</code>	<code>shm_lpid</code>	Process ID of last shared memory operation.
12762	<code>pid_t</code>	<code>shm_cpid</code>	Process ID of creator.
12763	<code>shmatt_t</code>	<code>shm_nattch</code>	Number of current attaches.
12764	<code>time_t</code>	<code>shm_atime</code>	Time of last <code>shmat()</code> .
12765	<code>time_t</code>	<code>shm_dtime</code>	Time of last <code>shmdt()</code> .
12766	<code>time_t</code>	<code>shm_ctime</code>	Time of last change by <code>shmctl()</code> .

12767 The **<sys/shm.h>** header shall define the **pid\_t**, **size\_t**, and **time\_t** types as described in  
12768 **<sys/types.h>**.12769 The following shall be declared as functions and may also be defined as macros. Function  
12770 prototypes shall be provided.

```

12771 void *shmat(int, const void *, int);
12772 int shmctl(int, int, struct shmid_ds *);
12773 int shmdt(const void *);
12774 int shmget(key_t, size_t, int);

```

12775 In addition, the **<sys/shm.h>** header shall include the **<sys/ipc.h>** header.12776 **APPLICATION USAGE**

12777 None.

12778 **RATIONALE**

12779 None.

12780 **FUTURE DIRECTIONS**

12781 None.

12782 **SEE ALSO**12783 [<sys/ipc.h>](#), [<sys/types.h>](#)12784 XSH `shmat()`, `shmctl()`, `shmdt()`, `shmget()`

12785 **CHANGE HISTORY**

12786 First released in Issue 2. Derived from System V Release 2.0.

12787 **Issue 5**

12788 The type of *shm\_segsz* is changed from **int** to **size\_t**.

12789 **Issue 7**

12790 Austin Group Interpretation 1003.1-2001 #179 is applied.

12791 This reference page is clarified with respect to macros and symbolic constants.

## &lt;sys/socket.h&gt;

## 12792 NAME

12793 sys/socket.h — main sockets header

## 12794 SYNOPSIS

12795 #include &lt;sys/socket.h&gt;

## 12796 DESCRIPTION

12797 The <sys/socket.h> header shall define the **socklen\_t** type, which is an integer type of width of  
12798 at least 32 bits; see APPLICATION USAGE.12799 The <sys/socket.h> header shall define the **sa\_family\_t** unsigned integer type.12800 The <sys/socket.h> header shall define the **sockaddr** structure, which shall include at least the  
12801 following members:12802 sa\_family\_t sa\_family Address family.  
12803 char sa\_data[] Socket address (variable-length data).12804 The **sockaddr** structure is used to define a socket address which is used in the *bind()*, *connect()*,  
12805 *getpeername()*, *getsockname()*, *recvfrom()*, and *sendto()* functions.12806 The <sys/socket.h> header shall define the **sockaddr\_storage** structure, which shall be:

- 12807
- Large enough to accommodate all supported protocol-specific address structures
  - Aligned at an appropriate boundary so that pointers to it can be cast as pointers to  
12808 protocol-specific address structures and used to access the fields of those structures  
12809 without alignment problems
- 12810

12811 The **sockaddr\_storage** structure shall include at least the following members:

12812 sa\_family\_t ss\_family

12813 When a **sockaddr\_storage** structure is cast as a **sockaddr** structure, the *ss\_family* field of the  
12814 **sockaddr\_storage** structure shall map onto the *sa\_family* field of the **sockaddr** structure. When a  
12815 **sockaddr\_storage** structure is cast as a protocol-specific address structure, the *ss\_family* field  
12816 shall map onto a field of that structure that is of type **sa\_family\_t** and that identifies the  
12817 protocol's address family.12818 The <sys/socket.h> header shall define the **msghdr** structure, which shall include at least the  
12819 following members:12820 void \*msg\_name Optional address.  
12821 socklen\_t msg\_namelen Size of address.  
12822 struct iovec \*msg\_iov Scatter/gather array.  
12823 int msg\_iovlen Members in *msg\_iov*.  
12824 void \*msg\_control Ancillary data; see below.  
12825 socklen\_t msg\_controllen Ancillary data buffer *len*.  
12826 int msg\_flags Flags on received message.12827 The **msghdr** structure is used to minimize the number of directly supplied parameters to the  
12828 *recvmsg()* and *sendmsg()* functions. This structure is used as a *value-result* parameter in the  
12829 *recvmsg()* function and *value* only for the *sendmsg()* function.12830 The <sys/socket.h> header shall define the **iovec** structure as described in <sys/uiio.h>.12831 The <sys/socket.h> header shall define the **cmsghdr** structure, which shall include at least the  
12832 following members:12833 socklen\_t cmsg\_len Data byte count, including the **cmsghdr**.  
12834 int cmsg\_level Originating protocol.

- 12835           int            msg\_type    Protocol-specific type.
- 12836           The **msg\_hdr** structure is used for storage of ancillary data object information.
- 12837           Ancillary data consists of a sequence of pairs, each consisting of a **msg\_hdr** structure followed  
12838           by a data array. The data array contains the ancillary data message, and the **msg\_hdr** structure  
12839           contains descriptive information that allows an application to correctly parse the data.
- 12840           The values for *msg\_level* shall be legal values for the *level* argument to the *getsockopt()* and  
12841           *setsockopt()* functions. The system documentation shall specify the *msg\_type* definitions for the  
12842           supported protocols.
- 12843           Ancillary data is also possible at the socket level. The <sys/socket.h> header shall define the  
12844           following symbolic constant for use as the *msg\_type* value when *msg\_level* is SOL\_SOCKET:
- 12845           SCM\_RIGHTS       Indicates that the data array contains the access rights to be sent or  
12846                               received.
- 12847           The <sys/socket.h> header shall define the following macros to gain access to the data arrays in  
12848           the ancillary data associated with a message header:
- 12849           MSG\_DATA(*msg*)  
12850           If the argument is a pointer to a **msg\_hdr** structure, this macro shall return an unsigned  
12851           character pointer to the data array associated with the **msg\_hdr** structure.
- 12852           MSG\_NXTHDR(*mhdr, msg*)  
12853           If the first argument is a pointer to a **msg\_hdr** structure and the second argument is a pointer  
12854           to a **msg\_hdr** structure in the ancillary data pointed to by the *msg\_control* field of that  
12855           **msg\_hdr** structure, this macro shall return a pointer to the next **msg\_hdr** structure, or a null  
12856           pointer if this structure is the last **msg\_hdr** in the ancillary data.
- 12857           MSG\_FIRSTHDR(*mhdr*)  
12858           If the argument is a pointer to a **msg\_hdr** structure, this macro shall return a pointer to the  
12859           first **msg\_hdr** structure in the ancillary data associated with this **msg\_hdr** structure, or a null  
12860           pointer if there is no ancillary data associated with the **msg\_hdr** structure.
- 12861           The <sys/socket.h> header shall define the **linger** structure, which shall include at least the  
12862           following members:
- 12863           int    l\_onoff    Indicates whether linger option is enabled.  
12864           int    l\_linger   Linger time, in seconds.
- 12865           The <sys/socket.h> header shall define the following symbolic constants with distinct values:
- 12866           SOCK\_DGRAM      Datagram socket.
- 12867    RS    SOCK\_RAW        Raw Protocol Interface.
- 12868           SOCK\_SEQPACKET   Sequenced-packet socket.
- 12869           SOCK\_STREAM     Byte-stream socket.
- 12870           The <sys/socket.h> header shall define the following symbolic constant for use as the *level*  
12871           argument of *setsockopt()* and *getsockopt()*.
- 12872           SOL\_SOCKET      Options to be accessed at socket level, not protocol level.
- 12873           The <sys/socket.h> header shall define the following symbolic constants with distinct values for  
12874           use as the *option\_name* argument in *getsockopt()* or *setsockopt()* calls (see XSH Section 2.10.16, on  
12875           page 522):

## &lt;sys/socket.h&gt;

12876	SO_ACCEPTCONN	Socket is accepting connections.
12877	SO_BROADCAST	Transmission of broadcast messages is supported.
12878	SO_DEBUG	Debugging information is being recorded.
12879	SO_DONTROUTE	Bypass normal routing.
12880	SO_ERROR	Socket error status.
12881	SO_KEEPALIVE	Connections are kept alive with periodic messages.
12882	SO_LINGER	Socket lingers on close.
12883	SO_OOBINLINE	Out-of-band data is transmitted in line.
12884	SO_RCVBUF	Receive buffer size.
12885	SO_RCVLOWAT	Receive "low water mark".
12886	SO_RCVTIMEO	Receive timeout.
12887	SO_REUSEADDR	Reuse of local addresses is supported.
12888	SO_SNDBUF	Send buffer size.
12889	SO_SNDLOWAT	Send "low water mark".
12890	SO_SNDTIMEO	Send timeout.
12891	SO_TYPE	Socket type.
12892	The <sys/socket.h> header shall define the following symbolic constant for use as the maximum	
12893	<i>backlog</i> queue length which may be specified by the <i>backlog</i> field of the <i>listen()</i> function:	
12894	SOMAXCONN	The maximum <i>backlog</i> queue length.
12895	The <sys/socket.h> header shall define the following symbolic constants with distinct values for	
12896	use as the valid values for the <i>msg_flags</i> field in the <i>msghdr</i> structure, or the <i>flags</i> parameter in	
12897	<i>recv()</i> , <i>recvfrom()</i> , <i>recvmsg()</i> , <i>send()</i> , <i>sendmsg()</i> , or <i>sendto()</i> calls:	
12898	MSG_CTRUNC	Control data truncated.
12899	MSG_DONTROUTE	Send without using routing tables.
12900	MSG_EOR	Terminates a record (if supported by the protocol).
12901	MSG_OOB	Out-of-band data.
12902	MSG_NOSIGNAL	No SIGPIPE generated when an attempt to send is made on a stream-oriented socket that is no longer connected.
12903		
12904	MSG_PEEK	Leave received data in queue.
12905	MSG_TRUNC	Normal data truncated.
12906	MSG_WAITALL	Attempt to fill the read buffer.
12907	The <sys/socket.h> header shall define the following symbolic constants with distinct values:	
12908	AF_INET	Internet domain sockets for use with IPv4 addresses.
12909	IP6 AF_INET6	Internet domain sockets for use with IPv6 addresses.
12910	AF_UNIX	UNIX domain sockets.

12911 AF\_UNSPEC Unspecified.

12912 The <sys/socket.h> header shall define the following symbolic constants with distinct values:

12913 SHUT\_RD Disables further receive operations.

12914 SHUT\_RDWR Disables further send and receive operations.

12915 SHUT\_WR Disables further send operations.

12916 The <sys/socket.h> header shall define the **size\_t** and **ssize\_t** types as described in

12917 <sys/types.h>.

12918 The following shall be declared as functions and may also be defined as macros. Function

12919 prototypes shall be provided.

```

12920 int accept(int, struct sockaddr *restrict, socklen_t *restrict);
12921 int bind(int, const struct sockaddr *, socklen_t);
12922 int connect(int, const struct sockaddr *, socklen_t);
12923 int getpeername(int, struct sockaddr *restrict, socklen_t *restrict);
12924 int getsockname(int, struct sockaddr *restrict, socklen_t *restrict);
12925 int getsockopt(int, int, int, void *restrict, socklen_t *restrict);
12926 int listen(int, int);
12927 ssize_t recv(int, void *, size_t, int);
12928 ssize_t recvfrom(int, void *restrict, size_t, int,
12929 struct sockaddr *restrict, socklen_t *restrict);
12930 ssize_t recvmsg(int, struct msghdr *, int);
12931 ssize_t send(int, const void *, size_t, int);
12932 ssize_t sendmsg(int, const struct msghdr *, int);
12933 ssize_t sendto(int, const void *, size_t, int, const struct sockaddr *,
12934 socklen_t);
12935 int setsockopt(int, int, int, const void *, socklen_t);
12936 int shutdown(int, int);
12937 int socketatmark(int);
12938 int socket(int, int, int);
12939 int socketpair(int, int, int, int [2]);

```

12940 Inclusion of <sys/socket.h> may also make visible all symbols from <sys/uio.h>.

#### 12941 APPLICATION USAGE

12942 To forestall portability problems, it is recommended that applications not use values larger than

12943  $2^{31} - 1$  for the **socklen\_t** type.

12944 The **sockaddr\_storage** structure solves the problem of declaring storage for automatic variables

12945 which is both large enough and aligned enough for storing the socket address data structure of

12946 any family. For example, code with a file descriptor and without the context of the address

12947 family can pass a pointer to a variable of this type, where a pointer to a socket address structure

12948 is expected in calls such as *getpeername()*, and determine the address family by accessing the

12949 received content after the call.

12950 The example below illustrates a data structure which aligns on a 64-bit boundary. An

12951 implementation-defined field *\_ss\_align* following *\_ss\_pad1* is used to force a 64-bit alignment

12952 which covers proper alignment good enough for needs of at least **sockaddr\_in6** (IPv6) and

12953 **sockaddr\_in** (IPv4) address data structures. The size of padding field *\_ss\_pad1* depends on the

12954 chosen alignment boundary. The size of padding field *\_ss\_pad2* depends on the value of overall

12955 size chosen for the total size of the structure. This size and alignment are represented in the

12956 above example by implementation-defined (not required) constants *\_SS\_MAXSIZE* (chosen

## &lt;sys/socket.h&gt;

12957 value 128) and `_SS_ALIGNMENT` (with chosen value 8). Constants `_SS_PAD1SIZE` (derived  
12958 value 6) and `_SS_PAD2SIZE` (derived value 112) are also for illustration and not required. The  
12959 implementation-defined definitions and structure field names above start with an <underscore>  
12960 to denote implementation private name space. Portable code is not expected to access or  
12961 reference those fields or constants.

```

12962 /*
12963  * Desired design of maximum size and alignment.
12964  */
12965 #define _SS_MAXSIZE 128
12966     /* Implementation-defined maximum size. */
12967 #define _SS_ALIGNSIZE (sizeof(int64_t))
12968     /* Implementation-defined desired alignment. */
12969
12970 /*
12971  * Definitions used for sockaddr_storage structure paddings design.
12972  */
12973 #define _SS_PAD1SIZE (_SS_ALIGNSIZE - sizeof(sa_family_t))
12974 #define _SS_PAD2SIZE (_SS_MAXSIZE - (sizeof(sa_family_t) + \
12975     _SS_PAD1SIZE + _SS_ALIGNSIZE))
12976 struct sockaddr_storage {
12977     sa_family_t ss_family; /* Address family. */
12978     /*
12979     * Following fields are implementation-defined.
12980     */
12981     char _ss_pad1[_SS_PAD1SIZE];
12982     /* 6-byte pad; this is to make implementation-defined
12983     pad up to alignment field that follows explicit in
12984     the data structure. */
12985     int64_t _ss_align; /* Field to force desired structure
12986     storage alignment. */
12987     char _ss_pad2[_SS_PAD2SIZE];
12988     /* 112-byte pad to achieve desired size,
12989     _SS_MAXSIZE value minus size of ss_family
12990     __ss_pad1, __ss_align fields is 112. */
12991 };

```

12991 **RATIONALE**

12992 None.

12993 **FUTURE DIRECTIONS**

12994 None.

12999 *socketpair()*

13000 **CHANGE HISTORY**

13001 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

13002 The **restrict** keyword is added to the prototypes for *accept()*, *getpeername()*, *getsockname()*,  
13003 *getsockopt()*, and *recvfrom()*.

13004 **Issue 7**

13005 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the `ssize_t` type.

13006 SD5-XBD-ERN-62 is applied.

13007 The `MSG_NOSIGNAL` symbolic constant is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

13009 This reference page is clarified with respect to macros and symbolic constants, and a declaration for the `size_t` type is added.

## &lt;sys/stat.h&gt;

## 13011 NAME

13012 sys/stat.h — data returned by the `stat()` function

## 13013 SYNOPSIS

13014 #include <sys/stat.h>

## 13015 DESCRIPTION

13016 The <sys/stat.h> header shall define the structure of the data returned by the `fstat()`, `lstat()`, and  
13017 `stat()` functions.

13018 The <sys/stat.h> header shall define the `stat` structure, which shall include at least the following  
13019 members:

13020	<code>dev_t st_dev</code>	Device ID of device containing file.
13021	<code>ino_t st_ino</code>	File serial number.
13022	<code>mode_t st_mode</code>	Mode of file (see below).
13023	<code>nlink_t st_nlink</code>	Number of hard links to the file.
13024	<code>uid_t st_uid</code>	User ID of file.
13025	<code>gid_t st_gid</code>	Group ID of file.
13026	XSI <code>dev_t st_rdev</code>	Device ID (if file is character or block special).
13027	<code>off_t st_size</code>	For regular files, the file size in bytes. For symbolic links, the length in bytes of the 13028 pathname contained in the symbolic link.
13029		For a shared memory object, the length in bytes.
13030	SHM	For a typed memory object, the length in bytes.
13031	TYM	For other file types, the use of this field is 13032 unspecified.
13033		
13034	<code>struct timespec st_atim</code>	Last data access timestamp.
13035	<code>struct timespec st_mtim</code>	Last data modification timestamp.
13036	<code>struct timespec st_ctim</code>	Last file status change timestamp.
13037	XSI <code>blksize_t st_blksize</code>	A file system-specific preferred I/O block size 13038 for this object. In some file system types, this 13039 may vary from file to file.
13040	<code>blkcnt_t st_blocks</code>	Number of blocks allocated for this object.

13041 The `st_ino` and `st_dev` fields taken together uniquely identify the file within the system.

13042 The <sys/stat.h> header shall define the `blkcnt_t`, `blksize_t`, `dev_t`, `ino_t`, `mode_t`, `nlink_t`,  
13043 `uid_t`, `gid_t`, `off_t`, and `time_t` types as described in <sys/types.h>.

13044 The <sys/stat.h> header shall define the `timespec` structure as described in <time.h>. Times  
13045 shall be given in seconds since the Epoch.

13046 Which structure members have meaningful values depends on the type of file. For further  
13047 information, see the descriptions of `fstat()`, `lstat()`, and `stat()` in the System Interfaces volume of  
13048 POSIX.1-2008.

13049 For compatibility with earlier versions of this standard, the `st_atime` macro shall be defined with  
13050 the value `st_atim.tv_sec`. Similarly, `st_ctime` and `st_mtime` shall be defined as macros with the  
13051 values `st_ctim.tv_sec` and `st_mtim.tv_sec`, respectively.

13052 The <sys/stat.h> header shall define the following symbolic constants for the file types encoded  
13053 in type **mode\_t**. The values shall be suitable for use in **#if** preprocessing directives:

13054	XSI	<b>S_IFMT</b>	Type of file.
13055		<b>S_IFBLK</b>	Block special.
13056		<b>S_IFCHR</b>	Character special.
13057		<b>S_IFIFO</b>	FIFO special.
13058		<b>S_IFREG</b>	Regular.
13059		<b>S_IFDIR</b>	Directory.
13060		<b>S_IFLNK</b>	Symbolic link.
13061		<b>S_IFSOCK</b>	Socket.

13062 The <sys/stat.h> header shall define the following symbolic constants for the file mode bits  
13063 encoded in type **mode\_t**, with the indicated numeric values. These macros shall expand to an  
13064 expression which has a type that allows them to be used, either singly or OR'ed together, as the  
13065 third argument to *open()* without the need for a **mode\_t** cast. The values shall be suitable for use  
13066 in **#if** preprocessing directives.

Name	Numeric Value	Description
S_IRWXU	0700	Read, write, execute/search by owner.
S_IRUSR	0400	Read permission, owner.
S_IWUSR	0200	Write permission, owner.
S_IXUSR	0100	Execute/search permission, owner.
S_IRWXG	070	Read, write, execute/search by group.
S_IRGRP	040	Read permission, group.
S_IWGRP	020	Write permission, group.
S_IXGRP	010	Execute/search permission, group.
S_IRWXO	07	Read, write, execute/search by others.
S_IROTH	04	Read permission, others.
S_IWOTH	02	Write permission, others.
S_IXOTH	01	Execute/search permission, others.
S_ISUID	04000	Set-user-ID on execution.
S_ISGID	02000	Set-group-ID on execution.
XSI S_ISVTX	01000	On directories, restricted deletion flag.

13083 The following macros shall be provided to test whether a file is of the specified type. The value  
13084 *m* supplied to the macros is the value of *st\_mode* from a **stat** structure. The macro shall evaluate  
13085 to a non-zero value if the test is true; 0 if the test is false.

13086	<b>S_ISBLK</b> ( <i>m</i> )	Test for a block special file.
13087	<b>S_ISCHR</b> ( <i>m</i> )	Test for a character special file.
13088	<b>S_ISDIR</b> ( <i>m</i> )	Test for a directory.
13089	<b>S_ISFIFO</b> ( <i>m</i> )	Test for a pipe or FIFO special file.
13090	<b>S_ISREG</b> ( <i>m</i> )	Test for a regular file.

13091		S_ISLNK( <i>m</i> )	Test for a symbolic link.
13092		S_ISSOCK( <i>m</i> )	Test for a socket.
13093		The implementation may implement message queues, semaphores, or shared memory objects as distinct file types. The following macros shall be provided to test whether a file is of the specified type. The value of the <i>buf</i> argument supplied to the macros is a pointer to a <b>stat</b> structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the <b>stat</b> structure referenced by <i>buf</i> . Otherwise, the macro shall evaluate to zero.	
13094			
13095			
13096			
13097			
13098			
13099		S_TYPEISMQ( <i>buf</i> )	Test for a message queue.
13100		S_TYPEISSEM( <i>buf</i> )	Test for a semaphore.
13101		S_TYPEISSHM( <i>buf</i> )	Test for a shared memory object.
13102	TYM	The implementation may implement typed memory objects as distinct file types, and the following macro shall test whether a file is of the specified type. The value of the <i>buf</i> argument supplied to the macros is a pointer to a <b>stat</b> structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the <b>stat</b> structure referenced by <i>buf</i> . Otherwise, the macro shall evaluate to zero.	
13103			
13104			
13105			
13106			
13107		S_TYPEISTMO( <i>buf</i> )	Test macro for a typed memory object.
13108		The <sys/stat.h> header shall define the following symbolic constants as distinct integer values outside of the range [0,999 999 999], for use with the <i>futimens()</i> and <i>utimensat()</i> functions:	
13109			
13110		UTIME_NOW	
13111		UTIME_OMIT	
13112		The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.	
13113			
13114		int chmod(const char *, mode_t);	
13115		int fchmod(int, mode_t);	
13116		int fchmodat(int, const char *, mode_t, int);	
13117		int fstat(int, struct stat *);	
13118		int fstatat(int, const char *restrict, struct stat *restrict, int);	
13119		int futimens(int, const struct timespec [2]);	
13120		int lstat(const char *restrict, struct stat *restrict);	
13121		int mkdir(const char *, mode_t);	
13122		int mkdirat(int, const char *, mode_t);	
13123		int mkfifo(const char *, mode_t);	
13124		int mkfifoat(int, const char *, mode_t);	
13125	XSI	int mknod(const char *, mode_t, dev_t);	
13126		int mknodat(int, const char *, mode_t, dev_t);	
13127		int stat(const char *restrict, struct stat *restrict);	
13128		mode_t umask(mode_t);	
13129		int utimensat(int, const char *, const struct timespec [2], int);	

13130 **APPLICATION USAGE**

13131 Use of the macros is recommended for determining the type of a file.

13132 **RATIONALE**

13133 A conforming C-language application must include <sys/stat.h> for functions that have  
 13134 arguments or return values of type **mode\_t**, so that symbolic values for that type can be used.  
 13135 An alternative would be to require that these constants are also defined by including  
 13136 <sys/types.h>.

13137 The S\_ISUID and S\_ISGID bits may be cleared on any write, not just on *open()*, as some  
 13138 historical implementations do.

13139 System calls that update the time entry fields in the **stat** structure must be documented by the  
 13140 implementors. POSIX-conforming systems should not update the time entry fields for functions  
 13141 listed in the System Interfaces volume of POSIX.1-2008 unless the standard requires that they do,  
 13142 except in the case of documented extensions to the standard.

13143 Upon assignment, file timestamps are immediately converted to the resolution of the file system  
 13144 by truncation (i.e., the recorded time can be older than the actual time). For example, if the file  
 13145 system resolution is 1 microsecond, then a conforming *stat()* must always return an  
 13146 *st\_mtim.tv\_nsec* that is a multiple of 1000. Some older implementations returned higher-  
 13147 resolution timestamps while the *inode* information was cached, and then spontaneously  
 13148 truncated the *tv\_nsec* fields when they were stored to and retrieved from disk, but this behavior  
 13149 does not conform.

13150 Note that *st\_dev* must be unique within a Local Area Network (LAN) in a “system” made up of  
 13151 multiple computers’ file systems connected by a LAN.

13152 Networked implementations of a POSIX-conforming system must guarantee that all files visible  
 13153 within the file tree (including parts of the tree that may be remotely mounted from other  
 13154 machines on the network) on each individual processor are uniquely identified by the  
 13155 combination of the *st\_ino* and *st\_dev* fields.

13156 The unit for the *st\_blocks* member of the **stat** structure is not defined within POSIX.1-2008. In  
 13157 some implementations it is 512 bytes. It may differ on a file system basis. There is no correlation  
 13158 between values of the *st\_blocks* and *st\_blksize*, and the *f\_bsize* (from <sys/statvfs.h>) structure  
 13159 members.

13160 Traditionally, some implementations defined the multiplier for *st\_blocks* in <sys/param.h> as the  
 13161 symbol *DEV\_BSIZE*.

13162 Some earlier versions of this standard did not specify values for the file mode bit macros. The  
 13163 expectation was that some implementors might choose to use a different encoding for these bits  
 13164 than the traditional one, and that new applications would use symbolic file modes instead of  
 13165 numeric. This version of the standard specifies the traditional encoding, in recognition that  
 13166 nearly 20 years after the first publication of this standard numeric file modes are still in  
 13167 widespread use by application developers, and that all conforming implementations still use the  
 13168 traditional encoding.

13169 **FUTURE DIRECTIONS**

13170 No new S\_IFMT symbolic names for the file type values of **mode\_t** will be defined by  
 13171 POSIX.1-2008; if new file types are required, they will only be testable through *S\_ISxx()* or  
 13172 *S\_TYPEISxxx()* macros instead.

13173 **SEE ALSO**13174 [<sys/statvfs.h>](#), [<sys/types.h>](#), [<time.h>](#)13175 XSH [chmod\(\)](#), [fchmod\(\)](#), [fstat\(\)](#), [fstatat\(\)](#), [futimens\(\)](#), [mkdir\(\)](#), [mkfifo\(\)](#), [mknod\(\)](#), [umask\(\)](#)13176 **CHANGE HISTORY**

13177 First released in Issue 1. Derived from Issue 1 of the SVID.

13178 **Issue 5**

13179 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

13180 The type of *st\_blksize* is changed from **long** to **blksize\_t**; the type of *st\_blocks* is changed from  
13181 **long** to **blkcnt\_t**.13182 **Issue 6**13183 The S\_TYPEISMQ(), S\_TYPEISSEM(), and S\_TYPEISSHM() macros are unconditionally  
13184 mandated.13185 The Open Group Corrigendum U035/4 is applied. In the DESCRIPTION, the types **blksize\_t**  
13186 and **blkcnt\_t** have been described.13187 The following new requirements on POSIX implementations derive from alignment with the  
13188 Single UNIX Specification:

- 13189
- The **dev\_t**, **ino\_t**, **mode\_t**, **nlink\_t**, **uid\_t**, **gid\_t**, **off\_t**, and **time\_t** types are mandated.

13190 S\_IFSOCK and S\_ISSOCK are added for sockets.

13191 The description of **stat** structure members is changed to reflect contents when file type is a  
13192 symbolic link.

13193 The test macro S\_TYPEISTMO is added for alignment with IEEE Std 1003.1j-2000.

13194 The **restrict** keyword is added to the prototypes for *lstat()* and *stat()*.13195 The *lstat()* function is made mandatory.13196 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/17 is applied, adding text regarding the  
13197 *st\_blocks* member of the **stat** structure to the RATIONALE.13198 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/25 is applied, adding to the  
13199 DESCRIPTION that the **timespec** structure may be defined as described in the **<time.h>** header.13200 **Issue 7**13201 SD5-XSH-ERN-161 is applied, updating the DESCRIPTION to clarify that the descriptions of the  
13202 interfaces should be consulted in order to determine which structure members have meaningful  
13203 values.13204 The [fchmodat\(\)](#), [fstatat\(\)](#), [mkdirat\(\)](#), [mkfifoat\(\)](#), [mknodat\(\)](#), and [utimensat\(\)](#) functions are added  
13205 from The Open Group Technical Standard, 2006, Extended API Set Part 2.13206 The [futimens\(\)](#) function is added.

13207 This reference page is clarified with respect to macros and symbolic constants.

13208 Changes are made related to support for finegrained timestamps and the **UTIME\_NOW** and  
13209 **UTIME\_OMIT** symbolic constants are added.

13210 **NAME**

13211 sys/statvfs.h — VFS File System information structure

13212 **SYNOPSIS**

13213 #include &lt;sys/statvfs.h&gt;

13214 **DESCRIPTION**13215 The <sys/statvfs.h> header shall define the **statvfs** structure, which shall include at least the  
13216 following members:

13217	unsigned long	f_bsize	File system block size.
13218	unsigned long	f_frsize	Fundamental file system block size.
13219	fsblkcnt_t	f_blocks	Total number of blocks on file system in units of <i>f_frsize</i> .
13220	fsblkcnt_t	f_bfree	Total number of free blocks.
13221	fsblkcnt_t	f_bavail	Number of free blocks available to non-privileged process.
13222			
13223	fsfilcnt_t	f_files	Total number of file serial numbers.
13224	fsfilcnt_t	f_ffree	Total number of free file serial numbers.
13225	fsfilcnt_t	f_favail	Number of file serial numbers available to non-privileged process.
13226			
13227	unsigned long	f_fsid	File system ID.
13228	unsigned long	f_flag	Bit mask of <i>f_flag</i> values.
13229	unsigned long	f_namemax	Maximum filename length.

13230 The <sys/statvfs.h> header shall define the **fsblkcnt\_t** and **fsfilcnt\_t** types as described in  
13231 <sys/types.h>.13232 The <sys/statvfs.h> header shall define the following symbolic constants for the *f\_flag* member:

13233 ST\_RDONLY Read-only file system.

13234 ST\_NOSUID Does not support the semantics of the ST\_ISUID and ST\_ISGID file mode bits.

13235 The following shall be declared as functions and may also be defined as macros. Function  
13236 prototypes shall be provided.13237 int fstatvfs(int, struct statvfs \*);  
13238 int statvfs(const char \*restrict, struct statvfs \*restrict);13239 **APPLICATION USAGE**

13240 None.

13241 **RATIONALE**

13242 None.

13243 **FUTURE DIRECTIONS**

13244 None.

13245 **SEE ALSO**

13246 &lt;sys/types.h&gt;

13247 XSH *fstatvfs()*13248 **CHANGE HISTORY**

13249 First released in Issue 4, Version 2.

13250 **Issue 5**13251 The type of *f\_blocks*, *f\_bfree*, and *f\_bavail* is changed from **unsigned long** to **fsblkcnt\_t**; the type of  
13252 *f\_files*, *f\_ffree*, and *f\_favail* is changed from **unsigned long** to **fsfilcnt\_t**.

## &lt;sys/statvfs.h&gt;

Headers

13253 **Issue 6**

13254 The Open Group Corrigendum U035/5 is applied. In the DESCRIPTION, the types **fsblkcnt\_t**  
13255 and **fsfilcnt\_t** have been described.

13256 The **restrict** keyword is added to the prototype for *statvfs()*.

13257 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/18 is applied, changing the description of  
13258 ST\_NOSUID from “Does not support *setuid()/setgid()* semantics” to “Does not support the  
13259 semantics of the ST\_ISUID and ST\_ISGID file mode bits”.

13260 **Issue 7**

13261 The <sys/statvfs.h> header is moved from the XSI option to the Base.

13262 This reference page is clarified with respect to macros and symbolic constants.

13263 **NAME**

13264 sys/time.h — time types

13265 **SYNOPSIS**13266 XSI 

```
#include <sys/time.h>
```

13267 **DESCRIPTION**13268 The <sys/time.h> header shall define the **timeval** structure, which shall include at least the  
13269 following members:13270 time\_t tv\_sec Seconds.  
13271 suseconds\_t tv\_usec Microseconds.13272 OB The <sys/time.h> header shall define the **itimerval** structure, which shall include at least the  
13273 following members:13274 struct timeval it\_interval Timer interval.  
13275 struct timeval it\_value Current value.13276 The <sys/time.h> header shall define the **time\_t** and **suseconds\_t** types as described in  
13277 <sys/types.h>.13278 The <sys/time.h> header shall define the **fd\_set** type as described in <sys/select.h>.13279 OB The <sys/time.h> header shall define the following symbolic constants for the *which* argument of  
13280 *getitimer()* and *setitimer()*:13281 ITIMER\_REAL Decrements in real time.  
13282 ITIMER\_VIRTUAL Decrements in process virtual time.  
13283 ITIMER\_PROF Decrements both in process virtual time and when the system is running  
13284 on behalf of the process.

13285 The &lt;sys/time.h&gt; header shall define the following as described in &lt;sys/select.h&gt;:

13286 FD\_CLR()  
13287 FD\_ISSET()  
13288 FD\_SET()  
13289 FD\_ZERO()  
13290 FD\_SETSIZE13291 The following shall be declared as functions and may also be defined as macros. Function  
13292 prototypes shall be provided.13293 OB 

```
int getitimer(int, struct itimerval *);  
13294 int gettimeofday(struct timeval *restrict, void *restrict);  
13295 int setitimer(int, const struct itimerval *restrict,  
13296 struct itimerval *restrict);  
13297 int select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,  
13298 struct timeval *restrict);  
13299 int utimes(const char *, const struct timeval [2]);
```

13300 Inclusion of the <sys/time.h> header may make visible all symbols from the <sys/select.h>  
13301 header.

## &lt;sys/types.h&gt;

## 13348 NAME

13349 sys/types.h — data types

## 13350 SYNOPSIS

13351 #include &lt;sys/types.h&gt;

## 13352 DESCRIPTION

13353 The &lt;sys/types.h&gt; header shall define at least the following types:

13354	<b>blkcnt_t</b>	Used for file block counts.
13355	<b>blksize_t</b>	Used for block sizes.
13356	<b>clock_t</b>	Used for system times in clock ticks or CLOCKS_PER_SEC; see <time.h>.
13357		
13358	<b>clockid_t</b>	Used for clock ID type in the clock and timer functions.
13359	<b>dev_t</b>	Used for device IDs.
13360	XSI <b>fsblkcnt_t</b>	Used for file system block counts.
13361	XSI <b>fsfilcnt_t</b>	Used for file system file counts.
13362	<b>gid_t</b>	Used for group IDs.
13363	<b>id_t</b>	Used as a general identifier; can be used to contain at least a <b>pid_t</b> , <b>uid_t</b> , or <b>gid_t</b> .
13364		
13365	<b>ino_t</b>	Used for file serial numbers.
13366	XSI <b>key_t</b>	Used for XSI interprocess communication.
13367	<b>mode_t</b>	Used for some file attributes.
13368	<b>nlink_t</b>	Used for link counts.
13369	<b>off_t</b>	Used for file sizes.
13370	<b>pid_t</b>	Used for process IDs and process group IDs.
13371	<b>pthread_attr_t</b>	Used to identify a thread attribute object.
13372	<b>pthread_barrier_t</b>	Used to identify a barrier.
13373	<b>pthread_barrierattr_t</b>	Used to define a barrier attributes object.
13374	<b>pthread_cond_t</b>	Used for condition variables.
13375	<b>pthread_condattr_t</b>	Used to identify a condition attribute object.
13376	<b>pthread_key_t</b>	Used for thread-specific data keys.
13377	<b>pthread_mutex_t</b>	Used for mutexes.
13378	<b>pthread_mutexattr_t</b>	Used to identify a mutex attribute object.
13379	<b>pthread_once_t</b>	Used for dynamic package initialization.
13380	<b>pthread_rwlock_t</b>	Used for read-write locks.
13381	<b>pthread_rwlockattr_t</b>	Used for read-write lock attributes.
13382	<b>pthread_spinlock_t</b>	Used to identify a spin lock.

13383		<b>pthread_t</b>	Used to identify a thread.
13384		<b>size_t</b>	Used for sizes of objects.
13385		<b>ssize_t</b>	Used for a count of bytes or an error indication.
13386	XSI	<b>suseconds_t</b>	Used for time in microseconds.
13387		<b>time_t</b>	Used for time in seconds.
13388		<b>timer_t</b>	Used for timer ID returned by <i>timer_create()</i> .
13389	OB TRC		Also used to identify a trace stream attributes object.
13390	OB TRC	<b>trace_event_id_t</b>	Used to identify a trace event type.
13391	OB TEF	<b>trace_event_set_t</b>	Used to identify a trace event type set.
13392	OB TRC	<b>trace_id_t</b>	Used to identify a trace stream.
13393		<b>uid_t</b>	Used for user IDs.
13394			All of the types shall be defined as arithmetic types of an appropriate length, with the following
13395			exceptions:
13396		<b>pthread_attr_t</b>	
13397		<b>pthread_barrier_t</b>	
13398		<b>pthread_barrierattr_t</b>	
13399		<b>pthread_cond_t</b>	
13400		<b>pthread_condattr_t</b>	
13401		<b>pthread_key_t</b>	
13402		<b>pthread_mutex_t</b>	
13403		<b>pthread_mutexattr_t</b>	
13404		<b>pthread_once_t</b>	
13405		<b>pthread_rwlock_t</b>	
13406		<b>pthread_rwlockattr_t</b>	
13407		<b>pthread_spinlock_t</b>	
13408		<b>pthread_t</b>	
13409	OB TRC	<b>trace_attr_t</b>	
13410		<b>trace_event_id_t</b>	
13411	OB TEF	<b>trace_event_set_t</b>	
13412	OB TRC	<b>trace_id_t</b>	
13413			Additionally:
13414			• <b>mode_t</b> shall be an integer type.
13415			• <b>nlink_t</b> , <b>uid_t</b> , <b>gid_t</b> , and <b>id_t</b> shall be integer types.
13416			• <b>blkcnt_t</b> and <b>off_t</b> shall be signed integer types.
13417	XSI		• <b>fsblkcnt_t</b> , <b>fsfilcnt_t</b> , and <b>ino_t</b> shall be defined as unsigned integer types.
13418			• <b>size_t</b> shall be an unsigned integer type.
13419			• <b>blksize_t</b> , <b>pid_t</b> , and <b>ssize_t</b> shall be signed integer types.
13420			• <b>time_t</b> and <b>clock_t</b> shall be integer or real-floating types.
13421			The type <b>ssize_t</b> shall be capable of storing values at least in the range $[-1, \{SSIZE\_MAX\}]$ .

13422	XSI	The type <b>suseconds_t</b> shall be a signed integer type capable of storing values at least in the range [-1, 1 000 000].
13423		
13424		The implementation shall support one or more programming environments in which the widths of <b>blksize_t</b> , <b>pid_t</b> , <b>size_t</b> , <b>ssize_t</b> , and <b>suseconds_t</b> are no greater than the width of type <b>long</b> .
13425		
13426		The names of these programming environments can be obtained using the <i>confstr()</i> function or the <i>getconf</i> utility.
13427		
13428		There are no defined comparison or assignment operators for the following types:
13429		<b>pthread_attr_t</b>
13430		<b>pthread_barrier_t</b>
13431		<b>pthread_barrierattr_t</b>
13432		<b>pthread_cond_t</b>
13433		<b>pthread_condattr_t</b>
13434		<b>pthread_mutex_t</b>
13435		<b>pthread_mutexattr_t</b>
13436		<b>pthread_rwlock_t</b>
13437		<b>pthread_rwlockattr_t</b>
13438		<b>pthread_spinlock_t</b>
13439	OB TRC	<b>trace_attr_t</b>

## 13450 CHANGE HISTORY

13451 First released in Issue 1. Derived from Issue 1 of the SVID.

## 13452 Issue 5

13453 The **clockid\_t** and **timer\_t** types are defined for alignment with the POSIX Realtime Extension.13454 The types **blkcnt\_t**, **blksize\_t**, **fsblkcnt\_t**, **fsfilcnt\_t**, and **suseconds\_t** are added.

13455 Large File System extensions are added.

13456 Updated for alignment with the POSIX Threads Extension.

## 13457 Issue 6

13458 The **pthread\_barrier\_t**, **pthread\_barrierattr\_t**, and **pthread\_spinlock\_t** types are added for alignment with IEEE Std 1003.1j-2000.13460 The margin code is changed from XSI to THR for the **pthread\_rwlock\_t** and **pthread\_rwlockattr\_t** types as Read-Write Locks have been absorbed into the POSIX Threads option. The threads types are marked THR.

## Headers

## &lt;sys/types.h&gt;

- 13463 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/26 is applied, adding **pthread\_t** to the list  
13464 of types that are not required to be arithmetic types, thus allowing **pthread\_t** to be defined as a  
13465 structure.
- 13466 **Issue 7**
- 13467 Austin Group Interpretation 1003.1-2001 #033 is applied, requiring **key\_t** to be an arithmetic  
13468 type.
- 13469 The Trace option types are marked obsolescent.
- 13470 The **clock\_t** and **id\_t** types are moved from the XSI option to the Base.
- 13471 The **pthread\_barrier\_t** and **pthread\_barrierattr\_t** types are moved from the Barriers option to  
13472 the Base.
- 13473 The **pthread\_spinlock\_t** type is moved from the Spin Locks option to the Base.
- 13474 Functionality relating to the Timers and Threads options is moved to the Base.

**<sys/uio.h>**

Headers

13475 **NAME**

13476 sys/uio.h — definitions for vector I/O operations

13477 **SYNOPSIS**13478 XSI `#include <sys/uio.h>`13479 **DESCRIPTION**13480 The **<sys/uio.h>** header shall define the **iovec** structure, which shall include at least the  
13481 following members:13482 `void *iov_base` Base address of a memory region for input or output.  
13483 `size_t iov_len` The size of the memory pointed to by *iov\_base*.13484 The **<sys/uio.h>** header uses the **iovec** structure for scatter/gather I/O.13485 The **<sys/uio.h>** header shall define the **ssize\_t** and **size\_t** types as described in **<sys/types.h>**.13486 The following shall be declared as functions and may also be defined as macros. Function  
13487 prototypes shall be provided.13488 `ssize_t readv(int, const struct iovec *, int);`  
13489 `ssize_t writev(int, const struct iovec *, int);`13490 **APPLICATION USAGE**13491 The implementation can put a limit on the number of scatter/gather elements which can be  
13492 processed in one call. The symbol {IOV\_MAX} defined in **<limits.h>** should always be used to  
13493 learn about the limits instead of assuming a fixed value.13494 **RATIONALE**13495 Traditionally, the maximum number of scatter/gather elements the system can process in one  
13496 call were described by the symbolic value {UIO\_MAXIOV}. In IEEE Std 1003.1-2001 this value is  
13497 replaced by the constant {IOV\_MAX} which can be found in **<limits.h>**.13498 **FUTURE DIRECTIONS**

13499 None.

13500 **SEE ALSO**13501 **<limits.h>**, **<sys/types.h>**13502 XSH *read()*, *readv()*, *write()*, *writev()*13503 **CHANGE HISTORY**

13504 First released in Issue 4, Version 2.

13505 **Issue 6**

13506 Text referring to scatter/gather I/O is added to the DESCRIPTION.

13507 **NAME**

13508 sys/un.h — definitions for UNIX domain sockets

13509 **SYNOPSIS**

13510 #include &lt;sys/un.h&gt;

13511 **DESCRIPTION**13512 The <sys/un.h> header shall define the **sockaddr\_un** structure, which shall include at least the  
13513 following members:13514 sa\_family\_t sun\_family Address family.  
13515 char sun\_path[] Socket pathname.13516 The **sockaddr\_un** structure is used to store addresses for UNIX domain sockets. Values of this  
13517 type shall be cast by applications to **struct sockaddr** for use with socket functions.13518 The <sys/un.h> header shall define the **sa\_family\_t** type as described in <sys/socket.h>.13519 **APPLICATION USAGE**13520 The size of *sun\_path* has intentionally been left undefined. This is because different  
13521 implementations use different sizes. For example, 4.3 BSD uses a size of 108, and 4.4 BSD uses a  
13522 size of 104. Since most implementations originate from BSD versions, the size is typically in the  
13523 range 92 to 108.13524 Applications should not assume a particular length for *sun\_path* or assume that it can hold  
13525 {\_POSIX\_PATH\_MAX} bytes (256).13526 **RATIONALE**

13527 None.

13528 **FUTURE DIRECTIONS**

13529 None.

13530 **SEE ALSO**

13531 &lt;sys/socket.h&gt;

13532 XSH *bind()*, *socket()*, *socketpair()*13533 **CHANGE HISTORY**

13534 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

13535 **Issue 7**

13536 The value for {\_POSIX\_PATH\_MAX} is updated to 256.

## &lt;sys/utsname.h&gt;

Headers

13537 **NAME**

13538 sys/utsname.h — system name structure

13539 **SYNOPSIS**

13540 #include &lt;sys/utsname.h&gt;

13541 **DESCRIPTION**13542 The <sys/utsname.h> header shall define the structure **utsname** which shall include at least the  
13543 following members:

13544 char sysname[] Name of this implementation of the operating system.  
 13545 char nodename[] Name of this node within the communications  
 13546 network to which this node is attached, if any.  
 13547 char release[] Current release level of this implementation.  
 13548 char version[] Current version level of this release.  
 13549 char machine[] Name of the hardware type on which the system is running.

13550 The character arrays are of unspecified size, but the data stored in them shall be terminated by a  
 13551 null byte.

13552 The following shall be declared as a function and may also be defined as a macro:

13553 int uname(struct utsname \*);

13554 **APPLICATION USAGE**

13555 None.

13556 **RATIONALE**

13557 None.

13558 **FUTURE DIRECTIONS**

13559 None.

13560 **SEE ALSO**13561 XSH *uname()*13562 **CHANGE HISTORY**

13563 First released in Issue 1. Derived from Issue 1 of the SVID.

13564 **Issue 6**

13565 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/27 is applied, changing the description of  
 13566 *nodename* within the **utsname** structure from “an implementation-defined communications  
 13567 network” to “the communications network to which this node is attached, if any”.

## Headers

## &lt;sys/wait.h&gt;

## 13568 NAME

13569 sys/wait.h — declarations for waiting

## 13570 SYNOPSIS

13571 #include <sys/wait.h>

## 13572 DESCRIPTION

13573 The <sys/wait.h> header shall define the following symbolic constants for use with *waitpid()*:

13574 XSI **WCONTINUED** Report status of continued child process.  
 13575 **WNOHANG** Do not hang if no status is available; return immediately.  
 13576 **WUNTRACED** Report status of stopped child process.

13577 The <sys/wait.h> header shall define the following macros for analysis of process status values:

13578 **WEXITSTATUS** Return exit status.  
 13579 XSI **WIFCONTINUED** True if child has been continued.  
 13580 **WIFEXITED** True if child exited normally.  
 13581 **WIFSIGNALED** True if child exited due to uncaught signal.  
 13582 **WIFSTOPPED** True if child is currently stopped.  
 13583 **WSTOPSIG** Return signal number that caused process to stop.  
 13584 **WTERMSIG** Return signal number that caused process to terminate.

13585 The <sys/wait.h> header shall define the following symbolic constants as possible values for the  
 13586 *options* argument to *waitid()*:

13587 **WEXITED** Wait for processes that have exited.  
 13588 **WNOWAIT** Keep the process whose status is returned in *infp* in a waitable state.  
 13589 **WSTOPPED** Status is returned for any child that has stopped upon receipt of a signal.

13590 XSI The **WCONTINUED** and **WNOHANG** constants, described above for *waitpid()*, can also be  
 13591 used with *waitid()*.

13592 The type **idtype\_t** shall be defined as an enumeration type whose possible values shall include  
 13593 at least the following:

13594 P\_ALL  
 13595 P\_PGID  
 13596 P\_PID

13597 The <sys/wait.h> header shall define the **id\_t** and **pid\_t** types as described in <sys/types.h>.

13598 The <sys/wait.h> header shall define the **siginfo\_t** type as described in <signal.h>.

13599 Inclusion of the <sys/wait.h> header may also make visible all symbols from <signal.h>.

13600 The following shall be declared as functions and may also be defined as macros. Function  
 13601 prototypes shall be provided.

```
13602 pid_t wait(int *);
13603 int waitid(idtype_t, id_t, siginfo_t *, int);
13604 pid_t waitpid(pid_t, int *, int);
```

## &lt;sys/wait.h&gt;

Headers

13605 **APPLICATION USAGE**

13606 None.

13607 **RATIONALE**

13608 None.

13609 **FUTURE DIRECTIONS**

13610 None.

13615 First released in Issue 3.

13616 Included for alignment with the POSIX.1-1988 standard.

13617 **Issue 6**13618 The *wait3()* function is removed.13619 **Issue 7**13620 The *waitid()* function and symbolic constants for its *options* argument are moved to the Base.

13621 The description of the WNOHANG constant is clarified.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

13622 **NAME**

13623            syslog.h — definitions for system error logging

13624 **SYNOPSIS**

13625 XSI        #include &lt;syslog.h&gt;

13626 **DESCRIPTION**13627            The <syslog.h> header shall define the following symbolic constants, zero or more of which  
13628            may be OR'ed together to form the *logopt* option of *openlog()*:

13629            LOG\_PID                Log the process ID with each message.

13630            LOG\_CONS               Log to the system console on error.

13631            LOG\_NDELAY             Connect to syslog daemon immediately.

13632            LOG\_ODELAY             Delay open until *syslog()* is called.

13633            LOG\_NOWAIT            Do not wait for child processes.

13634            The <syslog.h> header shall define the following symbolic constants for use as the *facility*  
13635            argument to *openlog()*:

13636            LOG\_KERN               Reserved for message generated by the system.

13637            LOG\_USER               Message generated by a process.

13638            LOG\_MAIL               Reserved for message generated by mail system.

13639            LOG\_NEWS               Reserved for message generated by news system.

13640            LOG\_UUCP               Reserved for message generated by UUCP system.

13641            LOG\_DAEMON            Reserved for message generated by system daemon.

13642            LOG\_AUTH               Reserved for message generated by authorization daemon.

13643            LOG\_CRON               Reserved for message generated by clock daemon.

13644            LOG\_LPR                Reserved for message generated by printer system.

13645            LOG\_LOCAL0            Reserved for local use.

13646            LOG\_LOCAL1            Reserved for local use.

13647            LOG\_LOCAL2            Reserved for local use.

13648            LOG\_LOCAL3            Reserved for local use.

13649            LOG\_LOCAL4            Reserved for local use.

13650            LOG\_LOCAL5            Reserved for local use.

13651            LOG\_LOCAL6            Reserved for local use.

13652            LOG\_LOCAL7            Reserved for local use.

13653            The <syslog.h> header shall define the following macros for constructing the *maskpri* argument  
13654            to *setlogmask()*. The following macros expand to an expression of type **int** when the argument  
13655            *pri* is an expression of type **int**:13656            LOG\_MASK(*pri*)        A mask for priority *pri*.13657            The <syslog.h> header shall define the following symbolic constants for use as the *priority*  
13658            argument of *syslog()*:

## &lt;syslog.h&gt;

Headers

13659	LOG_EMERG	A panic condition was reported to all processes.
13660	LOG_ALERT	A condition that should be corrected immediately.
13661	LOG_CRIT	A critical condition.
13662	LOG_ERR	An error message.
13663	LOG_WARNING	A warning message.
13664	LOG_NOTICE	A condition requiring special handling.
13665	LOG_INFO	A general information message.
13666	LOG_DEBUG	A message useful for debugging programs.
13667	The following shall be declared as functions and may also be defined as macros. Function

## Headers

## &lt;tar.h&gt;

13687 **NAME**

13688 tar.h — extended tar definitions

13689 **SYNOPSIS**

13690 #include &lt;tar.h&gt;

13691 **DESCRIPTION**

13692 The &lt;tar.h&gt; header shall define the following symbolic constants with the indicated values.

13693 General definitions:

Name	Value	Description
TMAGIC	"ustar"	ustar plus null byte.
TMAGLEN	6	Length of the above.
TVERSION	"00"	00 without a null byte.
TVERSLEN	2	Length of the above.

13699 *Typeflag* field definitions:

Name	Value	Description
REGTYPE	' 0'	Regular file.
AREGTYPE	' \0'	Regular file.
LNKTYPE	' 1'	Link.
SYMTYPE	' 2'	Symbolic link.
CHRTYPE	' 3'	Character special.
BLKTYPE	' 4'	Block special.
DIRTYPE	' 5'	Directory.
FIFOTYPE	' 6'	FIFO special.
CONTTYPE	' 7'	Reserved.

13710 *Mode* field bit definitions (octal):

Name	Value	Description
TSUID	04000	Set UID on execution.
TSGID	02000	Set GID on execution.
TSVTX	01000	On directories, restricted deletion flag.
TUREAD	00400	Read by owner.
TUWRITE	00200	Write by owner special.
TUEXEC	00100	Execute/search by owner.
TGREAD	00040	Read by group.
TGWRITE	00020	Write by group.
TGEXEC	00010	Execute/search by group.
TOREAD	00004	Read by other.
TOWRITE	00002	Write by other.
TOEXEC	00001	Execute/search by other.

## &lt;tar.h&gt;

13738 **NAME**13739 `termios.h` — define values for `termios`13740 **SYNOPSIS**13741 `#include <termios.h>`13742 **DESCRIPTION**13743 The `<termios.h>` header shall contain the definitions used by the terminal I/O interfaces (see  
13744 [Chapter 11](#) (on page 199) for the structures and names defined).13745 **The `termios` Structure**13746 The `<termios.h>` header shall define the following data types through **typedef**:13747 **cc\_t** Used for terminal special characters.13748 **speed\_t** Used for terminal baud rates.13749 **tcflag\_t** Used for terminal modes.

13750 The above types shall be all unsigned integer types.

13751 The implementation shall support one or more programming environments in which the widths  
13752 of **cc\_t**, **speed\_t**, and **tcflag\_t** are no greater than the width of type **long**. The names of these  
13753 programming environments can be obtained using the `confstr()` function or the `getconf` utility.13754 The `<termios.h>` header shall define the **termios** structure, which shall include at least the  
13755 following members:

13756	<code>tcflag_t</code>	<code>c_iflag</code>	Input modes.
13757	<code>tcflag_t</code>	<code>c_oflag</code>	Output modes.
13758	<code>tcflag_t</code>	<code>c_cflag</code>	Control modes.
13759	<code>tcflag_t</code>	<code>c_lflag</code>	Local modes.
13760	<code>cc_t</code>	<code>c_cc[NCCS]</code>	Control characters.

13761 The `<termios.h>` header shall define the following symbolic constant:13762 **NCCS** Size of the array `c_cc` for control characters.13763 The `<termios.h>` header shall define the following symbolic constants for use as subscripts for  
13764 the array `c_cc`:

	Subscript Usage		Description
	Canonical Mode	Non-Canonical Mode	
13765	VEOF		EOF character.
13766	VEOL		EOL character.
13767	VERASE		ERASE character.
13768	VINTR	VINTR	INTR character.
13769	VKILL		KILL character.
13770		VMIN	MIN value.
13771	VQUIT	VQUIT	QUIT character.
13772	VSTART	VSTART	START character.
13773	VSTOP	VSTOP	STOP character.
13774	VSUSP	VSUSP	SUSP character.
13775		VTIME	TIME value.

13778 The subscript values shall be suitable for use in `#if` preprocessing directives and shall be distinct,  
13779 except that the **VMIN** and **VTIME** subscripts may have the same values as the **VEOF** and **VEOL**  
13780 subscripts, respectively.

<termios.h>

13781 **Input Modes**

13782 The <termios.h> header shall define the following symbolic constants for use as flags in the  
13783 *c\_iflag* field. The *c\_iflag* field describes the basic terminal input control.

- 13784 BRKINT Signal interrupt on break.
- 13785 ICRNL Map CR to NL on input.
- 13786 IGNBRK Ignore break condition.
- 13787 IGNCR Ignore CR.
- 13788 IGNPAR Ignore characters with parity errors.
- 13789 INLCR Map NL to CR on input.
- 13790 INPCK Enable input parity check.
- 13791 ISTRIP Strip character.
- 13792 IXANY Enable any character to restart output.
- 13793 IXOFF Enable start/stop input control.
- 13794 IXON Enable start/stop output control.
- 13795 PARMRK Mark parity errors.

13796 **Output Modes**

13797 The <termios.h> header shall define the following symbolic constants for use as flags in the  
13798 *c\_oflag* field. The *c\_oflag* field specifies the system treatment of output.

- 13799 OPOST Post-process output.
- 13800 XSI ONLCR Map NL to CR-NL on output.
- 13801 XSI OCRNL Map CR to NL on output.
- 13802 XSI ONOCR No CR output at column 0.
- 13803 XSI ONLRET NL performs CR function.
- 13804 XSI OFDEL Fill is DEL.
- 13805 XSI OFILL Use fill characters for delay.
- 13806 XSI NLDLY Select newline delays:
  - 13807 NL0 Newline type 0.
  - 13808 NL1 Newline type 1.
- 13809 XSI CRDLY Select carriage-return delays:
  - 13810 CR0 Carriage-return delay type 0.
  - 13811 CR1 Carriage-return delay type 1.
  - 13812 CR2 Carriage-return delay type 2.
  - 13813 CR3 Carriage-return delay type 3.

## Headers

## &lt;termios.h&gt;

13814	XSI	<b>TABDLY</b>	Select horizontal-tab delays:
13815		TAB0	Horizontal-tab delay type 0.
13816		TAB1	Horizontal-tab delay type 1.
13817		TAB2	Horizontal-tab delay type 2.
13818		TAB3	Expand tabs to spaces.
13819	XSI	<b>BSDLY</b>	Select backspace delays:
13820		BS0	Backspace-delay type 0.
13821		BS1	Backspace-delay type 1.
13822	XSI	<b>VTDLY</b>	Select vertical-tab delays:
13823		VT0	Vertical-tab delay type 0.
13824		VT1	Vertical-tab delay type 1.
13825	XSI	<b>FFDLY</b>	Select form-feed delays:
13826		FF0	Form-feed delay type 0.
13827		FF1	Form-feed delay type 1.

13828 **Baud Rate Selection**

13829 The <termios.h> header shall define the following symbolic constants for use as values of  
 13830 objects of type **speed\_t**.

13831 The input and output baud rates are stored in the **termios** structure. These are the valid values  
 13832 for objects of type **speed\_t**. Not all baud rates need be supported by the underlying hardware.

13833	B0	Hang up
13834	B50	50 baud
13835	B75	75 baud
13836	B110	110 baud
13837	B134	134.5 baud
13838	B150	150 baud
13839	B200	200 baud
13840	B300	300 baud
13841	B600	600 baud
13842	B1200	1 200 baud
13843	B1800	1 800 baud
13844	B2400	2 400 baud

## &lt;termios.h&gt;

## Headers

13845	B4800	4 800 baud
13846	B9600	9 600 baud
13847	B19200	19 200 baud
13848	B38400	38 400 baud

13849 **Control Modes**

13850 The <termios.h> header shall define the following symbolic constants for use as flags in the  
 13851 *c\_cflag* field. The *c\_cflag* field describes the hardware control of the terminal; not all values  
 13852 specified are required to be supported by the underlying hardware.

13853	CSIZE	Character size:
13854		CS5 5 bits
13855		CS6 6 bits
13856		CS7 7 bits
13857		CS8 8 bits
13858	CSTOPB	Send two stop bits, else one.
13859	CREAD	Enable receiver.
13860	PARENB	Parity enable.
13861	PARODD	Odd parity, else even.
13862	HUPCL	Hang up on last close.
13863	CLOCAL	Ignore modem status lines.

13864 The implementation shall support the functionality associated with the symbols CS7, CS8,  
 13865 CSTOPB, PARODD, and PARENB.

13866 **Local Modes**

13867 The <termios.h> header shall define the following symbolic constants for use as flags in the  
 13868 *c\_lflag* field. The *c\_lflag* field of the argument structure is used to control various terminal  
 13869 functions.

13870	ECHO	Enable echo.
13871	ECHOE	Echo erase character as error-correcting backspace.
13872	ECHOK	Echo KILL.
13873	ECHONL	Echo NL.
13874	ICANON	Canonical input (erase and kill processing).
13875	IEXTEN	Enable extended input character processing.
13876	ISIG	Enable signals.
13877	NOFLSH	Disable flush after interrupt or quit.
13878	TOSTOP	Send SIGTTOU for background output.

13879 **Attribute Selection**

13880 The <termios.h> header shall define the following symbolic constants for use with *tcsetattr()*:

- 13881 TCSANOW Change attributes immediately.
- 13882 TCSADRAIN Change attributes when output has drained.
- 13883 TCSAFLUSH Change attributes when output has drained; also flush pending input.

13884 **Line Control**

13885 The <termios.h> header shall define the following symbolic constants for use with *tcflush()*:

- 13886 TCIFLUSH Flush pending input.
- 13887 TCIOFLUSH Flush both pending input and untransmitted output.
- 13888 TCOFLUSH Flush untransmitted output.

13889 The <termios.h> header shall define the following symbolic constants for use with *tcflow()*:

- 13890 TCIOFF Transmit a STOP character, intended to suspend input data.
- 13891 TCION Transmit a START character, intended to restart input data.
- 13892 TCOOFF Suspend output.
- 13893 TCOON Restart output.

13894 The <termios.h> header shall define the **pid\_t** type as described in <sys/types.h>.

13895 The following shall be declared as functions and may also be defined as macros. Function  
13896 prototypes shall be provided.

```
13897 speed_t cfgetispeed(const struct termios *);
13898 speed_t cfgetospeed(const struct termios *);
13899 int cfsetispeed(struct termios *, speed_t);
13900 int cfsetospeed(struct termios *, speed_t);
13901 int tcdrain(int);
13902 int tcflow(int, int);
13903 int tcflush(int, int);
13904 int tcgetattr(int, struct termios *);
13905 pid_t tcgetsid(int);
13906 int tcsendbreak(int, int);
13907 int tcsetattr(int, int, const struct termios *);
```

13908 **APPLICATION USAGE**

13909 The following names are reserved for XSI-conformant systems to use as an extension to the  
13910 above; therefore strictly conforming applications shall not use them:

13911	CBAUD	EXTB	VDSUSP
13912	DEFECHO	FLUSHO	VLNEXT
13913	ECHOCTL	LOBLK	VREPRINT
13914	ECHOKE	PENDIN	VSTATUS
13915	ECHOPRT	SWTCH	VWERASE
13916	EXTA	VDISCARD

- 13926 **CHANGE HISTORY**  
 13927 First released in Issue 3.  
 13928 Included for alignment with the ISO POSIX-1 standard.
- 13929 **Issue 6**  
 13930 The LEGACY symbols IUCLC, OLCUC, and XCASE are removed.  
 13931 FIPS 151-2 requirements for the symbols CS7, CS8, CSTOPB, PARODD, and PARENB are  
 13932 reaffirmed.  
 13933 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/19 is applied, changing ECHOK to  
 13934 ECHOKE in the APPLICATION USAGE section.
- 13935 **Issue 7**  
 13936 Austin Group Interpretation 1003.1-2001 #144 is applied, moving functionality relating to the  
 13937 IXANY symbol from the XSI option to the Base.  
 13938 SD5-XBD-ERN-35 is applied, adding the OFDEL output mode.  
 13939 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
 13940 for the `pid_t` type is added.

## Headers

## &lt;tgmath.h&gt;

## 13941 NAME

13942 tgmath.h — type-generic macros

## 13943 SYNOPSIS

13944 #include &lt;tgmath.h&gt;

## 13945 DESCRIPTION

13946 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 13947 conflict between the requirements described here and the ISO C standard is unintentional. This  
 13948 volume of POSIX.1-2008 defers to the ISO C standard.

13949 The <tgmath.h> header shall include the headers <math.h> and <complex.h> and shall define  
 13950 several type-generic macros.

13951 Of the functions contained within the <math.h> and <complex.h> headers without an *f* (**float**)  
 13952 or *l* (**long double**) suffix, several have one or more parameters whose corresponding real type is  
 13953 XSI **double**. For each such function, except *modf()*, *j0()*, *j1()*, *jn()*, *y0()*, *y1()*, and *yn()*, there shall  
 13954 be a corresponding type-generic macro. The parameters whose corresponding real type is  
 13955 **double** in the function synopsis are generic parameters. Use of the macro invokes a function  
 13956 whose corresponding real type and type domain are determined by the arguments for the  
 13957 generic parameters.

13958 Use of the macro invokes a function whose generic parameters have the corresponding real type  
 13959 determined as follows:

- 13960 • First, if any argument for generic parameters has type **long double**, the type determined is  
 13961 **long double**.
- 13962 • Otherwise, if any argument for generic parameters has type **double** or is of integer type,  
 13963 the type determined is **double**.
- 13964 • Otherwise, the type determined is **float**.

13965 For each unsuffixed function in the <math.h> header for which there is a function in the  
 13966 <complex.h> header with the same name except for a *c* prefix, the corresponding type-generic  
 13967 macro (for both functions) has the same name as the function in the <math.h> header. The  
 13968 corresponding type-generic macro for *fabs()* and *cabs()* is *fabs()*.

13983

13984

13985

13986

<math.h> Function	<complex.h> Function	Type-Generic Macro
<i>acos()</i>	<i>cacos()</i>	<i>acos()</i>
<i>asin()</i>	<i>casin()</i>	<i>asin()</i>
<i>atan()</i>	<i>catan()</i>	<i>atan()</i>
<i>acosh()</i>	<i>cacosh()</i>	<i>acosh()</i>
<i>asinh()</i>	<i>casinh()</i>	<i>asinh()</i>
<i>atanh()</i>	<i>catanh()</i>	<i>atanh()</i>
<i>cos()</i>	<i>ccos()</i>	<i>cos()</i>
<i>sin()</i>	<i>csin()</i>	<i>sin()</i>
<i>tan()</i>	<i>ctan()</i>	<i>tan()</i>
<i>cosh()</i>	<i>ccosh()</i>	<i>cosh()</i>
<i>sinh()</i>	<i>csinh()</i>	<i>sinh()</i>
<i>tanh()</i>	<i>ctanh()</i>	<i>tanh()</i>
<i>exp()</i>	<i>cexp()</i>	<i>exp()</i>
<i>log()</i>	<i>clog()</i>	<i>log()</i>
<i>pow()</i>	<i>cpow()</i>	<i>pow()</i>
<i>sqrt()</i>	<i>csqrt()</i>	<i>sqrt()</i>
<i>fabs()</i>	<i>cabs()</i>	<i>fabs()</i>

<tgmath.h>

13987 If at least one argument for a generic parameter is complex, then use of the macro invokes a  
 13988 complex function; otherwise, use of the macro invokes a real function.

13989 For each unsuffixed function in the <math.h> header without a *c*-prefixed counterpart in the  
 13990 XSI <complex.h> header, except for *modf()*, *j0()*, *j1()*, *jn()*, *y0()*, *y1()*, and *yn()*, the corresponding  
 13991 type-generic macro has the same name as the function. These type-generic macros are:

13992	<i>atan2()</i>	<i>fma()</i>	<i>llround()</i>	<i>remainder()</i>
13993	<i>cbrt()</i>	<i>fmax()</i>	<i>log10()</i>	<i>remquo()</i>
13994	<i>ceil()</i>	<i>fmin()</i>	<i>log1p()</i>	<i>rint()</i>
13995	<i>copysign()</i>	<i>fmod()</i>	<i>log2()</i>	<i>round()</i>
13996	<i>erf()</i>	<i>frexp()</i>	<i>logb()</i>	<i>scalbn()</i>
13997	<i>erfc()</i>	<i>hypot()</i>	<i>lrint()</i>	<i>scalbln()</i>
13998	<i>exp2()</i>	<i>ilogb()</i>	<i>lround()</i>	<i>tgamma()</i>
13999	<i>expm1()</i>	<i>ldexp()</i>	<i>nearbyint()</i>	<i>trunc()</i>
14000	<i>fdim()</i>	<i>lgamma()</i>	<i>nextafter()</i>	
14001	<i>floor()</i>	<i>llrint()</i>	<i>nexttoward()</i>	

14002 If all arguments for generic parameters are real, then use of the macro invokes a real function;  
 14003 otherwise, use of the macro results in undefined behavior.

14004 For each unsuffixed function in the <complex.h> header that is not a *c*-prefixed counterpart to a  
 14005 function in the <math.h> header, the corresponding type-generic macro has the same name as  
 14006 the function. These type-generic macros are:

14007	<i>carg()</i>
14008	<i>cimag()</i>
14009	<i>conj()</i>
14010	<i>cproj()</i>
14011	<i>creal()</i>

14012 Use of the macro with any real or complex argument invokes a complex function.

**APPLICATION USAGE**

14013 With the declarations:

```
14014 #include <tgmath.h>
14015 int n;
14016 float f;
14017 double d;
14018 long double ld;
14019 float complex fc;
14020 double complex dc;
14021 long double complex ldc;
```

14022 functions invoked by use of type-generic macros are shown in the following table:

Macro	Use Invokes
<i>exp(n)</i>	<i>exp(n)</i> , the function
<i>acosh(f)</i>	<i>acosh(f)</i>
<i>sin(d)</i>	<i>sin(d)</i> , the function
<i>atan(ld)</i>	<i>atanl(ld)</i>
<i>log(fc)</i>	<i>clog(fc)</i>
<i>sqrt(dc)</i>	<i>csqrt(dc)</i>

	Macro	Use Invokes
14031		
14032	<i>pow(ldc,f)</i>	<i>cpowl(ldc,f)</i>
14033	<i>remainder(n,n)</i>	<i>remainder(n,n)</i> , the function
14034	<i>nextafter(d,f)</i>	<i>nextafter(d,f)</i> , the function
14035	<i>nexttoward(f,ld)</i>	<i>nexttowardf(f,ld)</i>
14036	<i>copysign(n,ld)</i>	<i>copysignl(n,ld)</i>
14037	<i>ceil(fc)</i>	Undefined behavior
14038	<i>rint(dc)</i>	Undefined behavior
14039	<i>fmax(ldc,ld)</i>	Undefined behavior
14040	<i>carg(n)</i>	<i>carg(n)</i> , the function
14041	<i>cproj(f)</i>	<i>cprojf(f)</i>
14042	<i>creal(d)</i>	<i>creal(d)</i> , the function
14043	<i>cimag(ld)</i>	<i>cimagl(ld)</i>
14044	<i>cabs(fc)</i>	<i>cabsf(fc)</i>
14045	<i>carg(dc)</i>	<i>carg(dc)</i> , the function
14046	<i>cproj(ldc)</i>	<i>cprojl(ldc)</i>

14047 **RATIONALE**

14048 Type-generic macros allow calling a function whose type is determined by the argument type, as  
 14049 is the case for C operators such as '+' and '\*'. For example, with a type-generic *cos()* macro,  
 14050 the expression *cos((float)x)* will have type **float**. This feature enables writing more portably  
 14051 efficient code and alleviates need for awkward casting and suffixing in the process of porting or  
 14052 adjusting precision. Generic math functions are a widely appreciated feature of Fortran.

14053 The only arguments that affect the type resolution are the arguments corresponding to the  
 14054 parameters that have type **double** in the synopsis. Hence the type of a type-generic call to  
 14055 *nexttoward()*, whose second parameter is **long double** in the synopsis, is determined solely by  
 14056 the type of the first argument.

14057 The term "type-generic" was chosen over the proposed alternatives of intrinsic and overloading.  
 14058 The term is more specific than intrinsic, which already is widely used with a more general  
 14059 meaning, and reflects a closer match to Fortran's generic functions than to C++ overloading.

14060 The macros are placed in their own header in order not to silently break old programs that  
 14061 include the <math.h> header; for example, with:

```
14062 printf ("%e", sin(x))
```

14063 *modf(double, double \*)* is excluded because no way was seen to make it safe without  
 14064 complicating the type resolution.

14065 The implementation might, as an extension, endow appropriate ones of the macros that  
 14066 POSIX.1-2008 specifies only for real arguments with the ability to invoke the complex functions.

14067 POSIX.1-2008 does not prescribe any particular implementation mechanism for generic macros.  
 14068 It could be implemented simply with built-in macros. The generic macro for *sqrt()*, for example,  
 14069 could be implemented with:

```
14070 #undef sqrt
14071 #define sqrt(x) __BUILTIN_GENERIC_sqrt(x)
```

14072 Generic macros are designed for a useful level of consistency with C++ overloaded math  
 14073 functions.

14074 The great majority of existing C programs are expected to be unaffected when the <tgmath.h>  
 14075 header is included instead of the <math.h> or <complex.h> headers. Generic macros are similar  
 14076 to the ISO/IEC 9899:1999 standard library masking macros, though the semantic types of return

**<tgmath.h>**

Headers

- 14077 values differ.
- 14078 The ability to overload on integer as well as floating types would have been useful for some  
14079 functions; for example, *copysign()*. Overloading with different numbers of arguments would  
14080 have allowed reusing names; for example, *remainder()* for *remquo()*. However, these facilities  
14081 would have complicated the specification; and their natural consistent use, such as for a floating  
14082 *abs()* or a two-argument *atan()*, would have introduced further inconsistencies with the  
14083 ISO/IEC 9899:1999 standard for insufficient benefit.
- 14084 The ISO C standard in no way limits the implementation's options for efficiency, including  
14085 inlining library functions.
- 14086 **FUTURE DIRECTIONS**
- 14087 None.

## Headers

## &lt;time.h&gt;

## 14096 NAME

14097 time.h — time types

## 14098 SYNOPSIS

14099 #include &lt;time.h&gt;

## 14100 DESCRIPTION

14101 CX Some of the functionality described on this reference page extends the ISO C standard.  
 14102 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 14103 enable the visibility of these symbols in this header.

14104 The <time.h> header shall define the **clock\_t**, **size\_t**, **time\_t**, types as described in  
 14105 <sys/types.h>.

14106 CX The <time.h> header shall define the **clockid\_t** and **timer\_t** types as described in <sys/types.h>.

14107 CX The <time.h> header shall define the **locale\_t** type as described in <locale.h>.

14108 CPT The <time.h> header shall define the **pid\_t** type as described in <sys/types.h>.

14109 CX The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which  
 14110 are described in the <signal.h> header.

14111 The <time.h> header shall declare the **tm** structure, which shall include at least the following  
 14112 members:

14113	int	tm_sec	Seconds [0,60].
14114	int	tm_min	Minutes [0,59].
14115	int	tm_hour	Hour [0,23].
14116	int	tm_mday	Day of month [1,31].
14117	int	tm_mon	Month of year [0,11].
14118	int	tm_year	Years since 1900.
14119	int	tm_wday	Day of week [0,6] (Sunday =0).
14120	int	tm_yday	Day of year [0,365].
14121	int	tm_isdst	Daylight Savings flag.

14122 The value of *tm\_isdst* shall be positive if Daylight Savings Time is in effect, 0 if Daylight Savings  
 14123 Time is not in effect, and negative if the information is not available.

14124 CX The <time.h> header shall declare the **timespec** structure, which shall include at least the  
 14125 following members:

14126	time_t	tv_sec	Seconds.
14127	long	tv_nsec	Nanoseconds.

14128 The <time.h> header shall also declare the **itimerspec** structure, which shall include at least the  
 14129 following members:

14130	struct timespec	it_interval	Timer period.
14131	struct timespec	it_value	Timer expiration.

14132 The <time.h> header shall define the following macros:

14133 NULL As described in <stddef.h>.

14134 CLOCKS\_PER\_SEC A number used to convert the value returned by the *clock()* function into  
 14135 XSI seconds. The value shall be an expression with type **clock\_t**. The value of  
 14136 CLOCKS\_PER\_SEC shall be 1 million on XSI-conformant systems.

14137		However, it may be variable on other systems, and it should not be
14138		assumed that <code>CLOCKS_PER_SEC</code> is a compile-time constant.
14139	CX	The <time.h> header shall define the following symbolic constants. The values shall have a type
14140		that is assignment-compatible with <code>clockid_t</code> .
14141	MON	<code>CLOCK_MONOTONIC</code>
14142		The identifier for the system-wide monotonic clock, which is defined as a
14143		clock measuring real time, whose value cannot be set via <code>clock_settime()</code>
14144		and which cannot have negative clock jumps. The maximum possible
14145		clock jump shall be implementation-defined.
14146	CPT	<code>CLOCK_PROCESS_CPUTIME_ID</code>
14147		The identifier of the CPU-time clock associated with the process making a
14148		<code>clock()</code> or <code>timer*()</code> function call.
14149	CX	<code>CLOCK_REALTIME</code> The identifier of the system-wide clock measuring real time.
14150	TCT	<code>CLOCK_THREAD_CPUTIME_ID</code>
14151		The identifier of the CPU-time clock associated with the thread making a
14152		<code>clock()</code> or <code>timer*()</code> function call.
14153		The <time.h> header shall define the following symbolic constant:
14154		<code>TIMER_ABSTIME</code> Flag indicating time is absolute. For functions taking timer objects, this
14155		refers to the clock associated with the timer.
14156	XSI	The <time.h> header shall provide a declaration or definition for <code>getdate_err</code> . The <code>getdate_err</code>
14157		symbol shall expand to an expression of type <code>int</code> . It is unspecified whether <code>getdate_err</code> is a macro
14158		or an identifier declared with external linkage, and whether or not it is a modifiable lvalue. If a
14159		macro definition is suppressed in order to access an actual object, or a program defines an
14160		identifier with the name <code>getdate_err</code> , the behavior is undefined.
14161		The following shall be declared as functions and may also be defined as macros. Function
14162		prototypes shall be provided.
14163	OB	<code>char *asctime(const struct tm *);</code>
14164	OB CX	<code>char *asctime_r(const struct tm *restrict, char *restrict);</code>
14165		<code>clock_t clock(void);</code>
14166	CPT	<code>int clock_getcpuclockid(pid_t, clockid_t *);</code>
14167	CX	<code>int clock_getres(clockid_t, struct timespec *);</code>
14168		<code>int clock_gettime(clockid_t, struct timespec *);</code>
14169		<code>int clock_nanosleep(clockid_t, int, const struct timespec *,</code>
14170		<code>struct timespec *);</code>
14171		<code>int clock_settime(clockid_t, const struct timespec *);</code>
14172	OB	<code>char *ctime(const time_t *);</code>
14173	OB CX	<code>char *ctime_r(const time_t *, char *);</code>
14174		<code>double difftime(time_t, time_t);</code>
14175	XSI	<code>struct tm *getdate(const char *);</code>
14176		<code>struct tm *gmtime(const time_t *);</code>
14177	CX	<code>struct tm *gmtime_r(const time_t *restrict, struct tm *restrict);</code>
14178		<code>struct tm *localtime(const time_t *);</code>
14179	CX	<code>struct tm *localtime_r(const time_t *restrict, struct tm *restrict);</code>
14180		<code>time_t mktime(struct tm *);</code>
14181	CX	<code>int nanosleep(const struct timespec *, struct timespec *);</code>
14182		<code>size_t strftime(char *restrict, size_t, const char *restrict,</code>
14183		<code>const struct tm *restrict);</code>

```

14184 CX      size_t      strftime_l(char *restrict, size_t, const char *restrict,
14185           const struct tm *restrict, locale_t);
14186 XSI      char        *strptime(const char *restrict, const char *restrict,
14187           struct tm *restrict);
14188           time_t      time(time_t *);
14189 CX      int          timer_create(clockid_t, struct sigevent *restrict,
14190           timer_t *restrict);
14191           int          timer_delete(timer_t);
14192           int          timer_getoverrun(timer_t);
14193           int          timer_gettime(timer_t, struct itimerspec *);
14194           int          timer_settime(timer_t, int, const struct itimerspec *restrict,
14195           struct itimerspec *restrict);
14196           void         tzset(void);

```

14197 The <time.h> header shall declare the following as variables:

```

14198 XSI      extern int     daylight;
14199           extern long    timezone;
14200 CX      extern char    *tzname[];

```

14201 CX Inclusion of the <time.h> header may make visible all symbols from the <signal.h> header.

#### 14202 APPLICATION USAGE

14203 The range [0,60] for *tm\_sec* allows for the occasional leap second.

14204 *tm\_year* is a signed value; therefore, years before 1900 may be represented.

14205 To obtain the number of clock ticks per second returned by the *times()* function, applications  
14206 should call *sysconf(\_SC\_CLK\_TCK)*.

#### 14207 RATIONALE

14208 The range [0,60] seconds allows for positive or negative leap seconds. The formal definition of  
14209 UTC does not permit double leap seconds, so all mention of double leap seconds has been  
14210 removed, and the range shortened from the former [0,61] seconds seen in earlier versions of this  
14211 standard.

#### 14212 FUTURE DIRECTIONS

14213 None.

#### 14221 CHANGE HISTORY

14222 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 14223 Issue 5

14224 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
14225 Threads Extension.

14226 **Issue 6**

14227 The Open Group Corrigendum U035/6 is applied. In the DESCRIPTION, the types **clockid\_t**  
 14228 and **timer\_t** have been described.

14229 The following changes are made for alignment with the ISO POSIX-1:1996 standard:

- 14230 • The POSIX timer-related functions are marked as part of the Timers option.

14231 The symbolic name CLK\_TCK is removed. Application usage is added describing how its  
 14232 equivalent functionality can be obtained using *sysconf()*.

14233 The *clock\_getcpuclockid()* function and manifest constants CLOCK\_PROCESS\_CPUTIME\_ID and  
 14234 CLOCK\_THREAD\_CPUTIME\_ID are added for alignment with IEEE Std 1003.1d-1999.

14235 The manifest constant CLOCK\_MONOTONIC and the *clock\_nanosleep()* function are added for  
 14236 alignment with IEEE Std 1003.1j-2000.

14237 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 14238 • The range for seconds is changed from [0,61] to [0,60].
- 14239 • The **restrict** keyword is added to the prototypes for *asctime\_r()*, *gmtime\_r()*, *localtime\_r()*,  
 14240 *strftime()*, *strptime()*, *timer\_create()*, and *timer\_settime()*.

14241 IEEE PASC Interpretation 1003.1 #84 is applied adding the statement that symbols from the  
 14242 <**signal.h**> header may be made visible when the <**time.h**> header is included.

14243 Extensions beyond the ISO C standard are marked.

14244 **Issue 7**

14245 Austin Group Interpretation 1003.1-2001 #111 is applied.

14246 SD5-XBD-ERN-74 is applied.

14247 The *strftime\_l()* function is added from The Open Group Technical Standard, 2006, Extended API  
 14248 Set Part 4.

14249 Functionality relating to the Timers option is moved to the Base.

14250 This reference page is clarified with respect to macros and symbolic constants, and declarations  
 14251 for the **locale\_t** and **pid\_t** types and the **sigevent** structure are added.

14252 The description of the *getdate\_err* value is expanded.

## Headers

## &lt;trace.h&gt;

## 14253 NAME

14254 trace.h — tracing

## 14255 SYNOPSIS

14256 OB TRC #include &lt;trace.h&gt;

## 14257 DESCRIPTION

14258 The <trace.h> header shall define the **posix\_trace\_event\_info** structure, which shall include at  
14259 least the following members:

```

14260 trace_event_id_t  posix_event_id
14261 pid_t             posix_pid
14262 void              *posix_prog_address
14263 pthread_t         posix_thread_id
14264 struct timespec   posix_timestamp
14265 int               posix_truncation_status

```

14266 The <trace.h> header shall define the **posix\_trace\_status\_info** structure, which shall include at  
14267 least the following members:

```

14268 int      posix_stream_full_status
14269 int      posix_stream_overrun_status
14270 int      posix_stream_status
14271 OB TRL  int      posix_log_full_status
14272 int      posix_log_overrun_status
14273 int      posix_stream_flush_error
14274 int      posix_stream_flush_status

```

14275 The &lt;trace.h&gt; header shall define the following symbolic constants:

```

14276 POSIX_TRACE_ALL_EVENTS
14277 OB TRL  POSIX_TRACE_APPEND
14278 OB TRI  POSIX_TRACE_CLOSE_FOR_CHILD
14279 OB TEF  POSIX_TRACE_FILTER
14280 OB TRL  POSIX_TRACE_FLUSH
14281        POSIX_TRACE_FLUSH_START
14282        POSIX_TRACE_FLUSH_STOP
14283        POSIX_TRACE_FLUSHING
14284        POSIX_TRACE_FULL
14285        POSIX_TRACE_LOOP
14286        POSIX_TRACE_NO_OVERRUN
14287 OB TRL  POSIX_TRACE_NOT_FLUSHING
14288        POSIX_TRACE_NOT_FULL
14289 OB TRI  POSIX_TRACE_INHERITED
14290        POSIX_TRACE_NOT_TRUNCATED
14291        POSIX_TRACE_OVERFLOW
14292        POSIX_TRACE_OVERRUN
14293        POSIX_TRACE_RESUME
14294        POSIX_TRACE_RUNNING
14295        POSIX_TRACE_START
14296        POSIX_TRACE_STOP
14297        POSIX_TRACE_SUSPENDED
14298        POSIX_TRACE_SYSTEM_EVENTS
14299        POSIX_TRACE_TRUNCATED_READ

```

14300 POSIX\_TRACE\_TRUNCATED\_RECORD  
 14301 POSIX\_TRACE\_UNNAMED\_USER\_EVENT  
 14302 POSIX\_TRACE\_UNTIL\_FULL  
 14303 POSIX\_TRACE\_WOPID\_EVENTS

14304 OB TEF The <trace.h> header shall define the **size\_t**, **trace\_attr\_t**, **trace\_event\_id\_t**, **trace\_event\_set\_t**,  
 14305 and **trace\_id\_t** types as described in <sys/types.h>.

14306 The following shall be declared as functions and may also be defined as macros. Function  
 14307 prototypes shall be provided.

14308 int posix\_trace\_attr\_destroy(trace\_attr\_t \*);  
 14309 int posix\_trace\_attr\_getclockres(const trace\_attr\_t \*,  
 14310 struct timespec \*);

14396 **CHANGE HISTORY**

14397 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

14398 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/40 is applied, adding the TRL margin  
14399 code to the *posix\_trace\_flush()* function, for alignment with the System Interfaces volume of  
14400 POSIX.1-2008.

14401 **Issue 7**

14402 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size\_t** type.

14403 The <trace.h> header is marked obsolescent.

14404 This reference page is clarified with respect to macros and symbolic constants.

14427 **Issue 7**14428 The <**ulimit.h**> header is marked obsolescent.

**<unistd.h>**

Headers

14429 **NAME**

14430 unistd.h — standard symbolic constants and types

14431 **SYNOPSIS**

14432 #include &lt;unistd.h&gt;

14433 **DESCRIPTION**

14434 The **<unistd.h>** header defines miscellaneous symbolic constants and types, and declares  
 14435 miscellaneous functions. The actual values of the constants are unspecified except as shown. The  
 14436 contents of this header are shown below.

14437 **Version Test Macros**

14438 The **<unistd.h>** header shall define the following symbolic constants. The values shall be  
 14439 suitable for use in **#if** preprocessing directives.

14440 **\_POSIX\_VERSION**

14441 Integer value indicating version of this standard (C-language binding) to which the  
 14442 implementation conforms. For implementations conforming to POSIX.1-2008, the value  
 14443 shall be 200809L.

14444 **\_POSIX2\_VERSION**

14445 Integer value indicating version of the Shell and Utilities volume of POSIX.1 to which the  
 14446 implementation conforms. For implementations conforming to POSIX.1-2008, the value  
 14447 shall be 200809L.

14448 The **<unistd.h>** header shall define the following symbolic constant only if the implementation  
 14449 supports the XSI option; see [Section 2.1.4](#) (on page 19). If defined, its value shall be suitable for  
 14450 use in **#if** preprocessing directives.

14451 XSI **\_XOPEN\_VERSION**

14452 Integer value indicating version of the X/Open Portability Guide to which the  
 14453 implementation conforms. The value shall be 700.

14454 **Constants for Options and Option Groups**

14455 The following symbolic constants, if defined in **<unistd.h>**, shall have a value of  $-1$ ,  $0$ , or  
 14456 greater, unless otherwise specified below. The values shall be suitable for use in **#if**  
 14457 preprocessing directives.

14458 If a symbolic constant is not defined or is defined with the value  $-1$ , the option is not supported  
 14459 for compilation. If it is defined with a value greater than zero, the option shall always be  
 14460 supported when the application is executed. If it is defined with the value zero, the option shall  
 14461 be supported for compilation and might or might not be supported at runtime. See [Section 2.1.6](#)  
 14462 (on page 26) for further information about the conformance requirements of these three  
 14463 categories of support.

14464 ADV **\_POSIX\_ADVISORY\_INFO**

14465 The implementation supports the Advisory Information option. If this symbol is defined in  
 14466 **<unistd.h>**, it shall be defined to be  $-1$ ,  $0$ , or 200809L. The value of this symbol reported by  
 14467 *sysconf()* shall either be  $-1$  or 200809L.

14468 **\_POSIX\_ASYNCHRONOUS\_IO**

14469 The implementation supports asynchronous input and output. This symbol shall always be  
 14470 set to the value 200809L.

14471		<b>_POSIX_BARRIERS</b>
14472		The implementation supports barriers. This symbol shall always be set to the value
14473		200809L.
14474		<b>_POSIX_CHOWN_RESTRICTED</b>
14475		The use of <i>chown()</i> and <i>fchown()</i> is restricted to a process with appropriate privileges, and
14476		to changing the group ID of a file only to the effective group ID of the process or to one of
14477		its supplementary group IDs. This symbol shall be defined with a value other than -1.
14478		<b>_POSIX_CLOCK_SELECTION</b>
14479		The implementation supports clock selection. This symbol shall always be set to the value
14480		200809L.
14481	CPT	<b>_POSIX_CPUTIME</b>
14482		The implementation supports the Process CPU-Time Clocks option. If this symbol is
14483		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14484		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14485	FSC	<b>_POSIX_FSYNC</b>
14486		The implementation supports the File Synchronization option. If this symbol is defined in
14487		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14488		<i>sysconf()</i> shall either be -1 or 200809L.
14489		<b>_POSIX_IPV6</b>
14490		The implementation supports the IPv6 option. If this symbol is defined in <unistd.h>, it
14491		shall be defined to be -1, 0, or 200809L. The value of this symbol reported by <i>sysconf()</i> shall
14492		either be -1 or 200809L.
14493		<b>_POSIX_JOB_CONTROL</b>
14494		The implementation supports job control. This symbol shall always be set to a value greater
14495		than zero.
14496		<b>_POSIX_MAPPED_FILES</b>
14497		The implementation supports memory mapped Files. This symbol shall always be set to the
14498		value 200809L.
14499	ML	<b>_POSIX_MEMLOCK</b>
14500		The implementation supports the Process Memory Locking option. If this symbol is defined
14501		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14502		by <i>sysconf()</i> shall either be -1 or 200809L.
14503	MLR	<b>_POSIX_MEMLOCK_RANGE</b>
14504		The implementation supports the Range Memory Locking option. If this symbol is defined
14505		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14506		by <i>sysconf()</i> shall either be -1 or 200809L.
14507		<b>_POSIX_MEMORY_PROTECTION</b>
14508		The implementation supports memory protection. This symbol shall always be set to the
14509		value 200809L.
14510	MSG	<b>_POSIX_MESSAGE_PASSING</b>
14511		The implementation supports the Message Passing option. If this symbol is defined in
14512		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14513		<i>sysconf()</i> shall either be -1 or 200809L.
14514	MON	<b>_POSIX_MONOTONIC_CLOCK</b>
14515		The implementation supports the Monotonic Clock option. If this symbol is defined in
14516		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by

14517		<code>sysconf()</code> shall either be <code>-1</code> or <code>200809L</code> .
14518		<code>_POSIX_NO_TRUNC</code>
14519		Pathname components longer than <code>{NAME_MAX}</code> generate an error. This symbol shall be
14520		defined with a value other than <code>-1</code> .
14521	PIO	<code>_POSIX_PRIORITIZED_IO</code>
14522		The implementation supports the Prioritized Input and Output option. If this symbol is
14523		defined in <code>&lt;unistd.h&gt;</code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol
14524		reported by <code>sysconf()</code> shall either be <code>-1</code> or <code>200809L</code> .
14525	PS	<code>_POSIX_PRIORITY_SCHEDULING</code>
14526		The implementation supports the Process Scheduling option. If this symbol is defined in
14527		<code>&lt;unistd.h&gt;</code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported by
14528		<code>sysconf()</code> shall either be <code>-1</code> or <code>200809L</code> .
14529	RS	<code>_POSIX_RAW_SOCKETS</code>
14530		The implementation supports the Raw Sockets option. If this symbol is defined in
14531		<code>&lt;unistd.h&gt;</code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported by
14532		<code>sysconf()</code> shall either be <code>-1</code> or <code>200809L</code> .
14533		<code>_POSIX_READER_WRITER_LOCKS</code>
14534		The implementation supports read-write locks. This symbol shall always be set to the value
14535		<code>200809L</code> .
14536		<code>_POSIX_REALTIME_SIGNALS</code>
14537		The implementation supports realtime signals. This symbol shall always be set to the value
14538		<code>200809L</code> .
14539		<code>_POSIX_REGEX</code>
14540		The implementation supports the Regular Expression Handling option. This symbol shall
14541		always be set to a value greater than zero.
14542		<code>_POSIX_SAVED_IDS</code>
14543		Each process has a saved set-user-ID and a saved set-group-ID. This symbol shall always be
14544		set to a value greater than zero.
14545		<code>_POSIX_SEMAPHORES</code>
14546		The implementation supports semaphores. This symbol shall always be set to the value
14547		<code>200809L</code> .
14548	SHM	<code>_POSIX_SHARED_MEMORY_OBJECTS</code>
14549		The implementation supports the Shared Memory Objects option. If this symbol is defined
14550		in <code>&lt;unistd.h&gt;</code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported
14551		by <code>sysconf()</code> shall either be <code>-1</code> or <code>200809L</code> .
14552		<code>_POSIX_SHELL</code>
14553		The implementation supports the POSIX shell. This symbol shall always be set to a value
14554		greater than zero.
14555	SPN	<code>_POSIX_SPAWN</code>
14556		The implementation supports the Spawn option. If this symbol is defined in <code>&lt;unistd.h&gt;</code> , it
14557		shall be defined to be <code>-1</code> , <code>0</code> , or <code>200809L</code> . The value of this symbol reported by <code>sysconf()</code> shall
14558		either be <code>-1</code> or <code>200809L</code> .
14559		<code>_POSIX_SPIN_LOCKS</code>
14560		The implementation supports spin locks. This symbol shall always be set to the value
14561		<code>200809L</code> .

## Headers

## &lt;unistd.h&gt;

14562	SS	<b>_POSIX_SPARADIC_SERVER</b>
14563		The implementation supports the Process Sporadic Server option. If this symbol is defined
14564		in <b>&lt;unistd.h&gt;</b> , it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14565		by <i>sysconf()</i> shall either be -1 or 200809L.
14566	SIO	<b>_POSIX_SYNCHRONIZED_IO</b>
14567		The implementation supports the Synchronized Input and Output option. If this symbol is
14568		defined in <b>&lt;unistd.h&gt;</b> , it shall be defined to be -1, 0, or 200809L. The value of this symbol
14569		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14570	TSA	<b>_POSIX_THREAD_ATTR_STACKADDR</b>
14571		The implementation supports the Thread Stack Address Attribute option. If this symbol is
14572		defined in <b>&lt;unistd.h&gt;</b> , it shall be defined to be -1, 0, or 200809L. The value of this symbol
14573		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14574	TSS	<b>_POSIX_THREAD_ATTR_STACKSIZE</b>
14575		The implementation supports the Thread Stack Size Attribute option. If this symbol is
14576		defined in <b>&lt;unistd.h&gt;</b> , it shall be defined to be -1, 0, or 200809L. The value of this symbol
14577		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14578	TCT	<b>_POSIX_THREAD_CPU_TIME</b>
14579		The implementation supports the Thread CPU-Time Clocks option. If this symbol is
14580		defined in <b>&lt;unistd.h&gt;</b> , it shall be defined to be -1, 0, or 200809L. The value of this symbol
14581		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14582	TPI	<b>_POSIX_THREAD_PRIO_INHERIT</b>
14583		The implementation supports the Non-Robust Mutex Priority Inheritance option. If this
14584		symbol is defined in <b>&lt;unistd.h&gt;</b> , it shall be defined to be -1, 0, or 200809L. The value of this
14585		symbol reported by <i>sysconf()</i> shall either be -1 or 200809L.
14586	TPP	<b>_POSIX_THREAD_PRIO_PROTECT</b>
14587		The implementation supports the Non-Robust Mutex Priority Protection option. If this
14588		symbol is defined in <b>&lt;unistd.h&gt;</b> , it shall be defined to be -1, 0, or 200809L. The value of this
14589		symbol reported by <i>sysconf()</i> shall either be -1 or 200809L.
14590	TPS	<b>_POSIX_THREAD_PRIORITY_SCHEDULING</b>
14591		The implementation supports the Thread Execution Scheduling option. If this symbol is
14592		defined in <b>&lt;unistd.h&gt;</b> , it shall be defined to be -1, 0, or 200809L. The value of this symbol
14593		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14594	TSH	<b>_POSIX_THREAD_PROCESS_SHARED</b>
14595		The implementation supports the Thread Process-Shared Synchronization option. If this
14596		symbol is defined in <b>&lt;unistd.h&gt;</b> , it shall be defined to be -1, 0, or 200809L. The value of this
14597		symbol reported by <i>sysconf()</i> shall either be -1 or 200809L.
14598	RPI	<b>_POSIX_THREAD_ROBUST_PRIO_INHERIT</b>
14599		The implementation supports the Robust Mutex Priority Inheritance option. If this symbol
14600		is defined in <b>&lt;unistd.h&gt;</b> , it shall be defined to be -1, 0, or 200809L. The value of this symbol
14601		reported by <i>sysconf()</i> shall either be -1 or 200809L.
14602	RPP	<b>_POSIX_THREAD_ROBUST_PRIO_PROTECT</b>
14603		The implementation supports the Robust Mutex Priority Protection option. If this symbol is
14604		defined in <b>&lt;unistd.h&gt;</b> , it shall be defined to be -1, 0, or 200809L. The value of this symbol
14605		reported by <i>sysconf()</i> shall either be -1 or 200809L.

14606		<code>_POSIX_THREAD_SAFE_FUNCTIONS</code>	The implementation supports thread-safe functions. This symbol shall always be set to the value 200809L.
14607			
14608			
14609	TSP	<code>_POSIX_THREAD_SPORADIC_SERVER</code>	The implementation supports the Thread Sporadic Server option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by <code>sysconf()</code> shall either be -1 or 200809L.
14610			
14611			
14612			
14613		<code>_POSIX_THREADS</code>	The implementation supports threads. This symbol shall always be set to the value 200809L.
14614			
14615			
14616		<code>_POSIX_TIMEOUTS</code>	The implementation supports timeouts. This symbol shall always be set to the value 200809L.
14617			
14618			
14619		<code>_POSIX_TIMERS</code>	The implementation supports timers. This symbol shall always be set to the value 200809L.
14620			
14621	OB TRC	<code>_POSIX_TRACE</code>	The implementation supports the Trace option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by <code>sysconf()</code> shall either be -1 or 200809L.
14622			
14623			
14624			
14625	OB TEF	<code>_POSIX_TRACE_EVENT_FILTER</code>	The implementation supports the Trace Event Filter option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by <code>sysconf()</code> shall either be -1 or 200809L.
14626			
14627			
14628			
14629	OB TRI	<code>_POSIX_TRACE_INHERIT</code>	The implementation supports the Trace Inherit option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by <code>sysconf()</code> shall either be -1 or 200809L.
14630			
14631			
14632			
14633	OB TRL	<code>_POSIX_TRACE_LOG</code>	The implementation supports the Trace Log option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by <code>sysconf()</code> shall either be -1 or 200809L.
14634			
14635			
14636			
14637	TYM	<code>_POSIX_TYPED_MEMORY_OBJECTS</code>	The implementation supports the Typed Memory Objects option. If this symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by <code>sysconf()</code> shall either be -1 or 200809L.
14638			
14639			
14640			
14641	OB	<code>_POSIX_V6_ILP32_OFF32</code>	The implementation provides a C-language compilation environment with 32-bit <b>int</b> , <b>long</b> , <b>pointer</b> , and <b>off_t</b> types.
14642			
14643			
14644	OB	<code>_POSIX_V6_ILP32_OFFBIG</code>	The implementation provides a C-language compilation environment with 32-bit <b>int</b> , <b>long</b> , and <b>pointer</b> types and an <b>off_t</b> type using at least 64 bits.
14645			
14646			
14647	OB	<code>_POSIX_V6_LP64_OFF64</code>	The implementation provides a C-language compilation environment with 32-bit <b>int</b> and 64-bit <b>long</b> , <b>pointer</b> , and <b>off_t</b> types.
14648			
14649

14694			

## &lt;unistd.h&gt;

## Headers

14695	OB BE	<u>_POSIX2_PBS_CHECKPOINT</u>
14696		The implementation supports the Batch Checkpoint/Restart option. If this symbol is
14697		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14698		reported by <i>sysconf</i> () shall either be -1 or 200809L.
14699	OB BE	<u>_POSIX2_PBS_LOCATE</u>
14700		The implementation supports the Locate Batch Job Request option. If this symbol is defined
14701		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14702		by <i>sysconf</i> () shall either be -1 or 200809L.
14703	OB BE	<u>_POSIX2_PBS_MESSAGE</u>
14704		The implementation supports the Batch Job Message Request option. If this symbol is
14705		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14706		reported by <i>sysconf</i> () shall either be -1 or 200809L.
14707	OB BE	<u>_POSIX2_PBS_TRACK</u>
14708		The implementation supports the Track Batch Job Request option. If this symbol is defined
14709		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14710		by <i>sysconf</i> () shall either be -1 or 200809L.
14711	SD	<u>_POSIX2_SW_DEV</u>
14712		The implementation supports the Software Development Utilities option. If this symbol is
14713		defined in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol
14714		reported by <i>sysconf</i> () shall either be -1 or 200809L.
14715	UP	<u>_POSIX2_UPE</u>
14716		The implementation supports the User Portability Utilities option. If this symbol is defined
14717		in <unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported
14718		by <i>sysconf</i> () shall either be -1 or 200809L.
14719	XSI	<u>_XOPEN_CRYPT</u>
14720		The implementation supports the X/Open Encryption Option Group.
14721		<u>_XOPEN_ENH_I18N</u>
14722		The implementation supports the Issue 4, Version 2 Enhanced Internationalization Option
14723		Group. This symbol shall always be set to a value other than -1.
14724		<u>_XOPEN_REALTIME</u>
14725		The implementation supports the X/Open Realtime Option Group.
14726		<u>_XOPEN_REALTIME_THREADS</u>
14727		The implementation supports the X/Open Realtime Threads Option Group.
14728		<u>_XOPEN_SHM</u>
14729		The implementation supports the Issue 4, Version 2 Shared Memory Option Group. This
14730		symbol shall always be set to a value other than -1.
14731	OB XSR	<u>_XOPEN_STREAMS</u>
14732		The implementation supports the XSI STREAMS Option Group.
14733	XSI	<u>_XOPEN_UNIX</u>
14734		The implementation supports the XSI option.
14735	UU	<u>_XOPEN_UUCP</u>
14736		The implementation supports the UUCP Utilities option. If this symbol is defined in
14737		<unistd.h>, it shall be defined to be -1, 0, or 200809L. The value of this symbol reported by
14738		<i>sysconf</i> () shall be either -1 or 200809L.

14739 **Execution-Time Symbolic Constants**

14740 If any of the following symbolic constants are not defined in the <unistd.h> header, the value  
 14741 shall vary depending on the file to which it is applied. If defined, they shall have values suitable  
 14742 for use in #if preprocessing directives.

14743 If any of the following symbolic constants are defined to have value -1 in the <unistd.h> header,  
 14744 the implementation shall not provide the option on any file; if any are defined to have a value  
 14745 other than -1 in the <unistd.h> header, the implementation shall provide the option on all  
 14746 applicable files.

14747 All of the following values, whether defined as symbolic constants in <unistd.h> or not, may be  
 14748 queried with respect to a specific file using the *pathconf()* or *fpathconf()* functions:

14749 `_POSIX_ASYNC_IO`

14750 Asynchronous input or output operations may be performed for the associated file.

14751 `_POSIX_PRIO_IO`

14752 Prioritized input or output operations may be performed for the associated file.

14753 `_POSIX_SYNC_IO`

14754 Synchronized input or output operations may be performed for the associated file.

14755 If the following symbolic constants are defined in the <unistd.h> header, they apply to files and  
 14756 all paths in all file systems on the implementation:

14757 `_POSIX_TIMESTAMP_RESOLUTION`

14758 The resolution in nanoseconds for all file timestamps.

14759 `_POSIX2_SYMLINKS`

14760 Symbolic links can be created.

14761 **Constants for Functions**

14762 The <unistd.h> header shall define NULL as described in <stddef.h>.

14763 The <unistd.h> header shall define the following symbolic constants for use with the *access()*  
 14764 function. The values shall be suitable for use in #if preprocessing directives.

14765 `F_OK` Test for existence of file.

14766 `R_OK` Test for read permission.

14767 `W_OK` Test for write permission.

14768 `X_OK` Test for execute (search) permission.

14769 The constants `F_OK`, `R_OK`, `W_OK`, and `X_OK` and the expressions `R_OK | W_OK`, `R_OK | X_OK`,  
 14770 and `R_OK | W_OK | X_OK` shall all have distinct values.

14771 The <unistd.h> header shall define the following symbolic constants for the *confstr()* function:

14772 `_CS_PATH`

14773 This is the value for the *PATH* environment variable that finds all standard utilities.

14774 `_CS_POSIX_V7_ILP32_OFF32_CFLAGS`

14775 If *sysconf(\_SC\_V7\_ILP32\_OFF32)* returns -1, the meaning of this value is unspecified.  
 14776 Otherwise, this value is the set of initial options to be given to the *c99* utility to build an  
 14777 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off\_t** types.

- 14778 `_CS_POSIX_V7_ILP32_OFF32_LDFLAGS`  
 14779 If `sysconf(_SC_V7_ILP32_OFF32)` returns `-1`, the meaning of this value is unspecified.  
 14780 Otherwise, this value is the set of final options to be given to the `c99` utility to build an  
 14781 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off\_t** types.
- 14782 `_CS_POSIX_V7_ILP32_OFF32_LIBS`  
 14783 If `sysconf(_SC_V7_ILP32_OFF32)` returns `-1`, the meaning of this value is unspecified.  
 14784 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an  
 14785 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off\_t** types.
- 14786 `_CS_POSIX_V7_ILP32_OFFBIG_CFLAGS`  
 14787 If `sysconf(_SC_V7_ILP32_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 14788 Otherwise, this value is the set of initial options to be given to the `c99` utility to build an  
 14789 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an  
 14790 **off\_t** type using at least 64 bits.
- 14791 `_CS_POSIX_V7_ILP32_OFFBIG_LDFLAGS`  
 14792 If `sysconf(_SC_V7_ILP32_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 14793 Otherwise, this value is the set of final options to be given to the `c99` utility to build an  
 14794 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an  
 14795 **off\_t** type using at least 64 bits.
- 14796 `_CS_POSIX_V7_ILP32_OFFBIG_LIBS`  
 14797 If `sysconf(_SC_V7_ILP32_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 14798 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an  
 14799 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an  
 14800 **off\_t** type using at least 64 bits.
- 14801 `_CS_POSIX_V7_LP64_OFF64_CFLAGS`  
 14802 If `sysconf(_SC_V7_LP64_OFF64)` returns `-1`, the meaning of this value is unspecified.  
 14803 Otherwise, this value is the set of initial options to be given to the `c99` utility to build an  
 14804 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off\_t**  
 14805 types.
- 14806 `_CS_POSIX_V7_LP64_OFF64_LDFLAGS`  
 14807 If `sysconf(_SC_V7_LP64_OFF64)` returns `-1`, the meaning of this value is unspecified.  
 14808 Otherwise, this value is the set of final options to be given to the `c99` utility to build an  
 14809 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off\_t**  
 14810 types.
- 14811 `_CS_POSIX_V7_LP64_OFF64_LIBS`  
 14812 If `sysconf(_SC_V7_LP64_OFF64)` returns `-1`, the meaning of this value is unspecified.  
 14813 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an  
 14814 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off\_t**  
 14815 types.
- 14816 `_CS_POSIX_V7_LPBIG_OFFBIG_CFLAGS`  
 14817 If `sysconf(_SC_V7_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 14818 Otherwise, this value is the set of initial options to be given to the `c99` utility to build an  
 14819 application using a programming model with an **int** type using at least 32 bits and **long**,  
 14820 **pointer**, and **off\_t** types using at least 64 bits.
- 14821 `_CS_POSIX_V7_LPBIG_OFFBIG_LDFLAGS`  
 14822 If `sysconf(_SC_V7_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 14823 Otherwise, this value is the set of final options to be given to the `c99` utility to build an  
 14824 application using a programming model with an **int** type using at least 32 bits and **long**,

- 14825 **pointer**, and **off\_t** types using at least 64 bits.
- 14826 `_CS_POSIX_V7_LPBIG_OFFBIG_LIBS`  
 14827 If `sysconf(_SC_V7_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.  
 14828 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an  
 14829 application using a programming model with an **int** type using at least 32 bits and **long**,  
 14830 **pointer**, and **off\_t** types using at least 64 bits.
- 14831 `_CS_POSIX_V7_THREADS_CFLAGS`  
 14832 If `sysconf(_SC_POSIX_THREADS)` returns `-1`, the meaning of this value is unspecified.  
 14833 Otherwise, this value is the set of initial options to be given to the `c99` utility to build a  
 14834 multi-threaded application. These flags are in addition to those associated with any of the  
 14835 other `_CS_POSIX_V7*_CFLAGS` values used to specify particular type size programming  
 14836 environments.
- 14837 `_CS_POSIX_V7_THREADS_LDFLAGS`  
 14838 If `sysconf(_SC_POSIX_THREADS)` returns `-1`, the meaning of this value is unspecified.  
 14839 Otherwise, this value is the set of final options to be given to the `c99` utility to build a multi-  
 14840 threaded application. These flags are in addition to those associated with any of the other  
 14841 `_CS_POSIX_V7*_LDFLAGS` values used to specify particular type size programming  
 14842 environments.
- 14843 `_CS_POSIX_V7_WIDTH_RESTRICTED_ENVS`  
 14844 This value is a <newline>-separated list of names of programming environments supported  
 14845 by the implementation in which the widths of the **blksize\_t**, **cc\_t**, **mode\_t**, **nfds\_t**, **pid\_t**,  
 14846 **ptrdiff\_t**, **size\_t**, **speed\_t**, **ssize\_t**, **suseconds\_t**, **tcflag\_t**, **wchar\_t**, and **wint\_t** types are no  
 14847 greater than the width of type **long**. The format of each name shall be suitable for use with  
 14848 the `getconf -v` option.
- 14849 `_CS_V7_ENV`  
 14850 This is the value that provides the environment variable information (other than that  
 14851 provided by `_CS_PATH`) that is required by the implementation to create a conforming  
 14852 environment, as described in the implementation's conformance documentation.
- 14853 OB The following symbolic constants are reserved for compatibility with Issue 6:
- 14854 `_CS_POSIX_V6_ILP32_OFF32_CFLAGS`  
 14855 `_CS_POSIX_V6_ILP32_OFF32_LDFLAGS`  
 14856 `_CS_POSIX_V6_ILP32_OFF32_LIBS`  
 14857 `_CS_POSIX_V6_ILP32_OFFBIG_CFLAGS`  
 14858 `_CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS`  
 14859 `_CS_POSIX_V6_ILP32_OFFBIG_LIBS`  
 14860 `_CS_POSIX_V6_LP64_OFF64_CFLAGS`  
 14861 `_CS_POSIX_V6_LP64_OFF64_LDFLAGS`  
 14862 `_CS_POSIX_V6_LP64_OFF64_LIBS`  
 14863 `_CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS`  
 14864 `_CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS`  
 14865 `_CS_POSIX_V6_LPBIG_OFFBIG_LIBS`  
 14866 `_CS_POSIX_V6_WIDTH_RESTRICTED_ENVS`  
 14867 `_CS_V6_ENV`
- 14868 The <unistd.h> header shall define `SEEK_CUR`, `SEEK_END`, and `SEEK_SET` as described in  
 14869 <stdio.h>.
- 14870 The <unistd.h> header shall define the following symbolic constants as possible values for the

## &lt;unistd.h&gt;

14871	<i>function</i> argument to the <i>lockf()</i> function:
14872	F_LOCK            Lock a section for exclusive use.
14873	F_TEST            Test section for locks by other processes.
14874	F_TLOCK          Test and lock a section for exclusive use.
14875	F_ULOCK          Unlock locked sections.
14876	The <unistd.h> header shall define the following symbolic constants for <i>pathconf()</i> :
14877	_PC_2_SYMLINKS
14878	_PC_ALLOC_SIZE_MIN
14879	_PC_ASYNC_IO
14880	_PC_CHOWN_RESTRICTED
14881	_PC_FILESIZEBITS
14882	_PC_LINK_MAX
14883	_PC_MAX_CANON
14884	_PC_MAX_INPUT
14885	_PC_NAME_MAX
14886	_PC_NO_TRUNC
14887	_PC_PATH_MAX
14888	_PC_PIPE_BUF
14889	_PC_PRIO_IO
14890	_PC_REC_INCR_XFER_SIZE
14891	_PC_REC_MAX_XFER_SIZE
14892	_PC_REC_MIN_XFER_SIZE
14893	_PC_REC_XFER_ALIGN
14894	_PC_SYMLINK_MAX
14895	_PC_SYNC_IO
14896	_PC_TIMESTAMP_RESOLUTION
14897	_PC_VDISABLE
14898	The <unistd.h> header shall define the following symbolic constants for <i>sysconf()</i> :
14899	_SC_2_C_BIND
14900	_SC_2_C_DEV
14901	_SC_2_CHAR_TERM
14902	_SC_2_FORT_DEV
14903	_SC_2_FORT_RUN
14904	_SC_2_LOCALEDEF
14905	_SC_2_PBS
14906	_SC_2_PBS_ACCOUNTING

 15014 \_SC\_VERSION  
 15015 \_SC\_XOPEN\_CRYPT  
 15016 \_SC\_XOPEN\_ENH\_I18N  
 15017 \_SC\_XOPEN\_REALTIME  
 15018 \_SC\_XOPEN\_REALTIME\_THREADS  
 15019 \_SC\_XOPEN\_SHM  
 15020 \_SC\_XOPEN\_STREAMS  
 15021 \_SC\_XOPEN\_UNIX  
 15022 \_SC\_XOPEN\_UUCP

15023 `_SC_XOPEN_VERSION`

15024 The two constants `_SC_PAGESIZE` and `_SC_PAGE_SIZE` may be defined to have the same value.

15025 The <unistd.h> header shall define the following symbolic constants for file streams:

15026 `STDERR_FILENO` File number of *stderr*; 2.

15027 `STDIN_FILENO` File number of *stdin*; 0.

15028 `STDOUT_FILENO` File number of *stdout*; 1.

15029 The <unistd.h> header shall define the following symbolic constant for terminal special  
15030 character handling:

15031 `_POSIX_VDISABLE` This symbol shall be defined to be the value of a character that shall  
15032 disable terminal special character handling as described in Section 11.2.6  
15033 (on page 212). This symbol shall always be set to a value other than -1.

### 15034 Type Definitions

15035 The <unistd.h> header shall define the `size_t`, `ssize_t`, `uid_t`, `gid_t`, `off_t`, and `pid_t` types as  
15036 described in <sys/types.h>.

15037 The <unistd.h> header shall define the `intptr_t` type as described in <inttypes.h>.

### 15038 Declarations

15039 The following shall be declared as functions and may also be defined as macros. Function  
15040 prototypes shall be provided.

```

15041 int      access(const char *, int);
15042 unsigned alarm(unsigned);
15043 int      chdir(const char *);
15044 int      chown(const char *, uid_t, gid_t);
15045 int      close(int);
15046 size_t   confstr(int, char *, size_t);
15047 XSI     char *crypt(const char *, const char *);
15048 CX      char *ctermid(char *);
15049 int      dup(int);
15050 int      dup2(int, int);
15051 void     _exit(int);
15052 XSI     void encrypt(char [64], int);
15053 int      execl(const char *, const char *, ...);
15054 int      execlp(const char *, const char *, ...);
15055 int      execlp(const char *, const char *, ...);
15056 int      execv(const char *, char *const []);
15057 int      execve(const char *, char *const [], char *const []);
15058 int      execvp(const char *, char *const []);
15059 int      faccessat(int, const char *, int, int);
15060 int      fchdir(int);
15061 int      fchown(int, uid_t, gid_t);
15062 int      fchownat(int, const char *, uid_t, gid_t, int);
15063 SIO     int fdatsync(int);
15064 int      fexecve(int, char *const [], char *const []);
15065 pid_t    fork(void);
15066 long     fpathconf(int, int);

```

15067	FSC	int	fsync(int);
15068		int	ftruncate(int, off_t);
15069		char	*getcwd(char *, size_t);
15070		gid_t	getegid(void);
15071		uid_t	geteuid(void);
15072		gid_t	getgid(void);
15073		int	getgroups(int, gid_t []);
15074	XSI	long	gethostid(void);
15075		int	gethostname(char *, size_t);
15076		char	*getlogin(void);
15077		int	getlogin_r(char *, size_t);
15078		int	getopt(int, char * const [], const char *);
15079		pid_t	getpgid(pid_t);
15080		pid_t	getpgrp(void);
15081		pid_t	getpid(void);
15082		pid_t	getppid(void);
15083		pid_t	getsid(pid_t);
15084		uid_t	getuid(void);
15085		int	isatty(int);
15086		int	lchown(const char *, uid_t, gid_t);
15087		int	link(const char *, const char *);
15088		int	linkat(int, const char *, int, const char *, int);
15089	XSI	int	lockf(int, int, off_t);
15090		off_t	lseek(int, off_t, int);
15091	XSI	int	nice(int);
15092		long	pathconf(const char *, int);
15093		int	pause(void);
15094		int	pipe(int [2]);
15095		ssize_t	pread(int, void *, size_t, off_t);
15096		ssize_t	pwrite(int, const void *, size_t, off_t);
15097		ssize_t	read(int, void *, size_t);
15098		ssize_t	readlink(const char *restrict, char *restrict, size_t);
15099		ssize_t	readlinkat(int, const char *restrict, char *restrict, size_t);
15100		int	rmdir(const char *);
15101		int	setegid(gid_t);
15102		int	seteuid(uid_t);
15103		int	setgid(gid_t);
15104		int	setpgid(pid_t, pid_t);
15105	OB XSI	pid_t	setpgrp(void);
15106	XSI	int	setregid(gid_t, gid_t);
15107		int	setreuid(uid_t, uid_t);
15108		pid_t	setsid(void);
15109		int	setuid(uid_t);
15110		unsigned	sleep(unsigned);
15111	XSI	void	swab(const void *restrict, void *restrict, ssize_t);
15112		int	symlink(const char *, const char *);
15113		int	symlinkat(const char *, int, const char *);
15114	XSI	void	sync(void);
15115		long	sysconf(int);
15116		pid_t	tcgetpgrp(int);
15117		int	tcsetpgrp(int, pid_t);
15118		int	truncate(const char *, off_t);

```

15119     char          *ttyname(int);
15120     int           ttyname_r(int, char *, size_t);
15121     int           unlink(const char *);
15122     int           unlinkat(int, const char *, int);
15123     ssize_t       write(int, const void *, size_t);

```

15124 Implementations may also include the *pthread\_atfork()* prototype as defined in <pthread.h>.

15125 The <unistd.h> header shall declare the following external variables:

```

15126     extern char   *optarg;
15127     extern int    opterr, optind, optopt;

```

#### 15128 APPLICATION USAGE

15129 POSIX.1-2008 only describes the behavior of systems that claim conformance to it. However,  
 15130 application developers who want to write applications that adapt to other versions of this  
 15131 standard (or to systems that do not conform to any POSIX standard) may find it useful to code  
 15132 them so as to conditionally compile different code depending on the value of  
 15133 `_POSIX_VERSION`, for example:

```

15134     #if _POSIX_VERSION >= 200112L
15135     /* Use the newer function that copes with large files. */
15136     off_t pos=ftello(fp);
15137     #else
15138     /* Either this is an old version of POSIX, or _POSIX_VERSION is
15139        not even defined, so use the traditional function. */
15140     long pos=ftell(fp);
15141     #endif

```

15142 Earlier versions of POSIX.1-2008 and of the Single UNIX Specification can be identified by the  
 15143 following macros:

```

15144     POSIX.1-1988 standard
15145     _POSIX_VERSION == 198808L

```

```

15146     POSIX.1-1990 standard
15147     _POSIX_VERSION == 199009L

```

```

15148     ISO POSIX-1: 1996 standard
15149     _POSIX_VERSION == 199506L

```

```

15150     Single UNIX Specification, Version 1
15151     _XOPEN_UNIX and _XOPEN_VERSION == 4

```

```

15152     Single UNIX Specification, Version 2
15153     _XOPEN_UNIX and _XOPEN_VERSION == 500

```

```

15154     ISO POSIX-1: 2001 and Single UNIX Specification, Version 3
15155     _POSIX_VERSION == 200112L, plus (if the XSI option is supported) _XOPEN_UNIX and
15156     _XOPEN_VERSION == 600

```

15157 POSIX.1-2008 does not make any attempt to define application binary interaction with the  
 15158 underlying operating system. However, application developers may find it useful to query  
 15159 `_SC_VERSION` at runtime via *sysconf()* to determine whether the current version of the  
 15160 operating system supports the necessary functionality as in the following program fragment:

```

15161     if (sysconf(_SC_VERSION) < 200809L) {
15162         fprintf(stderr, "POSIX.1-2008 system required, terminating \n");
15163         exit(1);

```

15164            }

15165            New applications should not use `_XOPEN_SHM` or `_XOPEN_ENH_I18N`.

#### 15166 **RATIONALE**

15167            As POSIX.1-2008 evolved, certain options became sufficiently standardized that it was  
15168            concluded that simply requiring one of the option choices was simpler than retaining the option.  
15169            However, for backwards-compatibility, the option flags (with required constant values) are  
15170            retained.

#### 15171 **Version Test Macros**

15172            The standard developers considered altering the definition of `_POSIX_VERSION` and removing  
15173            `_SC_VERSION` from the specification of `sysconf()` since the utility to an application was deemed  
15174            by some to be minimal, and since the implementation of the functionality is potentially  
15175            problematic. However, they recognized that support for existing application binaries is a  
15176            concern to manufacturers, application developers, and the users of implementations conforming  
15177            to POSIX.1-2008.

15178            While the example using `_SC_VERSION` in the APPLICATION USAGE section does not provide  
15179            the greatest degree of imaginable utility to the application developer or user, it is arguably better  
15180            than a **core** file or some other equally obscure result. (It is also possible for implementations to  
15181            encode and recognize application binaries compiled in various POSIX.1-conforming  
15182            environments, and modify the semantics of the underlying system to conform to the  
15183            expectations of the application.) For the reasons outlined in the preceding paragraphs and in the  
15184            APPLICATION USAGE section, the standard developers elected to retain the `_POSIX_VERSION`  
15185            and `_SC_VERSION` functionality.

#### 15186 **Compile-Time Symbolic Constants for System-Wide Options**

15187            POSIX.1-2008 includes support in certain areas for the newly adopted policy governing options  
15188            and stubs.

15189            This policy provides flexibility for implementations in how they support options. It also  
15190            specifies how conforming applications can adapt to different implementations that support  
15191            different sets of options. It allows the following:

- 15192            1. If an implementation has no interest in supporting an option, it does not have to provide  
15193            anything associated with that option beyond the announcement that it does not support  
15194            it.
- 15195            2. An implementation can support a partial or incompatible version of an option (as a non-  
15196            standard extension) as long as it does not claim to support the option.
- 15197            3. An application can determine whether the option is supported. A strictly conforming  
15198            application must check this announcement mechanism before first using anything  
15199            associated with the option.

15200            There is an important implication of this policy. POSIX.1-2008 cannot dictate the behavior of  
15201            interfaces associated with an option when the implementation does not claim to support the  
15202            option. In particular, it cannot require that a function associated with an unsupported option  
15203            will fail if it does not perform as specified. However, this policy does not prevent a standard  
15204            from requiring certain functions to always be present, but that they shall always fail on some  
15205            implementations. The `setpgid()` function in the POSIX.1-1990 standard, for example, is  
15206            considered appropriate.

15207            The POSIX standards include various options, and the C-language binding support for an

15208 option implies that the implementation must supply data types and function interfaces. An  
 15209 application must be able to discover whether the implementation supports each option.

15210 Any application must consider the following three cases for each option:

15211 1. Option never supported.

15212 The implementation advertises at compile time that the option will never be supported.  
 15213 In this case, it is not necessary for the implementation to supply any of the data types or  
 15214 function interfaces that are provided only as part of the option. The implementation  
 15215 might provide data types and functions that are similar to those defined by POSIX.1-2008,  
 15216 but there is no guarantee for any particular behavior.

15217 2. Option always supported.

15218 The implementation advertises at compile time that the option will always be supported.  
 15219 In this case, all data types and function interfaces shall be available and shall operate as  
 15220 specified.

15221 3. Option might or might not be supported.

15222 Some implementations might not provide a mechanism to specify support of options at  
 15223 compile time. In addition, the implementation might be unable or unwilling to specify  
 15224 support or non-support at compile time. In either case, any application that might use the  
 15225 option at runtime must be able to compile and execute. The implementation must  
 15226 provide, at compile time, all data types and function interfaces that are necessary to allow  
 15227 this. In this situation, there must be a mechanism that allows the application to query, at  
 15228 runtime, whether the option is supported. If the application attempts to use the option  
 15229 when it is not supported, the result is unspecified unless explicitly specified otherwise in  
 15230 POSIX.1-2008.

#### 15243 CHANGE HISTORY

15244 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 15245 Issue 5

15246 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
 15247 Threads Extension.

15248 The symbolic constants `_XOPEN_REALTIME` and `_XOPEN_REALTIME_THREADS` are added.  
 15249 `_POSIX2_C_BIND`, `_XOPEN_ENH_I18N`, and `_XOPEN_SHM` must now be set to a value other  
 15250 than `-1` by a conforming implementation.

15251 Large File System extensions are added.

- 15252 The type of the argument to *sbrk()* is changed from **int** to **intptr\_t**.
- 15253 `_XBS_` constants are added to the list of constants for Options and Option Groups, to the list of  
15254 constants for the *confstr()* function, and to the list of constants to the *sysconf()* function. These  
15255 are all marked EX.
- 15256 **Issue 6**
- 15257 `_POSIX2_C_VERSION` is removed.
- 15258 The Open Group Corrigendum U026/4 is applied, adding the prototype for *fdatasync()*.
- 15259 The Open Group Corrigendum U026/1 is applied, adding the symbols `_SC_XOPEN_LEGACY`,  
15260 `_SC_XOPEN_REALTIME`, and `_SC_XOPEN_REALTIME_THREADS`.
- 15261 The symbols `_XOPEN_STREAMS` and `_SC_XOPEN_STREAMS` are added to support the XSI  
15262 STREAMS Option Group.
- 15263 Text in the DESCRIPTION relating to conformance requirements is moved elsewhere in  
15264 IEEE Std 1003.1-2001.
- 15265 The LEGACY symbol `_SC_PASS_MAX` is removed.
- 15266 The following new requirements on POSIX implementations derive from alignment with the  
15267 Single UNIX Specification:
- 15268 • The `_CS_POSIX_*` and `_CS_XBS5_*` constants are added for the *confstr()* function.
  - 15269 • The `_SC_XBS5_*` constants are added for the *sysconf()* function.
  - 15270 • The symbolic constants `F_ULOCK`, `F_LOCK`, `F_TLOCK`, and `F_TEST` are added.
  - 15271 • The **uid\_t**, **gid\_t**, **off\_t**, **pid\_t**, and **useconds\_t** types are mandated.
- 15272 The *gethostname()* prototype is added for sockets.
- 15273 A new section is added for System-Wide Options.
- 15274 Function prototypes for *setegid()* and *seteuid()* are added.
- 15275 Option symbolic constants are added for `_POSIX_ADVISORY_INFO`, `_POSIX_CPUTIME`,  
15276 `_POSIX_SPAWN`, `_POSIX_SPARADIC_SERVER`, `_POSIX_THREAD_CPUTIME`,  
15277 `_POSIX_THREAD_SPARADIC_SERVER`, and `_POSIX_TIMEOUTS`, and *pathconf()* variables are  
15278 added for `_PC_ALLOC_SIZE_MIN`, `_PC_REC_INCR_XFER_SIZE`, `_PC_REC_MAX_XFER_SIZE`,  
15279 `_PC_REC_MIN_XFER_SIZE`, and `_PC_REC_XFER_ALIGN` for alignment with IEEE Std  
15280 1003.1d-1999.
- 15281 The following are added for alignment with IEEE Std 1003.1j-2000:
- 15282 • Option symbolic constants `_POSIX_BARRIERS`, `_POSIX_CLOCK_SELECTION`,  
15283 `_POSIX_MONOTONIC_CLOCK`, `_POSIX_READER_WRITER_LOCKS`,  
15284 `_POSIX_SPIN_LOCKS`, and `_POSIX_TYPED_MEMORY_OBJECTS`
  - 15285 • *sysconf()* variables `_SC_BARRIERS`, `_SC_CLOCK_SELECTION`,  
15286 `_SC_MONOTONIC_CLOCK`, `_SC_READER_WRITER_LOCKS`, `_SC_SPIN_LOCKS`, and  
15287 `_SC_TYPED_MEMORY_OBJECTS`
- 15288 The `_SC_XBS5` macros associated with the ISO/IEC 9899:1990 standard are marked LEGACY,  
15289 and new equivalent `_SC_V6` macros associated with the ISO/IEC 9899:1999 standard are  
15290 introduced.
- 15291 The *getwd()* function is marked LEGACY.
- 15292 The **restrict** keyword is added to the prototypes for *readlink()* and *swab()*.

- 15293 Constants for options are now harmonized, so when supported they take the year of approval of  
15294 IEEE Std 1003.1-2001 as the value.
- 15295 The following are added for alignment with IEEE Std 1003.1q-2000:
- 15296 • Optional symbolic constants `_POSIX_TRACE`, `_POSIX_TRACE_EVENT_FILTER`,  
15297 `_POSIX_TRACE_LOG`, and `_POSIX_TRACE_INHERIT`
  - 15298 • The `sysconf()` symbolic constants `_SC_TRACE`, `_SC_TRACE_EVENT_FILTER`,  
15299 `_SC_TRACE_LOG`, and `_SC_TRACE_INHERIT`
- 15300 The `brk()` and `sbrk()` LEGACY functions are removed.
- 15301 The Open Group Base Resolution bwg2001-006 is applied, which reworks the XSI versioning  
15302 information.
- 15303 The Open Group Base Resolution bwg2001-008 is applied, changing the `namelen` parameter for  
15304 `gethostname()` from `socklen_t` to `size_t`.
- 15305 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/2 is applied, changing “Thread Stack  
15306 Address Size” to “Thread Stack Size Attribute”.
- 15307 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/20 is applied, adding the `_POSIX_IPV6`,  
15308 `_SC_V6`, and `_SC_RAW_SOCKETS` symbols.
- 15309 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/21 is applied, correcting the description  
15310 in “Constants for Functions” for the `_CS_POSIX_V6_LP64_OFF64_CFLAGS`,  
15311 `_CS_POSIX_V6_LP64_OFF64_LDFLAGS`, and `_CS_POSIX_V6_LP64_OFF64_LIBS` symbols.
- 15312 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/22 is applied, removing the shading for  
15313 the `_PC*` and `_SC*` constants, since these are mandatory on all implementations.
- 15314 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/23 is applied, adding the  
15315 `_PC_SYMLINK_MAX` and `_SC_SYMLINK_MAX` constants.
- 15316 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/24 is applied, correcting the shading and  
15317 margin code for the `fsync()` function.
- 15318 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/25 is applied, adding the following text to  
15319 the APPLICATION USAGE section: “New applications should not use `_XOPEN_SHM` or  
15320 `_XOPEN_ENH_I18N`.”.
- 15321 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/29 is applied, clarifying the requirements  
15322 for when constants for Options and Option Groups can be defined or undefined.
- 15323 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/30 is applied, changing the  
15324 `_V6_ILP32_OFF32`, `_V6_ILP32_OFFBIG`, `_V6_LP64_OFF64`, and `_V6_LP64_OFFBIG` symbols to  
15325 `_POSIX_V6_ILP32_OFF32`, `_POSIX_V6_ILP32_OFFBIG`, `_POSIX_V6_LP64_OFF64`, and  
15326 `_POSIX_V6_LP64_OFFBIG`, respectively. This is for consistency with the `sysconf()` and `c99`  
15327 reference pages.
- 15328 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/31 is applied, adding that the format of  
15329 names of programming environments can be obtained using the `getconf -v` option.
- 15330 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/32 is applied, deleting the  
15331 `_SC_FILE_LOCKING`, `_SC_2_C_VERSION`, and `_SC_XOPEN_XCU_VERSION` constants.
- 15332 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/33 is applied, adding  
15333 `_SC_SS_REPL_MAX`, `_SC_TRACE_EVENT_NAME_MAX`, `_SC_TRACE_NAME_MAX`,  
15334 `_SC_TRACE_SYS_MAX`, and `_SC_TRACE_USER_EVENT_MAX` to the list of symbolic constants  
15335 for `sysconf()`.

- 15336 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/34 is applied, updating the prototype for  
15337 the *symlink()* function to match that in the System Interfaces volume of IEEE Std 1003.1-2001.
- 15338 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/35 is applied, adding `_PC_2_SYMLINKS`  
15339 to the symbolic constants list for *pathconf()*. This corresponds to the definition of  
15340 `POSIX2_SYMLINKS` in the Shell and Utilities volume of IEEE Std 1003.1-2001.
- 15341 **Issue 7**
- 15342 Austin Group Interpretations 1003.1-2001 #026 and #047 are applied.
- 15343 Austin Group Interpretation 1003.1-2001 #166 is applied to permit an additional compiler flag to  
15344 enable threads.
- 15345 Austin Group Interpretation 1003.1-2001 #178 is applied, clarifying the values allowed for  
15346 `_POSIX2_CHAR_TERM`.
- 15347 SD5-XBD-ERN-41 is applied, adding the `_POSIX2_SYMLINKS` constant.
- 15348 SD5-XBD-ERN-76 and SD5-XBD-ERN-77 are applied.
- 15349 Symbols to support the UUCP Utilities option are added.
- 15350 The variables for the supported programming environments are updated to be V7.
- 15351 The LEGACY and obsolescent symbols are removed.
- 15352 The *faccessat()*, *fchownat()*, *fexecve()*, *linkat()*, *readlinkat()*, *symlinkat()*, and *unlinkat()* functions  
15353 are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.
- 15354 The `_POSIX_TRACE*` constants from the Trace option are marked obsolescent.
- 15355 The `_POSIX2_PBS*` constants from the Batch Environment Services and Utilities option are  
15356 marked obsolescent.
- 15357 Functionality relating to the Asynchronous Input and Output, Barriers, Clock Selection, Memory  
15358 Mapped Files, Memory Protection, Realtime Signals Extension, Semaphores, Spin Locks,  
15359 Threads, Timeouts, and Timers options is moved to the Base.
- 15360 Functionality relating to the Thread Priority Protection and Thread Priority Inheritance options  
15361 is changed to be Non-Robust Mutex or Robust Mutex Priority Protection and Non-Robust Mutex  
15362 or Robust Mutex Priority Inheritance, respectively.
- 15363 This reference page is clarified with respect to macros and symbolic constants.
- 15364 Changes are made related to support for finegrained timestamps and the  
15365 `_POSIX_TIMESTAMP_RESOLUTION` constant is added.
- 15366 The `_SC_THREAD_ROBUST_PRIO_INHERIT` and `_SC_THREAD_ROBUST_PRIO_PROTECT`  
15367 symbolic constants are added.

15368 **NAME**15369 `utime.h` — access and modification times structure15370 **SYNOPSIS**15371 OB `#include <utime.h>`15372 **DESCRIPTION**15373 The <utime.h> header shall declare the **utimbuf** structure, which shall include the following  
15374 members:15375 `time_t` `actime` Access time.  
15376 `time_t` `modtime` Modification time.

15377 The times shall be measured in seconds since the Epoch.

15378 The <utime.h> header shall define the **time\_t** type as described in <sys/types.h>.15379 The following shall be declared as a function and may also be defined as a macro. A function  
15380 prototype shall be provided.15381 `int utime(const char *, const struct utimbuf *)`;15382 **APPLICATION USAGE**15383 The `utime()` function only allows setting file timestamps to the nearest second. Applications  
15384 should use the `utimensat()` function instead. See <sys/stat.h>.15385 **RATIONALE**

15386 None.

15387 **FUTURE DIRECTIONS**

15388 The &lt;utime.h&gt; header may be removed in a future version.

15389 **SEE ALSO**

15390 &lt;sys/stat.h&gt;, &lt;sys/types.h&gt;

15391 XSH `futimens()`, `utime()`15392 **CHANGE HISTORY**

15393 First released in Issue 3.

15394 **Issue 6**15395 The following new requirements on POSIX implementations derive from alignment with the  
15396 Single UNIX Specification:

- 15397
- The **time\_t** type is defined.

15398 **Issue 7**

15399 The &lt;utime.h&gt; header is marked obsolescent.

**<utmpx.h>**15400 **NAME**

15401 utmpx.h — user accounting database definitions

15402 **SYNOPSIS**15403 XSI `#include <utmpx.h>`15404 **DESCRIPTION**15405 The **<utmpx.h>** header shall define the **utmpx** structure that shall include at least the following  
15406 members:

15407	char	ut_user[]	User login name.
15408	char	ut_id[]	Unspecified initialization process identifier.
15409	char	ut_line[]	Device name.
15410	pid_t	ut_pid	Process ID.
15411	short	ut_type	Type of entry.
15412	struct timeval	ut_tv	Time entry was made.

15413 The **<utmpx.h>** header shall define the **pid\_t** type through **typedef**, as described in  
15414 **<sys/types.h>**.15415 The **<utmpx.h>** header shall define the **timeval** structure as described in **<sys/time.h>**.15416 Inclusion of the **<utmpx.h>** header may also make visible all symbols from **<sys/time.h>**.15417 The **<utmpx.h>** header shall define the following symbolic constants as possible values for the  
15418 *ut\_type* member of the **utmpx** structure:

15419	EMPTY	No valid user accounting information.
15420	BOOT_TIME	Identifies time of system boot.
15421	OLD_TIME	Identifies time when system clock changed.
15422	NEW_TIME	Identifies time after system clock changed.
15423	USER_PROCESS	Identifies a process.
15424	INIT_PROCESS	Identifies a process spawned by the init process.
15425	LOGIN_PROCESS	Identifies the session leader of a logged-in user.
15426	DEAD_PROCESS	Identifies a session leader who has exited.

15427 The following shall be declared as functions and may also be defined as macros. Function  
15428 prototypes shall be provided.

```

15429 void          endutxent (void);
15430 struct utmpx *getutxent (void);
15431 struct utmpx *getutxid (const struct utmpx *);
15432 struct utmpx *getutxline (const struct utmpx *);
15433 struct utmpx *pututxline (const struct utmpx *);
15434 void          setutxent (void);

```

**<wchar.h>**15446 **NAME**15447            **wchar.h** — wide-character handling15448 **SYNOPSIS**

15449            #include &lt;wchar.h&gt;

15450 **DESCRIPTION**

15451 CX        Some of the functionality described on this reference page extends the ISO C standard.  
 15452        Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 15453        enable the visibility of these symbols in this header.

15454        The &lt;wchar.h&gt; header shall define the following types:

15455 CX        **FILE**            As described in <stdio.h>.15456 CX        **locale\_t**        As described in <locale.h>.

15457        **mbstate\_t**        An object type other than an array type that can hold the conversion state  
 15458        information necessary to convert between sequences of (possibly multi-byte)  
 15459 CX        characters and wide characters. If a codeset is being used such that an  
 15460        **mbstate\_t** needs to preserve more than two levels of reserved state, the results  
 15461        are unspecified.

15462        **size\_t**            As described in <stddef.h>.15463 CX        **va\_list**        As described in <stdarg.h>.15464        **wchar\_t**           As described in <stddef.h>.

15465 OB XSI    **wctype\_t**        A scalar type of a data object that can hold values which represent locale-  
 15466        specific character classification.

15467        **wint\_t**            An integer type capable of storing any valid value of **wchar\_t** or WEOF.

15468        The tag **tm** shall be declared as naming an incomplete structure type, the contents of which are  
 15469        described in the <time.h> header.

15470        The implementation shall support one or more programming environments in which the width  
 15471        of **wint\_t** is no greater than the width of type **long**. The names of these programming  
 15472        environments can be obtained using the *confstr()* function or the *getconf* utility.

15473        The &lt;wchar.h&gt; header shall define the following macros:

15474        **WCHAR\_MAX**        As described in <stdint.h>.15475        **WCHAR\_MIN**        As described in <stdint.h>.

15476        **WEOF**            Constant expression of type **wint\_t** that is returned by several WP functions to  
 15477        indicate end-of-file.

15478        **NULL**            As described in <stddef.h>.

15479 CX        Inclusion of the <wchar.h> header may make visible all symbols from the headers <ctype.h>,  
 15480        <string.h>, <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, and <time.h>.

15481        The following shall be declared as functions and may also be defined as macros. Function  
 15482        prototypes shall be provided for use with ISO C standard compilers.

15483        **wint\_t**            btowc(int);15484        **wint\_t**            fgetwc(FILE \*);15485        **wchar\_t**        \*fgetws(wchar\_t \*restrict, int, FILE \*restrict);15486        **wint\_t**            fputwc(wchar\_t, FILE \*);15487        **int**                fputws(const wchar\_t \*restrict, FILE \*restrict);

15584		int	wprintf(const wchar_t *restrict, ...);
15585		int	wscanf(const wchar_t *restrict, ...);

15586 **APPLICATION USAGE**

15587 The *iswblank()* function was a late addition to the ISO C standard and was introduced at the  
 15588 same time as the ISO C standard introduced <wctype.h>, which contains all of the *isw\*()*  
 15589 functions. The Open Group Base Specifications had previously aligned with the MSE working  
 15590 draft and had introduced the rest of the *isw\*()* functions into <wchar.h>. For backwards-  
 15591 compatibility, the original set of *isw\*()* functions, without *iswblank()*, are permitted (as part of  
 15592 the XSI option) in <wchar.h>. For maximum portability, applications should include  
 15593 <wctype.h> in order to obtain declarations for the *isw\*()* functions. This compatibility has been  
 15594 made obsolescent.

15595 **RATIONALE**

15596 In the ISO C standard, the symbols referenced as XSI extensions are in <wctype.h>. Their  
 15597 presence here is thus an extension.

15598 **FUTURE DIRECTIONS**

15599 None.

15600 **SEE ALSO**

15613 **CHANGE HISTORY**

15614 First released in Issue 4.

15615 **Issue 5**

15616 Aligned with the ISO/IEC 9899:1990/Amendment 1:1995 (E).

15617 **Issue 6**

15618 The Open Group Corrigendum U021/10 is applied. The prototypes for *wcswidth()* and  
 15619 *wcwidth()* are marked as extensions.

15620 The Open Group Corrigendum U028/5 is applied, correcting the prototype for the *mbsinit()*  
 15621 function.

15622 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 15623 • Various function prototypes are updated to add the **restrict** keyword.
- 15624 • The functions *vwscanf()*, *vwscanf()*, *wcstof()*, *wcstold()*, *wcstoll()*, and *wcstoull()* are  
 15625 added.

15626 The type **wctype\_t**, the *isw\*()*, *to\*()*, and *wctype()* functions are marked as XSI extensions.

15627 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/26 is applied, adding the APPLICATION  
 15628 USAGE section.

## &lt;wchar.h&gt;

Headers

15629 **Issue 7**

15630 The *mbsnrto wcs()*, *open\_wmemstream()*, *wcpcpy()*, *wcpncpy()*, *wscasecmp()*, *wcsdup()*,  
15631 *wcsncasecmp()*, *wcsnlen()*, and *wscnrto mbs()* functions are added from The Open Group  
15632 Technical Standard, 2006, Extended API Set Part 1.

15633 The *wscasecmp\_l()*, *wcsncasecmp\_l()*, *wscoll\_l()*, and *wcsxfrm\_l()* functions are added from The  
15634 Open Group Technical Standard, 2006, Extended API Set Part 4.

15635 The **wctype\_t** type, and the *isw\**, *towlower()*, and *towupper()* functions are marked obsolescent in  
15636 <wchar.h> since the ISO C standard requires the declarations to be in <wctype.h>.

15637 This reference page is clarified with respect to macros and symbolic constants, and a declaration  
15638 for the **locale\_t** type is added.

## Headers

## &lt;wctype.h&gt;

## 15639 NAME

15640 wctype.h — wide-character classification and mapping utilities

## 15641 SYNOPSIS

15642 #include <wctype.h>

## 15643 DESCRIPTION

15644 CX Some of the functionality described on this reference page extends the ISO C standard.  
 15645 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to  
 15646 enable the visibility of these symbols in this header.

15647 The <wctype.h> header shall define the following types:

15648 **wint\_t** As described in <wchar.h>.

15649 **wctrans\_t** A scalar type that can hold values which represent locale-specific character  
 15650 mappings.

15651 **wctype\_t** As described in <wchar.h>.

15652 CX The <wctype.h> header shall define the **locale\_t** type as described in <locale.h>.

15653 The <wctype.h> header shall define the following macro:

15654 **WEOF** As described in <wchar.h>.

15655 For all functions described in this header that accept an argument of type **wint\_t**, the value is  
 15656 representable as a **wchar\_t** or equals the value of **WEOF**. If this argument has any other value,  
 15657 the behavior is undefined.

15658 The behavior of these functions shall be affected by the *LC\_CTYPE* category of the current locale.

15659 CX Inclusion of the <wctype.h> header may make visible all symbols from the headers <ctype.h>,  
 15660 <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, <string.h>, <time.h>, and <wchar.h>.

15661 The following shall be declared as functions and may also be defined as macros. Function  
 15662 prototypes shall be provided for use with ISO C standard compilers.

```

15663 int iswalnum(wint_t);
15664 CX int iswalnum_l(wint_t, locale_t);
15665 int iswalpna(wint_t);
15666 CX int iswalpna_l(wint_t, locale_t);
15667 int iswblank(wint_t);
15668 CX int iswblank_l(wint_t, locale_t);
15669 int iswcntrl(wint_t);
15670 CX int iswcntrl_l(wint_t, locale_t);
15671 int iswctype(wint_t, wctype_t);
15672 CX int iswctype_l(wint_t, wctype_t, locale_t);
15673 int iswdigit(wint_t);
15674 CX int iswdigit_l(wint_t, locale_t);
15675 int iswgraph(wint_t);
15676 CX int iswgraph_l(wint_t, locale_t);
15677 int iswlower(wint_t);
15678 CX int iswlower_l(wint_t, locale_t);
15679 int iswprint(wint_t);
15680 CX int iswprint_l(wint_t, locale_t);
15681 int iswpunct(wint_t);
15682 CX int iswpunct_l(wint_t, locale_t);
15683 int iswspace(wint_t);
  
```

## &lt;wctype.h&gt;

Headers

```

15684 CX      int      iswspace_l(wint_t, locale_t);
15685        int      iswupper(wint_t);
15686 CX      int      iswupper_l(wint_t, locale_t);
15687        int      iswxdigit(wint_t);
15688 CX      int      iswxdigit_l(wint_t, locale_t);
15689        wint_t    towctrans(wint_t, wctrans_t);
15690 CX      wint_t    towctrans_l(wint_t, wctrans_t, locale_t);
15691        wint_t    tolower(wint_t);
15692 CX      wint_t    tolower_l(wint_t, locale_t);
15693        wint_t    toupper(wint_t);
15694 CX      wint_t    toupper_l(wint_t, locale_t);
15695        wctrans_t wctrans(const char *);
15696 CX      wctrans_t wctrans_l(const char *, locale_t);
15697        wctype_t  wctype(const char *);
15698 CX      wctype_t  wctype_l(const char *, locale_t);

15711 **CHANGE HISTORY**

15712 First released in Issue 5. Derived from the ISO/IEC 9899:1990/Amendment 1:1995 (E).

15713 **Issue 6**15714 The [iswblank\(\)](#) function is added for alignment with the ISO/IEC 9899:1999 standard.15715 **Issue 7**

15716 SD5-XBD-ERN-6 is applied.

15717 The [\\*\\_l\(\)](#) functions are added from The Open Group Technical Standard, 2006, Extended API Set  
15718 Part 4.

15719 This reference page is clarified with respect to macros and symbolic constants.

## Headers

## &lt;wordexp.h&gt;

## 15720 NAME

15721 wordexp.h — word-expansion types

## 15722 SYNOPSIS

15723 #include &lt;wordexp.h&gt;

## 15724 DESCRIPTION

15725 The <wordexp.h> header shall define the structures and symbolic constants used by the  
15726 *wordexp()* and *wordfree()* functions.15727 The <wordexp.h> header shall define the **wordexp\_t** structure type, which shall include at least  
15728 the following members:

15729	size_t	we_wordc	Count of words matched by <i>words</i> .
15730	char	**we_wordv	Pointer to list of expanded words.
15731	size_t	we_offs	Slots to reserve at the beginning of <i>we_wordv</i> .

15732 The <wordexp.h> header shall define the following symbolic constants for use as flags for the  
15733 *wordexp()* function:

15734	WRDE_APPEND	Append words to those previously generated.
15735	WRDE_DOOFFS	Number of null pointers to prepend to <i>we_wordv</i> .
15736	WRDE_NOCMD	Fail if command substitution is requested.
15737	WRDE_REUSE	The <i>pwordexp</i> argument was passed to a previous successful call to 15738 <i>wordexp()</i> , and has not been passed to <i>wordfree()</i> . The result is the same 15739 as if the application had called <i>wordfree()</i> and then called <i>wordexp()</i> 15740 without WRDE_REUSE.

15741 WRDE\_SHOWERR Do not redirect *stderr* to */dev/null*.

15742 WRDE\_UNDEF Report error on an attempt to expand an undefined shell variable.

15743 The &lt;wordexp.h&gt; header shall define the following symbolic constants as error return values:

15744	WRDE_BADCHAR	One of the unquoted characters—<newline>, '   ', ' & ', ' ; ', ' < ', ' > ', 15745 ' ( ', ' ) ', ' { ', ' } '—appears in <i>words</i> in an inappropriate context.
15746	WRDE_BADVAL	Reference to undefined shell variable when WRDE_UNDEF is set in <i>flags</i> .
15747	WRDE_CMDSUB	Command substitution requested when WRDE_NOCMD was set in <i>flags</i> .
15748	WRDE_NOSPACE	Attempt to allocate memory failed.
15749	WRDE_SYNTAX	Shell syntax error, such as unbalanced parentheses or unterminated 15750 string.

15751 The <wordexp.h> header shall define the **size\_t** type as described in <stddef.h>.15752 The following shall be declared as functions and may also be defined as macros. Function  
15753 prototypes shall be provided.

```
15754 int wordexp(const char *restrict, wordexp_t *restrict, int);
15755 void wordfree(wordexp_t *);
```

Chapter 1

15779

# Introduction

15780

The System Interfaces volume of POSIX.1-2008 describes the interfaces offered to application programs by POSIX-conformant systems.

15781

## 1.1 Relationship to Other Formal Standards

15783

Great care has been taken to ensure that this volume of POSIX.1-2008 is fully aligned with the following standards:

15784

15785

ISO C (1999)

15786

ISO/IEC 9899:1999, Programming Languages C, including ISO/IEC

15787

9899:1999/Cor.1:2001(E), ISO/IEC 9899:1999/Cor.2:2004(E), and ISO/IEC

15788

9899:1999/Cor.3.

15789

Parts of the ISO/IEC 9899:1999 standard (hereinafter referred to as the ISO C standard) are referenced to describe requirements also mandated by this volume of POSIX.1-2008. Some functions and headers included within this volume of POSIX.1-2008 have a version in the ISO C standard; in this case CX markings are added as appropriate to show where the ISO C standard has been extended (see [Section 1.7.1](#), on page 7). Any conflict between this volume of POSIX.1-2008 and the ISO C standard is unintentional.

15790

15791

15792

15793

15794

15795

This volume of POSIX.1-2008 also allows, but does not require, mathematics functions to support IEEE Std 754-1985 and IEEE Std 854-1987.

15796

## 1.2 Format of Entries

15798

The entries in [Chapter 3](#) are based on a common format as follows. The only sections relating to conformance are the SYNOPSIS, DESCRIPTION, RETURN VALUE, and ERRORS sections.

15799

15800

### NAME

15801

This section gives the name or names of the entry and briefly states its purpose.

15802

### SYNOPSIS

15803

This section summarizes the use of the entry being described. If it is necessary to include a header to use this function, the names of such headers are shown, for example:

15804

15805

15806

```
#include <stdio.h>
```

15807

### DESCRIPTION

15808

This section describes the functionality of the function or header.

15809

### RETURN VALUE

15810

This section indicates the possible return values, if any.

15811

If the implementation can detect errors, "successful completion" means that no error

- 15812 has been detected during execution of the function. If the implementation does detect  
15813 an error, the error is indicated.
- 15814 For functions where no errors are defined, “successful completion” means that if the  
15815 implementation checks for errors, no error has been detected. If the implementation can  
15816 detect errors, and an error is detected, the indicated return value is returned and *errno*  
15817 may be set.
- 15818 **ERRORS**
- 15819 This section gives the symbolic names of the error values returned by a function or  
15820 stored into a variable accessed through the symbol *errno* if an error occurs.
- 15821 “No errors are defined” means that error values returned by a function or stored into a  
15822 variable accessed through the symbol *errno*, if any, depend on the implementation.
- 15823 **EXAMPLES**
- 15824 This section is informative.
- 15825 This section gives examples of usage, where appropriate. In the event of conflict  
15826 between an example and a normative part of this volume of POSIX.1-2008, the  
15827 normative material is to be taken as correct.
- 15828 **APPLICATION USAGE**
- 15829 This section is informative.
- 15830 This section gives warnings and advice to application developers about the entry. In the  
15831 event of conflict between warnings and advice and a normative part of this volume of  
15832 POSIX.1-2008, the normative material is to be taken as correct.
- 15833 **RATIONALE**
- 15834 This section is informative.
- 15835 This section contains historical information concerning the contents of this volume of  
15836 POSIX.1-2008 and why features were included or discarded by the standard  
15837 developers.
- 15838 **FUTURE DIRECTIONS**
- 15839 This section is informative.
- 15840 This section provides comments which should be used as a guide to current thinking;  
15841 there is not necessarily a commitment to adopt these future directions.
- 15842 **SEE ALSO**
- 15843 This section is informative.
- 15844 This section gives references to related information.
- 15845 **CHANGE HISTORY**
- 15846 This section is informative.
- 15847 This section shows the derivation of the entry and any significant changes that have  
15848 been made to it.

15849

Chapter 2

15850

## General Information

15851

This chapter covers information that is relevant to all the functions specified in Chapter 3 and XBD Chapter 13 (on page 219).

15852

## 2.1 Use and Implementation of Interfaces

15853

### 2.1.1 Use and Implementation of Functions

15854

15855

Each of the following statements shall apply to all functions unless explicitly stated otherwise in the detailed descriptions that follow:

15856

15857

1. If an argument to a function has an invalid value (such as a value outside the domain of the function, or a pointer outside the address space of the program, or a null pointer), the behavior is undefined.

15858

15859

15860

15861

15862

15863

15864

15865

15866

15867

2. Any function declared in a header may also be implemented as a macro defined in the header, so a function should not be declared explicitly if its header is included. Any macro definition of a function can be suppressed locally by enclosing the name of the function in parentheses, because the name is then not followed by the <left-parenthesis> that indicates expansion of a macro function name. For the same syntactic reason, it is permitted to take the address of a function even if it is also defined as a macro. The use of the C-language `#undef` construct to remove any such macro definition shall also ensure that an actual function is referred to.

15868

15869

15870

3. Any invocation of a function that is implemented as a macro shall expand to code that evaluates each of its arguments exactly once, fully protected by parentheses where necessary, so it is generally safe to use arbitrary expressions as arguments.

15871

15872

15873

4. Provided that a function can be declared without reference to any type defined in a header, it is also permissible to declare the function explicitly and use it without including its associated header.

15874

15875

5. If a function that accepts a variable number of arguments is not declared (explicitly or by including its associated header), the behavior is undefined.

15876 **2.1.2 Use and Implementation of Macros**

15877 Each of the following statements shall apply to all macros unless explicitly stated otherwise:

- 15878 1. Any definition of an object-like macro in a header shall expand to code that is fully  
15879 protected by parentheses where necessary, so that it groups in an arbitrary expression as  
15880 if it were a single identifier.
- 15881 2. All object-like macros listed as expanding to integer constant expressions shall  
15882 additionally be suitable for use in `#if` preprocessing directives.
- 15883 3. Any definition of a function-like macro in a header shall expand to code that evaluates  
15884 each of its arguments exactly once, fully protected by parentheses where necessary, so  
15885 that it is generally safe to use arbitrary expressions as arguments.
- 15886 4. Any definition of a function-like macro in a header can be invoked in an expression  
15887 anywhere a function with a compatible return type could be called.

15888 **2.2 The Compilation Environment**15889 **2.2.1 POSIX.1 Symbols**

15890 Certain symbols in this volume of POSIX.1-2008 are defined in headers (see XBD [Chapter 13](#), on  
15891 page 219). Some of those headers could also define symbols other than those defined by  
15892 POSIX.1-2008, potentially conflicting with symbols used by the application. Also, POSIX.1-2008  
15893 defines symbols that are not permitted by other standards to appear in those headers without  
15894 some control on the visibility of those symbols.

15895 Symbols called “feature test macros” are used to control the visibility of symbols that might be  
15896 included in a header. Implementations, future versions of this standard, and other standards  
15897 may define additional feature test macros.

15898 In the compilation of an application that `#defines` a feature test macro specified by  
15899 POSIX.1-2008, no header defined by POSIX.1-2008 shall be included prior to the definition of the  
15900 feature test macro. This restriction also applies to any implementation-provided header in  
15901 which these feature test macros are used. If the definition of the macro does not precede the  
15902 `#include`, the result is undefined.

15903 Feature test macros shall begin with the <underscore> character (‘\_’).

15904 **2.2.1.1 The `_POSIX_C_SOURCE` Feature Test Macro**

15905 A POSIX-conforming application shall ensure that the feature test macro `_POSIX_C_SOURCE` is  
15906 defined before inclusion of any header.

15907 When an application includes a header described by POSIX.1-2008, and when this feature test  
15908 macro is defined to have the value 200809L:

- 15909 1. All symbols required by POSIX.1-2008 to appear when the header is included shall be  
15910 made visible.

- 15911 2. Symbols that are explicitly permitted, but not required, by POSIX.1-2008 to appear in that  
15912 header (including those in reserved name spaces) may be made visible.
- 15913 3. Additional symbols not required or explicitly permitted by POSIX.1-2008 to be in that  
15914 header shall not be made visible, except when enabled by another feature test macro.
- 15915 Identifiers in POSIX.1-2008 may only be undefined using the **#undef** directive as described in  
15916 [Section 2.1](#) (on page 467) or [Section 2.2.2](#). These **#undef** directives shall follow all **#include**  
15917 directives of any header in POSIX.1-2008.
- 15918 **Note:** The POSIX.1-1990 standard specified a macro called `_POSIX_SOURCE`. This has been  
15919 superseded by `_POSIX_C_SOURCE`.

#### 15920 2.2.1.2 The `_XOPEN_SOURCE` Feature Test Macro

15921 XSI An XSI-conforming application shall ensure that the feature test macro `_XOPEN_SOURCE` is  
15922 defined with the value 700 before inclusion of any header. This is needed to enable the  
15923 functionality described in [Section 2.2.1.1](#) (on page 468) and to ensure that the XSI option is  
15924 enabled.

15925 Since this volume of POSIX.1-2008 is aligned with the ISO C standard, and since all functionality  
15926 enabled by `_POSIX_C_SOURCE` set equal to 200809L is enabled by `_XOPEN_SOURCE` set equal  
15927 to 700, there should be no need to define `_POSIX_C_SOURCE` if `_XOPEN_SOURCE` is so  
15928 defined. Therefore, if `_XOPEN_SOURCE` is set equal to 700 and `_POSIX_C_SOURCE` is set equal  
15929 to 200809L, the behavior is the same as if only `_XOPEN_SOURCE` is defined and set equal to  
15930 700. However, should `_POSIX_C_SOURCE` be set to a value greater than 200809L, the behavior  
15931 is unspecified.

15932 If `_XOPEN_SOURCE` is defined with the value 700 and `_POSIX_C_SOURCE` is undefined before  
15933 inclusion of any header, then the header may define the `_POSIX_C_SOURCE` macro with the  
15934 value 200809L.

### 15935 2.2.2 The Name Space

15936 All identifiers in this volume of POSIX.1-2008, except *environ*, are defined in at least one of the  
15937 XSI headers, as shown in XBD [Chapter 13](#) (on page 219). When `_XOPEN_SOURCE` or  
15938 `_POSIX_C_SOURCE` is defined, each header defines or declares some identifiers, potentially  
15939 conflicting with identifiers used by the application. The set of identifiers visible to the  
15940 application consists of precisely those identifiers from the header pages of the included headers,  
15941 as well as additional identifiers reserved for the implementation. In addition, some headers may  
15942 make visible identifiers from other headers as indicated on the relevant header pages.

15943 Implementations may also add members to a structure or union without controlling the  
15944 visibility of those members with a feature test macro, as long as a user-defined macro with the  
15945 same name cannot interfere with the correct interpretation of the program. The identifiers  
15946 reserved for use by the implementation are described below:

- 15947 1. Each identifier with external linkage described in the header section is reserved for use as  
15948 an identifier with external linkage if the header is included.
- 15949 2. Each macro described in the header section is reserved for any use if the header is  
15950 included.
- 15951 3. Each identifier with file scope described in the header section is reserved for use as an  
15952 identifier with file scope in the same name space if the header is included.

15953 The prefixes `posix_`, `POSIX_`, and `_POSIX_` are reserved for use by POSIX.1-2008 and other

- 15954 POSIX standards. Implementations may add symbols to the headers shown in the following  
15955 table, provided the identifiers for those symbols either:
- 15956 1. Begin with the corresponding reserved prefixes in the table, or
  - 15957 2. Have one of the corresponding complete names in the table, or
  - 15958 3. End in the string indicated as a reserved suffix in the table and do not use the reserved  
15959 prefixes `posix_`, `POSIX_`, or `_POSIX_`, as long as the reserved suffix is in that part of the  
15960 name considered significant by the implementation.
- 15961 Symbols that use the reserved prefix `_POSIX_` may be made visible by implementations in any  
15962 header defined by POSIX.1-2008.

16030 XSI	<utmpx.h>	ut_	_LVL, _PROCESS, _TIME	
16031				
16032	<wchar.h>	wcs[a-z]		
16033	<wctype.h>	is[a-z], to[a-z]		
16034	<wordexp.h>	we_, WRDE_		
16035	ANY header		_t	

**Note:** The notation [A-Z] indicates any uppercase letter in the portable character set. The notation [a-z] indicates any lowercase letter in the portable character set. Commas and spaces in the lists of prefixes and complete names in the above table are not part of any prefix or complete name.

16039 If any header in the following table is included, macros with the prefixes shown may be defined.  
 16040 After the last inclusion of a given header, an application may use identifiers with the  
 16041 corresponding prefixes for its own purpose, provided their use is preceded by a **#undef** of the  
 16042 corresponding macro.

Header	Prefix
<errno.h>	E[0-9], E[A-Z]
<fcntl.h>	F_, O_
<fenv.h>	FE_[A-Z]
<inttypes.h>	PRI[Xa-z], SCN[Xa-z]
<locale.h>	LC_[A-Z]
<math.h>	FP_[A-Z]
<netinet/in.h>	IMPLINK_, IN_, IP_, IPPORT_, SOCK_
16051 IP6	IN6_
16052	<signal.h> SIG_, SIG[A-Z],
16053 XSI	SV_
16054 CX	<stdio.h> SEEK_
16055 OB XSR	<stropts.h> M_, MUXID_R[A-Z], STR
16056 XSI	<sys/resource.h> RLIM_
16057 XSI	<sys/socket.h> CMSG_
16058	<sys/stat.h> S_
16059 XSI	<sys/uio.h> IOV_
16060	<termios.h> I, O, V (See below.)
16061	<unistd.h> SEEK_

16062 The following are used to reserve complete names for the <stdint.h> header:

16063 INT[0-9A-Za-z\_]\*\_MIN  
 16064 INT[0-9A-Za-z\_]\*\_MAX  
 16065 INT[0-9A-Za-z\_]\*\_C  
 16066 UINT[0-9A-Za-z\_]\*\_MIN  
 16067 UINT[0-9A-Za-z\_]\*\_MAX  
 16068 UINT[0-9A-Za-z\_]\*\_C

16069 **Note:** The notation [0-9] indicates any digit. The notation [A-Z] indicates any uppercase letter in the  
 16070 portable character set. The notation [0-9a-z\_] indicates any digit, any lowercase letter in the  
 16071 portable character set, or <underscore>.

16072 XSI The following reserved names are used as exact matches for <termios.h>:

16073 CBAUD	EXTB	VDSUSP
16074 DEFECHO	FLUSHO	VLNEXT
16075 ECHOCTL	LOBLK	VREPRINT
16076 ECHOK	PENDIN	VSTATUS
16077 ECHOPRT	SWTCH	VWERASE
16078 EXTA	VDISCARD	

- 16079 The following identifiers are reserved regardless of the inclusion of headers:
- 16080 1. With the exception of identifiers beginning with the prefix `_POSIX_`, all identifiers that
- 16081 begin with an `<underscore>` and either an uppercase letter or another `<underscore>` are
- 16082 always reserved for any use by the implementation.
- 16083 2. All identifiers that begin with an `<underscore>` are always reserved for use as identifiers
- 16084 with file scope in both the ordinary identifier and tag name spaces.
- 16085 3. All identifiers in the table below are reserved for use as identifiers with external linkage.
- 16086 Some of these identifiers do not appear in this volume of POSIX.1-2008, but are reserved for
- 16087 future use by the ISO C standard.
- 16088 4. All functions and external identifiers defined in XBD [Chapter 13](#) (on page 219) are reserved
- 16089 for use as identifiers with external linkage.
- 16090 5. All the identifiers defined in this volume of POSIX.1-2008 that have external linkage are
- 16091 always reserved for use as identifiers with external linkage.
- 16092 **Note:** The notation `[a-z]` indicates any lowercase letter in the portable character set. The notation `'**'`
- 16093 indicates any combination of digits, letters in the portable character set, or `<underscore>`.
- 16094 No other identifiers are reserved.

16179 Applications shall not declare or define identifiers with the same name as an identifier reserved  
 16180 in the same context. Since macro names are replaced whenever found, independent of scope and  
 16181 name space, macro names matching any of the reserved identifier names shall not be defined by  
 16182 an application if any associated header is included.

16183 Except that the effect of each inclusion of `<assert.h>` depends on the definition of `NDEBUG`,  
 16184 headers may be included in any order, and each may be included more than once in a given  
 16185 scope, with no difference in effect from that of being included only once.

16186 If used, the application shall ensure that a header is included outside of any external declaration  
 16187 or definition, and it shall be first included before the first reference to any type or macro it  
 16188 defines, or to any function or object it declares. However, if an identifier is declared or defined in  
 16189 more than one header, the second and subsequent associated headers may be included after the  
 16190 initial reference to the identifier. Prior to the inclusion of a header, the application shall not  
 16191 define any macros with names lexically identical to symbols defined by that header.

## 16192 2.3 Error Numbers

16193 Most functions can provide an error number. The means by which each function provides its  
16194 error numbers is specified in its description.

16195 Some functions provide the error number in a variable accessed through the symbol *errno*,  
16196 defined by including the `<errno.h>` header. The value of *errno* should only be examined when it  
16197 is indicated to be valid by a function's return value. No function in this volume of POSIX.1-2008  
16198 shall set *errno* to zero. For each thread of a process, the value of *errno* shall not be affected by  
16199 function calls or assignments to *errno* by other threads.

16200 Some functions return an error number directly as the function value. These functions return a  
16201 value of zero to indicate success.

16202 If more than one error occurs in processing a function call, any one of the possible errors may be  
16203 returned, as the order of detection is undefined.

16204 Implementations may support additional errors not included in this list; may generate errors  
16205 included in this list under circumstances other than those described here, or may contain  
16206 extensions or limitations that prevent some errors from occurring.

16207 The ERRORS section on each reference page specifies which error conditions shall be detected  
16208 by all implementations ("shall fail") and which may be optionally detected by an  
16209 implementation ("may fail"). If no error condition is detected, the action requested shall be  
16210 successful.

16211 Implementations may generate error numbers listed here under circumstances other than those  
16212 described, if and only if all those error conditions can always be treated identically to the error  
16213 conditions as described in this volume of POSIX.1-2008. Implementations shall not generate a  
16214 different error number from one required by this volume of POSIX.1-2008 for an error condition  
16215 described in this volume of POSIX.1-2008, but may generate additional errors unless explicitly  
16216 disallowed for a particular function.

16217 Each implementation shall document, in the conformance document, situations in which each of  
16218 the optional conditions defined in POSIX.1-2008 is detected. The conformance document may  
16219 also contain statements that one or more of the optional error conditions are not detected.

16220 Certain threads-related functions are not allowed to return an error code of [EINTR]. Where this  
16221 applies it is stated in the ERRORS section on the individual function pages.

16222 The following macro names identify the possible error numbers, in the context of the functions  
16223 specifically defined in this volume of POSIX.1-2008; these general descriptions are more  
16224 precisely defined in the ERRORS sections of the functions that return them. Only these macro  
16225 names should be used in programs, since the actual value of the error number is unspecified. All  
16226 values listed in this section shall be unique, except as noted below. The values for all these  
16227 macros shall be found in the `<errno.h>` header defined in the Base Definitions volume of  
16228 POSIX.1-2008. The actual values are unspecified by this volume of POSIX.1-2008.

16229 [E2BIG]

16230 Argument list too long. The sum of the number of bytes used by the new process image's  
16231 argument list and environment list is greater than the system-imposed limit of {ARG\_MAX}  
16232 bytes.

16233 or:

16234 Lack of space in an output buffer.

16235 or:

16236 Argument is greater than the system-imposed maximum.

16237	[EACCES]	
16238		Permission denied. An attempt was made to access a file in a way forbidden by its file
16239		access permissions.
16240	[EADDRINUSE]	
16241		Address in use. The specified address is in use.
16242	[EADDRNOTAVAIL]	
16243		Address not available. The specified address is not available from the local system.
16244	[EAFNOSUPPORT]	
16245		Address family not supported. The implementation does not support the specified address
16246		family, or the specified address is not a valid address for the address family of the specified
16247		socket.
16248	[EAGAIN]	
16249		Resource temporarily unavailable. This is a temporary condition and later calls to the same
16250		routine may complete normally.
16251	[EALREADY]	
16252		Connection already in progress. A connection request is already in progress for the specified
16253		socket.
16254	[EBADF]	
16255		Bad file descriptor. A file descriptor argument is out of range, refers to no open file, or a
16256		read (write) request is made to a file that is only open for writing (reading).
16257	[EBADMSG]	
16258	OB XSR	Bad message. During a <i>read()</i> , <i>getmsg()</i> , <i>getpmsg()</i> , or <i>ioctl()</i> I_RECVFD request to a
16259		STREAMS device, a message arrived at the head of the STREAM that is inappropriate for
16260		the function receiving the message.
16261		<i>read()</i> Message waiting to be read on a STREAM is not a data message.
16262		<i>getmsg()</i> or <i>getpmsg()</i>
16263		A file descriptor was received instead of a control message.
16264		<i>ioctl()</i> Control or data information was received instead of a file descriptor when
16265		I_RECVFD was specified.
16266		or:
16267		Bad Message. The implementation has detected a corrupted message.
16268	[EBUSY]	
16269		Resource busy. An attempt was made to make use of a system resource that is not currently
16270		available, as it is being used by another process in a manner that would have conflicted
16271		with the request being made by this process.
16272	[ECANCELED]	
16273		Operation canceled. The associated asynchronous operation was canceled before
16274		completion.
16275	[ECHILD]	
16276		No child process. A <i>wait()</i> , <i>waitid()</i> , or <i>waitpid()</i> function was executed by a process that
16277		had no existing or unwaited-for child process.
16278	[ECONNABORTED]	
16279		Connection aborted. The connection has been aborted.

## General Information

## Error Numbers

16280	[ECONNREFUSED]
16281	Connection refused. An attempt to connect to a socket was refused because there was no
16282	process listening or because the queue of connection requests was full and the underlying
16283	protocol does not support retransmissions.
16284	[ECONNRESET]
16285	Connection reset. The connection was forcibly closed by the peer.
16286	[EDEADLK]
16287	Resource deadlock would occur. An attempt was made to lock a system resource that would
16288	have resulted in a deadlock situation.
16289	[EDESTADDRREQ]
16290	Destination address required. No bind address was established.
16291	[EDOM]
16292	Domain error. An input argument is outside the defined domain of the mathematical
16293	function (defined in the ISO C standard).
16294	[EDQUOT]
16295	Reserved.
16296	[EEXIST]
16297	File exists. An existing file was mentioned in an inappropriate context; for example, as a
16298	new link name in the <i>link()</i> function.
16299	[EFAULT]
16300	Bad address. The system detected an invalid address in attempting to use an argument of a
16301	call. The reliable detection of this error cannot be guaranteed, and when not detected may
16302	result in the generation of a signal, indicating an address violation, which is sent to the
16303	process.
16304	[EFBIG]
16305	File too large. The size of a file would exceed the maximum file size of an implementation
16306	or offset maximum established in the corresponding file description.
16307	[EHOSTUNREACH]
16308	Host is unreachable. The destination host cannot be reached (probably because the host is
16309	down or a remote router cannot reach it).
16310	[EIDRM]
16311	Identifier removed. Returned during XSI interprocess communication if an identifier has
16312	been removed from the system.
16313	[EILSEQ]
16314	Illegal byte sequence. A wide-character code has been detected that does not correspond to
16315	a valid character, or a byte sequence does not form a valid wide-character code (defined in
16316	the ISO C standard).
16317	[EINPROGRESS]
16318	Operation in progress. This code is used to indicate that an asynchronous operation has not
16319	yet completed.
16320	or:
16321	O_NONBLOCK is set for the socket file descriptor and the connection cannot be
16322	immediately established.

16323	[EINTR]	
16324		Interrupted function call. An asynchronous signal was caught by the process during the
16325		execution of an interruptible function. If the signal handler performs a normal return, the
16326		interrupted function call may return this condition (see the Base Definitions volume of
16327		POSIX.1-2008, <signal.h>).
16328	[EINVAL]	
16329		Invalid argument. Some invalid argument was supplied; for example, specifying an
16330		undefined signal in a <i>signal()</i> function or a <i>kill()</i> function.
16331	[EIO]	
16332		Input/output error. Some physical input or output error has occurred. This error may be
16333		reported on a subsequent operation on the same file descriptor. Any other error-causing
16334		operation on the same file descriptor may cause the [EIO] error indication to be lost.
16335	[EISCONN]	
16336		Socket is connected. The specified socket is already connected.
16337	[EISDIR]	
16338		Is a directory. An attempt was made to open a directory with write mode specified.
16339	[ELOOP]	
16340		Symbolic link loop. A loop exists in symbolic links encountered during pathname
16341		resolution. This error may also be returned if more than {SYMLOOP_MAX} symbolic links
16342		are encountered during pathname resolution.
16343	[EMFILE]	
16344		File descriptor value too large or too many open streams. An attempt was made to open a
16345	XSI	file descriptor with a value greater than or equal to {OPEN_MAX}, or greater than or equal
16346		to the soft limit RLIMIT_NOFILE for the process (if smaller than {OPEN_MAX}); or an
16347		attempt was made to open more than the maximum number of streams allowed in the
16348		process.
16349	[EMLINK]	
16350		Too many links. An attempt was made to have the link count of a single file exceed
16351		{LINK_MAX}.
16352	[EMSGSIZE]	
16353		Message too large. A message sent on a transport provider was larger than an internal
16354		message buffer or some other network limit.
16355		or:
16356		Inappropriate message buffer length.
16357	[EMULTIHOP]	
16358		Reserved.
16359	[ENAMETOOLONG]	
16360		Filename too long. The length of a pathname exceeds {PATH_MAX} and the
16361		implementation considers this to be an error, or a pathname component is longer than
16362		{NAME_MAX}. This error may also occur when pathname substitution, as a result of
16363		encountering a symbolic link during pathname resolution, results in a pathname string the
16364		size of which exceeds {PATH_MAX}.
16365	[ENETDOWN]	
16366		Network is down. The local network interface used to reach the destination is down.

## General Information

## Error Numbers

16367		[ENETRESET]
16368		The connection was aborted by the network.
16369		[ENETUNREACH]
16370		Network unreachable. No route to the network is present.
16371		[ENFILE]
16372		Too many files open in system. Too many files are currently open in the system. The system
16373		has reached its predefined limit for simultaneously open files and temporarily cannot
16374		accept requests to open another one.
16375		[ENOBUFS]
16376		No buffer space available. Insufficient buffer resources were available in the system to
16377		perform the socket operation.
16378	OB XSR	[ENODATA]
16379		No message available. No message is available on the STREAM head read queue.
16380		[ENODEV]
16381		No such device. An attempt was made to apply an inappropriate function to a device; for
16382		example, trying to read a write-only device such as a printer.
16383		[ENOENT]
16384		No such file or directory. A component of a specified pathname does not exist, or the
16385		pathname is an empty string.
16386		[ENOEXEC]
16387		Executable file format error. A request is made to execute a file that, although it has
16388		appropriate privileges, is not in the format required by the implementation for executable
16389		files.
16390		[ENOLCK]
16391		No locks available. A system-imposed limit on the number of simultaneous file and record
16392		locks has been reached and no more are currently available.
16393		[ENOLINK]
16394		Reserved.
16395		[ENOMEM]
16396		Not enough space. The new process image requires more memory than is allowed by the
16397		hardware or system-imposed memory management constraints.
16398		[ENOMSG]
16399		No message of the desired type. The message queue does not contain a message of the
16400		required type during XSI interprocess communication.
16401		[ENOPROTOPT]
16402		Protocol not available. The protocol option specified to <i>setsockopt()</i> is not supported by the
16403		implementation.
16404		[ENOSPC]
16405		No space left on a device. During the <i>write()</i> function on a regular file or when extending a
16406		directory, there is no free space left on the device.
16407	OB XSR	[ENOSR]
16408		No STREAM resources. Insufficient STREAMS memory resources are available to perform a
16409		STREAMS-related function. This is a temporary condition; it may be recovered from if other
16410		processes release resources.

16411	OB XSR	[ENOSTR]
16412		Not a STREAM. A STREAM function was attempted on a file descriptor that was not
16413		associated with a STREAMS device.
16414		[ENOSYS]
16415		Function not implemented. An attempt was made to use a function that is not available in
16416		this implementation.
16417		[ENOTCONN]
16418		Socket not connected. The socket is not connected.
16419		[ENOTDIR]
16420		Not a directory. A component of the specified pathname exists, but it is not a directory,
16421		when a directory was expected.
16422		[ENOTEMPTY]
16423		Directory not empty. A directory other than an empty directory was supplied when an
16424		empty directory was expected.
16425		[ENOTRECOVERABLE]
16426		State not recoverable. The state protected by a robust mutex is not recoverable.
16427		[ENOTSOCK]
16428		Not a socket. The file descriptor does not refer to a socket.
16429		[ENOTSUP]
16430		Not supported. The implementation does not support this feature of the Realtime Option
16431		Group.
16432		[ENOTTY]
16433		Inappropriate I/O control operation. A control function has been attempted for a file or
16434		special file for which the operation is inappropriate.
16435		[ENXIO]
16436		No such device or address. Input or output on a special file refers to a device that does not
16437		exist, or makes a request beyond the capabilities of the device. It may also occur when, for
16438		example, a tape drive is not on-line.
16439		[EOPNOTSUPP]
16440		Operation not supported on socket. The type of socket (address family or protocol) does not
16441		support the requested operation. A conforming implementation may assign the same values
16442		for [EOPNOTSUPP] and [ENOTSUP].
16443		[EOVERFLOW]
16444		Value too large to be stored in data type. An operation was attempted which would
16445		generate a value that is outside the range of values that can be represented in the relevant
16446		data type or that are allowed for a given data item.
16447		[EOWNERDEAD]
16448		Previous owner died. The owner of a robust mutex terminated while holding the mutex
16449		lock.
16450		[EPERM]
16451		Operation not permitted. An attempt was made to perform an operation limited to
16452		processes with appropriate privileges or to the owner of a file or other resource.
16453		[EPIPE]
16454		Broken pipe. A write was attempted on a socket, pipe, or FIFO for which there is no process
16455		to read the data.

## General Information

## Error Numbers

16456	[EPROTO]	
16457		Protocol error. Some protocol error occurred. This error is device-specific, but is generally not related to a hardware failure.
16458		
16459	[EPROTONOSUPPORT]	
16460		Protocol not supported. The protocol is not supported by the address family, or the protocol is not supported by the implementation.
16461		
16462	[EPROTOTYPE]	
16463		Protocol wrong type for socket. The socket type is not supported by the protocol.
16464	[ERANGE]	
16465		Result too large or too small. The result of the function is too large (overflow) or too small (underflow) to be represented in the available space (defined in the ISO C standard).
16466		
16467	[EROFS]	
16468		Read-only file system. An attempt was made to modify a file or directory on a file system that is read-only.
16469		
16470	[ESPIPE]	
16471		Invalid seek. An attempt was made to access the file offset associated with a pipe or FIFO.
16472	[ESRCH]	
16473		No such process. No process can be found corresponding to that specified by the given process ID.
16474		
16475	[ESTALE]	
16476		Reserved.
16477	OB XSR [ETIME]	
16478		STREAM <i>ioctl()</i> timeout. The timer set for a STREAMS <i>ioctl()</i> call has expired. The cause of this error is device-specific and could indicate either a hardware or software failure, or a timeout value that is too short for the specific operation. The status of the <i>ioctl()</i> operation is unspecified.
16479		
16480		
16481		
16482	[ETIMEDOUT]	
16483		Connection timed out. The connection to a remote machine has timed out. If the connection timed out during execution of the function that reported this error (as opposed to timing out prior to the function being called), it is unspecified whether the function has completed some or all of the documented behavior associated with a successful completion of the function.
16484		
16485		
16486		
16487		
16488		or:
16489		Operation timed out. The time limit associated with the operation was exceeded before the operation completed.
16490		
16491	[EIXTBSY]	
16492		Text file busy. An attempt was made to execute a pure-procedure program that is currently open for writing, or an attempt has been made to open for writing a pure-procedure program that is being executed.
16493		
16494		
16495	[EWOULDBLOCK]	
16496		Operation would block. An operation on a socket marked as non-blocking has encountered a situation such as no data available that otherwise would have caused the function to suspend execution.
16497		
16498		
16499		A conforming implementation may assign the same values for [EWOULDBLOCK] and [EAGAIN].
16500		

16501 [EXDEV]  
 16502 Improper link. A link to a file on another file system was attempted.

### 16503 2.3.1 Additional Error Numbers

16504 Additional implementation-defined error numbers may be defined in `<errno.h>`.

## 16505 2.4 Signal Concepts

### 16506 2.4.1 Signal Generation and Delivery

16507 A signal is said to be “generated” for (or sent to) a process or thread when the event that causes  
 16508 the signal first occurs. Examples of such events include detection of hardware faults, timer  
 16509 expiration, signals generated via the **sigevent** structure and terminal activity, as well as  
 16510 invocations of the `kill()` and `sigqueue()` functions. In some circumstances, the same event  
 16511 generates signals for multiple processes.

16512 At the time of generation, a determination shall be made whether the signal has been generated  
 16513 for the process or for a specific thread within the process. Signals which are generated by some  
 16514 action attributable to a particular thread, such as a hardware fault, shall be generated for the  
 16515 thread that caused the signal to be generated. Signals that are generated in association with a  
 16516 process ID or process group ID or an asynchronous event, such as terminal activity, shall be  
 16517 generated for the process.

16518 Each process has an action to be taken in response to each signal defined by the system (see  
 16519 [Section 2.4.3](#), on page 486). A signal is said to be “delivered” to a process when the appropriate  
 16520 action for the process and signal is taken. A signal is said to be “accepted” by a process when the  
 16521 signal is selected and returned by one of the `sigwait()` functions.

16522 During the time between the generation of a signal and its delivery or acceptance, the signal is  
 16523 said to be “pending”. Ordinarily, this interval cannot be detected by an application. However, a  
 16524 signal can be “blocked” from delivery to a thread. If the action associated with a blocked signal  
 16525 is anything other than to ignore the signal, and if that signal is generated for the thread, the  
 16526 signal shall remain pending until it is unblocked, it is accepted when it is selected and returned  
 16527 by a call to the `sigwait()` function, or the action associated with it is set to ignore the signal.  
 16528 Signals generated for the process shall be delivered to exactly one of those threads within the  
 16529 process which is in a call to a `sigwait()` function selecting that signal or has not blocked delivery  
 16530 of the signal. If there are no threads in a call to a `sigwait()` function selecting that signal, and if all  
 16531 threads within the process block delivery of the signal, the signal shall remain pending on the  
 16532 process until a thread calls a `sigwait()` function selecting that signal, a thread unblocks delivery  
 16533 of the signal, or the action associated with the signal is set to ignore the signal. If the action  
 16534 associated with a blocked signal is to ignore the signal and if that signal is generated for the  
 16535 process, it is unspecified whether the signal is discarded immediately upon generation or  
 16536 remains pending.

16537 Each thread has a “signal mask” that defines the set of signals currently blocked from delivery  
 16538 to it. The signal mask for a thread shall be initialized from that of its parent or creating thread,  
 16539 or from the corresponding thread in the parent process if the thread was created as the result of a  
 16540 call to `fork()`. The `pthread_sigmask()`, `sigaction()`, `sigprocmask()`, and `sigsuspend()` functions control  
 16541 the manipulation of the signal mask.

16542 The determination of which action is taken in response to a signal is made at the time the signal  
 16543 is delivered, allowing for any changes since the time of generation. This determination is  
 16544 independent of the means by which the signal was originally generated. If a subsequent  
 16545 occurrence of a pending signal is generated, it is implementation-defined as to whether the  
 16546 signal is delivered or accepted more than once in circumstances other than those in which  
 16547 queuing is required. The order in which multiple, simultaneously pending signals outside the  
 16548 range SIGRTMIN to SIGRTMAX are delivered to or accepted by a process is unspecified.

16549 When any stop signal (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is generated for a process, any  
 16550 pending SIGCONT signals for that process shall be discarded. Conversely, when SIGCONT is  
 16551 generated for a process, all pending stop signals for that process shall be discarded. When  
 16552 SIGCONT is generated for a process that is stopped, the process shall be continued, even if the  
 16553 SIGCONT signal is blocked or ignored. If SIGCONT is blocked and not ignored, it shall remain  
 16554 pending until it is either unblocked or a stop signal is generated for the process.

16555 An implementation shall document any condition not specified by this volume of POSIX.1-2008  
 16556 under which the implementation generates signals.

#### 16557 2.4.2 Realtime Signal Generation and Delivery

16558 This section describes functionality to support realtime signal generation and delivery.

16559 Some signal-generating functions, such as high-resolution timer expiration, asynchronous I/O  
 16560 completion, interprocess message arrival, and the *sigqueue()* function, support the specification  
 16561 of an application-defined value, either explicitly as a parameter to the function or in a **sigevent**  
 16562 structure parameter. The **sigevent** structure is defined in **<signal.h>** and contains at least the  
 16563 following members:

Member Type	Member Name	Description
int	<i>sigev_notify</i>	Notification type.
int	<i>sigev_signo</i>	Signal number.
union sigval	<i>sigev_value</i>	Signal value.
void*(union sigval)	<i>sigev_notify_function</i>	Notification function.
(pthread_attr_t*)	<i>sigev_notify_attributes</i>	Notification attributes.

16570 The *sigev\_notify* member specifies the notification mechanism to use when an asynchronous  
 16571 event occurs. This volume of POSIX.1-2008 defines the following values for the *sigev\_notify*  
 16572 member:

16573 SIGEV\_NONE No asynchronous notification shall be delivered when the event of  
 16574 interest occurs.

16575 SIGEV\_SIGNAL The signal specified in *sigev\_signo* shall be generated for the process when  
 16576 the event of interest occurs. If the implementation supports the Realtime  
 16577 Signals Extension option and if the SA\_SIGINFO flag is set for that signal  
 16578 number, then the signal shall be queued to the process and the value  
 16579 specified in *sigev\_value* shall be the *si\_value* component of the generated  
 16580 signal. If SA\_SIGINFO is not set for that signal number, it is unspecified  
 16581 whether the signal is queued and what value, if any, is sent.

16582 SIGEV\_THREAD A notification function shall be called to perform notification.

16583 An implementation may define additional notification mechanisms.

16584 The *sigev\_signo* member specifies the signal to be generated. The *sigev\_value* member is the  
 16585 application-defined value to be passed to the signal-catching function at the time of the signal

16586 delivery or to be returned at signal acceptance as the *si\_value* member of the **siginfo\_t** structure.

16587 The **signal** union is defined in **<signal.h>** and contains at least the following members:

Member Type	Member Name	Description
<b>int</b>	<i>sival_int</i>	Integer signal value.
<b>void*</b>	<i>sival_ptr</i>	Pointer signal value.

16591 The *sival\_int* member shall be used when the application-defined value is of type **int**; the  
16592 *sival\_ptr* member shall be used when the application-defined value is a pointer.

16593 When a signal is generated by the *sigqueue()* function or any signal-generating function that  
16594 supports the specification of an application-defined value, the signal shall be marked pending  
16595 and, if the SA\_SIGINFO flag is set for that signal, the signal shall be queued to the process along  
16596 with the application-specified signal value. Multiple occurrences of signals so generated are  
16597 queued in FIFO order. It is unspecified whether signals so generated are queued when the  
16598 SA\_SIGINFO flag is not set for that signal.

16599 Signals generated by the *kill()* function or other events that cause signals to occur, such as  
16600 detection of hardware faults, *alarm()* timer expiration, or terminal activity, and for which the  
16601 implementation does not support queuing, shall have no effect on signals already queued for the  
16602 same signal number.

16603 When multiple unblocked signals, all in the range SIGRTMIN to SIGRTMAX, are pending, the  
16604 behavior shall be as if the implementation delivers the pending unblocked signal with the  
16605 lowest signal number within that range. No other ordering of signal delivery is specified.

16606 If, when a pending signal is delivered, there are additional signals queued to that signal number,  
16607 the signal shall remain pending. Otherwise, the pending indication shall be reset.

16608 Multi-threaded programs can use an alternate event notification mechanism. When a  
16609 notification is processed, and the *sigev\_notify* member of the **sigevent** structure has the value  
16610 SIGEV\_THREAD, the function *sigev\_notify\_function* is called with parameter *sigev\_value*.

16611 The function shall be executed in an environment as if it were the *start\_routine* for a newly  
16612 created thread with thread attributes specified by *sigev\_notify\_attributes*. If *sigev\_notify\_attributes*  
16613 is NULL, the behavior shall be as if the thread were created with the *detachstate* attribute set to  
16614 PTHREAD\_CREATE\_DETACHED. Supplying an attributes structure with a *detachstate* attribute  
16615 of PTHREAD\_CREATE\_JOINABLE results in undefined behavior. The signal mask of this  
16616 thread is implementation-defined.

### 16617 2.4.3 Signal Actions

16618 There are three types of action that can be associated with a signal: SIG\_DFL, SIG\_IGN, or a  
16619 pointer to a function. Initially, all signals shall be set to SIG\_DFL or SIG\_IGN prior to entry of  
16620 the *main()* routine (see the *exec* functions). The actions prescribed by these values are as follows.

#### 16621 SIG\_DFL

16622 Signal-specific default action.

16623 The default actions for the signals defined in this volume of POSIX.1-2008 are specified under  
16624 **<signal.h>**. The default actions for the realtime signals in the range SIGRTMIN to SIGRTMAX  
16625 shall be to terminate the process abnormally.

16626 If the default action is to terminate the process abnormally, the process is terminated as if by a  
16627 call to *\_exit()*, except that the status made available to *wait()*, *waitid()*, and *waitpid()* indicates

- 16628 XSI abnormal termination by the signal. If the default action is to terminate the process abnormally  
 16629 with additional actions, implementation-defined abnormal termination actions, such as creation  
 16630 of a core file, may also occur.
- 16631 If the default action is to stop the process, the execution of that process is temporarily  
 16632 suspended. When a process stops, a SIGCHLD signal shall be generated for its parent process,  
 16633 unless the parent process has set the SA\_NOCLDSTOP flag. While a process is stopped, any  
 16634 additional signals that are sent to the process shall not be delivered until the process is  
 16635 continued, except SIGKILL which always terminates the receiving process. A process that is a  
 16636 member of an orphaned process group shall not be allowed to stop in response to the SIGTSTP,  
 16637 SIGTTIN, or SIGTTOU signals. In cases where delivery of one of these signals would stop such a  
 16638 process, the signal shall be discarded.
- 16639 If the default action is to ignore the signal, delivery of the signal shall have no effect on the  
 16640 process.
- 16641 Setting a signal action to SIG\_DFL for a signal that is pending, and whose default action is to  
 16642 ignore the signal (for example, SIGCHLD), shall cause the pending signal to be discarded,  
 16643 whether or not it is blocked. Any queued values pending shall be discarded and the resources  
 16644 used to queue them shall be released and returned to the system for other use.
- 16645 The default action for SIGCONT is to resume execution at the point where the process was  
 16646 stopped, after first handling any pending unblocked signals.
- 16647 XSI When a stopped process is continued, a SIGCHLD signal may be generated for its parent  
 16648 process, unless the parent process has set the SA\_NOCLDSTOP flag.
- 16649 **SIG\_IGN**
- 16650 Ignore signal.
- 16651 Delivery of the signal shall have no effect on the process. The behavior of a process is undefined  
 16652 after it ignores a SIGFPE, SIGILL, SIGSEGV, or SIGBUS signal that was not generated by *kill()*,  
 16653 *sigqueue()*, or *raise()*.
- 16654 The system shall not allow the action for the signals SIGKILL or SIGSTOP to be set to SIG\_IGN.
- 16655 Setting a signal action to SIG\_IGN for a signal that is pending shall cause the pending signal to  
 16656 be discarded, whether or not it is blocked.
- 16657 If a process sets the action for the SIGCHLD signal to SIG\_IGN, the behavior is unspecified,  
 16658 XSI except as specified below.
- 16659 If the action for the SIGCHLD signal is set to SIG\_IGN, child processes of the calling processes  
 16660 shall not be transformed into zombie processes when they terminate. If the calling process  
 16661 subsequently waits for its children, and the process has no unwaited-for children that were  
 16662 transformed into zombie processes, it shall block until all of its children terminate, and *wait()*,  
 16663 *waitid()*, and *waitpid()* shall fail and set *errno* to [ECHILD].
- 16664 Any queued values pending shall be discarded and the resources used to queue them shall be  
 16665 released and made available to queue other signals.

16666 **Pointer to a Function**

16667 Catch signal.

16668 On delivery of the signal, the receiving process is to execute the signal-catching function at the  
 16669 specified address. After returning from the signal-catching function, the receiving process shall  
 16670 resume execution at the point at which it was interrupted.

16671 If the SA\_SIGINFO flag for the signal is cleared, the signal-catching function shall be entered as  
 16672 a C-language function call as follows:

```
16673 void func(int signo);
```

16674 If the SA\_SIGINFO flag for the signal is set, the signal-catching function shall be entered as a C-  
 16675 language function call as follows:

```
16676 void func(int signo, siginfo_t *info, void *context);
```

16677 where *func* is the specified signal-catching function, *signo* is the signal number of the signal  
 16678 being delivered, and *info* is a pointer to a **siginfo\_t** structure defined in **<signal.h>** containing at  
 16679 least the following members:

Member Type	Member Name	Description
int	<i>si_signo</i>	Signal number.
int	<i>si_code</i>	Cause of the signal.
pid_t	<i>si_pid</i>	Sending process ID.
uid_t	<i>si_uid</i>	Real user ID of sending process.
void *	<i>si_addr</i>	Address of faulting instruction.
int	<i>si_status</i>	Exit value or signal.
union signal	<i>si_value</i>	Signal value.

16688 The *si\_signo* member shall contain the signal number. This shall be the same as the *signo*  
 16689 parameter. The *si\_code* member shall contain a code identifying the cause of the signal. The  
 16690 following non-signal-specific values are defined for *si\_code*:

16691 SI\_USER The signal was sent by the *kill()* function. The implementation may set *si\_code*  
 16692 to SI\_USER if the signal was sent by the *raise()* or *abort()* functions or any  
 16693 similar functions provided as implementation extensions.

16694 SI\_QUEUE The signal was sent by the *sigqueue()* function.

16695 SI\_TIMER The signal was generated by the expiration of a timer set by *timer\_settime()*.

16696 SI\_ASYNCIO The signal was generated by the completion of an asynchronous I/O request.

16697 MSG SI\_MESGQ The signal was generated by the arrival of a message on an empty message  
 16698 queue.

16699 Signal-specific values for *si\_code* are also defined, as described in XBD **<signal.h>**.

16700 If the signal was not generated by one of the functions or events listed above, *si\_code* shall be set  
 16701 either to one of the signal-specific values described in XBD **<signal.h>**, or to an implementation-  
 16702 defined value that is not equal to any of the values defined above.

16703 XSI If *si\_code* is SI\_USER or SI\_QUEUE, or any value less than or equal to 0, then the signal was  
 16704 generated by a process and *si\_pid* and *si\_uid* shall be set to the process ID and the real user ID of  
 16705 the sender, respectively.

16706 In addition, *si\_addr*, *si\_pid*, *si\_status*, and *si\_uid* shall be set for certain signal-specific values of  
 16707 *si\_code*, as described in XBD **<signal.h>**.

16708 If *si\_code* is one of SI\_QUEUE, SI\_TIMER, SI\_ASYNCIO, or SI\_MESGQ, then *si\_value* shall

## General Information

## Signal Concepts

- 16709 contain the application-specified signal value. Otherwise, the contents of *si\_value* are undefined.
- 16710 The behavior of a process is undefined after it returns normally from a signal-catching function  
16711 for a SIGBUS, SIGFPE, SIGILL, or SIGSEGV signal that was not generated by *kill()*, *sigqueue()*,  
16712 or *raise()*.
- 16713 The system shall not allow a process to catch the signals SIGKILL and SIGSTOP.
- 16714 If a process establishes a signal-catching function for the SIGCHLD signal while it has a  
16715 terminated child process for which it has not waited, it is unspecified whether a SIGCHLD  
16716 signal is generated to indicate that child process.
- 16717 When signal-catching functions are invoked asynchronously with process execution, the  
16718 behavior of some of the functions defined by this volume of POSIX.1-2008 is unspecified if they  
16719 are called from a signal-catching function.
- 16720 The following table defines a set of functions that shall be async-signal-safe. Therefore,  
16721 applications can invoke them, without restriction, from signal-catching functions:

16722	<i>_Exit()</i>	<i>fexecve()</i>	<i>poll()</i>	<i>sigqueue()</i>
16723	<i>_exit()</i>	<i>fork()</i>	<i>posix_trace_event()</i>	<i>sigset()</i>
16724	<i>abort()</i>	<i>fstat()</i>	<i>pselect()</i>	<i>sigsuspend()</i>
16725	<i>accept()</i>	<i>fstatat()</i>	<i>raise()</i>	<i>sleep()</i>
16726	<i>access()</i>	<i>fsync()</i>	<i>read()</i>	<i>socketmark()</i>
16727	<i>aio_error()</i>	<i>ftruncate()</i>	<i>readlink()</i>	<i>socket()</i>
16728	<i>aio_return()</i>	<i>futimens()</i>	<i>readlinkat()</i>	<i>socketpair()</i>
16729	<i>aio_suspend()</i>	<i>getegid()</i>	<i>recv()</i>	<i>stat()</i>
16730	<i>alarm()</i>	<i>geteuid()</i>	<i>recvfrom()</i>	<i>symlink()</i>
16731	<i>bind()</i>	<i>getgid()</i>	<i>recvmsg()</i>	<i>symlinkat()</i>
16732	<i>cfgetispeed()</i>	<i>getgroups()</i>	<i>rename()</i>	<i>tcdrain()</i>
16733	<i>cfgetospeed()</i>	<i>getpeername()</i>	<i>renameat()</i>	<i>tcflow()</i>
16734	<i>cfsetispeed()</i>	<i>getpgrp()</i>	<i>rmdir()</i>	<i>tcflush()</i>
16735	<i>cfsetospeed()</i>	<i>getpid()</i>	<i>select()</i>	<i>tcgetattr()</i>
16736	<i>chdir()</i>	<i>getppid()</i>	<i>sem_post()</i>	<i>tcgetpgrp()</i>
16737	<i>chmod()</i>	<i>getsockname()</i>	<i>send()</i>	<i>tcsendbreak()</i>
16738	<i>chown()</i>	<i>getsockopt()</i>	<i>sendmsg()</i>	<i>tcsetattr()</i>
16739	<i>clock_gettime()</i>	<i>getuid()</i>	<i>sendto()</i>	<i>tcsetpgrp()</i>
16740	<i>close()</i>	<i>kill()</i>	<i>setgid()</i>	<i>time()</i>
16741	<i>connect()</i>	<i>link()</i>	<i>setpgid()</i>	<i>timer_getoverrun()</i>
16742	<i>creat()</i>	<i>linkat()</i>	<i>setsid()</i>	<i>timer_gettime()</i>
16743	<i>dup()</i>	<i>listen()</i>	<i>setsockopt()</i>	<i>timer_settime()</i>
16744	<i>dup2()</i>	<i>lseek()</i>	<i>setuid()</i>	<i>times()</i>
16745	<i>execl()</i>	<i>lstat()</i>	<i>shutdown()</i>	<i>umask()</i>
16746	<i>execle()</i>	<i>mkdir()</i>	<i>sigaction()</i>	<i>uname()</i>
16747	<i>execv()</i>	<i>mkdirat()</i>	<i>sigaddset()</i>	<i>unlink()</i>
16748	<i>execve()</i>	<i>mkfifo()</i>	<i>sigdelset()</i>	<i>unlinkat()</i>
16749	<i>faccessat()</i>	<i>mkfifoat()</i>	<i>sigemptyset()</i>	<i>utime()</i>
16750	<i>fchmod()</i>	<i>mknod()</i>	<i>sigfillset()</i>	<i>utimensat()</i>
16751	<i>fchmodat()</i>	<i>mknodat()</i>	<i>sigismember()</i>	<i>utimes()</i>
16752	<i>fchown()</i>	<i>open()</i>	<i>signal()</i>	<i>wait()</i>
16753	<i>fchownat()</i>	<i>openat()</i>	<i>sigpause()</i>	<i>waitpid()</i>
16754	<i>fcntl()</i>	<i>pause()</i>	<i>sigpending()</i>	<i>write()</i>
16755	<i>fdatasync()</i>	<i>pipe()</i>	<i>sigprocmask()</i>	

- 16756 All functions not in the above table are considered to be unsafe with respect to signals. In the  
16757 presence of signals, all functions defined by this volume of POSIX.1-2008 shall behave as defined

16758 when called from or interrupted by a signal-catching function, with a single exception: when a  
 16759 signal interrupts an unsafe function and the signal-catching function calls an unsafe function,  
 16760 the behavior is undefined.

16761 Operations which obtain the value of *errno* and operations which assign a value to *errno* shall be  
 16762 *async-signal-safe*.

16763 When a signal is delivered to a thread, if the action of that signal specifies termination, stop, or  
 16764 continue, the entire process shall be terminated, stopped, or continued, respectively.

#### 16765 2.4.4 Signal Effects on Other Functions

16766 Signals affect the behavior of certain functions defined by this volume of POSIX.1-2008 if  
 16767 delivered to a process while it is executing such a function. If the action of the signal is to  
 16768 terminate the process, the process shall be terminated and the function shall not return. If the  
 16769 action of the signal is to stop the process, the process shall stop until continued or terminated.  
 16770 Generation of a SIGCONT signal for the process shall cause the process to be continued, and the  
 16771 original function shall continue at the point the process was stopped. If the action of the signal is  
 16772 to invoke a signal-catching function, the signal-catching function shall be invoked; in this case  
 16773 the original function is said to be “interrupted” by the signal. If the signal-catching function  
 16774 executes a **return** statement, the behavior of the interrupted function shall be as described  
 16775 individually for that function, except as noted for unsafe functions. Signals that are ignored shall  
 16776 not affect the behavior of any function; signals that are blocked shall not affect the behavior of  
 16777 any function until they are unblocked and then delivered, except as specified for the *sigpending()*  
 16778 and *sigwait()* functions.

### 16779 2.5 Standard I/O Streams

16780 CX A stream is associated with an external file (which may be a physical device) or memory buffer  
 16781 CX by “opening” a file or buffer. This may involve “creating” a new file. Creating an existing file  
 16782 causes its former contents to be discarded if necessary. If a file can support positioning requests  
 16783 (such as a disk file, as opposed to a terminal), then a “file position indicator” associated with the  
 16784 stream is positioned at the start (byte number 0) of the file, unless the file is opened with append  
 16785 mode, in which case it is implementation-defined whether the file position indicator is initially  
 16786 positioned at the beginning or end of the file. The file position indicator is maintained by  
 16787 subsequent reads, writes, and positioning requests, to facilitate an orderly progression through  
 16788 the file. All input takes place as if bytes were read by successive calls to *fgetc()*; all output takes  
 16789 place as if bytes were written by successive calls to *fputc()*.

16790 When a stream is “unbuffered”, bytes are intended to appear from the source or at the  
 16791 destination as soon as possible; otherwise, bytes may be accumulated and transmitted as a  
 16792 block. When a stream is “fully buffered”, bytes are intended to be transmitted as a block when a  
 16793 buffer is filled. When a stream is “line buffered”, bytes are intended to be transmitted as a block  
 16794 when a <newline> byte is encountered. Furthermore, bytes are intended to be transmitted as a  
 16795 block when a buffer is filled, when input is requested on an unbuffered stream, or when input is  
 16796 requested on a line-buffered stream that requires the transmission of bytes. Support for these  
 16797 characteristics is implementation-defined, and may be affected via *setbuf()* and *setvbuf()*.

16798 A file may be disassociated from a controlling stream by “closing” the file. Output streams are  
 16799 flushed (any unwritten buffer contents are transmitted) before the stream is disassociated from  
 16800 the file. The value of a pointer to a **FILE** object is unspecified after the associated file is closed  
 16801 (including the standard streams).

16802 A file may be subsequently reopened, by the same or another program execution, and its  
 16803 contents reclaimed or modified (if it can be repositioned at its start). If the *main()* function  
 16804 returns to its original caller, or if the *exit()* function is called, all open files are closed (hence all  
 16805 output streams are flushed) before program termination. Other paths to program termination,  
 16806 such as calling *abort()*, need not close all files properly.

16807 The address of the **FILE** object used to control a stream may be significant; a copy of a **FILE**  
 16808 object need not necessarily serve in place of the original.

16809 At program start-up, three streams are predefined and need not be opened explicitly: *standard*  
 16810 *input* (for reading conventional input), *standard output* (for writing conventional output), and  
 16811 *standard error* (for writing diagnostic output). When opened, the standard error stream is not  
 16812 fully buffered; the standard input and standard output streams are fully buffered if and only if  
 16813 the stream can be determined not to refer to an interactive device.

16814 CX A stream associated with a memory buffer shall have the same operations for text files that a  
 16815 stream associated with an external file would have. In addition, the stream orientation shall be  
 16816 determined in exactly the same fashion.

16817 Input and output operations on a stream associated with a memory buffer by a call to  
 16818 *fmemopen()* shall be constrained by the implementation to take place within the bounds of the  
 16819 memory buffer. In the case of a stream opened by *open\_memstream()* or *open\_wmemstream()*, the  
 16820 memory area shall grow dynamically to accommodate write operations as necessary. For output,  
 16821 data is moved from the buffer provided by *setvbuf()* to the memory stream during a flush or  
 16822 close operation.

## 16823 2.5.1 Interaction of File Descriptors and Standard I/O Streams

16824 CX This section describes the interaction of file descriptors and standard I/O streams. The  
 16825 functionality described in this section is an extension to the ISO C standard (and the rest of this  
 16826 section is not further CX shaded).

16827 An open file description may be accessed through a file descriptor, which is created using  
 16828 functions such as *open()* or *pipe()*, or through a stream, which is created using functions such as  
 16829 *fopen()* or *popen()*. Either a file descriptor or a stream is called a “handle” on the open file  
 16830 description to which it refers; an open file description may have several handles.

16831 Handles can be created or destroyed by explicit user action, without affecting the underlying  
 16832 open file description. Some of the ways to create them include *fcntl()*, *dup()*, *fdopen()*, *fileno()*,  
 16833 and *fork()*. They can be destroyed by at least *fclose()*, *close()*, and the *exec* functions.

16834 A file descriptor that is never used in an operation that could affect the file offset (for example,  
 16835 *read()*, *write()*, or *lseek()*) is not considered a handle for this discussion, but could give rise to  
 16836 one (for example, as a consequence of *fdopen()*, *dup()*, or *fork()*). This exception does not include  
 16837 the file descriptor underlying a stream, whether created with *fopen()* or *fdopen()*, so long as it is  
 16838 not used directly by the application to affect the file offset. The *read()* and *write()* functions  
 16839 implicitly affect the file offset; *lseek()* explicitly affects it.

16840 The result of function calls involving any one handle (the “active handle”) is defined elsewhere  
 16841 in this volume of POSIX.1-2008, but if two or more handles are used, and any one of them is a  
 16842 stream, the application shall ensure that their actions are coordinated as described below. If this  
 16843 is not done, the result is undefined.

16844 A handle which is a stream is considered to be closed when either an *fclose()* or *freopen()* is  
 16845 executed on it (the result of *freopen()* is a new stream, which cannot be a handle on the same  
 16846 open file description as its previous value), or when the process owning that stream terminates  
 16847 with *exit()*, *abort()*, or due to a signal. A file descriptor is closed by *close()*, *\_exit()*, or the *exec*

- 16848 functions when `FD_CLOEXEC` is set on that file descriptor.
- 16849 For a handle to become the active handle, the application shall ensure that the actions below are  
 16850 performed between the last use of the handle (the current active handle) and the first use of the  
 16851 second handle (the future active handle). The second handle then becomes the active handle. All  
 16852 activity by the application affecting the file offset on the first handle shall be suspended until it  
 16853 again becomes the active file handle. (If a stream function has as an underlying function one that  
 16854 affects the file offset, the stream function shall be considered to affect the file offset.)
- 16855 The handles need not be in the same process for these rules to apply.
- 16856 Note that after a `fork()`, two handles exist where one existed before. The application shall ensure  
 16857 that, if both handles can ever be accessed, they are both in a state where the other could become  
 16858 the active handle first. The application shall prepare for a `fork()` exactly as if it were a change of  
 16859 active handle. (If the only action performed by one of the processes is one of the `exec` functions or  
 16860 `_exit()` (not `exit()`), the handle is never accessed in that process.)
- 16861 For the first handle, the first applicable condition below applies. After the actions required  
 16862 below are taken, if the handle is still open, the application can close it.
- 16863 • If it is a file descriptor, no action is required.
  - 16864 • If the only further action to be performed on any handle to this open file descriptor is to  
 16865 close it, no action need be taken.
  - 16866 • If it is a stream which is unbuffered, no action need be taken.
  - 16867 • If it is a stream which is line buffered, and the last byte written to the stream was a  
 16868 <newline> (that is, as if a:
- ```
16869         putchar('\n')
```
- 16870 was the most recent operation on that stream), no action need be taken.
- 16871 • If it is a stream which is open for writing or appending (but not also open for reading), the  
 16872 application shall either perform an `fflush()`, or the stream shall be closed.
  - 16873 • If the stream is open for reading and it is at the end of the file (`feof()` is true), no action need  
 16874 be taken.
  - 16875 • If the stream is open with a mode that allows reading and the underlying open file  
 16876 description refers to a device that is capable of seeking, the application shall either perform  
 16877 an `fflush()`, or the stream shall be closed.
- 16878 Otherwise, the result is undefined.
- 16879 For the second handle:
- 16880 • If any previous active handle has been used by a function that explicitly changed the file  
 16881 offset, except as required above for the first handle, the application shall perform an `lseek()`  
 16882 or `fseek()` (as appropriate to the type of handle) to an appropriate location.
- 16883 If the active handle ceases to be accessible before the requirements on the first handle, above,  
 16884 have been met, the state of the open file description becomes undefined. This might occur  
 16885 during functions such as a `fork()` or `_exit()`.
- 16886 The `exec` functions make inaccessible all streams that are open at the time they are called,  
 16887 independent of which streams or file descriptors may be available to the new process image.
- 16888 When these rules are followed, regardless of the sequence of handles used, implementations  
 16889 shall ensure that an application, even one consisting of several processes, shall yield correct

16890 results: no data shall be lost or duplicated when writing, and all data shall be written in order,  
 16891 except as requested by seeks. It is implementation-defined whether, and under what conditions,  
 16892 all input is seen exactly once.

16893 If the rules above are not followed, the result is unspecified.

16894 Each function that operates on a stream is said to have zero or more “underlying functions”.  
 16895 This means that the stream function shares certain traits with the underlying functions, but does  
 16896 not require that there be any relation between the implementations of the stream function and its  
 16897 underlying functions.

## 16898 2.5.2 Stream Orientation and Encoding Rules

16899 For conformance to the ISO/IEC 9899:1999 standard, the definition of a stream includes an  
 16900 “orientation”. After a stream is associated with an external file, but before any operations are  
 16901 performed on it, the stream is without orientation. Once a wide-character input/output function  
 16902 has been applied to a stream without orientation, the stream shall become “wide-oriented”.  
 16903 Similarly, once a byte input/output function has been applied to a stream without orientation,  
 16904 the stream shall become “byte-oriented”. Only a call to the *freopen()* function or the *fwide()*  
 16905 function can otherwise alter the orientation of a stream.

16906 A successful call to *freopen()* shall remove any orientation. The three predefined streams *standard*  
 16907 *input*, *standard output*, and *standard error* shall be unoriented at program start-up.

16908 Byte input/output functions cannot be applied to a wide-oriented stream, and wide-character  
 16909 input/output functions cannot be applied to a byte-oriented stream. The remaining stream  
 16910 operations shall not affect and shall not be affected by a stream’s orientation, except for the  
 16911 following additional restriction:

- 16912 • For wide-oriented streams, after a successful call to a file-positioning function that leaves  
 16913 the file position indicator prior to the end-of-file, a wide-character output function can  
 16914 overwrite a partial character; any file contents beyond the byte(s) written are henceforth  
 16915 undefined.

16916 Each wide-oriented stream has an associated **mbstate\_t** object that stores the current parse state  
 16917 of the stream. A successful call to *fgetpos()* shall store a representation of the value of this  
 16918 **mbstate\_t** object as part of the value of the **fpos\_t** object. A later successful call to *fsetpos()* using  
 16919 the same stored **fpos\_t** value shall restore the value of the associated **mbstate\_t** object as well as  
 16920 the position within the controlled stream.

16921 Implementations that support multiple encoding rules associate an encoding rule with the  
 16922 stream. The encoding rule shall be determined by the setting of the *LC\_CTYPE* category in the  
 16923 current locale at the time when the stream becomes wide-oriented. As with the stream’s  
 16924 orientation, the encoding rule associated with a stream cannot be changed once it has been set,  
 16925 except by a successful call to *freopen()* which clears the encoding rule and resets the orientation  
 16926 to unoriented.

16927 Although wide-oriented streams are conceptually sequences of wide characters, the external file  
 16928 associated with a wide-oriented stream is a sequence of (possibly multi-byte) characters  
 16929 generalized as follows:

- 16930 • Multi-byte encodings within files may contain embedded null bytes (unlike multi-byte  
 16931 encodings valid for use internal to the program).
- 16932 • A file need not begin nor end in the initial shift state.

16933 Moreover, the encodings used for characters may differ among files. Both the nature and choice  
 16934 of such encodings are implementation-defined.

16935 The wide-character input functions read characters from the stream and convert them to wide  
 16936 characters as if they were read by successive calls to the *fgetc()* function. Each conversion shall  
 16937 occur as if by a call to the *mbrtowc()* function, with the conversion state described by the  
 16938 CX stream's own **mbstate\_t** object, except the encoding rule associated with the stream is used  
 16939 instead of the encoding rule implied by the *LC\_CTYPE* category of the current locale.

16940 The wide-character output functions convert wide characters to (possibly multi-byte) characters  
 16941 and write them to the stream as if they were written by successive calls to the *fputc()* function.  
 16942 Each conversion shall occur as if by a call to the *wctomb()* function, with the conversion state  
 16943 CX described by the stream's own **mbstate\_t** object, except the encoding rule associated with the  
 16944 stream is used instead of the encoding rule implied by the *LC\_CTYPE* category of the current  
 16945 locale.

16946 An "encoding error" shall occur if the character sequence presented to the underlying *mbrtowc()*  
 16947 function does not form a valid (generalized) character, or if the code value passed to the  
 16948 underlying *wctomb()* function does not correspond to a valid (generalized) character. The wide-  
 16949 character input/output functions and the byte input/output functions store the value of the  
 16950 macro [EILSEQ] in *errno* if and only if an encoding error occurs.

## 16951 2.6 STREAMS

16952 OB XSR STREAMS functionality is provided on implementations supporting the XSI STREAMS Option  
 16953 Group. The functionality described in this section is dependent on support of the XSI STREAMS  
 16954 option (and the rest of this section is not further shaded for this option).

16955 STREAMS provides a uniform mechanism for implementing networking services and other  
 16956 character-based I/O. The STREAMS function provides direct access to protocol modules.  
 16957 STREAMS modules are unspecified objects. Access to STREAMS modules is provided by  
 16958 interfaces in POSIX.1-2008. Creation of STREAMS modules is outside the scope of  
 16959 POSIX.1-2008.

16960 A STREAM is typically a full-duplex connection between a process and an open device or  
 16961 pseudo-device. However, since pipes may be STREAMS-based, a STREAM can be a full-duplex  
 16962 connection between two processes. The STREAM itself exists entirely within the implementation  
 16963 and provides a general character I/O function for processes. It optionally includes one or more  
 16964 intermediate processing modules that are interposed between the process end of the STREAM  
 16965 (STREAM head) and a device driver at the end of the STREAM (STREAM end).

16966 STREAMS I/O is based on messages. There are three types of message:

- 16967 • *Data messages* containing actual data for input or output
- 16968 • *Control data* containing instructions for the STREAMS modules and underlying  
 16969 implementation
- 16970 • Other messages, which include file descriptors

16971 The interface between the STREAM and the rest of the implementation is provided by a set of  
 16972 functions at the STREAM head. When a process calls *write()*, *writev()*, *putmsg()*, *putpmsg()*, or  
 16973 *ioctl()*, messages are sent down the STREAM, and *read()*, *readv()*, *getmsg()*, or *getpmsg()* accepts  
 16974 data from the STREAM and passes it to a process. Data intended for the device at the  
 16975 downstream end of the STREAM is packaged into messages and sent downstream, while data  
 16976 and signals from the device are composed into messages by the device driver and sent upstream  
 16977 to the STREAM head.

16978 When a STREAMS-based device is opened, a STREAM shall be created that contains the

16979 STREAM head and the STREAM end (driver). If pipes are STREAMS-based in an  
 16980 implementation, when a pipe is created, two STREAMS shall be created, each containing a  
 16981 STREAM head. Other modules are added to the STREAM using *ioctl()*. New modules are  
 16982 “pushed” onto the STREAM one at a time in last-in, first-out (LIFO) style, as though the  
 16983 STREAM was a push-down stack.

#### 16984 **Priority**

16985 Message types are classified according to their queuing priority and may be *normal* (non-  
 16986 priority), *priority*, or *high-priority* messages. A message belongs to a particular priority band that  
 16987 determines its ordering when placed on a queue. Normal messages have a priority band of 0  
 16988 and shall always be placed at the end of the queue following all other messages in the queue.  
 16989 High-priority messages are always placed at the head of a queue, but shall be discarded if there  
 16990 is already a high-priority message in the queue. Their priority band shall be ignored; they are  
 16991 high-priority by virtue of their type. Priority messages have a priority band greater than 0.  
 16992 Priority messages are always placed after any messages of the same or higher priority. High-  
 16993 priority and priority messages are used to send control and data information outside the normal  
 16994 flow of control. By convention, high-priority messages shall not be affected by flow control.  
 16995 Normal and priority messages have separate flow controls.

#### 16996 **Message Parts**

16997 A process may access STREAMS messages that contain a data part, control part, or both. The  
 16998 data part is that information which is transmitted over the communication medium and the  
 16999 control information is used by the local STREAMS modules. The other types of messages are  
 17000 used between modules and are not accessible to processes. Messages containing only a data part  
 17001 are accessible via *putmsg()*, *putpmsg()*, *getmsg()*, *getpmsg()*, *read()*, *readv()*, *write()*, or *writv()*.  
 17002 Messages containing a control part with or without a data part are accessible via calls to  
 17003 *putmsg()*, *putpmsg()*, *getmsg()*, or *getpmsg()*.

### 17004 **2.6.1 Accessing STREAMS**

17005 A process accesses STREAMS-based files using the standard functions *close()*, *ioctl()*, *getmsg()*,  
 17006 *getpmsg()*, *open()*, *pipe()*, *poll()*, *putmsg()*, *putpmsg()*, *read()*, or *write()*. Refer to the applicable  
 17007 function definitions for general properties and errors.

17008 Calls to *ioctl()* shall perform control functions on the STREAM associated with the file descriptor  
 17009 *fildevs*. The control functions may be performed by the STREAM head, a STREAMS module, or  
 17010 the STREAMS driver for the STREAM.

17011 STREAMS modules and drivers can detect errors, sending an error message to the STREAM  
 17012 head, thus causing subsequent functions to fail and set *errno* to the value specified in the  
 17013 message. In addition, STREAMS modules and drivers can elect to fail a particular *ioctl()* request  
 17014 alone by sending a negative acknowledgement message to the STREAM head. This shall cause  
 17015 just the pending *ioctl()* request to fail and set *errno* to the value specified in the message.

17016 **2.7 XSI Interprocess Communication**

17017 XSI This section describes extensions to support interprocess communication. The functionality  
 17018 described in this section shall be provided on implementations that support the XSI option (and  
 17019 the rest of this section is not further shaded).

17020 The following message passing, semaphore, and shared memory services form an XSI  
 17021 interprocess communication facility. Certain aspects of their operation are common, and are  
 17022 defined as follows.

| IPC Functions   |                 |                 |
|-----------------|-----------------|-----------------|
| <i>msgctl()</i> | <i>semctl()</i> | <i>shmat()</i>  |
| <i>msgget()</i> | <i>semget()</i> | <i>shmctl()</i> |
| <i>msgrcv()</i> | <i>semop()</i>  | <i>shmdt()</i>  |
| <i>msgsnd()</i> |                 | <i>shmget()</i> |

17028 Another interprocess communication facility is provided by functions in the Realtime Option  
 17029 Group; see Section 2.8 (on page 497).

17030 **2.7.1 IPC General Description**

17031 Each individual shared memory segment, message queue, and semaphore set shall be identified  
 17032 by a unique positive integer, called, respectively, a shared memory identifier, *shmid*, a semaphore  
 17033 identifier, *semid*, and a message queue identifier, *msgid*. The identifiers shall be returned by calls  
 17034 to *shmget()*, *semget()*, and *msgget()*, respectively.

17035 Associated with each identifier is a data structure which contains data related to the operations  
 17036 which may be or may have been performed; see the Base Definitions volume of POSIX.1-2008,  
 17037 <**sys/shm.h**>, <**sys/sem.h**>, and <**sys/msg.h**> for their descriptions.

17038 Each of the data structures contains both ownership information and an **ipc\_perm** structure (see  
 17039 the Base Definitions volume of POSIX.1-2008, <**sys/ipc.h**>) which are used in conjunction to  
 17040 determine whether or not read/write (read/alter for semaphores) permissions should be  
 17041 granted to processes using the IPC facilities. The *mode* member of the **ipc\_perm** structure acts as  
 17042 a bit field which determines the permissions.

17043 The values of the bits are given below in octal notation.

| Bit  | Meaning          |
|------|------------------|
| 0400 | Read by user.    |
| 0200 | Write by user.   |
| 0040 | Read by group.   |
| 0020 | Write by group.  |
| 0004 | Read by others.  |
| 0002 | Write by others. |

17051 The name of the **ipc\_perm** structure is *shm\_perm*, *sem\_perm*, or *msg\_perm*, depending on which  
 17052 service is being used. In each case, read and write/alter permissions shall be granted to a  
 17053 process if one or more of the following are true ("xxx" is replaced by *shm*, *sem*, or *msg*, as  
 17054 appropriate):

- 17055 • The process has appropriate privileges.
- 17056 • The effective user ID of the process matches *xxx\_perm.cuid* or *xxx\_perm.uid* in the data  
 17057 structure associated with the IPC identifier, and the appropriate bit of the *user* field in  
 17058 *xxx\_perm.mode* is set.

- 17059 • The effective user ID of the process does not match *xxx\_perm.cuid* or *xxx\_perm.uid* but the  
 17060 effective group ID of the process matches *xxx\_perm.cgid* or *xxx\_perm.gid* in the data  
 17061 structure associated with the IPC identifier, and the appropriate bit of the *group* field in  
 17062 *xxx\_perm.mode* is set.
- 17063 • The effective user ID of the process does not match *xxx\_perm.cuid* or *xxx\_perm.uid* and the  
 17064 effective group ID of the process does not match *xxx\_perm.cgid* or *xxx\_perm.gid* in the data  
 17065 structure associated with the IPC identifier, but the appropriate bit of the *other* field in  
 17066 *xxx\_perm.mode* is set.
- 17067 Otherwise, the permission shall be denied.

## 17068 2.8 Realtime

17069 This section defines functions to support the source portability of applications with realtime  
 17070 requirements. The presence of some of these functions is dependent on support for  
 17071 implementation options described in the text.

17072 The specific functional areas included in this section and their scope include the following. Full  
 17073 definitions of these terms can be found in XBD Chapter 3 (on page 33).

- 17074 • Semaphores
- 17075 • Process Memory Locking
- 17076 • Memory Mapped Files and Shared Memory Objects
- 17077 • Priority Scheduling
- 17078 • Realtime Signal Extension
- 17079 • Timers
- 17080 • Interprocess Communication
- 17081 • Synchronized Input and Output
- 17082 • Asynchronous Input and Output

17083 All the realtime functions defined in this volume of POSIX.1-2008 are portable, although some of  
 17084 the numeric parameters used by an implementation may have hardware dependencies.

### 17085 2.8.1 Realtime Signals

17086 See Section 2.4.2 (on page 485).

### 17087 2.8.2 Asynchronous I/O

17088 An asynchronous I/O control block structure **aiocb** is used in many asynchronous I/O  
 17089 functions. It is defined in the Base Definitions volume of POSIX.1-2008, <**aiocb.h**> and has at least  
 17090 the following members:

|       | Member Type            | Member Name           | Description                |
|-------|------------------------|-----------------------|----------------------------|
| 17091 | <b>int</b>             | <i>aio_fildes</i>     | File descriptor.           |
| 17092 | <b>off_t</b>           | <i>aio_offset</i>     | File offset.               |
| 17093 | <b>volatile void*</b>  | <i>aio_buf</i>        | Location of buffer.        |
| 17094 | <b>size_t</b>          | <i>aio_nbytes</i>     | Length of transfer.        |
| 17095 | <b>int</b>             | <i>aio_reqprio</i>    | Request priority offset.   |
| 17096 | <b>struct sigevent</b> | <i>aio_sigevent</i>   | Signal number and value.   |
| 17097 | <b>int</b>             | <i>aio_lio_opcode</i> | Operation to be performed. |
| 17098 |                        |                       |                            |

17099 The *aio\_fildes* element is the file descriptor on which the asynchronous operation is performed.

17100 If O\_APPEND is not set for the file descriptor *aio\_fildes* and if *aio\_fildes* is associated with a  
 17101 device that is capable of seeking, then the requested operation takes place at the absolute  
 17102 position in the file as given by *aio\_offset*, as if *lseek()* were called immediately prior to the  
 17103 operation with an *offset* argument equal to *aio\_offset* and a *whence* argument equal to SEEK\_SET.  
 17104 If O\_APPEND is set for the file descriptor, or if *aio\_fildes* is associated with a device that is  
 17105 incapable of seeking, write operations append to the file in the same order as the calls were  
 17106 made, with the following exception: under implementation-defined circumstances, such as  
 17107 operation on a multi-processor or when requests of differing priorities are submitted at the same  
 17108 time, the ordering restriction may be relaxed. Since there is no way for a strictly conforming  
 17109 application to determine whether this relaxation applies, all strictly conforming applications  
 17110 which rely on ordering of output shall be written in such a way that they will operate correctly if  
 17111 the relaxation applies. After a successful call to enqueue an asynchronous I/O operation, the  
 17112 value of the file offset for the file is unspecified. The *aio\_nbytes* and *aio\_buf* elements are the same  
 17113 as the *nbyte* and *buf* arguments defined by *read()* and *write()*, respectively.

17114 If \_POSIX\_PRIORITIZED\_IO and \_POSIX\_PRIORITY\_SCHEDULING are defined, then  
 17115 asynchronous I/O is queued in priority order, with the priority of each asynchronous operation  
 17116 based on the current scheduling priority of the calling process. The *aio\_reqprio* member can be  
 17117 used to lower (but not raise) the asynchronous I/O operation priority and is within the range  
 17118 zero through {AIO\_PRIO\_DELTA\_MAX}, inclusive. Unless both \_POSIX\_PRIORITIZED\_IO and  
 17119 \_POSIX\_PRIORITY\_SCHEDULING are defined, the order of processing asynchronous I/O  
 17120 requests is unspecified. When both \_POSIX\_PRIORITIZED\_IO and  
 17121 \_POSIX\_PRIORITY\_SCHEDULING are defined, the order of processing of requests submitted  
 17122 by processes whose schedulers are not SCHED\_FIFO, SCHED\_RR, or SCHED\_SPORADIC is  
 17123 unspecified. The priority of an asynchronous request is computed as (process scheduling  
 17124 priority) minus *aio\_reqprio*. The priority assigned to each asynchronous I/O request is an  
 17125 indication of the desired order of execution of the request relative to other asynchronous I/O  
 17126 requests for this file. If \_POSIX\_PRIORITIZED\_IO is defined, requests issued with the same  
 17127 priority to a character special file are processed by the underlying device in FIFO order; the  
 17128 order of processing of requests of the same priority issued to files that are not character special  
 17129 files is unspecified. Numerically higher priority values indicate requests of higher priority. The  
 17130 value of *aio\_reqprio* has no effect on process scheduling priority. When prioritized asynchronous  
 17131 I/O requests to the same file are blocked waiting for a resource required for that I/O operation,  
 17132 the higher-priority I/O requests shall be granted the resource before lower-priority I/O requests  
 17133 are granted the resource. The relative priority of asynchronous I/O and synchronous I/O is  
 17134 implementation-defined. If \_POSIX\_PRIORITIZED\_IO is defined, the implementation shall  
 17135 define for which files I/O prioritization is supported.

17136 The *aio\_sigevent* determines how the calling process shall be notified upon I/O completion, as  
 17137 specified in Section 2.4.1 (on page 484). If *aio\_sigevent.sigev\_notify* is SIGEV\_NONE, then no  
 17138 signal shall be posted upon I/O completion, but the error status for the operation and the return  
 17139 status for the operation shall be set appropriately.

17140 The *aio\_lio\_opcode* field is used only by the *lio\_listio()* call. The *lio\_listio()* call allows multiple

17141 asynchronous I/O operations to be submitted at a single time. The function takes as an  
 17142 argument an array of pointers to **aio** structures. Each **aio** structure indicates the operation to  
 17143 be performed (read or write) via the *aio\_lio\_opcode* field.

17144 The address of the **aio** structure is used as a handle for retrieving the error status and return  
 17145 status of the asynchronous operation while it is in progress.

17146 The **aio** structure and the data buffers associated with the asynchronous I/O operation are  
 17147 being used by the system for asynchronous I/O while, and only while, the error status of the  
 17148 asynchronous operation is equal to [EINPROGRESS]. Applications shall not modify the **aio**  
 17149 structure while the structure is being used by the system for asynchronous I/O.

17150 The return status of the asynchronous operation is the number of bytes transferred by the I/O  
 17151 operation. If the error status is set to indicate an error completion, then the return status is set to  
 17152 the return value that the corresponding *read()*, *write()*, or *fsync()* call would have returned.  
 17153 When the error status is not equal to [EINPROGRESS], the return status shall reflect the return  
 17154 status of the corresponding synchronous operation.

### 17155 2.8.3 Memory Management

#### 17156 2.8.3.1 Memory Locking

17157 MLR Range memory locking operations are defined in terms of pages. Implementations may restrict  
 17158 the size and alignment of range lockings to be on page-size boundaries. The page size, in bytes,  
 17159 is the value of the configurable system variable {PAGESIZE}. If an implementation has no  
 17160 restrictions on size or alignment, it may specify a 1-byte page size.

17161 ML|MLR Memory locking guarantees the residence of portions of the address space. It is implementation-  
 17162 defined whether locking memory guarantees fixed translation between virtual addresses (as  
 17163 seen by the process) and physical addresses. Per-process memory locks are not inherited across a  
 17164 *fork()*, and all memory locks owned by a process are unlocked upon *exec* or process termination.  
 17165 Unmapping of an address range removes any memory locks established on that address range  
 17166 by this process.

#### 17167 2.8.3.2 Memory Mapped Files

17168 Range memory mapping operations are defined in terms of pages. Implementations may  
 17169 restrict the size and alignment of range mappings to be on page-size boundaries. The page size,  
 17170 in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has  
 17171 no restrictions on size or alignment, it may specify a 1-byte page size.

17172 Memory mapped files provide a mechanism that allows a process to access files by directly  
 17173 incorporating file data into its address space. Once a file is mapped into a process address space,  
 17174 the data can be manipulated as memory. If more than one process maps a file, its contents are  
 17175 shared among them. If the mappings allow shared write access, then data written into the  
 17176 memory object through the address space of one process appears in the address spaces of all  
 17177 processes that similarly map the same portion of the memory object.

17178 SHM Shared memory objects are named regions of storage that may be independent of the file system  
 17179 and can be mapped into the address space of one or more processes to allow them to share the  
 17180 associated memory.

17181 SHM An *unlink()* of a file or *shm\_unlink()* of a shared memory object, while causing the removal of  
 17182 the name, does not unmap any mappings established for the object. Once the name has been  
 17183 removed, the contents of the memory object are preserved as long as it is referenced. The  
 17184 memory object remains referenced as long as a process has the memory object open or has some  
 17185 area of the memory object mapped.

#### 17186 2.8.3.3 Memory Protection

17187 When an object is mapped, various application accesses to the mapped region may result in  
 17188 signals. In this context, SIGBUS is used to indicate an error using the mapped object, and  
 17189 SIGSEGV is used to indicate a protection violation or misuse of an address:

- 17190 • A mapping may be restricted to disallow some types of access.
- 17191 • Write attempts to memory that was mapped without write access, or any access to  
 17192 memory mapped PROT\_NONE, shall result in a SIGSEGV signal.
- 17193 • References to unmapped addresses shall result in a SIGSEGV signal.
- 17194 • Reference to whole pages within the mapping, but beyond the current length of the object,  
 17195 shall result in a SIGBUS signal.
- 17196 • The size of the object is unaffected by access beyond the end of the object (even if a  
 17197 SIGBUS is not generated).

#### 17198 2.8.3.4 Typed Memory Objects

17199 TYM The functionality described in this section shall be provided on implementations that support  
 17200 the Typed Memory Objects option (and the rest of this section is not further shaded for this  
 17201 option).

17202 Implementations may support the Typed Memory Objects option independently of support for  
 17203 memory mapped files or shared memory objects. Typed memory objects are implementation-  
 17204 configurable named storage pools accessible from one or more processors in a system, each via  
 17205 one or more ports, such as backplane buses, LANs, I/O channels, and so on. Each valid  
 17206 combination of a storage pool and a port is identified through a name that is defined at system  
 17207 configuration time, in an implementation-defined manner; the name may be independent of the  
 17208 file system. Using this name, a typed memory object can be opened and mapped into process  
 17209 address space. For a given storage pool and port, it is necessary to support both dynamic  
 17210 allocation from the pool as well as mapping at an application-supplied offset within the pool;  
 17211 when dynamic allocation has been performed, subsequent deallocation must be supported.  
 17212 Lastly, accessing typed memory objects from different ports requires a method for obtaining the  
 17213 offset and length of contiguous storage of a region of typed memory (dynamically allocated or  
 17214 not); this allows typed memory to be shared among processes and/or processors while being  
 17215 accessed from the desired port.

17216 **2.8.4 Process Scheduling**

17217 PS The functionality described in this section shall be provided on implementations that support  
 17218 the Process Scheduling option (and the rest of this section is not further shaded for this option).

17219 **Scheduling Policies**

17220 The scheduling semantics described in this volume of POSIX.1-2008 are defined in terms of a  
 17221 conceptual model that contains a set of thread lists. No implementation structures are  
 17222 necessarily implied by the use of this conceptual model. It is assumed that no time elapses  
 17223 during operations described using this model, and therefore no simultaneous operations are  
 17224 possible. This model discusses only processor scheduling for runnable threads, but it should be  
 17225 noted that greatly enhanced predictability of realtime applications results if the sequencing of  
 17226 other resources takes processor scheduling policy into account.

17227 There is, conceptually, one thread list for each priority. A runnable thread will be on the thread  
 17228 list for that thread's priority. Multiple scheduling policies shall be provided. Each non-empty  
 17229 thread list is ordered, contains a head as one end of its order, and a tail as the other. The purpose  
 17230 of a scheduling policy is to define the allowable operations on this set of lists (for example,  
 17231 moving threads between and within lists).

17232 The POSIX model treats a "process" as an aggregation of system resources, including one or  
 17233 more threads that may be scheduled by the operating system on the processor(s) it controls.  
 17234 Although a process has its own set of scheduling attributes, these have an indirect effect (if any)  
 17235 on the scheduling behavior of individual threads as described below.

17236 Each thread shall be controlled by an associated scheduling policy and priority. These  
 17237 parameters may be specified by explicit application execution of the *pthread\_setschedparam()*  
 17238 function. Additionally, the scheduling parameters of a thread (but not its scheduling policy) may  
 17239 be changed by application execution of the *pthread\_setschedprio()* function.

17240 Each process shall be controlled by an associated scheduling policy and priority. These  
 17241 parameters may be specified by explicit application execution of the *sched\_setscheduler()* or  
 17242 *sched\_setparam()* functions.

17243 The effect of the process scheduling attributes on individual threads in the process is dependent  
 17244 on the scheduling contention scope of the threads (see [Section 2.9.4](#), on page 509):

- 17245 • For threads with system scheduling contention scope, the process scheduling attributes  
 17246 shall have no effect on the scheduling attributes or behavior either of the thread or an  
 17247 underlying kernel scheduling entity dedicated to that thread.
- 17248 • For threads with process scheduling contention scope, the process scheduling attributes  
 17249 shall have no effect on the scheduling attributes of the thread. However, any underlying  
 17250 kernel scheduling entity used by these threads shall at all times behave as specified by the  
 17251 scheduling attributes of the containing process, and this behavior may affect the  
 17252 scheduling behavior of the process contention scope threads. For example, a process  
 17253 contention scope thread with scheduling policy `SCHED_FIFO` and the system maximum  
 17254 priority *H* (the value returned by *sched\_get\_priority\_max(SCHED\_FIFO)*) in a process with  
 17255 scheduling policy `SCHED_RR` and system minimum priority *L* (the value returned by  
 17256 *sched\_get\_priority\_min(SCHED\_RR)*) shall be subject to timeslicing and to preemption by  
 17257 any thread with an effective priority higher than *L*.

17258 Associated with each policy is a priority range. Each policy definition shall specify the minimum  
 17259 priority range for that policy. The priority ranges for each policy may but need not overlap the  
 17260 priority ranges of other policies.

17261 A conforming implementation shall select the thread that is defined as being at the head of the

- 17262 highest priority non-empty thread list to become a running thread, regardless of its associated  
17263 policy. This thread is then removed from its thread list.
- 17264 Four scheduling policies are specifically required. Other implementation-defined scheduling  
17265 policies may be defined. The following symbols are defined in the Base Definitions volume of  
17266 POSIX.1-2008, <sched.h>:
- 17267 SCHED\_FIFO First in, first out (FIFO) scheduling policy.
- 17268 SCHED\_RR Round robin scheduling policy.
- 17269 SS SCHED\_SPORADIC Sporadic server scheduling policy.
- 17270 SCHED\_OTHER Another scheduling policy.
- 17271 The values of these symbols shall be distinct.
- 17272 **SCHED\_FIFO**
- 17273 Conforming implementations shall include a scheduling policy called the FIFO scheduling  
17274 policy.
- 17275 Threads scheduled under this policy are chosen from a thread list that is ordered by the time its  
17276 threads have been on the list without being executed; generally, the head of the list is the thread  
17277 that has been on the list the longest time, and the tail is the thread that has been on the list the  
17278 shortest time.
- 17279 Under the SCHED\_FIFO policy, the modification of the definitional thread lists is as follows:
- 17280 1. When a running thread becomes a preempted thread, it becomes the head of the thread  
17281 list for its priority.
  - 17282 2. When a blocked thread becomes a runnable thread, it becomes the tail of the thread list  
17283 for its priority.
  - 17284 3. When a running thread calls the *sched\_setscheduler()* function, the process specified in the  
17285 function call is modified to the specified policy and the priority specified by the *param*  
17286 argument.
  - 17287 4. When a running thread calls the *sched\_setparam()* function, the priority of the process  
17288 specified in the function call is modified to the priority specified by the *param* argument.
  - 17289 5. When a running thread calls the *pthread\_setschedparam()* function, the thread specified in  
17290 the function call is modified to the specified policy and the priority specified by the *param*  
17291 argument.
  - 17292 6. When a running thread calls the *pthread\_setschedprio()* function, the thread specified in the  
17293 function call is modified to the priority specified by the *prio* argument.
  - 17294 7. If a thread whose policy or priority has been modified other than by *pthread\_setschedprio()*  
17295 is a running thread or is runnable, it then becomes the tail of the thread list for its new  
17296 priority.
  - 17297 8. If a thread whose priority has been modified by *pthread\_setschedprio()* is a running thread  
17298 or is runnable, the effect on its position in the thread list depends on the direction of the  
17299 modification, as follows:
    - 17300 a. If the priority is raised, the thread becomes the tail of the thread list.
    - 17301 b. If the priority is unchanged, the thread does not change position in the thread list.

- 17302 c. If the priority is lowered, the thread becomes the head of the thread list.
- 17303 9. When a running thread issues the *sched\_yield()* function, the thread becomes the tail of
- 17304 the thread list for its priority.
- 17305 10. At no other time is the position of a thread with this scheduling policy within the thread
- 17306 lists affected.

17307 For this policy, valid priorities shall be within the range returned by the *sched\_get\_priority\_max()*

17308 and *sched\_get\_priority\_min()* functions when SCHED\_FIFO is provided as the parameter.

17309 Conforming implementations shall provide a priority range of at least 32 priorities for this

17310 policy.

### 17311 SCHED\_RR

17312 Conforming implementations shall include a scheduling policy called the “round robin”

17313 scheduling policy. This policy shall be identical to the SCHED\_FIFO policy with the additional

17314 condition that when the implementation detects that a running thread has been executing as a

17315 running thread for a time period of the length returned by the *sched\_rr\_get\_interval()* function or

17316 longer, the thread shall become the tail of its thread list and the head of that thread list shall be

17317 removed and made a running thread.

17318 The effect of this policy is to ensure that if there are multiple SCHED\_RR threads at the same

17319 priority, one of them does not monopolize the processor. An application should not rely only on

17320 the use of SCHED\_RR to ensure application progress among multiple threads if the application

17321 includes threads using the SCHED\_FIFO policy at the same or higher priority levels or

17322 SCHED\_RR threads at a higher priority level.

17323 A thread under this policy that is preempted and subsequently resumes execution as a running

17324 thread completes the unexpired portion of its round robin interval time period.

17325 For this policy, valid priorities shall be within the range returned by the *sched\_get\_priority\_max()*

17326 and *sched\_get\_priority\_min()* functions when SCHED\_RR is provided as the parameter.

17327 Conforming implementations shall provide a priority range of at least 32 priorities for this

17328 policy.

### 17329 SCHED\_SPORADIC

17330 SS|TSP The functionality described in this section shall be provided on implementations that support

17331 the Process Sporadic Server or Thread Sporadic Server options (and the rest of this section is not

17332 further shaded for these options).

17333 If `_POSIX_SPORADIC_SERVER` or `_POSIX_THREAD_SPORADIC_SERVER` is defined, the

17334 implementation shall include a scheduling policy identified by the value SCHED\_SPORADIC.

17335 The sporadic server policy is based primarily on two time parameters: the replenishment period

17336 and the available execution capacity. The replenishment period is given by the

17337 *sched\_ss\_repl\_period* member of the **sched\_param** structure. The available execution capacity is

17338 initialized to the value given by the *sched\_ss\_init\_budget* member of the same parameter. The

17339 sporadic server policy is identical to the SCHED\_FIFO policy with some additional conditions

17340 that cause the thread’s assigned priority to be switched between the values specified by the

17341 *sched\_priority* and *sched\_ss\_low\_priority* members of the **sched\_param** structure.

17342 The priority assigned to a thread using the sporadic server scheduling policy is determined in

17343 the following manner: if the available execution capacity is greater than zero and the number of

17344 pending replenishment operations is strictly less than *sched\_ss\_max\_repl*, the thread is assigned

17345 the priority specified by *sched\_priority*; otherwise, the assigned priority shall be

17346 *sched\_ss\_low\_priority*. If the value of *sched\_priority* is less than or equal to the value of

17347 *sched\_ss\_low\_priority*, the results are undefined. When active, the thread shall belong to the  
 17348 thread list corresponding to its assigned priority level, according to the mentioned priority  
 17349 assignment. The modification of the available execution capacity and, consequently of the  
 17350 assigned priority, is done as follows:

- 17351 1. When the thread at the head of the *sched\_priority* list becomes a running thread, its  
 17352 execution time shall be limited to at most its available execution capacity, plus the  
 17353 resolution of the execution time clock used for this scheduling policy. This resolution shall  
 17354 be implementation-defined.
- 17355 2. Each time the thread is inserted at the tail of the list associated with *sched\_priority*—  
 17356 because as a blocked thread it became runnable with priority *sched\_priority* or because a  
 17357 replenishment operation was performed—the time at which this operation is done is  
 17358 posted as the *activation\_time*.
- 17359 3. When the running thread with assigned priority equal to *sched\_priority* becomes a  
 17360 preempted thread, it becomes the head of the thread list for its priority, and the execution  
 17361 time consumed is subtracted from the available execution capacity. If the available  
 17362 execution capacity would become negative by this operation, it shall be set to zero.
- 17363 4. When the running thread with assigned priority equal to *sched\_priority* becomes a blocked  
 17364 thread, the execution time consumed is subtracted from the available execution capacity,  
 17365 and a replenishment operation is scheduled, as described in 6 and 7. If the available  
 17366 execution capacity would become negative by this operation, it shall be set to zero.
- 17367 5. When the running thread with assigned priority equal to *sched\_priority* reaches the limit  
 17368 imposed on its execution time, it becomes the tail of the thread list for  
 17369 *sched\_ss\_low\_priority*, the execution time consumed is subtracted from the available  
 17370 execution capacity (which becomes zero), and a replenishment operation is scheduled, as  
 17371 described in 6 and 7.
- 17372 6. Each time a replenishment operation is scheduled, the amount of execution capacity to be  
 17373 replenished, *replenish\_amount*, is set equal to the execution time consumed by the thread  
 17374 since the *activation\_time*. The replenishment is scheduled to occur at *activation\_time* plus  
 17375 *sched\_ss\_repl\_period*. If the scheduled time obtained is before the current time, the  
 17376 replenishment operation is carried out immediately. Several replenishment operations  
 17377 may be pending at the same time, each of which will be serviced at its respective  
 17378 scheduled time. With the above rules, the number of replenishment operations  
 17379 simultaneously pending for a given thread that is scheduled under the sporadic server  
 17380 policy shall not be greater than *sched\_ss\_max\_repl*.
- 17381 7. A replenishment operation consists of adding the corresponding *replenish\_amount* to the  
 17382 available execution capacity at the scheduled time. If, as a consequence of this operation,  
 17383 the execution capacity would become larger than *sched\_ss\_initial\_budget*, it shall be  
 17384 rounded down to a value equal to *sched\_ss\_initial\_budget*. Additionally, if the thread was  
 17385 runnable or running, and had assigned priority equal to *sched\_ss\_low\_priority*, then it  
 17386 becomes the tail of the thread list for *sched\_priority*.

17387 Execution time is defined in XBD Section 3.118 (on page 52).

17388 For this policy, changing the value of a CPU-time clock via *clock\_settime()* shall have no effect on  
 17389 its behavior.

17390 For this policy, valid priorities shall be within the range returned by the *sched\_get\_priority\_min()*  
 17391 and *sched\_get\_priority\_max()* functions when SCHED\_SPORADIC is provided as the parameter.  
 17392 Conforming implementations shall provide a priority range of at least 32 distinct priorities for  
 17393 this policy.

17394 If the scheduling policy of the target process is either SCHED\_FIFO or SCHED\_RR, the  
 17395 *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, and *sched\_ss\_init* budget members of the *param*  
 17396 argument shall have no effect on the scheduling behavior. If the scheduling policy of this process  
 17397 is not SCHED\_FIFO, SCHED\_RR, or SCHED\_SPORADIC, the effects of these members are  
 17398 implementation-defined; this case includes the SCHED\_OTHER policy.

#### 17399 SCHED\_OTHER

17400 Conforming implementations shall include one scheduling policy identified as SCHED\_OTHER  
 17401 (which may execute identically with either the FIFO or round robin scheduling policy). The  
 17402 effect of scheduling threads with the SCHED\_OTHER policy in a system in which other threads  
 17403 SS are executing under SCHED\_FIFO, SCHED\_RR, or SCHED\_SPORADIC is implementation-  
 17404 defined.

17405 This policy is defined to allow strictly conforming applications to be able to indicate in a  
 17406 portable manner that they no longer need a realtime scheduling policy.

17407 For threads executing under this policy, the implementation shall use only priorities within the  
 17408 range returned by the *sched\_get\_priority\_max()* and *sched\_get\_priority\_min()* functions when  
 17409 SCHED\_OTHER is provided as the parameter.

### 17410 2.8.5 Clocks and Timers

17411 The `<time.h>` header defines the types and manifest constants used by the timing facility.

#### 17412 Time Value Specification Structures

17413 Many of the timing facility functions accept or return time value specifications. A time value  
 17414 structure `timespec` specifies a single time value and includes at least the following members:

| Member Type         | Member Name    | Description  |
|---------------------|----------------|--------------|
| <code>time_t</code> | <i>tv_sec</i>  | Seconds.     |
| <code>long</code>   | <i>tv_nsec</i> | Nanoseconds. |

17418 The *tv\_nsec* member is only valid if greater than or equal to zero, and less than the number of  
 17419 nanoseconds in a second (1 000 million). The time interval described by this structure is ( $tv\_sec * 10^9 + tv\_nsec$ ) nanoseconds.

17421 A time value structure `itimerspec` specifies an initial timer value and a repetition interval for use  
 17422 by the per-process timer functions. This structure includes at least the following members:

| Member Type                  | Member Name        | Description       |
|------------------------------|--------------------|-------------------|
| <code>struct timespec</code> | <i>it_interval</i> | Timer period.     |
| <code>struct timespec</code> | <i>it_value</i>    | Timer expiration. |

17426 If the value described by *it\_value* is non-zero, it indicates the time to or time of the next timer  
 17427 expiration (for relative and absolute timer values, respectively). If the value described by *it\_value*  
 17428 is zero, the timer shall be disarmed.

17429 If the value described by *it\_interval* is non-zero, it specifies an interval which shall be used in  
 17430 reloading the timer when it expires; that is, a periodic timer is specified. If the value described  
 17431 by *it\_interval* is zero, the timer is disarmed after its next expiration; that is, a one-shot timer is  
 17432 specified.

17433 **Timer Event Notification Control Block**

17434 Per-process timers may be created that notify the process of timer expirations by queuing a  
 17435 realtime extended signal. The **sigevent** structure, defined in the Base Definitions volume of  
 17436 POSIX.1-2008, **<signal.h>**, is used in creating such a timer. The **sigevent** structure contains the  
 17437 signal number and an application-specific data value which shall be used when notifying the  
 17438 calling process of timer expiration events.

17439 **Manifest Constants**

17440 The following constants are defined in the Base Definitions volume of POSIX.1-2008, **<time.h>**:

17441 **CLOCK\_REALTIME** The identifier for the system-wide realtime clock.

17442 **TIMER\_ABSTIME** Flag indicating time is absolute with respect to the clock associated  
 17443 with a timer.

17444 **MON** **CLOCK\_MONOTONIC** The identifier for the system-wide monotonic clock, which is defined  
 17445 as a clock whose value cannot be set via *clock\_settime()* and which  
 17446 cannot have backward clock jumps. The maximum possible clock  
 17447 jump is implementation-defined.

17448 **MON** The maximum allowable resolution for **CLOCK\_REALTIME** and **CLOCK\_MONOTONIC** clocks  
 17449 and all time services based on these clocks is represented by **{\_POSIX\_CLOCKRES\_MIN}** and  
 17450 shall be defined as 20 ms (1/50 of a second). Implementations may support smaller values of  
 17451 resolution for these clocks to provide finer granularity time bases. The actual resolution  
 17452 supported by an implementation for a specific clock is obtained using the *clock\_getres()* function.  
 17453 If the actual resolution supported for a time service based on one of these clocks differs from the  
 17454 resolution supported for that clock, the implementation shall document this difference.

17455 **MON** The minimum allowable maximum value for **CLOCK\_REALTIME** and **CLOCK\_MONOTONIC**  
 17456 clocks and all absolute time services based on them is the same as that defined by the ISO C  
 17457 standard for the **time\_t** type. If the maximum value supported by a time service based on one of  
 17458 these clocks differs from the maximum value supported by that clock, the implementation shall  
 17459 document this difference.

17460 **Execution Time Monitoring**

17461 **CPT** If **\_POSIX\_CPUTIME** is defined, process CPU-time clocks shall be supported in addition to the  
 17462 clocks described in **Manifest Constants**.

17463 **TCT** If **\_POSIX\_THREAD\_CPUTIME** is defined, thread CPU-time clocks shall be supported.

17464 **CPT|TCT** CPU-time clocks measure execution or CPU time, which is defined in XBD **Section 3.118** (on  
 17465 page 52). The mechanism used to measure execution time is described in XBD **Section 4.10** (on  
 17466 page 110).

17467 **CPT** If **\_POSIX\_CPUTIME** is defined, the following constant of the type **clockid\_t** is defined in  
 17468 **<time.h>**:

17469 **CLOCK\_PROCESS\_CPUTIME\_ID**

17470 When this value of the type **clockid\_t** is used in a *clock()* or *timer\*()* function call, it is  
 17471 interpreted as the identifier of the CPU-time clock associated with the process making the  
 17472 function call.

17473 **TCT** If **\_POSIX\_THREAD\_CPUTIME** is defined, the following constant of the type **clockid\_t** is  
 17474 defined in **<time.h>**:

17475 CLOCK\_THREAD\_CPUTIME\_ID  
 17476 When this value of the type `clockid_t` is used in a `clock()` or `timer*()` function call, it is  
 17477 interpreted as the identifier of the CPU-time clock associated with the thread making the  
 17478 function call.

## 17479 2.9 Threads

17480 This section defines functionality to support multiple flows of control, called “threads” within a  
 17481 process. For the definition of threads, see XBD Section 3.396 (on page 97).

17482 The specific functional areas covered by threads and their scope include:

- 17483 • Thread management: the creation, control, and termination of multiple flows of control in  
 17484 the same process under the assumption of a common shared address space
- 17485 • Synchronization primitives optimized for tightly coupled operation of multiple control  
 17486 flows in a common, shared address space

### 17487 2.9.1 Thread-Safety

17488 All functions defined by this volume of POSIX.1-2008 shall be thread-safe, except that the  
 17489 following functions<sup>7</sup> need not be thread-safe.

|       |                             |                                 |                              |                                 |
|-------|-----------------------------|---------------------------------|------------------------------|---------------------------------|
| 17490 | <code>asctime()</code>      | <code>ftw()</code>              | <code>getservbyport()</code> | <code>putc_unlocked()</code>    |
| 17491 | <code>basename()</code>     | <code>getc_unlocked()</code>    | <code>getservent()</code>    | <code>putchar_unlocked()</code> |
| 17492 | <code>catgets()</code>      | <code>getchar_unlocked()</code> | <code>getutxent()</code>     | <code>putenv()</code>           |
| 17493 | <code>crypt()</code>        | <code>getdate()</code>          | <code>getutxid()</code>      | <code>pututxline()</code>       |
| 17494 | <code>ctime()</code>        | <code>getenv()</code>           | <code>getutxline()</code>    | <code>rand()</code>             |
| 17495 | <code>dbm_clearerr()</code> | <code>getgrent()</code>         | <code>gmtime()</code>        | <code>readdir()</code>          |
| 17496 | <code>dbm_close()</code>    | <code>getgrgid()</code>         | <code>hcreate()</code>       | <code>setenv()</code>           |
| 17497 | <code>dbm_delete()</code>   | <code>getgrnam()</code>         | <code>hdestroy()</code>      | <code>setgrent()</code>         |
| 17498 | <code>dbm_error()</code>    | <code>gethostent()</code>       | <code>hsearch()</code>       | <code>setkey()</code>           |
| 17499 | <code>dbm_fetch()</code>    | <code>getlogin()</code>         | <code>inet_ntoa()</code>     | <code>setpwent()</code>         |
| 17500 | <code>dbm_firstkey()</code> | <code>getnetbyaddr()</code>     | <code>l64a()</code>          | <code>setutxent()</code>        |
| 17501 | <code>dbm_nextkey()</code>  | <code>getnetbyname()</code>     | <code>lgamma()</code>        | <code>strerror()</code>         |
| 17502 | <code>dbm_open()</code>     | <code>getnetent()</code>        | <code>lgammaf()</code>       | <code>strsignal()</code>        |
| 17503 | <code>dbm_store()</code>    | <code>getopt()</code>           | <code>lgammal()</code>       | <code>strtok()</code>           |
| 17504 | <code>dirname()</code>      | <code>getprotobyname()</code>   | <code>localeconv()</code>    | <code>system()</code>           |
| 17505 | <code>dlderror()</code>     | <code>getprotobynumber()</code> | <code>localtime()</code>     | <code>ttyname()</code>          |
| 17506 | <code>drand48()</code>      | <code>getprotoent()</code>      | <code>lrand48()</code>       | <code>unsetenv()</code>         |
| 17507 | <code>encrypt()</code>      | <code>getpwent()</code>         | <code>mrnd48()</code>        | <code>wcstombs()</code>         |
| 17508 | <code>endgrent()</code>     | <code>getpwnam()</code>         | <code>nftw()</code>          | <code>wctomb()</code>           |
| 17509 | <code>endpwent()</code>     | <code>getpwuid()</code>         | <code>nl_langinfo()</code>   |                                 |
| 17510 | <code>endutxent()</code>    | <code>getservbyname()</code>    | <code>ptsname()</code>       |                                 |

17511 The `ctermid()` and `tmpnam()` functions need not be thread-safe if passed a NULL argument. The  
 17512 `wcrtomb()` and `wcsrtombs()` functions need not be thread-safe if passed a NULL *ps* argument.

17513 7. The functions in the table are not shaded to denote applicable options. Individual reference pages should be consulted.

17514 Implementations shall provide internal synchronization as necessary in order to satisfy this  
17515 requirement.

17516 Since multi-threaded applications are not allowed to use the *environ* variable to access or modify  
17517 any environment variable while any other thread is concurrently modifying any environment  
17518 variable, any function dependent on any environment variable is not thread-safe if another  
17519 thread is modifying the environment; see XSH *exec* (on page 772).

### 17520 2.9.2 Thread IDs

17521 Although implementations may have thread IDs that are unique in a system, applications  
17522 should only assume that thread IDs are usable and unique within a single process. The effect of  
17523 calling any of the functions defined in this volume of POSIX.1-2008 and passing as an argument  
17524 the thread ID of a thread from another process is unspecified. The lifetime of a thread ID ends  
17525 after the thread terminates if it was created with the *detachstate* attribute set to  
17526 PTHREAD\_CREATE\_DETACHED or if *pthread\_detach()* or *pthread\_join()* has been called for that  
17527 thread. A conforming implementation is free to reuse a thread ID after its lifetime has ended. If  
17528 an application attempts to use a thread ID whose lifetime has ended, the behavior is undefined.

17529 If a thread is detached, its thread ID is invalid for use as an argument in a call to *pthread\_detach()*  
17530 or *pthread\_join()*.

### 17531 2.9.3 Thread Mutexes

17532 A thread that has blocked shall not prevent any unblocked thread that is eligible to use the same  
17533 processing resources from eventually making forward progress in its execution. Eligibility for  
17534 processing resources is determined by the scheduling policy.

17535 A thread shall become the owner of a mutex, *m*, when one of the following occurs:

- 17536 • It returns successfully from *pthread\_mutex\_lock()* with *m* as the *mutex* argument.
- 17537 • It returns successfully from *pthread\_mutex\_trylock()* with *m* as the *mutex* argument.
- 17538 • It returns successfully from *pthread\_mutex\_timedlock()* with *m* as the *mutex* argument.
- 17539 • It returns (successfully or not) from *pthread\_cond\_wait()* with *m* as the *mutex* argument  
17540 (except as explicitly indicated otherwise for certain errors).
- 17541 • It returns (successfully or not) from *pthread\_cond\_timedwait()* with *m* as the *mutex*  
17542 argument (except as explicitly indicated otherwise for certain errors).

17543 The thread shall remain the owner of *m* until one of the following occurs:

- 17544 • It executes *pthread\_mutex\_unlock()* with *m* as the *mutex* argument
- 17545 • It blocks in a call to *pthread\_cond\_wait()* with *m* as the *mutex* argument.
- 17546 • It blocks in a call to *pthread\_cond\_timedwait()* with *m* as the *mutex* argument.

17547 The implementation shall behave as if at all times there is at most one owner of any mutex.

17548 A thread that becomes the owner of a mutex is said to have “acquired” the mutex and the mutex  
17549 is said to have become “locked”; when a thread gives up ownership of a mutex it is said to have  
17550 “released” the mutex and the mutex is said to have become “unlocked”.

17551 A problem can occur if a process terminates while one of its threads holds a mutex lock.  
17552 Depending on the mutex type, it might be possible for another thread to unlock the mutex and  
17553 recover the state of the mutex. However, it is difficult to perform this recovery reliably.

17554 Robust mutexes provide a means to enable the implementation to notify other threads in the  
 17555 event of a process terminating while one of its threads holds a mutex lock. The next thread that  
 17556 acquires the mutex is notified about the termination by the return value [EOWNERDEAD] from  
 17557 the locking function. The notified thread can then attempt to recover the state protected by the  
 17558 mutex, and if successful mark the state protected by the mutex as consistent by a call to  
 17559 *pthread\_mutex\_consistent*( ). If the notified thread is unable to recover the state, it can declare the  
 17560 state as not recoverable by a call to *pthread\_mutex\_unlock*( ) without a prior call to  
 17561 *pthread\_mutex\_consistent*( ).

17562 Whether or not the state protected by a mutex can be recovered is dependent solely on the  
 17563 application using robust mutexes. The robust mutex support provided in the implementation  
 17564 provides notification only that a mutex owner has terminated while holding a lock, or that the  
 17565 state of the mutex is not recoverable.

#### 17566 2.9.4 Thread Scheduling

17567 TPS The functionality described in this section shall be provided on implementations that support  
 17568 the Thread Execution Scheduling option (and the rest of this section is not further shaded for  
 17569 this option).

##### 17570 Thread Scheduling Attributes

17571 In support of the scheduling function, threads have attributes which are accessed through the  
 17572 **pthread\_attr\_t** thread creation attributes object.

17573 The *contentionscope* attribute defines the scheduling contention scope of the thread to be either  
 17574 PTHREAD\_SCOPE\_PROCESS or PTHREAD\_SCOPE\_SYSTEM.

17575 The *inheritsched* attribute specifies whether a newly created thread is to inherit the scheduling  
 17576 attributes of the creating thread or to have its scheduling values set according to the other  
 17577 scheduling attributes in the **pthread\_attr\_t** object.

17578 The *schedpolicy* attribute defines the scheduling policy for the thread. The *schedparam* attribute  
 17579 defines the scheduling parameters for the thread. The interaction of threads having different  
 17580 policies within a process is described as part of the definition of those policies.

17581 If the Thread Execution Scheduling option is defined, and the *schedpolicy* attribute specifies one  
 17582 of the priority-based policies defined under this option, the *schedparam* attribute contains the  
 17583 scheduling priority of the thread. A conforming implementation ensures that the priority value  
 17584 in *schedparam* is in the range associated with the scheduling policy when the thread attributes  
 17585 object is used to create a thread, or when the scheduling attributes of a thread are dynamically  
 17586 modified. The meaning of the priority value in *schedparam* is the same as that of *priority*.

17587 TSP If `_POSIX_THREAD_SPORADIC_SERVER` is defined, the *schedparam* attribute supports four  
 17588 new members that are used for the sporadic server scheduling policy. These members are  
 17589 *sched\_ss\_low\_priority*, *sched\_ss\_repl\_period*, *sched\_ss\_init\_budget*, and *sched\_ss\_max\_repl*. The  
 17590 meaning of these attributes is the same as in the definitions that appear under Section 2.8.4 (on  
 17591 page 501).

17592 When a process is created, its single thread has a scheduling policy and associated attributes  
 17593 equal to the policy and attributes of the process. The default scheduling contention scope value  
 17594 is implementation-defined. The default values of other scheduling attributes are  
 17595 implementation-defined.

17596 **Thread Scheduling Contention Scope**

17597 The scheduling contention scope of a thread defines the set of threads with which the thread  
 17598 competes for use of the processing resources. The scheduling operation selects at most one  
 17599 thread to execute on each processor at any point in time and the thread's scheduling attributes  
 17600 (for example, *priority*), whether under process scheduling contention scope or system scheduling  
 17601 contention scope, are the parameters used to determine the scheduling decision.

17602 The scheduling contention scope, in the context of scheduling a mixed scope environment  
 17603 affects threads as follows:

- 17604 • A thread created with PTHREAD\_SCOPE\_SYSTEM scheduling contention scope contends  
 17605 for resources with all other threads in the same scheduling allocation domain relative to  
 17606 their system scheduling attributes. The system scheduling attributes of a thread created  
 17607 with PTHREAD\_SCOPE\_SYSTEM scheduling contention scope are the scheduling  
 17608 attributes with which the thread was created. The system scheduling attributes of a thread  
 17609 created with PTHREAD\_SCOPE\_PROCESS scheduling contention scope are the  
 17610 implementation-defined mapping into system attribute space of the scheduling attributes  
 17611 with which the thread was created.
- 17612 • Threads created with PTHREAD\_SCOPE\_PROCESS scheduling contention scope contend  
 17613 directly with other threads within their process that were created with  
 17614 PTHREAD\_SCOPE\_PROCESS scheduling contention scope. The contention is resolved  
 17615 based on the threads' scheduling attributes and policies. It is unspecified how such threads  
 17616 are scheduled relative to threads in other processes or threads with  
 17617 PTHREAD\_SCOPE\_SYSTEM scheduling contention scope.
- 17618 • Conforming implementations shall support the PTHREAD\_SCOPE\_PROCESS scheduling  
 17619 contention scope, the PTHREAD\_SCOPE\_SYSTEM scheduling contention scope, or both.

17620 **Scheduling Allocation Domain**

17621 Implementations shall support scheduling allocation domains containing one or more  
 17622 processors. It should be noted that the presence of multiple processors does not automatically  
 17623 indicate a scheduling allocation domain size greater than one. Conforming implementations on  
 17624 multi-processors may map all or any subset of the CPUs to one or multiple scheduling allocation  
 17625 domains, and could define these scheduling allocation domains on a per-thread, per-process, or  
 17626 per-system basis, depending on the types of applications intended to be supported by the  
 17627 implementation. The scheduling allocation domain is independent of scheduling contention  
 17628 scope, as the scheduling contention scope merely defines the set of threads with which a thread  
 17629 contends for processor resources, while scheduling allocation domain defines the set of  
 17630 processors for which it contends. The semantics of how this contention is resolved among  
 17631 threads for processors is determined by the scheduling policies of the threads.

17632 The choice of scheduling allocation domain size and the level of application control over  
 17633 scheduling allocation domains is implementation-defined. Conforming implementations may  
 17634 change the size of scheduling allocation domains and the binding of threads to scheduling  
 17635 allocation domains at any time.

17636 For application threads with scheduling allocation domains of size equal to one, the scheduling  
 17637 rules defined for SCHED\_FIFO and SCHED\_RR shall be used; see [Scheduling Policies](#) (on page  
 17638 501). All threads with system scheduling contention scope, regardless of the processes in which  
 17639 they reside, compete for the processor according to their priorities. Threads with process  
 17640 scheduling contention scope compete only with other threads with process scheduling  
 17641 contention scope within their process.

17642 For application threads with scheduling allocation domains of size greater than one, the rules

17643 TSP defined for SCHED\_FIFO, SCHED\_RR, and SCHED\_SPORADIC shall be used in an  
 17644 implementation-defined manner. Each thread with system scheduling contention scope  
 17645 competes for the processors in its scheduling allocation domain in an implementation-defined  
 17646 manner according to its priority. Threads with process scheduling contention scope are  
 17647 scheduled relative to other threads within the same scheduling contention scope in the process.

17648 TSP If \_POSIX\_THREAD\_SPORADIC\_SERVER is defined, the rules defined for SCHED\_SPORADIC  
 17649 in *Scheduling Policies* (on page 501) shall be used in an implementation-defined manner for  
 17650 application threads whose scheduling allocation domain size is greater than one.

### 17651 Scheduling Documentation

17652 If \_POSIX\_PRIORITY\_SCHEDULING is defined, then any scheduling policies beyond  
 17653 TSP SCHED\_OTHER, SCHED\_FIFO, SCHED\_RR, and SCHED\_SPORADIC, as well as the effects of  
 17654 the scheduling policies indicated by these other values, and the attributes required in order to  
 17655 support such a policy, are implementation-defined. Furthermore, the implementation shall  
 17656 document the effect of all processor scheduling allocation domain values supported for these  
 17657 policies.

## 17658 2.9.5 Thread Cancellation

17659 The thread cancellation mechanism allows a thread to terminate the execution of any other  
 17660 thread in the process in a controlled manner. The target thread (that is, the one that is being  
 17661 canceled) is allowed to hold cancellation requests pending in a number of ways and to perform  
 17662 application-specific cleanup processing when the notice of cancellation is acted upon.

17663 Cancellation is controlled by the cancellation control functions. Each thread maintains its own  
 17664 cancelability state. Cancellation may only occur at cancellation points or when the thread is  
 17665 asynchronously cancelable.

17666 The thread cancellation mechanism described in this section depends upon programs having set  
 17667 *deferred* cancelability state, which is specified as the default. Applications shall also carefully  
 17668 follow static lexical scoping rules in their execution behavior. For example, use of *setjmp()*,  
 17669 *return*, *goto*, and so on, to leave user-defined cancellation scopes without doing the necessary  
 17670 scope pop operation results in undefined behavior.

17671 Use of asynchronous cancelability while holding resources which potentially need to be released  
 17672 may result in resource loss. Similarly, cancellation scopes may only be safely manipulated  
 17673 (pushed and popped) when the thread is in the *deferred* or *disabled* cancelability states.

### 17674 2.9.5.1 Cancelability States

17675 The cancelability state of a thread determines the action taken upon receipt of a cancellation  
 17676 request. The thread may control cancellation in a number of ways.

17677 Each thread maintains its own cancelability state, which may be encoded in two bits:

- 17678 1. Cancelability-Enable: When cancelability is PTHREAD\_CANCEL\_DISABLE (as defined  
 17679 in the Base Definitions volume of POSIX.1-2008, **<pthread.h>**), cancellation requests  
 17680 against the target thread are held pending. By default, cancelability is set to  
 17681 PTHREAD\_CANCEL\_ENABLE (as defined in **<pthread.h>**).
- 17682 2. Cancelability Type: When cancelability is enabled and the cancelability type is  
 17683 PTHREAD\_CANCEL\_ASYNCHRONOUS (as defined in **<pthread.h>**), new or pending  
 17684 cancellation requests may be acted upon at any time. When cancelability is enabled and  
 17685 the cancelability type is PTHREAD\_CANCEL\_DEFERRED (as defined in **<pthread.h>**),

17686 cancellation requests are held pending until a cancellation point (see below) is reached. If  
 17687 cancelability is disabled, the setting of the cancelability type has no immediate effect as all  
 17688 cancellation requests are held pending; however, once cancelability is enabled again the  
 17689 new type is in effect. The cancelability type is PTHREAD\_CANCEL\_DEFERRED in all  
 17690 newly created threads including the thread in which *main()* was first invoked.

17691 2.9.5.2 Cancellation Points

17692 Cancellation points shall occur when a thread is executing the following functions:

|       |                          |                                 |                        |
|-------|--------------------------|---------------------------------|------------------------|
| 17693 | <i>accept()</i>          | <i>nanosleep()</i>              | <i>select()</i>        |
| 17694 | <i>aio_suspend()</i>     | <i>open()</i>                   | <i>sem_timedwait()</i> |
| 17695 | <i>clock_nanosleep()</i> | <i>openat()</i>                 | <i>sem_wait()</i>      |
| 17696 | <i>close()</i>           | <i>pause()</i>                  | <i>send()</i>          |
| 17697 | <i>connect()</i>         | <i>poll()</i>                   | <i>sendmsg()</i>       |
| 17698 | <i>creat()</i>           | <i>pread()</i>                  | <i>sendto()</i>        |
| 17699 | <i>fcntl()†</i>          | <i>pselect()</i>                | <i>sigsuspend()</i>    |
| 17700 | <i>fdatasync()</i>       | <i>pthread_cond_timedwait()</i> | <i>sigtimedwait()</i>  |
| 17701 | <i>fsync()</i>           | <i>pthread_cond_wait()</i>      | <i>sigwait()</i>       |
| 17702 | <i>getmsg()</i>          | <i>pthread_join()</i>           | <i>sigwaitinfo()</i>   |
| 17703 | <i>getpmsg()</i>         | <i>pthread_testcancel()</i>     | <i>sleep()</i>         |
| 17704 | <i>lockf()††</i>         | <i>putmsg()</i>                 | <i>system()</i>        |
| 17705 | <i>mq_receive()</i>      | <i>putpmsg()</i>                | <i>tcdrain()</i>       |
| 17706 | <i>mq_send()</i>         | <i>pwrite()</i>                 | <i>wait()</i>          |
| 17707 | <i>mq_timedreceive()</i> | <i>read()</i>                   | <i>waitid()</i>        |
| 17708 | <i>mq_timedsend()</i>    | <i>readv()</i>                  | <i>waitpid()</i>       |
| 17709 | <i>msgrcv()</i>          | <i>recv()</i>                   | <i>write()</i>         |
| 17710 | <i>msgsnd()</i>          | <i>recvfrom()</i>               | <i>writen()</i>        |
| 17711 | <i>msync()</i>           | <i>recvmsg()</i>                |                        |

| 17788 | <i>pthread_rwlock_wrlock()</i>                | <i>sigpause()</i>         |                     |
| 17789 |                                               | <i>stat()</i>             |                     |

17790 An implementation shall not introduce cancellation points into any other functions specified in  
17791 this volume of POSIX.1-2008.

17792 The side-effects of acting upon a cancellation request while suspended during a call of a function  
17793 are the same as the side-effects that may be seen in a single-threaded program when a call to a  
17794 function is interrupted by a signal and the given function returns [EINTR]. Any such side-  
17795 effects occur before any cancellation cleanup handlers are called.

17796 Whenever a thread has cancelability enabled and a cancellation request has been made with that  
17797 thread as the target, and the thread then calls any function that is a cancellation point (such as  
17798 *pthread\_testcancel()* or *read()*), the cancellation request shall be acted upon before the function  
17799 returns. If a thread has cancelability enabled and a cancellation request is made with the thread  
17800 as a target while the thread is suspended at a cancellation point, the thread shall be awakened  
17801 and the cancellation request shall be acted upon. It is unspecified whether the cancellation  
17802 request is acted upon or whether the cancellation request remains pending and the thread  
17803 resumes normal execution if:

- 17804 • The thread is suspended at a cancellation point and the event for which it is waiting occurs

17805 † For any value of the *cmd* argument.

17806 †† If *opterr* is non-zero.

17807           • A specified timeout expired  
17808           before the cancellation request is acted upon.

### 17809 2.9.5.3 Thread Cancellation Cleanup Handlers

17810           Each thread maintains a list of cancellation cleanup handlers. The programmer uses the  
17811 *pthread\_cleanup\_push()* and *pthread\_cleanup\_pop()* functions to place routines on and remove  
17812 routines from this list.

17813           When a cancellation request is acted upon, or when a thread calls *pthread\_exit()*, the thread first  
17814 disables cancellation by setting its cancelability state to `PTHREAD_CANCEL_DISABLE` and its  
17815 cancelability type to `PTHREAD_CANCEL_DEFERRED`. The cancelability state shall remain set  
17816 to `PTHREAD_CANCEL_DISABLE` until the thread has terminated. The behavior is undefined if  
17817 a cancellation cleanup handler or thread-specific data destructor routine changes the  
17818 cancelability state to `PTHREAD_CANCEL_ENABLE`.

17819           The routines in the thread's list of cancellation cleanup handlers are invoked one by one in LIFO  
17820 sequence; that is, the last routine pushed onto the list (Last In) is the first to be invoked (First  
17821 Out). When the cancellation cleanup handler for a scope is invoked, the storage for that scope  
17822 remains valid. If the last cancellation cleanup handler returns, thread-specific data destructors (if  
17823 any) associated with thread-specific data keys for which the thread has non-NULL values will  
17824 be run, in unspecified order, as described for *pthread\_key\_create()*.

17825           After all cancellation cleanup handlers and thread-specific data destructors have returned,  
17826 thread execution is terminated. If the thread has terminated because of a call to *pthread\_exit()*,  
17827 the *value\_ptr* argument is made available to any threads joining with the target. If the thread has  
17828 terminated by acting on a cancellation request, a status of `PTHREAD_CANCELED` is made  
17829 available to any threads joining with the target. The symbolic constant `PTHREAD_CANCELED`  
17830 expands to a constant expression of type `(void *)` whose value matches no pointer to an object in  
17831 memory nor the value `NULL`.

17832           A side-effect of acting upon a cancellation request while in a condition variable wait is that the  
17833 mutex is re-acquired before calling the first cancellation cleanup handler. In addition, the thread  
17834 is no longer considered to be waiting for the condition and the thread shall not have consumed  
17835 any pending condition signals on the condition.

17836           A cancellation cleanup handler cannot exit via *longjmp()* or *siglongjmp()*.

### 17837 2.9.5.4 Async-Cancel Safety

17838           The *pthread\_cancel()*, *pthread\_setcancelstate()*, and *pthread\_setcanceltype()* functions are defined to  
17839 be async-cancel safe.

17840           No other functions in this volume of POSIX.1-2008 are required to be async-cancel-safe.

## 17841 2.9.6 Thread Read-Write Locks

17842           Multiple readers, single writer (read-write) locks allow many threads to have simultaneous  
17843 read-only access to data while allowing only one thread to have exclusive write access at any  
17844 given time. They are typically used to protect data that is read more frequently than it is  
17845 changed.

17846           One or more readers acquire read access to the resource by performing a read lock operation on  
17847 the associated read-write lock. A writer acquires exclusive write access by performing a write  
17848 lock operation. Basically, all readers exclude any writers and a writer excludes all readers and

17849 any other writers.

17850 A thread that has blocked on a read-write lock (for example, has not yet returned from a  
17851 *pthread\_rwlock\_rdlock()* or *pthread\_rwlock\_wrlock()* call) shall not prevent any unblocked thread  
17852 that is eligible to use the same processing resources from eventually making forward progress in  
17853 its execution. Eligibility for processing resources shall be determined by the scheduling policy.

17854 Read-write locks can be used to synchronize threads in the current process and other processes if  
17855 they are allocated in memory that is writable and shared among the cooperating processes and  
17856 have been initialized for this behavior.

### 17857 2.9.7 Thread Interactions with Regular File Operations

17858 All of the following functions shall be atomic with respect to each other in the effects specified in  
17859 POSIX.1-2008 when they operate on regular files or symbolic links:

|       |                   |                    |                     |                    |                    |
|-------|-------------------|--------------------|---------------------|--------------------|--------------------|
| 17860 | <i>chmod()</i>    | <i>fchownat()</i>  | <i>lseek()</i>      | <i>readv()</i>     | <i>unlink()</i>    |
| 17861 | <i>chown()</i>    | <i>fcntl()</i>     | <i>lstat()</i>      | <i>pwrite()</i>    | <i>unlinkat()</i>  |
| 17862 | <i>close()</i>    | <i>fstat()</i>     | <i>open()</i>       | <i>rename()</i>    | <i>utime()</i>     |
| 17863 | <i>creat()</i>    | <i>fstatat()</i>   | <i>openat()</i>     | <i>renameat()</i>  | <i>utimensat()</i> |
| 17864 | <i>dup2()</i>     | <i>ftruncate()</i> | <i>pread()</i>      | <i>stat()</i>      | <i>utimes()</i>    |
| 17865 | <i>fchmod()</i>   | <i>lchown()</i>    | <i>read()</i>       | <i>symlink()</i>   | <i>write()</i>     |
| 17866 | <i>fchmodat()</i> | <i>link()</i>      | <i>readlink()</i>   | <i>symlinkat()</i> | <i>writetv()</i>   |
| 17867 | <i>fchown()</i>   | <i>linkat()</i>    | <i>readlinkat()</i> | <i>truncate()</i>  |                    |

17868 If two threads each call one of these functions, each call shall either see all of the specified effects  
17869 of the other call, or none of them.

### 17870 2.9.8 Use of Application-Managed Thread Stacks

17871 An “application-managed thread stack” is a region of memory allocated by the application—for  
17872 example, memory returned by the *malloc()* or *mmap()* functions—and designated as a stack  
17873 through the act of passing the address and size of the stack, respectively, as the *stackaddr* and  
17874 *stacksize* arguments to *pthread\_attr\_setstack()*. Application-managed stacks allow the application  
17875 to precisely control the placement and size of a stack.

17876 The application grants to the implementation permanent ownership of and control over the  
17877 application-managed stack when the attributes object in which the *stack* or *stackaddr* attribute has  
17878 been set is used, either by presenting that attribute’s object as the *attr* argument in a call to  
17879 *pthread\_create()* that completes successfully, or by storing a pointer to the attributes object in the  
17880 *sigev\_notify\_attributes* member of a **struct sigevent** and passing that **struct sigevent** to a function  
17881 accepting such argument that completes successfully. The application may thereafter utilize the  
17882 memory within the stack only within the normal context of stack usage within or properly  
17883 synchronized with a thread that has been scheduled by the implementation with stack pointer  
17884 value(s) that are within the range of that stack. In particular, the region of memory cannot be  
17885 freed, nor can it be later specified as the stack for another thread.

17886 When specifying an attributes object with an application-managed stack through the  
17887 *sigev\_notify\_attributes* member of a **struct sigevent**, the results are undefined if the requested  
17888 signal is generated multiple times (as for a repeating timer).

17889 Until an attributes object in which the *stack* or *stackaddr* attribute has been set is used, the  
17890 application retains ownership of and control over the memory allocated to the stack. It may free  
17891 or reuse the memory as long as it either deletes the attributes object, or before using the

17892 attributes object replaces the stack by making an additional call to *pthread\_attr\_setstack()*, that  
 17893 was used originally to designate the stack. There is no mechanism to retract the reference to an  
 17894 application-managed stack by an existing attributes object.

17895 Once an attributes object with an application-managed stack has been used, that attributes object  
 17896 cannot be used again by a subsequent call to *pthread\_create()* or any function accepting a **struct**  
 17897 **sigevent** with *sigev\_notify\_attributes* containing a pointer to the attributes object, without  
 17898 designating an unused application-managed stack by making an additional call to  
 17899 *pthread\_attr\_setstack()*.

## 17900 2.10 Sockets

17901 A socket is an endpoint for communication using the facilities described in this section. A socket  
 17902 is created with a specific socket type, described in [Section 2.10.6](#) (on page 518), and is associated  
 17903 with a specific protocol, detailed in [Section 2.10.3](#). A socket is accessed via a file descriptor  
 17904 obtained when the socket is created.

### 17905 2.10.1 Address Families

17906 All network protocols are associated with a specific address family. An address family provides  
 17907 basic services to the protocol implementation to allow it to function within a specific network  
 17908 environment. These services may include packet fragmentation and reassembly, routing,  
 17909 addressing, and basic transport. An address family is normally comprised of a number of  
 17910 protocols, one per socket type. Each protocol is characterized by an abstract socket type. It is not  
 17911 required that an address family support all socket types. An address family may contain  
 17912 multiple protocols supporting the same socket abstraction.

17913 [Section 2.10.17](#) (on page 525), [Section 2.10.19](#) (on page 526), and [Section 2.10.20](#) (on page 526),  
 17914 respectively, describe the use of sockets for local UNIX connections, for Internet protocols based  
 17915 on IPv4, and for Internet protocols based on IPv6.

### 17916 2.10.2 Addressing

17917 An address family defines the format of a socket address. All network addresses are described  
 17918 using a general structure, called a **sockaddr**, as defined in the Base Definitions volume of  
 17919 POSIX.1-2008, `<sys/socket.h>`. However, each address family imposes finer and more specific  
 17920 structure, generally defining a structure with fields specific to the address family. The field  
 17921 *sa\_family* in the **sockaddr** structure contains the address family identifier, specifying the format  
 17922 of the *sa\_data* area. The size of the *sa\_data* area is unspecified.

### 17923 2.10.3 Protocols

17924 A protocol supports one of the socket abstractions detailed in [Section 2.10.6](#) (on page 518).  
 17925 Selecting a protocol involves specifying the address family, socket type, and protocol number to  
 17926 the *socket()* function. Certain semantics of the basic socket abstractions are protocol-specific. All  
 17927 protocols are expected to support the basic model for their particular socket type, but may, in  
 17928 addition, provide non-standard facilities or extensions to a mechanism.

17929 **2.10.4 Routing**

17930 Sockets provides packet routing facilities. A routing information database is maintained, which  
17931 is used in selecting the appropriate network interface when transmitting packets.

17932 **2.10.5 Interfaces**

17933 Each network interface in a system corresponds to a path through which messages can be sent  
17934 and received. A network interface usually has a hardware device associated with it, though  
17935 certain interfaces such as the loopback interface, do not.

17936 **2.10.6 Socket Types**

17937 A socket is created with a specific type, which defines the communication semantics and which  
17938 allows the selection of an appropriate communication protocol. Four types are defined:  
17939 RS SOCK\_DGRAM, SOCK\_RAW, SOCK\_SEQPACKET, and SOCK\_STREAM. Implementations  
17940 may specify additional socket types.

17941 The SOCK\_STREAM socket type provides reliable, sequenced, full-duplex octet streams  
17942 between the socket and a peer to which the socket is connected. A socket of type  
17943 SOCK\_STREAM must be in a connected state before any data may be sent or received. Record  
17944 boundaries are not maintained; data sent on a stream socket using output operations of one size  
17945 may be received using input operations of smaller or larger sizes without loss of data. Data may  
17946 be buffered; successful return from an output function does not imply that the data has been  
17947 delivered to the peer or even transmitted from the local system. If data cannot be successfully  
17948 transmitted within a given time then the connection is considered broken, and subsequent  
17949 operations shall fail. A SIGPIPE signal is raised if a thread attempts to send data on a broken  
17950 stream (one that is no longer connected), except that the signal is suppressed if the  
17951 MSG\_NOSIGNAL flag is used in calls to *send()*, *sendto()*, and *sendmsg()*. Support for an out-of-  
17952 band data transmission facility is protocol-specific.

17953 The SOCK\_SEQPACKET socket type is similar to the SOCK\_STREAM type, and is also  
17954 connection-oriented. The only difference between these types is that record boundaries are  
17955 maintained using the SOCK\_SEQPACKET type. A record can be sent using one or more output  
17956 operations and received using one or more input operations, but a single operation never  
17957 transfers parts of more than one record. Record boundaries are visible to the receiver via the  
17958 MSG\_EOR flag in the received message flags returned by the *recvmsg()* function. It is protocol-  
17959 specific whether a maximum record size is imposed.

17960 The SOCK\_DGRAM socket type supports connectionless data transfer which is not necessarily  
17961 acknowledged or reliable. Datagrams may be sent to the address specified (possibly multicast or  
17962 broadcast) in each output operation, and incoming datagrams may be received from multiple  
17963 sources. The source address of each datagram is available when receiving the datagram. An  
17964 application may also pre-specify a peer address, in which case calls to output functions that do  
17965 not specify a peer address shall send to the pre-specified peer. If a peer has been specified, only  
17966 datagrams from that peer shall be received. A datagram must be sent in a single output  
17967 operation, and must be received in a single input operation. The maximum size of a datagram is  
17968 protocol-specific; with some protocols, the limit is implementation-defined. Output datagrams  
17969 may be buffered within the system; thus, a successful return from an output function does not  
17970 guarantee that a datagram is actually sent or received. However, implementations should  
17971 attempt to detect any errors possible before the return of an output function, reporting any error  
17972 by an unsuccessful return value.

17973 RS The SOCK\_RAW socket type is similar to the SOCK\_DGRAM type. It differs in that it is  
 17974 normally used with communication providers that underlie those used for the other socket  
 17975 types. For this reason, the creation of a socket with type SOCK\_RAW shall require appropriate  
 17976 privileges. The format of datagrams sent and received with this socket type generally include  
 17977 specific protocol headers, and the formats are protocol-specific and implementation-defined.

#### 17978 **2.10.7 Socket I/O Mode**

17979 The I/O mode of a socket is described by the O\_NONBLOCK file status flag which pertains to  
 17980 the open file description for the socket. This flag is initially off when a socket is created, but may  
 17981 be set and cleared by the use of the F\_SETFL command of the *fcntl()* function.

17982 When the O\_NONBLOCK flag is set, certain functions that would normally block until they are  
 17983 complete shall return immediately.

17984 The *bind()* function initiates an address assignment and shall return without blocking when  
 17985 O\_NONBLOCK is set; if the socket address cannot be assigned immediately, *bind()* shall return  
 17986 the [EINPROGRESS] error to indicate that the assignment was initiated successfully, but that it  
 17987 has not yet completed.

17988 The *connect()* function initiates a connection and shall return without blocking when  
 17989 O\_NONBLOCK is set; it shall return the error [EINPROGRESS] to indicate that the connection  
 17990 was initiated successfully, but that it has not yet completed.

17991 Data transfer operations (the *read()*, *write()*, *send()*, and *recv()* functions) shall complete  
 17992 immediately, transfer only as much as is available, and then return without blocking, or return  
 17993 an error indicating that no transfer could be made without blocking.

#### 17994 **2.10.8 Socket Owner**

17995 The owner of a socket is unset when a socket is created. The owner may be set to a process ID or  
 17996 process group ID using the F\_SETOWN command of the *fcntl()* function.

#### 17997 **2.10.9 Socket Queue Limits**

17998 The transmit and receive queue sizes for a socket are set when the socket is created. The default  
 17999 sizes used are both protocol-specific and implementation-defined. The sizes may be changed  
 18000 using the *setsockopt()* function.

#### 18001 **2.10.10 Pending Error**

18002 Errors may occur asynchronously, and be reported to the socket in response to input from the  
 18003 network protocol. The socket stores the pending error to be reported to a user of the socket at the  
 18004 next opportunity. The error is returned in response to a subsequent *send()*, *recv()*, or *getsockopt()*  
 18005 operation on the socket, and the pending error is then cleared.

18006 **2.10.11 Socket Receive Queue**

18007 A socket has a receive queue that buffers data when it is received by the system until it is  
 18008 removed by a receive call. Depending on the type of the socket and the communication provider,  
 18009 the receive queue may also contain ancillary data such as the addressing and other protocol data  
 18010 associated with the normal data in the queue, and may contain out-of-band or expedited data.  
 18011 The limit on the queue size includes any normal, out-of-band data, datagram source addresses,  
 18012 and ancillary data in the queue. The description in this section applies to all sockets, even  
 18013 though some elements cannot be present in some instances.

18014 The contents of a receive buffer are logically structured as a series of data segments with  
 18015 associated ancillary data and other information. A data segment may contain normal data or  
 18016 out-of-band data, but never both. A data segment may complete a record if the protocol  
 18017 supports records (always true for types SOCK\_SEQPACKET and SOCK\_DGRAM). A record  
 18018 may be stored as more than one segment; the complete record might never be present in the  
 18019 receive buffer at one time, as a portion might already have been returned to the application, and  
 18020 another portion might not yet have been received from the communications provider. A data  
 18021 segment may contain ancillary protocol data, which is logically associated with the segment.  
 18022 Ancillary data is received as if it were queued along with the first normal data octet in the  
 18023 segment (if any). A segment may contain ancillary data only, with no normal or out-of-band  
 18024 data. For the purposes of this section, a datagram is considered to be a data segment that  
 18025 terminates a record, and that includes a source address as a special type of ancillary data. Data  
 18026 segments are placed into the queue as data is delivered to the socket by the protocol. Normal  
 18027 data segments are placed at the end of the queue as they are delivered. If a new segment  
 18028 contains the same type of data as the preceding segment and includes no ancillary data, and if  
 18029 the preceding segment does not terminate a record, the segments are logically merged into a  
 18030 single segment.

18031 The receive queue is logically terminated if an end-of-file indication has been received or a  
 18032 connection has been terminated. A segment shall be considered to be terminated if another  
 18033 segment follows it in the queue, if the segment completes a record, or if an end-of-file or other  
 18034 connection termination has been reported. The last segment in the receive queue shall also be  
 18035 considered to be terminated while the socket has a pending error to be reported.

18036 A receive operation shall never return data or ancillary data from more than one segment.

18037 **2.10.12 Socket Out-of-Band Data State**

18038 The handling of received out-of-band data is protocol-specific. Out-of-band data may be placed  
 18039 in the socket receive queue, either at the end of the queue or before all normal data in the queue.  
 18040 In this case, out-of-band data is returned to an application program by a normal receive call.  
 18041 Out-of-band data may also be queued separately rather than being placed in the socket receive  
 18042 queue, in which case it shall be returned only in response to a receive call that requests out-of-  
 18043 band data. It is protocol-specific whether an out-of-band data mark is placed in the receive  
 18044 queue to demarcate data preceding the out-of-band data and following the out-of-band data. An  
 18045 out-of-band data mark is logically an empty data segment that cannot be merged with other  
 18046 segments in the queue. An out-of-band data mark is never returned in response to an input  
 18047 operation. The *socketmark()* function can be used to test whether an out-of-band data mark is the  
 18048 first element in the queue. If an out-of-band data mark is the first element in the queue when an  
 18049 input function is called without the MSG\_PEEK option, the mark is removed from the queue  
 18050 and the following data (if any) is processed as if the mark had not been present.

18051 **2.10.13 Connection Indication Queue**

18052 Sockets that are used to accept incoming connections maintain a queue of outstanding  
 18053 connection indications. This queue is a list of connections that are awaiting acceptance by the  
 18054 application; see *listen()*.

18055 **2.10.14 Signals**

18056 One category of event at the socket interface is the generation of signals. These signals report  
 18057 protocol events or process errors relating to the state of the socket. The generation or delivery of  
 18058 a signal does not change the state of the socket, although the generation of the signal may have  
 18059 been caused by a state change.

18060 The SIGPIPE signal shall be sent to a thread that attempts to send data on a socket that is no  
 18061 longer able to send (one that is no longer connected), except that the signal is suppressed if the  
 18062 MSG\_NOSIGNAL flag is used in calls to *send()*, *sendto()*, and *sendmsg()*. Regardless of whether  
 18063 the generation of the signal is suppressed, the send operation shall fail with the [EPIPE] error.

18064 If a socket has an owner, the SIGURG signal is sent to the owner of the socket when it is notified  
 18065 of expedited or out-of-band data. The socket state at this time is protocol-dependent, and the  
 18066 status of the socket is specified in [Section 2.10.17](#) (on page 525), [Section 2.10.19](#) (on page 526),  
 18067 and [Section 2.10.20](#) (on page 526). Depending on the protocol, the expedited data may or may  
 18068 not have arrived at the time of signal generation.

18069 **2.10.15 Asynchronous Errors**

18070 If any of the following conditions occur asynchronously for a socket, the corresponding value  
 18071 listed below shall become the pending error for the socket:

18072 [ECONNABORTED]

18073 The connection was aborted locally.

18074 [ECONNREFUSED]

18075 For a connection-mode socket attempting a non-blocking connection, the attempt to connect  
 18076 was forcefully rejected. For a connectionless-mode socket, an attempt to deliver a datagram  
 18077 was forcefully rejected.

18078 [ECONNRESET]

18079 The peer has aborted the connection.

18080 [EHOSTDOWN]

18081 The destination host has been determined to be down or disconnected.

18082 [EHOSTUNREACH]

18083 The destination host is not reachable.

18084 [EMSGSIZE]

18085 For a connectionless-mode socket, the size of a previously sent datagram prevented  
 18086 delivery.

18087 [ENETDOWN]

18088 The local network connection is not operational.

18089 [ENETRESET]

18090 The connection was aborted by the network.

18091 [ENETUNREACH]  
 18092 The destination network is not reachable.

18093 **2.10.16 Use of Options**

18094 There are a number of socket options which either specialize the behavior of a socket or provide  
 18095 useful information. These options may be set at different protocol levels and are always present  
 18096 at the uppermost “socket” level.

18097 Socket options are manipulated by two functions, *getsockopt()* and *setsockopt()*. These functions  
 18098 allow an application program to customize the behavior and characteristics of a socket to  
 18099 provide the desired effect.

18100 All of the options have default values. The type and meaning of these values is defined by the  
 18101 protocol level to which they apply. Instead of using the default values, an application program  
 18102 may choose to customize one or more of the options. However, in the bulk of cases, the default  
 18103 values are sufficient for the application.

18104 Some of the options are used to enable or disable certain behavior within the protocol modules  
 18105 (for example, turn on debugging) while others may be used to set protocol-specific information  
 18106 (for example, IP time-to-live on all the application’s outgoing packets). As each of the options is  
 18107 introduced, its effect on the underlying protocol modules is described.

18108 Table 2-1 shows the value for the socket level.

18109 **Table 2-1** Value of Level for Socket Options

| Name       | Description                                 |
|------------|---------------------------------------------|
| SOL_SOCKET | Options are intended for the sockets level. |

18112 Table 2-2 (on page 523) lists those options present at the socket level; that is, when the *level*  
 18113 parameter of the *getsockopt()* or *setsockopt()* function is SOL\_SOCKET, the types of the option  
 18114 value parameters associated with each option, and a brief synopsis of the meaning of the option  
 18115 value parameter. Unless otherwise noted, each may be examined with *getsockopt()* and set with  
 18116 *setsockopt()* on all types of socket. Options at other protocol levels vary in format and name.

18117

Table 2-2 Socket-Level Options

| Option        | Parameter Type | Parameter Meaning                                                                                                 |
|---------------|----------------|-------------------------------------------------------------------------------------------------------------------|
| SO_ACCEPTCONN | int            | Non-zero indicates that socket listening is enabled ( <i>getsockopt()</i> only).                                  |
| SO_BROADCAST  | int            | Non-zero requests permission to transmit broadcast datagrams (SOCK_DGRAM sockets only).                           |
| SO_DEBUG      | int            | Non-zero requests debugging in underlying protocol modules.                                                       |
| SO_DONTROUTE  | int            | Non-zero requests bypass of normal routing; route based on destination address only.                              |
| SO_ERROR      | int            | Requests and clears pending error information on the socket ( <i>getsockopt()</i> only).                          |
| SO_KEEPALIVE  | int            | Non-zero requests periodic transmission of keepalive messages (protocol-specific).                                |
| SO_LINGER     | struct linger  | Specify actions to be taken for queued, unsent data on <i>close()</i> : linger on/off and linger time in seconds. |
| SO_OOBINLINE  | int            | Non-zero requests that out-of-band data be placed into normal data input queue as received.                       |
| SO_RCVBUF     | int            | Size of receive buffer (in bytes).                                                                                |
| SO_RCVLOWAT   | int            | Minimum amount of data to return to application for input operations (in bytes).                                  |
| SO_RCVTIMEO   | struct timeval | Timeout value for a socket receive operation.                                                                     |
| SO_REUSEADDR  | int            | Non-zero requests reuse of local addresses in <i>bind()</i> (protocol-specific).                                  |
| SO_SNDBUF     | int            | Size of send buffer (in bytes).                                                                                   |
| SO_SNDLOWAT   | int            | Minimum amount of data to send for output operations (in bytes).                                                  |
| SO_SNDTIMEO   | struct timeval | Timeout value for a socket send operation.                                                                        |
| SO_TYPE       | int            | Identify socket type ( <i>getsockopt()</i> only).                                                                 |

18148 The SO\_ACCEPTCONN option is used only on *getsockopt()*. When this option is specified,  
 18149 *getsockopt()* shall report whether socket listening is enabled for the socket. A value of zero shall  
 18150 indicate that socket listening is disabled; non-zero that it is enabled. SO\_ACCEPTCONN has no  
 18151 default value.

18152 The SO\_BROADCAST option requests permission to send broadcast datagrams on the socket.  
 18153 Support for SO\_BROADCAST is protocol-specific. The default for SO\_BROADCAST is that the  
 18154 ability to send broadcast datagrams on a socket is disabled.

18155 The SO\_DEBUG option enables debugging in the underlying protocol modules. This can be  
 18156 useful for tracing the behavior of the underlying protocol modules during normal system  
 18157 operation. The semantics of the debug reports are implementation-defined. The default value for  
 18158 SO\_DEBUG is for debugging to be turned off.

18159 The SO\_DONTROUTE option requests that outgoing messages bypass the standard routing  
 18160 facilities. The destination must be on a directly-connected network, and messages are directed to  
 18161 the appropriate network interface according to the destination address. It is protocol-specific  
 18162 whether this option has any effect and how the outgoing network interface is chosen. Support  
 18163 for this option with each protocol is implementation-defined.

18164 The SO\_ERROR option is used only on *getsockopt()*. When this option is specified, *getsockopt()*

18165 shall return any pending error on the socket and clear the error status. It shall return a value of 0  
 18166 if there is no pending error. SO\_ERROR may be used to check for asynchronous errors on  
 18167 connected connectionless-mode sockets or for other types of asynchronous errors. SO\_ERROR  
 18168 has no default value.

18169 The SO\_KEEPALIVE option enables the periodic transmission of messages on a connected  
 18170 socket. The behavior of this option is protocol-specific. On a connection-mode socket for which a  
 18171 connection has been established, if SO\_KEEPALIVE is enabled and the connected socket fails to  
 18172 respond to the keep-alive messages, the connection shall be broken. The default value for  
 18173 SO\_KEEPALIVE is zero, specifying that this capability is turned off.

18174 The SO\_LINGER option controls the action of the interface when unsent messages are queued  
 18175 on a socket and a *close()* is performed. The details of this option are protocol-specific. If  
 18176 SO\_LINGER is enabled, the system shall block the calling thread during *close()* until it can  
 18177 transmit the data or until the end of the interval indicated by the *l\_linger* member, whichever  
 18178 comes first. If SO\_LINGER is not specified, and *close()* is issued, the system handles the call in a  
 18179 way that allows the calling thread to continue as quickly as possible. The default value for  
 18180 SO\_LINGER is zero, or off, for the *l\_onoff* element of the option value and zero seconds for the  
 18181 linger time specified by the *l\_linger* element.

18182 The SO\_OOBINLINE option is valid only on protocols that support out-of-band data. The  
 18183 SO\_OOBINLINE option requests that out-of-band data be placed in the normal data input  
 18184 queue as received; it is then accessible using the *read()* or *recv()* functions without the  
 18185 MSG\_OOB flag set. The default for SO\_OOBINLINE is off; that is, for out-of-band data not to be  
 18186 placed in the normal data input queue.

18187 The SO\_RCVBUF option requests that the buffer space allocated for receive operations on this  
 18188 socket be set to the value, in bytes, of the option value. Applications may wish to increase buffer  
 18189 size for high volume connections, or may decrease buffer size to limit the possible backlog of  
 18190 incoming data. The default value for the SO\_RCVBUF option value is implementation-defined,  
 18191 and may vary by protocol.

18192 The SO\_RCVLOWAT option sets the minimum number of bytes to process for socket input  
 18193 operations. In general, receive calls block until any (non-zero) amount of data is received, then  
 18194 return the smaller of the amount available or the amount requested. The default value for  
 18195 SO\_RCVLOWAT is 1, and does not affect the general case. If SO\_RCVLOWAT is set to a larger  
 18196 value, blocking receive calls normally wait until they have received the smaller of the low water  
 18197 mark value or the requested amount. Receive calls may still return less than the low water mark  
 18198 if an error occurs, a signal is caught, or the type of data next in the receive queue is different  
 18199 from that returned (for example, out-of-band data). As mentioned previously, the default value  
 18200 for SO\_RCVLOWAT is 1 byte. It is implementation-defined whether the SO\_RCVLOWAT option  
 18201 can be set.

18202 The SO\_RCVTIMEO option is an option to set a timeout value for input operations. It accepts a  
 18203 **timeval** structure with the number of seconds and microseconds specifying the limit on how  
 18204 long to wait for an input operation to complete. If a receive operation has blocked for this much  
 18205 time without receiving additional data, it shall return with a partial count or *errno* shall be set to  
 18206 [EAGAIN] or [EWOULDBLOCK] if no data were received. The default for this option is the  
 18207 value zero, which indicates that a receive operation will not time out. It is implementation-  
 18208 defined whether the SO\_RCVTIMEO option can be set.

18209 The SO\_REUSEADDR option indicates that the rules used in validating addresses supplied in a  
 18210 *bind()* should allow reuse of local addresses. Operation of this option is protocol-specific. The  
 18211 default value for SO\_REUSEADDR is off; that is, reuse of local addresses is not permitted.

18212 The SO\_SNDBUF option requests that the buffer space allocated for send operations on this  
 18213 socket be set to the value, in bytes, of the option value. The default value for the SO\_SNDBUF

18214 option value is implementation-defined, and may vary by protocol.

18215 The SO\_SNDBLOWAT option sets the minimum number of bytes to process for socket output  
 18216 operations. Most output operations process all of the data supplied by the call, delivering data to  
 18217 the protocol for transmission and blocking as necessary for flow control. Non-blocking output  
 18218 operations process as much data as permitted subject to flow control without blocking, but  
 18219 process no data if flow control does not allow the smaller of the send low water mark value or  
 18220 the entire request to be processed. A *select()* operation testing the ability to write to a socket shall  
 18221 return true only if the send low water mark could be processed. The default value for  
 18222 SO\_SNDBLOWAT is implementation-defined and protocol-specific. It is implementation-defined  
 18223 whether the SO\_SNDBLOWAT option can be set.

18224 The SO\_SNDTIMEO option is an option to set a timeout value for the amount of time that an  
 18225 output function shall block because flow control prevents data from being sent. As noted in  
 18226 Table 2-2 (on page 523), the option value is a **timeval** structure with the number of seconds and  
 18227 microseconds specifying the limit on how long to wait for an output operation to complete. If a  
 18228 send operation has blocked for this much time, it shall return with a partial count or *errno* set to  
 18229 [EAGAIN] or [EWOULDBLOCK] if no data were sent. The default for this option is the value  
 18230 zero, which indicates that a send operation will not time out. It is implementation-defined  
 18231 whether the SO\_SNDTIMEO option can be set.

18232 The SO\_TYPE option is used only on *getsockopt()*. When this option is specified, *getsockopt()*  
 18233 shall return the type of the socket (for example, SOCK\_STREAM). This option is useful to  
 18234 servers that inherit sockets on start-up. SO\_TYPE has no default value.

## 18235 2.10.17 Use of Sockets for Local UNIX Connections

18236 Support for UNIX domain sockets is mandatory.

18237 UNIX domain sockets provide process-to-process communication in a single system.

### 18238 2.10.17.1 Headers

18239 The symbolic constant AF\_UNIX defined in the `<sys/socket.h>` header is used to identify the  
 18240 UNIX domain address family. The `<sys/un.h>` header contains other definitions used in  
 18241 connection with UNIX domain sockets. See XBD Chapter 13 (on page 219).

18242 The `sockaddr_storage` structure defined in `<sys/socket.h>` shall be large enough to  
 18243 accommodate a `sockaddr_un` structure (see the `<sys/un.h>` header defined in XBD Chapter 13,  
 18244 on page 219) and shall be aligned at an appropriate boundary so that pointers to it can be cast as  
 18245 pointers to `sockaddr_un` structures and used to access the fields of those structures without  
 18246 alignment problems. When a `sockaddr_storage` structure is cast as a `sockaddr_un` structure, the  
 18247 `ss_family` field maps onto the `sun_family` field.

## 18248 2.10.18 Use of Sockets over Internet Protocols

18249 When a socket is created in the Internet family with a protocol value of zero, the implementation  
 18250 shall use the protocol listed below for the type of socket created.

18251 SOCK\_STREAM      IPPROTO\_TCP.

18252 SOCK\_DGRAM      IPPROTO\_UDP.

18253 RS `SOCK_RAW` `IPPROTO_RAW`.

18254 `SOCK_SEQPACKET` Unspecified.

18255 RS A raw interface to IP is available by creating an Internet socket of type `SOCK_RAW`. The default  
 18256 protocol for type `SOCK_RAW` shall be identified in the IP header with the value  
 18257 `IPPROTO_RAW`. Applications should not use the default protocol when creating a socket with  
 18258 type `SOCK_RAW`, but should identify a specific protocol by value. The ICMP control protocol is  
 18259 accessible from a raw socket by specifying a value of `IPPROTO_ICMP` for protocol.

## 18260 2.10.19 Use of Sockets over Internet Protocols Based on IPv4

18261 Support for sockets over Internet protocols based on IPv4 is mandatory.

### 18262 2.10.19.1 Headers

18263 The symbolic constant `AF_INET` defined in the `<sys/socket.h>` header is used to identify the  
 18264 IPv4 Internet address family. The `<netinet/in.h>` header contains other definitions used in  
 18265 connection with IPv4 Internet sockets. See XBD Chapter 13 (on page 219).

18266 The `sockaddr_storage` structure defined in `<sys/socket.h>` shall be large enough to  
 18267 accommodate a `sockaddr_in` structure (see the `<netinet/in.h>` header defined in XBD Chapter  
 18268 13, on page 219) and shall be aligned at an appropriate boundary so that pointers to it can be  
 18269 cast as pointers to `sockaddr_in` structures and used to access the fields of those structures  
 18270 without alignment problems. When a `sockaddr_storage` structure is cast as a `sockaddr_in`  
 18271 structure, the `ss_family` field maps onto the `sin_family` field.

## 18272 2.10.20 Use of Sockets over Internet Protocols Based on IPv6

18273 IP6 This section describes extensions to support sockets over Internet protocols based on IPv6. The  
 18274 functionality described in this section shall be provided on implementations that support the  
 18275 IPV6 option (and the rest of this section is not further shaded for this option).

18276 To enable smooth transition from IPv4 to IPv6, the features defined in this section may, in certain  
 18277 circumstances, also be used in connection with IPv4; see Section 2.10.20.2 (on page 527).

### 18278 2.10.20.1 Addressing

18279 IPv6 overcomes the addressing limitations of earlier versions by using 128-bit addresses instead  
 18280 of 32-bit addresses. The IPv6 address architecture is described in RFC 2373.

18281 There are three kinds of IPv6 address:

#### 18282 Unicast

18283 Identifies a single interface.

18284 A unicast address can be global, link-local (designed for use on a single link), or site-local  
 18285 (designed for systems not connected to the Internet). Link-local and site-local addresses  
 18286 need not be globally unique.

#### 18287 Anycast

18288 Identifies a set of interfaces such that a packet sent to the address can be delivered to any  
 18289 member of the set.

18290 An anycast address is similar to a unicast address; the nodes to which an anycast address is

- 18291 assigned must be explicitly configured to know that it is an anycast address.
- 18292 Multicast
- 18293 Identifies a set of interfaces such that a packet sent to the address should be delivered to
- 18294 every member of the set.
- 18295 An application can send multicast datagrams by simply specifying an IPv6 multicast
- 18296 address in the *address* argument of *sendto()*. To receive multicast datagrams, an application
- 18297 must join the multicast group (using *setsockopt()* with `IPV6_JOIN_GROUP`) and must bind
- 18298 to the socket the UDP port on which datagrams will be received. Some applications should
- 18299 also bind the multicast group address to the socket, to prevent other datagrams destined to
- 18300 that port from being delivered to the socket.
- 18301 A multicast address can be global, node-local, link-local, site-local, or organization-local.
- 18302 The following special IPv6 addresses are defined:
- 18303 Unspecified
- 18304 An address that is not assigned to any interface and is used to indicate the absence of an
- 18305 address.
- 18306 Loopback
- 18307 A unicast address that is not assigned to any interface and can be used by a node to send
- 18308 packets to itself.
- 18309 Two sets of IPv6 addresses are defined to correspond to IPv4 addresses:
- 18310 IPv4-compatible addresses
- 18311 These are assigned to nodes that support IPv6 and can be used when traffic is “tunneled”
- 18312 through IPv4.
- 18313 IPv4-mapped addresses
- 18314 These are used to represent IPv4 addresses in IPv6 address format; see [Section 2.10.20.2](#).
- 18315 Note that the unspecified address and the loopback address must not be treated as
- 18316 IPv4-compatible addresses.
- 18317 **2.10.20.2 Compatibility with IPv4**
- 18318 The API provides the ability for IPv6 applications to interoperate with applications using IPv4,
- 18319 by using IPv4-mapped IPv6 addresses. These addresses can be generated automatically by the
- 18320 *getaddrinfo()* function when the specified host has only IPv4 addresses.
- 18321 Applications can use `AF_INET6` sockets to open TCP connections to IPv4 nodes, or send UDP
- 18322 packets to IPv4 nodes, by simply encoding the destination’s IPv4 address as an IPv4-mapped
- 18323 IPv6 address, and passing that address, within a `sockaddr_in6` structure, in the *connect()*,
- 18324 *sendto()*, or *sendmsg()* function. When applications use `AF_INET6` sockets to accept TCP
- 18325 connections from IPv4 nodes, or receive UDP packets from IPv4 nodes, the system shall return
- 18326 the peer’s address to the application in the *accept()*, *recvfrom()*, *recvmsg()*, or *getpeername()*
- 18327 function using a `sockaddr_in6` structure encoded this way. If a node has an IPv4 address, then
- 18328 the implementation shall allow applications to communicate using that address via an
- 18329 `AF_INET6` socket. In such a case, the address will be represented at the API by the
- 18330 corresponding IPv4-mapped IPv6 address. Also, the implementation may allow an `AF_INET6`
- 18331 socket bound to `in6addr_any` to receive inbound connections and packets destined to one of the
- 18332 node’s IPv4 addresses.
- 18333 An application can use `AF_INET6` sockets to bind to a node’s IPv4 address by specifying the
- 18334 address as an IPv4-mapped IPv6 address in a `sockaddr_in6` structure in the *bind()* function. For
- 18335 an `AF_INET6` socket bound to a node’s IPv4 address, the system shall return the address in the

- 18336 `getsockname()` function as an IPv4-mapped IPv6 address in a `sockaddr_in6` structure.
- 18337 **2.10.20.3 Interface Identification**
- 18338 Each local interface is assigned a unique positive integer as a numeric index. Indexes start at 1;  
18339 zero is not used. There may be gaps so that there is no current interface for a particular positive  
18340 index. Each interface also has a unique implementation-defined name.
- 18341 **2.10.20.4 Options**
- 18342 The following options apply at the IPPROTO\_IPV6 level:
- 18343 **IPV6\_JOIN\_GROUP**  
18344 When set via `setsockopt()`, it joins the application to a multicast group on an interface  
18345 (identified by its index) and addressed by a given multicast address, enabling packets sent  
18346 to that address to be read via the socket. If the interface index is specified as zero, the  
18347 system selects the interface (for example, by looking up the address in a routing table and  
18348 using the resulting interface).
- 18349 An attempt to read this option using `getsockopt()` shall result in an [EOPNOTSUPP] error.
- 18350 The parameter type of this option is a pointer to an `ipv6_mreq` structure.
- 18351 **IPV6\_LEAVE\_GROUP**  
18352 When set via `setsockopt()`, it removes the application from the multicast group on an  
18353 interface (identified by its index) and addressed by a given multicast address.
- 18354 An attempt to read this option using `getsockopt()` shall result in an [EOPNOTSUPP] error.
- 18355 The parameter type of this option is a pointer to an `ipv6_mreq` structure.
- 18356 **IPV6\_MULTICAST\_HOPS**  
18357 The value of this option is the hop limit for outgoing multicast IPv6 packets sent via the  
18358 socket. Its possible values are the same as those of IPV6\_UNICAST\_HOPS. If the  
18359 IPV6\_MULTICAST\_HOPS option is not set, a value of 1 is assumed. This option can be set  
18360 via `setsockopt()` and read via `getsockopt()`.
- 18361 The parameter type of this option is a pointer to an `int`. (Default value: 1)
- 18362 **IPV6\_MULTICAST\_IF**  
18363 The index of the interface to be used for outgoing multicast packets. It can be set via  
18364 `setsockopt()` and read via `getsockopt()`. If the interface index is specified as zero, the system  
18365 selects the interface (for example, by looking up the address in a routing table and using the  
18366 resulting interface).
- 18367 The parameter type of this option is a pointer to an **unsigned int**. (Default value: 0)
- 18368 **IPV6\_MULTICAST\_LOOP**  
18369 This option controls whether outgoing multicast packets should be delivered back to the  
18370 local application when the sending interface is itself a member of the destination multicast  
18371 group. If it is set to 1 they are delivered. If it is set to 0 they are not. Other values result in an  
18372 [EINVAL] error. This option can be set via `setsockopt()` and read via `getsockopt()`.
- 18373 The parameter type of this option is a pointer to an **unsigned int** which is used as a Boolean  
18374 value. (Default value: 1)
- 18375 **IPV6\_UNICAST\_HOPS**  
18376 The value of this option is the hop limit for outgoing unicast IPv6 packets sent via the  
18377 socket. If the option is not set, or is set to -1, the system selects a default value. Attempts to

18378 set a value less than  $-1$  or greater than  $255$  shall result in an [EINVAL] error. This option can  
18379 be set via `setsockopt()` and read via `getsockopt()`.

18380 The parameter type of this option is a pointer to an **int**. (Default value: Unspecified)

18381 IPV6\_V6ONLY

18382 This socket option restricts AF\_INET6 sockets to IPv6 communications only. AF\_INET6  
18383 sockets may be used for both IPv4 and IPv6 communications. Some applications may want  
18384 to restrict their use of an AF\_INET6 socket to IPv6 communications only. For these  
18385 applications, the IPV6\_V6ONLY socket option is defined. When this option is turned on, the  
18386 socket can be used to send and receive IPv6 packets only. This is an IPPROTO\_IPV6-level  
18387 option.

18388 The parameter type of this option is a pointer to an **int** which is used as a Boolean value.  
18389 (Default value: 0)

18390 An [EOPNOTSUPP] error shall result if IPV6\_JOIN\_GROUP or IPV6\_LEAVE\_GROUP is used  
18391 with `getsockopt()`.

#### 18392 2.10.20.5 Headers

18393 The symbolic constant AF\_INET6 is defined in the `<sys/socket.h>` header to identify the IPv6  
18394 Internet address family. See XBD Chapter 13 (on page 219).

18395 The `sockaddr_storage` structure defined in `<sys/socket.h>` shall be large enough to  
18396 accommodate a `sockaddr_in6` structure (see the `<netinet/in.h>` header defined in XBD Chapter  
18397 13, on page 219) and shall be aligned at an appropriate boundary so that pointers to it can be  
18398 cast as pointers to `sockaddr_in6` structures and used to access the fields of those structures  
18399 without alignment problems. When a `sockaddr_storage` structure is cast as a `sockaddr_in6`  
18400 structure, the `ss_family` field maps onto the `sin6_family` field.

18401 The `<netinet/in.h>`, `<arpa/inet.h>`, and `<netdb.h>` headers contain other definitions used in  
18402 connection with IPv6 Internet sockets; see XBD Chapter 13 (on page 219).

## 18403 2.11 Tracing

18404 OB TRC This section describes extensions to support tracing of user applications. The functionality  
18405 described in this section is dependent on support of the Trace option (and the rest of this section  
18406 is not further shaded for this option).

18407 The tracing facilities defined in POSIX.1-2008 allow a process to select a set of trace event types,  
18408 to activate a trace stream of the selected trace events as they occur in the flow of execution, and  
18409 to retrieve the recorded trace events.

18410 The tracing operation relies on three logically different components: the traced process, the  
18411 controller process, and the analyzer process. During the execution of the traced process, when a  
18412 trace point is reached, a trace event is recorded into the trace streams created for that process in  
18413 which the associated trace event type identifier is not being filtered out. The controller process  
18414 controls the operation of recording the trace events into the trace stream. It shall be able to:

- 18415 • Initialize the attributes of a trace stream
- 18416 • Create the trace stream (for a specified traced process) using those attributes

- 18417 • Start and stop tracing for the trace stream
- 18418 • Filter the type of trace events to be recorded, if the Trace Event Filter option is supported
- 18419 • Shut a trace stream down

18420 These operations can be done for an active trace stream. The analyzer process retrieves the  
 18421 traced events either at runtime, when the trace stream has not yet been shut down, but is still  
 18422 recording trace events; or after opening a trace log that had been previously recorded and shut  
 18423 down. These three logically different operations can be performed by the same process, or can  
 18424 be distributed into different processes.

18425 A trace stream identifier can be created by a call to *posix\_trace\_create()*,  
 18426 *posix\_trace\_create\_withlog()*, or *posix\_trace\_open()*. The *posix\_trace\_create()* and  
 18427 *posix\_trace\_create\_withlog()* functions should be used by a controller process. The  
 18428 *posix\_trace\_open()* should be used by an analyzer process.

18429 The tracing functions can serve different purposes. One purpose is debugging the possibly pre-  
 18430 instrumented code, while another is post-mortem fault analysis. These two potential uses differ  
 18431 in that the first requires pre-filtering capabilities to avoid overwhelming the trace stream and  
 18432 permits focusing on expected information; while the second needs comprehensive trace  
 18433 capabilities in order to be able to record all types of information.

18434 The events to be traced belong to two classes:

- 18435 1. User trace events (generated by the application instrumentation)
- 18436 2. System trace events (generated by the operating system)

18437 The trace interface defines several system trace event types associated with control of and  
 18438 operation of the trace stream. This small set of system trace events includes the minimum  
 18439 required to interpret correctly the trace event information present in the stream. Other desirable  
 18440 system trace events for some particular application profile may be implemented and are  
 18441 encouraged; for example, process and thread scheduling, signal occurrence, and so on.

18442 Each traced process shall have a mapping of the trace event names to trace event type identifiers  
 18443 that have been defined for that process. Each active trace stream shall have a mapping that  
 18444 incorporates all the trace event type identifiers predefined by the trace system plus all the  
 18445 mappings of trace event names to trace event type identifiers of the processes that are being  
 18446 traced into that trace stream. These mappings are defined from the instrumented application by  
 18447 calling the *posix\_trace\_eventid\_open()* function and from the controller process by calling the  
 18448 *posix\_trace\_trid\_eventid\_open()* function. For a pre-recorded trace stream, the list of trace event  
 18449 types is obtained from the pre-recorded trace log.

18450 The last data modification and file status change timestamps of a file associated with an active  
 18451 trace stream shall be marked for update every time any of the tracing operations modifies that  
 18452 file.

18453 The last data access timestamp of a file associated with a trace stream shall be marked for  
 18454 update every time any of the tracing operations causes data to be read from that file.

18455 Results are undefined if the application performs any operation on a file descriptor associated  
 18456 with an active or pre-recorded trace stream until *posix\_trace\_shutdown()* or *posix\_trace\_close()* is  
 18457 called for that trace stream. Results are also undefined if the analyzer process and the traced  
 18458 process do not share the same programming environment (see *c99*, Programming Environments  
 18459 in the Shell and Utilities volume of POSIX.1-2008).

18460 The main purpose of this option is to define a complete set of functions and concepts that allow  
 18461 a conforming application to be traced from creation to termination, whatever its realtime  
 18462 constraints and properties.

## 18463 2.11.1 Tracing Data Definitions

## 18464 2.11.1.1 Structures

18465 The **<trace.h>** header shall define the *posix\_trace\_status\_info* and *posix\_trace\_event\_info* structures  
18466 described below. Implementations may add extensions to these structures.

18467 **posix\_trace\_status\_info** Structure

18468 To facilitate control of a trace stream, information about the current state of an active trace  
18469 stream can be obtained dynamically. This structure is returned by a call to the  
18470 *posix\_trace\_get\_status()* function.

18471 The **posix\_trace\_status\_info** structure defined in **<trace.h>** shall contain at least the following  
18472 members:

| Member Type | Member Name                        | Description                                                   |
|-------------|------------------------------------|---------------------------------------------------------------|
| int         | <i>posix_stream_status</i>         | The operating mode of the trace stream.                       |
| int         | <i>posix_stream_full_status</i>    | The full status of the trace stream.                          |
| int         | <i>posix_stream_overrun_status</i> | Indicates whether trace events were lost in the trace stream. |

18478 If the Trace Log option is supported in addition to the Trace option, the **posix\_trace\_status\_info**  
18479 structure defined in **<trace.h>** shall contain at least the following additional members:

| Member Type | Member Name                      | Description                                                           |
|-------------|----------------------------------|-----------------------------------------------------------------------|
| int         | <i>posix_stream_flush_status</i> | Indicates whether a flush is in progress.                             |
| int         | <i>posix_stream_flush_error</i>  | Indicates whether any error occurred during the last flush operation. |
| int         | <i>posix_log_overrun_status</i>  | Indicates whether trace events were lost in the trace log.            |
| int         | <i>posix_log_full_status</i>     | The full status of the trace log.                                     |

18487 The *posix\_stream\_status* member indicates the operating mode of the trace stream and shall have  
18488 one of the following values defined by manifest constants in the **<trace.h>** header:

18489 POSIX\_TRACE\_RUNNING

18490 Tracing is in progress; that is, the trace stream is accepting trace events.

18491 POSIX\_TRACE\_SUSPENDED

18492 The trace stream is not accepting trace events. The tracing operation has not yet started or  
18493 has stopped, either following a *posix\_trace\_stop()* function call or because the trace resources  
18494 are exhausted.

18495 The *posix\_stream\_full\_status* member indicates the full status of the trace stream, and it shall have  
18496 one of the following values defined by manifest constants in the **<trace.h>** header:

18497 POSIX\_TRACE\_FULL

18498 The space in the trace stream for trace events is exhausted.

18499 POSIX\_TRACE\_NOT\_FULL

18500 There is still space available in the trace stream.

18501 The combination of the *posix\_stream\_status* and *posix\_stream\_full\_status* members also indicates  
18502 the actual status of the stream. The status shall be interpreted as follows:

|       |                                                                                                                          |
|-------|--------------------------------------------------------------------------------------------------------------------------|
| 18503 | POSIX_TRACE_RUNNING and POSIX_TRACE_NOT_FULL                                                                             |
| 18504 | This status combination indicates that tracing is in progress, and there is space available for                          |
| 18505 | recording more trace events.                                                                                             |
| 18506 | POSIX_TRACE_RUNNING and POSIX_TRACE_FULL                                                                                 |
| 18507 | This status combination indicates that tracing is in progress and that the trace stream is full                          |
| 18508 | of trace events. This status combination cannot occur unless the <i>stream-full-policy</i> is set to                     |
| 18509 | POSIX_TRACE_LOOP. The trace stream contains trace events recorded during a moving                                        |
| 18510 | time window of prior trace events, and some older trace events may have been overwritten                                 |
| 18511 | and thus lost.                                                                                                           |
| 18512 | POSIX_TRACE_SUSPENDED and POSIX_TRACE_NOT_FULL                                                                           |
| 18513 | This status combination indicates that tracing has not yet been started, has been stopped by                             |
| 18514 | the <i>posix_trace_stop()</i> function, or has been cleared by the <i>posix_trace_clear()</i> function.                  |
| 18515 | POSIX_TRACE_SUSPENDED and POSIX_TRACE_FULL                                                                               |
| 18516 | This status combination indicates that tracing has been stopped by the implementation                                    |
| 18517 | because the <i>stream-full-policy</i> attribute was POSIX_TRACE_UNTIL_FULL and trace                                     |
| 18518 | resources were exhausted, or that the trace stream was stopped by the function                                           |
| 18519 | <i>posix_trace_stop()</i> at a time when trace resources were exhausted.                                                 |
| 18520 | The <i>posix_stream_overrun_status</i> member indicates whether trace events were lost in the trace                      |
| 18521 | stream, and shall have one of the following values defined by manifest constants in the                                  |
| 18522 | <trace.h> header:                                                                                                        |
| 18523 | POSIX_TRACE_OVERRUN                                                                                                      |
| 18524 | At least one trace event was lost and thus was not recorded in the trace stream.                                         |
| 18525 | POSIX_TRACE_NO_OVERRUN                                                                                                   |
| 18526 | No trace events were lost.                                                                                               |
| 18527 | When the corresponding trace stream is created, the <i>posix_stream_overrun_status</i> member shall be                   |
| 18528 | set to POSIX_TRACE_NO_OVERRUN.                                                                                           |
| 18529 | Whenever an overrun occurs, the <i>posix_stream_overrun_status</i> member shall be set to                                |
| 18530 | POSIX_TRACE_OVERRUN.                                                                                                     |
| 18531 | An overrun occurs when:                                                                                                  |
| 18532 | • The policy is POSIX_TRACE_LOOP and a recorded trace event is overwritten.                                              |
| 18533 | • The policy is POSIX_TRACE_UNTIL_FULL and the trace stream is full when a trace event                                   |
| 18534 | is generated.                                                                                                            |
| 18535 | • If the Trace Log option is supported, the policy is POSIX_TRACE_FLUSH and at least one                                 |
| 18536 | trace event is lost while flushing the trace stream to the trace log.                                                    |
| 18537 | The <i>posix_stream_overrun_status</i> member is reset to zero after its value is read.                                  |
| 18538 | If the Trace Log option is supported in addition to the Trace option, the <i>posix_stream_flush_status</i> ,             |
| 18539 | <i>posix_stream_flush_error</i> , <i>posix_log_overrun_status</i> , and <i>posix_log_full_status</i> members are defined |
| 18540 | as follows; otherwise, they are undefined.                                                                               |
| 18541 | The <i>posix_stream_flush_status</i> member indicates whether a flush operation is being performed                       |
| 18542 | and shall have one of the following values defined by manifest constants in the header                                   |
| 18543 | <trace.h>:                                                                                                               |
| 18544 | POSIX_TRACE_FLUSHING                                                                                                     |
| 18545 | The trace stream is currently being flushed to the trace log.                                                            |

- 18546 POSIX\_TRACE\_NOT\_FLUSHING  
18547 No flush operation is in progress.
- 18548 The *posix\_stream\_flush\_status* member shall be set to POSIX\_TRACE\_FLUSHING if a flush  
18549 operation is in progress either due to a call to the *posix\_trace\_flush()* function (explicit or caused  
18550 by a trace stream shutdown operation) or because the trace stream has become full with the  
18551 *stream-full-policy* attribute set to POSIX\_TRACE\_FLUSH. The *posix\_stream\_flush\_status* member  
18552 shall be set to POSIX\_TRACE\_NOT\_FLUSHING if no flush operation is in progress.
- 18553 The *posix\_stream\_flush\_error* member shall be set to zero if no error occurred during flushing. If  
18554 an error occurred during a previous flushing operation, the *posix\_stream\_flush\_error* member  
18555 shall be set to the value of the first error that occurred. If more than one error occurs while  
18556 flushing, error values after the first shall be discarded. The *posix\_stream\_flush\_error* member is  
18557 reset to zero after its value is read.
- 18558 The *posix\_log\_overrun\_status* member indicates whether trace events were lost in the trace log,  
18559 and shall have one of the following values defined by manifest constants in the `<trace.h>`  
18560 header:
- 18561 POSIX\_TRACE\_OVERRUN  
18562 At least one trace event was lost.
- 18563 POSIX\_TRACE\_NO\_OVERRUN  
18564 No trace events were lost.
- 18565 When the corresponding trace stream is created, the *posix\_log\_overrun\_status* member shall be set  
18566 to POSIX\_TRACE\_NO\_OVERRUN. Whenever an overrun occurs, this status shall be set to  
18567 POSIX\_TRACE\_OVERRUN. The *posix\_log\_overrun\_status* member is reset to zero after its value  
18568 is read.
- 18569 The *posix\_log\_full\_status* member indicates the full status of the trace log, and it shall have one of  
18570 the following values defined by manifest constants in the `<trace.h>` header:
- 18571 POSIX\_TRACE\_FULL  
18572 The space in the trace log is exhausted.
- 18573 POSIX\_TRACE\_NOT\_FULL  
18574 There is still space available in the trace log.
- 18575 The *posix\_log\_full\_status* member is only meaningful if the *log-full-policy* attribute is either  
18576 POSIX\_TRACE\_UNTIL\_FULL or POSIX\_TRACE\_LOOP.
- 18577 For an active trace stream without log, that is created by the *posix\_trace\_create()* function, the  
18578 *posix\_log\_overrun\_status* member shall be set to POSIX\_TRACE\_NO\_OVERRUN and the  
18579 *posix\_log\_full\_status* member shall be set to POSIX\_TRACE\_NOT\_FULL.
- 18580 **posix\_trace\_event\_info Structure**
- 18581 The trace event structure **posix\_trace\_event\_info** contains the information for one recorded  
18582 trace event. This structure is returned by the set of functions *posix\_trace\_getnext\_event()*,  
18583 *posix\_trace\_timedgetnext\_event()*, and *posix\_trace\_trygetnext\_event()*.
- 18584 The **posix\_trace\_event\_info** structure defined in `<trace.h>` shall contain at least the following  
18585 members:

| Member Type             | Member Name                    | Description                                                               |
|-------------------------|--------------------------------|---------------------------------------------------------------------------|
| <b>trace_event_id_t</b> | <i>posix_event_id</i>          | Trace event type identification.                                          |
| <b>pid_t</b>            | <i>posix_pid</i>               | Process ID of the process that generated the trace event.                 |
| <b>void *</b>           | <i>posix_prog_address</i>      | Address at which the trace point was invoked.                             |
| <b>int</b>              | <i>posix_truncation_status</i> | Status about the truncation of the data associated with this trace event. |
| <b>struct timespec</b>  | <i>posix_timestamp</i>         | Time at which the trace event was generated.                              |

18596 In addition, the **posix\_trace\_event\_info** structure defined in `<trace.h>` shall contain the  
 18597 following additional member:

| Member Type      | Member Name            | Description                                             |
|------------------|------------------------|---------------------------------------------------------|
| <b>pthread_t</b> | <i>posix_thread_id</i> | Thread ID of the thread that generated the trace event. |

18601 The *posix\_event\_id* member represents the identification of the trace event type and its value is  
 18602 not directly defined by the user. This identification is returned by a call to one of the following  
 18603 functions: *posix\_trace\_trid\_eventid\_open()*, *posix\_trace\_eventtypelist\_getnext\_id()*, or  
 18604 *posix\_trace\_eventid\_open()*. The name of the trace event type can be obtained by calling  
 18605 *posix\_trace\_eventid\_get\_name()*.

18606 The *posix\_pid* is the process identifier of the traced process which generated the trace event. If  
 18607 the *posix\_event\_id* member is one of the implementation-defined system trace events and that  
 18608 trace event is not associated with any process, the *posix\_pid* member shall be set to zero.

18609 For a user trace event, the *posix\_prog\_address* member is the process mapped address of the point  
 18610 at which the associated call to the *posix\_trace\_event()* function was made. For a system trace  
 18611 event, if the trace event is caused by a system service explicitly called by the application, the  
 18612 *posix\_prog\_address* member shall be the address of the process at the point where the call to that  
 18613 system service was made.

18614 The *posix\_truncation\_status* member defines whether the data associated with a trace event has  
 18615 been truncated at the time the trace event was generated, or at the time the trace event was read  
 18616 from the trace stream, or (if the Trace Log option is supported) from the trace log (see the *event*  
 18617 argument from the *posix\_trace\_getnext\_event()* function). The *posix\_truncation\_status* member  
 18618 shall have one of the following values defined by manifest constants in the `<trace.h>` header:

18619 **POSIX\_TRACE\_NOT\_TRUNCATED**  
 18620 All the traced data is available.

18621 **POSIX\_TRACE\_TRUNCATED\_RECORD**  
 18622 Data was truncated at the time the trace event was generated.

18623 **POSIX\_TRACE\_TRUNCATED\_READ**  
 18624 Data was truncated at the time the trace event was read from a trace stream or a trace log  
 18625 because the reader's buffer was too small. This truncation status overrides the  
 18626 **POSIX\_TRACE\_TRUNCATED\_RECORD** status.

18627 The *posix\_timestamp* member shall be the time at which the trace event was generated. The clock  
 18628 used is implementation-defined, but the resolution of this clock can be retrieved by a call to the  
 18629 *posix\_trace\_attr\_getclockres()* function.

18630 The *posix\_thread\_id* member is the identifier of the thread that generated the trace event. If the  
 18631 *posix\_event\_id* member is one of the implementation-defined system trace events and that trace

18632 event is not associated with any thread, the *posix\_thread\_id* member shall be set to zero.

#### 18633 2.11.1.2 Trace Stream Attributes

18634 Trace streams have attributes that compose the **posix\_trace\_attr\_t** trace stream attributes object.  
18635 This object shall contain at least the following attributes:

- 18636 • The *generation-version* attribute identifies the origin and version of the trace system.
- 18637 • The *trace-name* attribute is a character string defined by the trace controller, and that  
18638 identifies the trace stream.
- 18639 • The *creation-time* attribute represents the time of the creation of the trace stream.
- 18640 • The *clock-resolution* attribute defines the clock resolution of the clock used to generate  
18641 timestamps.
- 18642 • The *stream-min-size* attribute defines the minimum size in bytes of the trace stream strictly  
18643 reserved for the trace events.
- 18644 • The *stream-full-policy* attribute defines the policy followed when the trace stream is full; its  
18645 value is POSIX\_TRACE\_LOOP, POSIX\_TRACE\_UNTIL\_FULL, or POSIX\_TRACE\_FLUSH.
- 18646 • The *max-data-size* attribute defines the maximum record size in bytes of a trace event.

18647 In addition, if the Trace option and the Trace Inherit option are both supported, the  
18648 **posix\_trace\_attr\_t** trace stream creation attributes object shall contain at least the following  
18649 attributes:

- 18650 • The *inheritance* attribute specifies whether a newly created trace stream will inherit tracing  
18651 in its parent's process trace stream. It is either POSIX\_TRACE\_INHERITED or  
18652 POSIX\_TRACE\_CLOSE\_FOR\_CHILD.

18653 In addition, if the Trace option and the Trace Log option are both supported, the  
18654 **posix\_trace\_attr\_t** trace stream creation attributes object shall contain at least the following  
18655 attribute:

- 18656 • If the file type corresponding to the trace log supports the POSIX\_TRACE\_LOOP or the  
18657 POSIX\_TRACE\_UNTIL\_FULL policies, the *log-max-size* attribute defines the maximum  
18658 size in bytes of the trace log associated with an active trace stream. Other stream data—for  
18659 example, trace attribute values—shall not be included in this size.
- 18660 • The *log-full-policy* attribute defines the policy of a trace log associated with an active trace  
18661 stream to be POSIX\_TRACE\_LOOP, POSIX\_TRACE\_UNTIL\_FULL, or  
18662 POSIX\_TRACE\_APPEND.

## 18663 2.11.2 Trace Event Type Definitions

### 18664 2.11.2.1 System Trace Event Type Definitions

18665 The following system trace event types, defined in the **<trace.h>** header, track the invocation of  
18666 the trace operations:

- 18667 • POSIX\_TRACE\_START shall be associated with a trace start operation.

- 18668
- POSIX\_TRACE\_STOP shall be associated with a trace stop operation.
- 18669
- If the Trace Event Filter option is supported, POSIX\_TRACE\_FILTER shall be associated
- 18670
- with a trace event type filter change operation.
- 18671
- The following system trace event types, defined in the `<trace.h>` header, report operational trace
- 18672
- events:
- 18673
- POSIX\_TRACE\_OVERFLOW shall mark the beginning of a trace overflow condition.
- 18674
- POSIX\_TRACE\_RESUME shall mark the end of a trace overflow condition.
- 18675
- If the Trace Log option is supported, POSIX\_TRACE\_FLUSH\_START shall mark the
- 18676
- beginning of a flush operation.
- 18677
- If the Trace Log option is supported, POSIX\_TRACE\_FLUSH\_STOP shall mark the end of
- 18678
- a flush operation.
- 18679
- If an implementation-defined trace error condition is reported, it shall be marked
- 18680
- POSIX\_TRACE\_ERROR.
- 18681
- The interpretation of a trace stream or a trace log by a trace analyzer process relies on the
- 18682
- information recorded for each trace event, and also on system trace events that indicate the
- 18683
- invocation of trace control operations and trace system operational trace events.
- 18684
- The POSIX\_TRACE\_START and POSIX\_TRACE\_STOP trace events specify the time windows
- 18685
- during which the trace stream is running.
- 18686
- The POSIX\_TRACE\_STOP trace event with an associated data that is equal to zero
- 18687
- indicates a call of the function `posix_trace_stop()`.
- 18688
- The POSIX\_TRACE\_STOP trace event with an associated data that is different from zero
- 18689
- indicates an automatic stop of the trace stream (see the definition of the
- 18690
- `posix_trace_attr_getstreamfullpolicy()` function in `posix_trace_attr_getinherited()`).
- 18691
- The POSIX\_TRACE\_FILTER trace event indicates that a trace event type filter value changed
- 18692
- while the trace stream was running.
- 18693
- The POSIX\_TRACE\_ERROR serves to inform the analyzer process that an implementation-
- 18694
- defined internal error of the trace system occurred.
- 18695
- The POSIX\_TRACE\_OVERFLOW trace event shall be reported with a timestamp equal to the
- 18696
- timestamp of the first trace event overwritten. This is an indication that some generated trace
- 18697
- events have been lost.
- 18698
- The POSIX\_TRACE\_RESUME trace event shall be reported with a timestamp equal to the
- 18699
- timestamp of the first valid trace event reported after the overflow condition ends and shall be
- 18700
- reported before this first valid trace event. This is an indication that the trace system is reliably
- 18701
- recording trace events after an overflow condition.
- 18702
- Each of these trace event types shall be defined by a constant trace event name and a
- 18703
- `trace_event_id_t` constant; trace event data is associated with some of these trace events.
- 18704
- If the Trace option is supported and the Trace Event Filter option and the Trace Log option are
- 18705
- not supported, the following predefined system trace events in Table 2-3 (on page 537) shall be
- 18706
- defined:

18707

**Table 2-3** Trace Option: System Trace Events

| Event Name           | Constant             | Associated Data |
|----------------------|----------------------|-----------------|
|                      |                      | Data Type       |
| posix_trace_error    | POSIX_TRACE_ERROR    | error           |
|                      |                      | <b>int</b>      |
| posix_trace_start    | POSIX_TRACE_START    | None.           |
| posix_trace_stop     | POSIX_TRACE_STOP     | auto            |
|                      |                      | <b>int</b>      |
| posix_trace_overflow | POSIX_TRACE_OVERFLOW | None.           |
| posix_trace_resume   | POSIX_TRACE_RESUME   | None.           |

18717 If the Trace option and the Trace Event Filter option are both supported, and if the Trace Log  
 18718 option is not supported, the following predefined system trace events in Table 2-4 shall be  
 18719 defined:

18720

**Table 2-4** Trace and Trace Event Filter Options: System Trace Events

| Event Name           | Constant             | Associated Data          |
|----------------------|----------------------|--------------------------|
|                      |                      | Data Type                |
| posix_trace_error    | POSIX_TRACE_ERROR    | error                    |
|                      |                      | <b>int</b>               |
| posix_trace_start    | POSIX_TRACE_START    | event_filter             |
|                      |                      | <b>trace_event_set_t</b> |
| posix_trace_stop     | POSIX_TRACE_STOP     | auto                     |
|                      |                      | <b>int</b>               |
| posix_trace_filter   | POSIX_TRACE_FILTER   | old_event_filter         |
|                      |                      | new_event_filter         |
|                      |                      | <b>trace_event_set_t</b> |
| posix_trace_overflow | POSIX_TRACE_OVERFLOW | None.                    |
| posix_trace_resume   | POSIX_TRACE_RESUME   | None.                    |

18734 If the Trace option and the Trace Log option are both supported, and if the Trace Event Filter  
 18735 option is not supported, the following predefined system trace events in Table 2-5 (on page 538)  
 18736 shall be defined:

18737

| posix_trace_start       | POSIX_TRACE_START       | event_filter             |
|                         |                         | <b>trace_event_set_t</b> |
| posix_trace_stop        | POSIX_TRACE_STOP        | auto                     |
|                         |                         | <b>int</b>               |
| posix_trace_filter      | POSIX_TRACE_FILTER      | old_event_filter         |
|                         |                         | new_event_filter         |
|                         |                         | <b>trace_event_set_t</b> |
| posix_trace_overflow    | POSIX_TRACE_OVERFLOW    | None.                    |
| posix_trace_resume      | POSIX_TRACE_RESUME      | None.                    |
| posix_trace_flush_start | POSIX_TRACE_FLUSH_START | None.                    |
| posix_trace_flush_stop  | POSIX_TRACE_FLUSH_STOP  | None.                    |

18767 2.11.2.2 User Trace Event Type Definitions

18768

18769

18770

18771

18772

The user trace event POSIX\_TRACE\_UNNAMED\_USEREVENT is defined in the <trace.h> header. If the limit of per-process user trace event names represented by {TRACE\_USER\_EVENT\_MAX} has already been reached, this predefined user event shall be returned when the application tries to register more events than allowed. The data associated with this trace event is application-defined.

18773

The following predefined user trace event in Table 2-7 (on page 539) shall be defined:

18774

Table 2-7 Trace Option: User Trace Event

18775

18776

| Event Name                    | Constant                      |
|-------------------------------|-------------------------------|
| posix_trace_unnamed_userevent | POSIX_TRACE_UNNAMED_USEREVENT |

18777 **2.11.3 Trace Functions**

18778

18779

18780

18781

18782

18783

The trace interface is built and structured to improve portability through use of trace data of opaque type. The object-oriented approach for the manipulation of trace attributes and trace event type identifiers requires definition of many constructor and selector functions which operate on these opaque types. Also, the trace interface must support several different tracing roles. To facilitate reading the trace interface, the trace functions are grouped into small functional sets supporting the three different roles:

18784

18785

- A trace controller process requires functions to set up and customize all the resources needed to run a trace stream, including:

18786

18787

18788

18789

18790

18791

18792

18793

18794

18795

18796

18797

- Attribute initialization and destruction (*posix\_trace\_attr\_init()*)
- Identification information manipulation (*posix\_trace\_attr\_getgenversion()*)
- Trace system behavior modification (*posix\_trace\_attr\_getinherited()*)
- Trace stream and trace log size set (*posix\_trace\_attr\_getmaxusereventsize()*)
- Trace stream creation, flush, and shutdown (*posix\_trace\_create()*)
- Trace stream and trace log clear (*posix\_trace\_clear()*)
- Trace event type identifier manipulation (*posix\_trace\_trid\_eventid\_open()*)
- Trace event type identifier list exploration (*posix\_trace\_eventtypelist\_getnext\_id()*)
- Trace event type set manipulation (*posix\_trace\_eventset\_empty()*)
- Trace event type filter set (*posix\_trace\_set\_filter()*)
- Trace stream start and stop (*posix\_trace\_start()*)
- Trace stream information and status read (*posix\_trace\_get\_attr()*)

18798

18799

- A traced process requires functions to instrument trace points:

18800

18801

18802

18803

18804

18805

18806

18807

- Trace event type identifiers definition and trace points insertion (*posix\_trace\_event()*)
- A trace analyzer process requires functions to retrieve information from a trace stream and trace log:
  - Identification information read (*posix\_trace\_attr\_getgenversion()*)
  - Trace system behavior information read (*posix\_trace\_attr\_getinherited()*)
  - Trace stream and trace log size get (*posix\_trace\_attr\_getmaxusereventsize()*)
  - Trace event type identifier manipulation (*posix\_trace\_trid\_eventid\_open()*)
  - Trace event type identifier list exploration (*posix\_trace\_eventtypelist\_getnext\_id()*)
  - Trace log open, rewind, and close (*posix\_trace\_open()*)

- 18808 — Trace stream information and status read (*posix\_trace\_get\_attr()*)
- 18809 — Trace event read (*posix\_trace\_getnext\_event()*)

18810 **2.12 Data Types**

18811 **2.12.1 Defined Types**

18812 All of the data types used by various functions are defined by the implementation. The  
 18813 following table describes some of these types. Other types referenced in the description of a  
 18814 function, not mentioned here, can be found in the appropriate header for that function.

| Defined Type                      | Description                                                                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| 18815 <b>cc_t</b>                 | Type used for terminal special characters.                                                                                                  |
| 18816 <b>clock_t</b>              | Integer or real-floating type used for processor times, as defined in the ISO C standard.                                                   |
| 18817                             |                                                                                                                                             |
| 18818                             |                                                                                                                                             |
| 18819 <b>clockid_t</b>            | Used for clock ID type in some timer functions.                                                                                             |
| 18820 <b>dev_t</b>                | Arithmetic type used for device numbers.                                                                                                    |
| 18821 <b>DIR</b>                  | Type representing a directory stream.                                                                                                       |
| 18822 <b>div_t</b>                | Structure type returned by the <i>div()</i> function.                                                                                       |
| 18823 <b>FILE</b>                 | Structure containing information about a file.                                                                                              |
| 18824 <b>glob_t</b>               | Structure type used in pathname pattern matching.                                                                                           |
| 18825 <b>fpos_t</b>               | Type containing all information needed to specify uniquely every position within a file.                                                    |
| 18826                             |                                                                                                                                             |
| 18827 <b>gid_t</b>                | Integer type used for group IDs.                                                                                                            |
| 18828 <b>iconv_t</b>              | Type used for conversion descriptors.                                                                                                       |
| 18829 <b>id_t</b>                 | Integer type used as a general identifier; can be used to contain at least the largest of a <b>pid_t</b> , <b>uid_t</b> , or <b>gid_t</b> . |
| 18830                             |                                                                                                                                             |
| 18831 <b>ino_t</b>                | Unsigned integer type used for file serial numbers.                                                                                         |
| 18832 <b>key_t</b>                | Arithmetic type used for XSI interprocess communication.                                                                                    |
| 18833 <b>ldiv_t</b>               | Structure type returned by the <i>ldiv()</i> function.                                                                                      |
| 18834 <b>mode_t</b>               | Integer type used for file attributes.                                                                                                      |
| 18835 <b>mqd_t</b>                | Used for message queue descriptors.                                                                                                         |
| 18836 <b>nfds_t</b>               | Integer type used for the number of file descriptors.                                                                                       |
| 18837 <b>nlink_t</b>              | Integer type used for link counts.                                                                                                          |
| 18838 <b>off_t</b>                | Signed integer type used for file sizes.                                                                                                    |
| 18839 <b>pid_t</b>                | Signed integer type used for process and process group IDs.                                                                                 |
| 18840 <b>pthread_attr_t</b>       | Used to identify a thread attribute object.                                                                                                 |
| 18841 <b>pthread_cond_t</b>       | Used for condition variables.                                                                                                               |
| 18842 <b>pthread_condattr_t</b>   | Used to identify a condition attribute object.                                                                                              |
| 18843 <b>pthread_key_t</b>        | Used for thread-specific data keys.                                                                                                         |
| 18844 <b>pthread_mutex_t</b>      | Used for mutexes.                                                                                                                           |
| 18845 <b>pthread_mutexattr_t</b>  | Used to identify a mutex attribute object.                                                                                                  |
| 18846 <b>pthread_once_t</b>       | Used for dynamic package initialization.                                                                                                    |
| 18847 <b>pthread_rwlock_t</b>     | Used for read-write locks.                                                                                                                  |
| 18848 <b>pthread_rwlockattr_t</b> | Used for read-write lock attributes.                                                                                                        |
| 18849 <b>pthread_t</b>            | Used to identify a thread.                                                                                                                  |

|       | Defined Type        | Description                                                                                                                                               |
|-------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 18850 |                     |                                                                                                                                                           |
| 18851 | <b>ptrdiff_t</b>    | Signed integer type of the result of subtracting two pointers.                                                                                            |
| 18852 | <b>regex_t</b>      | Structure type used in regular expression matching.                                                                                                       |
| 18853 | <b>regmatch_t</b>   | Structure type used in regular expression matching.                                                                                                       |
| 18854 | <b>rlim_t</b>       | Unsigned integer type used for limit values, to which objects of type <b>int</b> and <b>off_t</b> can be cast without loss of value.                      |
| 18855 |                     |                                                                                                                                                           |
| 18856 | <b>sem_t</b>        | Type used in performing semaphore operations.                                                                                                             |
| 18857 | <b>sig_atomic_t</b> | Integer type of an object that can be accessed as an atomic entity, even in the presence of asynchronous interrupts.                                      |
| 18858 |                     |                                                                                                                                                           |
| 18859 | <b>sigset_t</b>     | Integer or structure type of an object used to represent sets of signals.                                                                                 |
| 18860 |                     |                                                                                                                                                           |
| 18861 | <b>size_t</b>       | Unsigned integer type used for size of objects.                                                                                                           |
| 18862 | <b>speed_t</b>      | Type used for terminal baud rates.                                                                                                                        |
| 18863 | <b>ssize_t</b>      | Signed integer type used for a count of bytes or an error indication.                                                                                     |
| 18864 |                     |                                                                                                                                                           |
| 18865 | <b>suseconds_t</b>  | Signed integer type used for time in microseconds.                                                                                                        |
| 18866 | <b>tcflag_t</b>     | Type used for terminal modes.                                                                                                                             |
| 18867 | <b>time_t</b>       | Integer or real-floating type used for time in seconds, as defined in the ISO C standard.                                                                 |
| 18868 |                     |                                                                                                                                                           |
| 18869 | <b>timer_t</b>      | Used for timer ID returned by the <i>timer_create()</i> function.                                                                                         |
| 18870 | <b>uid_t</b>        | Integer type used for user IDs.                                                                                                                           |
| 18871 | <b>va_list</b>      | Type used for traversing variable argument lists.                                                                                                         |
| 18872 | <b>wchar_t</b>      | Integer type whose range of values can represent distinct codes for all members of the largest extended character set specified by the supported locales. |
| 18873 |                     |                                                                                                                                                           |
| 18874 |                     |                                                                                                                                                           |
| 18875 | <b>wctype_t</b>     | Scalar type which represents a character class descriptor.                                                                                                |
| 18876 | <b>wint_t</b>       | Integer type capable of storing any valid value of <b>wchar_t</b> or WEOF.                                                                                |
| 18877 |                     |                                                                                                                                                           |
| 18878 | <b>wordexp_t</b>    | Structure type used in word expansion.                                                                                                                    |

### 18879 2.12.2 The char Type

18880 The type **char** is defined as a single byte; see XBD [Chapter 3](#) (on page 33) (Byte and Character).

### 18881 2.12.3 Pointer Types

18882 All function pointer types shall have the same representation as the type pointer to **void**.  
 18883 Conversion of a function pointer to **void \*** shall not alter the representation. A **void \*** value  
 18884 resulting from such a conversion can be converted back to the original function pointer type,  
 18885 using an explicit cast, without loss of information.

18886 **Note:** The ISO C standard does not require this, but it is required for POSIX conformance.

Chapter 3

18888

 *System Interfaces*

18889

This chapter describes the functions, macros, and external variables to support applications portability at the C-language source level.

18890

**FD\_CLR()**18891 **NAME**

18892 FD\_CLR — macros for synchronous I/O multiplexing

18893 **SYNOPSIS**

```
18894     #include <sys/select.h>
18895     void FD_CLR(int fd, fd_set *fdset);
18896     int FD_ISSET(int fd, fd_set *fdset);
18897     void FD_SET(int fd, fd_set *fdset);
18898     void FD_ZERO(fd_set *fdset);
```

18899 **DESCRIPTION**18900 Refer to *pselect()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

18901 **NAME**18902 `_Exit, _exit` — terminate a process18903 **SYNOPSIS**18904 `#include <stdlib.h>`18905 `void _Exit(int status);`18906 `#include <unistd.h>`18907 `void _exit(int status);`18908 **DESCRIPTION**18909 CX For `_Exit()`: The functionality described on this reference page is aligned with the ISO C  
18910 standard. Any conflict between the requirements described here and the ISO C standard is  
18911 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.18912 CX The value of *status* may be 0, `EXIT_SUCCESS`, `EXIT_FAILURE`, or any other value, though only  
18913 the least significant 8 bits (that is, *status* & 0377) shall be available to a waiting parent process.18914 CX The `_Exit()` and `_exit()` functions shall be functionally equivalent.18915 CX The `_Exit()` and `_exit()` functions shall not call functions registered with `atexit()` nor any  
18916 CX registered signal handlers. Open streams shall not be flushed. Whether open streams are  
18917 closed (without flushing) is implementation-defined. Finally, the calling process shall be  
18918 terminated with the consequences described below.18919 **Consequences of Process Termination**18920 CX **Process termination caused by any reason shall have the following consequences:**18921 **Note:** These consequences are all extensions to the ISO C standard and are not further CX shaded.  
18922 However, functionality relating to the XSI option is shaded.18923 • All of the file descriptors, directory streams, conversion descriptors, and message catalog  
18924 descriptors open in the calling process shall be closed.18925 XSI • If the parent process of the calling process is executing a `wait()`, `waitid()`, or `waitpid()`, and  
18926 has neither set its `SA_NOCLDWAIT` flag nor set `SIGCHLD` to `SIG_IGN`, it shall be notified  
18927 of termination of the calling process and the low-order eight bits (that is, bits 0377) of *status*  
18928 shall be made available to it. If the parent is not waiting, the child's status shall be made  
18929 available to it when the parent subsequently executes `wait()`, `waitid()`, or `waitpid()`.18930 The semantics of the `waitid()` function shall be equivalent to `wait()`.18931 XSI • If the parent process of the calling process is not executing a `wait()`, `waitid()`, or `waitpid()`,  
18932 and has neither set its `SA_NOCLDWAIT` flag nor set `SIGCHLD` to `SIG_IGN`, the calling  
18933 process shall be transformed into a *zombie process*. A *zombie process* is an inactive process  
18934 and it shall be deleted at some later time when its parent process executes `wait()`, `waitid()`,  
18935 or `waitpid()`.18936 XSI **The semantics of the `waitid()` function shall be equivalent to `wait()`.**18937 • Termination of a process does not directly terminate its children. The sending of a `SIGHUP`  
18938 signal as described below indirectly terminates children in some circumstances.

18939 • Either:

18940 If the implementation supports the `SIGCHLD` signal, a `SIGCHLD` shall be sent to the  
18941 parent process.

18942 Or:

Exit()

- 18943 XSI If the parent process has set its SA\_NOCLDWAIT flag, or set SIGCHLD to SIG\_IGN, the  
18944 status shall be discarded, and the lifetime of the calling process shall end immediately. If  
18945 SA\_NOCLDWAIT is set, it is implementation-defined whether a SIGCHLD signal is sent to  
18946 the parent process.
- 18947 • The parent process ID of all of the existing child processes and zombie processes of the  
18948 calling process shall be set to the process ID of an implementation-defined system process.  
18949 That is, these processes shall be inherited by a special system process.
- 18950 XSI • Each attached shared-memory segment is detached and the value of *shm\_nattch* (see  
18951 *shmget()*) in the data structure associated with its shared memory ID shall be decremented  
18952 by 1.
- 18953 XSI • For each semaphore for which the calling process has set a *semadj* value (see *semop()*), that  
18954 value shall be added to the *semval* of the specified semaphore.
- 18955 • If the process is a controlling process, the SIGHUP signal shall be sent to each process in  
18956 the foreground process group of the controlling terminal belonging to the calling process.
- 18957 • If the process is a controlling process, the controlling terminal associated with the session  
18958 shall be disassociated from the session, allowing it to be acquired by a new controlling  
18959 process.
- 18960 • If the exit of the process causes a process group to become orphaned, and if any member of  
18961 the newly-orphaned process group is stopped, then a SIGHUP signal followed by a  
18962 SIGCONT signal shall be sent to each process in the newly-orphaned process group.
- 18963 • All open named semaphores in the calling process shall be closed as if by appropriate calls  
18964 to *sem\_close()*.
- 18965 ML • Any memory locks established by the process via calls to *mlockall()* or *mlock()* shall be  
18966 removed. If locked pages in the address space of the calling process are also mapped into  
18967 the address spaces of other processes and are locked by those processes, the locks  
18968 established by the other processes shall be unaffected by the call by this process to *\_Exit()*  
18969 or *\_exit()*.
- 18970 • Memory mappings that were created in the process shall be unmapped before the process  
18971 is destroyed.
- 18972 TYM • Any blocks of typed memory that were mapped in the calling process shall be unmapped,  
18973 as if *mummap()* was implicitly called to unmap them.
- 18974 MSG • All open message queue descriptors in the calling process shall be closed as if by  
18975 appropriate calls to *mq\_close()*.
- 18976 • Any outstanding cancelable asynchronous I/O operations may be canceled. Those  
18977 asynchronous I/O operations that are not canceled shall complete as if the *\_Exit()* or  
18978 *\_exit()* operation had not yet occurred, but any associated signal notifications shall be  
18979 suppressed. The *\_Exit()* or *\_exit()* operation may block awaiting such I/O completion.  
18980 Whether any I/O is canceled, and which I/O may be canceled upon *\_Exit()* or *\_exit()*, is  
18981 implementation-defined.
- 18982 • Threads terminated by a call to *\_Exit()* or *\_exit()* shall not invoke their cancellation  
18983 cleanup handlers or per-thread data destructors.
- 18984 OB TRC • If the calling process is a trace controller process, any trace streams that were created by  
18985 the calling process shall be shut down as described by the *posix\_trace\_shutdown()* function,  
18986 and mapping of trace event names to trace event type identifiers of any process built for  
18987 these trace streams may be deallocated.

18988 **RETURN VALUE**

18989 These functions do not return.

18990 **ERRORS**

18991 No errors are defined.

18992 **EXAMPLES**

18993 None.

18994 **APPLICATION USAGE**18995 Normally applications should use *exit()* rather than *\_Exit()* or *\_exit()*.18996 **RATIONALE**18997 **Process Termination**

18998 Early proposals drew a distinction between normal and abnormal process termination.  
 18999 Abnormal termination was caused only by certain signals and resulted in implementation-  
 19000 defined “actions”, as discussed below. Subsequent proposals distinguished three types of  
 19001 termination: *normal termination* (as in the current specification), *simple abnormal termination*, and  
 19002 *abnormal termination with actions*. Again the distinction between the two types of abnormal  
 19003 termination was that they were caused by different signals and that implementation-defined  
 19004 actions would result in the latter case. Given that these actions were completely implementation-  
 19005 defined, the early proposals were only saying when the actions could occur and how their  
 19006 occurrence could be detected, but not what they were. This was of little or no use to conforming  
 19007 applications, and thus the distinction is not made in this volume of POSIX.1-2008.

19008 The implementation-defined actions usually include, in most historical implementations, the  
 19009 creation of a file named **core** in the current working directory of the process. This file contains an  
 19010 image of the memory of the process, together with descriptive information about the process,  
 19011 perhaps sufficient to reconstruct the state of the process at the receipt of the signal.

19012 There is a potential security problem in creating a **core** file if the process was set-user-ID and the  
 19013 current user is not the owner of the program, if the process was set-group-ID and none of the  
 19014 user’s groups match the group of the program, or if the user does not have permission to write  
 19015 in the current directory. In this situation, an implementation either should not create a **core** file  
 19016 or should make it unreadable by the user.

19017 Despite the silence of this volume of POSIX.1-2008 on this feature, applications are advised not  
 19018 to create files named **core** because of potential conflicts in many implementations. Some  
 19019 implementations use a name other than **core** for the file; for example, by appending the process  
 19020 ID to the filename.

19021 **Terminating a Process**

19022 It is important that the consequences of process termination as described occur regardless of  
 19023 whether the process called *\_exit()* (perhaps indirectly through *exit()*) or instead was terminated  
 19024 due to a signal or for some other reason. Note that in the specific case of *exit()* this means that  
 19025 the *status* argument to *exit()* is treated in the same way as the *status* argument to *\_exit()*.

19026 A language other than C may have other termination primitives than the C-language *exit()*  
 19027 function, and programs written in such a language should use its native termination primitives,  
 19028 but those should have as part of their function the behavior of *\_exit()* as described.  
 19029 Implementations in languages other than C are outside the scope of this version of this volume  
 19030 of POSIX.1-2008, however.

19031 As required by the ISO C standard, using **return** from *main()* has the same behavior (other than

**\_Exit()**

19032 with respect to language scope issues) as calling *exit()* with the returned value. Reaching the end  
19033 of the *main()* function has the same behavior as calling *exit(0)*.

19034 A value of zero (or *EXIT\_SUCCESS*, which is required to be zero) for the argument *status*  
19035 conventionally indicates successful termination. This corresponds to the specification for *exit()*  
19036 in the ISO C standard. The convention is followed by utilities such as *make* and various shells,  
19037 which interpret a zero status from a child process as success. For this reason, applications should  
19038 not call *exit(0)* or *\_exit(0)* when they terminate unsuccessfully; for example, in signal-catching  
19039 functions.

19040 Historically, the implementation-defined process that inherits children whose parents have  
19041 terminated without waiting on them is called *init* and has a process ID of 1.

19042 The sending of a *SIGHUP* to the foreground process group when a controlling process  
19043 terminates corresponds to somewhat different historical implementations. In System V, the  
19044 kernel sends a *SIGHUP* on termination of (essentially) a controlling process. In 4.2 BSD, the  
19045 kernel does not send *SIGHUP* in a case like this, but the termination of a controlling process is  
19046 usually noticed by a system daemon, which arranges to send a *SIGHUP* to the foreground  
19047 process group with the *vhangup()* function. However, in 4.2 BSD, due to the behavior of the  
19048 shells that support job control, the controlling process is usually a shell with no other processes  
19049 in its process group. Thus, a change to make *\_exit()* behave this way in such systems should not  
19050 cause problems with existing applications.

19051 The termination of a process may cause a process group to become orphaned in either of two  
19052 ways. The connection of a process group to its parent(s) outside of the group depends on both  
19053 the parents and their children. Thus, a process group may be orphaned by the termination of the  
19054 last connecting parent process outside of the group or by the termination of the last direct  
19055 descendant of the parent process(es). In either case, if the termination of a process causes a  
19056 process group to become orphaned, processes within the group are disconnected from their job  
19057 control shell, which no longer has any information on the existence of the process group.  
19058 Stopped processes within the group would languish forever. In order to avoid this problem,  
19059 newly orphaned process groups that contain stopped processes are sent a *SIGHUP* signal and a  
19060 *SIGCONT* signal to indicate that they have been disconnected from their session. The *SIGHUP*  
19061 signal causes the process group members to terminate unless they are catching or ignoring  
19062 *SIGHUP*. Under most circumstances, all of the members of the process group are stopped if any  
19063 of them are stopped.

19064 The action of sending a *SIGHUP* and a *SIGCONT* signal to members of a newly orphaned  
19065 process group is similar to the action of 4.2 BSD, which sends *SIGHUP* and *SIGCONT* to each  
19066 stopped child of an exiting process. If such children exit in response to the *SIGHUP*, any  
19067 additional descendants receive similar treatment at that time. In this volume of POSIX.1-2008,  
19068 the signals are sent to the entire process group at the same time. Also, in this volume of  
19069 POSIX.1-2008, but not in 4.2 BSD, stopped processes may be orphaned, but may be members of a  
19070 process group that is not orphaned; therefore, the action taken at *\_exit()* must consider processes  
19071 other than child processes.

19072 It is possible for a process group to be orphaned by a call to *setpgid()* or *setsid()*, as well as by  
19073 process termination. This volume of POSIX.1-2008 does not require sending *SIGHUP* and  
19074 *SIGCONT* in those cases, because, unlike process termination, those cases are not caused  
19075 accidentally by applications that are unaware of job control. An implementation can choose to  
19076 send *SIGHUP* and *SIGCONT* in those cases as an extension; such an extension must be  
19077 documented as required in **<signal.h>**.

19078 The ISO/IEC 9899:1999 standard adds the *\_Exit()* function that results in immediate program  
19079 termination without triggering signals or *atexit()*-registered functions. In POSIX.1-2008, this is

19080 equivalent to the `_exit()` function.

19081 **FUTURE DIRECTIONS**

19082 None.

19083 **SEE ALSO**

19084 `atexit()`, `exit()`, `mlock()`, `mlockall()`, `mq_close()`, `munmap()`, `posix_trace_create()`, `sem_close()`,  
19085 `semop()`, `setpgid()`, `setsid()`, `shmget()`, `wait()`, `waitid()`

19086 XBD `<stdlib.h>`, `<unistd.h>`

19087 **CHANGE HISTORY**

19088 First released in Issue 1. Derived from Issue 1 of the SVID.

19089 **Issue 5**

19090 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
19091 Threads Extension.

19092 Interactions with the SA\_NOCLDWAIT flag and SIGCHLD signal are further clarified.

19093 The values of *status* from `exit()` are better described.

19094 **Issue 6**

19095 Extensions beyond the ISO C standard are marked.

19096 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics  
19097 for typed memory.

19098 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 19099 • The `_Exit()` function is included.
- 19100 • The DESCRIPTION is updated.

19101 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

19102 References to the `wait3()` function are removed.

19103 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/16 is applied, correcting grammar in the  
19104 DESCRIPTION.

19105 **Issue 7**

19106 Austin Group Interpretation 1003.1-2001 #031 is applied, separating these functions from the  
19107 `exit()` function.

19108 Austin Group Interpretation 1003.1-2001 #085 is applied, clarifying the text regarding flushing of  
19109 streams and closing of temporary files.

19110 Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, and  
19111 Semaphores options is moved to the Base.

**\_longjmp()**19112 **NAME**

19113        \_longjmp, \_setjmp — non-local goto

19114 **SYNOPSIS**

```

19115 OB XSI #include <setjmp.h>
19116 void _longjmp(jmp_buf env, int val);
19117 int _setjmp(jmp_buf env);

```

19118 **DESCRIPTION**

19119        The *\_longjmp()* and *\_setjmp()* functions shall be equivalent to *longjmp()* and *setjmp()*,  
 19120        respectively, with the additional restriction that *\_longjmp()* and *\_setjmp()* shall not manipulate  
 19121        the signal mask.

19122        If *\_longjmp()* is called even though *env* was never initialized by a call to *\_setjmp()*, or when the  
 19123        last such call was in a function that has since returned, the results are undefined.

19124 **RETURN VALUE**19125        Refer to *longjmp()* and *setjmp()*.19126 **ERRORS**

19127        No errors are defined.

19128 **EXAMPLES**

19129        None.

19130 **APPLICATION USAGE**

19131        If *\_longjmp()* is executed and the environment in which *\_setjmp()* was executed no longer exists,  
 19132        errors can occur. The conditions under which the environment of the *\_setjmp()* no longer exists  
 19133        include exiting the function that contains the *\_setjmp()* call, and exiting an inner block with  
 19134        temporary storage. This condition might not be detectable, in which case the *\_longjmp()* occurs  
 19135        and, if the environment no longer exists, the contents of the temporary storage of an inner block  
 19136        are unpredictable. This condition might also cause unexpected process termination. If the  
 19137        function has returned, the results are undefined.

19138        Passing *longjmp()* a pointer to a buffer not created by *setjmp()*, passing *\_longjmp()* a pointer to a  
 19139        buffer not created by *\_setjmp()*, passing *siglongjmp()* a pointer to a buffer not created by  
 19140        *sigsetjmp()*, or passing any of these three functions a buffer that has been modified by the user  
 19141        can cause all the problems listed above, and more.

19142        The *\_longjmp()* and *\_setjmp()* functions are included to support programs written to historical  
 19143        system interfaces. New applications should use *siglongjmp()* and *sigsetjmp()* respectively.

19144 **RATIONALE**

19145        None.

19146 **FUTURE DIRECTIONS**19147        The *\_longjmp()* and *\_setjmp()* functions may be removed in a future version.19148 **SEE ALSO**19149        *longjmp()*, *setjmp()*, *siglongjmp()*, *sigsetjmp()*

19150        XBD &lt;setjmp.h&gt;

19151 **CHANGE HISTORY**

19152        First released in Issue 4, Version 2.

- 19153 **Issue 5**  
19154 Moved from X/OPEN UNIX extension to BASE.
- 19155 **Issue 7**  
19156 The *\_longjmp()* and *\_setjmp()* functions are marked obsolescent.

**\_tolower()**19157 **NAME**

19158        \_toupper — transliterate uppercase characters to lowercase

19159 **SYNOPSIS**

```
19160 OB XSI #include <ctype.h>
19161         int _tolower(int c);
```

19162 **DESCRIPTION**

19163        The *\_tolower()* macro shall be equivalent to *tolower(c)* except that the application shall ensure  
 19164        that the argument *c* is an uppercase letter.

19165 **RETURN VALUE**

19166        Upon successful completion, *\_tolower()* shall return the lowercase letter corresponding to the  
 19167        argument passed.

19168 **ERRORS**

19169        No errors are defined.

19170 **EXAMPLES**

19171        None.

19172 **APPLICATION USAGE**19173        Applications should use the *tolower()* function instead of the obsolescent *\_tolower()* function.19174 **RATIONALE**

19175        None.

19176 **FUTURE DIRECTIONS**19177        The *\_tolower()* function may be removed in a future version.19178 **SEE ALSO**19179        *tolower()*, *isupper()*19180        XBD Chapter 7 (on page 135), *<ctype.h>*19181 **CHANGE HISTORY**

19182        First released in Issue 1. Derived from Issue 1 of the SVID.

19183 **Issue 6**

19184        The normative text is updated to avoid use of the term “must” for application requirements.

19185 **Issue 7**19186        The *\_tolower()* function is marked obsolescent.

19187 **NAME**

19188        \_toupper — transliterate lowercase characters to uppercase

19189 **SYNOPSIS**

```
19190 OB XSI #include <ctype.h>
19191         int _toupper(int c);
```

19192 **DESCRIPTION**

19193        The *\_toupper()* macro shall be equivalent to *toupper()* except that the application shall ensure  
 19194        that the argument *c* is a lowercase letter.

19195 **RETURN VALUE**

19196        Upon successful completion, *\_toupper()* shall return the uppercase letter corresponding to the  
 19197        argument passed.

19198 **ERRORS**

19199        No errors are defined.

19200 **EXAMPLES**

19201        None.

19202 **APPLICATION USAGE**

19203        Applications should use the *toupper()* function instead of the obsolescent *\_toupper()* function.

19204 **RATIONALE**

19205        None.

19206 **FUTURE DIRECTIONS**

19207        The *\_toupper()* function may be removed in a future version.

19208 **SEE ALSO**

19209        *islower()*, *toupper()*

19210        XBD Chapter 7 (on page 135), *<ctype.h>*

19211 **CHANGE HISTORY**

19212        First released in Issue 1. Derived from Issue 1 of the SVID.

19213 **Issue 6**

19214        The normative text is updated to avoid use of the term “must” for application requirements.

19215 **Issue 7**

19216        The *\_toupper()* function is marked obsolescent.

**a64l()**19217 **NAME**

19218 a64l, l64a — convert between a 32-bit integer and a radix-64 ASCII string

19219 **SYNOPSIS**

```
19220 xSI #include <stdlib.h>
19221 long a64l(const char *s);
19222 char *l64a(long value);
```

19223 **DESCRIPTION**

19224 These functions maintain numbers stored in radix-64 ASCII characters. This is a notation by  
 19225 which 32-bit integers can be represented by up to six characters; each character represents a digit  
 19226 in radix-64 notation. If the type **long** contains more than 32 bits, only the low-order 32 bits shall  
 19227 be used for these operations.

19228 The characters used to represent digits are '.' (dot) for 0, '/' for 1, '0' through '9' for [2,11],  
 19229 'A' through 'Z' for [12,37], and 'a' through 'z' for [38,63].

19230 The *a64l()* function shall take a pointer to a radix-64 representation, in which the first digit is the  
 19231 least significant, and return the corresponding **long** value. If the string pointed to by *s* contains  
 19232 more than six characters, *a64l()* shall use the first six. If the first six characters of the string  
 19233 contain a null terminator, *a64l()* shall use only characters preceding the null terminator. The  
 19234 *a64l()* function shall scan the character string from left to right with the least significant digit on  
 19235 the left, decoding each character as a 6-bit radix-64 number. If the type **long** contains more than  
 19236 32 bits, the resulting value is sign-extended. The behavior of *a64l()* is unspecified if *s* is a null  
 19237 pointer or the string pointed to by *s* was not generated by a previous call to *l64a()*.

19238 The *l64a()* function shall take a **long** argument and return a pointer to the corresponding  
 19239 radix-64 representation. The behavior of *l64a()* is unspecified if *value* is negative.

19240 The value returned by *l64a()* may be a pointer into a static buffer. Subsequent calls to *l64a()* may  
 19241 overwrite the buffer.

19242 The *l64a()* function need not be thread-safe.

19243 **RETURN VALUE**

19244 Upon successful completion, *a64l()* shall return the **long** value resulting from conversion of the  
 19245 input string. If a string pointed to by *s* is an empty string, *a64l()* shall return 0L.

19246 The *l64a()* function shall return a pointer to the radix-64 representation. If *value* is 0L, *l64a()* shall  
 19247 return a pointer to an empty string.

19248 **ERRORS**

19249 No errors are defined.

19250 **EXAMPLES**

19251 None.

19252 **APPLICATION USAGE**

19253 If the type **long** contains more than 32 bits, the result of *a64l(l64a(x))* is *x* in the low-order 32 bits.

19254 **RATIONALE**

19255 This is not the same encoding as used by either encoding variant of the *uuencode* utility.

19256 **FUTURE DIRECTIONS**

19257 None.

19258 **SEE ALSO**19259 [strtol\(\)](#)19260 XBD [<stdlib.h>](#)19261 XCU [uuencode](#)19262 **CHANGE HISTORY**

19263 First released in Issue 4, Version 2.

19264 **Issue 5**

19265 Moved from X/OPEN UNIX extension to BASE.

19266 Normative text previously in the APPLICATION USAGE section is moved to the  
19267 DESCRIPTION.19268 A note indicating that the *l64a()* function need not be reentrant is added to the DESCRIPTION.19269 **Issue 7**

19270 Austin Group Interpretation 1003.1-2001 #156 is applied.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**abort()**19271 **NAME**

19272 abort — generate an abnormal process abort

19273 **SYNOPSIS**

19274 #include &lt;stdlib.h&gt;

19275 void abort(void);

19276 **DESCRIPTION**

19277 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 19278 conflict between the requirements described here and the ISO C standard is unintentional. This  
 19279 volume of POSIX.1-2008 defers to the ISO C standard.

19280 The *abort()* function shall cause abnormal process termination to occur, unless the signal  
 19281 SIGABRT is being caught and the signal handler does not return.

19282 CX The abnormal termination processing shall include the default actions defined for SIGABRT and  
 19283 may include an attempt to effect *fclose()* on all open streams.

19284 The SIGABRT signal shall be sent to the calling process as if by means of *raise()* with the  
 19285 argument SIGABRT.

19286 CX The status made available to *wait()*, *waitid()*, or *waitpid()* by *abort()* shall be that of a process  
 19287 terminated by the SIGABRT signal. The *abort()* function shall override blocking or ignoring the  
 19288 SIGABRT signal.

19289 **RETURN VALUE**19290 The *abort()* function shall not return.19291 **ERRORS**

19292 No errors are defined.

19293 **EXAMPLES**

19294 None.

19295 **APPLICATION USAGE**

19296 Catching the signal is intended to provide the application developer with a portable means to  
 19297 abort processing, free from possible interference from any implementation-supplied functions.

19298 **RATIONALE**

19299 The ISO/IEC 9899:1999 standard requires the *abort()* function to be async-signal-safe. Since  
 19300 POSIX.1-2008 defers to the ISO C standard, this required a change to the DESCRIPTION from  
 19301 “shall include the effect of *fclose()*” to “may include an attempt to effect *fclose()*.”

19302 The revised wording permits some backwards-compatibility and avoids a potential deadlock  
 19303 situation.

19304 The Open Group Base Resolution bwg2002-003 is applied, removing the following XSI shaded  
 19305 paragraph from the DESCRIPTION:

19306 “On XSI-conformant systems, in addition the abnormal termination processing shall include the  
 19307 effect of *fclose()* on message catalog descriptors.”

19308 There were several reasons to remove this paragraph:

- 19309 • No special processing of open message catalogs needs to be performed prior to abnormal  
 19310 process termination.
- 19311 • The main reason to specifically mention that *abort()* includes the effect of *fclose()* on open  
 19312 streams is to flush output queued on the stream. Message catalogs in this context are read-  
 19313 only and, therefore, do not need to be flushed.

- 19314 • The effect of *fclose()* on a message catalog descriptor is unspecified. Message catalog  
 19315 descriptors are allowed, but not required to be implemented using a file descriptor, but  
 19316 there is no mention in POSIX.1-2008 of a message catalog descriptor using a standard I/O  
 19317 stream FILE object as would be expected by *fclose()*.

#### 19318 FUTURE DIRECTIONS

19319 None.

#### 19320 SEE ALSO

19321 *exit()*, *kill()*, *raise()*, *signal()*, *wait()*, *waitid()*

19322 XBD <stdlib.h>

#### 19323 CHANGE HISTORY

19324 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 19325 Issue 6

19326 Extensions beyond the ISO C standard are marked.

19327 Changes are made to the DESCRIPTION for alignment with the ISO/IEC 9899:1999 standard.

19328 The Open Group Base Resolution bwg2002-003 is applied.

19329 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/10 is applied, changing the  
 19330 DESCRIPTION of abnormal termination processing and adding to the RATIONALE section.

19331 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/9 is applied, changing “implementation-  
 19332 defined functions” to “implementation-supplied functions” in the APPLICATION USAGE  
 19333 section.

STANDARDSISO.COM : Click to view the full text of ISO/IEC/IEEE 9945:2009

**abs()**19334 **NAME**19335 `abs` — return an integer absolute value19336 **SYNOPSIS**19337 `#include <stdlib.h>`19338 `int abs(int i);`19339 **DESCRIPTION**19340 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
19341 conflict between the requirements described here and the ISO C standard is unintentional. This  
19342 volume of POSIX.1-2008 defers to the ISO C standard.19343 The `abs()` function shall compute the absolute value of its integer operand, *i*. If the result cannot  
19344 be represented, the behavior is undefined.19345 **RETURN VALUE**19346 The `abs()` function shall return the absolute value of its integer operand.19347 **ERRORS**

19348 No errors are defined.

19349 **EXAMPLES**

19350 None.

19351 **APPLICATION USAGE**19352 In two's-complement representation, the absolute value of the negative integer with largest  
19353 magnitude `{INT_MIN}` might not be representable.19354 **RATIONALE**

19355 None.

19356 **FUTURE DIRECTIONS**

19357 None.

19358 **SEE ALSO**19359 [\*`fabs\(\)`\*](#), [\*`labs\(\)`\*](#)19360 **XBD** `<stdlib.h>`19361 **CHANGE HISTORY**

19362 First released in Issue 1. Derived from Issue 1 of the SVID.

19363 **Issue 6**

19364 Extensions beyond the ISO C standard are marked.

19365 **NAME**

19366 accept — accept a new connection on a socket

19367 **SYNOPSIS**

19368 #include &lt;sys/socket.h&gt;

19369 int accept(int socket, struct sockaddr \*restrict address,  
19370 socklen\_t \*restrict address\_len);19371 **DESCRIPTION**19372 The *accept()* function shall extract the first connection on the queue of pending connections,  
19373 create a new socket with the same socket type protocol and address family as the specified  
19374 socket, and allocate a new file descriptor for that socket.19375 The *accept()* function takes the following arguments:19376 *socket* Specifies a socket that was created with *socket()*, has been bound to an address  
19377 with *bind()*, and has issued a successful call to *listen()*.19378 *address* Either a null pointer, or a pointer to a **sockaddr** structure where the address of  
19379 the connecting socket shall be returned.19380 *address\_len* Points to a **socklen\_t** structure which on input specifies the length of the  
19381 supplied **sockaddr** structure, and on output specifies the length of the stored  
19382 address.19383 If *address* is not a null pointer, the address of the peer for the accepted connection shall be stored  
19384 in the **sockaddr** structure pointed to by *address*, and the length of this address shall be stored in  
19385 the object pointed to by *address\_len*.19386 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,  
19387 the stored address shall be truncated.19388 If the protocol permits connections by unbound clients, and the peer is not bound, then the  
19389 value stored in the object pointed to by *address* is unspecified.19390 If the listen queue is empty of connection requests and O\_NONBLOCK is not set on the file  
19391 descriptor for the socket, *accept()* shall block until a connection is present. If the *listen()* queue is  
19392 empty of connection requests and O\_NONBLOCK is set on the file descriptor for the socket,  
19393 *accept()* shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].19394 The accepted socket cannot itself accept more connections. The original socket remains open and  
19395 can accept more connections.19396 **RETURN VALUE**19397 Upon successful completion, *accept()* shall return the non-negative file descriptor of the accepted  
19398 socket. Otherwise, -1 shall be returned and *errno* set to indicate the error.19399 **ERRORS**19400 The *accept()* function shall fail if:

19401 [EAGAIN] or [EWOULDBLOCK]

19402 O\_NONBLOCK is set for the socket file descriptor and no connections are  
19403 present to be accepted.19404 [EBADF] The *socket* argument is not a valid file descriptor.

19405 [ECONNABORTED]

19406 A connection has been aborted.

**accept()**

|       |              |                                                                                                             |
|-------|--------------|-------------------------------------------------------------------------------------------------------------|
| 19407 | [EINTR]      | The <i>accept()</i> function was interrupted by a signal that was caught before a valid connection arrived. |
| 19408 |              |                                                                                                             |
| 19409 | [EINVAL]     | The <i>socket</i> is not accepting connections.                                                             |
| 19410 | [EMFILE]     | All file descriptors available to the process are currently open.                                           |
| 19411 | [ENFILE]     | The maximum number of file descriptors in the system are already open.                                      |
| 19412 | [ENOBUFS]    | No buffer space is available.                                                                               |
| 19413 | [ENOMEM]     | There was insufficient memory available to complete the operation.                                          |
| 19414 | [ENOTSOCK]   | The <i>socket</i> argument does not refer to a socket.                                                      |
| 19415 | [EOPNOTSUPP] | The <i>socket</i> type of the specified socket does not support accepting connections.                      |
| 19416 |              |                                                                                                             |

19417 The *accept()* function may fail if:

|       |                 |                                                                                                  |
|-------|-----------------|--------------------------------------------------------------------------------------------------|
| 19418 | OB XSR [EPROTO] | A protocol error has occurred; for example, the STREAMS protocol stack has not been initialized. |
| 19419 |                 |                                                                                                  |

**EXAMPLES**

19420 None.

**APPLICATION USAGE**

19423 When a connection is available, *select()* indicates that the file descriptor for the socket is ready for reading.

**RATIONALE**

19426 None.

**FUTURE DIRECTIONS**

19428 None.

**SEE ALSO**

19430 *bind()*, *connect()*, *listen()*, *socket()*

19431 XBD <sys/socket.h>

**CHANGE HISTORY**

19433 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19434 The **restrict** keyword is added to the *accept()* prototype for alignment with the ISO/IEC 9899:1999 standard.

**Issue 7**

19437 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

19438 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOBUFS] and [ENOMEM] errors to become “shall fail” errors.

19440 Functionality relating to XSI STREAMS is marked obsolescent.

19441 **NAME**19442 `access, faccessat` — determine accessibility of a file relative to directory file descriptor19443 **SYNOPSIS**

```
19444 #include <unistd.h>
19445
19445 int access(const char *path, int amode);
19446 int faccessat(int fd, const char *path, int amode, int flag);
```

19447 **DESCRIPTION**

19448 The `access()` function shall check the file named by the pathname pointed to by the `path`  
 19449 argument for accessibility according to the bit pattern contained in `amode`, using the real user ID  
 19450 in place of the effective user ID and the real group ID in place of the effective group ID.

19451 The value of `amode` is either the bitwise-inclusive OR of the access permissions to be checked  
 19452 (R\_OK, W\_OK, X\_OK) or the existence test (F\_OK).

19453 If any access permissions are checked, each shall be checked individually, as described in XBD  
 19454 Section 4.4 (on page 108), except that where that description refers to execute permission for a  
 19455 process with appropriate privileges, an implementation may indicate success for X\_OK even if  
 19456 execute permission is not granted to any user.

19457 The `faccessat()` function shall be equivalent to the `access()` function, except in the case where `path`  
 19458 specifies a relative path. In this case the file whose accessibility is to be determined shall be  
 19459 located relative to the directory associated with the file descriptor `fd` instead of the current  
 19460 working directory. If the file descriptor was opened without O\_SEARCH, the function shall  
 19461 check whether directory searches are permitted using the current permissions of the directory  
 19462 underlying the file descriptor. If the file descriptor was opened with O\_SEARCH, the function  
 19463 shall not perform the check.

19464 If `faccessat()` is passed the special value AT\_FDCWD in the `fd` parameter, the current working  
 19465 directory is used and the behavior shall be identical to a call to `access()`.

19466 Values for `flag` are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 19467 in `<fcntl.h>`:

19468 AT\_EACCESS The checks for accessibility are performed using the effective user and group  
 19469 IDs instead of the real user and group ID as required in a call to `access()`.

19470 **RETURN VALUE**

19471 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 19472 return -1 and set `errno` to indicate the error.

19473 **ERRORS**

19474 These functions shall fail if:

19475 [EACCES] Permission bits of the file mode do not permit the requested access, or search  
 19476 permission is denied on a component of the path prefix.

19477 [ELOOP] A loop exists in symbolic links encountered during resolution of the `path`  
 19478 argument.

19479 [ENAMETOOLONG]

19480 The length of a component of a pathname is longer than {NAME\_MAX}.

19481 [ENOENT] A component of `path` does not name an existing file or `path` is an empty string.

19482 [ENOTDIR] A component of the path prefix is not a directory, or the `path` argument  
 19483 contains at least one non-`<slash>` character and ends with one or more trailing  
 19484 `<slash>` characters and the last pathname component names an existing file

**access()**

|       |                |                                                                                                                                                                      |
|-------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 19485 |                | that is neither a directory nor a symbolic link to a directory.                                                                                                      |
| 19486 | [EROFS]        | Write access is requested for a file on a read-only file system.                                                                                                     |
| 19487 |                | The <i>faccessat()</i> function shall fail if:                                                                                                                       |
| 19488 | [EACCES]       | <i>fd</i> was not opened with O_SEARCH and the permissions of the directory underlying <i>fd</i> do not permit directory searches.                                   |
| 19489 |                |                                                                                                                                                                      |
| 19490 | [EBADF]        | The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching. |
| 19491 |                |                                                                                                                                                                      |
| 19492 |                | These functions may fail if:                                                                                                                                         |
| 19493 | [EINVAL]       | The value of the <i>amode</i> argument is invalid.                                                                                                                   |
| 19494 | [ELOOP]        | More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.                                                               |
| 19495 |                |                                                                                                                                                                      |
| 19496 | [ENAMETOOLONG] |                                                                                                                                                                      |
| 19497 |                | The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.        |
| 19498 |                |                                                                                                                                                                      |
| 19499 |                |                                                                                                                                                                      |
| 19500 | [ETXTBSY]      | Write access is requested for a pure procedure (shared text) file that is being executed.                                                                            |
| 19501 |                |                                                                                                                                                                      |
| 19502 |                | The <i>faccessat()</i> function may fail if:                                                                                                                         |
| 19503 | [EINVAL]       | The value of the <i>flag</i> argument is not valid.                                                                                                                  |
| 19504 | [ENOTDIR]      | The <i>path</i> argument is not an absolute path and <i>fd</i> is neither AT_FDCWD nor a file descriptor associated with a directory.                                |
| 19505 |                |                                                                                                                                                                      |

19506 **EXAMPLES**19507 **Testing for the Existence of a File**

19508 The following example tests whether a file named **myfile** exists in the **/tmp** directory.

```
19509 #include <unistd.h>
19510 ...
19511 int result;
19512 const char*filename = "/tmp/myfile";
19513 result = access (filename, F_OK);
```

19514 **APPLICATION USAGE**

19515 Additional values of *amode* other than the set defined in the description may be valid; for  
19516 example, if a system has extended access controls.

19517 The use of the AT\_EACCESS value for *flag* enables functionality not available in *access()*.

19518 **RATIONALE**

19519 In early proposals, some inadequacies in the *access()* function led to the creation of an *eaccess()*  
19520 function because:

- 19521 1. Historical implementations of *access()* do not test file access correctly when the process'  
19522 real user ID is superuser. In particular, they always return zero when testing execute  
19523 permissions without regard to whether the file is executable.

19524 2. The superuser has complete access to all files on a system. As a consequence, programs  
 19525 started by the superuser and switched to the effective user ID with lesser privileges  
 19526 cannot use *access()* to test their file access permissions.

19527 However, the historical model of *eaccess()* does not resolve problem (1), so this volume of  
 19528 POSIX.1-2008 now allows *access()* to behave in the desired way because several implementations  
 19529 have corrected the problem. It was also argued that problem (2) is more easily solved by using  
 19530 *open()*, *chdir()*, or one of the *exec* functions as appropriate and responding to the error, rather  
 19531 than creating a new function that would not be as reliable. Therefore, *eaccess()* is not included in  
 19532 this volume of POSIX.1-2008.

19533 The sentence concerning appropriate privileges and execute permission bits reflects the two  
 19534 possibilities implemented by historical implementations when checking superuser access for  
 19535 X\_OK.

19536 New implementations are discouraged from returning X\_OK unless at least one execution  
 19537 permission bit is set.

19538 The purpose of the *faccessat()* function is to enable the checking of the accessibility of files in  
 19539 directories other than the current working directory without exposure to race conditions. Any  
 19540 part of the path of a file could be changed in parallel to a call to *access()*, resulting in unspecified  
 19541 behavior. By opening a file descriptor for the target directory and using the *faccessat()* function it  
 19542 can be guaranteed that the file tested for accessibility is located relative to the desired directory.

#### 19543 FUTURE DIRECTIONS

19544 None.

#### 19545 SEE ALSO

19546 *chmod()*, *fstatat()*

19547 XBD Section 4.4 (on page 108), [<fcntl.h>](#), [<unistd.h>](#)

#### 19548 CHANGE HISTORY

19549 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 19550 Issue 6

19551 The following new requirements on POSIX implementations derive from alignment with the  
 19552 Single UNIX Specification:

- 19553 • The [ELOOP] mandatory error condition is added.
- 19554 • A second [ENAMETOOLONG] is added as an optional error condition.
- 19555 • The [ETXTBSY] optional error condition is added.

19556 The following changes were made to align with the IEEE P1003.1a draft standard:

- 19557 • The [ELOOP] optional error condition is added.

#### 19558 Issue 7

19559 Austin Group Interpretations 1003.1-2001 #046 and #143 are applied.

19560 The *faccessat()* function is added from The Open Group Technical Standard, 2006, Extended API  
 19561 Set Part 2.

19562 Changes are made to allow a directory to be opened for searching.

19563 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
 19564 pathname exists but is not a directory or a symbolic link to a directory.

**acos()**19565 **NAME**

19566           acos, acosf, acosl — arc cosine functions

19567 **SYNOPSIS**

```
19568       #include <math.h>
19569       double acos(double x);
19570       float  acosf(float x);
19571       long double acosl(long double x);
```

19572 **DESCRIPTION**

19573 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
 19574 conflict between the requirements described here and the ISO C standard is unintentional. This  
 19575 volume of POSIX.1-2008 defers to the ISO C standard.

19576       These functions shall compute the principal value of the arc cosine of their argument  $x$ . The  
 19577 value of  $x$  should be in the range  $[-1,1]$ .

19578       An application wishing to check for error situations should set *errno* to zero and call  
 19579 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 19580 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 19581 zero, an error has occurred.

19582 **RETURN VALUE**

19583       Upon successful completion, these functions shall return the arc cosine of  $x$ , in the range  $[0,\pi]$   
 19584 radians.

19585 **MX**       For finite values of  $x$  not in the range  $[-1,1]$ , a domain error shall occur, and either a NaN (if  
 19586 supported), or an implementation-defined value shall be returned.

19587 **MX**       If  $x$  is NaN, a NaN shall be returned.

19588       If  $x$  is  $+1$ ,  $+0$  shall be returned.

19589       If  $x$  is  $\pm\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 19590 defined value shall be returned.

19591 **ERRORS**

19592       These functions shall fail if:

19593 **MX**       Domain Error   The  $x$  argument is finite and is not in the range  $[-1,1]$ , or is  $\pm\text{Inf}$ .

19594       If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 19595 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 19596 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 19597 shall be raised.

19598 **EXAMPLES**

19599       None.

19600 **APPLICATION USAGE**

19601       On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 19602 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

19603 **RATIONALE**

19604       None.

19605 **FUTURE DIRECTIONS**

19606 None.

19610 **CHANGE HISTORY**

19611 First released in Issue 1. Derived from Issue 1 of the SVID.

19612 **Issue 5**19613 The DESCRIPTION is updated to indicate how an application should check for an error. This  
19614 text was previously published in the APPLICATION USAGE section.19615 **Issue 6**19616 The *acosf()* and *acosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.19617 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
19618 revised to align with the ISO/IEC 9899:1999 standard.19619 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
19620 marked.

**acosh()**19621 **NAME**19622 `acosh, acoshf, acoshl` — inverse hyperbolic cosine functions19623 **SYNOPSIS**

```
19624 #include <math.h>
19625 double acosh(double x);
19626 float acoshf(float x);
19627 long double acoshl(long double x);
```

19628 **DESCRIPTION**

19629 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 19630 conflict between the requirements described here and the ISO C standard is unintentional. This  
 19631 volume of POSIX.1-2008 defers to the ISO C standard.

19632 These functions shall compute the inverse hyperbolic cosine of their argument  $x$ .

19633 An application wishing to check for error situations should set *errno* to zero and call  
 19634 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 19635 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 19636 zero, an error has occurred.

19637 **RETURN VALUE**

19638 Upon successful completion, these functions shall return the inverse hyperbolic cosine of their  
 19639 argument.

19640 **MX** For finite values of  $x < 1$ , a domain error shall occur, and either a NaN (if supported), or an  
 19641 implementation-defined value shall be returned.

19642 **MX** If  $x$  is NaN, a NaN shall be returned.

19643 If  $x$  is +1, +0 shall be returned.

19644 If  $x$  is +Inf, +Inf shall be returned.

19645 If  $x$  is -Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-  
 19646 defined value shall be returned.

19647 **ERRORS**

19648 These functions shall fail if:

19649 **MX** Domain Error The  $x$  argument is finite and less than +1.0, or is -Inf.

19650 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 19651 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling* &  
 19652 MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 19653 shall be raised.

19654 **EXAMPLES**

19655 None.

19656 **APPLICATION USAGE**

19657 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 19658 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

19659 **RATIONALE**

19660 None.

19661 **FUTURE DIRECTIONS**

19662 None.

19663 **SEE ALSO**19664 *cosh()*, *feclearexcept()*, *fetestexcept()*19665 XBD Section 4.19 (on page 116), `<math.h>`19666 **CHANGE HISTORY**

19667 First released in Issue 4, Version 2.

19668 **Issue 5**

19669 Moved from X/OPEN UNIX extension to BASE.

19670 **Issue 6**19671 The *acosh()* function is no longer marked as an extension.19672 The *acoshf()* and *acoshl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

19674 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

19676 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

**acosl()***System Interfaces*19678 **NAME**

19679           acosl — arc cosine functions

19680 **SYNOPSIS**

19681           #include &lt;math.h&gt;

19682           long double acosl(long double x);

19683 **DESCRIPTION**19684           Refer to *acos()*.

19685 **NAME**

19686 aio\_cancel — cancel an asynchronous I/O request

19687 **SYNOPSIS**

19688 #include &lt;aio.h&gt;

19689 int aio\_cancel(int *fildev*, struct aiocb \**aiocbp*);19690 **DESCRIPTION**

19691 The *aio\_cancel()* function shall attempt to cancel one or more asynchronous I/O requests  
 19692 currently outstanding against file descriptor *fildev*. The *aiocbp* argument points to the  
 19693 asynchronous I/O control block for a particular request to be canceled. If *aiocbp* is NULL, then  
 19694 all outstanding cancelable asynchronous I/O requests against *fildev* shall be canceled.

19695 Normal asynchronous notification shall occur for asynchronous I/O operations that are  
 19696 successfully canceled. If there are requests that cannot be canceled, then the normal  
 19697 asynchronous completion process shall take place for those requests when they are completed.

19698 For requested operations that are successfully canceled, the associated error status shall be set to  
 19699 [ECANCELED] and the return status shall be -1. For requested operations that are not  
 19700 successfully canceled, the *aiocbp* shall not be modified by *aio\_cancel()*.

19701 If *aiocbp* is not NULL, then if *fildev* does not have the same value as the file descriptor with which  
 19702 the asynchronous operation was initiated, unspecified results occur.

19703 Which operations are cancelable is implementation-defined.

19704 **RETURN VALUE**

19705 The *aio\_cancel()* function shall return the value AIO\_CANCELED if the requested operation(s)  
 19706 were canceled. The value AIO\_NOTCANCELED shall be returned if at least one of the  
 19707 requested operation(s) cannot be canceled because it is in progress. In this case, the state of the  
 19708 other operations, if any, referenced in the call to *aio\_cancel()* is not indicated by the return value  
 19709 of *aio\_cancel()*. The application may determine the state of affairs for these operations by using  
 19710 *aio\_error()*. The value AIO\_ALLDONE is returned if all of the operations have already  
 19711 completed. Otherwise, the function shall return -1 and set *errno* to indicate the error.

19712 **ERRORS**

19713 The *aio\_cancel()* function shall fail if:

19714 [EBADF] The *fildev* argument is not a valid file descriptor.

19715 **EXAMPLES**

19716 None.

19717 **APPLICATION USAGE**

19718 None.

19719 **RATIONALE**

19720 None.

19721 **FUTURE DIRECTIONS**

19737 **NAME**

19738 aio\_error — retrieve errors status for an asynchronous I/O operation

19739 **SYNOPSIS**

19740 #include &lt;aio.h&gt;

19741 int aio\_error(const struct aiocb \*aiocbp);

19742 **DESCRIPTION**

19743 The *aio\_error()* function shall return the error status associated with the **aiocb** structure  
 19744 referenced by the *aiocbp* argument. The error status for an asynchronous I/O operation is the  
 19745 SIO *errno* value that would be set by the corresponding *read()*, *write()*, *fdatasync()*, or *fsync()*  
 19746 operation. If the operation has not yet completed, then the error status shall be equal to  
 19747 [EINPROGRESS].

19748 If the **aiocb** structure pointed to by *aiocbp* is not associated with an operation that has been  
 19749 scheduled, the results are undefined.

19750 **RETURN VALUE**

19751 If the asynchronous I/O operation has completed successfully, then 0 shall be returned. If the  
 19752 asynchronous operation has completed unsuccessfully, then the error status, as described for  
 19753 SIO *read()*, *write()*, *fdatasync()*, and *fsync()*, shall be returned. If the asynchronous I/O operation has  
 19754 not yet completed, then [EINPROGRESS] shall be returned.

19755 If the *aio\_error()* function fails, it shall return -1 and set *errno* to indicate the error.

19756 **ERRORS**19757 The *aio\_error()* function may fail if:

19758 [EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose  
 19759 return status has not yet been retrieved.

19760 **EXAMPLES**

19761 None.

19762 **APPLICATION USAGE**

19780 SD5-XSH-ERN-148 is applied.

19781 The *aio\_error()* function is moved from the Asynchronous Input and Output option to the Base.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

19782 **NAME**

19783 aio\_fsync — asynchronous file synchronization

19784 **SYNOPSIS**

19785 #include &lt;aio.h&gt;

19786 int aio\_fsync(int *op*, struct aiocb \**aiocbp*);19787 **DESCRIPTION**

19788 The *aio\_fsync()* function shall asynchronously force all I/O operations associated with the file  
 19789 indicated by the file descriptor *aio\_fildes* member of the **aiocb** structure referenced by the *aiocbp*  
 19790 argument and queued at the time of the call to *aio\_fsync()* to the synchronized I/O completion  
 19791 state. The function call shall return when the synchronization request has been initiated or  
 19792 queued to the file or device (even when the data cannot be synchronized immediately).

19793 If *op* is O\_DSYNC, all currently queued I/O operations shall be completed as if by a call to  
 19794 *fdatasync()*; that is, as defined for synchronized I/O data integrity completion. If *op* is O\_SYNC,  
 19795 all currently queued I/O operations shall be completed as if by a call to *fsync()*; that is, as  
 19796 defined for synchronized I/O file integrity completion. If the *aio\_fsync()* function fails, or if the  
 19797 operation queued by *aio\_fsync()* fails, then, as for *fsync()* and *fdatasync()*, outstanding I/O  
 19798 operations are not guaranteed to have been completed.

19799 If *aio\_fsync()* succeeds, then it is only the I/O that was queued at the time of the call to  
 19800 *aio\_fsync()* that is guaranteed to be forced to the relevant completion state. The completion of  
 19801 subsequent I/O on the file descriptor is not guaranteed to be completed in a synchronized  
 19802 fashion.

19803 The *aiocbp* argument refers to an asynchronous I/O control block. The *aiocbp* value may be used  
 19804 as an argument to *aio\_error()* and *aio\_return()* in order to determine the error status and return  
 19805 status, respectively, of the asynchronous operation while it is proceeding. When the request is  
 19806 queued, the error status for the operation is [EINPROGRESS]. When all data has been  
 19807 successfully transferred, the error status shall be reset to reflect the success or failure of the  
 19808 operation. If the operation does not complete successfully, the error status for the operation shall  
 19809 be set to indicate the error. The *aio\_sigevent* member determines the asynchronous notification to  
 19810 occur as specified in Section 2.4.1 (on page 484) when all operations have achieved synchronized  
 19811 I/O completion. All other members of the structure referenced by *aiocbp* are ignored. If the  
 19812 control block referenced by *aiocbp* becomes an illegal address prior to asynchronous I/O  
 19813 completion, then the behavior is undefined.

19814 If the *aio\_fsync()* function fails or *aiocbp* indicates an error condition, data is not guaranteed to  
 19815 have been successfully transferred.

19816 **RETURN VALUE**

19817 The *aio\_fsync()* function shall return the value 0 if the I/O operation is successfully queued;  
 19818 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

19819 **ERRORS**

19820 The *aio\_fsync()* function shall fail if:

- |       |          |                                                                                                                                                      |
|-------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 19821 | [EAGAIN] | The requested asynchronous operation was not queued due to temporary resource limitations.                                                           |
| 19822 |          |                                                                                                                                                      |
| 19823 | [EBADF]  | The <i>aio_fildes</i> member of the <b>aiocb</b> structure referenced by the <i>aiocbp</i> argument is not a valid file descriptor open for writing. |
| 19824 |          |                                                                                                                                                      |
| 19825 | [EINVAL] | This implementation does not support synchronized I/O for this file.                                                                                 |

19852 **NAME**

19853 aio\_read — asynchronous read from a file

19854 **SYNOPSIS**

19855 #include &lt;aio.h&gt;

19856 int aio\_read(struct aiocb \*aiocbp);

19857 **DESCRIPTION**

19858 The *aio\_read()* function shall read *aiocbp->aio\_nbytes* from the file associated with  
 19859 *aiocbp->aio\_fildes* into the buffer pointed to by *aiocbp->aio\_buf*. The function call shall return  
 19860 when the read request has been initiated or queued to the file or device (even when the data  
 19861 cannot be delivered immediately).

19862 **PIO** If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted  
 19863 at a priority equal to a base scheduling priority minus *aiocbp->aio\_reqprio*. If Thread Execution  
 19864 Scheduling is not supported, then the base scheduling priority is that of the calling process;  
 19865 **PIO TPS** otherwise, the base scheduling priority is that of the calling thread.

19866 The *aiocbp* value may be used as an argument to *aio\_error()* and *aio\_return()* in order to  
 19867 determine the error status and return status, respectively, of the asynchronous operation while it  
 19868 is proceeding. If an error condition is encountered during queuing, the function call shall return  
 19869 without having initiated or queued the request. The requested operation takes place at the  
 19870 absolute position in the file as given by *aio\_offset*, as if *lseek()* were called immediately prior to  
 19871 the operation with an *offset* equal to *aio\_offset* and a *whence* equal to *SEEK\_SET*. After a  
 19872 successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file  
 19873 is unspecified.

19874 The *aio\_sigevent* member specifies the notification which occurs when the request is completed.

19875 The *aiocbp->aio\_lio\_opcode* field shall be ignored by *aio\_read()*.

19876 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio\_buf* or  
 19877 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O  
 19878 completion, then the behavior is undefined.

19879 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

19880 **SIO** If synchronized I/O is enabled on the file associated with *aiocbp->aio\_fildes*, the behavior of this  
 19881 function shall be according to the definitions of synchronized I/O data integrity completion and  
 19882 synchronized I/O file integrity completion.

19883 For any system action that changes the process memory space while an asynchronous I/O is  
 19884 outstanding to the address range being changed, the result of that action is undefined.

19885 For regular files, no data transfer shall occur past the offset maximum established in the open  
 19886 file description associated with *aiocbp->aio\_fildes*.

19887 **RETURN VALUE**

19888 The *aio\_read()* function shall return the value zero if the I/O operation is successfully queued;  
 19889 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

19890 **ERRORS**

19891 The *aio\_read()* function shall fail if:

19892 [EAGAIN] The requested asynchronous I/O operation was not queued due to system  
 19893 resource limitations.

19894 Each of the following conditions may be detected synchronously at the time of the call to  
 19895 *aio\_read()*, or asynchronously. If any of the conditions below are detected synchronously, the

**aio\_read()**

- 19896 *aio\_read()* function shall return `-1` and set *errno* to the corresponding value. If any of the  
 19897 conditions below are detected asynchronously, the return status of the asynchronous operation  
 19898 is set to `-1`, and the error status of the asynchronous operation is set to the corresponding value.
- 19899 [EBADF] The *aioctx->aio\_fildes* argument is not a valid file descriptor open for reading.
- 19900 [EINVAL] The file offset value implied by *aioctx->aio\_offset* would be invalid,  
 19901 PIO *aioctx->aio\_reqprio* is not a valid value, or *aioctx->aio\_nbytes* is an invalid  
 19902 value.
- 19903 In the case that the *aio\_read()* successfully queues the I/O operation but the operation is  
 19904 subsequently canceled or encounters an error, the return status of the asynchronous operation is  
 19905 one of the values normally returned by the *read()* function call. In addition, the error status of  
 19906 the asynchronous operation is set to one of the error statuses normally set by the *read()* function  
 19907 call, or one of the following values:
- 19908 [EBADF] The *aioctx->aio\_fildes* argument is not a valid file descriptor open for reading.
- 19909 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit  
 19910 *aio\_cancel()* request.
- 19911 [EINVAL] The file offset value implied by *aioctx->aio\_offset* would be invalid.
- 19912 The following condition may be detected synchronously or asynchronously:
- 19913 [EOVERFLOW] The file is a regular file, *aioctx->aio\_nbytes* is greater than 0, and the starting  
 19914 offset in *aioctx->aio\_offset* is before the end-of-file and is at or beyond the  
 19915 offset maximum in the open file description associated with *aioctx->aio\_fildes*.

**Issue 6**

19932 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 19933 implementation does not support the Asynchronous Input and Output option.

19934 The APPLICATION USAGE section is added.

- 19935 The following new requirements on POSIX implementations derive from alignment with the  
19936 Single UNIX Specification:
- 19937 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open  
19938 file description. This change is to support large files.
  - 19939 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support  
19940 large files.
- 19941 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/12 is applied, rewording the  
19942 DESCRIPTION when prioritized I/O is supported to account for threads, and removing the  
19943 words “to the calling process” in the RETURN VALUE section.
- 19944 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/13 is applied, updating the [EINVAL]  
19945 error, so that detection of an [EINVAL] error for an invalid value of *aiochp*→*aio\_reqprio* is only  
19946 required if the Prioritized Input and Output option is supported.
- 19947 **Issue 7**
- 19948 Austin Group Interpretation 1003.1-2001 #082 is applied.
- 19949 The *aio\_read()* function is moved from the Asynchronous Input and Output option to the Base.

**aio\_return()**19950 **NAME**

19951 aio\_return — retrieve return status of an asynchronous I/O operation

19952 **SYNOPSIS**

19953 #include &lt;aio.h&gt;

19954 ssize\_t aio\_return(struct aiocb \*aiocbp);

19955 **DESCRIPTION**

19956 The *aio\_return()* function shall return the return status associated with the **aiocb** structure  
 19957 referenced by the *aiocbp* argument. The return status for an asynchronous I/O operation is the  
 19958 value that would be returned by the corresponding *read()*, *write()*, or *fsync()* function call. If the  
 19959 error status for the operation is equal to [EINPROGRESS], then the return status for the  
 19960 operation is undefined. The *aio\_return()* function may be called exactly once to retrieve the  
 19961 return status of a given asynchronous operation; thereafter, if the same **aiocb** structure is used in  
 19962 a call to *aio\_return()* or *aio\_error()*, an error may be returned. When the **aiocb** structure referred  
 19963 to by *aiocbp* is used to submit another asynchronous operation, then *aio\_return()* may be  
 19964 successfully used to retrieve the return status of that operation.

19965 **RETURN VALUE**

19966 If the asynchronous I/O operation has completed, then the return status, as described for *read()*,  
 19967 *write()*, and *fsync()*, shall be returned. If the asynchronous I/O operation has not yet completed,  
 19968 the results of *aio\_return()* are undefined.

19969 If the *aio\_return()* function fails, it shall return -1 and set *errno* to indicate the error.

19970 **ERRORS**19971 The *aio\_return()* function may fail if:

19972 [EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose  
 19973 return status has not yet been retrieved.

19986 **CHANGE HISTORY**

19987 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

19988 **Issue 6**

19989 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 19990 implementation does not support the Asynchronous Input and Output option.

19991 The APPLICATION USAGE section is added.

19992 The [EINVAL] error condition is made optional. This is for consistency with the DESCRIPTION.

19993 **Issue 7**

19994 SD5-XSH-ERN-148 is applied.

19995 The *aio\_return()* function is moved from the Asynchronous Input and Output option to the Base.

**aio\_suspend()**19996 **NAME**

19997 aio\_suspend — wait for an asynchronous I/O request

19998 **SYNOPSIS**

19999 #include &lt;aio.h&gt;

20000 int aio\_suspend(const struct aiocb \*const list[], int nent,  
20001 const struct timespec \*timeout);20002 **DESCRIPTION**

20003 The *aio\_suspend()* function shall suspend the calling thread until at least one of the asynchronous  
 20004 I/O operations referenced by the *list* argument has completed, until a signal interrupts the  
 20005 function, or, if *timeout* is not NULL, until the time interval specified by *timeout* has passed. If any  
 20006 of the **aiocb** structures in the list correspond to completed asynchronous I/O operations (that is,  
 20007 the error status for the operation is not equal to [EINPROGRESS]) at the time of the call, the  
 20008 function shall return without suspending the calling thread. The *list* argument is an array of  
 20009 pointers to asynchronous I/O control blocks. The *nent* argument indicates the number of  
 20010 elements in the array. Each **aiocb** structure pointed to has been used in initiating an  
 20011 asynchronous I/O request via *aio\_read()*, *aio\_write()*, or *lio\_listio()*. This array may contain null  
 20012 pointers, which are ignored. If this array contains pointers that refer to **aiocb** structures that have  
 20013 not been used in submitting asynchronous I/O, the effect is undefined.

20014 If the time interval indicated in the **timespec** structure pointed to by *timeout* passes before any of  
 20015 the I/O operations referenced by *list* are completed, then *aio\_suspend()* shall return with an error.

20016 MON If the Monotonic Clock option is supported, the clock that shall be used to measure this time  
 20017 interval shall be the CLOCK\_MONOTONIC clock.

20018 **RETURN VALUE**

20019 If the *aio\_suspend()* function returns after one or more asynchronous I/O operations have  
 20020 completed, the function shall return zero. Otherwise, the function shall return a value of -1 and  
 20021 set *errno* to indicate the error.

20022 The application may determine which asynchronous I/O completed by scanning the associated  
 20023 error and return status using *aio\_error()* and *aio\_return()*, respectively.

20024 **ERRORS**

20025 The *aio\_suspend()* function shall fail if:

20026 [EAGAIN] No asynchronous I/O indicated in the list referenced by *list* completed in the  
 20027 time interval indicated by *timeout*.

20028 [EINTR] A signal interrupted the *aio\_suspend()* function. Note that, since each  
 20029 asynchronous I/O operation may possibly provoke a signal when it  
 20030 completes, this error return may be caused by the completion of one (or more)  
 20031 of the very I/O operations being awaited.

20040 **SEE ALSO**20041 *aio\_read()*, *aio\_write()*, *lio\_listio()*20042 XBD <*aio.h*>20043 **CHANGE HISTORY**

20044 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

20045 **Issue 6**20046 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
20047 implementation does not support the Asynchronous Input and Output option.

20048 The APPLICATION USAGE section is added.

20049 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the  
20050 CLOCK\_MONOTONIC clock, if supported, is used.20051 **Issue 7**20052 The *aio\_suspend()* function is moved from the Asynchronous Input and Output option to the  
20053 Base.

**aio\_write()**20054 **NAME**

20055 aio\_write — asynchronous write to a file

20056 **SYNOPSIS**

20057 #include &lt;aio.h&gt;

20058 int aio\_write(struct aiocb \*aiocbp);

20059 **DESCRIPTION**

20060 The *aio\_write()* function shall write *aiocbp->aio\_nbytes* to the file associated with  
 20061 *aiocbp->aio\_fildes* from the buffer pointed to by *aiocbp->aio\_buf*. The function shall return when  
 20062 the write request has been initiated or, at a minimum, queued to the file or device.

20063 **PIO** If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted  
 20064 at a priority equal to a base scheduling priority minus *aiocbp->aio\_reqprio*. If Thread Execution  
 20065 Scheduling is not supported, then the base scheduling priority is that of the calling process;  
 20066 **PIO TPS** otherwise, the base scheduling priority is that of the calling thread.

20067 The *aiocbp* argument may be used as an argument to *aio\_error()* and *aio\_return()* in order to  
 20068 determine the error status and return status, respectively, of the asynchronous operation while it  
 20069 is proceeding.

20070 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio\_buf* or  
 20071 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O  
 20072 completion, then the behavior is undefined.

20073 If **O\_APPEND** is not set for the file descriptor *aio\_fildes*, then the requested operation shall take  
 20074 place at the absolute position in the file as given by *aio\_offset*, as if *lseek()* were called  
 20075 immediately prior to the operation with an *offset* equal to *aio\_offset* and a *whence* equal to  
 20076 **SEEK\_SET**. If **O\_APPEND** is set for the file descriptor, write operations append to the file in the  
 20077 same order as the calls were made. After a successful call to enqueue an asynchronous I/O  
 20078 operation, the value of the file offset for the file is unspecified.

20079 The *aio\_sigevent* member specifies the notification which occurs when the request is completed.

20080 The *aiocbp->aio\_lio\_opcode* field shall be ignored by *aio\_write()*.

20081 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

20082 **SIO** If synchronized I/O is enabled on the file associated with *aiocbp->aio\_fildes*, the behavior of this  
 20083 function shall be according to the definitions of synchronized I/O data integrity completion, and  
 20084 synchronized I/O file integrity completion.

20085 For any system action that changes the process memory space while an asynchronous I/O is  
 20086 outstanding to the address range being changed, the result of that action is undefined.

20087 For regular files, no data transfer shall occur past the offset maximum established in the open  
 20088 file description associated with *aiocbp->aio\_fildes*.

20089 **RETURN VALUE**

20090 The *aio\_write()* function shall return the value zero if the I/O operation is successfully queued;  
 20091 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

20092 **ERRORS**

20093 The *aio\_write()* function shall fail if:

20094 **[EAGAIN]** The requested asynchronous I/O operation was not queued due to system  
 20095 resource limitations.

20096 Each of the following conditions may be detected synchronously at the time of the call to  
 20097 *aio\_write()*, or asynchronously. If any of the conditions below are detected synchronously, the

20098 *aio\_write()* function shall return `-1` and set *errno* to the corresponding value. If any of the  
 20099 conditions below are detected asynchronously, the return status of the asynchronous operation  
 20100 shall be set to `-1`, and the error status of the asynchronous operation is set to the corresponding  
 20101 value.

20102 [EBADF] The *aiocbp*→*aio\_fildes* argument is not a valid file descriptor open for writing.

20103 [EINVAL] The file offset value implied by *aiocbp*→*aio\_offset* would be invalid,  
 20104 PIO *aiocbp*→*aio\_reqprio* is not a valid value, or *aiocbp*→*aio\_nbytes* is an invalid  
 20105 value.

20106 In the case that the *aio\_write()* successfully queues the I/O operation, the return status of the  
 20107 asynchronous operation shall be one of the values normally returned by the *write()* function call.  
 20108 If the operation is successfully queued but is subsequently canceled or encounters an error, the  
 20109 error status for the asynchronous operation contains one of the values normally set by the  
 20110 *write()* function call, or one of the following:

20111 [EBADF] The *aiocbp*→*aio\_fildes* argument is not a valid file descriptor open for writing.

20112 [EINVAL] The file offset value implied by *aiocbp*→*aio\_offset* would be invalid.

20113 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit  
 20114 *aio\_cancel()* request.

20115 The following condition may be detected synchronously or asynchronously:

20116 [EFBIG] The file is a regular file, *aiocbp*→*aio\_nbytes* is greater than 0, and the starting  
 20117 offset in *aiocbp*→*aio\_offset* is at or beyond the offset maximum in the open file  
 20118 description associated with *aiocbp*→*aio\_fildes*.

#### 20131 CHANGE HISTORY

20132 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

20133 Large File Summit extensions are added.

#### 20134 Issue 6

20135 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 20136 implementation does not support the Asynchronous Input and Output option.

20137 The APPLICATION USAGE section is added.

20138 The following new requirements on POSIX implementations derive from alignment with the  
 20139 Single UNIX Specification:

**aio\_write()**

- 20140
- 20141
- 20142
- In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs past the offset maximum established in the open file description associated with *aiocbp*→*aio\_fildes*.
- 20143
- The [EFBIG] error is added as part of the large file support extensions.
- 20144
- 20145
- 20146
- IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/14 is applied, rewording the DESCRIPTION when prioritized I/O is supported to account for threads, and removing the words “to the calling process” in the RETURN VALUE section.
- 20147
- 20148
- 20149
- IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/15 is applied, updating the [EINVAL] error, so that detection of an [EINVAL] error for an invalid value of *aiocbp*→*aio\_reqprio* is only required if the Prioritized Input and Output option is supported.
- 20150 **Issue 7**
- 20151 Austin Group Interpretation 1003.1-2001 #082 is applied.
- 20152 The *aio\_write()* function is moved from the Asynchronous Input and Output option to the Base.

20153 **NAME**

20154 alarm — schedule an alarm signal

20155 **SYNOPSIS**

20156 #include &lt;unistd.h&gt;

20157 unsigned alarm(unsigned seconds);

20158 **DESCRIPTION**

20159 The *alarm()* function shall cause the system to generate a SIGALRM signal for the process after  
 20160 the number of realtime seconds specified by *seconds* have elapsed. Processor scheduling delays  
 20161 may prevent the process from handling the signal as soon as it is generated.

20162 If *seconds* is 0, a pending alarm request, if any, is canceled.

20163 Alarm requests are not stacked; only one SIGALRM generation can be scheduled in this manner.  
 20164 If the SIGALRM signal has not yet been generated, the call shall result in rescheduling the time  
 20165 at which the SIGALRM signal is generated.

20166 XSI Interactions between *alarm()* and *setitimer()* are unspecified.

20167 **RETURN VALUE**

20168 If there is a previous *alarm()* request with time remaining, *alarm()* shall return a non-zero value  
 20169 that is the number of seconds until the previous request would have generated a SIGALRM  
 20170 signal. Otherwise, *alarm()* shall return 0.

20171 **ERRORS**

20172 The *alarm()* function is always successful, and no return value is reserved to indicate an error.

20173 **EXAMPLES**

20174 None.

20175 **APPLICATION USAGE**

20176 The *fork()* function clears pending alarms in the child process. A new process image created by  
 20177 one of the *exec* functions inherits the time left to an alarm signal in the image of the old process.

20178 Application developers should note that the type of the argument *seconds* and the return value of  
 20179 *alarm()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces  
 20180 Application cannot pass a value greater than the minimum guaranteed value for {UINT\_MAX},  
 20181 which the ISO C standard sets as 65 535, and any application passing a larger value is restricting  
 20182 its portability. A different type was considered, but historical implementations, including those  
 20183 with a 16-bit **int** type, consistently use either **unsigned** or **int**.

20184 Application developers should be aware of possible interactions when the same process uses  
 20185 both the *alarm()* and *sleep()* functions.

20186 **RATIONALE**

20187 Many historical implementations (including Version 7 and System V) allow an alarm to occur up  
 20188 to a second early. Other implementations allow alarms up to half a second or one clock tick  
 20189 early or do not allow them to occur early at all. The latter is considered most appropriate, since it  
 20190 gives the most predictable behavior, especially since the signal can always be delayed for an  
 20191 indefinite amount of time due to scheduling. Applications can thus choose the *seconds* argument  
 20192 as the minimum amount of time they wish to have elapse before the signal.

20193 The term “realtime” here and elsewhere (*sleep()*, *times()*) is intended to mean “wall clock” time  
 20194 as common English usage, and has nothing to do with “realtime operating systems”. It is in  
 20195 contrast to *virtual time*, which could be misinterpreted if just *time* were used.

20196 In some implementations, including 4.3 BSD, very large values of the *seconds* argument are  
 20197 silently rounded down to an implementation-specific maximum value. This maximum is large

**alarm()**

- 20198 enough (to the order of several months) that the effect is not noticeable.
- 20199 There were two possible choices for alarm generation in multi-threaded applications: generation  
20200 for the calling thread or generation for the process. The first option would not have been  
20201 particularly useful since the alarm state is maintained on a per-process basis and the alarm that  
20202 is established by the last invocation of *alarm()* is the only one that would be active.
- 20203 Furthermore, allowing generation of an asynchronous signal for a thread would have  
20204 introduced an exception to the overall signal model. This requires a compelling reason in order  
20205 to be justified.
- 20206 **FUTURE DIRECTIONS**
- 20207 None.
- 20208 **SEE ALSO**
- 20209 *alarm()*, *exec*, *fork()*, *getitimer()*, *pause()*, *sigaction()*, *sleep()*
- 20210 XBD [<signal.h>](#), [<unistd.h>](#)
- 20211 **CHANGE HISTORY**
- 20212 First released in Issue 1. Derived from Issue 1 of the SVID.
- 20213 **Issue 6**
- 20214 The following new requirements on POSIX implementations derive from alignment with the  
20215 Single UNIX Specification:
- 20216 • The DESCRIPTION is updated to indicate that interactions with the *setitimer()*, *ualarm()*,  
20217 and *usleep()* functions are unspecified.
- 20218 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/16 is applied, replacing “an  
20219 implementation-defined maximum value” with “an implementation-specific maximum value”  
20220 in the RATIONALE.

20221 **NAME**

20222           alphasort, scandir — scan a directory

20223 **SYNOPSIS**

20224           #include &lt;dirent.h&gt;

```

20225           int alphasort(const struct dirent **d1, const struct dirent **d2);
20226           int scandir(const char *dir, struct dirent ***namelist,
20227                       int (*sel)(const struct dirent *),
20228                       int (*compar)(const struct dirent **, const struct dirent **));

```

20229 **DESCRIPTION**

20230       The *alphasort()* function can be used as the comparison function for the *scandir()* function to sort  
 20231       the directory entries, *d1* and *d2*, into alphabetical order. Sorting happens as if by calling the  
 20232       *strcoll()* function on the *d\_name* element of the **dirent** structures passed as the two parameters. If  
 20233       the *strcoll()* function fails, the return value of *alphasort()* is unspecified.

20234       The *alphasort()* function shall not change the setting of *errno* if successful. Since no return value  
 20235       is reserved to indicate an error, an application wishing to check for error situations should set  
 20236       *errno* to 0, then call *alphasort()*, then check *errno*.

20237       The *scandir()* function shall scan the directory *dir*, calling the function referenced by *sel* on each  
 20238       directory entry. Entries for which the function referenced by *sel* returns non-zero shall be stored  
 20239       in strings allocated as if by a call to *malloc()*, and sorted as if by a call to *qsort()* with the  
 20240       comparison function *compar*, except that *compar* need not provide total ordering. The strings are  
 20241       collected in array *namelist* which shall be allocated as if by a call to *malloc()*. If *sel* is a null  
 20242       pointer, all entries shall be selected. If the comparison function *compar* does not provide total  
 20243       ordering, the order in which the directory entries are stored is unspecified.

20244 **RETURN VALUE**

20245       Upon successful completion, the *alphasort()* function shall return an integer greater than, equal  
 20246       to, or less than 0, according to whether the name of the directory entry pointed to by *d1* is  
 20247       lexically greater than, equal to, or less than the directory pointed to by *d2* when both are  
 20248       interpreted as appropriate to the current locale. There is no return value reserved to indicate an  
 20249       error.

20250       Upon successful completion, the *scandir()* function shall return the number of entries in the  
 20251       array and a pointer to the array through the parameter *namelist*. Otherwise, the *scandir()*  
 20252       function shall return -1.

20253 **ERRORS**20254       The *scandir()* function shall fail if:

20255       [EACCES]       Search permission is denied for the component of the path prefix of *dir* or read  
 20256       permission is denied for *dir*.

20257       [ELOOP]        A loop exists in symbolic links encountered during resolution of the *dir*  
 20258       argument.

20259       [ENAMETOOLONG]   The length of a component of a pathname is longer than {NAME\_MAX}.

20261       [ENOENT]        A component of *dir* does not name an existing directory or *dir* is an empty  
 20262       string.

20263       [ENOMEM]        Insufficient storage space is available.

**alphasort()**

- 20264 [ENOTDIR] A component of *dir* is not a directory.
- 20265 The *scandir()* function may fail if:
- 20266 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
20267 resolution of the *dir* argument.
- 20268 [EMFILE] {OPEN\_MAX} file descriptors are currently open in the calling process.
- 20269 [ENAMETOOLONG]
- 20270 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
20271 symbolic link produced an intermediate result with a length that exceeds  
20272 {PATH\_MAX}.
- 20273 [ENFILE] Too many files are currently open in the system.

**EXAMPLES**

20274 An example to print the files in the current directory:

```

20276 #include <dirent.h>
20277 #include <stdio.h>
20278 #include <stdlib.h>
20279 ...
20280 struct dirent **namelist;
20281 int i,n;

20282     n = scandir(".", &namelist, 0, alphasort);
20283     if (n < 0)
20284         perror("scandir");
20285     else {
20286         for (i = 0; i < n; i++) {
20287             printf("%s\n", namelist[i]->d_name);
20288             free(namelist[i]);
20289         }
20290     }
20291     free(namelist);
20292     ...

```

**APPLICATION USAGE**

20293 If *dir* contains filenames that contain characters outside the domain of the collating sequence of  
20294 the current locale, the *alphasort()* function need not provide a total ordering.

20296 The *scandir()* function may allocate dynamic storage during its operation. If *scandir()* is forcibly  
20297 terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *sel*  
20298 or *compar*, or by an interrupt routine, *scandir()* does not have a chance to free that storage, so it  
20299 remains permanently allocated. A safe way to handle interrupts is to store the fact that an  
20300 interrupt has occurred, then wait until *scandir()* returns to act on the interrupt.

20301 For functions that allocate memory as if by *malloc()*, the application should release such memory  
20302 when it is no longer required by a call to *free()*. For *scandir()*, this is *namelist* (including all of the  
20303 individual strings in *namelist*).

**RATIONALE**

**asctime()**20313 **NAME**20314 `asctime, asctime_r` — convert date and time to a string20315 **SYNOPSIS**

```
20316 OB #include <time.h>
20317 char *asctime(const struct tm *timeptr);
20318 OB CX char *asctime_r(const struct tm *restrict tm, char *restrict buf);
```

20319 **DESCRIPTION**

20320 CX For `asctime()`: The functionality described on this reference page is aligned with the ISO C  
 20321 standard. Any conflict between the requirements described here and the ISO C standard is  
 20322 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

20323 The `asctime()` function shall convert the broken-down time in the structure pointed to by `timeptr`  
 20324 into a string in the form:

```
20325 Sun Sep 16 01:03:52 1973\n\0
```

20326 using the equivalent of the following algorithm:

```
20327 char *asctime(const struct tm *timeptr)
20328 {
20329     static char wday_name[7][3] = {
20330         "Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"
20331     };
20332     static char mon_name[12][3] = {
20333         "Jan", "Feb", "Mar", "Apr", "May", "Jun",
20334         "Jul", "Aug", "Sep", "Oct", "Nov", "Dec"
20335     };
20336     static char result[26];
20337     sprintf(result, "%.3s %.3s%3d %.2d:%.2d:%.2d %d\n",
20338         wday_name[timeptr->tm_wday],
20339         mon_name[timeptr->tm_mon],
20340         timeptr->tm_mday, timeptr->tm_hour,
20341         timeptr->tm_min, timeptr->tm_sec,
20342         1900 + timeptr->tm_year);
20343     return result;
20344 }
```

20345 However, the behavior is undefined if `timeptr->tm_wday` or `timeptr->tm_mon` are not within the  
 20346 normal ranges as defined in `<time.h>`, or if `timeptr->tm_year` exceeds `{INT_MAX}-1990`, or if the  
 20347 above algorithm would attempt to generate more than 26 bytes of output (including the  
 20348 terminating null).

20349 The `tm` structure is defined in the `<time.h>` header.

20350 CX The `asctime()`, `ctime()`, `gmtime()`, and `localtime()` functions shall return values in one of two static  
 20351 objects: a broken-down time structure and an array of type `char`. Execution of any of the  
 20352 functions may overwrite the information returned in either of these objects by any of the other  
 20353 functions.

20354 The `asctime()` function need not be thread-safe.

20355 The `asctime_r()` function shall convert the broken-down time in the structure pointed to by `tm`  
 20356 into a string (of the same form as that returned by `asctime()`), and with the same undefined  
 20357 behavior when input or output is out of range) that is placed in the user-supplied buffer pointed

20358 to by *buf* (which shall contain at least 26 bytes) and then return *buf*.

#### 20359 RETURN VALUE

20360 CX Upon successful completion, *asctime()* shall return a pointer to the string. If the function is  
20361 unsuccessful, it shall return NULL.

20362 Upon successful completion, *asctime\_r()* shall return a pointer to a character string containing  
20363 the date and time. This string is pointed to by the argument *buf*. If the function is unsuccessful,  
20364 it shall return NULL.

#### 20365 ERRORS

20366 No errors are defined.

#### 20367 EXAMPLES

20368 None.

#### 20369 APPLICATION USAGE

20370 These functions are included only for compatibility with older implementations. They have  
20371 undefined behavior if the resulting string would be too long, so the use of these functions  
20372 should be discouraged. On implementations that do not detect output string length overflow, it  
20373 is possible to overflow the output buffers in such a way as to cause applications to fail, or  
20374 possible system security violations. Also, these functions do not support localized date and time  
20375 formats. To avoid these problems, applications should use *strptime()* to generate strings from  
20376 broken-down times.

20377 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.

20378 The *asctime\_r()* function is thread-safe and shall return values in a user-supplied buffer instead  
20379 of possibly using a static data area that may be overwritten by each call.

#### 20380 RATIONALE

20381 The standard developers decided to mark the *asctime()* and *asctime\_r()* functions obsolescent  
20382 even though they are in the ISO C standard due to the possibility of buffer overflow. The ISO C  
20383 standard also provides the *strptime()* function which can be used to avoid these problems.

#### 20384 FUTURE DIRECTIONS

20385 These functions may be removed in a future version.

#### 20386 SEE ALSO

20387 *clock()*, *ctime()*, *difftime()*, *gmtime()*, *localtime()*, *mktime()*, *strptime()*, *strptime\_r()*, *time()*, *utime()*

20388 XBD <time.h>

#### 20389 CHANGE HISTORY

20390 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 20391 Issue 5

20392 Normative text previously in the APPLICATION USAGE section is moved to the  
20393 DESCRIPTION.

20394 The *asctime\_r()* function is included for alignment with the POSIX Threads Extension.

20395 A note indicating that the *asctime()* function need not be reentrant is added to the  
20396 DESCRIPTION.

#### 20397 Issue 6

20398 The *asctime\_r()* function is marked as part of the Thread-Safe Functions option.

20399 Extensions beyond the ISO C standard are marked.

20400 The APPLICATION USAGE section is updated to include a note on the thread-safe function and

**asctime()**

- 20401 its avoidance of possibly using a static data area.
- 20402 The DESCRIPTION of *asctime\_r()* is updated to describe the format of the string returned.
- 20403 The **restrict** keyword is added to the *asctime\_r()* prototype for alignment with the  
20404 ISO/IEC 9899: 1999 standard
- 20405 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/17 is applied, adding the CX extension in  
20406 the RETURN VALUE section requiring that if the *asctime()* function is unsuccessful it returns  
20407 NULL.
- 20408 **Issue 7**
- 20409 Austin Group Interpretation 1003.1-2001 #053 is applied, marking these functions obsolescent.
- 20410 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 20411 The *asctime\_r()* function is moved from the Thread-Safe Functions option to the Base.

20412 **NAME**

20413 asin, asinf, asinl — arc sine function

20414 **SYNOPSIS**

```
20415 #include <math.h>
20416 double asin(double x);
20417 float asinf(float x);
20418 long double asinl(long double x);
```

20419 **DESCRIPTION**

20420 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 20421 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20422 volume of POSIX.1-2008 defers to the ISO C standard.

20423 These functions shall compute the principal value of the arc sine of their argument  $x$ . The value  
 20424 of  $x$  should be in the range  $[-1,1]$ .

20425 An application wishing to check for error situations should set *errno* to zero and call  
 20426 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 20427 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 20428 zero, an error has occurred.

20429 **RETURN VALUE**

20430 Upon successful completion, these functions shall return the arc sine of  $x$ , in the range  
 20431  $[-\pi/2, \pi/2]$  radians.

20432 **MX** For finite values of  $x$  not in the range  $[-1,1]$ , a domain error shall occur, and either a NaN (if  
 20433 supported), or an implementation-defined value shall be returned.

20434 **MX** If  $x$  is NaN, a NaN shall be returned.

20435 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

20436 If  $x$  is  $\pm \text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 20437 defined value shall be returned.

20438 If  $x$  is subnormal, a range error may occur and  $x$  should be returned.

20439 **ERRORS**

20440 These functions shall fail if:

20441 **MX** Domain Error The  $x$  argument is finite and is not in the range  $[-1,1]$ , or is  $\pm \text{Inf}$ .

20442 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 20443 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 20444 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 20445 shall be raised.

20446 These functions may fail if:

20447 **MX** Range Error The value of  $x$  is subnormal.

20448 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 20449 then *errno* shall be set to [ERANGE]. If the integer expression  
 20450 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 20451 floating-point exception shall be raised.

**asin()**20452 **EXAMPLES**

20453 None.

20454 **APPLICATION USAGE**20455 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
20456 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.20457 **RATIONALE**

20458 None.

20465 First released in Issue 1. Derived from Issue 1 of the SVID.

20466 **Issue 5**20467 The DESCRIPTION is updated to indicate how an application should check for an error. This  
20468 text was previously published in the APPLICATION USAGE section.20469 **Issue 6**20470 The *asinf()* and *asinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.20471 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
20472 revised to align with the ISO/IEC 9899:1999 standard.20473 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
20474 marked.

20475 **NAME**

20476 asinh, asinhf, asinhl — inverse hyperbolic sine functions

20477 **SYNOPSIS**

```
20478 #include <math.h>
20479 double asinh(double x);
20480 float asinhf(float x);
20481 long double asinhl(long double x);
```

20482 **DESCRIPTION**

20483 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 20484 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20485 volume of POSIX.1-2008 defers to the ISO C standard.

20486 These functions shall compute the inverse hyperbolic sine of their argument *x*.

20487 An application wishing to check for error situations should set *errno* to zero and call  
 20488 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 20489 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 20490 zero, an error has occurred.

20491 **RETURN VALUE**

20492 Upon successful completion, these functions shall return the inverse hyperbolic sine of their  
 20493 argument.

20494 **MX** If *x* is NaN, a NaN shall be returned.

20495 If *x* is  $\pm 0$ , or  $\pm \text{Inf}$ , *x* shall be returned.

20496 If *x* is subnormal, a range error may occur and *x* should be returned.

20497 **ERRORS**

20498 These functions may fail if:

20499 **MX** **Range Error** The value of *x* is subnormal.

20500 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 20501 then *errno* shall be set to [ERANGE]. If the integer expression  
 20502 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 20503 floating-point exception shall be raised.

20504 **EXAMPLES**

20505 None.

20506 **APPLICATION USAGE**

20507 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 20508 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**assert()**20535 **NAME**20536 `assert` — insert program diagnostics20537 **SYNOPSIS**20538 `#include <assert.h>`20539 `void assert(scalar expression);`20540 **DESCRIPTION**

20541 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 20542 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20543 volume of POSIX.1-2008 defers to the ISO C standard.

20544 The `assert()` macro shall insert diagnostics into programs; it shall expand to a **void** expression.  
 20545 When it is executed, if *expression* (which shall have a **scalar** type) is false (that is, compares equal  
 20546 to 0), `assert()` shall write information about the particular call that failed on `stderr` and shall call  
 20547 `abort()`.

20548 The information written about the call that failed shall include the text of the argument, the  
 20549 name of the source file, the source file line number, and the name of the enclosing function; the  
 20550 latter are, respectively, the values of the preprocessing macros `_FILE_` and `__LINE_` and of  
 20551 the identifier `__func_`.

20552 Forcing a definition of the name `NDEBUG`, either from the compiler command line or with the  
 20553 preprocessor control statement `#define NDEBUG` ahead of the `#include <assert.h>` statement,  
 20554 shall stop assertions from being compiled into the program.

20555 **RETURN VALUE**20556 The `assert()` macro shall not return a value.20557 **ERRORS**

20558 No errors are defined.

20571 First released in Issue 1. Derived from Issue 1 of the SVID.

20572 **Issue 6**20573 The prototype for the *expression* argument to `assert()` is changed from **int** to **scalar** for alignment  
 20574 with the ISO/IEC 9899:1999 standard.20575 The DESCRIPTION of `assert()` is updated for alignment with the ISO/IEC 9899:1999 standard.

20576 **NAME**

20577 atan, atanf, atanl — arc tangent function

20578 **SYNOPSIS**

```
20579 #include <math.h>
20580 double atan(double x);
20581 float atanf(float x);
20582 long double atanl(long double x);
```

20583 **DESCRIPTION**

20584 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 20585 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20586 volume of POSIX.1-2008 defers to the ISO C standard.

20587 These functions shall compute the principal value of the arc tangent of their argument  $x$ .

20588 An application wishing to check for error situations should set *errno* to zero and call  
 20589 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 20590 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 20591 zero, an error has occurred.

20592 **RETURN VALUE**

20593 Upon successful completion, these functions shall return the arc tangent of  $x$  in the range  
 20594  $[-\pi/2, \pi/2]$  radians.

20595 MX If  $x$  is NaN, a NaN shall be returned.

20596 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

20597 If  $x$  is  $\pm\text{Inf}$ ,  $\pm\pi/2$  shall be returned.

20598 If  $x$  is subnormal, a range error may occur and  $x$  should be returned.

20599 **ERRORS**

20600 These functions may fail if:

20601 MX Range Error The value of  $x$  is subnormal.

20602 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 20603 then *errno* shall be set to [ERANGE]. If the integer expression  
 20604 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 20605 floating-point exception shall be raised.

20606 **EXAMPLES**

20607 None.

20608 **APPLICATION USAGE**

20609 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 20610 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

20629 **NAME**

20630 atan2, atan2f, atan2l — arc tangent functions

20631 **SYNOPSIS**

20632 #include &lt;math.h&gt;

20633 double atan2(double y, double x);

20634 float atan2f(float y, float x);

20635 long double atan2l(long double y, long double x);

20636 **DESCRIPTION**20637 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
20638 conflict between the requirements described here and the ISO C standard is unintentional. This  
20639 volume of POSIX.1-2008 defers to the ISO C standard.20640 These functions shall compute the principal value of the arc tangent of  $y/x$ , using the signs of  
20641 both arguments to determine the quadrant of the return value.20642 An application wishing to check for error situations should set *errno* to zero and call  
20643 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
20644 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
20645 zero, an error has occurred.20646 **RETURN VALUE**20647 Upon successful completion, these functions shall return the arc tangent of  $y/x$  in the range  
20648  $[-\pi, \pi]$  radians.20649 If  $y$  is  $\pm 0$  and  $x$  is  $< 0$ ,  $\pm\pi$  shall be returned.20650 If  $y$  is  $\pm 0$  and  $x$  is  $> 0$ ,  $\pm 0$  shall be returned.20651 If  $y$  is  $< 0$  and  $x$  is  $\pm 0$ ,  $-\pi/2$  shall be returned.20652 If  $y$  is  $> 0$  and  $x$  is  $\pm 0$ ,  $\pi/2$  shall be returned.20653 If  $x$  is 0, a pole error shall not occur.20654 **MX** If either  $x$  or  $y$  is NaN, a NaN shall be returned.20655 If the result underflows, a range error may occur and  $y/x$  should be returned.20656 If  $y$  is  $\pm 0$  and  $x$  is  $-0$ ,  $\pm\pi$  shall be returned.20657 If  $y$  is  $\pm 0$  and  $x$  is  $+0$ ,  $\pm 0$  shall be returned.20658 For finite values of  $\pm y > 0$ , if  $x$  is  $-\text{Inf}$ ,  $\pm\pi$  shall be returned.20659 For finite values of  $\pm y > 0$ , if  $x$  is  $+\text{Inf}$ ,  $\pm 0$  shall be returned.20660 For finite values of  $x$ , if  $y$  is  $\pm\text{Inf}$ ,  $\pm\pi/2$  shall be returned.20661 If  $y$  is  $\pm\text{Inf}$  and  $x$  is  $-\text{Inf}$ ,  $\pm 3\pi/4$  shall be returned.20662 If  $y$  is  $\pm\text{Inf}$  and  $x$  is  $+\text{Inf}$ ,  $\pm\pi/4$  shall be returned.

20663 If both arguments are 0, a domain error shall not occur.

20664 **ERRORS**

20665 These functions may fail if:

20666 **MX** **Range Error** The result underflows.20667 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
20668 then *errno* shall be set to [ERANGE]. If the integer expression

**atan2()**

20669 *(math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 20670 floating-point exception shall be raised.

20671 **EXAMPLES**20672 **Converting Cartesian to Polar Coordinates System**

20673 The function below uses *atan2()* to convert a 2d vector expressed in cartesian coordinates  $(x,y)$  to  
 20674 the polar coordinates  $(rho,theta)$ . There are other ways to compute the angle *theta*, using *asin()*  
 20675 *acos()*, or *atan()*. However, *atan2()* presents here two advantages:

- 20676 • The angle's quadrant is automatically determined.
- 20677 • The singular cases  $(0,y)$  are taken into account.

20678 Finally, this example uses *hypot()* rather than *sqrt()* since it is better for special cases; see *hypot()*  
 20679 for more information.

```
20680 #include <math.h>
20681 void
20682 cartesian_to_polar(const double x, const double y,
20683                  double *rho, double *theta)
20684 {
20685     {
20686         *rho = hypot (x,y); /* better than sqrt(x*x+y*y) */
20687         *theta = atan2 (y,x);
20688     }

```

20689 **APPLICATION USAGE**

20690 On error, the expressions *(math\_errhandling* & MATH\_ERRNO) and *(math\_errhandling* &  
 20691 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

20692 **RATIONALE**

20693 None.

20694 **FUTURE DIRECTIONS**

20695 None.

20698 XBD Section 4.19 (on page 116), **<math.h>**

20699 **CHANGE HISTORY**

20700 First released in Issue 1. Derived from Issue 1 of the SVID.

20701 **Issue 5**

20702 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 20703 text was previously published in the APPLICATION USAGE section.

20704 **Issue 6**

20705 The *atan2f()* and *atan2l()* functions are added for alignment with the ISO/IEC 9899:1999  
 20706 standard.

20707 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 20708 revised to align with the ISO/IEC 9899:1999 standard, and the IEC 60559:1989 standard  
 20709 floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

20710  
20711

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/18 is applied, adding to the EXAMPLES section.

**atanf()**20712 **NAME**

20713            atanf — arc tangent function

20714 **SYNOPSIS**

20715            #include &lt;math.h&gt;

20716            float atanf(float x);

20717 **DESCRIPTION**20718            Refer to *atan()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

20719 **NAME**

20720 atanh, atanhf, atanhf — inverse hyperbolic tangent functions

20721 **SYNOPSIS**

```
20722 #include <math.h>
20723 double atanh(double x);
20724 float atanhf(float x);
20725 long double atanhf(long double x);
```

20726 **DESCRIPTION**

20727 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 20728 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20729 volume of POSIX.1-2008 defers to the ISO C standard.

20730 These functions shall compute the inverse hyperbolic tangent of their argument  $x$ .

20731 An application wishing to check for error situations should set *errno* to zero and call  
 20732 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 20733 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 20734 zero, an error has occurred.

20735 **RETURN VALUE**

20736 Upon successful completion, these functions shall return the inverse hyperbolic tangent of their  
 20737 argument.

20738 If  $x$  is  $\pm 1$ , a pole error shall occur, and *atanh*( $x$ ), *atanhf*( $x$ ), and *atanhl*( $x$ ) shall return the value of the  
 20739 macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively, with the same sign as the  
 20740 correct value of the function.

20741 MX For finite  $|x| > 1$ , a domain error shall occur, and either a NaN (if supported), or an  
 20742 implementation-defined value shall be returned.

20743 MX If  $x$  is NaN, a NaN shall be returned.

20744 If  $x$  is  $\pm 0$ ,  $x$  shall be returned.

20745 If  $x$  is  $\pm \text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 20746 defined value shall be returned.

20747 If  $x$  is subnormal, a range error may occur and  $x$  should be returned.

20748 **ERRORS**

20749 These functions shall fail if:

20750 MX **Domain Error** The  $x$  argument is finite and not in the range  $[-1,1]$ , or is  $\pm \text{Inf}$ .

20751 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 20752 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 20753 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 20754 shall be raised.

20755 **Pole Error** The  $x$  argument is  $\pm 1$ .

20756 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 20757 then *errno* shall be set to [ERANGE]. If the integer expression  
 20758 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the divide-by-zero  
 20759 floating-point exception shall be raised.

**atanh()**

20760 These functions may fail if:

20761 MX **Range Error** The value of  $x$  is subnormal.

20762 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 20763 then *errno* shall be set to [ERANGE]. If the integer expression  
 20764 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 20765 floating-point exception shall be raised.

20766 **EXAMPLES**

20767 None.

20768 **APPLICATION USAGE**

20769 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 20770 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

20771 **RATIONALE**

20772 None.

20773 **FUTURE DIRECTIONS**

20774 None.

20795 **DESCRIPTION**20796       Refer to *atan()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**atexit()**20797 **NAME**20798 `atexit` — register a function to run at process termination20799 **SYNOPSIS**

```
20800 #include <stdlib.h>
20801 int atexit(void (*func)(void));
```

20802 **DESCRIPTION**

20803 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 20804 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20805 volume of POSIX.1-2008 defers to the ISO C standard.

20806 The `atexit()` function shall register the function pointed to by `func`, to be called without  
 20807 arguments at normal program termination. At normal program termination, all functions  
 20808 registered by the `atexit()` function shall be called, in the reverse order of their registration, except  
 20809 that a function is called after any previously registered functions that had already been called at  
 20810 the time it was registered. Normal termination occurs either by a call to `exit()` or a return from  
 20811 `main()`.

20812 At least 32 functions can be registered with `atexit()`.

20813 CX After a successful call to any of the `exec` functions, any functions previously registered by `atexit()`  
 20814 shall no longer be registered.

20815 **RETURN VALUE**

20816 Upon successful completion, `atexit()` shall return 0; otherwise, it shall return a non-zero value.

20817 **ERRORS**

20818 No errors are defined.

20819 **EXAMPLES**

20820 None.

20821 **APPLICATION USAGE**

20822 The functions registered by a call to `atexit()` must return to ensure that all registered functions  
 20823 are called.

20824 The application should call `sysconf()` to obtain the value of `{ATEXIT_MAX}`, the number of  
 20825 functions that can be registered. There is no way for an application to tell how many functions  
 20826 have already been registered with `atexit()`.

20827 Since the behavior is undefined if the `exit()` function is called more than once, portable  
 20828 applications calling `atexit()` must ensure that the `exit()` function is not called at normal process  
 20829 termination when all functions registered by the `atexit()` function are called.

20830 All functions registered by the `atexit()` function are called at normal process termination, which  
 20831 occurs by a call to the `exit()` function or a return from `main()` or on the last thread termination,  
 20832 when the behavior is as if the implementation called `exit()` with a zero argument at thread  
 20833 termination time.

20834 If, at normal process termination, a function registered by the `atexit()` function is called and a  
 20835 portable application needs to stop further `exit()` processing, it must call the `_exit()` function or  
 20836 the `_Exit()` function or one of the functions which cause abnormal process termination.

20837 **RATIONALE**

20838 None.

20839 **FUTURE DIRECTIONS**

20840 None.

20841 **SEE ALSO**20842 *exec*, *exit()*, *sysconf()*20843 XBD `<stdlib.h>`20844 **CHANGE HISTORY**

20845 First released in Issue 4. Derived from the ANSI C standard.

20846 **Issue 6**

20847 Extensions beyond the ISO C standard are marked.

20848 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

20849 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/19 is applied, adding further clarification  
20850 to the APPLICATION USAGE section.

**atof()**20851 **NAME**20852            **atof** — convert a string to a double-precision number20853 **SYNOPSIS**

20854            #include &lt;stdlib.h&gt;

20855            double atof(const char \*str);

20856 **DESCRIPTION**

20857 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
 20858 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20859 volume of POSIX.1-2008 defers to the ISO C standard.

20860            The call *atof(str)* shall be equivalent to:

20861            strtod(str, (char \*\*)NULL),

20862 except that the handling of errors may differ. If the value cannot be represented, the behavior is  
 20863 undefined.

20864 **RETURN VALUE**20865            The *atof()* function shall return the converted value if the value can be represented.20866 **ERRORS**

20867            No errors are defined.

20868 **EXAMPLES**

20869            None.

20870 **APPLICATION USAGE**

20871            The *atof()* function is subsumed by *strtod()* but is retained because it is used extensively in  
 20872 existing code. If the number is not known to be in range, *strtod()* should be used because *atof()*  
 20873 is not required to perform any error checking.

20874 **RATIONALE**

20875            None.

20876 **FUTURE DIRECTIONS**

20877            None.

20878 **SEE ALSO**20879            *strtod()*

20880            XBD &lt;stdlib.h&gt;

20881 **CHANGE HISTORY**

20882            First released in Issue 1. Derived from Issue 1 of the SVID.

20883 **NAME**

20884        atoi — convert a string to an integer

20885 **SYNOPSIS**

```
20886        #include <stdlib.h>
20887        int atoi(const char *str);
```

20888 **DESCRIPTION**

20889 **CX**        The functionality described on this reference page is aligned with the ISO C standard. Any  
 20890 conflict between the requirements described here and the ISO C standard is unintentional. This  
 20891 volume of POSIX.1-2008 defers to the ISO C standard.

20892        The call *atoi(str)* shall be equivalent to:

```
20893        (int) strtol(str, (char **)NULL, 10)
```

20894        except that the handling of errors may differ. If the value cannot be represented, the behavior is  
 20895 undefined.

20896 **RETURN VALUE**

20897        The *atoi()* function shall return the converted value if the value can be represented.

20898 **ERRORS**

20899        No errors are defined.

20900 **EXAMPLES**20901        **Converting an Argument**

20902        The following example checks for proper usage of the program. If there is an argument and the  
 20903 decimal conversion of this argument (obtained using *atoi()*) is greater than 0, then the program  
 20904 has a valid number of minutes to wait for an event.

```
20905        #include <stdlib.h>
20906        #include <stdio.h>
20907        ...
20908        int minutes_to_event;
20909        ...
20910        if (argc < 2 || ((minutes_to_event = atoi (argv[1]))) <= 0) {
20911            fprintf(stderr, "Usage: %s minutes\n", argv[0]); exit(1);
20912        }
20913        ...
```

20914 **APPLICATION USAGE**

20915        The *atoi()* function is subsumed by *strtol()* but is retained because it is used extensively in  
 20916 existing code. If the number is not known to be in range, *strtol()* should be used because *atoi()* is  
 20917 not required to perform any error checking.

20918 **RATIONALE**

20919        None.

20920 **FUTURE DIRECTIONS**

20921        None.

20962 **Issue 6**20963 The *atoll()* function is added for alignment with the ISO/IEC 9899:1999 standard.20964 **Issue 7**20965 SD5-XSH-ERN-61 is applied, correcting the DESCRIPTION of *atoll()*.

# basename()

20966 **NAME**

20967 `basename` — return the last component of a pathname

20968 **SYNOPSIS**

```
20969 XSI #include <libgen.h>
20970 char *basename(char *path);
```

20971 **DESCRIPTION**

20972 The `basename()` function shall take the pathname pointed to by `path` and return a pointer to the  
 20973 final component of the pathname, deleting any trailing `'/'` characters.

20974 If the string pointed to by `path` consists entirely of the `'/'` character, `basename()` shall return a  
 20975 pointer to the string `"/"`. If the string pointed to by `path` is exactly `"/"`, it is implementation-  
 20976 defined whether `'/'` or `"/"` is returned.

20977 If `path` is a null pointer or points to an empty string, `basename()` shall return a pointer to the  
 20978 string  `"."`.

20979 The `basename()` function may modify the string pointed to by `path`, and may return a pointer to  
 20980 static storage that may then be overwritten by a subsequent call to `basename()`.

20981 The `basename()` function need not be thread-safe.

20982 **RETURN VALUE**

20983 The `basename()` function shall return a pointer to the final component of `path`.

20984 **ERRORS**

20985 No errors are defined.

20986 **EXAMPLES**

20987 **Using `basename()`**

20988 The following program fragment returns a pointer to the value `lib`, which is the base name of  
 20989 `/usr/lib`.

```
20990 #include <libgen.h>
20991 ...
20992 char *name = "/usr/lib";
20993 char *base;
20994 base = basename(name);
20995 ...
```

20996 **Sample Input and Output Strings for `basename()`**

20997 In the following table, the input string is the value pointed to by `path`, and the output string is  
 20998 the return value of the `basename()` function.

| Input String               | Output String      |
|----------------------------|--------------------|
| <code>"/usr/lib"</code>    | <code>"lib"</code> |
| <code>"/usr/"</code>       | <code>"usr"</code> |
| <code>"/"</code>           | <code>"/"</code>   |
| <code>"/" / "</code>       | <code>"/"</code>   |
| <code>"/usr//lib//"</code> | <code>"lib"</code> |

21005 **APPLICATION USAGE**

21017 **Issue 5**

21018 Moved from X/OPEN UNIX extension to BASE.

21019 Normative text previously in the APPLICATION USAGE section is moved to the  
21020 DESCRIPTION.

21021 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

21022 **Issue 6**

21023 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

21024 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/20 is applied, changing the  
21025 DESCRIPTION to make it clear that the string referenced is the string pointed to by *path*.21026 **Issue 7**

21027 Austin Group Interpretation 1003.1-2001 #156 is applied.

**bind()**21028 **NAME**21029 `bind` — bind a name to a socket21030 **SYNOPSIS**21031 `#include <sys/socket.h>`21032 `int bind(int socket, const struct sockaddr *address,`  
21033 `socklen_t address_len);`21034 **DESCRIPTION**21035 The `bind()` function shall assign a local socket address `address` to a socket identified by descriptor  
21036 `socket` that has no local socket address assigned. Sockets created with the `socket()` function are  
21037 initially unnamed; they are identified only by their address family.21038 The `bind()` function takes the following arguments:21039 `socket` Specifies the file descriptor of the socket to be bound.21040 `address` Points to a **sockaddr** structure containing the address to be bound to the  
21041 socket. The length and format of the address depend on the address family of  
21042 the socket.21043 `address_len` Specifies the length of the **sockaddr** structure pointed to by the `address`  
21044 argument.21045 The socket specified by `socket` may require the process to have appropriate privileges to use the  
21046 `bind()` function.21047 If the socket address cannot be assigned immediately and `O_NONBLOCK` is set for the file  
21048 descriptor for the socket, `bind()` shall fail and set `errno` to `[EINPROGRESS]`, but the assignment  
21049 request shall not be aborted, and the assignment shall be completed asynchronously. Subsequent  
21050 calls to `bind()` for the same socket, before the assignment is completed, shall fail and set `errno` to  
21051 `[EALREADY]`.21052 When the assignment has been performed asynchronously, `pselect()`, `select()`, and `poll()` shall  
21053 indicate that the file descriptor for the socket is ready for reading and writing.21054 **RETURN VALUE**21055 Upon successful completion, `bind()` shall return 0; otherwise, `-1` shall be returned and `errno` set  
21056 to indicate the error.21057 **ERRORS**21058 The `bind()` function shall fail if:21059 `[EADDRINUSE]` The specified address is already in use.21060 `[EADDRNOTAVAIL]`

21061 The specified address is not available from the local machine.

21062 `[EAFNOSUPPORT]`21063 The specified address is not a valid address for the address family of the  
21064 specified socket.21065 `[EALREADY]` An assignment request is already in progress for the specified socket.21066 `[EBADF]` The `socket` argument is not a valid file descriptor.21067 `[EINPROGRESS]` `O_NONBLOCK` is set for the file descriptor for the socket and the assignment  
21068 cannot be immediately performed; the assignment shall be performed  
21069 asynchronously.

|       |                            |                                                                                                                                                                                                                                                                                                                                                                            |
|-------|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 21070 | [EINVAL]                   | The socket is already bound to an address, and the protocol does not support binding to a new address; or the socket has been shut down.                                                                                                                                                                                                                                   |
| 21071 |                            |                                                                                                                                                                                                                                                                                                                                                                            |
| 21072 | [ENOBUFS]                  | Insufficient resources were available to complete the call.                                                                                                                                                                                                                                                                                                                |
| 21073 | [ENOTSOCK]                 | The <i>socket</i> argument does not refer to a socket.                                                                                                                                                                                                                                                                                                                     |
| 21074 | [EOPNOTSUPP]               | The socket type of the specified socket does not support binding to an address.                                                                                                                                                                                                                                                                                            |
| 21075 |                            | If the address family of the socket is AF_UNIX, then <i>bind()</i> shall fail if:                                                                                                                                                                                                                                                                                          |
| 21076 | [EACCES]                   | A component of the path prefix denies search permission, or the requested name requires writing in a directory with a mode that denies write permission.                                                                                                                                                                                                                   |
| 21077 |                            |                                                                                                                                                                                                                                                                                                                                                                            |
| 21078 |                            |                                                                                                                                                                                                                                                                                                                                                                            |
| 21079 | [EDESTADDRREQ] or [EISDIR] |                                                                                                                                                                                                                                                                                                                                                                            |
| 21080 |                            | The <i>address</i> argument is a null pointer.                                                                                                                                                                                                                                                                                                                             |
| 21081 | [EIO]                      | An I/O error occurred.                                                                                                                                                                                                                                                                                                                                                     |
| 21082 | [ELOOP]                    | A loop exists in symbolic links encountered during resolution of the pathname in <i>address</i> .                                                                                                                                                                                                                                                                          |
| 21083 |                            |                                                                                                                                                                                                                                                                                                                                                                            |
| 21084 | [ENAMETOOLONG]             |                                                                                                                                                                                                                                                                                                                                                                            |
| 21085 |                            | The length of a component of a pathname is longer than {NAME_MAX}.                                                                                                                                                                                                                                                                                                         |
| 21086 | [ENOENT]                   | A component of the pathname does not name an existing file or the pathname is an empty string.                                                                                                                                                                                                                                                                             |
| 21087 |                            |                                                                                                                                                                                                                                                                                                                                                                            |
| 21088 | [ENOTDIR]                  | A component of the path prefix of the pathname in <i>address</i> is not a directory, or the pathname in <i>address</i> contains at least one non- <i>&lt;slash&gt;</i> character and ends with one or more trailing <i>&lt;slash&gt;</i> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory. |

**bind()**21105 **EXAMPLES**

21106 The following code segment shows how to create a socket and bind it to a name in the AF\_UNIX  
21107 domain.

```
21108 #define MY_SOCKET_PATH "/somepath"
21109
21109 int sfd;
21110 struct sockaddr_un my_addr;
21111
21111 sfd = socket(AF_UNIX, SOCK_STREAM, 0);
21112 if (sfd == -1)
21113     /* Handle error */;
21114
21114 memset(&my_addr, '\0', sizeof(struct sockaddr_un));
21115     /* Clear structure */
21116 my_addr.sun_family = AF_UNIX;
21117 strncpy(my_addr.sun_path, MY_SOCKET_PATH, sizeof(my_addr.sun_path) - 1);
21118
21118 if (bind(sfd, (struct sockaddr *) &my_addr,
21119         sizeof(struct sockaddr_un)) == -1)
21120     /* Handle error */;
```

21121 **APPLICATION USAGE**

21122 An application program can retrieve the assigned socket name with the *getsockname()* function.

21123 **RATIONALE**

21124 None.

21125 **FUTURE DIRECTIONS**

21126 None.

21127 **SEE ALSO**

21128 *connect()*, *getsockname()*, *listen()*, *socket()*

21129 XBD <sys/socket.h>

21130 **CHANGE HISTORY**

21131 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

21132 **Issue 7**

21133 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOBUFS]  
21134 error to become a “shall fail” error.

21135 Austin Group Interpretation 1003.1-2001 #143 is applied.

21136 SD5-XSH-ERN-185 is applied.

21137 An example is added.

**bsearch()**

```

21182     char *string;
21183     int length;
21184 };
21185 struct node table[TABSIZE];    /* Table to be searched. */
21186     .
21187     .
21188     .
21189 {
21190     struct node *node_ptr, node;
21191     /* Routine to compare 2 nodes. */
21192     int node_compare(const void *, const void *);
21193     .
21194     .
21195     .
21196     while (scanf("%ms", &node.string) != EOF) {
21197         node_ptr = (struct node *)bsearch((void *)(&node),
21198             (void *)table, TABSIZE,
21199             sizeof(struct node), node_compare);
21200         if (node_ptr != NULL) {
21201             (void)printf("string = %20s, length = %d\n",
21202                 node_ptr->string, node_ptr->length);
21203         } else {
21204             (void)printf("not found: %s\n", node.string);
21205         }
21206         free(node.string);
21207     }
21208 }
21209 /*
21210     This routine compares two nodes based on an
21211     alphabetical ordering of the string field.
21212 */
21213 int
21214 node_compare(const void *node1, const void *node2)
21215 {
21216     return strcmp(((const struct node *)node1)->string,
21217         ((const struct node *)node2)->string);
21218 }

```

**APPLICATION USAGE**

The pointers to the key and the element at the base of the table should be of type pointer-to-element.

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

In practice, the array is usually sorted according to the comparison function.

**RATIONALE**

The requirement that the second argument (hereafter referred to as *p*) to the comparison function is a pointer to an element of the array implies that for every call all of the following expressions are non-zero:

```

((char *)p - (char *(base) % width) == 0
(char *)p >= (char *)base

```

21231 (char \*)p < (char \*)base + nel \* width

21232 **FUTURE DIRECTIONS**

21233 None.

21238 First released in Issue 1. Derived from Issue 1 of the SVID.

21239 **Issue 6**

21240 The normative text is updated to avoid use of the term “must” for application requirements.

21241 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/11 is applied, adding to the  
21242 DESCRIPTION the last sentence of the first non-shaded paragraph, and the following three  
21243 paragraphs. The RATIONALE section is also updated. These changes are for alignment with the  
21244 ISO C standard.

21245 **Issue 7**

21246 The EXAMPLES section is revised.

**btowc()**21247 **NAME**21248 `btowc` — single byte to wide character conversion21249 **SYNOPSIS**

```
21250 #include <stdio.h>
21251 #include <wchar.h>
21252 wint_t btowc(int c);
```

21253 **DESCRIPTION**

21254 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 21255 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21256 volume of POSIX.1-2008 defers to the ISO C standard.

21257 The `btowc()` function shall determine whether `c` constitutes a valid (one-byte) character in the  
 21258 initial shift state.

21259 The behavior of this function shall be affected by the `LC_CTYPE` category of the current locale.

21260 **RETURN VALUE**

21261 The `btowc()` function shall return `WEOF` if `c` has the value `EOF` or if (**unsigned char**) `c` does not  
 21262 constitute a valid (one-byte) character in the initial shift state. Otherwise, it shall return the  
 21263 wide-character representation of that character.

21264 **ERRORS**

21265 No errors are defined.

21266 **EXAMPLES**

21267 None.

21268 **APPLICATION USAGE**

21269 None.

21270 **RATIONALE**

21271 None.

21272 **FUTURE DIRECTIONS**

21273 None.

21277 **CHANGE HISTORY**

21278 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
 21279 (E).

21280 **NAME**

21281 cabs, cabsf, cabsl — return a complex absolute value

21282 **SYNOPSIS**

```
21283 #include <complex.h>
21284 double cabs(double complex z);
21285 float cabsf(float complex z);
21286 long double cabsl(long double complex z);
```

21287 **DESCRIPTION**

21288 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 21289 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21290 volume of POSIX.1-2008 defers to the ISO C standard.

21291 These functions shall compute the complex absolute value (also called norm, modulus, or  
 21292 magnitude) of *z*.

21293 **RETURN VALUE**

21294 These functions shall return the complex absolute value.

21295 **ERRORS**

21296 No errors are defined.

21297 **EXAMPLES**

21298 None.

21299 **APPLICATION USAGE**

21300 None.

21340 **NAME**

21341 cacosh, cacoshf, cacoshl — complex arc hyperbolic cosine functions

21342 **SYNOPSIS**

```
21343 #include <complex.h>
21344 double complex cacosh(double complex z);
21345 float complex cacoshf(float complex z);
21346 long double complex cacoshl(long double complex z);
```

21347 **DESCRIPTION**

21348 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 21349 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21350 volume of POSIX.1-2008 defers to the ISO C standard.

21351 These functions shall compute the complex arc hyperbolic cosine of  $z$ , with a branch cut at  
 21352 values less than 1 along the real axis.

21353 **RETURN VALUE**

21354 These functions shall return the complex arc hyperbolic cosine value, in the range of a half-strip  
 21355 of non-negative values along the real axis and in the interval  $[-i\pi, +i\pi]$  along the imaginary axis.

21356 **ERRORS**

21357 No errors are defined.

21358 **EXAMPLES**

21359 None.

**cacosl()***System Interfaces*21371 **NAME**

21372           cacosl — complex arc cosine functions

21373 **SYNOPSIS**

21374           #include &lt;complex.h&gt;

21375           long double complex cacosl(long double complex z);

21376 **DESCRIPTION**21377           Refer to *cacos()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

21378 **NAME**

21379        calloc — a memory allocator

21380 **SYNOPSIS**

21381        #include &lt;stdlib.h&gt;

21382        void \*calloc(size\_t *nelem*, size\_t *elsize*);21383 **DESCRIPTION**21384 CX        The functionality described on this reference page is aligned with the ISO C standard. Any  
21385 conflict between the requirements described here and the ISO C standard is unintentional. This  
21386 volume of POSIX.1-2008 defers to the ISO C standard.21387        The *calloc()* function shall allocate unused space for an array of *nelem* elements each of whose  
21388 size in bytes is *elsize*. The space shall be initialized to all bits 0.21389        The order and contiguity of storage allocated by successive calls to *calloc()* is unspecified. The  
21390 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to  
21391 a pointer to any type of object and then used to access such an object or an array of such objects  
21392 in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall  
21393 yield a pointer to an object disjoint from any other object. The pointer returned shall point to the  
21394 start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer  
21395 shall be returned. If the size of the space requested is 0, the behavior is implementation-defined:  
21396 the value returned shall be either a null pointer or a unique pointer.21397 **RETURN VALUE**21398        Upon successful completion with both *nelem* and *elsize* non-zero, *calloc()* shall return a pointer to  
21399 the allocated space. If either *nelem* or *elsize* is 0, then either a null pointer or a unique pointer  
21400 value that can be successfully passed to *free()* shall be returned. Otherwise, it shall return a null  
21401 CX        pointer and set *errno* to indicate the error.21402 **ERRORS**21403        The *calloc()* function shall fail if:

21404 CX        [ENOMEM]        Insufficient memory is available.

21405 **EXAMPLES**

21406        None.

21407 **APPLICATION USAGE**

21408        There is now no requirement for the implementation to support the inclusion of &lt;malloc.h&gt;.

21409 **RATIONALE**

21410        None.

21411 **FUTURE DIRECTIONS**

21412        None.

21413 **SEE ALSO**21414        *free()*, *malloc()*, *realloc()*

21415        XBD &lt;stdlib.h&gt;

21416 **CHANGE HISTORY**

21417        First released in Issue 1. Derived from Issue 1 of the SVID.

21418 **Issue 6**

21419        Extensions beyond the ISO C standard are marked.

**calloc()**

- 21420 The following new requirements on POSIX implementations derive from alignment with the  
21421 Single UNIX Specification:
- 21422     • The setting of *errno* and the [ENOMEM] error condition are mandatory if an insufficient  
21423 memory condition occurs.

*System Interfaces***catanl()**21588 **NAME**

21589         catanl — complex arc tangent functions

21590 **SYNOPSIS**

21591         #include &lt;complex.h&gt;

21592         long double complex catanl(long double complex z);

21593 **DESCRIPTION**21594         Refer to *catan()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**catclose()**21595 **NAME**21596 `catclose` — close a message catalog descriptor21597 **SYNOPSIS**21598 `#include <nl_types.h>`21599 `int catclose(nl_catd catd);`21600 **DESCRIPTION**21601 The `catclose()` function shall close the message catalog identified by `catd`. If a file descriptor is  
21602 used to implement the type `nl_catd`, that file descriptor shall be closed.21603 **RETURN VALUE**21604 Upon successful completion, `catclose()` shall return 0; otherwise, `-1` shall be returned, and `errno`  
21605 set to indicate the error.21606 **ERRORS**21607 The `catclose()` function may fail if:

21608 [EBADF] The catalog descriptor is not valid.

21609 [EINTR] The `catclose()` function was interrupted by a signal.21610 **EXAMPLES**

21611 None.

21612 **APPLICATION USAGE**

21613 None.

21614 **RATIONALE**

21615 None.

21616 **FUTURE DIRECTIONS**

21617 None.

21618 **SEE ALSO**21619 `catgets()`, `catopen()`21620 XBD `<nl_types.h>`21621 **CHANGE HISTORY**

21622 First released in Issue 2.

21623 **Issue 7**21624 The `catclose()` function is moved from the XSI option to the Base.

21625 **NAME**21626 `catgets` — read a program message21627 **SYNOPSIS**21628 `#include <nl_types.h>`21629 `char *catgets(nl_catd catd, int set_id, int msg_id, const char *s);`21630 **DESCRIPTION**

21631 The `catgets()` function shall attempt to read message `msg_id`, in set `set_id`, from the message  
 21632 catalog identified by `catd`. The `catd` argument is a message catalog descriptor returned from an  
 21633 earlier call to `catopen()`. The results are undefined if `catd` is not a value returned by `catopen()` for  
 21634 a message catalog still open in the process. The `s` argument points to a default message string  
 21635 which shall be returned by `catgets()` if it cannot retrieve the identified message.

21636 The `catgets()` function need not be thread-safe.21637 **RETURN VALUE**

21638 If the identified message is retrieved successfully, `catgets()` shall return a pointer to an internal  
 21639 buffer area containing the null-terminated message string. If the call is unsuccessful for any  
 21640 reason, `s` shall be returned and `errno` shall be set to indicate the error.

21641 **ERRORS**21642 The `catgets()` function shall fail if:

21643 [EINTR] The read operation was terminated due to the receipt of a signal, and no data  
 21644 was transferred.

21645 [ENOMSG] The message identified by `set_id` and `msg_id` is not in the message catalog.

21646 The `catgets()` function may fail if:

21647 [EBADF] The `catd` argument is not a valid message catalog descriptor open for reading.

21648 [EBADMSG] The message identified by `set_id` and `msg_id` in the specified message catalog  
 21649 did not satisfy implementation-defined security criteria.

21650 [EINVAL] The message catalog identified by `catd` is corrupted.

21651 **EXAMPLES**

21652 None.

21653 **APPLICATION USAGE**

21654 None.

21655 **RATIONALE**

21656 None.

21657 **FUTURE DIRECTIONS**

21658 None.

21659 **SEE ALSO**21660 `catclose()`, `catopen()`21661 XBD `<nl_types.h>`21662 **CHANGE HISTORY**

21663 First released in Issue 2.

**catgets()**21664 **Issue 5**

21665 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

21666 **Issue 6**

21667 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

21668 **Issue 7**

21669 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [EINTR] and  
21670 [ENOMSG] errors to become “shall fail” errors, updating the RETURN VALUE section, and  
21671 updating the DESCRIPTION to note that: “The results are undefined if *catd* is not a value  
21672 returned by *catopen()* for a message catalog still open in the process.

21673 Austin Group Interpretation 1003.1-2001 #148 is applied, adding

21674 The *catgets()* function is moved from the XSI option to the Base.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

21675 **NAME**21676 `catopen` — open a message catalog21677 **SYNOPSIS**21678 `#include <nl_types.h>`21679 `nl_catd catopen(const char *name, int oflag);`21680 **DESCRIPTION**

21681 The `catopen()` function shall open a message catalog and return a message catalog descriptor.  
 21682 The `name` argument specifies the name of the message catalog to be opened. If `name` contains a  
 21683 `'/'`, then `name` specifies a complete name for the message catalog. Otherwise, the environment  
 21684 variable `NLSPATH` is used with `name` substituted for the `%N` conversion specification (see XBD  
 21685 Chapter 8, on page 173). If `NLSPATH` exists in the environment when the process starts, then if  
 21686 the process has appropriate privileges, the behavior of `catopen()` is undefined. If `NLSPATH` does  
 21687 not exist in the environment, or if a message catalog cannot be found in any of the components  
 21688 specified by `NLSPATH`, then an implementation-defined default path shall be used. This default  
 21689 may be affected by the setting of `LC_MESSAGES` if the value of `oflag` is `NL_CAT_LOCALE`, or  
 21690 the `LANG` environment variable if `oflag` is 0.

21691 A message catalog descriptor shall remain valid in a process until that process closes it, or a  
 21692 successful call to one of the `exec` functions. A change in the setting of the `LC_MESSAGES`  
 21693 category may invalidate existing open catalogs.

21694 If a file descriptor is used to implement message catalog descriptors, the `FD_CLOEXEC` flag  
 21695 shall be set; see `<fcntl.h>`.

21696 If the value of the `oflag` argument is 0, the `LANG` environment variable is used to locate the  
 21697 catalog without regard to the `LC_MESSAGES` category. If the `oflag` argument is  
 21698 `NL_CAT_LOCALE`, the `LC_MESSAGES` category is used to locate the message catalog (see XBD  
 21699 Section 8.2, on page 174).

21700 **RETURN VALUE**

21701 Upon successful completion, `catopen()` shall return a message catalog descriptor for use on  
 21702 subsequent calls to `catgets()` and `catclose()`. Otherwise, `catopen()` shall return `(nl_catd) -1` and set  
 21703 `errno` to indicate the error.

21704 **ERRORS**21705 The `catopen()` function may fail if:

21706 [EACCES] Search permission is denied for the component of the path prefix of the  
 21707 message catalog or read permission is denied for the message catalog.

21708 [EMFILE] All file descriptors available to the process are currently open.

21709 [ENAMETOOLONG]

21710 The length of a component of a pathname is longer than `{NAME_MAX}`.

21711 [ENAMETOOLONG]

21712 The length of a pathname exceeds `{PATH_MAX}`, or pathname resolution of a  
 21713 symbolic link produced an intermediate result with a length that exceeds  
 21714 `{PATH_MAX}`.

21715 [ENFILE] Too many files are currently open in the system.

21716 [ENOENT] The message catalog does not exist or the `name` argument points to an empty  
 21717 string.

**catopen()**

| 21721 |                          |                                                                                                                                                                                                                                                                                                                                                                                  |
| 21722 |                          |                                                                                                                                                                                                                                                                                                                                                                                  |
| 21723 |                          |                                                                                                                                                                                                                                                                                                                                                                                  |
| 21724 | <b>EXAMPLES</b>          |                                                                                                                                                                                                                                                                                                                                                                                  |
| 21725 | None.                    |                                                                                                                                                                                                                                                                                                                                                                                  |
| 21726 | <b>APPLICATION USAGE</b> |                                                                                                                                                                                                                                                                                                                                                                                  |
| 21727 |                          | Some implementations of <i>catopen()</i> use <i>malloc()</i> to allocate space for internal buffer areas. The <i>catopen()</i> function may fail if there is insufficient storage space available to accommodate these buffers.                                                                                                                                                  |
| 21728 |                          |                                                                                                                                                                                                                                                                                                                                                                                  |
| 21729 |                          |                                                                                                                                                                                                                                                                                                                                                                                  |
| 21730 |                          |                                                                                                                                                                                                                                                                                                                                                                                  |
| 21731 |                          | Conforming applications must assume that message catalog descriptors are not valid after a call to one of the <i>exec</i> functions.                                                                                                                                                                                                                                             |
| 21732 |                          | Application developers should be aware that guidelines for the location of message catalogs have not yet been developed. Therefore they should take care to avoid conflicting with catalogs used by other applications and the standard utilities.                                                                                                                               |
| 21733 |                          |                                                                                                                                                                                                                                                                                                                                                                                  |
| 21734 |                          |                                                                                                                                                                                                                                                                                                                                                                                  |
| 21735 |                          |                                                                                                                                                                                                                                                                                                                                                                                  |

21748 **NAME**

21749 cbrt, cbrtf, cbrtl — cube root functions

21750 **SYNOPSIS**

```
21751 #include <math.h>
21752 double cbrt(double x);
21753 float cbrtf(float x);
21754 long double cbrtl(long double x);
```

21755 **DESCRIPTION**

21756 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 21757 conflict between the requirements described here and the ISO C standard is unintentional. This  
 21758 volume of POSIX.1-2008 defers to the ISO C standard.

21759 These functions shall compute the real cube root of their argument  $x$ .21760 **RETURN VALUE**21761 Upon successful completion, these functions shall return the cube root of  $x$ .21762 MX If  $x$  is NaN, a NaN shall be returned.21763 If  $x$  is  $\pm 0$  or  $\pm \text{Inf}$ ,  $x$  shall be returned.21764 **ERRORS**

21765 No errors are defined.

21766 **EXAMPLES**

21767 None.

21768 **APPLICATION USAGE**

21769 None.

21770 **RATIONALE**

21771 For some applications, a true cube root function, which returns negative results for negative  
 21772 arguments, is more appropriate than  $\text{pow}(x, 1.0/3.0)$ , which returns a NaN for  $x$  less than 0.

21773 **FUTURE DIRECTIONS**

21774 None.

21775 **SEE ALSO**21776 XBD [<math.h>](#)21777 **CHANGE HISTORY**

21778 First released in Issue 4, Version 2.

21779 **Issue 5**

21780 Moved from X/OPEN UNIX extension to BASE.

21781 **Issue 6**21782 The `cbrt()` function is no longer marked as an extension.21783 The `cbrtf()` and `cbrtl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

21784 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 21785 revised to align with the ISO/IEC 9899:1999 standard.

21786 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 21787 marked.

**ccos()**21788 **NAME**21789 `ccos, ccosf, ccosl` — complex cosine functions21790 **SYNOPSIS**21791 `#include <complex.h>`21792 `double complex ccos(double complex z);`21793 `float complex ccosf(float complex z);`21794 `long double complex ccosl(long double complex z);`21795 **DESCRIPTION**21796 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
21797 conflict between the requirements described here and the ISO C standard is unintentional. This  
21798 volume of POSIX.1-2008 defers to the ISO C standard.21799 These functions shall compute the complex cosine of *z*.21800 **RETURN VALUE**

21801 These functions shall return the complex cosine value.

21802 **ERRORS**

21803 No errors are defined.

21804 **EXAMPLES**

21805 None.

21806 **APPLICATION USAGE**

21807 None.

21808 **RATIONALE**

21809 None.

**ccosl()***System Interfaces*21846 **NAME**

21847           ccosl — complex cosine functions

21848 **SYNOPSIS**

21849           #include &lt;complex.h&gt;

21850           long double complex ccosl(long double complex z);

21851 **DESCRIPTION**21852           Refer to *ccos()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

21853 **NAME**

21854           ceil, ceilf, ceill — ceiling value function

21855 **SYNOPSIS**

```
21856       #include <math.h>
21857       double ceil(double x);
21858       float ceilf(float x);
21859       long double ceill(long double x);
```

21860 **DESCRIPTION**

21861 CX       The functionality described on this reference page is aligned with the ISO C standard. Any  
21862 conflict between the requirements described here and the ISO C standard is unintentional. This  
21863 volume of POSIX.1-2008 defers to the ISO C standard.

21864       These functions shall compute the smallest integral value not less than *x*.

21865       An application wishing to check for error situations should set *errno* to zero and call  
21866 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
21867 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
21868 zero, an error has occurred.

21869 **RETURN VALUE**

21870       Upon successful completion, *ceil()*, *ceilf()*, and *ceill()* shall return the smallest integral value not  
21871 less than *x*, expressed as a type **double**, **float**, or **long double**, respectively.

21872 MX       If *x* is NaN, a NaN shall be returned.

21873       If *x* is  $\pm 0$  or  $\pm \text{Inf}$ , *x* shall be returned.

21874 XSI       If the correct value would cause overflow, a range error shall occur and *ceil()*, *ceilf()*, and *ceill()*  
21875 shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively.

21876 **ERRORS**

21877       These functions shall fail if:

21878 XSI       Range Error       The result overflows.

21879       If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
21880 then *errno* shall be set to [ERANGE]. If the integer expression  
21881 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
21882 floating-point exception shall be raised.

21883 **EXAMPLES**

21884       None.

21885 **APPLICATION USAGE**

21886       The integral value returned by these functions need not be expressible as an **int** or **long**. The  
21887 return value should be tested before assigning it to an integer type to avoid the undefined  
21888 results of an integer overflow.

21889       The *ceil()* function can only overflow when the floating-point representation has  
21890 DBL\_MANT\_DIG > DBL\_MAX\_EXP.

21891       On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
21892 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**ceil()**21893 **RATIONALE**

21894 None.

21895 **FUTURE DIRECTIONS**

21896 None.

21897 **SEE ALSO**21898 *feclearexcept()*, *fetestexcept()*, *floor()*, *isnan()*21899 XBD Section 4.19 (on page 116), **<math.h>**21900 **CHANGE HISTORY**

21901 First released in Issue 1. Derived from Issue 1 of the SVID.

21902 **Issue 5**21903 The DESCRIPTION is updated to indicate how an application should check for an error. This  
21904 text was previously published in the APPLICATION USAGE section.21905 **Issue 6**21906 The *ceilf()* and *ceilll()* functions are added for alignment with the ISO/IEC 9899:1999 standard.21907 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
21908 revised to align with the ISO/IEC 9899:1999 standard.21909 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
21910 marked.

21911 **NAME**

21912 cexp, cexpf, cexpl — complex exponential functions

21913 **SYNOPSIS**

21914 #include &lt;complex.h&gt;

21915 double complex cexp(double complex z);

21916 float complex cexpf(float complex z);

21917 long double complex cexpl(long double complex z);

21918 **DESCRIPTION**21919 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
21920 conflict between the requirements described here and the ISO C standard is unintentional. This  
21921 volume of POSIX.1-2008 defers to the ISO C standard.21922 These functions shall compute the complex exponent of  $z$ , defined as  $e^z$ .21923 **RETURN VALUE**21924 These functions shall return the complex exponential value of  $z$ .21925 **ERRORS**

21926 No errors are defined.

21927 **EXAMPLES**

21928 None.

21929 **APPLICATION USAGE**

21930 None.

21931 **RATIONALE**

21932 None.

21933 **FUTURE DIRECTIONS**

21934 None.

21935 **SEE ALSO**21936 [clog\(\)](#)21937 XBD [<complex.h>](#)21938 **CHANGE HISTORY**

21939 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**cfgetispeed()**21940 **NAME**21941 `cfgetispeed` — get input baud rate21942 **SYNOPSIS**21943 `#include <termios.h>`21944 `speed_t cfgetispeed(const struct termios *termios_p);`21945 **DESCRIPTION**21946 The `cfgetispeed()` function shall extract the input baud rate from the **termios** structure to which  
21947 the `termios_p` argument points.21948 This function shall return exactly the value in the **termios** data structure, without interpretation.21949 **RETURN VALUE**21950 Upon successful completion, `cfgetispeed()` shall return a value of type **speed\_t** representing the  
21951 input baud rate.21952 **ERRORS**

21953 No errors are defined.

21954 **EXAMPLES**

21955 None.

21956 **APPLICATION USAGE**

21957 None.

21958 **RATIONALE**21959 The term “baud” is used historically here, but is not technically correct. This is properly “bits per  
21960 second”, which may not be the same as baud. However, the term is used because of the  
21961 historical usage and understanding.21962 The `cfgetispeed()`, `cfgetispeed()`, `cfsetispeed()`, and `cfsetispeed()` functions do not take arguments as  
21963 numbers, but rather as symbolic names. There are two reasons for this:

- 21964 1. Historically, numbers were not used because of the way the rate was stored in the data  
21965 structure. This is retained even though a function is now used.
- 21966 2. More importantly, only a limited set of possible rates is at all portable, and this constrains  
21967 the application to that set.

21968 There is nothing to prevent an implementation accepting as an extension a number (such as 126),  
21969 and since the encoding of the Bxxx symbols is not specified, this can be done to avoid  
21970 introducing ambiguity.21971 Setting the input baud rate to zero was a mechanism to allow for split baud rates. Clarifications  
21972 in this volume of POSIX.1-2008 have made it possible to determine whether split rates are  
21973 supported and to support them without having to treat zero as a special case. Since this  
21974 functionality is also confusing, it has been declared obsolescent. The 0 argument referred to is  
21975 the literal constant 0, not the symbolic constant B0. This volume of POSIX.1-2008 does not  
21976 preclude B0 from being defined as the value 0; in fact, implementations would likely benefit  
21977 from the two being equivalent. This volume of POSIX.1-2008 does not fully specify whether the  
21978 previous `cfsetispeed()` value is retained after a `tcgetattr()` as the actual value or as zero. Therefore,  
21979 conforming applications should always set both the input speed and output speed when setting  
21980 either.21981 In historical implementations, the baud rate information is traditionally kept in **c\_cflag**.  
21982 Applications should be written to presume that this might be the case (and thus not blindly copy  
21983 **c\_cflag**), but not to rely on it in case it is in some other field of the structure. Setting the **c\_cflag**  
21984 field absolutely after setting a baud rate is a non-portable action because of this. In general, the

21985 unused parts of the flag fields might be used by the implementation and should not be blindly  
21986 copied from the descriptions of one terminal device to another.

21987 **FUTURE DIRECTIONS**

21988 None.

22089 **CHANGE HISTORY**

22090 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

22091 **Issue 6**22092 The following new requirements on POSIX implementations derive from alignment with the  
22093 Single UNIX Specification:

- 22094
- The optional setting of *errno* and the [EINVAL] error conditions are added.

22095 **NAME**

22096 chdir — change working directory

22097 **SYNOPSIS**

```
22098 #include <unistd.h>
22099 int chdir(const char *path);
```

22100 **DESCRIPTION**

22101 The *chdir()* function shall cause the directory named by the pathname pointed to by the *path*  
 22102 argument to become the current working directory; that is, the starting point for path searches  
 22103 for pathnames not beginning with *'/'*.

22104 **RETURN VALUE**

22105 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned, the current  
 22106 working directory shall remain unchanged, and *errno* shall be set to indicate the error.

22107 **ERRORS**

22108 The *chdir()* function shall fail if:

- 22109 [EACCES] Search permission is denied for any component of the pathname.
- 22110 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 22111 argument.
- 22112 [ENAMETOOLONG]  
 22113 The length of a component of a pathname is longer than {NAME\_MAX}.
- 22114 [ENOENT] A component of *path* does not name an existing directory or *path* is an empty  
 22115 string.
- 22116 [ENOTDIR] A component of the pathname is not a directory.

22117 The *chdir()* function may fail if:

- 22118 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 22119 resolution of the *path* argument.
- 22120 [ENAMETOOLONG]  
 22121 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 22122 symbolic link produced an intermediate result with a length that exceeds  
 22123 {PATH\_MAX}.

22124 **EXAMPLES**22125 **Changing the Current Working Directory**

22126 The following example makes the value pointed to by **directory**, */tmp*, the current working  
 22127 directory.

```
22128 #include <unistd.h>
22129 ...
22130 char *directory = "/tmp";
22131 int ret;
22132 ret = chdir (directory);
```

**chdir()**22133 **APPLICATION USAGE**

22134 None.

22135 **RATIONALE**22136 The *chdir()* function only affects the working directory of the current process.22137 **FUTURE DIRECTIONS**

22138 None.

22139 **SEE ALSO**22140 *getcwd()*22141 XBD <*unistd.h*>22142 **CHANGE HISTORY**

22143 First released in Issue 1. Derived from Issue 1 of the SVID.

22144 **Issue 6**

22145 The APPLICATION USAGE section is added.

22146 The following new requirements on POSIX implementations derive from alignment with the  
22147 Single UNIX Specification:

- 22148 • The [ELOOP] mandatory error condition is added.
- 22149 • A second [ENAMETOOLONG] is added as an optional error condition.

22150 The following changes were made to align with the IEEE P1003.1a draft standard:

- 22151 • The [ELOOP] optional error condition is added.

22152 **Issue 7**

22153 Austin Group Interpretation 1003.1-2001 #143 is applied.

22154 **NAME**

22155 chmod, fchmodat — change mode of a file relative to directory file descriptor

22156 **SYNOPSIS**

22157 #include &lt;sys/stat.h&gt;

22158 int chmod(const char \*path, mode\_t mode);

22159 int fchmodat(int fd, const char \*path, mode\_t mode, int flag);

22160 **DESCRIPTION**

22161 XSI The *chmod()* function shall change S\_ISUID, S\_ISGID, S\_ISVTX, and the file permission bits of  
 22162 the file named by the pathname pointed to by the *path* argument to the corresponding bits in the  
 22163 *mode* argument. The application shall ensure that the effective user ID of the process matches the  
 22164 owner of the file or the process has appropriate privileges in order to do this.

22165 XSI S\_ISUID, S\_ISGID, S\_ISVTX, and the file permission bits are described in <sys/stat.h>.

22166 If the calling process does not have appropriate privileges, and if the group ID of the file does  
 22167 not match the effective group ID or one of the supplementary group IDs and if the file is a  
 22168 regular file, bit S\_ISGID (set-group-ID on execution) in the file's mode shall be cleared upon  
 22169 successful return from *chmod()*.

22170 Additional implementation-defined restrictions may cause the S\_ISUID and S\_ISGID bits in  
 22171 *mode* to be ignored.

22172 The effect on file descriptors for files open at the time of a call to *chmod()* is implementation-  
 22173 defined.

22174 Upon successful completion, *chmod()* shall mark for update the last file status change timestamp  
 22175 of the file.

22176 The *fchmodat()* function shall be equivalent to the *chmod()* function except in the case where *path*  
 22177 specifies a relative path. In this case the file to be changed is determined relative to the directory  
 22178 associated with the file descriptor *fd* instead of the current working directory. If the file  
 22179 descriptor was opened without O\_SEARCH, the function shall check whether directory searches  
 22180 are permitted using the current permissions of the directory underlying the file descriptor. If the  
 22181 file descriptor was opened with O\_SEARCH, the function shall not perform the check.

22182 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
 22183 in <fcntl.h>:

22184 AT\_SYMLINK\_NOFOLLOW

22185 If *path* names a symbolic link, then the mode of the symbolic link is changed.

22186 If *fchmodat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
 22187 directory is used. If also *flag* is zero, the behavior shall be identical to a call to *chmod()*.

22188 **RETURN VALUE**

22189 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
 22190 return -1 and set *errno* to indicate the error. If -1 is returned, no change to the file mode occurs.

22191 **ERRORS**

22192 These functions shall fail if:

22193 [EACCES] Search permission is denied on a component of the path prefix.

22194 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 22195 argument.

**chmod()**

|       |                |                                                                                                    |
|-------|----------------|----------------------------------------------------------------------------------------------------|

| 22197 |                | The length of a component of a pathname is longer than {NAME_MAX}.                                 |
| 22198 | [ENOENT]       | A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.       |
| 22199 | [ENOTDIR]      | A component of the path prefix is not a directory, or the <i>path</i> argument                     |
| 22200 |                | contains at least one non- <code>&lt;slash&gt;</code> character and ends with one or more trailing |
| 22201 |                | <code>&lt;slash&gt;</code> characters and the last pathname component names an existing file       |
| 22202 |                | that is neither a directory nor a symbolic link to a directory.                                    |
| 22203 | [EPERM]        | The effective user ID does not match the owner of the file and the process does                    |
| 22204 |                | not have appropriate privileges.                                                                   |
| 22205 | [EROFS]        | The named file resides on a read-only file system.                                                 |
| 22206 |                | The <i>fchmodat()</i> function shall fail if:                                                      |
| 22207 | [EACCES]       | <i>fd</i> was not opened with O_SEARCH and the permissions of the directory                        |
| 22208 |                | underlying <i>fd</i> do not permit directory searches.                                             |
| 22209 | [EBADF]        | The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is           |
| 22210 |                | neither AT_FDCWD nor a valid file descriptor open for reading or searching.                        |
| 22211 |                | These functions may fail if:                                                                       |
| 22212 | [EINTR]        | A signal was caught during execution of the function.                                              |
| 22213 | [EINVAL]       | The value of the <i>mode</i> argument is invalid.                                                  |
| 22214 | [ELOOP]        | More than {SYMLOOP_MAX} symbolic links were encountered during                                     |
| 22215 |                | resolution of the <i>path</i> argument.                                                            |
| 22216 | [ENAMETOOLONG] |                                                                                                    |
| 22217 |                | The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a                           |
| 22218 |                | symbolic link produced an intermediate result with a length that exceeds                           |
| 22219 |                | {PATH_MAX}.                                                                                        |
| 22220 |                | The <i>fchmodat()</i> function may fail if:                                                        |
| 22221 | [EINVAL]       | The value of the <i>flag</i> argument is invalid.                                                  |
| 22222 | [ENOTDIR]      | The <i>path</i> argument is not an absolute path and <i>fd</i> is neither AT_FDCWD nor a           |
| 22223 |                | file descriptor associated with a directory.                                                       |
| 22224 | [EOPNOTSUPP]   | The AT_SYMLINK_NOFOLLOW bit is set in the <i>flag</i> argument, <i>path</i> names a                |
| 22225 |                | symbolic link, and the system does not support changing the mode of a                              |
| 22226 |                | symbolic link.                                                                                     |

22227 **EXAMPLES**22228 **Setting Read Permissions for User, Group, and Others**

22229 The following example sets read permissions for the owner, group, and others.

```

22230 #include <sys/stat.h>
22231 const char *path;
22232 ...
22233 chmod(path, S_IRUSR|S_IRGRP|S_IROTH);

```

### 22234 **Setting Read, Write, and Execute Permissions for the Owner Only**

22235 The following example sets read, write, and execute permissions for the owner, and no  
22236 permissions for group and others.

```
22237 #include <sys/stat.h>
22238 const char *path;
22239 ...
22240 chmod(path, S_IRWXU);
```

### 22241 **Setting Different Permissions for Owner, Group, and Other**

22242 The following example sets owner permissions for CHANGEFILE to read, write, and execute,  
22243 group permissions to read and execute, and other permissions to read.

```
22244 #include <sys/stat.h>
22245 #define CHANGEFILE "/etc/myfile"
22246 ...
22247 chmod(CHANGEFILE, S_IRWXU|S_IRGRP|S_IXGRP|S_IROTH);
```

### 22248 **Setting and Checking File Permissions**

22249 The following example sets the file permission bits for a file named `/home/cnd/mod1`, then calls  
22250 the `stat()` function to verify the permissions.

```
22251 #include <sys/types.h>
22252 #include <sys/stat.h>
22253 int status;
22254 struct stat buffer
22255 ...
22256 chmod("home/cnd/mod1", S_IRWXU|S_IRWXG|S_IROTH|S_IWOTH);
22257 status = stat("home/cnd/mod1", &buffer);
```

### 22258 **APPLICATION USAGE**

22259 In order to ensure that the `S_ISUID` and `S_ISGID` bits are set, an application requiring this  
22260 should use `stat()` after a successful `chmod()` to verify this.

22261 Any file descriptors currently open by any process on the file could possibly become invalid if  
22262 the mode of the file is changed to a value which would deny access to that process. One  
22263 situation where this could occur is on a stateless file system. This behavior will not occur in a  
22264 conforming environment.

### 22265 **RATIONALE**

22266 This volume of POSIX.1-2008 specifies that the `S_ISGID` bit is cleared by `chmod()` on a regular file  
22267 under certain conditions. This is specified on the assumption that regular files may be executed,  
22268 and the system should prevent users from making executable `setgid()` files perform with  
22269 privileges that the caller does not have. On implementations that support execution of other file  
22270 types, the `S_ISGID` bit should be cleared for those file types under the same circumstances.

22271 Implementations that use the `S_ISUID` bit to indicate some other function (for example,  
22272 mandatory record locking) on non-executable files need not clear this bit on writing. They  
22273 should clear the bit for executable files and any other cases where the bit grants special powers  
22274 to processes that change the file contents. Similar comments apply to the `S_ISGID` bit.

22275 The purpose of the `fchmodat()` function is to enable changing the mode of files in directories

**chmod()**

22276 other than the current working directory without exposure to race conditions. Any part of the  
 22277 path of a file could be changed in parallel to a call to *chmod()*, resulting in unspecified behavior.  
 22278 By opening a file descriptor for the target directory and using the *fchmodat()* function it can be  
 22279 guaranteed that the changed file is located relative to the desired directory. Some  
 22280 implementations might allow changing the mode of symbolic links. This is not supported by the  
 22281 interfaces in the POSIX specification. Systems with such support provide an interface named  
 22282 *lchmod()*. To support such implementations *fchmodat()* has a *flag* parameter.

22283 **FUTURE DIRECTIONS**

22284 None.

22285 **SEE ALSO**22286 *access()*, *chown()*, *exec*, *fstatat()*, *fstatvfs()*, *mkdir()*, *mkfifo()*, *mknod()*, *open()*22287 XBD [<fcntl.h>](#), [<sys/stat.h>](#), [<sys/types.h>](#)22288 **CHANGE HISTORY**

22289 First released in Issue 1. Derived from Issue 1 of the SVID.

22290 **Issue 6**22291 The following new requirements on POSIX implementations derive from alignment with the  
 22292 Single UNIX Specification:

- 22293 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
 22294 required for conforming implementations of previous POSIX specifications, it was not  
 22295 required for UNIX applications.
- 22296 • The [EINVAL] and [EINTR] optional error conditions are added.
- 22297 • A second [ENAMETOOLONG] is added as an optional error condition.

22298 The following changes were made to align with the IEEE P1003.1a draft standard:

- 22299 • The [ELOOP] optional error condition is added.

22300 The normative text is updated to avoid use of the term “must” for application requirements.

22301 **Issue 7**

22302 Austin Group Interpretation 1003.1-2001 #143 is applied.

22303 The *fchmodat()* function is added from The Open Group Technical Standard, 2006, Extended API  
 22304 Set Part 2.

22305 Changes are made related to support for finegrained timestamps.

22306 Changes are made to allow a directory to be opened for searching.

22307 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
 22308 pathname exists but is not a directory or a symbolic link to a directory.

22309 **NAME**

22310 chown, fchownat — change owner and group of a file relative to directory file descriptor

22311 **SYNOPSIS**

```
22312 #include <unistd.h>
22313
22313 int chown(const char *path, uid_t owner, gid_t group);
22314 int fchownat(int fd, const char *path, uid_t owner, gid_t group,
22315             int flag);
```

22316 **DESCRIPTION**

22317 The *chown()* function shall change the user and group ownership of a file.

22318 The *path* argument points to a pathname naming a file. The user ID and group ID of the named  
22319 file shall be set to the numeric values contained in *owner* and *group*, respectively.

22320 Only processes with an effective user ID equal to the user ID of the file or with appropriate  
22321 privileges may change the ownership of a file. If `_POSIX_CHOWN_RESTRICTED` is in effect for  
22322 *path*:

- 22323 • Changing the user ID is restricted to processes with appropriate privileges.
- 22324 • Changing the group ID is permitted to a process with an effective user ID equal to the user  
22325 ID of the file, but without appropriate privileges, if and only if *owner* is equal to the file's  
22326 user ID or `(uid_t)-1` and *group* is equal either to the calling process' effective group ID or to  
22327 one of its supplementary group IDs.

22328 If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of  
22329 the file mode are set, and the process does not have appropriate privileges, the set-user-ID  
22330 (`S_ISUID`) and set-group-ID (`S_ISGID`) bits of the file mode shall be cleared upon successful  
22331 return from *chown()*. If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`,  
22332 or `S_IXOTH` bits of the file mode are set, and the process has appropriate privileges, it is  
22333 implementation-defined whether the set-user-ID and set-group-ID bits are altered. If the *chown()*  
22334 function is successfully invoked on a file that is not a regular file and one or more of the  
22335 `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of the file mode are set, the set-user-ID and set-group-ID  
22336 bits may be cleared.

22337 If *owner* or *group* is specified as `(uid_t)-1` or `(gid_t)-1`, respectively, the corresponding ID of the  
22338 file shall not be changed. If both *owner* and *group* are `-1`, the times need not be updated.

22339 Upon successful completion, *chown()* shall mark for update the last file status change timestamp  
22340 of the file.

22341 The *fchownat()* function shall be equivalent to the *chown()* and *lchown()* functions except in the  
22342 case where *path* specifies a relative path. In this case the file to be changed is determined relative  
22343 to the directory associated with the file descriptor *fd* instead of the current working directory. If  
22344 the file descriptor was opened without `O_SEARCH`, the function shall check whether directory  
22345 searches are permitted using the current permissions of the directory underlying the file  
22346 descriptor. If the file descriptor was opened with `O_SEARCH`, the function shall not perform the  
22347 check.

22348 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
22349 in `<fcntl.h>`:

22350 `AT_SYMLINK_NOFOLLOW`

22351 If *path* names a symbolic link, ownership of the symbolic link is changed.

22352 If *fchownat()* is passed the special value `AT_FDCWD` in the *fd* parameter, the current working  
22353 directory is used and the behavior shall be identical to a call to *chown()* or *lchown()* respectively,

**chown()**

- 22354 depending on whether or not the `AT_SYMLINK_NOFOLLOW` bit is set in the *flag* argument.
- 22355 **RETURN VALUE**
- 22356 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
22357 return `-1` and set *errno* to indicate the error. If `-1` is returned, no changes are made in the user ID  
22358 and group ID of the file.
- 22359 **ERRORS**
- 22360 These functions shall fail if:
- 22361 `[EACCES]` Search permission is denied on a component of the path prefix.
- 22362 `[ELOOP]` A loop exists in symbolic links encountered during resolution of the *path*  
22363 argument.
- 22364 `[ENAMETOOLONG]`  
22365 The length of a component of a pathname is longer than `{NAME_MAX}`.
- 22366 `[ENOENT]` A component of *path* does not name an existing file or *path* is an empty string.
- 22367 `[ENOTDIR]` A component of the path prefix is not a directory, or the *path* argument  
22368 contains at least one non-`<slash>` character and ends with one or more trailing  
22369 `<slash>` characters and the last pathname component names an existing file  
22370 that is neither a directory nor a symbolic link to a directory.
- 22371 `[EPERM]` The effective user ID does not match the owner of the file, or the calling  
22372 process does not have appropriate privileges and  
22373 `_POSIX_CHOWN_RESTRICTED` indicates that such privilege is required.
- 22374 `[EROFS]` The named file resides on a read-only file system.
- 22375 The *fchownat()* function shall fail if:
- 22376 `[EACCES]` *fd* was not opened with `O_SEARCH` and the permissions of the directory  
22377 underlying *fd* do not permit directory searches.
- 22378 `[EBADF]` The *path* argument does not specify an absolute path and the *fd* argument is  
22379 neither `AT_FDCWD` nor a valid file descriptor open for reading or searching.
- 22380 These functions may fail if:
- 22381 `[EIO]` An I/O error occurred while reading or writing to the file system.
- 22382 `[EINTR]` The *chown()* function was interrupted by a signal which was caught.
- 22383 `[EINVAL]` The owner or group ID supplied is not a value supported by the  
22384 implementation.
- 22385 `[ELOOP]` More than `{SYMLOOP_MAX}` symbolic links were encountered during  
22386 resolution of the *path* argument.
- 22387 `[ENAMETOOLONG]`  
22388 The length of a pathname exceeds `{PATH_MAX}`, or pathname resolution of a  
22389 symbolic link produced an intermediate result with a length that exceeds  
22390 `{PATH_MAX}`.
- 22391 The *fchownat()* function may fail if:
- 22392 `[EINVAL]` The value of the *flag* argument is not valid.

22393 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT\_FDCWD nor a  
 22394 file descriptor associated with a directory.

#### 22395 EXAMPLES

22396 None.

#### 22397 APPLICATION USAGE

22398 Although *chown()* can be used on some implementations by the file owner to change the owner  
 22399 and group to any desired values, the only portable use of this function is to change the group of  
 22400 a file to the effective GID of the calling process or to a member of its group set.

#### 22401 RATIONALE

22402 System III and System V allow a user to give away files; that is, the owner of a file may change  
 22403 its user ID to anything. This is a serious problem for implementations that are intended to meet  
 22404 government security regulations. Version 7 and 4.3 BSD permit only the superuser to change the  
 22405 user ID of a file. Some government agencies (usually not ones concerned directly with security)  
 22406 find this limitation too confining. This volume of POSIX.1-2008 uses *may* to permit secure  
 22407 implementations while not disallowing System V.

22408 System III and System V allow the owner of a file to change the group ID to anything. Version 7  
 22409 permits only the superuser to change the group ID of a file. 4.3 BSD permits the owner to  
 22410 change the group ID of a file to its effective group ID or to any of the groups in the list of  
 22411 supplementary group IDs, but to no others.

22412 The POSIX.1-1990 standard requires that the *chown()* function invoked by a non-appropriate  
 22413 privileged process clear the S\_ISGID and the S\_ISUID bits for regular files, and permits them to  
 22414 be cleared for other types of files. This is so that changes in accessibility do not accidentally  
 22415 cause files to become security holes. Unfortunately, requiring these bits to be cleared on non-  
 22416 executable data files also clears the mandatory file locking bit (shared with S\_ISGID), which is  
 22417 an extension on many implementations (it first appeared in System V). These bits should only be  
 22418 required to be cleared on regular files that have one or more of their execute bits set.

22419 The purpose of the *fchownat()* function is to enable changing ownership of files in directories  
 22420 other than the current working directory without exposure to race conditions. Any part of the  
 22421 path of a file could be changed in parallel to a call to *chown()* or *lchown()*, resulting in  
 22422 unspecified behavior. By opening a file descriptor for the target directory and using the  
 22423 *fchownat()* function it can be guaranteed that the changed file is located relative to the desired  
 22424 directory.

#### 22425 FUTURE DIRECTIONS

22426 None.

#### 22430 CHANGE HISTORY

22431 First released in Issue 1. Derived from Issue 1 of the SVID.

#### 22432 Issue 6

22433 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 22434 • The wording describing the optional dependency on `_POSIX_CHOWN_RESTRICTED` is
- 22435 restored.

**chown()**

- 22436 • The [EPERM] error is restored as an error dependent on `_POSIX_CHOWN_RESTRICTED`.  
 22437 This is since its operand is a pathname and applications should be aware that the error  
 22438 may not occur for that pathname if the file system does not support  
 22439 `_POSIX_CHOWN_RESTRICTED`.
- 22440 The following new requirements on POSIX implementations derive from alignment with the  
 22441 Single UNIX Specification:
- 22442 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
 22443 required for conforming implementations of previous POSIX specifications, it was not  
 22444 required for UNIX applications.
  - 22445 • The value for *owner* of `(uid_t)-1` allows the use of `-1` by the owner of a file to change the  
 22446 group ID only. A corresponding change is made for group.
  - 22447 • The [ELOOP] mandatory error condition is added.
  - 22448 • The [EIO] and [EINTR] optional error conditions are added.
  - 22449 • A second [ENAMETOOLONG] is added as an optional error condition.
- 22450 The following changes were made to align with the IEEE P1003.1a draft standard:
- 22451 • Clarification is added that the `S_ISUID` and `S_ISGID` bits do not need to be cleared when  
 22452 the process has appropriate privileges.
  - 22453 • The [ELOOP] optional error condition is added.
- 22454 **Issue 7**
- 22455 Austin Group Interpretation 1003.1-2001 #143 is applied.
- 22456 The `fchownat()` function is added from The Open Group Technical Standard, 2006, Extended API  
 22457 Set Part 2.
- 22458 Changes are made related to support for finegrained timestamps.
- 22459 Changes are made to allow a directory to be opened for searching.
- 22460 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
 22461 pathname exists but is not a directory or a symbolic link to a directory.

22462 **NAME**

22463           cimag, cimagf, cimagl — complex imaginary functions

22464 **SYNOPSIS**

22465           #include &lt;complex.h&gt;

22466           double cimag(double complex z);

22467           float cimagf(float complex z);

22468           long double cimagl(long double complex z);

22469 **DESCRIPTION**22470 **CX**       The functionality described on this reference page is aligned with the ISO C standard. Any  
22471 conflict between the requirements described here and the ISO C standard is unintentional. This  
22472 volume of POSIX.1-2008 defers to the ISO C standard.

22473           These functions shall compute the imaginary part of z.

22474 **RETURN VALUE**

22475           These functions shall return the imaginary part value (as a real).

22476 **ERRORS**

22477           No errors are defined.

22478 **EXAMPLES**

22479           None.

22480 **APPLICATION USAGE**

22481           For a variable z of complex type:

22482           z == creal(z) + cimag(z)\*I

22483 **RATIONALE**

22484           None.

22485 **FUTURE DIRECTIONS**

22486           None.

22489           XBD &lt;complex.h&gt;

22490 **CHANGE HISTORY**

22491           First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**clearerr()**22492 **NAME**

22493 clearerr — clear indicators on a stream

22494 **SYNOPSIS**

22495 #include &lt;stdio.h&gt;

22496 void clearerr(FILE \*stream);

22497 **DESCRIPTION**22498 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
22499 conflict between the requirements described here and the ISO C standard is unintentional. This  
22500 volume of POSIX.1-2008 defers to the ISO C standard.22501 The *clearerr()* function shall clear the end-of-file and error indicators for the stream to which  
22502 *stream* points.22503 **RETURN VALUE**22504 The *clearerr()* function shall not return a value.22505 **ERRORS**

22506 No errors are defined.

22507 **EXAMPLES**

22508 None.

22509 **APPLICATION USAGE**

22510 None.

22511 **RATIONALE**

22512 None.

22513 **FUTURE DIRECTIONS**

22514 None.

22515 **SEE ALSO**

22516 XBD &lt;stdio.h&gt;

22517 **CHANGE HISTORY**

22518 First released in Issue 1. Derived from Issue 1 of the SVID.

22519 **NAME**

22520 clock — report CPU time used

22521 **SYNOPSIS**

22522 #include &lt;time.h&gt;

22523 clock\_t clock(void);

22524 **DESCRIPTION**

22525 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 22526 conflict between the requirements described here and the ISO C standard is unintentional. This  
 22527 volume of POSIX.1-2008 defers to the ISO C standard.

22528 The *clock()* function shall return the implementation's best approximation to the processor time  
 22529 used by the process since the beginning of an implementation-defined era related only to the  
 22530 process invocation.

22531 **RETURN VALUE**

22532 To determine the time in seconds, the value returned by *clock()* should be divided by the value  
 22533 XSI of the macro `CLOCKS_PER_SEC`. `CLOCKS_PER_SEC` is defined to be one million in `<time.h>`.  
 22534 If the processor time used is not available or its value cannot be represented, the function shall  
 22535 return the value `(clock_t)-1`.

22536 **ERRORS**

22537 No errors are defined.

22538 **EXAMPLES**

22539 None.

22540 **APPLICATION USAGE**

22541 In order to measure the time spent in a program, *clock()* should be called at the start of the  
 22542 program and its return value subtracted from the value returned by subsequent calls. The value  
 22543 returned by *clock()* is defined for compatibility across systems that have clocks with different  
 22544 resolutions. The resolution on any particular system need not be to microsecond accuracy.

22545 The value returned by *clock()* may wrap around on some implementations. For example, on a  
 22546 machine with 32-bit values for `clock_t`, it wraps after 2 147 seconds or 36 minutes.

22547 **RATIONALE**

22548 None.

22549 **FUTURE DIRECTIONS**

22550 None.

**clock\_getcpuclockid()**22556 **NAME**22557 clock\_getcpuclockid — access a process CPU-time clock (**ADVANCED REALTIME**)22558 **SYNOPSIS**

```
22559 CPT #include <time.h>
22560 int clock_getcpuclockid(pid_t pid, clockid_t *clock_id);
```

22561 **DESCRIPTION**

22562 The *clock\_getcpuclockid()* function shall return the clock ID of the CPU-time clock of the process  
 22563 specified by *pid*. If the process described by *pid* exists and the calling process has permission, the  
 22564 clock ID of this clock shall be returned in *clock\_id*.

22565 If *pid* is zero, the *clock\_getcpuclockid()* function shall return the clock ID of the CPU-time clock of  
 22566 the process making the call, in *clock\_id*.

22567 The conditions under which one process has permission to obtain the CPU-time clock ID of  
 22568 other processes are implementation-defined.

22569 **RETURN VALUE**

22570 Upon successful completion, *clock\_getcpuclockid()* shall return zero; otherwise, an error number  
 22571 shall be returned to indicate the error.

22572 **ERRORS**

22573 The *clock\_getcpuclockid()* function shall fail if:

22574 [EPERM] The requesting process does not have permission to access the CPU-time clock  
 22575 for the process.

22576 The *clock\_getcpuclockid()* function may fail if:

22577 [ESRCH] No process can be found corresponding to the process specified by *pid*.

22578 **EXAMPLES**

22579 None.

22580 **APPLICATION USAGE**

22581 The *clock\_getcpuclockid()* function is part of the Process CPU-Time Clocks option and need not be  
 22582 provided on all implementations.

22583 **RATIONALE**

22584 None.

22585 **FUTURE DIRECTIONS**

22586 None.

22587 **SEE ALSO**

22589 XBD [<time.h>](#)

22590 **CHANGE HISTORY**

22591 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

22592 In the SYNOPSIS, the inclusion of [<sys/types.h>](#) is no longer required.

22593 **NAME**

22594 clock\_getres, clock\_gettime, clock\_settime — clock and timer functions

22595 **SYNOPSIS**

```

22596 CX #include <time.h>
22597
22597 int clock_getres(clockid_t clock_id, struct timespec *res);
22598 int clock_gettime(clockid_t clock_id, struct timespec *tp);
22599 int clock_settime(clockid_t clock_id, const struct timespec *tp);

```

22600 **DESCRIPTION**

22601 The *clock\_getres()* function shall return the resolution of any clock. Clock resolutions are  
 22602 implementation-defined and cannot be set by a process. If the argument *res* is not NULL, the  
 22603 resolution of the specified clock shall be stored in the location pointed to by *res*. If *res* is NULL,  
 22604 the clock resolution is not returned. If the *time* argument of *clock\_settime()* is not a multiple of *res*,  
 22605 then the value is truncated to a multiple of *res*.

22606 The *clock\_gettime()* function shall return the current value *tp* for the specified clock, *clock\_id*.

22607 The *clock\_settime()* function shall set the specified clock, *clock\_id*, to the value specified by *tp*.  
 22608 Time values that are between two consecutive non-negative integer multiples of the resolution of  
 22609 the specified clock shall be truncated down to the smaller multiple of the resolution.

22610 A clock may be system-wide (that is, visible to all processes) or per-process (measuring time that  
 22611 is meaningful only within a process). All implementations shall support a *clock\_id* of  
 22612 CLOCK\_REALTIME as defined in <time.h>. This clock represents the clock measuring real time  
 22613 for the system. For this clock, the values returned by *clock\_gettime()* and specified by  
 22614 *clock\_settime()* represent the amount of time (in seconds and nanoseconds) since the Epoch. An  
 22615 implementation may also support additional clocks. The interpretation of time values for these  
 22616 clocks is unspecified.

22617 If the value of the CLOCK\_REALTIME clock is set via *clock\_settime()*, the new value of the clock  
 22618 shall be used to determine the time of expiration for absolute time services based upon the  
 22619 CLOCK\_REALTIME clock. This applies to the time at which armed absolute timers expire. If the  
 22620 absolute time requested at the invocation of such a time service is before the new value of the  
 22621 clock, the time service shall expire immediately as if the clock had reached the requested time  
 22622 normally.

22623 Setting the value of the CLOCK\_REALTIME clock via *clock\_settime()* shall have no effect on  
 22624 threads that are blocked waiting for a relative time service based upon this clock, including the  
 22625 *nanosleep()* function; nor on the expiration of relative timers based upon this clock.  
 22626 Consequently, these time services shall expire when the requested relative interval elapses,  
 22627 independently of the new or old value of the clock.

22628 MON If the Monotonic Clock option is supported, all implementations shall support a *clock\_id* of  
 22629 CLOCK\_MONOTONIC defined in <time.h>. This clock represents the monotonic clock for the  
 22630 system. For this clock, the value returned by *clock\_gettime()* represents the amount of time (in  
 22631 seconds and nanoseconds) since an unspecified point in the past (for example, system start-up  
 22632 time, or the Epoch). This point does not change after system start-up time. The value of the  
 22633 CLOCK\_MONOTONIC clock cannot be set via *clock\_settime()*. This function shall fail if it is  
 22634 invoked with a *clock\_id* argument of CLOCK\_MONOTONIC.

22635 The effect of setting a clock via *clock\_settime()* on armed per-process timers associated with a  
 22636 clock other than CLOCK\_REALTIME is implementation-defined.

22637 If the value of the CLOCK\_REALTIME clock is set via *clock\_settime()*, the new value of the clock  
 22638 shall be used to determine the time at which the system shall awaken a thread blocked on an

**clock\_getres()**

- 22639 absolute *clock\_nanosleep()* call based upon the CLOCK\_REALTIME clock. If the absolute time  
 22640 requested at the invocation of such a time service is before the new value of the clock, the call  
 22641 shall return immediately as if the clock had reached the requested time normally.
- 22642 Setting the value of the CLOCK\_REALTIME clock via *clock\_settime()* shall have no effect on any  
 22643 thread that is blocked on a relative *clock\_nanosleep()* call. Consequently, the call shall return  
 22644 when the requested relative interval elapses, independently of the new or old value of the clock.
- 22645 Appropriate privileges to set a particular clock are implementation-defined.
- 22646 CPT If \_POSIX\_CPUTIME is defined, implementations shall support clock ID values obtained by  
 22647 invoking *clock\_getcpuclockid()*, which represent the CPU-time clock of a given process.  
 22648 Implementations shall also support the special **clockid\_t** value  
 22649 CLOCK\_PROCESS\_CPUTIME\_ID, which represents the CPU-time clock of the calling process  
 22650 when invoking one of the *clock\_\**() or *timer\_\**() functions. For these clock IDs, the values  
 22651 returned by *clock\_gettime()* and specified by *clock\_settime()* represent the amount of execution  
 22652 time of the process associated with the clock. Changing the value of a CPU-time clock via  
 22653 *clock\_settime()* shall have no effect on the behavior of the sporadic server scheduling policy (see  
 22654 [Scheduling Policies](#), on page 501).
- 22655 TCT If \_POSIX\_THREAD\_CPUTIME is defined, implementations shall support clock ID values  
 22656 obtained by invoking *pthread\_getcpuclockid()*, which represent the CPU-time clock of a given  
 22657 thread. Implementations shall also support the special **clockid\_t** value  
 22658 CLOCK\_THREAD\_CPUTIME\_ID, which represents the CPU-time clock of the calling thread  
 22659 when invoking one of the *clock\_\**() or *timer\_\**() functions. For these clock IDs, the values  
 22660 returned by *clock\_gettime()* and specified by *clock\_settime()* shall represent the amount of  
 22661 execution time of the thread associated with the clock. Changing the value of a CPU-time clock  
 22662 via *clock\_settime()* shall have no effect on the behavior of the sporadic server scheduling policy  
 22663 (see [Scheduling Policies](#), on page 501).
- 22664 **RETURN VALUE**
- 22665 A return value of 0 shall indicate that the call succeeded. A return value of -1 shall indicate that  
 22666 an error occurred, and *errno* shall be set to indicate the error.
- 22667 **ERRORS**
- 22668 The *clock\_getres()*, *clock\_gettime()*, and *clock\_settime()* functions shall fail if:
- 22669 [EINVAL] The *clock\_id* argument does not specify a known clock.
- 22670 The *clock\_settime()* function shall fail if:
- 22671 [EINVAL] The *tp* argument to *clock\_settime()* is outside the range for the given clock ID.
- 22672 [EINVAL] The *tp* argument specified a nanosecond value less than zero or greater than or  
 22673 equal to 1 000 million.
- 22674 MON [EINVAL] The value of the *clock\_id* argument is CLOCK\_MONOTONIC.
- 22675 The *clock\_settime()* function may fail if:
- 22676 [EPERM] The requesting process does not have appropriate privileges to set the  
 22677 specified clock.

22678 **EXAMPLES**

22679 None.

22680 **APPLICATION USAGE**

22681 Note that the absolute value of the monotonic clock is meaningless (because its origin is  
 22682 arbitrary), and thus there is no need to set it. Furthermore, realtime applications can rely on the  
 22683 fact that the value of this clock is never set and, therefore, that time intervals measured with this  
 22684 clock will not be affected by calls to *clock\_settime()*.

22685 **RATIONALE**

22686 None.

22687 **FUTURE DIRECTIONS**

22688 None.

22689 **SEE ALSO**

22692 XBD <[time.h](#)>22693 **CHANGE HISTORY**

22694 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

22695 **Issue 6**

22696 The [ENOSYS] error condition has been removed as stubs need not be provided if an  
 22697 implementation does not support the Timers option.

22698 The APPLICATION USAGE section is added.

22699 The following changes were made to align with the IEEE P1003.1a draft standard:

- 22700 • Clarification is added of the effect of resetting the clock resolution.

22701 CPU-time clocks and the *clock\_getcpuclockid()* function are added for alignment with IEEE Std  
 22702 1003.1d-1999.

22703 The following changes are added for alignment with IEEE Std 1003.1j-2000:

- 22704 • The DESCRIPTION is updated as follows:

- 22705 — The value returned by *clock\_gettime()* for CLOCK\_MONOTONIC is specified.

- 22706 — The *clock\_settime()* function failing for CLOCK\_MONOTONIC is specified.

- 22707 — The effects of *clock\_settime()* on the *clock\_nanosleep()* function with respect to  
 22708 CLOCK\_REALTIME are specified.

- 22709 • An [EINVAL] error is added to the ERRORS section, indicating that *clock\_settime()* fails for  
 22710 CLOCK\_MONOTONIC.

- 22711 • The APPLICATION USAGE section notes that the CLOCK\_MONOTONIC clock need not  
 22712 and shall not be set by *clock\_settime()* since the absolute value of the  
 22713 CLOCK\_MONOTONIC clock is meaningless.

- 22714 • The *clock\_nanosleep()*, *mq\_timedreceive()*, *mq\_timedsend()*, *pthread\_mutex\_timedlock()*,  
 22715 *sem\_timedwait()*, *timer\_create()*, and *timer\_settime()* functions are added to the SEE ALSO  
 22716 section.

**clock\_getres()**22717 **Issue 7**

22718           Functionality relating to the Clock Selection option is moved to the Base.

22719           The *clock\_getres()*, *clock\_gettime()*, and *clock\_settime()* functions are moved from the Timers  
22720           option to the Base.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

22721 **NAME**22722 `clock_nanosleep` — high resolution sleep with specifiable clock22723 **SYNOPSIS**

```
22724 CX #include <time.h>
22725 int clock_nanosleep(clockid_t clock_id, int flags,
22726 const struct timespec *rqtp, struct timespec *rmtp);
```

22727 **DESCRIPTION**

22728 If the flag `TIMER_ABSTIME` is not set in the *flags* argument, the `clock_nanosleep()` function shall  
 22729 cause the current thread to be suspended from execution until either the time interval specified  
 22730 by the *rqtp* argument has elapsed, or a signal is delivered to the calling thread and its action is to  
 22731 invoke a signal-catching function, or the process is terminated. The clock used to measure the  
 22732 time shall be the clock specified by *clock\_id*.

22733 If the flag `TIMER_ABSTIME` is set in the *flags* argument, the `clock_nanosleep()` function shall  
 22734 cause the current thread to be suspended from execution until either the time value of the clock  
 22735 specified by *clock\_id* reaches the absolute time specified by the *rqtp* argument, or a signal is  
 22736 delivered to the calling thread and its action is to invoke a signal-catching function, or the  
 22737 process is terminated. If, at the time of the call, the time value specified by *rqtp* is less than or  
 22738 equal to the time value of the specified clock, then `clock_nanosleep()` shall return immediately  
 22739 and the calling process shall not be suspended.

22740 The suspension time caused by this function may be longer than requested because the  
 22741 argument value is rounded up to an integer multiple of the sleep resolution, or because of the  
 22742 scheduling of other activity by the system. But, except for the case of being interrupted by a  
 22743 signal, the suspension time for the relative `clock_nanosleep()` function (that is, with the  
 22744 `TIMER_ABSTIME` flag not set) shall not be less than the time interval specified by *rqtp*, as  
 22745 measured by the corresponding clock. The suspension for the absolute `clock_nanosleep()` function  
 22746 (that is, with the `TIMER_ABSTIME` flag set) shall be in effect at least until the value of the  
 22747 corresponding clock reaches the absolute time specified by *rqtp*, except for the case of being  
 22748 interrupted by a signal.

22749 The use of the `clock_nanosleep()` function shall have no effect on the action or blockage of any  
 22750 signal.

22751 The `clock_nanosleep()` function shall fail if the *clock\_id* argument refers to the CPU-time clock of  
 22752 the calling thread. It is unspecified whether *clock\_id* values of other CPU-time clocks are allowed.

22753 **RETURN VALUE**

22754 If the `clock_nanosleep()` function returns because the requested time has elapsed, its return value  
 22755 shall be zero.

22756 If the `clock_nanosleep()` function returns because it has been interrupted by a signal, it shall  
 22757 return the corresponding error value. For the relative `clock_nanosleep()` function, if the *rmtp*  
 22758 argument is non-NULL, the **timespec** structure referenced by it shall be updated to contain the  
 22759 amount of time remaining in the interval (the requested time minus the time actually slept). If  
 22760 the *rmtp* argument is NULL, the remaining time is not returned. The absolute `clock_nanosleep()`  
 22761 function has no effect on the structure referenced by *rmtp*.

22762 If `clock_nanosleep()` fails, it shall return the corresponding error value.

**clock\_nanosleep()**22763 **ERRORS**22764 The *clock\_nanosleep()* function shall fail if:22765 [EINTR] The *clock\_nanosleep()* function was interrupted by a signal.

22766 [EINVAL] The *rqt*p argument specified a nanosecond value less than zero or greater than or equal to 1 000 million; or the `TIMER_ABSTIME` flag was specified in flags and the *rqt*p argument is outside the range for the clock specified by *clock\_id* or the *clock\_id* argument does not specify a known clock, or specifies the CPU-time clock of the calling thread.

22771 [ENOTSUP] The *clock\_id* argument specifies a clock for which *clock\_nanosleep()* is not supported, such as a CPU-time clock.

22773 **EXAMPLES**

22774 None.

22775 **APPLICATION USAGE**

22776 Calling *clock\_nanosleep()* with the value `TIMER_ABSTIME` not set in the *flags* argument and with a *clock\_id* of `CLOCK_REALTIME` is equivalent to calling *nanosleep()* with the same *rqt*p and *rmt*p arguments.

22779 **RATIONALE**

22780 The *nanosleep()* function specifies that the system-wide clock `CLOCK_REALTIME` is used to measure the elapsed time for this time service. However, with the introduction of the monotonic clock `CLOCK_MONOTONIC` a new relative sleep function is needed to allow an application to take advantage of the special characteristics of this clock.

22784 There are many applications in which a process needs to be suspended and then activated multiple times in a periodic way; for example, to poll the status of a non-interrupting device or to refresh a display device. For these cases, it is known that precise periodic activation cannot be achieved with a relative *sleep()* or *nanosleep()* function call. Suppose, for example, a periodic process that is activated at time  $T_0$ , executes for a while, and then wants to suspend itself until time  $T_0+T$ , the period being  $T$ . If this process wants to use the *nanosleep()* function, it must first call *clock\_gettime()* to get the current time, then calculate the difference between the current time and  $T_0+T$  and, finally, call *nanosleep()* using the computed interval. However, the process could be preempted by a different process between the two function calls, and in this case the interval computed would be wrong; the process would wake up later than desired. This problem would not occur with the absolute *clock\_nanosleep()* function, since only one function call would be necessary to suspend the process until the desired time. In other cases, however, a relative sleep is needed, and that is why both functionalities are required.

22797 Although it is possible to implement periodic processes using the timers interface, this implementation would require the use of signals, and the reservation of some signal numbers. In this regard, the reasons for including an absolute version of the *clock\_nanosleep()* function in POSIX.1-2008 are the same as for the inclusion of the relative *nanosleep()*.

22801 It is also possible to implement precise periodic processes using *pthread\_cond\_timedwait()*, in which an absolute timeout is specified that takes effect if the condition variable involved is never signaled. However, the use of this interface is unnatural, and involves performing other operations on mutexes and condition variables that imply an unnecessary overhead. Furthermore, *pthread\_cond\_timedwait()* is not available in implementations that do not support threads.

22807 Although the interface of the relative and absolute versions of the new high resolution sleep service is the same *clock\_nanosleep()* function, the *rmt*p argument is only used in the relative sleep. This argument is needed in the relative *clock\_nanosleep()* function to reissue the function

22810 call if it is interrupted by a signal, but it is not needed in the absolute *clock\_nanosleep()* function  
22811 call; if the call is interrupted by a signal, the absolute *clock\_nanosleep()* function can be invoked  
22812 again with the same *rqt* argument used in the interrupted call.

22813 **FUTURE DIRECTIONS**

22814 None.

22815 **SEE ALSO**

22860 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**close()**22861 **NAME**

22862 close — close a file descriptor

22863 **SYNOPSIS**

22864 #include &lt;unistd.h&gt;

22865 int close(int *fildev*);22866 **DESCRIPTION**

22867 The *close()* function shall deallocate the file descriptor indicated by *fildev*. To deallocate means to  
 22868 make the file descriptor available for return by subsequent calls to *open()* or other functions that  
 22869 allocate file descriptors. All outstanding record locks owned by the process on the file associated  
 22870 with the file descriptor shall be removed (that is, unlocked).

22871 If *close()* is interrupted by a signal that is to be caught, it shall return  $-1$  with *errno* set to [EINTR]  
 22872 and the state of *fildev* is unspecified. If an I/O error occurred while reading from or writing to  
 22873 the file system during *close()*, it may return  $-1$  with *errno* set to [EIO]; if this error is returned, the  
 22874 state of *fildev* is unspecified.

22875 When all file descriptors associated with a pipe or FIFO special file are closed, any data  
 22876 remaining in the pipe or FIFO shall be discarded.

22877 When all file descriptors associated with an open file description have been closed, the open file  
 22878 description shall be freed.

22879 If the link count of the file is 0, when all file descriptors associated with the file are closed, the  
 22880 space occupied by the file shall be freed and the file shall no longer be accessible.

22881 OB XSR If a STREAMS-based *fildev* is closed and the calling process was previously registered to receive  
 22882 a SIGPOLL signal for events associated with that STREAM, the calling process shall be  
 22883 unregistered for events associated with the STREAM. The last *close()* for a STREAM shall cause  
 22884 the STREAM associated with *fildev* to be dismantled. If O\_NONBLOCK is not set and there have  
 22885 been no signals posted for the STREAM, and if there is data on the module's write queue, *close()*  
 22886 shall wait for an unspecified time (for each module and driver) for any output to drain before  
 22887 dismantling the STREAM. The time delay can be changed via an I\_SETCLTIME *ioctl()* request. If  
 22888 the O\_NONBLOCK flag is set, or if there are any pending signals, *close()* shall not wait for  
 22889 output to drain, and shall dismantle the STREAM immediately.

22890 If the implementation supports STREAMS-based pipes, and *fildev* is associated with one end of a  
 22891 pipe, the last *close()* shall cause a hangup to occur on the other end of the pipe. In addition, if the  
 22892 other end of the pipe has been named by *fattach()*, then the last *close()* shall force the named end  
 22893 to be detached by *fdetach()*. If the named end has no open file descriptors associated with it and  
 22894 gets detached, the STREAM associated with that end shall also be dismantled.

22895 XSI If *fildev* refers to the master side of a pseudo-terminal, and this is the last close, a SIGHUP signal  
 22896 shall be sent to the controlling process, if any, for which the slave side of the pseudo-terminal is  
 22897 the controlling terminal. It is unspecified whether closing the master side of the pseudo-terminal  
 22898 flushes all queued input and output.

22899 OB XSR If *fildev* refers to the slave side of a STREAMS-based pseudo-terminal, a zero-length message  
 22900 may be sent to the master.

22901 When there is an outstanding cancelable asynchronous I/O operation against *fildev* when *close()*  
 22902 is called, that I/O operation may be canceled. An I/O operation that is not canceled completes  
 22903 as if the *close()* operation had not yet occurred. All operations that are not canceled shall  
 22904 complete as if the *close()* blocked until the operations completed. The *close()* operation itself  
 22905 need not block awaiting such I/O completion. Whether any I/O operation is canceled, and  
 22906 which I/O operation may be canceled upon *close()*, is implementation-defined.

22907 SHM If a memory mapped file or a shared memory object remains referenced at the last close (that is,  
 22908 a process has it mapped), then the entire contents of the memory object shall persist until the  
 22909 SHM memory object becomes unreferenced. If this is the last close of a memory mapped file or a  
 22910 shared memory object and the close results in the memory object becoming unreferenced, and  
 22911 the memory object has been unlinked, then the memory object shall be removed.

22912 If *fdes* refers to a socket, *close()* shall cause the socket to be destroyed. If the socket is in  
 22913 connection-mode, and the `SO_LINGER` option is set for the socket with non-zero linger time,  
 22914 and the socket has untransmitted data, then *close()* shall block for up to the current linger  
 22915 interval until all data is transmitted.

#### 22916 RETURN VALUE

22917 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to  
 22918 indicate the error.

#### 22919 ERRORS

22920 The *close()* function shall fail if:

22921 [EBADF] The *fdes* argument is not a valid file descriptor.

22922 [EINTR] The *close()* function was interrupted by a signal.

22923 The *close()* function may fail if:

22924 [EIO] An I/O error occurred while reading from or writing to the file system.

#### 22925 EXAMPLES

##### 22926 Reassigning a File Descriptor

22927 The following example closes the file descriptor associated with standard output for the current  
 22928 process, re-assigns standard output to a new file descriptor, and closes the original file descriptor  
 22929 to clean up. This example assumes that the file descriptor 0 (which is the descriptor for standard  
 22930 input) is not closed.

```
22931 #include <unistd.h>
22932 ...
22933 int pfd;
22934 ...
22935 close(1);
22936 dup(pfd);
22937 close(pfd);
22938 ...
```

22939 Incidentally, this is exactly what could be achieved using:

```
22940 dup2(pfd, 1);
22941 close(pfd);
```

**close()**22942 **Closing a File Descriptor**

22943 In the following example, *close()* is used to close a file descriptor after an unsuccessful attempt is  
 22944 made to associate that file descriptor with a stream.

```

22945 #include <stdio.h>
22946 #include <unistd.h>
22947 #include <stdlib.h>

22948 #define LOCKFILE "/etc/ptmp"
22949 ...
22950 int pfd;
22951 FILE *fpfd;
22952 ...
22953 if ((fpfd = fdopen (pfd, "w")) == NULL) {
22954     close(pfd);
22955     unlink(LOCKFILE);
22956     exit(1);
22957 }
22958 ...
  
```

22959 **APPLICATION USAGE**

22960 An application that had used the *stdio* routine *fopen()* to open a file should use the  
 22961 corresponding *fclose()* routine rather than *close()*. Once a file is closed, the file descriptor no  
 22962 longer exists, since the integer corresponding to it no longer refers to a file.

22963 **RATIONALE**

22964 The use of interruptible device close routines should be discouraged to avoid problems with the  
 22965 implicit closes of file descriptors by *exec* and *exit()*. This volume of POSIX.1-2008 only intends to  
 22966 permit such behavior by specifying the [EINTR] error condition.

22967 Note that the requirement for *close()* on a socket to block for up to the current linger interval is  
 22968 not conditional on the O\_NONBLOCK setting.

22969 **FUTURE DIRECTIONS**

22970 None.

22974 **CHANGE HISTORY**

22975 First released in Issue 1. Derived from Issue 1 of the SVID.

22976 **Issue 5**

22977 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

22978 **Issue 6**

22979 The DESCRIPTION related to a STREAMS-based file or pseudo-terminal is marked as part of  
 22980 the XSI STREAMS Option Group.

22981 The following new requirements on POSIX implementations derive from alignment with the  
 22982 Single UNIX Specification:

- 22983 • The [EIO] error condition is added as an optional error.

- 22984                   • The DESCRIPTION is updated to describe the state of the *fildev* file descriptor as  
22985                   unspecified if an I/O error occurs and an [EIO] error condition is returned.
- 22986                   Text referring to sockets is added to the DESCRIPTION.
- 22987                   The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
22988                   shared memory objects and memory mapped files (and not typed memory objects) are the types  
22989                   of memory objects to which the paragraph on last closes applies.
- 22990                   IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/12 is applied, correcting the XSH shaded  
22991                   text relating to the master side of a pseudo-terminal. The reason for the change is that the  
22992                   behavior of pseudo-terminals and regular terminals should be as much alike as possible in this  
22993                   case; the change achieves that and matches historical behavior.
- 22994   **Issue 7**
- 22995                   Functionality relating to the XSI STREAMS option is marked obsolescent.
- 22996                   Functionality relating to the Asynchronous Input and Output and Memory Mapped Files  
22997                   options is moved to the Base.
- 22998                   Austin Group Interpretation 1003.1-2001 #139 is applied, clarifying that the requirement for  
22999                   *close()* on a socket to block for up to the current linger interval is not conditional on the  
23000                   O\_NONBLOCK setting.

**closedir()**23001 **NAME**

23002           closedir — close a directory stream

23003 **SYNOPSIS**

```
23004       #include <dirent.h>
23005       int closedir(DIR *dirp);
```

23006 **DESCRIPTION**

23007       The *closedir()* function shall close the directory stream referred to by the argument *dirp*. Upon  
 23008       return, the value of *dirp* may no longer point to an accessible object of the type **DIR**. If a file  
 23009       descriptor is used to implement type **DIR**, that file descriptor shall be closed.

23010 **RETURN VALUE**

23011       Upon successful completion, *closedir()* shall return 0; otherwise, -1 shall be returned and *errno*  
 23012       set to indicate the error.

23013 **ERRORS**

23014       The *closedir()* function may fail if:

- |       |         |                                                                      |
|-------|---------|----------------------------------------------------------------------|
| 23015 | [EBADF] | The <i>dirp</i> argument does not refer to an open directory stream. |
| 23016 | [EINTR] | The <i>closedir()</i> function was interrupted by a signal.          |

23017 **EXAMPLES**23018           **Closing a Directory Stream**

23019       The following program fragment demonstrates how the *closedir()* function is used.

```
23020       ...
23021       DIR *dir;
23022       struct dirent *dp;
23023       ...
23024       if ((dir = opendir (".")) == NULL) {
23025       ...
23026       }
23027       while ((dp = readdir (dir)) != NULL) {
23028       ...
23029       }
23030       closedir(dir);
23031       ...

```

23032 **APPLICATION USAGE**

23033       None.

23034 **RATIONALE**

23035       None.

23036 **FUTURE DIRECTIONS**

23037       None.

23038 **SEE ALSO**

23040       XBD <dirent.h>

23041 **CHANGE HISTORY**

23042 First released in Issue 2.

23043 **Issue 6**23044 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.23045 The following new requirements on POSIX implementations derive from alignment with the  
23046 Single UNIX Specification:

- 23047 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
23048 required for conforming implementations of previous POSIX specifications, it was not  
23049 required for UNIX applications.
- 23050 • The [EINTR] error condition is added as an optional error condition.

**closelog()**23051 **NAME**

23052 closelog, openlog, setlogmask, syslog — control system log

23053 **SYNOPSIS**

```

23054 XSI #include <syslog.h>
23055 void closelog(void);
23056 void openlog(const char *ident, int logopt, int facility);
23057 int setlogmask(int maskpri);
23058 void syslog(int priority, const char *message, ... /* arguments */);

```

23059 **DESCRIPTION**

23060 The *syslog()* function shall send a message to an implementation-defined logging facility, which  
 23061 may log it in an implementation-defined system log, write it to the system console, forward it to  
 23062 a list of users, or forward it to the logging facility on another host over the network. The logged  
 23063 message shall include a message header and a message body. The message header contains at  
 23064 least a timestamp and a tag string.

23065 The message body is generated from the *message* and following arguments in the same manner  
 23066 as if these were arguments to *printf()*, except that the additional conversion specification `%m`  
 23067 shall be recognized; it shall convert no arguments, shall cause the output of the error message  
 23068 string associated with the value of *errno* on entry to *syslog()*, and may be mixed with argument  
 23069 specifications of the "`%n$`" form. If a complete conversion specification with the *m* conversion  
 23070 specifier character is not just `%m`, the behavior is undefined. A trailing `<newline>` may be added  
 23071 if needed.

23072 Values of the *priority* argument are formed by OR'ing together a severity-level value and an  
 23073 optional facility value. If no facility value is specified, the current default facility value is used.

23074 Possible values of severity level include:

|       |             |                                                                                                 |
|-------|-------------|-------------------------------------------------------------------------------------------------|
| 23075 | LOG_EMERG   | A panic condition.                                                                              |
| 23076 | LOG_ALERT   | A condition that should be corrected immediately, such as a corrupted system<br>23077 database. |
| 23078 | LOG_CRIT    | Critical conditions, such as hard device errors.                                                |
| 23079 | LOG_ERR     | Errors.                                                                                         |
| 23080 | LOG_WARNING | Warning messages.                                                                               |
| 23081 |             |                                                                                                 |
| 23082 | LOG_NOTICE  | Conditions that are not error conditions, but that may require special<br>23083 handling.       |
| 23084 | LOG_INFO    | Informational messages.                                                                         |
| 23085 | LOG_DEBUG   | Messages that contain information normally of use only when debugging a<br>23086 program.       |

23087 The facility indicates the application or system component generating the message. Possible  
 23088 facility values include:

|       |            |                                                                                                                   |
|-------|------------|-------------------------------------------------------------------------------------------------------------------|
| 23089 | LOG_USER   | Messages generated by arbitrary processes. This is the default facility<br>23090 identifier if none is specified. |
| 23091 | LOG_LOCAL0 | Reserved for local use.                                                                                           |

|       |                     |                                                                                                                                  |
|-------|---------------------|----------------------------------------------------------------------------------------------------------------------------------|
| 23092 | LOG_LOCAL1          | Reserved for local use.                                                                                                          |
| 23093 | LOG_LOCAL2          | Reserved for local use.                                                                                                          |
| 23094 | LOG_LOCAL3          | Reserved for local use.                                                                                                          |
| 23095 | LOG_LOCAL4          | Reserved for local use.                                                                                                          |
| 23096 | LOG_LOCAL5          | Reserved for local use.                                                                                                          |
| 23097 | LOG_LOCAL6          | Reserved for local use.                                                                                                          |
| 23098 | LOG_LOCAL7          | Reserved for local use.                                                                                                          |
| 23099 |                     | The <i>openlog()</i> function shall set process attributes that affect subsequent calls to <i>syslog()</i> . The                 |
| 23100 |                     | <i>ident</i> argument is a string that is prepended to every message. The <i>logopt</i> argument indicates                       |
| 23101 |                     | logging options. Values for <i>logopt</i> are constructed by a bitwise-inclusive OR of zero or more of                           |
| 23102 |                     | the following:                                                                                                                   |
| 23103 | LOG_PID             | Log the process ID with each message. This is useful for identifying specific                                                    |
| 23104 |                     | processes.                                                                                                                       |
| 23105 | LOG_CONS            | Write messages to the system console if they cannot be sent to the logging                                                       |
| 23106 |                     | facility. The <i>syslog()</i> function ensures that the process does not acquire the                                             |
| 23107 |                     | console as a controlling terminal in the process of writing the message.                                                         |
| 23108 | LOG_NDELAY          | Open the connection to the logging facility immediately. Normally the open is                                                    |
| 23109 |                     | delayed until the first message is logged. This is useful for programs that need                                                 |
| 23110 |                     | to manage the order in which file descriptors are allocated.                                                                     |
| 23111 | LOG_ODELAY          | Delay open until <i>syslog()</i> is called.                                                                                      |
| 23112 | LOG_NOWAIT          | Do not wait for child processes that may have been created during the course                                                     |
| 23113 |                     | of logging the message. This option should be used by processes that enable                                                      |
| 23114 |                     | notification of child termination using SIGCHLD, since <i>syslog()</i> may                                                       |
| 23115 |                     | otherwise block waiting for a child whose exit status has already been                                                           |
| 23116 |                     | collected.                                                                                                                       |
| 23117 |                     | The <i>facility</i> argument encodes a default facility to be assigned to all messages that do not have an                       |
| 23118 |                     | explicit facility already encoded. The initial default facility is LOG_USER.                                                     |
| 23119 |                     | The <i>openlog()</i> and <i>syslog()</i> functions may allocate a file descriptor. It is not necessary to call                   |
| 23120 |                     | <i>openlog()</i> prior to calling <i>syslog()</i> .                                                                              |
| 23121 |                     | The <i>closelog()</i> function shall close any open file descriptors allocated by previous calls to                              |
| 23122 |                     | <i>openlog()</i> or <i>syslog()</i> .                                                                                            |
| 23123 |                     | The <i>setlogmask()</i> function shall set the log priority mask for the current process to <i>maskpri</i> and                   |
| 23124 |                     | return the previous mask. If the <i>maskpri</i> argument is 0, the current log mask is not modified.                             |
| 23125 |                     | Calls by the current process to <i>syslog()</i> with a priority not set in <i>maskpri</i> shall be rejected. The                 |
| 23126 |                     | default log mask allows all priorities to be logged. A call to <i>openlog()</i> is not required prior to                         |
| 23127 |                     | calling <i>setlogmask()</i> .                                                                                                    |
| 23128 |                     | Symbolic constants for use as values of the <i>logopt</i> , <i>facility</i> , <i>priority</i> , and <i>maskpri</i> arguments are |
| 23129 |                     | defined in the <b>&lt;syslog.h&gt;</b> header.                                                                                   |
| 23130 | <b>RETURN VALUE</b> |                                                                                                                                  |
| 23131 |                     | The <i>setlogmask()</i> function shall return the previous log priority mask. The <i>closelog()</i> , <i>openlog()</i> ,         |
| 23132 |                     | and <i>syslog()</i> functions shall not return a value.                                                                          |

**closelog()**23133 **ERRORS**

23134           None.

23135 **EXAMPLES**23136           **Using openlog()**

23137           The following example causes subsequent calls to *syslog()* to log the process ID with each  
 23138           message, and to write messages to the system console if they cannot be sent to the logging  
 23139           facility.

```
23140           #include <syslog.h>

23141           char *ident = "Process demo";
23142           int logopt = LOG_PID | LOG_CONS;
23143           int facility = LOG_USER;
23144           ...
23145           openlog(ident, logopt, facility);
```

23146           **Using setlogmask()**

23147           The following example causes subsequent calls to *syslog()* to accept error messages, and to reject  
 23148           all other messages.

```
23149           #include <syslog.h>

23150           int result;
23151           int mask = LOG_MASK (LOG_ERR);
23152           ...
23153           result = setlogmask(mask);
```

23154           **Using syslog**

23155           The following example sends the message "This is a message" to the default logging  
 23156           facility, marking the message as an error message generated by random processes.

```
23157           #include <syslog.h>

23158           char *message = "This is a message";
23159           int priority = LOG_ERR | LOG_USER;
23160           ...
23161           syslog(priority, message);
```

23162 **APPLICATION USAGE**

23163           None.

23164 **RATIONALE**

23165           None.

23166 **FUTURE DIRECTIONS**

23167           None.

23168 **SEE ALSO**23169           *fprintf()*23170           XBD *<syslog.h>*

23171 **CHANGE HISTORY**

**confstr()**23178 **NAME**23179 `confstr` — get configurable variables23180 **SYNOPSIS**23181 `#include <unistd.h>`23182 `size_t confstr(int name, char *buf, size_t len);`23183 **DESCRIPTION**23184 The `confstr()` function shall return configuration-defined string values. Its use and purpose are  
23185 similar to `sysconf()`, but it is used where string values rather than numeric values are returned.23186 The `name` argument represents the system variable to be queried. The implementation shall  
23187 support the following name values, defined in `<unistd.h>`. It may support others:

23188 `_CS_PATH`  
 23189 `_CS_POSIX_V7_ILP32_OFF32_CFLAGS`  
 23190 `_CS_POSIX_V7_ILP32_OFF32_LDFLAGS`  
 23191 `_CS_POSIX_V7_ILP32_OFF32_LIBS`  
 23192 `_CS_POSIX_V7_ILP32_OFFBIG_CFLAGS`  
 23193 `_CS_POSIX_V7_ILP32_OFFBIG_LDFLAGS`  
 23194 `_CS_POSIX_V7_ILP32_OFFBIG_LIBS`  
 23195 `_CS_POSIX_V7_LP64_OFF64_CFLAGS`  
 23196 `_CS_POSIX_V7_LP64_OFF64_LDFLAGS`  
 23197 `_CS_POSIX_V7_LP64_OFF64_LIBS`  
 23198 `_CS_POSIX_V7_LPBIG_OFFBIG_CFLAGS`  
 23199 `_CS_POSIX_V7_LPBIG_OFFBIG_LDFLAGS`  
 23200 `_CS_POSIX_V7_LPBIG_OFFBIG_LIBS`  
 23201 `_CS_POSIX_V7_THREADS_CFLAGS`  
 23202 `_CS_POSIX_V7_THREADS_LDFLAGS`  
 23203 `_CS_POSIX_V7_WIDTH_RESTRICTED_ENVS`  
 23204 `_CS_V7_ENV`

23205 **OR** `_CS_POSIX_V6_ILP32_OFF32_CFLAGS`  
 23206 `_CS_POSIX_V6_ILP32_OFF32_LDFLAGS`  
 23207 `_CS_POSIX_V6_ILP32_OFF32_LIBS`  
 23208 `_CS_POSIX_V6_ILP32_OFFBIG_CFLAGS`  
 23209 `_CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS`  
 23210 `_CS_POSIX_V6_ILP32_OFFBIG_LIBS`  
 23211 `_CS_POSIX_V6_LP64_OFF64_CFLAGS`  
 23212 `_CS_POSIX_V6_LP64_OFF64_LDFLAGS`  
 23213 `_CS_POSIX_V6_LP64_OFF64_LIBS`  
 23214 `_CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS`  
 23215 `_CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS`  
 23216 `_CS_POSIX_V6_LPBIG_OFFBIG_LIBS`  
 23217 `_CS_POSIX_V6_WIDTH_RESTRICTED_ENVS`  
 23218 `_CS_V6_ENV`

23219 If `len` is not 0, and if `name` has a configuration-defined value, `confstr()` shall copy that value into  
 23220 the `len`-byte buffer pointed to by `buf`. If the string to be returned is longer than `len` bytes,  
 23221 including the terminating null, then `confstr()` shall truncate the string to `len-1` bytes and null-  
 23222 terminate the result. The application can detect that the string was truncated by comparing the  
 23223 value returned by `confstr()` with `len`.

23224 If `len` is 0 and `buf` is a null pointer, then `confstr()` shall still return the integer value as defined  
 23225 below, but shall not return a string. If `len` is 0 but `buf` is not a null pointer, the result is

23226 unspecified.

23227 After a call to:

23228 `confstr(_CS_V7_ENV, buf, sizeof(buf))`

23229 the string stored in *buf* will contain the <space>-separated list of variable=value environment  
23230 variable pairs required by the implementation to create a conforming environment, as described  
23231 in the implementations' conformance documentation.

23232 If the implementation supports the POSIX shell option, the string stored in *buf* after a call to:

23233 `confstr(_CS_PATH, buf, sizeof(buf))`

23234 can be used as a value of the *PATH* environment variable that accesses all of the standard  
23235 utilities of POSIX.1-2008, if the return value is less than or equal to *sizeof(buf)*.

#### 23236 RETURN VALUE

23237 If *name* has a configuration-defined value, *confstr()* shall return the size of buffer that would be  
23238 needed to hold the entire configuration-defined value including the terminating null. If this  
23239 return value is greater than *len*, the string returned in *buf* is truncated.

23240 If *name* is invalid, *confstr()* shall return 0 and set *errno* to indicate the error.

23241 If *name* does not have a configuration-defined value, *confstr()* shall return 0 and leave *errno*  
23242 unchanged.

#### 23243 ERRORS

23244 The *confstr()* function shall fail if:

23245 [EINVAL] The value of the *name* argument is invalid.

#### 23246 EXAMPLES

23247 None.

#### 23248 APPLICATION USAGE

23249 An application can distinguish between an invalid *name* parameter value and one that  
23250 corresponds to a configurable variable that has no configuration-defined value by checking if  
23251 *errno* is modified. This mirrors the behavior of *sysconf()*.

23252 The original need for this function was to provide a way of finding the configuration-defined  
23253 default value for the environment variable *PATH*. Since *PATH* can be modified by the user to  
23254 include directories that could contain utilities replacing the standard utilities in the Shell and  
23255 Utilities volume of POSIX.1-2008, applications need a way to determine the system-supplied  
23256 *PATH* environment variable value that contains the correct search path for the standard utilities.

23257 An application could use:

23258 `confstr(name, (char *)NULL, (size_t)0)`

23259 to find out how big a buffer is needed for the string value; use *malloc()* to allocate a buffer to  
23260 hold the string; and call *confstr()* again to get the string. Alternately, it could allocate a fixed,  
23261 static buffer that is big enough to hold most answers (perhaps 512 or 1024 bytes), but then use  
23262 *malloc()* to allocate a larger buffer if it finds that this is too small.

#### 23263 RATIONALE

23264 Application developers can normally determine any configuration variable by means of reading  
23265 from the stream opened by a call to:

23266 `popen("command -p getconf variable", "r");`

23267 The *confstr()* function with a *name* argument of *\_CS\_PATH* returns a string that can be used as a

**confstr()**

- 23268 *PATH* environment variable setting that will reference the standard shell and utilities as  
23269 described in the Shell and Utilities volume of POSIX.1-2008.
- 23270 The *confstr()* function copies the returned string into a buffer supplied by the application instead  
23271 of returning a pointer to a string. This allows a cleaner function in some implementations (such  
23272 as those with lightweight threads) and resolves questions about when the application must copy  
23273 the string returned.
- 23274 **FUTURE DIRECTIONS**
- 23275 None.
- 23276 **SEE ALSO**
- 23277 *exec*, *fpathconf()*, *sysconf()*
- 23278 XBD <*unistd.h*>
- 23279 XCU *c99*
- 23280 **CHANGE HISTORY**
- 23281 First released in Issue 4. Derived from the ISO POSIX-2 standard.
- 23282 **Issue 5**
- 23283 A table indicating the permissible values of *name* is added to the DESCRIPTION. All those  
23284 marked EX are new in this version.
- 23285 **Issue 6**
- 23286 The Open Group Corrigendum U033/7 is applied. The return value for the case returning the  
23287 size of the buffer now explicitly states that this includes the terminating null.
- 23288 The following new requirements on POSIX implementations derive from alignment with the  
23289 Single UNIX Specification:
- 23290 • The DESCRIPTION is updated with new arguments which can be used to determine
  - 23291 configuration strings for C compiler flags, linker/loader flags, and libraries for each
  - 23292 different supported programming environment. This is a change to support data size
  - 23293 neutrality.
- 23294 The following changes were made to align with the IEEE P1003.1a draft standard:
- 23295 • The DESCRIPTION is updated to include text describing how *\_CS\_PATH* can be used to
  - 23296 obtain a *PATH* to access the standard utilities.
- 23297 The macros associated with the *c89* programming models are marked LEGACY and new  
23298 equivalent macros associated with *c99* are introduced.
- 23299 **Issue 7**
- 23300 Austin Group Interpretation 1003.1-2001 #047 is applied, adding the *\_CS\_V7\_ENV* variable.
- 23301 Austin Group Interpretations 1003.1-2001 #166 is applied to permit an additional compiler flag  
23302 to enable threads.
- 23303 The V6 variables for the supported programming environments are marked obsolescent.
- 23304 The variables for the supported programming environments are updated to be V7.
- 23305 The LEGACY variables and obsolescent values are removed.

23306 **NAME**

23307 conj, conjf, conjl — complex conjugate functions

23308 **SYNOPSIS**

23309 #include &lt;complex.h&gt;

23310 double complex conj(double complex z);

23311 float complex conjf(float complex z);

23312 long double complex conjl(long double complex z);

23313 **DESCRIPTION**

23314 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 23315 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23316 volume of POSIX.1-2008 defers to the ISO C standard.

23317 These functions shall compute the complex conjugate of *z*, by reversing the sign of its imaginary  
 23318 part.

23319 **RETURN VALUE**

23320 These functions return the complex conjugate value.

23321 **ERRORS**

23322 No errors are defined.

23323 **EXAMPLES**

23324 None.

23325 **APPLICATION USAGE**

23326 None.

23327 **RATIONALE**

23328 None.

23329 **FUTURE DIRECTIONS**

23330 None.

23335 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**connect()**

System Interfaces

23336 **NAME**

23337 connect — connect a socket

23338 **SYNOPSIS**

23339 #include &lt;sys/socket.h&gt;

23340 int connect(int *socket*, const struct sockaddr \**address*,  
23341 socklen\_t *address\_len*);23342 **DESCRIPTION**23343 The *connect()* function shall attempt to make a connection on a connection-mode socket or to set  
23344 or reset the peer address of a connectionless-mode socket. The function takes the following  
23345 arguments:

|       |                    |                                                                                                                                                     |
|-------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 23346 | <i>socket</i>      | Specifies the file descriptor associated with the socket.                                                                                           |
| 23347 | <i>address</i>     | Points to a <b>sockaddr</b> structure containing the peer address. The length and format of the address depend on the address family of the socket. |
| 23349 | <i>address_len</i> | Specifies the length of the <b>sockaddr</b> structure pointed to by the <i>address</i> argument.                                                    |

23351 If the socket has not already been bound to a local address, *connect()* shall bind it to an address  
23352 which, unless the socket's address family is AF\_UNIX, is an unused local address.23353 If the initiating socket is not connection-mode, then *connect()* shall set the socket's peer address,  
23354 and no connection is made. For SOCK\_DGRAM sockets, the peer address identifies where all  
23355 datagrams are sent on subsequent *send()* functions, and limits the remote sender for subsequent  
23356 *recv()* functions. If the *sa\_family* member of *address* is AF\_UNSPEC, the socket's peer address  
23357 shall be reset. Note that despite no connection being made, the term "connected" is used to  
23358 describe a connectionless-mode socket for which a peer address has been set.23359 If the initiating socket is connection-mode, then *connect()* shall attempt to establish a connection  
23360 to the address specified by the *address* argument. If the connection cannot be established  
23361 immediately and O\_NONBLOCK is not set for the file descriptor for the socket, *connect()* shall  
23362 block for up to an unspecified timeout interval until the connection is established. If the timeout  
23363 interval expires before the connection is established, *connect()* shall fail and the connection  
23364 attempt shall be aborted. If *connect()* is interrupted by a signal that is caught while blocked  
23365 waiting to establish a connection, *connect()* shall fail and set *errno* to [EINTR], but the connection  
23366 request shall not be aborted, and the connection shall be established asynchronously.23367 If the connection cannot be established immediately and O\_NONBLOCK is set for the file  
23368 descriptor for the socket, *connect()* shall fail and set *errno* to [EINPROGRESS], but the connection  
23369 request shall not be aborted, and the connection shall be established asynchronously. Subsequent  
23370 calls to *connect()* for the same socket, before the connection is established, shall fail and set *errno*  
23371 to [EALREADY].23372 When the connection has been established asynchronously, *pselect()*, *select()*, and *poll()* shall  
23373 indicate that the file descriptor for the socket is ready for writing.23374 The socket in use may require the process to have appropriate privileges to use the *connect()*  
23375 function.23376 **RETURN VALUE**23377 Upon successful completion, *connect()* shall return 0; otherwise, -1 shall be returned and *errno*  
23378 set to indicate the error.

23379 **ERRORS**

- 23380 The *connect()* function shall fail if:
- 23381 [EADDRNOTAVAIL]  
23382 The specified address is not available from the local machine.
- 23383 [EAFNOSUPPORT]  
23384 The specified address is not a valid address for the address family of the  
23385 specified socket.
- 23386 [EALREADY] A connection request is already in progress for the specified socket.
- 23387 [EBADF] The *socket* argument is not a valid file descriptor.
- 23388 [ECONNREFUSED]  
23389 The target address was not listening for connections or refused the connection  
23390 request.
- 23391 [EINPROGRESS] O\_NONBLOCK is set for the file descriptor for the socket and the connection  
23392 cannot be immediately established; the connection shall be established  
23393 asynchronously.
- 23394 [EINTR] The attempt to establish a connection was interrupted by delivery of a signal  
23395 that was caught; the connection shall be established asynchronously.
- 23396 [EISCONN] The specified socket is connection-mode and is already connected.
- 23397 [ENETUNREACH]  
23398 No route to the network is present.
- 23399 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 23400 [EPROTOTYPE] The specified address has a different type than the socket bound to the  
23401 specified peer address.
- 23402 [ETIMEDOUT] The attempt to connect timed out before a connection was made.
- 23403 If the address family of the socket is AF\_UNIX, then *connect()* shall fail if:
- 23404 [EIO] An I/O error occurred while reading from or writing to the file system.
- 23405 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname  
23406 in *address*.
- 23407 [ENAMETOOLONG]  
23408 The length of a component of a pathname is longer than {NAME\_MAX}.
- 23409 [ENOENT] A component of the pathname does not name an existing file or the pathname  
23410 is an empty string.
- 23411 [ENOTDIR] A component of the path prefix of the pathname in *address* is not a directory, or  
23412 the pathname in *address* contains at least one non-*<slash>* character and ends  
23413 with one or more trailing *<slash>* characters and the last pathname  
23414 component names an existing file that is neither a directory nor a symbolic  
23415 link to a directory.
- 23416 The *connect()* function may fail if:
- 23417 [EACCES] Search permission is denied for a component of the path prefix; or write access  
23418 to the named socket is denied.

**connect()**

System Interfaces

|       |                          |                                                                                                                                                                                     |
|-------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 23419 | [EADDRINUSE]             | Attempt to establish a connection that uses addresses that are already in use.                                                                                                      |
| 23420 | [ECONNRESET]             | Remote host reset the connection request.                                                                                                                                           |
| 23421 | [EHOSTUNREACH]           |                                                                                                                                                                                     |
| 23422 |                          | The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).                                                                      |
| 23423 |                          |                                                                                                                                                                                     |
| 23424 | [EINVAL]                 | The <i>address_len</i> argument is not a valid length for the address family, or invalid address family in the <b>sockaddr</b> structure.                                           |
| 23425 |                          |                                                                                                                                                                                     |
| 23426 | [ELOOP]                  | More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in <i>address</i> .                                                                       |
| 23427 |                          |                                                                                                                                                                                     |
| 23428 | [ENAMETOOLONG]           |                                                                                                                                                                                     |
| 23429 |                          | The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.                       |
| 23430 |                          |                                                                                                                                                                                     |
| 23431 |                          |                                                                                                                                                                                     |
| 23432 | [ENETDOWN]               | The local network interface used to reach the destination is down.                                                                                                                  |
| 23433 | [ENOBUFS]                | No buffer space is available.                                                                                                                                                       |
| 23434 | [EOPNOTSUPP]             | The socket is listening and cannot be connected.                                                                                                                                    |
| 23435 | <b>EXAMPLES</b>          |                                                                                                                                                                                     |
| 23436 |                          | None.                                                                                                                                                                               |
| 23437 | <b>APPLICATION USAGE</b> |                                                                                                                                                                                     |
| 23438 |                          | If <i>connect()</i> fails, the state of the socket is unspecified. Conforming applications should close the file descriptor and create a new socket before attempting to reconnect. |
| 23439 |                          |                                                                                                                                                                                     |
| 23440 | <b>RATIONALE</b>         |                                                                                                                                                                                     |

| 23455 |                          | Austin Group Interpretation 1003.1-2001 #188 is applied, changing the method used to reset a peer address for a datagram socket.                                                    |
| 23456 |                          |                                                                                                                                                                                     |
| 23457 |                          | SD5-XSH-ERN-185 is applied.                                                                                                                                                         |

23458 **NAME**

23459 copysign, copysignf, copysignl — number manipulation function

23460 **SYNOPSIS**

23461 #include &lt;math.h&gt;

23462 double copysign(double *x*, double *y*);23463 float copysignf(float *x*, float *y*);23464 long double copysignl(long double *x*, long double *y*);23465 **DESCRIPTION**

23466 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 23467 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23468 volume of POSIX.1-2008 defers to the ISO C standard.

23469 These functions shall produce a value with the magnitude of *x* and the sign of *y*. On  
 23470 implementations that represent a signed zero but do not treat negative zero consistently in  
 23471 arithmetic operations, these functions regard the sign of zero as positive.

23472 **RETURN VALUE**

23473 Upon successful completion, these functions shall return a value with the magnitude of *x* and  
 23474 the sign of *y*.

23475 **ERRORS**

23476 No errors are defined.

23477 **EXAMPLES**

23478 None.

23479 **APPLICATION USAGE**

23480 None.

23481 **RATIONALE**

23482 None.

23485 **SEE ALSO**23486 [signbit\(\)](#)23487 XBD [<math.h>](#)23488 **CHANGE HISTORY**

23489 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**cos()**23490 **NAME**

23491 cos, cosf, cosl — cosine function

23492 **SYNOPSIS**

```
23493 #include <math.h>
23494 double cos(double x);
23495 float cosf(float x);
23496 long double cosl(long double x);
```

23497 **DESCRIPTION**

23498 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 23499 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23500 volume of POSIX.1-2008 defers to the ISO C standard.

23501 These functions shall compute the cosine of their argument  $x$ , measured in radians.

23502 An application wishing to check for error situations should set *errno* to zero and call  
 23503 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 23504 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 23505 zero, an error has occurred.

23506 **RETURN VALUE**

23507 Upon successful completion, these functions shall return the cosine of  $x$ .

23508 **MX** If  $x$  is NaN, a NaN shall be returned.

23509 If  $x$  is  $\pm 0$ , the value 1.0 shall be returned.

23510 If  $x$  is  $\pm\text{Inf}$ , a domain error shall occur, and either a NaN (if supported), or an implementation-  
 23511 defined value shall be returned.

23512 **ERRORS**

23513 These functions shall fail if:

23514 **MX** **Domain Error** The  $x$  argument is  $\pm\text{Inf}$ .

23515 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 23516 then *errno* shall be set to [EDOM]. If the integer expression (*math\_errhandling*  
 23517 & MATH\_ERREXCEPT) is non-zero, then the invalid floating-point exception  
 23518 shall be raised.

23519 **EXAMPLES**23520 **Taking the Cosine of a 45-Degree Angle**

```
23521 #include <math.h>
23522 .
23523 double radians = 45 * M_PI / 180;
23524 double result;
23525 ...
23526 result = cos(radians);
```

23527 **APPLICATION USAGE**

23528 These functions may lose accuracy when their argument is near an odd multiple of  $\pi/2$  or is far  
 23529 from 0.

23530 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 23531 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23532 **RATIONALE**

23533 None.

23534 **FUTURE DIRECTIONS**

23535 None.

23540 First released in Issue 1. Derived from Issue 1 of the SVID.

23541 **Issue 5**23542 The DESCRIPTION is updated to indicate how an application should check for an error. This  
23543 text was previously published in the APPLICATION USAGE section.23544 **Issue 6**23545 The *cosf()* and *cosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.23546 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
23547 revised to align with the ISO/IEC 9899:1999 standard.23548 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
23549 marked.

**cosh()**23550 **NAME**

23551 cosh, coshf, coshl — hyperbolic cosine functions

23552 **SYNOPSIS**

```
23553 #include <math.h>
23554 double cosh(double x);
23555 float coshf(float x);
23556 long double coshl(long double x);
```

23557 **DESCRIPTION**

23558 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 23559 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23560 volume of POSIX.1-2008 defers to the ISO C standard.

23561 These functions shall compute the hyperbolic cosine of their argument *x*.

23562 An application wishing to check for error situations should set *errno* to zero and call  
 23563 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 23564 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 23565 zero, an error has occurred.

23566 **RETURN VALUE**23567 Upon successful completion, these functions shall return the hyperbolic cosine of *x*.

23568 If the correct value would cause overflow, a range error shall occur and *cosh()*, *coshf()*, and  
 23569 *coshl()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 23570 respectively.

23571 **MX** If *x* is NaN, a NaN shall be returned.23572 If *x* is  $\pm 0$ , the value 1.0 shall be returned.23573 If *x* is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned.23574 **ERRORS**

23575 These functions shall fail if:

23576 **Range Error** The result would cause an overflow.

23577 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 23578 then *errno* shall be set to [ERANGE]. If the integer expression  
 23579 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 23580 floating-point exception shall be raised.

23581 **EXAMPLES**

23582 None.

23583 **APPLICATION USAGE**

23584 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
 23585 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23586 For IEEE Std 754-1985 **double**,  $710.5 < |x|$  implies that *cosh(x)* has overflowed.23587 **RATIONALE**

23588 None.

23589 **FUTURE DIRECTIONS**

23590 None.

23610 **DESCRIPTION**23611           Refer to *cos()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

23612 **NAME**

23613 cpow, cpowf, cpowl — complex power functions

23614 **SYNOPSIS**

```
23615 #include <complex.h>
23616 double complex cpow(double complex x, double complex y);
23617 float complex cpowf(float complex x, float complex y);
23618 long double complex cpowl(long double complex x,
23619 long double complex y);
```

23620 **DESCRIPTION**

23621 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 23622 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23623 volume of POSIX.1-2008 defers to the ISO C standard.

23624 These functions shall compute the complex power function  $x^y$ , with a branch cut for the first  
 23625 parameter along the negative real axis.

23626 **RETURN VALUE**

23627 These functions shall return the complex power function value.

23628 **ERRORS**

23629 No errors are defined.

23630 **EXAMPLES**

23631 None.

23632 **APPLICATION USAGE**

23633 None.

23634 **RATIONALE**

23635 None.

23636 **FUTURE DIRECTIONS**

23637 None.

**cproj()**23643 **NAME**23644 `cproj`, `cprojf`, `cprojl` — complex projection functions23645 **SYNOPSIS**

```
23646 #include <complex.h>
23647 double complex cproj(double complex z);
23648 float complex cprojf(float complex z);
23649 long double complex cprojl(long double complex z);
```

23650 **DESCRIPTION**

23651 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 23652 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23653 volume of POSIX.1-2008 defers to the ISO C standard.

23654 These functions shall compute a projection of  $z$  onto the Riemann sphere:  $z$  projects to  $z$ , except  
 23655 that all complex infinities (even those with one infinite part and one NaN part) project to  
 23656 positive infinity on the real axis. If  $z$  has an infinite part, then  $cproj(z)$  shall be equivalent to:

```
23657 INFINITY + I * copysign(0.0, cimag(z))
```

23658 **RETURN VALUE**

23659 These functions shall return the value of the projection onto the Riemann sphere.

23660 **ERRORS**

23661 No errors are defined.

23662 **EXAMPLES**

23663 None.

23664 **APPLICATION USAGE**

23665 None.

23666 **RATIONALE**

23667 Two topologies are commonly used in complex mathematics: the complex plane with its  
 23668 continuum of infinities, and the Riemann sphere with its single infinity. The complex plane is  
 23669 better suited for transcendental functions, the Riemann sphere for algebraic functions. The  
 23670 complex types with their multiplicity of infinities provide a useful (though imperfect) model for  
 23671 the complex plane. The `cproj()` function helps model the Riemann sphere by mapping all  
 23672 infinities to one, and should be used just before any operation, especially comparisons, that  
 23673 might give spurious results for any of the other infinities. Note that a complex value with one  
 23674 infinite part and one NaN part is regarded as an infinity, not a NaN, because if one part is  
 23675 infinite, the complex value is infinite independent of the value of the other part. For the same  
 23676 reason, `cabs()` returns an infinity if its argument has an infinite part and a NaN part.

23677 **FUTURE DIRECTIONS**

23678 None.

23679 **SEE ALSO**23680 `carg()`, `cimag()`, `conj()`, `creal()`23681 XBD `<complex.h>`23682 **CHANGE HISTORY**

23683 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23684 **NAME**

23685 creal, crealf, creall — complex real functions

23686 **SYNOPSIS**

23687 #include &lt;complex.h&gt;

23688 double creal(double complex z);

23689 float crealf(float complex z);

23690 long double creall(long double complex z);

23691 **DESCRIPTION**

23692 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 23693 conflict between the requirements described here and the ISO C standard is unintentional. This  
 23694 volume of POSIX.1-2008 defers to the ISO C standard.

23695 These functions shall compute the real part of z.

23696 **RETURN VALUE**

23697 These functions shall return the real part value.

23698 **ERRORS**

23699 No errors are defined.

23700 **EXAMPLES**

23701 None.

23702 **APPLICATION USAGE**23703 For a variable z of type **complex**:23704 `z == creal(z) + cimag(z)*I`23705 **RATIONALE**

23706 None.

23707 **FUTURE DIRECTIONS**

23708 None.

23709 **SEE ALSO**23710 *carg()*, *cimag()*, *conj()*, *cproj()*

23711 XBD &lt;complex.h&gt;

23712 **CHANGE HISTORY**

23713 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**creat()**23714 **NAME**23715 `creat` — create a new file or rewrite an existing one23716 **SYNOPSIS**23717 OH `#include <sys/stat.h>`23718 `#include <fcntl.h>`23719 `int creat(const char *path, mode_t mode);`23720 **DESCRIPTION**23721 The `creat()` function shall behave as if it is implemented as follows:23722 `int creat(const char *path, mode_t mode)`23723 `{`23724 `return open(path, O_WRONLY|O_CREAT|O_TRUNC, mode);`23725 `}`23726 **RETURN VALUE**23727 Refer to `open()`.23728 **ERRORS**23729 Refer to `open()`.23730 **EXAMPLES**23731 **Creating a File**23732 The following example creates the file `/tmp/file` with read and write permissions for the file  
23733 owner and read permission for group and others. The resulting file descriptor is assigned to the  
23734 `fd` variable.23735 `#include <fcntl.h>`23736 `...`23737 `int fd;`23738 `mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;`23739 `char *filename = "/tmp/file";`23740 `...`23741 `fd = creat(filename, mode);`23742 `...`23743 **APPLICATION USAGE**

23744 None.

23745 **RATIONALE**23746 The `creat()` function is redundant. Its services are also provided by the `open()` function. It has  
23747 been included primarily for historical purposes since many existing applications depend on it. It  
23748 is best considered a part of the C binding rather than a function that should be provided in other  
23749 languages.23750 **FUTURE DIRECTIONS**

23751 None.

23752 **SEE ALSO**23753 `mknod()`, `open()`23754 XBD `<fcntl.h>`, `<sys/stat.h>`, `<sys/types.h>`

23755 **CHANGE HISTORY**

23756 First released in Issue 1. Derived from Issue 1 of the SVID.

23757 **Issue 6**

23758 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

23759 The following new requirements on POSIX implementations derive from alignment with the  
23760 Single UNIX Specification:

- 23761 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was  
23762 required for conforming implementations of previous POSIX specifications, it was not  
23763 required for UNIX applications.

23764 **Issue 7**

23765 SD5-XSH-ERN-186 is applied.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**crypt()**23766 **NAME**23767 crypt — string encoding function (**CRYPT**)23768 **SYNOPSIS**

```
23769 xSI #include <unistd.h>
23770 char *crypt(const char *key, const char *salt);
```

23771 **DESCRIPTION**23772 The *crypt()* function is a string encoding function. The algorithm is implementation-defined.23773 The *key* argument points to a string to be encoded. The *salt* argument shall be a string of at least  
23774 two bytes in length not including the null character chosen from the set:

```
23775 a b c d e f g h i j k l m n o p q r s t u v w x y z
23776 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
23777 0 1 2 3 4 5 6 7 8 9 . /
```

23778 The first two bytes of this string may be used to perturb the encoding algorithm.

23779 The return value of *crypt()* points to static data that is overwritten by each call.23780 The *crypt()* function need not be thread-safe.23781 **RETURN VALUE**23782 Upon successful completion, *crypt()* shall return a pointer to the encoded string. The first two  
23783 bytes of the returned value shall be those of the *salt* argument. Otherwise, it shall return a null  
23784 pointer and set *errno* to indicate the error.23785 **ERRORS**23786 The *crypt()* function shall fail if:

23787 [ENOSYS] The functionality is not supported on this implementation.

23788 **EXAMPLES**23789 **Encoding Passwords**

23790 The following example finds a user database entry matching a particular user name and changes  
23791 the current password to a new password. The *crypt()* function generates an encoded version of  
23792 each password. The first call to *crypt()* produces an encoded version of the old password; that  
23793 encoded password is then compared to the password stored in the user database. The second  
23794 call to *crypt()* encodes the new password before it is stored.

23795 The *putpwent()* function, used in the following example, is not part of POSIX.1-2008.

```
23796 #include <unistd.h>
23797 #include <pwd.h>
23798 #include <string.h>
23799 #include <stdio.h>
23800 ...
23801 int valid_change;
23802 int pfd; /* Integer for file descriptor returned by open(). */
23803 FILE *fpfd; /* File pointer for use in putpwent(). */
23804 struct passwd *p;
23805 char user[100];
23806 char oldpasswd[100];
23807 char newpasswd[100];
23808 char savepasswd[100];
```

```

23809     ...
23810     valid_change = 0;
23811     while ((p = getpwent()) != NULL) {
23812         /* Change entry if found. */
23813         if (strcmp(p->pw_name, user) == 0) {
23814             if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
23815                 strcpy(savepasswd, crypt(newpasswd, user));
23816                 p->pw_passwd = savepasswd;
23817                 valid_change = 1;
23818             }
23819             else {
23820                 fprintf(stderr, "Old password is not valid\n");
23821             }
23822         }
23823         /* Put passwd entry into ptmp. */
23824         putpwent(p, fpfd);
23825     }

```

**23826 APPLICATION USAGE**

23827 The values returned by this function need not be portable among XSI-conformant systems.

**23828 RATIONALE**

23829 None.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

24004 **NAME**

24005 ctermid — generate a pathname for the controlling terminal

24006 **SYNOPSIS**

```
24007 CX #include <stdio.h>
24008 char *ctermid(char *s);
```

24009 **DESCRIPTION**

24010 The *ctermid()* function shall generate a string that, when used as a pathname, refers to the  
 24011 current controlling terminal for the current process. If *ctermid()* returns a pathname, access to the  
 24012 file is not guaranteed.

24013 The *ctermid()* function need not be thread-safe if called with a NULL parameter.

24014 **RETURN VALUE**

24015 If *s* is a null pointer, the string shall be generated in an area that may be static (and therefore may  
 24016 be overwritten by each call), the address of which shall be returned. Otherwise, *s* is assumed to  
 24017 point to a character array of at least `L_ctermid` bytes; the string is placed in this array and the  
 24018 value of *s* shall be returned. The symbolic constant `L_ctermid` is defined in `<stdio.h>`, and shall  
 24019 have a value greater than 0.

24020 The *ctermid()* function shall return an empty string if the pathname that would refer to the  
 24021 controlling terminal cannot be determined, or if the function is unsuccessful.

24022 **ERRORS**

24023 No errors are defined.

24024 **EXAMPLES**24025 **Determining the Controlling Terminal for the Current Process**

24026 The following example returns a pointer to a string that identifies the controlling terminal for the  
 24027 current process. The pathname for the terminal is stored in the array pointed to by the *ptr*  
 24028 argument, which has a size of `L_ctermid` bytes, as indicated by the *term* argument.

```
24029 #include <stdio.h>
24030 ...
24031 char term[L_ctermid];
24032 char *ptr;
24033 ptr = ctermid(term);
```

24034 **APPLICATION USAGE**

24035 The difference between *ctermid()* and *ttyname()* is that *ttyname()* must be handed a file  
 24036 descriptor and return a path of the terminal associated with that file descriptor, while *ctermid()*  
 24037 returns a string (such as `"/dev/tty"`) that refers to the current controlling terminal if used as a  
 24038 pathname.

24039 **RATIONALE**

24040 `L_ctermid` must be defined appropriately for a given implementation and must be greater than  
 24041 zero so that array declarations using it are accepted by the compiler. The value includes the  
 24042 terminating null byte.

24043 Conforming applications that use multiple threads cannot call *ctermid()* with NULL as the  
 24044 parameter. If *s* is not NULL, the *ctermid()* function generates a string that, when used as a  
 24045 pathname, refers to the current controlling terminal for the current process. If *s* is NULL, the  
 24046 return value of *ctermid()* is undefined.

**ctermid()**

24047 There is no additional burden on the programmer—changing to use a hypothetical thread-safe  
24048 version of *ctermid()* along with allocating a buffer is more of a burden than merely allocating a  
24049 buffer. Application code should not assume that the returned string is short, as some  
24050 implementations have more than two pathname components before reaching a logical device  
24051 name.

**24052 FUTURE DIRECTIONS**

24053 None.

**24054 SEE ALSO**

24055 *ttyname()*

24056 XBD [<stdio.h>](#)

**24057 CHANGE HISTORY**

24058 First released in Issue 1. Derived from Issue 1 of the SVID.

**24059 Issue 5**

24060 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

**24061 Issue 6**

24062 The normative text is updated to avoid use of the term “must” for application requirements.

**24063 Issue 7**

24064 Austin Group Interpretation 1003.1-2001 #148 is applied, updating the RATIONALE.

24065 **NAME**

24066 ctime, ctime\_r — convert a time value to a date and time string

24067 **SYNOPSIS**

```
24068 OB #include <time.h>
24069 char *ctime(const time_t *clock);
24070 OB CX char *ctime_r(const time_t *clock, char *buf);
```

24071 **DESCRIPTION**

24072 CX For *ctime()*: The functionality described on this reference page is aligned with the ISO C  
 24073 standard. Any conflict between the requirements described here and the ISO C standard is  
 24074 unintentional. This volume of POSIX.1-2008 defers to the ISO C standard.

24075 The *ctime()* function shall convert the time pointed to by *clock*, representing time in seconds  
 24076 since the Epoch, to local time in the form of a string. It shall be equivalent to:

```
24077 asctime(localtime(clock))
```

24078 CX The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static  
 24079 objects: a broken-down time structure and an array of **char**. Execution of any of the functions  
 24080 may overwrite the information returned in either of these objects by any of the other functions.

24081 The *ctime()* function need not be thread-safe.

24082 The *ctime\_r()* function shall convert the calendar time pointed to by *clock* to local time in exactly  
 24083 the same form as *ctime()* and put the string into the array pointed to by *buf* (which shall be at  
 24084 least 26 bytes in size) and return *buf*.

24085 Unlike *ctime()*, the thread-safe version *ctime\_r()* is not required to set *tzname*.

24086 **RETURN VALUE**

24087 The *ctime()* function shall return the pointer returned by *asctime()* with that broken-down time  
 24088 as an argument.

24089 CX Upon successful completion, *ctime\_r()* shall return a pointer to the string pointed to by *buf*.  
 24090 When an error is encountered, a null pointer shall be returned.

24091 **ERRORS**

24092 No errors are defined.

24093 **EXAMPLES**

24094 None.

24095 **APPLICATION USAGE**

24096 These functions are included only for compatibility with older implementations. They have  
 24097 undefined behavior if the resulting string would be too long, so the use of these functions  
 24098 should be discouraged. On implementations that do not detect output string length overflow, it  
 24099 is possible to overflow the output buffers in such a way as to cause applications to fail, or  
 24100 possible system security violations. Also, these functions do not support localized date and time  
 24101 formats. To avoid these problems, applications should use *strftime()* to generate strings from  
 24102 broken-down times.

24103 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.

24104 The *ctime\_r()* function is thread-safe and shall return values in a user-supplied buffer instead of  
 24105 possibly using a static data area that may be overwritten by each call.

24106 Attempts to use *ctime()* or *ctime\_r()* for times before the Epoch or for times beyond the year 9999  
 24107 produce undefined results. Refer to *asctime()* (on page 590).

**ctime()**24108 **RATIONALE**

24109 The standard developers decided to mark the *ctime()* and *ctime\_r()* functions obsolescent even  
 24110 though they are in the ISO C standard due to the possibility of buffer overflow. The ISO C  
 24111 standard also provides the *strftime()* function which can be used to avoid these problems.

24112 **FUTURE DIRECTIONS**

24113 These functions may be removed in a future version.

24114 **SEE ALSO**

24115 *asctime()*, *clock()*, *difftime()*, *gmtime()*, *localtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*, *utime()*

24116 XBD <[time.h](#)>

24117 **CHANGE HISTORY**

24118 First released in Issue 1. Derived from Issue 1 of the SVID.

24119 **Issue 5**

24120 Normative text previously in the APPLICATION USAGE section is moved to the  
 24121 DESCRIPTION.

24122 The *ctime\_r()* function is included for alignment with the POSIX Threads Extension.

24123 A note indicating that the *ctime()* function need not be reentrant is added to the DESCRIPTION.

24124 **Issue 6**

24125 Extensions beyond the ISO C standard are marked.

24126 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

24127 The APPLICATION USAGE section is updated to include a note on the thread-safe function and  
 24128 its avoidance of possibly using a static data area.

24129 **Issue 7**

24130 Austin Group Interpretation 1003.1-2001 #156 is applied.

24131 SD5-XSH-ERN-25 is applied, updating the APPLICATION USAGE.

24132 Austin Group Interpretation 1003.1-2001 #053 is applied, marking these functions obsolescent.

24133 The *ctime\_r()* function is moved from the Thread-Safe Functions option to the Base.

24134 **NAME**

24135 daylight — daylight savings time flag

**dbm\_clearerr()**24141 **NAME**

24142 dbm\_clearerr, dbm\_close, dbm\_delete, dbm\_error, dbm\_fetch, dbm\_firstkey, dbm\_nextkey,  
24143 dbm\_open, dbm\_store — database functions

24144 **SYNOPSIS**

```
24145 xSI #include <ndbm.h>
24146 int dbm_clearerr(DBM *db);
24147 void dbm_close(DBM *db);
24148 int dbm_delete(DBM *db, datum key);
24149 int dbm_error(DBM *db);
24150 datum dbm_fetch(DBM *db, datum key);
24151 datum dbm_firstkey(DBM *db);
24152 datum dbm_nextkey(DBM *db);
24153 DBM *dbm_open(const char *file, int open_flags, mode_t file_mode);
24154 int dbm_store(DBM *db, datum key, datum content, int store_mode);
```

24155 **DESCRIPTION**

24156 These functions create, access, and modify a database.

24157 A **datum** consists of at least two members, *dptr* and *dsize*. The *dptr* member points to an object  
24158 that is *dsize* bytes in length. Arbitrary binary data, as well as character strings, may be stored in  
24159 the object pointed to by *dptr*.

24160 A database shall be stored in one or two files. When one file is used, the name of the database  
24161 file shall be formed by appending the suffix **.db** to the *file* argument given to *dbm\_open()*. When  
24162 two files are used, the names of the database files shall be formed by appending the suffixes **.dir**  
24163 and **.pag** respectively to the *file* argument.

24164 The *dbm\_open()* function shall open a database. The *file* argument to the function is the  
24165 pathname of the database. The *open\_flags* argument has the same meaning as the *flags* argument  
24166 of *open()* except that a database opened for write-only access opens the files for read and write  
24167 access and the behavior of the **O\_APPEND** flag is unspecified. The *file\_mode* argument has the  
24168 same meaning as the third argument of *open()*.

24169 The *dbm\_open()* function need not accept pathnames longer than  $\{\text{PATH\_MAX}\}-4$  bytes  
24170 (including the terminating null), or pathnames with a last component longer than  
24171  $\{\text{NAME\_MAX}\}-4$  bytes (excluding the terminating null).

24172 The *dbm\_close()* function shall close a database. The application shall ensure that argument *db* is  
24173 a pointer to a **dbm** structure that has been returned from a call to *dbm\_open()*.

24174 These database functions shall support an internal block size large enough to support  
24175 key/content pairs of at least 1 023 bytes.

24176 The *dbm\_fetch()* function shall read a record from a database. The argument *db* is a pointer to a  
24177 database structure that has been returned from a call to *dbm\_open()*. The argument *key* is a  
24178 **datum** that has been initialized by the application to the value of the key that matches the key of  
24179 the record the program is fetching.

24180 The *dbm\_store()* function shall write a record to a database. The argument *db* is a pointer to a  
24181 database structure that has been returned from a call to *dbm\_open()*. The argument *key* is a  
24182 **datum** that has been initialized by the application to the value of the key that identifies (for  
24183 subsequent reading, writing, or deleting) the record the application is writing. The argument  
24184 *content* is a **datum** that has been initialized by the application to the value of the record the  
24185 program is writing. The argument *store\_mode* controls whether *dbm\_store()* replaces any pre-  
24186 existing record that has the same key that is specified by the *key* argument. The application shall

24187 set *store\_mode* to either DBM\_INSERT or DBM\_REPLACE. If the database contains a record that  
 24188 matches the *key* argument and *store\_mode* is DBM\_REPLACE, the existing record shall be  
 24189 replaced with the new record. If the database contains a record that matches the *key* argument  
 24190 and *store\_mode* is DBM\_INSERT, the existing record shall be left unchanged and the new record  
 24191 ignored. If the database does not contain a record that matches the *key* argument and *store\_mode*  
 24192 is either DBM\_INSERT or DBM\_REPLACE, the new record shall be inserted in the database.

24193 If the sum of a key/content pair exceeds the internal block size, the result is unspecified.  
 24194 Moreover, the application shall ensure that all key/content pairs that hash together fit on a  
 24195 single block. The *dbm\_store()* function shall return an error in the event that a disk block fills  
 24196 with inseparable data.

24197 The *dbm\_delete()* function shall delete a record and its key from the database. The argument *db* is  
 24198 a pointer to a database structure that has been returned from a call to *dbm\_open()*. The argument  
 24199 *key* is a **datum** that has been initialized by the application to the value of the key that identifies  
 24200 the record the program is deleting.

24201 The *dbm\_firstkey()* function shall return the first key in the database. The argument *db* is a  
 24202 pointer to a database structure that has been returned from a call to *dbm\_open()*.

24203 The *dbm\_nextkey()* function shall return the next key in the database. The argument *db* is a  
 24204 pointer to a database structure that has been returned from a call to *dbm\_open()*. The application  
 24205 shall ensure that the *dbm\_firstkey()* function is called before calling *dbm\_nextkey()*. Subsequent  
 24206 calls to *dbm\_nextkey()* return the next key until all of the keys in the database have been  
 24207 returned.

24208 The *dbm\_error()* function shall return the error condition of the database. The argument *db* is a  
 24209 pointer to a database structure that has been returned from a call to *dbm\_open()*.

24210 The *dbm\_clearerr()* function shall clear the error condition of the database. The argument *db* is a  
 24211 pointer to a database structure that has been returned from a call to *dbm\_open()*.

24212 The *dptr* pointers returned by these functions may point into static storage that may be changed  
 24213 by subsequent calls.

24214 These functions need not be thread-safe.

#### 24215 RETURN VALUE

24216 The *dbm\_store()* and *dbm\_delete()* functions shall return 0 when they succeed and a negative  
 24217 value when they fail.

24218 The *dbm\_store()* function shall return 1 if it is called with a *flags* value of DBM\_INSERT and the  
 24219 function finds an existing record with the same key.

24220 The *dbm\_error()* function shall return 0 if the error condition is not set and return a non-zero  
 24221 value if the error condition is set.

24222 The return value of *dbm\_clearerr()* is unspecified.

24223 The *dbm\_firstkey()* and *dbm\_nextkey()* functions shall return a key **datum**. When the end of the  
 24224 database is reached, the *dptr* member of the key is a null pointer. If an error is detected, the *dptr*  
 24225 member of the key shall be a null pointer and the error condition of the database shall be set.

24226 The *dbm\_fetch()* function shall return a content **datum**. If no record in the database matches the  
 24227 key or if an error condition has been detected in the database, the *dptr* member of the content  
 24228 shall be a null pointer.

24229 The *dbm\_open()* function shall return a pointer to a database structure. If an error is detected  
 24230 during the operation, *dbm\_open()* shall return a **(DBM \*)0**.

**dbm\_clearerr()**24231 **ERRORS**

24232 No errors are defined.

24233 **EXAMPLES**

24234 None.

24235 **APPLICATION USAGE**

24236 The following code can be used to traverse the database:

24237 

```
for(key = dbm_firstkey(db); key.dpstr != NULL; key = dbm_nextkey(db))
```

24238 The *dbm\_\** functions provided in this library should not be confused in any way with those of a  
 24239 general-purpose database management system. These functions do not provide for multiple  
 24240 search keys per entry, they do not protect against multi-user access (in other words they do not  
 24241 lock records or files), and they do not provide the many other useful database functions that are  
 24242 found in more robust database management systems. Creating and updating databases by use of  
 24243 these functions is relatively slow because of data copies that occur upon hash collisions. These  
 24244 functions are useful for applications requiring fast lookup of relatively static information that is  
 24245 to be indexed by a single key.

24246 Note that a strictly conforming application is extremely limited by these functions: since there is  
 24247 no way to determine that the keys in use do not all hash to the same value (although that would  
 24248 be rare), a strictly conforming application cannot be guaranteed that it can store more than one  
 24249 block's worth of data in the database. As long as a key collision does not occur, additional data  
 24250 may be stored, but because there is no way to determine whether an error is due to a key  
 24251 collision or some other error condition (*dbm\_error()* being effectively a Boolean), once an error is  
 24252 detected, the application is effectively limited to guessing what the error might be if it wishes to  
 24253 continue using these functions.

24254 The *dbm\_delete()* function need not physically reclaim file space, although it does make it  
 24255 available for reuse by the database.

24256 After calling *dbm\_store()* or *dbm\_delete()* during a pass through the keys by *dbm\_firstkey()* and  
 24257 *dbm\_nextkey()*, the application should reset the database by calling *dbm\_firstkey()* before again  
 24258 calling *dbm\_nextkey()*. The contents of these files are unspecified and may not be portable.

24259 Applications should take care that database pathname arguments specified to *dbm\_open()* are  
 24260 not prefixes of unrelated files. This might be done, for example, by placing databases in a  
 24261 separate directory.

24262 Since some implementations use three characters for a suffix and others use four characters for a  
 24263 suffix, applications should ensure that the maximum portable pathname length passed to  
 24264 *dbm\_open()* is no greater than {PATH\_MAX}-4 bytes, with the last component of the pathname  
 24265 no greater than {NAME\_MAX}-4 bytes.

24266 **RATIONALE**

24267 Previously the standard required the database to be stored in two files, one file being a directory  
 24268 containing a bitmap of keys and having **.dir** as its suffix. The second file containing all data and  
 24269 having **.pag** as its suffix. This has been changed not to specify the use of the files and to allow  
 24270 newer implementations of the Berkeley DB interface using a single file that have evolved while  
 24271 remaining compatible with the application programming interface. The standard developers  
 24272 considered removing the specific suffixes altogether but decided to retain them so as not to  
 24273 pollute the application file name space more than necessary and to allow for portable backups of  
 24274 the database.

24275 **FUTURE DIRECTIONS**

24276 None.

24280 **CHANGE HISTORY**

24281 First released in Issue 4, Version 2.

24282 **Issue 5**

24283 Moved from X/OPEN UNIX extension to BASE.

24284 Normative text previously in the APPLICATION USAGE section is moved to the  
24285 DESCRIPTION.

24286 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

24287 **Issue 6**

24288 The normative text is updated to avoid use of the term “must” for application requirements.

24289 **Issue 7**24290 Austin Group Interpretation 1003.1-2001 #042 is applied so that the DESCRIPTION permits  
24291 newer implementations of the Berkeley DB interface.

24292 Austin Group Interpretation 1003.1-2001 #156 is applied.

**difftime()**24293 **NAME**24294 `difftime` — compute the difference between two calendar time values24295 **SYNOPSIS**24296 `#include <time.h>`24297 `double difftime(time_t time1, time_t time0);`24298 **DESCRIPTION**24299 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
24300 conflict between the requirements described here and the ISO C standard is unintentional. This  
24301 volume of POSIX.1-2008 defers to the ISO C standard.24302 The `difftime()` function shall compute the difference between two calendar times (as returned by  
24303 `time()`):  $time1 - time0$ .24304 **RETURN VALUE**24305 The `difftime()` function shall return the difference expressed in seconds as a type **double**.24306 **ERRORS**

24307 No errors are defined.

24308 **EXAMPLES**

24309 None.

24310 **APPLICATION USAGE**

24311 None.

24312 **RATIONALE**

24313 None.

24314 **FUTURE DIRECTIONS**

24315 None.

24316 **SEE ALSO**24317 `asctime()`, `clock()`, `ctime()`, `gmtime()`, `localtime()`, `mktime()`, `strftime()`, `strptime()`, `time()`, `utime()`24318 XBD `<time.h>`24319 **CHANGE HISTORY**

24320 First released in Issue 4. Derived from the ISO C standard.

24321 **NAME**

24322 dirfd — extract the file descriptor used by a DIR stream

24323 **SYNOPSIS**

```
24324 #include <dirent.h>
24325 int dirfd(DIR *dirp);
```

24326 **DESCRIPTION**

24327 The *dirfd()* function shall return a file descriptor referring to the same directory as the *dirp* argument. This file descriptor shall be closed by a call to *closedir()*. If any attempt is made to close the file descriptor, or to modify the state of the associated description, other than by means of *closedir()*, *readdir()*, *readdir\_r()*, or *rewinddir()*, the behavior is undefined.

24331 **RETURN VALUE**

24332 Upon successful completion, the *dirfd()* function shall return an integer which contains a file descriptor for the stream pointed to by *dirp*. Otherwise, it shall return  $-1$  and may set *errno* to indicate the error.

24335 **ERRORS**24336 The *dirfd()* function may fail if:

- |       |           |                                                                                            |
|-------|-----------|--------------------------------------------------------------------------------------------|
| 24337 | [EINVAL]  | The <i>dirp</i> argument does not refer to a valid directory stream.                       |
| 24338 | [ENOTSUP] | The implementation does not support the association of a file descriptor with a directory. |

24340 **EXAMPLES**

24341 None.

24342 **APPLICATION USAGE**

24343 The *dirfd()* function is intended to be a mechanism by which an application may obtain a file descriptor to use for the *fchdir()* function.

24345 **RATIONALE**

24346 This interface was introduced because the Base Definitions volume of POSIX.1-2008 does not make public the **DIR** data structure. Applications tend to use the *fchdir()* function on the file descriptor returned by this interface, and this has proven useful for security reasons; in particular, it is a better technique than others where directory names might change.

24350 The description uses the term “a file descriptor” rather than “the file descriptor”. The implication intended is that an implementation that does not use an *fd* for *diropen()* could still *open()* the directory to implement the *dirfd()* function. Such a descriptor must be closed later during a call to *closedir()*.

24354 An implementation that does not support file descriptors referring to directories may fail with [ENOTSUP].

24356 If it is necessary to allocate an *fd* to be returned by *dirfd()*, it should be done at the time of a call to *opendir()*.

24358 **FUTURE DIRECTIONS**

24359 None.

24360 **SEE ALSO**24361 *closedir()*, *fchdir()*, *fdopendir()*, *fileno()*, *open()*, *readdir()*24362 XBD [<dirent.h>](#)

24365 **NAME**

24366            dirname — report the parent directory name of a file pathname

24367 **SYNOPSIS**

```
24368 XSI      #include <libgen.h>
24369         char *dirname(char *path);
```

24370 **DESCRIPTION**

24371        The *dirname()* function shall take a pointer to a character string that contains a pathname, and  
 24372        return a pointer to a string that is a pathname of the parent directory of that file. Trailing '/'  
 24373        characters in the path are not counted as part of the path.

24374        If *path* does not contain a '/', then *dirname()* shall return a pointer to the string ".". If *path* is a  
 24375        null pointer or points to an empty string, *dirname()* shall return a pointer to the string ".".

24376        The *dirname()* function need not be thread-safe.

24377 **RETURN VALUE**

24378        The *dirname()* function shall return a pointer to a string that is the parent directory of *path*. If  
 24379        *path* is a null pointer or points to an empty string, a pointer to a string "." is returned.

24380        The *dirname()* function may modify the string pointed to by *path*, and may return a pointer to  
 24381        static storage that may then be overwritten by subsequent calls to *dirname()*.

24382 **ERRORS**

24383        No errors are defined.

24384 **EXAMPLES**

24385        The following code fragment reads a pathname, changes the current working directory to the  
 24386        parent directory, and opens the file.

```
24387     char *path = NULL, *pathcopy;
24388     size_t buflen = 0;
24389     ssize_t linelen = 0;
24390     int fd;
24391
24392     linelen = getline(&path, &buflen, stdin);
24393     path[linelen-1] = 0;
24394     pathcopy = strdup(path);
24395     if (chdir(dirname(pathcopy)) < 0) {
24396         ...
24397     }
24398     if ((fd = open(basename(path), O_RDONLY)) >= 0) {
24399         ...
24400         close (fd);
24401     }
24402     ...
24403     free (pathcopy);
24404     free (path);
```

# dirname()

24404 **Sample Input and Output Strings for dirname()**

24405 In the following table, the input string is the value pointed to by *path*, and the output string is  
 24406 the return value of the *dirname()* function.

| Input String | Output String |
|--------------|---------------|
| "/usr/lib"   | "/usr"        |
| "/usr/"      | "/"           |
| "usr"        | "."           |
| "/"          | "/"           |
| "."          | "."           |
| "."          | "."           |

24414 **APPLICATION USAGE**

24415 The *dirname()* and *basename()* functions together yield a complete pathname. The expression  
 24416 *dirname(path)* obtains the pathname of the directory where *basename(path)* is found.

24417 Since the meaning of the leading *"/"* is implementation-defined, *dirname("//foo)* may return  
 24418 either *"/"* or *'/'* (but nothing else).

24419 **RATIONALE**

24420 None.

24421 **FUTURE DIRECTIONS**

24422 None.

24429 Moved from X/OPEN UNIX extension to BASE.

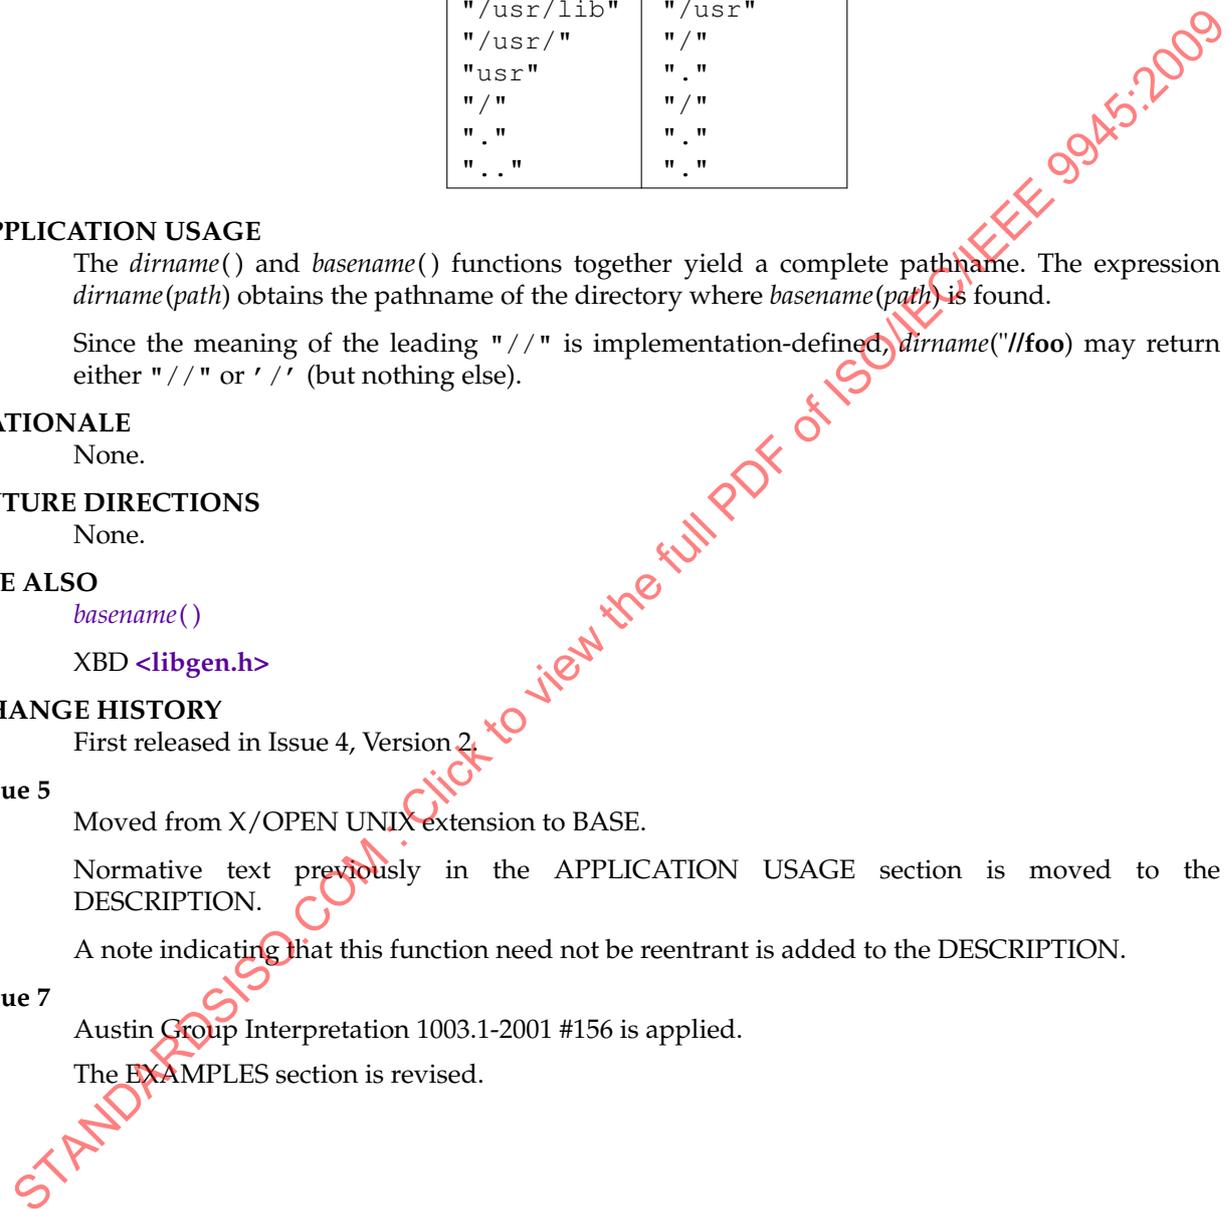

24430 Normative text previously in the APPLICATION USAGE section is moved to the  
 24431 DESCRIPTION.

24432 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

24433 **Issue 7**

24434 Austin Group Interpretation 1003.1-2001 #156 is applied.

24435 The EXAMPLES section is revised.

24436 **NAME**

24437 div — compute the quotient and remainder of an integer division

24438 **SYNOPSIS**

24439 #include &lt;stdlib.h&gt;

24440 div\_t div(int *numer*, int *denom*);24441 **DESCRIPTION**

24442 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 24443 conflict between the requirements described here and the ISO C standard is unintentional. This  
 24444 volume of POSIX.1-2008 defers to the ISO C standard.

24445 The *div()* function shall compute the quotient and remainder of the division of the numerator  
 24446 *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the integer  
 24447 of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be  
 24448 represented, the behavior is undefined; otherwise,  $quot * denom + rem$  shall equal *numer*.

24449 **RETURN VALUE**

24450 The *div()* function shall return a structure of type **div\_t**, comprising both the quotient and the  
 24451 remainder. The structure includes the following members, in any order:

```
24452 int quot; /* quotient */
24453 int rem; /* remainder */
```

24454 **ERRORS**

24468 First released in Issue 4. Derived from the ISO C standard.

**dlclose()**24469 **NAME**24470 `dlclose` — close a `dlopen()` object24471 **SYNOPSIS**

```
24472 #include <dlfcn.h>
24473 int dlclos(void *handle);
```

24474 **DESCRIPTION**

24475 The `dlclose()` function shall inform the system that the object referenced by a `handle` returned  
 24476 from a previous `dlopen()` invocation is no longer needed by the application.

24477 The use of `dlclose()` reflects a statement of intent on the part of the process, but does not create  
 24478 any requirement upon the implementation, such as removal of the code or symbols referenced  
 24479 by `handle`. Once an object has been closed using `dlclose()` an application should assume that its  
 24480 symbols are no longer available to `dlsym()`. All objects loaded automatically as a result of  
 24481 invoking `dlopen()` on the referenced object shall also be closed if this is the last reference to it.

24482 Although a `dlclose()` operation is not required to remove structures from an address space,  
 24483 neither is an implementation prohibited from doing so. The only restriction on such a removal is  
 24484 that no object shall be removed to which references have been relocated, until or unless all such  
 24485 references are removed. For instance, an object that had been loaded with a `dlopen()` operation  
 24486 specifying the `RTLD_GLOBAL` flag might provide a target for dynamic relocations performed in  
 24487 the processing of other objects—in such environments, an application may assume that no  
 24488 relocation, once made, shall be undone or remade unless the object requiring the relocation has  
 24489 itself been removed.

24490 **RETURN VALUE**

24491 If the referenced object was successfully closed, `dlclose()` shall return 0. If the object could not be  
 24492 closed, or if `handle` does not refer to an open object, `dlclose()` shall return a non-zero value. More  
 24493 detailed diagnostic information shall be available through `dLError()`.

24494 **ERRORS**

24495 No errors are defined.

24496 **EXAMPLES**24497 The following example illustrates use of `dlopen()` and `dlclose()`:

```
24498 ...
24499 /* Open a dynamic library and then close it ... */
24500 #include <dlfcn.h>
24501 void *mylib;
24502 int eret;
24503
24504 mylib = dlopen("mylib.so", RTLD_LOCAL | RTLD_LAZY);
24505 eret = dlclos(mylib);
24506 ...
```

24507 **APPLICATION USAGE**

24508 A conforming application should employ a `handle` returned from a `dlopen()` invocation only  
 24509 within a given scope bracketed by the `dlopen()` and `dlclose()` operations. Implementations are  
 24510 free to use reference counting or other techniques such that multiple calls to `dlopen()` referencing  
 24511 the same object may return the same object for `handle`. Implementations are also free to reuse a  
 24512 `handle`. For these reasons, the value of a `handle` must be treated as an opaque object by the  
 24513 application, used only in calls to `dlsym()` and `dlclose()`.

24514 **RATIONALE**

24515 None.

24516 **FUTURE DIRECTIONS**

24517 None.

24518 **SEE ALSO**24519 *dLError()*, *dlopen()*, *dlsym()*

24520 XBD &lt;dlfcn.h&gt;

24521 **CHANGE HISTORY**

24522 First released in Issue 5.

24523 **Issue 6**24524 The DESCRIPTION is updated to say that the referenced object is closed “if this is the last  
24525 reference to it”.24526 **Issue 7**24527 The *dlopen()* function is moved from the XSI option to Base.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**dlerror()**24528 **NAME**24529 `dlerror` — get diagnostic information24530 **SYNOPSIS**

```
24531 #include <dlfcn.h>
24532 char *dlerror(void);
```

24533 **DESCRIPTION**

24534 The `dlerror()` function shall return a null-terminated character string (with no trailing  
 24535 <newline>) that describes the last error that occurred during dynamic linking processing. If no  
 24536 dynamic linking errors have occurred since the last invocation of `dlerror()`, `dlerror()` shall return  
 24537 NULL. Thus, invoking `dlerror()` a second time, immediately following a prior invocation, shall  
 24538 result in NULL being returned.

24539 The `dlerror()` function need not be thread-safe.

24540 **RETURN VALUE**

24541 If successful, `dlerror()` shall return a null-terminated character string; otherwise, NULL shall be  
 24542 returned.

24543 **ERRORS**

24544 No errors are defined.

24545 **EXAMPLES**

24546 The following example prints out the last dynamic linking error:

```
24547 ...
24548 #include <dlfcn.h>
24549 char *errstr;
24550 errstr = dlerror();
24551 if (errstr != NULL)
24552     printf ("A dynamic linking error occurred: (%s)\n", errstr);
24553 ...
```

24554 **APPLICATION USAGE**

24555 The messages returned by `dlerror()` may reside in a static buffer that is overwritten on each call  
 24556 to `dlerror()`. Application code should not write to this buffer. Programs wishing to preserve an  
 24557 error message should make their own copies of that message. Depending on the application  
 24558 environment with respect to asynchronous execution events, such as signals or other  
 24559 asynchronous computation sharing the address space, conforming applications should use a  
 24560 critical section to retrieve the error pointer and buffer.

24561 **RATIONALE**

24562 None.

24563 **FUTURE DIRECTIONS**

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**dlopen()**24575 **NAME**24576 `dlopen` — gain access to an executable object file24577 **SYNOPSIS**24578 `#include <dlfcn.h>`24579 `void *dlopen(const char *file, int mode);`24580 **DESCRIPTION**

24581 The `dlopen()` function shall make an executable object file specified by *file* available to the calling  
 24582 program. The class of files eligible for this operation and the manner of their construction are  
 24583 implementation-defined, though typically such files are executable objects such as shared  
 24584 libraries, relocatable files, or programs. Note that some implementations permit the construction  
 24585 of dependencies between such objects that are embedded within files. In such cases, a `dlopen()`  
 24586 operation shall load such dependencies in addition to the object referenced by *file*.  
 24587 Implementations may also impose specific constraints on the construction of programs that can  
 24588 employ `dlopen()` and its related services.

24589 A successful `dlopen()` shall return a *handle* which the caller may use on subsequent calls to  
 24590 `dlsym()` and `dlclose()`. The value of this *handle* should not be interpreted in any way by the caller.

24591 The *file* argument is used to construct a pathname to the object file. If *file* contains a <slash>  
 24592 character, the *file* argument is used as the pathname for the file. Otherwise, *file* is used in an  
 24593 implementation-defined manner to yield a pathname.

24594 If the value of *file* is 0, `dlopen()` shall provide a *handle* on a global symbol object. This object shall  
 24595 provide access to the symbols from an ordered set of objects consisting of the original program  
 24596 image file, together with any objects loaded at program start-up as specified by that process  
 24597 image file (for example, shared libraries), and the set of objects loaded using a `dlopen()` operation  
 24598 together with the `RTLD_GLOBAL` flag. As the latter set of objects can change during execution,  
 24599 the set identified by *handle* can also change dynamically.

24600 Only a single copy of an object file is brought into the address space, even if `dlopen()` is invoked  
 24601 multiple times in reference to the file, and even if different pathnames are used to reference the  
 24602 file.

24603 The *mode* parameter describes how `dlopen()` shall operate upon *file* with respect to the processing  
 24604 of relocations and the scope of visibility of the symbols provided within *file*. When an object is  
 24605 brought into the address space of a process, it may contain references to symbols whose  
 24606 addresses are not known until the object is loaded. These references shall be relocated before the  
 24607 symbols can be accessed. The *mode* parameter governs when these relocations take place and  
 24608 may have the following values:

|       |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 24609 | <code>RTLD_LAZY</code> | Relocations shall be performed at an implementation-defined time,<br>ranging from the time of the <code>dlopen()</code> call until the first reference to a<br>given symbol occurs. Specifying <code>RTLD_LAZY</code> should improve<br>performance on implementations supporting dynamic symbol binding as<br>a process may not reference all of the functions in any given object. And,<br>for systems supporting dynamic symbol resolution for normal process<br>execution, this behavior mimics the normal handling of process<br>execution. |
|-------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|       |                       |                                                                                                                                                                                                                                                                                                                                                          |
|-------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 24617 | <code>RTLD_NOW</code> | All necessary relocations shall be performed when the object is first<br>loaded. This may waste some processing if relocations are performed for<br>functions that are never referenced. This behavior may be useful for<br>applications that need to know as soon as an object is loaded that all<br>symbols referenced during execution are available. |
|-------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

24622 Any object loaded by *dlopen()* that requires relocations against global symbols can reference the  
 24623 symbols in the original process image file, any objects loaded at program start-up, from the  
 24624 object itself as well as any other object included in the same *dlopen()* invocation, and any objects  
 24625 that were loaded in any *dlopen()* invocation and which specified the RTLD\_GLOBAL flag. To  
 24626 determine the scope of visibility for the symbols loaded with a *dlopen()* invocation, the *mode*  
 24627 parameter should be a bitwise-inclusive OR with one of the following values:

24628 RTLD\_GLOBAL The object's symbols shall be made available for the relocation processing  
 24629 of any other object. In addition, symbol lookup using *dlopen(0, mode)* and  
 24630 an associated *dlsym()* allows objects loaded with this *mode* to be searched.

24631 RTLD\_LOCAL The object's symbols shall not be made available for the relocation  
 24632 processing of any other object.

24633 If neither RTLD\_GLOBAL nor RTLD\_LOCAL are specified, then the default behavior is  
 24634 unspecified.

24635 If a *file* is specified in multiple *dlopen()* invocations, *mode* is interpreted at each invocation. Note,  
 24636 however, that once RTLD\_NOW has been specified all relocations shall have been completed  
 24637 rendering further RTLD\_NOW operations redundant and any further RTLD\_LAZY operations  
 24638 irrelevant. Similarly, note that once RTLD\_GLOBAL has been specified the object shall maintain  
 24639 the RTLD\_GLOBAL status regardless of any previous or future specification of RTLD\_LOCAL,  
 24640 as long as the object remains in the address space (see *dlclose()*).

24641 Symbols introduced into a program through calls to *dlopen()* may be used in relocation activities.  
 24642 Symbols so introduced may duplicate symbols already defined by the program or previous  
 24643 *dlopen()* operations. To resolve the ambiguities such a situation might present, the resolution of a  
 24644 symbol reference to symbol definition is based on a symbol resolution order. Two such  
 24645 resolution orders are defined: *load* or *dependency* ordering. Load order establishes an ordering  
 24646 among symbol definitions, such that the definition first loaded (including definitions from the  
 24647 image file and any dependent objects loaded with it) has priority over objects added later (via  
 24648 *dlopen()*). Load ordering is used in relocation processing. Dependency ordering uses a breadth-  
 24649 first order starting with a given object, then all of its dependencies, then any dependents of  
 24650 those, iterating until all dependencies are satisfied. With the exception of the global symbol  
 24651 object obtained via a *dlopen()* operation on a *file* of 0, dependency ordering is used by the  
 24652 *dlsym()* function. Load ordering is used in *dlsym()* operations upon the global symbol object.

24653 When an object is first made accessible via *dlopen()* it and its dependent objects are added in  
 24654 dependency order. Once all the objects are added, relocations are performed using load order.  
 24655 Note that if an object or its dependencies had been previously loaded, the load and dependency  
 24656 orders may yield different resolutions.

24657 The symbols introduced by *dlopen()* operations and available through *dlsym()* are at a minimum  
 24658 those which are exported as symbols of global scope by the object. Typically such symbols shall  
 24659 be those that were specified in (for example) C source code as having *extern* linkage. The precise  
 24660 manner in which an implementation constructs the set of exported symbols for a *dlopen()* object  
 24661 is specified by that implementation.

#### 24662 RETURN VALUE

24663 If *file* cannot be found, cannot be opened for reading, is not of an appropriate object format for  
 24664 processing by *dlopen()*, or if an error occurs during the process of loading *file* or relocating its  
 24665 symbolic references, *dlopen()* shall return NULL. More detailed diagnostic information shall be  
 24666 available through *dlerror()*.

**dlopen()**24667 **ERRORS**

24668 No errors are defined.

24669 **EXAMPLES**24670 Refer to *dlsym()* (on page 735).24671 **APPLICATION USAGE**

24672 None.

24673 **RATIONALE**

24674 None.

24675 **FUTURE DIRECTIONS**

24676 None.

24677 **SEE ALSO**24678 *dlclose()*, *dlderror()*, *dlsym()*24679 XBD **<dlfcn.h>**24680 **CHANGE HISTORY**

24681 First released in Issue 5.

24682 **Issue 6**24683 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/21 is applied, changing the default  
24684 behavior in the DESCRIPTION when neither RTLD\_GLOBAL nor RTLD\_LOCAL are specified  
24685 from implementation-defined to unspecified.24686 **Issue 7**24687 The *dlopen()* function is moved from the XSI option to the Base.24688 The EXAMPLES section is updated to refer to *dlsym()*.

24689 **NAME**24690 dlsym — obtain the address of a symbol from a *dlopen()* object24691 **SYNOPSIS**

24692 #include &lt;dlfcn.h&gt;

24693 void \*dlsym(void \*restrict handle, const char \*restrict name);

24694 **DESCRIPTION**

24695 The *dlsym()* function shall obtain the address of a symbol defined within an object made  
 24696 accessible through a *dlopen()* call. The *handle* argument is the value returned from a call to  
 24697 *dlopen()* (and which has not since been released via a call to *dlclose()*), and *name* is the symbol's  
 24698 name as a character string.

24699 The *dlsym()* function shall search for the named symbol in all objects loaded automatically as a  
 24700 result of loading the object referenced by *handle* (see *dlopen()*). Load ordering is used in *dlsym()*  
 24701 operations upon the global symbol object. The symbol resolution algorithm used shall be  
 24702 dependency order as described in *dlopen()*.

24703 The RTLD\_DEFAULT and RTLD\_NEXT flags are reserved for future use.

24704 **RETURN VALUE**

24705 If *handle* does not refer to a valid object opened by *dlopen()*, or if the named symbol cannot be  
 24706 found within any of the objects associated with *handle*, *dlsym()* shall return NULL. More  
 24707 detailed diagnostic information shall be available through *dLError()*.

24708 **ERRORS**

24709 No errors are defined.

24710 **EXAMPLES**

24711 The following example shows how *dlopen()* and *dlsym()* can be used to access either function or  
 24712 data objects. For simplicity, error checking has been omitted.

```
24713 void    *handle;
24714 int     *iptr, (*fptr)(int);

24715 /* open the needed object */
24716 handle = dlopen("/usr/home/me/libfoo.so", RTLD_LOCAL | RTLD_LAZY);

24717 /* find the address of function and data objects */
24718 *(void **)(&fptr) = dlsym(handle, "my_function");
24719 iptr = (int *)dlsym(handle, "my_object");

24720 /* invoke function, passing value of integer as a parameter */
24721 (*fptr)(*iptr);
```

24722 **APPLICATION USAGE**

24723 Special purpose values for *handle* are reserved for future use. These values and their meanings  
 24724 are:

24725 RTLD\_DEFAULT The symbol lookup happens in the normal global scope; that is, a search for a  
 24726 symbol using this handle would find the same definition as a direct use of this  
 24727 symbol in the program code.

24728 RTLD\_NEXT Specifies the next object after this one that defines *name*. *This one* refers to the  
 24729 object containing the invocation of *dlsym()*. The *next* object is the one found  
 24730 upon the application of a load order symbol resolution algorithm (see  
 24731 *dlopen()*). The next object is either one of global scope (because it was  
 24732 introduced as part of the original process image or because it was added with  
 24733 a *dlopen()* operation including the RTLD\_GLOBAL flag), or is an object that

**dlsym()**

24734 was included in the same *dlopen()* operation that loaded this one.

24735 The RTLD\_NEXT flag is useful to navigate an intentionally created hierarchy

24736 of multiply-defined symbols created through *interposition*. For example, if a

24737 program wished to create an implementation of *malloc()* that embedded some

24738 statistics gathering about memory allocations, such an implementation could

24739 use the real *malloc()* definition to perform the memory allocation—and itself

24740 only embed the necessary logic to implement the statistics gathering function.

**RATIONALE**

24741 The ISO C standard does not require that pointers to functions can be cast back and forth to

24742 pointers to data. However, POSIX-conforming implementations are required to support this, as

24743 noted in [Section 2.12.3](#) (on page 541). The result of converting a pointer to a function into a

24744 pointer to another data type (except **void \***) is still undefined, however.

24746 Note that compilers conforming to the ISO C standard are required to generate a warning if a

24747 conversion from a **void \*** pointer to a function pointer is attempted as in:

```
24748 fptr = (int (*)(int))dlsym(handle, "my_function");
```

**FUTURE DIRECTIONS**

24749 None.

**drand48()**24772 **NAME**

24773 **drand48**, **erand48**, **jrand48**, **lcong48**, **lrand48**, **mrnd48**, **nrnd48**, **seed48**, **srand48** — generate  
 24774 uniformly distributed pseudo-random numbers

24775 **SYNOPSIS**

```
24776 XSI #include <stdlib.h>
24777 double drand48(void);
24778 double erand48(unsigned short xsubi[3]);
24779 long jrand48(unsigned short xsubi[3]);
24780 void lcong48(unsigned short param[7]);
24781 long lrand48(void);
24782 long mrnd48(void);
24783 long nrnd48(unsigned short xsubi[3]);
24784 unsigned short *seed48(unsigned short seed16v[3]);
24785 void srand48(long seedval);
```

24786 **DESCRIPTION**

24787 This family of functions shall generate pseudo-random numbers using a linear congruential  
 24788 algorithm and 48-bit integer arithmetic.

24789 The *drand48()* and *erand48()* functions shall return non-negative, double-precision, floating-  
 24790 point values, uniformly distributed over the interval [0,0,1.0).

24791 The *lrand48()* and *nrnd48()* functions shall return non-negative, long integers, uniformly  
 24792 distributed over the interval [0,2<sup>31</sup>).

24793 The *mrnd48()* and *jrand48()* functions shall return signed long integers uniformly distributed  
 24794 over the interval [-2<sup>31</sup>,2<sup>31</sup>).

24795 The *srand48()*, *seed48()*, and *lcong48()* functions are initialization entry points, one of which  
 24796 should be invoked before either *drand48()*, *lrand48()*, or *mrnd48()* is called. (Although it is not  
 24797 recommended practice, constant default initializer values shall be supplied automatically if  
 24798 *drand48()*, *lrand48()*, or *mrnd48()* is called without a prior call to an initialization entry point.)  
 24799 The *erand48()*, *nrnd48()*, and *jrand48()* functions do not require an initialization entry point to  
 24800 be called first.

24801 All the routines work by generating a sequence of 48-bit integer values,  $X_i$ , according to the  
 24802 linear congruential formula:

$$24803 X_{n+1} = (aX_n + c)_{\text{mod } m} \quad n \geq 0$$

24804 The parameter  $m = 2^{48}$ ; hence 48-bit integer arithmetic is performed. Unless *lcong48()* is invoked,  
 24805 the multiplier value  $a$  and the addend value  $c$  are given by:

$$24806 a = 5DEECE66D_{16} = 273673163155_8$$

$$24807 c = B_{16} = 13_8$$

24808 The value returned by any of the *drand48()*, *erand48()*, *jrand48()*, *lrand48()*, *mrnd48()*, or  
 24809 *nrnd48()* functions is computed by first generating the next 48-bit  $X_i$  in the sequence. Then the  
 24810 appropriate number of bits, according to the type of data item to be returned, are copied from  
 24811 the high-order (leftmost) bits of  $X_i$  and transformed into the returned value.

24812 The *drand48()*, *lrand48()*, and *mrnd48()* functions store the last 48-bit  $X_i$  generated in an  
 24813 internal buffer; that is why the application shall ensure that these are initialized prior to being  
 24814 invoked. The *erand48()*, *nrnd48()*, and *jrand48()* functions require the calling program to

24815 provide storage for the successive  $X_i$  values in the array specified as an argument when the  
 24816 functions are invoked. That is why these routines do not have to be initialized; the calling  
 24817 program merely has to place the desired initial value of  $X_i$  into the array and pass it as an  
 24818 argument. By using different arguments, *erand48()*, *nrand48()*, and *rand48()* allow separate  
 24819 modules of a large program to generate several *independent* streams of pseudo-random numbers;  
 24820 that is, the sequence of numbers in each stream shall *not* depend upon how many times the  
 24821 routines are called to generate numbers for the other streams.

24822 The initializer function *srand48()* sets the high-order 32 bits of  $X_i$  to the low-order 32 bits  
 24823 contained in its argument. The low-order 16 bits of  $X_i$  are set to the arbitrary value  $330E_{16}$ .

24824 The initializer function *seed48()* sets the value of  $X_i$  to the 48-bit value specified in the argument  
 24825 array. The low-order 16 bits of  $X_i$  are set to the low-order 16 bits of *seed16v*[0]. The mid-order 16  
 24826 bits of  $X_i$  are set to the low-order 16 bits of *seed16v*[1]. The high-order 16 bits of  $X_i$  are set to the  
 24827 low-order 16 bits of *seed16v*[2]. In addition, the previous value of  $X_i$  is copied into a 48-bit  
 24828 internal buffer, used only by *seed48()*, and a pointer to this buffer is the value returned by  
 24829 *seed48()*. This returned pointer, which can just be ignored if not needed, is useful if a program is  
 24830 to be restarted from a given point at some future time—use the pointer to get at and store the  
 24831 last  $X_i$  value, and then use this value to reinitialize via *seed48()* when the program is restarted.

24832 The initializer function *lcong48()* allows the user to specify the initial  $X_i$ , the multiplier value  $a$ ,  
 24833 and the addend value  $c$ . Argument array elements *param*[0-2] specify  $X_i$ , *param*[3-5] specify the  
 24834 multiplier  $a$ , and *param*[6] specifies the 16-bit addend  $c$ . After *lcong48()* is called, a subsequent  
 24835 call to either *srand48()* or *seed48()* shall restore the standard multiplier and addend values,  $a$  and  
 24836  $c$ , specified above.

24837 The *drand48()*, *lrnd48()*, and *mrnd48()* functions need not be thread-safe.

#### 24838 RETURN VALUE

24839 As described in the DESCRIPTION above.

#### 24840 ERRORS

24860 **Issue 7**

24861 Austin Group Interpretation 1003.1-2001 #156 is applied.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

24862 **NAME**

24863 dup, dup2 — duplicate an open file descriptor

24864 **SYNOPSIS**

```
24865 #include <unistd.h>
24866 int dup(int fildes);
24867 int dup2(int fildes, int fildes2);
```

24868 **DESCRIPTION**

24869 The *dup()* function provides an alternative interface to the service provided by *fcntl()* using the  
 24870 F\_DUPFD command. The call *dup(fildes)* shall be equivalent to:

```
24871 fcntl(fildes, F_DUPFD, 0);
```

24872 The *dup2()* function shall cause the file descriptor *fildes2* to refer to the same open file  
 24873 description as the file descriptor *fildes* and to share any locks, and shall return *fildes2*. If *fildes2* is  
 24874 already a valid open file descriptor, it shall be closed first, unless *fildes* is equal to *fildes2* in which  
 24875 case *dup2()* shall return *fildes2* without closing it. If the close operation fails to close *fildes2*,  
 24876 *dup2()* shall return  $-1$  without changing the open file description to which *fildes2* refers. If *fildes*  
 24877 is not a valid file descriptor, *dup2()* shall return  $-1$  and shall not close *fildes2*. If *fildes2* is less than  
 24878 0 or greater than or equal to {OPEN\_MAX}, *dup2()* shall return  $-1$  with *errno* set to [EBADF].

24879 Upon successful completion, if *fildes* is not equal to *fildes2*, the FD\_CLOEXEC flag associated  
 24880 with *fildes2* shall be cleared. If *fildes* is equal to *fildes2*, the FD\_CLOEXEC flag associated with  
 24881 *fildes2* shall not be changed.

24882 TYM If *fildes* refers to a typed memory object, the result of the *dup2()* function is unspecified.

24883 **RETURN VALUE**

24884 Upon successful completion a non-negative integer, namely the file descriptor, shall be returned;  
 24885 otherwise,  $-1$  shall be returned and *errno* set to indicate the error.

24886 **ERRORS**

24887 The *dup()* function shall fail if:

24888 [EBADF] The *fildes* argument is not a valid open file descriptor.

24889 [EMFILE] All file descriptors available to the process are currently open.

24890 The *dup2()* function shall fail if:

24891 [EBADF] The *fildes* argument is not a valid open file descriptor or the argument *fildes2* is  
 24892 negative or greater than or equal to {OPEN\_MAX}.

24893 [EINTR] The *dup2()* function was interrupted by a signal.

24894 The *dup2()* function may fail if:

24895 [EIO] An I/O error occurred while attempting to close *fildes2*.

24896 **EXAMPLES**24897 **Redirecting Standard Output to a File**

24898 The following example closes standard output for the current processes, re-assigns standard  
 24899 output to go to the file referenced by *pfid*, and closes the original file descriptor to clean up.

```
24900 #include <unistd.h>
24901 ...
24902 int pfid;
24903 ...
```

**dup()**

```

24904     close(1);
24905     dup(pfd);
24906     close(pfd);
24907     ...

```

### 24908 **Redirecting Error Messages**

24909 The following example redirects messages from *stderr* to *stdout*.

```

24910     #include <unistd.h>
24911     ...
24912     dup2(1, 2);
24913     ...

```

### 24914 **APPLICATION USAGE**

24915 None.

### 24916 **RATIONALE**

24917 The *dup()* and *dup2()* functions are redundant. Their services are also provided by the *fcntl()*  
 24918 function. They have been included in this volume of POSIX.1-2008 primarily for historical  
 24919 reasons, since many existing applications use them.

24920 The *dup2()* function is not marked obsolescent because it presents a type-safe version of  
 24921 functionality provided in a type-unsafe version by *fcntl()*. It is used in the POSIX Ada binding.

24922 The *dup2()* function is not intended for use in critical regions as a synchronization mechanism.

24923 In the description of [EBADF], the case of *fildev* being out of range is covered by the given case of  
 24924 *fildev* not being valid. The descriptions for *fildev* and *fildev2* are different because the only kind of  
 24925 invalidity that is relevant for *fildev2* is whether it is out of range; that is, it does not matter  
 24926 whether *fildev2* refers to an open file when the *dup2()* call is made.

### 24927 **FUTURE DIRECTIONS**

24928 None.

### 24929 **SEE ALSO**

24930 *close()*, *fcntl()*, *open()*

24931 XBD <[unistd.h](#)>

### 24932 **CHANGE HISTORY**

24933 First released in Issue 1. Derived from Issue 1 of the SVID.

### 24934 **Issue 7**

24935 SD5-XSH-ERN-187 is applied.

24936 **NAME**

24937 duplocale — duplicate a locale object

24938 **SYNOPSIS**

```
24939 CX #include <locale.h>
24940 locale_t duplocale(locale_t locobj);
```

24941 **DESCRIPTION**

24942 The *duplocale()* function shall create a duplicate copy of the locale object referenced by the *locobj*  
 24943 argument.

24944 **RETURN VALUE**

24945 Upon successful completion, the *duplocale()* function shall return a handle for a new locale  
 24946 object. Otherwise, *duplocale()* shall return **(locale\_t)0** and set *errno* to indicate the error.

24947 **ERRORS**

24948 The *duplocale()* function shall fail if:

24949 [ENOMEM] There is not enough memory available to create the locale object or load the  
 24950 locale data.

24951 The *duplocale()* function may fail if:

24952 [EINVAL] *locobj* is not a handle for a locale object.

24953 **EXAMPLES**24954 **Constructing an Altered Version of an Existing Locale Object**

24955 The following example shows a code fragment to create a slightly altered version of an existing  
 24956 locale object. The function takes a locale object and a locale name and it replaces the *LC\_TIME*  
 24957 category data in the locale object with that from the named locale.

```
24958 #include <locale.h>
24959 ...
24960 locale_t
24961 with_changed_lc_time (locale_t obj, const char *name)
24962 {
24963     locale_t retval = duplocale (obj);
24964     if (retval != (locale_t) 0)
24965     {
24966         locale_t changed = newlocale (LC_TIME_MASK, name, retval);
24967         if (changed == (locale_t) 0)
24968             /* An error occurred. Free all allocated resources. */
24969             freelocale (retval);
24970         retval = changed;
24971     }
24972     return retval; }
24973 }
```

24974 **APPLICATION USAGE**

24975 The use of the *duplocale()* function is recommended for situations where a locale object is being  
 24976 used in multiple places, and it is possible that the lifetime of the locale object might end before  
 24977 all uses are finished. Another reason to duplicate a locale object is if a slightly modified form is  
 24978 needed. This can be achieved by a call to *newlocale()* following the *duplocale()* call.

**duplocale()**

24979 As with the *newlocale()* function, handles for locale objects created by the *duplocale()* function  
24980 should be released by a corresponding call to *freelocale()*.

24981 **RATIONALE**

24982 None.

24983 **FUTURE DIRECTIONS**

24984 None.

24985 **SEE ALSO**24986 *freelocale()*, *newlocale()*, *uselocale()*

24987 XBD &lt;locale.h&gt;

24988 **CHANGE HISTORY**

24989 First released in Issue 7.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

24990 **NAME**24991 encrypt — encoding function (**CRYPT**)24992 **SYNOPSIS**

```
24993 XSI #include <unistd.h>
24994 void encrypt(char block[64], int edflag);
```

24995 **DESCRIPTION**

24996 The *encrypt()* function shall provide access to an implementation-defined encoding algorithm.  
 24997 The key generated by *setkey()* is used to encrypt the string *block* with *encrypt()*.

24998 The *block* argument to *encrypt()* shall be an array of length 64 bytes containing only the bytes  
 24999 with values of 0 and 1. The array is modified in place to a similar array using the key set by  
 25000 *setkey()*. If *edflag* is 0, the argument is encoded. If *edflag* is 1, the argument may be decoded (see  
 25001 the APPLICATION USAGE section); if the argument is not decoded, *errno* shall be set to  
 25002 [ENOSYS].

25003 The *encrypt()* function shall not change the setting of *errno* if successful. An application wishing  
 25004 to check for error situations should set *errno* to 0 before calling *encrypt()*. If *errno* is non-zero on  
 25005 return, an error has occurred.

25006 The *encrypt()* function need not be thread-safe.

25007 **RETURN VALUE**

25008 The *encrypt()* function shall not return a value.

25009 **ERRORS**

25010 The *encrypt()* function shall fail if:

25011 [ENOSYS] The functionality is not supported on this implementation.

25012 **EXAMPLES**

25013 None.

25014 **APPLICATION USAGE**

25015 Historical implementations of the *encrypt()* function used a rather primitive encoding algorithm.

25016 In some environments, decoding might not be implemented. This is related to some Government  
 25017 restrictions on encryption and decryption routines. Historical practice has been to ship a  
 25018 different version of the encryption library without the decryption feature in the routines  
 25019 supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

25020 **RATIONALE**

25021 None.

25022 **FUTURE DIRECTIONS**

25023 None.

25024 **SEE ALSO**

25025 *crypt()*, *setkey()*

25035 **NAME**

25036 endgrent, getgrent, setgrent — group database entry functions

25037 **SYNOPSIS**

```

25038 xSI      #include <grp.h>
25039
25039      void endgrent(void);
25040      struct group *getgrent(void);
25041      void setgrent(void);

```

25042 **DESCRIPTION**

25043 The *getgrent()* function shall return a pointer to a structure containing the broken-out fields of an  
 25044 entry in the group database. When first called, *getgrent()* shall return a pointer to a **group**  
 25045 structure containing the first entry in the group database. Thereafter, it shall return a pointer to a  
 25046 **group** structure containing the next group structure in the group database, so successive calls  
 25047 may be used to search the entire database.

25048 An implementation that provides extended security controls may impose further  
 25049 implementation-defined restrictions on accessing the group database. In particular, the system  
 25050 may deny the existence of some or all of the group database entries associated with groups other  
 25051 than those groups associated with the caller and may omit users other than the caller from the  
 25052 list of members of groups in database entries that are returned.

25053 The *setgrent()* function shall rewind the group database to allow repeated searches.

25054 The *endgrent()* function may be called to close the group database when processing is complete.

25055 These functions need not be thread-safe.

25056 **RETURN VALUE**

25057 When first called, *getgrent()* shall return a pointer to the first group structure in the group  
 25058 database. Upon subsequent calls it shall return the next group structure in the group database.  
 25059 The *getgrent()* function shall return a null pointer on end-of-file or an error and *errno* may be set  
 25060 to indicate the error.

25061 The return value may point to a static area which is overwritten by a subsequent call to  
 25062 *getgrgid()*, *getgrnam()*, or *getgrent()*.

25063 **ERRORS**

25064 The *getgrent()* function may fail if:

- |       |          |                                                                        |
|-------|----------|------------------------------------------------------------------------|
| 25065 | [EINTR]  | A signal was caught during the operation.                              |
| 25066 | [EIO]    | An I/O error has occurred.                                             |
| 25067 | [EMFILE] | All file descriptors available to the process are currently open.      |
| 25068 | [ENFILE] | The maximum allowable number of files is currently open in the system. |

25069 **EXAMPLES**

25070 None.

25071 **APPLICATION USAGE**

25072 These functions are provided due to their historical usage. Applications should avoid  
 25073 dependencies on fields in the group database, whether the database is a single file, or where in  
 25074 the file system name space the database resides. Applications should use *getgrnam()* and  
 25075 *getgrgid()* whenever possible because it avoids these dependencies.

**endgrent()**

25082 XBD &lt;grp.h&gt;

25083 **CHANGE HISTORY**

25084 First released in Issue 4, Version 2.

25085 **Issue 5**

25086 Moved from X/OPEN UNIX extension to BASE.

25087 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
25088 VALUE section.

25089 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

25090 **Issue 6**

25091 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

25092 **Issue 7**

25093 Austin Group Interpretation 1003.1-2001 #156 is applied.

25094 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

25095 **NAME**

25096 endhostent, gethostent, sethostent — network host database functions

25097 **SYNOPSIS**

```
25098 #include <netdb.h>
25099 void endhostent(void);
25100 struct hostent *gethostent(void);
25101 void sethostent(int stayopen);
```

25102 **DESCRIPTION**

25103 These functions shall retrieve information about hosts. This information is considered to be  
 25104 stored in a database that can be accessed sequentially or randomly. The implementation of this  
 25105 database is unspecified.

25106 **Note:** In many cases this database is implemented by the Domain Name System, as documented in  
 25107 RFC 1034, RFC 1035, and RFC 1886.

25108 The *sethostent()* function shall open a connection to the database and set the next entry for  
 25109 retrieval to the first entry in the database. If the *stayopen* argument is non-zero, the connection  
 25110 shall not be closed by a call to *gethostent()*, and the implementation may maintain an open file  
 25111 descriptor.

25112 The *gethostent()* function shall read the next entry in the database, opening and closing a  
 25113 connection to the database as necessary.

25114 Entries shall be returned in **hostent** structures.

25115 The *endhostent()* function shall close the connection to the database, releasing any open file  
 25116 descriptor.

25117 These functions need not be thread-safe.

25118 **RETURN VALUE**

25119 Upon successful completion, the *gethostent()* function shall return a pointer to a **hostent**  
 25120 structure if the requested entry was found, and a null pointer if the end of the database was  
 25121 reached or the requested entry was not found.

25122 **ERRORS**

25123 No errors are defined for *endhostent()*, *gethostent()*, and *sethostent()*.

25124 **EXAMPLES**

25125 None.

25126 **APPLICATION USAGE**

25127 The *gethostent()* function may return pointers to static data, which may be overwritten by  
 25128 subsequent calls to any of these functions.

25129 **RATIONALE**

25130 None.

25131 **FUTURE DIRECTIONS**

25132 None.

25140 **NAME**

25141 endnetent, getnetbyaddr, getnetbyname, getnetent, setnetent — network database functions

25142 **SYNOPSIS**

```

25143     #include <netdb.h>

25144     void endnetent(void);
25145     struct netent *getnetbyaddr(uint32_t net, int type);
25146     struct netent *getnetbyname(const char *name);
25147     struct netent *getnetent(void);
25148     void setnetent(int stayopen);

```

25149 **DESCRIPTION**

25150 These functions shall retrieve information about networks. This information is considered to be  
 25151 stored in a database that can be accessed sequentially or randomly. The implementation of this  
 25152 database is unspecified.

25153 The *setnetent()* function shall open and rewind the database. If the *stayopen* argument is non-  
 25154 zero, the connection to the *net* database shall not be closed after each call to *getnetent()* (either  
 25155 directly, or indirectly through one of the other *getnet\**(*)* functions), and the implementation may  
 25156 maintain an open file descriptor to the database.

25157 The *getnetent()* function shall read the next entry of the database, opening and closing a  
 25158 connection to the database as necessary.

25159 The *getnetbyaddr()* function shall search the database from the beginning, and find the first entry  
 25160 for which the address family specified by *type* matches the *n\_addrtype* member and the network  
 25161 number *net* matches the *n\_net* member, opening and closing a connection to the database as  
 25162 necessary. The *net* argument shall be the network number in host byte order.

25163 The *getnetbyname()* function shall search the database from the beginning and find the first entry  
 25164 for which the network name specified by *name* matches the *n\_name* member, opening and  
 25165 closing a connection to the database as necessary.

25166 The *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* functions shall each return a pointer to a  
 25167 **netent** structure, the members of which shall contain the fields of an entry in the network  
 25168 database.

25169 The *endnetent()* function shall close the database, releasing any open file descriptor.

25170 These functions need not be thread-safe.

25171 **RETURN VALUE**

25172 Upon successful completion, *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* shall return a  
 25173 pointer to a **netent** structure if the requested entry was found, and a null pointer if the end of the  
 25174 database was reached or the requested entry was not found. Otherwise, a null pointer shall be  
 25175 returned.

25176 **ERRORS**

25177 No errors are defined.

**endnetent()**

System Interfaces

25178 **EXAMPLES**

25179 None.

25180 **APPLICATION USAGE**

25181 The *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* functions may return pointers to static data,  
25182 which may be overwritten by subsequent calls to any of these functions.

25183 **RATIONALE**

25184 None.

25193 **NAME**

25194 endprotoent, getprotobyname, getprotobynumber, getprotoent, setprotoent — network protocol  
25195 database functions

25196 **SYNOPSIS**

```
25197 #include <netdb.h>
25198 void endprotoent(void);
25199 struct protoent *getprotobyname(const char *name);
25200 struct protoent *getprotobynumber(int proto);
25201 struct protoent *getprotoent(void);
25202 void setprotoent(int stayopen);
```

25203 **DESCRIPTION**

25204 These functions shall retrieve information about protocols. This information is considered to be  
25205 stored in a database that can be accessed sequentially or randomly. The implementation of this  
25206 database is unspecified.

25207 The *setprotoent()* function shall open a connection to the database, and set the next entry to the  
25208 first entry. If the *stayopen* argument is non-zero, the connection to the network protocol database  
25209 shall not be closed after each call to *getprotoent()* (either directly, or indirectly through one of the  
25210 other *getproto\**(*)* functions), and the implementation may maintain an open file descriptor for  
25211 the database.

25212 The *getprotobyname()* function shall search the database from the beginning and find the first  
25213 entry for which the protocol name specified by *name* matches the *p\_name* member, opening and  
25214 closing a connection to the database as necessary.

25215 The *getprotobynumber()* function shall search the database from the beginning and find the first  
25216 entry for which the protocol number specified by *proto* matches the *p\_proto* member, opening  
25217 and closing a connection to the database as necessary.

25218 The *getprotoent()* function shall read the next entry of the database, opening and closing a  
25219 connection to the database as necessary.

25220 The *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* functions shall each return a pointer  
25221 to a **protoent** structure, the members of which shall contain the fields of an entry in the network  
25222 protocol database.

25223 The *endprotoent()* function shall close the connection to the database, releasing any open file  
25224 descriptor.

25225 These functions need not be thread-safe.

25226 **RETURN VALUE**

25227 Upon successful completion, *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* return a  
25228 pointer to a **protoent** structure if the requested entry was found, and a null pointer if the end of  
25229 the database was reached or the requested entry was not found. Otherwise, a null pointer is  
25230 returned.

25231 **ERRORS**

25232 No errors are defined.

**endprotoent()**

System Interfaces

25233 **EXAMPLES**

25234 None.

25235 **APPLICATION USAGE**25236 The *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* functions may return pointers to  
25237 static data, which may be overwritten by subsequent calls to any of these functions.25238 **RATIONALE**

25239 None.

25248 **NAME**

25249 endpwent, getpwent, setpwent — user database functions

25250 **SYNOPSIS**

```

25251 XSI #include <pwd.h>
25252 void endpwent(void);
25253 struct passwd *getpwent(void);
25254 void setpwent(void);

```

25255 **DESCRIPTION**

25256 These functions shall retrieve information about users.

25257 The *getpwent()* function shall return a pointer to a structure containing the broken-out fields of  
 25258 an entry in the user database. Each entry in the user database contains a **passwd** structure. When  
 25259 first called, *getpwent()* shall return a pointer to a **passwd** structure containing the first entry in  
 25260 the user database. Thereafter, it shall return a pointer to a **passwd** structure containing the next  
 25261 entry in the user database. Successive calls can be used to search the entire user database.

25262 If an end-of-file or an error is encountered on reading, *getpwent()* shall return a null pointer.

25263 An implementation that provides extended security controls may impose further  
 25264 implementation-defined restrictions on accessing the user database. In particular, the system  
 25265 may deny the existence of some or all of the user database entries associated with users other  
 25266 than the caller.

25267 The *setpwent()* function effectively rewinds the user database to allow repeated searches.25268 The *endpwent()* function may be called to close the user database when processing is complete.

25269 These functions need not be thread-safe.

25270 **RETURN VALUE**25271 The *getpwent()* function shall return a null pointer on end-of-file or error.25272 **ERRORS**

25273 These functions may fail if:

25274 [EIO] An I/O error has occurred.

25275 In addition, *getpwent()* and *setpwent()* may fail if:

25276 [EMFILE] All file descriptors available to the process are currently open.

25277 [ENFILE] The maximum allowable number of files is currently open in the system.

25278 The return value may point to a static area which is overwritten by a subsequent call to  
 25279 *getpwnid()*, *getpwnam()*, or *getpwent()*.

**endpwent()**25280 **EXAMPLES**25281 **Searching the User Database**

25282 The following example uses the *getpwent()* function to get successive entries in the user  
 25283 database, returning a pointer to a **passwd** structure that contains information about each user.  
 25284 The call to *endpwent()* closes the user database and cleans up.

```

25285 #include <pwd.h>
25286 #include <stdio.h>

25287 void printname(uid_t uid)
25288 {
25289     struct passwd *pwd;

25290     setpwent();
25291     while((pwd = getpwent()) != NULL) {
25292         if (pwd->pw_uid == uid) {
25293             printf("name=%s\n", pwd->pw_name);
25294             break;
25295         }
25296     }
25297     endpwent();
25298 }

```

25299 **APPLICATION USAGE**

25300 These functions are provided due to their historical usage. Applications should avoid  
 25301 dependencies on fields in the password database, whether the database is a single file, or where  
 25302 in the file system name space the database resides. Applications should use *getpwuid()*  
 25303 whenever possible because it avoids these dependencies.

25304 **RATIONALE**

25305 None.

25306 **FUTURE DIRECTIONS**

25307 None.

25308 **SEE ALSO**

25309 *endgrent()*, *getlogin()*, *getpwnam()*, *getpwuid()*

25310 XBD **<pwd.h>**

25311 **CHANGE HISTORY**

25312 First released in Issue 4, Version 2.

25313 **Issue 5**

25314 Moved from X/OPEN UNIX extension to BASE.

25315 Normative text previously in the APPLICATION USAGE section is moved to the RETURN  
 25316 VALUE section.

25317 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

25318 **Issue 6**

25319 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

- 25320 **Issue 7**
- 25321 Austin Group Interpretation 1003.1-2001 #156 is applied.
- 25322 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.
- 25323 The EXAMPLES section is revised.

**endservent()**25324 **NAME**

25325 endservent, getservbyname, getservbyport, getservent, setservent — network services database  
 25326 functions

25327 **SYNOPSIS**

```
25328 #include <netdb.h>
25329
25329 void endservent(void);
25330 struct servent *getservbyname(const char *name, const char *proto);
25331 struct servent *getservbyport(int port, const char *proto);
25332 struct servent *getservent(void);
25333 void setservent(int stayopen);
```

25334 **DESCRIPTION**

25335 These functions shall retrieve information about network services. This information is  
 25336 considered to be stored in a database that can be accessed sequentially or randomly. The  
 25337 implementation of this database is unspecified.

25338 The *setservent()* function shall open a connection to the database, and set the next entry to the  
 25339 first entry. If the *stayopen* argument is non-zero, the *net* database shall not be closed after each  
 25340 call to the *getservent()* function (either directly, or indirectly through one of the other *getserv\**(  
 25341 functions), and the implementation may maintain an open file descriptor for the database.

25342 The *getservent()* function shall read the next entry of the database, opening and closing a  
 25343 connection to the database as necessary.

25344 The *getservbyname()* function shall search the database from the beginning and find the first  
 25345 entry for which the service name specified by *name* matches the *s\_name* member and the protocol  
 25346 name specified by *proto* matches the *s\_proto* member, opening and closing a connection to the  
 25347 database as necessary. If *proto* is a null pointer, any value of the *s\_proto* member shall be  
 25348 matched.

25349 The *getservbyport()* function shall search the database from the beginning and find the first entry  
 25350 for which the port specified by *port* matches the *s\_port* member and the protocol name specified  
 25351 by *proto* matches the *s\_proto* member, opening and closing a connection to the database as  
 25352 necessary. If *proto* is a null pointer, any value of the *s\_proto* member shall be matched. The *port*  
 25353 argument shall be a value obtained by converting a **uint16\_t** in network byte order to **int**.

25354 The *getservbyname()*, *getservbyport()*, and *getservent()* functions shall each return a pointer to a  
 25355 **servent** structure, the members of which shall contain the fields of an entry in the network  
 25356 services database.

25357 The *endservent()* function shall close the database, releasing any open file descriptor.

25358 These functions need not be thread-safe.

25359 **RETURN VALUE**

25360 Upon successful completion, *getservbyname()*, *getservbyport()*, and *getservent()* return a pointer to  
 25361 a **servent** structure if the requested entry was found, and a null pointer if the end of the database  
 25362 was reached or the requested entry was not found. Otherwise, a null pointer is returned.

25363 **ERRORS**

25364 No errors are defined.

25365 **EXAMPLES**

25366 None.

25367 **APPLICATION USAGE**25368 The *port* argument of *getserbyport()* need not be compatible with the port values of all address  
25369 families.25370 The *getserbyname()*, *getserbyport()*, and *getservent()* functions may return pointers to static  
25371 data, which may be overwritten by subsequent calls to any of these functions.25372 **RATIONALE**

25373 None.

25374 **FUTURE DIRECTIONS**

25375 None.

**endutxent()**25384 **NAME**

25385 **endutxent**, **getutxent**, **getutxid**, **getutxline**, **pututxline**, **setutxent** — user accounting database  
 25386 functions

25387 **SYNOPSIS**

```
25388 xSI #include <utmpx.h>
25389 void endutxent(void);
25390 struct utmpx *getutxent(void);
25391 struct utmpx *getutxid(const struct utmpx *id);
25392 struct utmpx *getutxline(const struct utmpx *line);
25393 struct utmpx *pututxline(const struct utmpx *utmpx);
25394 void setutxent(void);
```

25395 **DESCRIPTION**

25396 These functions shall provide access to the user accounting database.

25397 The *getutxent()* function shall read the next entry from the user accounting database. If the  
 25398 database is not already open, it shall open it. If it reaches the end of the database, it shall fail.

25399 The *getutxid()* function shall search forward from the current point in the database. If the  
 25400 *ut\_type* value of the **utmpx** structure pointed to by *id* is *BOOT\_TIME*, *OLD\_TIME*, or  
 25401 *NEW\_TIME*, then it shall stop when it finds an entry with a matching *ut\_type* value. If the  
 25402 *ut\_type* value is *INIT\_PROCESS*, *LOGIN\_PROCESS*, *USER\_PROCESS*, or *DEAD\_PROCESS*,  
 25403 then it shall stop when it finds an entry whose type is one of these four and whose *ut\_id* member  
 25404 matches the *ut\_id* member of the **utmpx** structure pointed to by *id*. If the end of the database is  
 25405 reached without a match, *getutxid()* shall fail.

25406 The *getutxline()* function shall search forward from the current point in the database until it  
 25407 finds an entry of the type *LOGIN\_PROCESS* or *USER\_PROCESS* which also has a *ut\_line* value  
 25408 matching that in the **utmpx** structure pointed to by *line*. If the end of the database is reached  
 25409 without a match, *getutxline()* shall fail.

25410 The *getutxid()* or *getutxline()* function may cache data. For this reason, to use *getutxline()* to  
 25411 search for multiple occurrences, the application shall zero out the static data after each success,  
 25412 or *getutxline()* may return a pointer to the same **utmpx** structure.

25413 There is one exception to the rule about clearing the structure before further reads are done. The  
 25414 implicit read done by *pututxline()* (if it finds that it is not already at the correct place in the user  
 25415 accounting database) shall not modify the static structure returned by *getutxent()*, *getutxid()*, or  
 25416 *getutxline()*, if the application has modified this structure and passed the pointer back to  
 25417 *pututxline()*.

25418 For all entries that match a request, the *ut\_type* member indicates the type of the entry. Other  
 25419 members of the entry shall contain meaningful data based on the value of the *ut\_type* member as  
 25420 follows:

| 25421 | ut_type Member | Other Members with Meaningful Data                                                             |
|-------|----------------|------------------------------------------------------------------------------------------------|
| 25422 | EMPTY          | No others                                                                                      |
| 25423 | BOOT_TIME      | <i>ut_tv</i>                                                                                   |
| 25424 | OLD_TIME       | <i>ut_tv</i>                                                                                   |
| 25425 | NEW_TIME       | <i>ut_tv</i>                                                                                   |
| 25426 | USER_PROCESS   | <i>ut_id, ut_user</i> (login name of the user), <i>ut_line, ut_pid, ut_tv</i>                  |
| 25427 | INIT_PROCESS   | <i>ut_id, ut_pid, ut_tv</i>                                                                    |
| 25428 | LOGIN_PROCESS  | <i>ut_id, ut_user</i> (implementation-defined name of the login process), <i>ut_pid, ut_tv</i> |
| 25429 |                |                                                                                                |
| 25430 | DEAD_PROCESS   | <i>ut_id, ut_pid, ut_tv</i>                                                                    |

25431 An implementation that provides extended security controls may impose implementation-  
 25432 defined restrictions on accessing the user accounting database. In particular, the system may  
 25433 deny the existence of some or all of the user accounting database entries associated with users  
 25434 other than the caller.

25435 If the process has appropriate privileges, the *pututxline()* function shall write out the structure  
 25436 into the user accounting database. It shall use *getutxid()* to search for a record that satisfies the  
 25437 request. If this search succeeds, then the entry shall be replaced. Otherwise, a new entry shall be  
 25438 made at the end of the user accounting database.

25439 The *endutxent()* function shall close the user accounting database.

25440 The *setutxent()* function shall reset the input to the beginning of the database. This should be  
 25441 done before each search for a new entry if it is desired that the entire database be examined.

25442 These functions need not be thread-safe.

#### 25443 RETURN VALUE

25444 Upon successful completion, *getutxent()*, *getutxid()*, and *getutxline()* shall return a pointer to a  
 25445 **utmpx** structure containing a copy of the requested entry in the user accounting database.  
 25446 Otherwise, a null pointer shall be returned.

25447 The return value may point to a static area which is overwritten by a subsequent call to  
 25448 *getutxid()* or *getutxline()*.

25449 Upon successful completion, *pututxline()* shall return a pointer to a **utmpx** structure containing a  
 25450 copy of the entry added to the user accounting database. Otherwise, a null pointer shall be  
 25451 returned.

25452 The *endutxent()* and *setutxent()* functions shall not return a value.

#### 25453 ERRORS

25454 No errors are defined for the *endutxent()*, *getutxent()*, *getutxid()*, *getutxline()*, and *setutxent()*  
 25455 functions.

25456 The *pututxline()* function may fail if:

25457 [EPERM] The process does not have appropriate privileges.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

25492 **NAME**

25493 erf, erff, erfl — error functions

25494 **SYNOPSIS**

```
25495 #include <math.h>
25496 double erf(double x);
25497 float erff(float x);
25498 long double erfl(long double x);
```

25499 **DESCRIPTION**

25500 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 25501 conflict between the requirements described here and the ISO C standard is unintentional. This  
 25502 volume of POSIX.1-2008 defers to the ISO C standard.

25503 These functions shall compute the error function of their argument  $x$ , defined as:

$$25504 \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$$

25505 An application wishing to check for error situations should set *errno* to zero and call  
 25506 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 25507 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 25508 zero, an error has occurred.

25509 **RETURN VALUE**

25510 Upon successful completion, these functions shall return the value of the error function.

25511 MX If  $x$  is NaN, a NaN shall be returned.

25512 If  $x$  is  $\pm 0$ ,  $\pm 0$  shall be returned.

25513 If  $x$  is  $\pm \text{Inf}$ ,  $\pm 1$  shall be returned.

25514 If  $x$  is subnormal, a range error may occur, and  $2 * x / \text{sqrt}(\pi)$  should be returned.

25515 **ERRORS**

25516 These functions may fail if:

25517 MX **Range Error** The result underflows.

25518 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 25519 then *errno* shall be set to [ERANGE]. If the integer expression  
 25520 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 25521 floating-point exception shall be raised.

25522 **EXAMPLES**25523 **Computing the Probability for a Normal Variate**

25524 This example shows how to use *erf()* to compute the probability that a normal variate assumes a  
 25525 value in the range  $[x_1, x_2]$  with  $x_1 \leq x_2$ .

25526 This example uses the constant M\_SQRT1\_2 which is part of the XSI option.

```
25527 #include <math.h>
25528 double
25529 Phi(const double x1, const double x2)
25530 {
25531     return ( erf(x2*M_SQRT1_2) - erf(x1*M_SQRT1_2) ) / 2;
```

**erf()**

25532            }

25533 **APPLICATION USAGE**

25534            Underflow occurs when  $|x| < \text{DBL\_MIN} * (\text{sqrt}(\pi)/2)$ .

25535            On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
25536 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

25537 **RATIONALE**

25538            None.

25539 **FUTURE DIRECTIONS**

25540            None.

25541 **SEE ALSO**

25542            *erfc()*, *feclearexcept()*, *fetestexcept()*, *isnan()*

25543            XBD Section 4.19 (on page 116), **<math.h>**

25544 **CHANGE HISTORY**

25545            First released in Issue 1. Derived from Issue 1 of the SVID.

25546 **Issue 5**

25547            The DESCRIPTION is updated to indicate how an application should check for an error. This  
25548 text was previously published in the APPLICATION USAGE section.

25549 **Issue 6**

25550            The *erf()* function is no longer marked as an extension.

25551            The *erfc()* function is split out onto its own reference page.

25552            The *erff()* and *erfl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

25553            The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
25554 revised to align with the ISO/IEC 9899:1999 standard.

25555            IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
25556 marked.

25557            IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/22 is applied, adding the example to the  
25558 EXAMPLES section.

25559 **NAME**25560 `erfc`, `erfcf`, `erfcl` — complementary error functions25561 **SYNOPSIS**

```
25562 #include <math.h>
25563 double erfc(double x);
25564 float erfcf(float x);
25565 long double erfcl(long double x);
```

25566 **DESCRIPTION**

25567 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 25568 conflict between the requirements described here and the ISO C standard is unintentional. This  
 25569 volume of POSIX.1-2008 defers to the ISO C standard.

25570 These functions shall compute the complementary error function  $1.0 - \text{erf}(x)$ .

25571 An application wishing to check for error situations should set `errno` to zero and call  
 25572 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or  
 25573 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-  
 25574 zero, an error has occurred.

25575 **RETURN VALUE**

25576 Upon successful completion, these functions shall return the value of the complementary error  
 25577 function.

25578 If the correct value would cause underflow and is not representable, a range error may occur  
 25579 **MX** and either 0.0 (if representable), or an implementation-defined value shall be returned.

25580 **MX** If  $x$  is NaN, a NaN shall be returned.

25581 If  $x$  is  $\pm 0$ , +1 shall be returned.

25582 If  $x$  is  $-\text{Inf}$ , +2 shall be returned.

25583 If  $x$  is  $+\text{Inf}$ , +0 shall be returned.

25584 If the correct value would cause underflow and is representable, a range error may occur and  
 25585 the correct value shall be returned.

25586 **ERRORS**

25587 These functions may fail if:

25588 **Range Error** The result underflows.

25589 If the integer expression (`math_errhandling` & `MATH_ERRNO`) is non-zero,  
 25590 then `errno` shall be set to `[ERANGE]`. If the integer expression  
 25591 (`math_errhandling` & `MATH_ERREXCEPT`) is non-zero, then the underflow  
 25592 floating-point exception shall be raised.

25593 **EXAMPLES**

25594 None.

25595 **APPLICATION USAGE**

25596 The `erfc()` function is provided because of the extreme loss of relative accuracy if `erf(x)` is called  
 25597 for large  $x$  and the result subtracted from 1.0.

25598 Note for IEEE Std 754-1985 **double**,  $26.55 < x$  implies `erfc(x)` has underflowed.

25599 On error, the expressions (`math_errhandling` & `MATH_ERRNO`) and (`math_errhandling` &  
 25600 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

**erfc()**25601 **RATIONALE**

25602 None.

25603 **FUTURE DIRECTIONS**

25604 None.

25605 **SEE ALSO**25606 *erf()*, *feclearexcept()*, *fetestexcept()*, *isnan()*

25607 XBD Section 4.19 (on page 116), &lt;math.h&gt;

25608 **CHANGE HISTORY**

25609 First released in Issue 1. Derived from Issue 1 of the SVID.

25610 **Issue 5**25611 The DESCRIPTION is updated to indicate how an application should check for an error. This  
25612 text was previously published in the APPLICATION USAGE section.25613 **Issue 6**25614 The *erfc()* function is no longer marked as an extension.25615 These functions are split out from the *erf()* reference page.25616 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
25617 revised to align with the ISO/IEC 9899:1999 standard.25618 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
25619 marked.

*System Interfaces***erff()**25620 **NAME**25621 `erff, erfl` — error functions25622 **SYNOPSIS**25623 `#include <math.h>`25624 `float erff(float x);`25625 `long double erfl(long double x);`25626 **DESCRIPTION**25627 Refer to *erf()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**errno**25628 **NAME**25629 `errno` — error return value25630 **SYNOPSIS**25631 `#include <errno.h>`25632 **DESCRIPTION**25633 The lvalue *errno* is used by many functions to return error values.

25634 Many functions provide an error number in *errno*, which has type **int** and is defined in  
 25635 **<errno.h>**. The value of *errno* shall be defined only after a call to a function for which it is  
 25636 explicitly stated to be set and until it is changed by the next function call or if the application  
 25637 assigns it a value. The value of *errno* should only be examined when it is indicated to be valid by  
 25638 a function's return value. Applications shall obtain the definition of *errno* by the inclusion of  
 25639 **<errno.h>**. No function in this volume of POSIX.1-2008 shall set *errno* to 0. The setting of *errno*  
 25640 after a successful call to a function is unspecified unless the description of that function specifies  
 25641 that *errno* shall not be modified.

25642 It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a  
 25643 macro definition is suppressed in order to access an actual object, or a program defines an  
 25644 identifier with the name *errno*, the behavior is undefined.

25645 The symbolic values stored in *errno* are documented in the ERRORS sections on all relevant  
 25646 pages.

25647 **RETURN VALUE**

25648 None.

25649 **ERRORS**

25650 None.

25651 **EXAMPLES**

25652 None.

25653 **APPLICATION USAGE**

25654 Previously both POSIX and X/Open documents were more restrictive than the ISO C standard  
 25655 in that they required *errno* to be defined as an external variable, whereas the ISO C standard  
 25656 required only that *errno* be defined as a modifiable lvalue with type **int**.

25657 An application that needs to examine the value of *errno* to determine the error should set it to 0  
 25658 before a function call, then inspect it before a subsequent function call.

25659 **RATIONALE**

25660 None.

25661 **FUTURE DIRECTIONS**

25662 None.

25663 **SEE ALSO**25664 [Section 2.3](#)25665 XBD **<errno.h>**25666 **CHANGE HISTORY**

25667 First released in Issue 1. Derived from Issue 1 of the SVID.

25668 **Issue 5**

25669 The following sentence is deleted from the DESCRIPTION: "The value of *errno* is 0 at program  
 25670 start-up, but is never set to 0 by any XSI function".

25671 The DESCRIPTION also no longer states that conforming implementations may support the  
25672 declaration:

25673 `extern int errno;`

25674 **Issue 6**

25675 Obsolescent text regarding defining *errno* as:

25676 `extern int errno`

25677 is removed.

25678 Text regarding no function setting *errno* to zero to indicate an error is changed to no function  
25679 shall set *errno* to zero. This is for alignment with the ISO/IEC 9899:1999 standard.

25680 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/23 is applied, adding text to the  
25681 DESCRIPTION stating that the setting of *errno* after a successful call to a function is unspecified  
25682 unless the description of the function requires that it will not be modified.

## 25683 NAME

25684 environ, execl, execl, execlp, execv, execve, execvp, fexecve — execute a file

## 25685 SYNOPSIS

```

25686 #include <unistd.h>
25687 extern char **environ;
25688 int execl(const char *path, const char *arg0, ... /*, (char *)0 */);
25689 int execlp(const char *path, const char *arg0, ... /*,
25690 (char *)0, char *const envp[] */);
25691 int execlp(const char *file, const char *arg0, ... /*, (char *)0 */);
25692 int execv(const char *path, char *const argv[]);
25693 int execve(const char *path, char *const argv[], char *const envp[]);
25694 int execvp(const char *file, char *const argv[]);
25695 int fexecve(int fd, char *const argv[], char *const envp[]);

```

## 25696 DESCRIPTION

25697 The *exec* family of functions shall replace the current process image with a new process image.  
 25698 The new image shall be constructed from a regular, executable file called the *new process image*  
 25699 *file*. There shall be no return from a successful *exec*, because the calling process image is overlaid  
 25700 by the new process image.

25701 The *fexecve()* function shall be equivalent to the *execve()* function except that the file to be  
 25702 executed is determined by the file descriptor *fd* instead of a pathname. The file offset of *fd* is  
 25703 ignored.

25704 When a C-language program is executed as a result of a call to one of the *exec* family of  
 25705 functions, it shall be entered as a C-language function call as follows:

```
25706 int main (int argc, char *argv[]);
```

25707 where *argc* is the argument count and *argv* is an array of character pointers to the arguments  
 25708 themselves. In addition, the following variable:

```
25709 extern char **environ;
```

25710 is initialized as a pointer to an array of character pointers to the environment strings. The *argv*  
 25711 and *environ* arrays are each terminated by a null pointer. The null pointer terminating the *argv*  
 25712 array is not counted in *argc*.

25713 Conforming multi-threaded applications shall not use the *environ* variable to access or modify  
 25714 any environment variable while any other thread is concurrently modifying any environment  
 25715 variable. A call to any function dependent on any environment variable shall be considered a  
 25716 use of the *environ* variable to access that environment variable.

25717 The arguments specified by a program with one of the *exec* functions shall be passed on to the  
 25718 new process image in the corresponding *main()* arguments.

25719 The argument *path* points to a pathname that identifies the new process image file.

25720 The argument *file* is used to construct a pathname that identifies the new process image file. If  
 25721 the *file* argument contains a <slash> character, the *file* argument shall be used as the pathname  
 25722 for this file. Otherwise, the path prefix for this file is obtained by a search of the directories  
 25723 passed as the environment variable *PATH* (see XBD Chapter 8, on page 173). If this environment  
 25724 variable is not present, the results of the search are implementation-defined.

25725 There are two distinct ways in which the contents of the process image file may cause the  
 25726 execution to fail, distinguished by the setting of *errno* to either [ENOEXEC] or [EINVAL] (see the  
 25727 ERRORS section). In the cases where the other members of the *exec* family of functions would

25728 fail and set *errno* to [ENOEXEC], the *execlp()* and *execvp()* functions shall execute a command  
 25729 interpreter and the environment of the executed command shall be as if the process invoked the  
 25730 *sh* utility using *execl()* as follows:

```
25731 execl(<shell path>, arg0, file, arg1, ..., (char *)0);
```

25732 where *<shell path>* is an unspecified pathname for the *sh* utility, *file* is the process image file, and  
 25733 for *execvp()*, where *arg0*, *arg1*, and so on correspond to the values passed to *execvp()* in *argv[0]*  
 25734 *argv[1]*, and so on.

25735 The arguments represented by *arg0*,... are pointers to null-terminated character strings. These  
 25736 strings shall constitute the argument list available to the new process image. The list is  
 25737 terminated by a null pointer. The argument *arg0* should point to a filename that is associated  
 25738 with the process being started by one of the *exec* functions.

25739 The argument *argv* is an array of character pointers to null-terminated strings. The application  
 25740 shall ensure that the last member of this array is a null pointer. These strings shall constitute the  
 25741 argument list available to the new process image. The value in *argv[0]* should point to a filename  
 25742 that is associated with the process being started by one of the *exec* functions.

25743 The argument *envp* is an array of character pointers to null-terminated strings. These strings  
 25744 shall constitute the environment for the new process image. The *envp* array is terminated by a  
 25745 null pointer.

25746 For those forms not containing an *envp* pointer (*execl()*, *execv()*, *execlp()*, and *execvp()*), the  
 25747 environment for the new process image shall be taken from the external variable *environ* in the  
 25748 calling process.

25749 The number of bytes available for the new process' combined argument and environment lists is  
 25750 {ARG\_MAX}. It is implementation-defined whether null terminators, pointers, and/or any  
 25751 alignment bytes are included in this total.

25752 File descriptors open in the calling process image shall remain open in the new process image,  
 25753 except for those whose close-on-exec flag FD\_CLOEXEC is set. For those file descriptors that  
 25754 remain open, all attributes of the open file description remain unchanged. For any file descriptor  
 25755 that is closed for this reason, file locks are removed as a result of the close as described in *close()*.  
 25756 Locks that are not removed by closing of file descriptors remain unchanged.

25757 If file descriptors 0, 1, and 2 would otherwise be closed after a successful call to one of the *exec*  
 25758 family of functions, and the new process image file has the set-user-ID or set-group-ID file mode  
 25759 bits set, and the ST\_NOSUID bit is not set for the file system containing the new process image  
 25760 file, implementations may open an unspecified file for each of these file descriptors in the new  
 25761 process image.

25762 Directory streams open in the calling process image shall be closed in the new process image.

25763 The state of the floating-point environment in the initial thread of the new process image shall  
 25764 be set to the default.

25765 The state of conversion descriptors and message catalog descriptors in the new process image is  
 25766 undefined.

25767 For the new process image, the equivalent of:

```
25768 setlocale(LC_ALL, "C")
```

25769 shall be executed at start-up.

25770 Signals set to the default action (SIG\_DFL) in the calling process image shall be set to the default  
 25771 action in the new process image. Except for SIGCHLD, signals set to be ignored (SIG\_IGN) by

- 25772 the calling process image shall be set to be ignored by the new process image. Signals set to be  
 25773 caught by the calling process image shall be set to the default action in the new process image  
 25774 (see <signal.h>).
- 25775 If the SIGCHLD signal is set to be ignored by the calling process image, it is unspecified whether  
 25776 the SIGCHLD signal is set to be ignored or to the default action in the new process image.
- 25777 XSI After a successful call to any of the *exec* functions, alternate signal stacks are not preserved and  
 25778 the SA\_ONSTACK flag shall be cleared for all signals.
- 25779 After a successful call to any of the *exec* functions, any functions previously registered by the  
 25780 *atexit()* or *pthread\_atfork()* functions are no longer registered.
- 25781 XSI If the ST\_NOSUID bit is set for the file system containing the new process image file, then the  
 25782 effective user ID, effective group ID, saved set-user-ID, and saved set-group-ID are unchanged  
 25783 in the new process image. Otherwise, if the set-user-ID mode bit of the new process image file is  
 25784 set, the effective user ID of the new process image shall be set to the user ID of the new process  
 25785 image file. Similarly, if the set-group-ID mode bit of the new process image file is set, the  
 25786 effective group ID of the new process image shall be set to the group ID of the new process  
 25787 image file. The real user ID, real group ID, and supplementary group IDs of the new process  
 25788 image shall remain the same as those of the calling process image. The effective user ID and  
 25789 effective group ID of the new process image shall be saved (as the saved set-user-ID and the  
 25790 saved set-group-ID) for use by *setuid()*.
- 25791 XSI Any shared memory segments attached to the calling process image shall not be attached to the  
 25792 new process image.
- 25793 Any named semaphores open in the calling process shall be closed as if by appropriate calls to  
 25794 *sem\_close()*.
- 25795 TYM Any blocks of typed memory that were mapped in the calling process are unmapped, as if  
 25796 *munmap()* was implicitly called to unmap them.
- 25797 ML Memory locks established by the calling process via calls to *mlockall()* or *mlock()* shall be  
 25798 removed. If locked pages in the address space of the calling process are also mapped into the  
 25799 address spaces of other processes and are locked by those processes, the locks established by the  
 25800 other processes shall be unaffected by the call by this process to the *exec* function. If the *exec*  
 25801 function fails, the effect on memory locks is unspecified.
- 25802 Memory mappings created in the process are unmapped before the address space is rebuilt for  
 25803 the new process image.
- 25804 SS When the calling process image does not use the SCHED\_FIFO, SCHED\_RR, or  
 25805 SCHED\_SPORADIC scheduling policies, the scheduling policy and parameters of the new  
 25806 process image and the initial thread in that new process image are implementation-defined.
- 25807 PS When the calling process image uses the SCHED\_FIFO, SCHED\_RR, or SCHED\_SPORADIC  
 25808 scheduling policies, the process policy and scheduling parameter settings shall not be changed  
 25809 by a call to an *exec* function. The initial thread in the new process image shall inherit the process  
 25810 scheduling policy and parameters. It shall have the default system contention scope, but shall  
 25811 inherit its allocation domain from the calling process image.
- 25812 Per-process timers created by the calling process shall be deleted before replacing the current  
 25813 process image with the new process image.
- 25814 MSG All open message queue descriptors in the calling process shall be closed, as described in  
 25815 *mq\_close()*.
- 25816 Any outstanding asynchronous I/O operations may be canceled. Those asynchronous I/O

- 25817 operations that are not canceled shall complete as if the *exec* function had not yet occurred, but  
 25818 any associated signal notifications shall be suppressed. It is unspecified whether the *exec*  
 25819 function itself blocks awaiting such I/O completion. In no event, however, shall the new process  
 25820 image created by the *exec* function be affected by the presence of outstanding asynchronous I/O  
 25821 operations at the time the *exec* function is called. Whether any I/O is canceled, and which I/O  
 25822 may be canceled upon *exec*, is implementation-defined.
- 25823 CPT The new process image shall inherit the CPU-time clock of the calling process image. This  
 25824 inheritance means that the process CPU-time clock of the process being *exec*-ed shall not be  
 25825 reinitialized or altered as a result of the *exec* function other than to reflect the time spent by the  
 25826 process executing the *exec* function itself.
- 25827 TCT The initial value of the CPU-time clock of the initial thread of the new process image shall be set  
 25828 to zero.
- 25829 OB TRC If the calling process is being traced, the new process image shall continue to be traced into the  
 25830 same trace stream as the original process image, but the new process image shall not inherit the  
 25831 mapping of trace event names to trace event type identifiers that was defined by calls to the  
 25832 *posix\_trace\_eventid\_open()* or the *posix\_trace\_trid\_eventid\_open()* functions in the calling process  
 25833 image.
- 25834 If the calling process is a trace controller process, any trace streams that were created by the  
 25835 calling process shall be shut down as described in the *posix\_trace\_shutdown()* function.
- 25836 The thread ID of the initial thread in the new process image is unspecified.
- 25837 The size and location of the stack on which the initial thread in the new process image runs is  
 25838 unspecified.
- 25839 The initial thread in the new process image shall have its cancellation type set to  
 25840 `PTHREAD_CANCEL_DEFERRED` and its cancellation state set to  
 25841 `PTHREAD_CANCEL_ENABLED`.
- 25842 The initial thread in the new process image shall have all thread-specific data values set to  
 25843 `NULL` and all thread-specific data keys shall be removed by the call to *exec* without running  
 25844 destructors.
- 25845 The initial thread in the new process image shall be joinable, as if created with the *detachstate*  
 25846 attribute set to `PTHREAD_CREATE_JOINABLE`.
- 25847 The new process shall inherit at least the following attributes from the calling process image:
- 25848 XSI • Nice value (see *nice()*)
  - 25849 XSI • *semadj* values (see *semop()*)
  - 25850 • Process ID
  - 25851 • Parent process ID
  - 25852 • Process group ID
  - 25853 • Session membership
  - 25854 • Real user ID
  - 25855 • Real group ID
  - 25856 • Supplementary group IDs

- 25857 • Time left until an alarm clock signal (see *alarm()*)
- 25858 • Current working directory
- 25859 • Root directory
- 25860 • File mode creation mask (see *umask()*)
- 25861 XSI • File size limit (see *getrlimit()* and *setrlimit()*)
- 25862 • Process signal mask (see *pthread\_sigmask()*)
- 25863 • Pending signal (see *sigpending()*)
- 25864 • *tms\_utime*, *tms\_stime*, *tms\_cutime*, and *tms\_cstime* (see *times()*)
- 25865 XSI • Resource limits
- 25866 • Controlling terminal
- 25867 XSI • Interval timers
- 25868 The initial thread of the new process shall inherit at least the following attributes from the  
25869 calling thread:
- 25870 • Signal mask (see *sigprocmask()* and *pthread\_sigmask()*)
- 25871 • Pending signals (see *sigpending()*)
- 25872 All other process attributes defined in this volume of POSIX.1-2008 shall be inherited in the new  
25873 process image from the old process image. All other thread attributes defined in this volume of  
25874 POSIX.1-2008 shall be inherited in the initial thread in the new process image from the calling  
25875 thread in the old process image. The inheritance of process or thread attributes not defined by  
25876 this volume of POSIX.1-2008 is implementation-defined.
- 25877 A call to any *exec* function from a process with more than one thread shall result in all threads  
25878 being terminated and the new executable image being loaded and executed. No destructor  
25879 functions or cleanup handlers shall be called.
- 25880 Upon successful completion, the *exec* functions shall mark for update the last data access  
25881 timestamp of the file. If an *exec* function failed but was able to locate the process image file,  
25882 whether the last data access timestamp is marked for update is unspecified. Should the *exec*  
25883 function succeed, the process image file shall be considered to have been opened with *open()*.  
25884 The corresponding *close()* shall be considered to occur at a time after this open, but before  
25885 process termination or successful completion of a subsequent call to one of the *exec* functions,  
25886 *posix\_spawn()*, or *posix\_spawnp()*. The *argv[]* and *envp[]* arrays of pointers and the strings to  
25887 which those arrays point shall not be modified by a call to one of the *exec* functions, except as a  
25888 consequence of replacing the process image.
- 25889 XSI The saved resource limits in the new process image are set to be a copy of the process'  
25890 corresponding hard and soft limits.
- 25891 **RETURN VALUE**
- 25892 If one of the *exec* functions returns to the calling process image, an error has occurred; the return  
25893 value shall be  $-1$ , and *errno* shall be set to indicate the error.
- 25894 **ERRORS**
- 25895 The *exec* functions shall fail if:
- 25896 [E2BIG] The number of bytes used by the new process image's argument list and  
25897 environment list is greater than the system-imposed limit of {ARG\_MAX}  
25898 bytes.

|       |                |                                                                                                                                                                                                                                                                                                                                                                                      |
|-------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 25899 | [EACCES]       | Search permission is denied for a directory listed in the new process image file's path prefix, or the new process image file denies execution permission, or the new process image file is not a regular file and the implementation does not support execution of files of its type.                                                                                               |
| 25900 |                |                                                                                                                                                                                                                                                                                                                                                                                      |
| 25901 |                |                                                                                                                                                                                                                                                                                                                                                                                      |
| 25902 |                |                                                                                                                                                                                                                                                                                                                                                                                      |
| 25903 | [EINVAL]       | The new process image file has appropriate privileges and has a recognized executable binary format, but the system does not support execution of a file with this format.                                                                                                                                                                                                           |
| 25904 |                |                                                                                                                                                                                                                                                                                                                                                                                      |

| 25925 | [ENAMETOOLONG] |                                                                                                                                                                                                                                                                                                                                                                                      |
| 25926 |                | The length of the <i>path</i> argument or the length of the pathname constructed from the <i>file</i> argument exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.                                                                                                                                  |
| 25927 |                |                                                                                                                                                                                                                                                                                                                                                                                      |
| 25928 |                |                                                                                                                                                                                                                                                                                                                                                                                      |
| 25929 |                |                                                                                                                                                                                                                                                                                                                                                                                      |
| 25930 | [ENOMEM]       | The new process image requires more memory than is allowed by the hardware or system-imposed memory management constraints.                                                                                                                                                                                                                                                          |
| 25931 |                |                                                                                                                                                                                                                                                                                                                                                                                      |
| 25932 | [ETXTBSY]      | The new process image file is a pure procedure (shared text) file that is currently open for writing by some process.                                                                                                                                                                                                                                                                |
| 25933 |                |                                                                                                                                                                                                                                                                                                                                                                                      |

## 25934 EXAMPLES

25935 **Using execl()**

25936 The following example executes the *ls* command, specifying the pathname of the executable  
25937 (*/bin/ls*) and using arguments supplied directly to the command to produce single-column  
25938 output.

```
25939 #include <unistd.h>
25940 int ret;
25941 ...
25942 ret = execl ("/bin/ls", "ls", "-l", (char *)0);
```

25943 **Using execl\_e()**

25944 The following example is similar to [Using execl\(\)](#). In addition, it specifies the environment for  
25945 the new process image using the *env* argument.

```
25946 #include <unistd.h>
25947 int ret;
25948 char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
25949 ...
25950 ret = execl_e ("/bin/ls", "ls", "-l", (char *)0, env);
```

25951 **Using execl\_p()**

25952 The following example searches for the location of the *ls* command among the directories  
25953 specified by the *PATH* environment variable.

```
25954 #include <unistd.h>
25955 int ret;
25956 ...
25957 ret = execl_p ("ls", "ls", "-l", (char *)0);
```

25958 **Using execv()**

25959 The following example passes arguments to the *ls* command in the *cmd* array.

```
25960 #include <unistd.h>
25961 int ret;
25962 char *cmd[] = { "ls", "-l", (char *)0 };
25963 ...
25964 ret = execv ("/bin/ls", cmd);
```

25965 **Using `execve()`**

25966 The following example passes arguments to the `ls` command in the `cmd` array, and specifies the  
25967 environment for the new process image using the `env` argument.

```
25968 #include <unistd.h>
25969
25969 int ret;
25970 char *cmd[] = { "ls", "-l", (char *)0 };
25971 char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
25972 ...
25973 ret = execve ("/bin/ls", cmd, env);
```

25974 **Using `execvp()`**

25975 The following example searches for the location of the `ls` command among the directories  
25976 specified by the `PATH` environment variable, and passes arguments to the `ls` command in the  
25977 `cmd` array.

```
25978 #include <unistd.h>
25979
25979 int ret;
25980 char *cmd[] = { "ls", "-l", (char *)0 };
25981 ...
25982 ret = execvp ("ls", cmd);
```

25983 **APPLICATION USAGE**

25984 As the state of conversion descriptors and message catalog descriptors in the new process image  
25985 is undefined, conforming applications should not rely on their use and should close them prior  
25986 to calling one of the `exec` functions.

25987 Applications that require other than the default POSIX locale should call `setlocale()` with the  
25988 appropriate parameters to establish the locale of the new process.

25989 The `environ` array should not be accessed directly by the application.

25990 The new process might be invoked in a non-conforming environment if the `envp` array does not  
25991 contain implementation-defined variables required by the implementation to provide a  
25992 conforming environment. See the `_CS_V7_ENV` entry in `<unistd.h>` and `confstr()` for details.

25993 Applications should not depend on file descriptors 0, 1, and 2 being closed after an `exec`. A  
25994 future version may allow these file descriptors to be automatically opened for any process.

25995 If an application wants to perform a checksum test of the file being executed before executing it,  
25996 the file will need to be opened with read permission to perform the checksum test.

25997 Since execute permission is checked by `fexecve()`, the file description `fd` need not have been  
25998 opened with the `O_EXEC` flag. However, if the file to be executed denies read and write  
25999 permission for the process preparing to do the `exec`, the only way to provide the `fd` to `fexecve()`  
26000 will be to use the `O_EXEC` flag when opening `fd`. In this case, the application will not be able to  
26001 perform a checksum test since it will not be able to read the contents of the file.

26002 Note that when a file descriptor is opened with `O_RDONLY`, `O_RDWR`, or `O_WRONLY` mode,  
26003 the file descriptor can be used to read, read and write, or write the file, respectively, even if the  
26004 mode of the file changes after the file was opened. Using the `O_EXEC` open mode is different;  
26005 `fexecve()` will ignore the mode that was used when the file descriptor was opened and the `exec`  
26006 will fail if the mode of the file associated with `fd` does not grant execute permission to the calling  
26007 process at the time `fexecve()` is called.

## 26008 RATIONALE

26009 Early proposals required that the value of *argc* passed to *main()* be “one or greater”. This was  
 26010 driven by the same requirement in drafts of the ISO C standard. In fact, historical  
 26011 implementations have passed a value of zero when no arguments are supplied to the caller of  
 26012 the *exec* functions. This requirement was removed from the ISO C standard and subsequently  
 26013 removed from this volume of POSIX.1-2008 as well. The wording, in particular the use of the  
 26014 word *should*, requires a Strictly Conforming POSIX Application to pass at least one argument to  
 26015 the *exec* function, thus guaranteeing that *argc* be one or greater when invoked by such an  
 26016 application. In fact, this is good practice, since many existing applications reference *argv[0]*  
 26017 without first checking the value of *argc*.

26018 The requirement on a Strictly Conforming POSIX Application also states that the value passed as  
 26019 the first argument be a filename associated with the process being started. Although some  
 26020 existing applications pass a pathname rather than a filename in some circumstances, a filename  
 26021 is more generally useful, since the common usage of *argv[0]* is in printing diagnostics. In some  
 26022 cases the filename passed is not the actual filename of the file, for example, many  
 26023 implementations of the *login* utility use a convention of prefixing a <hyphen> (‘-’) to the actual  
 26024 filename, which indicates to the command interpreter being invoked that it is a “login shell”.

26025 Historically, there have been two ways that implementations can *exec* shell scripts.

26026 One common historical implementation is that the *execl()*, *execv()*, *execle()*, and *execve()*  
 26027 functions return an [ENOEXEC] error for any file not recognizable as executable, including a  
 26028 shell script. When the *execlp()* and *execvp()* functions encounter such a file, they assume the file  
 26029 to be a shell script and invoke a known command interpreter to interpret such files. This is now  
 26030 required by POSIX.1-2008. These implementations of *execvp()* and *execlp()* only give the  
 26031 [ENOEXEC] error in the rare case of a problem with the command interpreter’s executable file.  
 26032 Because of these implementations, the [ENOEXEC] error is not mentioned for *execlp()* or  
 26033 *execvp()*, although implementations can still give it.

26034 Another way that some historical implementations handle shell scripts is by recognizing the first  
 26035 two bytes of the file as the character string “#!” and using the remainder of the first line of the  
 26036 file as the name of the command interpreter to execute.

26037 One potential source of confusion noted by the standard developers is over how the contents of  
 26038 a process image file affect the behavior of the *exec* family of functions. The following is a  
 26039 description of the actions taken:

- 26040 1. If the process image file is a valid executable (in a format that is executable and valid and  
 26041 having appropriate privileges) for this system, then the system executes the file.
- 26042 2. If the process image file has appropriate privileges and is in a format that is executable  
 26043 but not valid for this system (such as a recognized binary for another architecture), then  
 26044 this is an error and *errno* is set to [EINVAL] (see later RATIONALE on [EINVAL]).
- 26045 3. If the process image file has appropriate privileges but is not otherwise recognized:
  - 26046 a. If this is a call to *execlp()* or *execvp()*, then they invoke a command interpreter  
 26047 assuming that the process image file is a shell script.
  - 26048 b. If this is not a call to *execlp()* or *execvp()*, then an error occurs and *errno* is set to  
 26049 [ENOEXEC].

26050 Applications that do not require to access their arguments may use the form:

26051 `main(void)`

26052 as specified in the ISO C standard. However, the implementation will always provide the two

26053 arguments *argc* and *argv*, even if they are not used.

26054 Some implementations provide a third argument to *main()* called *envp*. This is defined as a  
26055 pointer to the environment. The ISO C standard specifies invoking *main()* with two arguments,  
26056 so implementations must support applications written this way. Since this volume of  
26057 POSIX.1-2008 defines the global variable *environ*, which is also provided by historical  
26058 implementations and can be used anywhere that *envp* could be used, there is no functional need  
26059 for the *envp* argument. Applications should use the *getenv()* function rather than accessing the  
26060 environment directly via either *envp* or *environ*. Implementations are required to support the  
26061 two-argument calling sequence, but this does not prohibit an implementation from supporting  
26062 *envp* as an optional third argument.

26063 This volume of POSIX.1-2008 specifies that signals set to SIG\_IGN remain set to SIG\_IGN, and  
26064 that the new process image inherits the signal mask of the thread that called *exec* in the old  
26065 process image. This is consistent with historical implementations, and it permits some useful  
26066 functionality, such as the *nohup* command. However, it should be noted that many existing  
26067 applications wrongly assume that they start with certain signals set to the default action and/or  
26068 unblocked. In particular, applications written with a simpler signal model that does not include  
26069 blocking of signals, such as the one in the ISO C standard, may not behave properly if invoked  
26070 with some signals blocked. Therefore, it is best not to block or ignore signals across *execs* without  
26071 explicit reason to do so, and especially not to block signals across *execs* of arbitrary (not closely  
26072 co-operating) programs.

26073 The *exec* functions always save the value of the effective user ID and effective group ID of the  
26074 process at the completion of the *exec*, whether or not the set-user-ID or the set-group-ID bit of  
26075 the process image file is set.

26076 The statement about *argv[]* and *envp[]* being constants is included to make explicit to future  
26077 writers of language bindings that these objects are completely constant. Due to a limitation of  
26078 the ISO C standard, it is not possible to state that idea in standard C. Specifying two levels of  
26079 *const-qualification* for the *argv[]* and *envp[]* parameters for the *exec* functions may seem to be the  
26080 natural choice, given that these functions do not modify either the array of pointers or the  
26081 characters to which the function points, but this would disallow existing correct code. Instead,  
26082 only the array of pointers is noted as constant. The table of assignment compatibility for *dst=src*  
26083 derived from the ISO C standard summarizes the compatibility:

| 26084 | <i>dst:</i>         | char *[] | const char *[] | char *const[] | const char *const[] |
|-------|---------------------|----------|----------------|---------------|---------------------|
| 26085 | <i>src:</i>         |          |                |               |                     |
| 26086 | char *[]            | VALID    | —              | VALID         | —                   |
| 26087 | const char *[]      | —        | VALID          | —             | VALID               |
| 26088 | char *const[]       | —        | —              | VALID         | —                   |
| 26089 | const char *const[] | —        | —              | —             | VALID               |

26090 Since all existing code has a source type matching the first row, the column that gives the most  
26091 valid combinations is the third column. The only other possibility is the fourth column, but  
26092 using it would require a cast on the *argv* or *envp* arguments. It is unfortunate that the fourth  
26093 column cannot be used, because the declaration a non-expert would naturally use would be that  
26094 in the second row.

26095 The ISO C standard and this volume of POSIX.1-2008 do not conflict on the use of *environ*, but  
26096 some historical implementations of *environ* may cause a conflict. As long as *environ* is treated in  
26097 the same way as an entry point (for example, *fork()*), it conforms to both standards. A library can  
26098 contain *fork()*, but if there is a user-provided *fork()*, that *fork()* is given precedence and no  
26099 problem ensues. The situation is similar for *environ*: the definition in this volume of  
26100 POSIX.1-2008 is to be used if there is no user-provided *environ* to take precedence. At least three

| 26102 | [E2BIG]                 | The limit {ARG_MAX} applies not just to the size of the argument list, but to the sum of that and the size of the environment list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 26103 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 26104 | [EFAULT]                | Some historical systems return [EFAULT] rather than [ENOEXEC] when the new process image file is corrupted. They are non-conforming.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 26105 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 26106 | [EINVAL]                | This error condition was added to POSIX.1-2008 to allow an implementation to detect executable files generated for different architectures, and indicate this situation to the application. Historical implementations of shells, <i>execvp()</i> , and <i>execlp()</i> that encounter an [ENOEXEC] error will execute a shell on the assumption that the file is a shell script. This will not produce the desired effect when the file is a valid executable for a different architecture. An implementation may now choose to avoid this problem by returning [EINVAL] when a valid executable for a different architecture is encountered. Some historical implementations return [EINVAL] to indicate that the <i>path</i> argument contains a character with the high order bit set. The standard developers chose to deviate from historical practice for the following reasons: |

| 26125 | [ETXTBSY]               | System V returns this error when the executable file is currently open for writing by some process. This volume of POSIX.1-2008 neither requires nor prohibits this behavior.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 26126 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 26127 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 26128 |                         | Other systems (such as System V) may return [EINTR] from <i>exec</i> . This is not addressed by this volume of POSIX.1-2008, but implementations may have a window between the call to <i>exec</i> and the time that a signal could cause one of the <i>exec</i> calls to return with [EINTR].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 26129 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 26130 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 26131 |                         | An explicit statement regarding the floating-point environment (as defined in the <code>&lt;fenv.h&gt;</code> header) was added to make it clear that the floating-point environment is set to its default when a call to one of the <i>exec</i> functions succeeds. The requirements for inheritance or setting to the default for other process and thread start-up functions is covered by more generic statements in their descriptions and can be summarized as follows:                                                                                                                                                                                                                                                                                                                                                                                                           |
| 26132 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 26139 |                         | The purpose of the <i>fexecve()</i> function is to enable executing a file which has been verified to be the intended file. It is possible to actively check the file by reading from the file descriptor and be sure that the file is not exchanged for another between the reading and the execution. Alternatively, an function like <i>openat()</i> can be used to open a file which has been found by reading the content of a directory using <i>readdir()</i> .                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 26140 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 26141 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 26142 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 26143 |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

26144 **FUTURE DIRECTIONS**

26152 XBD Chapter 8 (on page 173), [<unistd.h>](#)26153 **CHANGE HISTORY**

26154 First released in Issue 1. Derived from Issue 1 of the SVID.

26155 **Issue 5**26156 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
26157 Threads Extension.

26158 Large File Summit extensions are added.

26159 **Issue 6**26160 The following new requirements on POSIX implementations derive from alignment with the  
26161 Single UNIX Specification:

- 26162 • In the DESCRIPTION, behavior is defined for when the process image file is not a valid  
26163 executable.
- 26164 • In this version, `_POSIX_SAVED_IDS` is mandated, thus the effective user ID and effective  
26165 group ID of the new process image shall be saved (as the saved set-user-ID and the saved  
26166 set-group-ID) for use by the `setuid(0)` function.
- 26167 • The [ELOOP] mandatory error condition is added.
- 26168 • A second [ENAMETOOLONG] is added as an optional error condition.
- 26169 • The [ETXTBSY] optional error condition is added.

26170 The following changes were made to align with the IEEE P1003.1a draft standard:

- 26171 • The [EINVAL] mandatory error condition is added.
- 26172 • The [ELOOP] optional error condition is added.

26173 The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

26174 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics  
26175 for typed memory.

26176 The normative text is updated to avoid use of the term “must” for application requirements.

26177 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

26178 IEEE PASC Interpretation 1003.1 #132 is applied.

26179 The DESCRIPTION is updated to make it explicit that the floating-point environment in the new  
26180 process image is set to the default.26181 The DESCRIPTION and RATIONALE are updated to include clarifications of how the contents  
26182 of a process image file affect the behavior of the *exec* functions.26183 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/15 is applied, adding a new paragraph to  
26184 the DESCRIPTION and text to the end of the APPLICATION USAGE section. This change

- 26185 addresses a security concern, where implementations may want to reopen file descriptors 0, 1,  
26186 and 2 for programs with the set-user-id or set-group-id file mode bits calling the *exec* family of  
26187 functions.
- 26188 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/24 is applied, applying changes to the  
26189 DESCRIPTION, addressing which attributes are inherited by threads, and behavioral  
26190 requirements for threads attributes.
- 26191 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/25 is applied, updating text in the  
26192 RATIONALE from “the process signal mask be unchanged across an *exec*” to “the new process  
26193 image inherits the signal mask of the thread that called *exec* in the old process image”.
- 26194 **Issue 7**
- 26195 Austin Group Interpretation 1003.1-2001 #047 is applied, adding the description of `_CS_V7_ENV`  
26196 to the APPLICATION USAGE.
- 26197 Austin Group Interpretation 1003.1-2001 #143 is applied.
- 26198 The *fexecve()* function is added from The Open Group Technical Standard, 2006, Extended API  
26199 Set Part 2.
- 26200 Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, Threads,  
26201 and Timers options is moved to the Base.
- 26202 Changes are made related to support for finegrained timestamps.

26203 **NAME**

26204 exit — terminate a process

26205 **SYNOPSIS**

26206 #include &lt;stdlib.h&gt;

26207 void exit(int status);

26208 **DESCRIPTION**

26209 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 26210 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26211 volume of POSIX.1-2008 defers to the ISO C standard.

26212 CX The value of *status* may be 0, EXIT\_SUCCESS, EXIT\_FAILURE, or any other value, though only  
 26213 the least significant 8 bits (that is, *status* & 0377) shall be available to a waiting parent process.

26214 The *exit()* function shall first call all functions registered by *atexit()*, in the reverse order of their  
 26215 registration, except that a function is called after any previously registered functions that had  
 26216 already been called at the time it was registered. Each function is called as many times as it was  
 26217 registered. If, during the call to any such function, a call to the *longjmp()* function is made that  
 26218 would terminate the call to the registered function, the behavior is undefined.

26219 If a function registered by a call to *atexit()* fails to return, the remaining registered functions shall  
 26220 not be called and the rest of the *exit()* processing shall not be completed. If *exit()* is called more  
 26221 than once, the behavior is undefined.

26222 The *exit()* function shall then flush all open streams with unwritten buffered data and close all  
 26223 CX open streams. Finally, the process shall be terminated with the same consequences as described  
 26224 in [Consequences of Process Termination](#) (on page 545).

26225 **RETURN VALUE**26226 The *exit()* function does not return.26227 **ERRORS**

26228 No errors are defined.

26229 **EXAMPLES**

26230 None.

26231 **APPLICATION USAGE**

26232 None.

26233 **RATIONALE**26234 See *\_Exit()*.26235 **FUTURE DIRECTIONS**

26236 None.

26237 **SEE ALSO**26238 *\_Exit()*, *atexit()*, *exec*, *longjmp()*, *tmpfile()*

26239 XBD &lt;stdlib.h&gt;

26240 **CHANGE HISTORY**26241 **Issue 7**26242 Austin Group Interpretation 1003.1-2001 #031 is applied, separating the *\_Exit()* and *\_exit()*  
 26243 functions from the *exit()* function.

26244 Austin Group Interpretation 1003.1-2001 #085 is applied.

**exp()**26245 **NAME**26246 `exp, expf, expl` — exponential function26247 **SYNOPSIS**26248 `#include <math.h>`26249 `double exp(double x);`26250 `float expf(float x);`26251 `long double expl(long double x);`26252 **DESCRIPTION**26253 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
26254 conflict between the requirements described here and the ISO C standard is unintentional. This  
26255 volume of POSIX.1-2008 defers to the ISO C standard.26256 These functions shall compute the base-*e* exponential of *x*.26257 An application wishing to check for error situations should set *errno* to zero and call  
26258 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
26259 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
26260 zero, an error has occurred.26261 **RETURN VALUE**26262 Upon successful completion, these functions shall return the exponential value of *x*.26263 If the correct value would cause overflow, a range error shall occur and *exp()*, *expf()*, and *expl()*  
26264 shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL, respectively.26265 If the correct value would cause underflow, and is not representable, a range error may occur,  
26266 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.26267 **MX** If *x* is NaN, a NaN shall be returned.26268 If *x* is ±0, 1 shall be returned.26269 If *x* is -Inf, +0 shall be returned.26270 If *x* is +Inf, *x* shall be returned.26271 If the correct value would cause underflow, and is representable, a range error may occur and  
26272 the correct value shall be returned.26273 **ERRORS**

26274 These functions shall fail if:

26275 **Range Error** The result overflows.26276 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
26277 then *errno* shall be set to [ERANGE]. If the integer expression  
26278 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
26279 floating-point exception shall be raised.

26280 These functions may fail if:

26281 **Range Error** The result underflows.26282 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
26283 then *errno* shall be set to [ERANGE]. If the integer expression  
26284 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
26285 floating-point exception shall be raised.

26286 **EXAMPLES**26287 **Computing the Density of the Standard Normal Distribution**

26288 This function shows an implementation for the density of the standard normal distribution  
 26289 using *exp()*. This example uses the constant `M_PI` which is part of the XSI option.

```
26290 #include <math.h>
26291
26292 double
26293 normal_density (double x)
26294 {
26295     return exp(-x*x/2) / sqrt (2*M_PI);
26296 }
```

26296 **APPLICATION USAGE**

26297 Note that for IEEE Std 754-1985 **double**,  $709.8 < x$  implies *exp(x)* has overflowed. The value  
 26298  $x < -708.4$  implies *exp(x)* has underflowed.

26299 On error, the expressions (*math\_errhandling* & `MATH_ERRNO`) and (*math\_errhandling* &  
 26300 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

26301 **RATIONALE**

26302 None.

26303 **FUTURE DIRECTIONS**

26304 None.

26305 **SEE ALSO**

26308 **CHANGE HISTORY**

26309 First released in Issue 1. Derived from Issue 1 of the SVID.

26310 **Issue 5**

26311 The DESCRIPTION is updated to indicate how an application should check for an error. This  
 26312 text was previously published in the APPLICATION USAGE section.

26313 **Issue 6**

26314 The *expf()* and *expl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

26315 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
 26316 revised to align with the ISO/IEC 9899:1999 standard.

26317 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
 26318 marked.

26319 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/26 is applied, adding the example to the  
 26320 EXAMPLES section.

**exp2()**26321 **NAME**26322 `exp2, exp2f, exp2l` — exponential base 2 functions26323 **SYNOPSIS**

```
26324 #include <math.h>
26325
26325 double exp2(double x);
26326 float exp2f(float x);
26327 long double exp2l(long double x);
```

26328 **DESCRIPTION**

26329 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 26330 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26331 volume of POSIX.1-2008 defers to the ISO C standard.

26332 These functions shall compute the base-2 exponential of  $x$ .

26333 An application wishing to check for error situations should set *errno* to zero and call  
 26334 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 26335 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 26336 zero, an error has occurred.

26337 **RETURN VALUE**

26338 Upon successful completion, these functions shall return  $2^x$ .

26339 If the correct value would cause overflow, a range error shall occur and *exp2()*, *exp2f()*, and  
 26340 *exp2l()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 26341 respectively.

26342 If the correct value would cause underflow, and is not representable, a range error may occur,  
 26343 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.

26344 **MX** If  $x$  is NaN, a NaN shall be returned.

26345 If  $x$  is  $\pm 0$ , 1 shall be returned.

26346 If  $x$  is  $-\text{Inf}$ , +0 shall be returned.

26347 If  $x$  is  $+\text{Inf}$ ,  $x$  shall be returned.

26348 If the correct value would cause underflow, and is representable, a range error may occur and  
 26349 the correct value shall be returned.

26350 **ERRORS**

26351 These functions shall fail if:

26352 **Range Error** The result overflows.

26353 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 26354 then *errno* shall be set to [ERANGE]. If the integer expression  
 26355 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 26356 floating-point exception shall be raised.

26357 These functions may fail if:

26358 **Range Error** The result underflows.

26359 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 26360 then *errno* shall be set to [ERANGE]. If the integer expression  
 26361 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 26362 floating-point exception shall be raised.

26363 **EXAMPLES**

26364 None.

26365 **APPLICATION USAGE**26366 For IEEE Std 754-1985 **double**,  $1024 \leq x$  implies  $\text{exp2}(x)$  has overflowed. The value  $x < -1022$   
26367 implies  $\text{exp}(x)$  has underflowed.26368 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
26369 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.26370 **RATIONALE**

26371 None.

26372 **FUTURE DIRECTIONS**

26373 None.

26374 **SEE ALSO**26375 *exp()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *log()*26376 XBD Section 4.19 (on page 116), **<math.h>**26377 **CHANGE HISTORY**

26378 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

**expm1()**26379 **NAME**26380 `expm1, expm1f, expm1l` — compute exponential functions26381 **SYNOPSIS**

```
26382 #include <math.h>
26383 double expm1(double x);
26384 float expm1f(float x);
26385 long double expm1l(long double x);
```

26386 **DESCRIPTION**

26387 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 26388 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26389 volume of POSIX.1-2008 defers to the ISO C standard.

26390 These functions shall compute  $e^x - 1.0$ .

26391 An application wishing to check for error situations should set *errno* to zero and call  
 26392 *feclearexcept*(FE\_ALL\_EXCEPT) before calling these functions. On return, if *errno* is non-zero or  
 26393 *fetestexcept*(FE\_INVALID | FE\_DIVBYZERO | FE\_OVERFLOW | FE\_UNDERFLOW) is non-  
 26394 zero, an error has occurred.

26395 **RETURN VALUE**26396 Upon successful completion, these functions return  $e^x - 1.0$ .

26397 If the correct value would cause overflow, a range error shall occur and *expm1()*, *expm1f()*, and  
 26398 *expm1l()* shall return the value of the macro HUGE\_VAL, HUGE\_VALF, and HUGE\_VALL,  
 26399 respectively.

26400 **MX** If *x* is NaN, a NaN shall be returned.26401 If *x* is  $\pm 0$ ,  $\pm 0$  shall be returned.26402 If *x* is  $-\text{Inf}$ ,  $-1$  shall be returned.26403 If *x* is  $+\text{Inf}$ , *x* shall be returned.26404 If *x* is subnormal, a range error may occur and *x* should be returned.26405 **ERRORS**

26406 These functions shall fail if:

26407 **Range Error** The result overflows.

26408 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 26409 then *errno* shall be set to [ERANGE]. If the integer expression  
 26410 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the overflow  
 26411 floating-point exception shall be raised.

26412 These functions may fail if:

26413 **MX** **Range Error** The value of *x* is subnormal.

26414 If the integer expression (*math\_errhandling* & MATH\_ERRNO) is non-zero,  
 26415 then *errno* shall be set to [ERANGE]. If the integer expression  
 26416 (*math\_errhandling* & MATH\_ERREXCEPT) is non-zero, then the underflow  
 26417 floating-point exception shall be raised.

26418 **EXAMPLES**

26419 None.

26420 **APPLICATION USAGE**26421 The value of  $\text{expm1}(x)$  may be more accurate than  $\text{exp}(x)-1.0$  for small values of  $x$ .26422 The  $\text{expm1}()$  and  $\text{log1p}()$  functions are useful for financial calculations of  $((1+x)^n-1)/x$ , namely:26423  $\text{expm1}(n * \text{log1p}(x)) / x$ 26424 when  $x$  is very small (for example, when calculating small daily interest rates). These functions  
26425 also simplify writing accurate inverse hyperbolic functions.26426 For IEEE Std 754-1985 **double**,  $709.8 < x$  implies  $\text{expm1}(x)$  has overflowed.26427 On error, the expressions (*math\_errhandling* & MATH\_ERRNO) and (*math\_errhandling* &  
26428 MATH\_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.26429 **RATIONALE**

26430 None.

26431 **FUTURE DIRECTIONS**

26432 None.

26433 **SEE ALSO**26434 *exp()*, *feclearexcept()*, *fetestexcept()*, *ilogb()*, *log1p()*26435 XBD Section 4.19 (on page 116), **<math.h>**26436 **CHANGE HISTORY**

26437 First released in Issue 4, Version 2.

26438 **Issue 5**

26439 Moved from X/OPEN UNIX extension to BASE.

26440 **Issue 6**26441 The  $\text{expm1f}()$  and  $\text{expm1l}()$  functions are added for alignment with the ISO/IEC 9899:1999  
26442 standard.26443 The  $\text{expm1}()$  function is no longer marked as an extension.26444 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are  
26445 revised to align with the ISO/IEC 9899:1999 standard.26446 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are  
26447 marked.

**fabs()**26448 **NAME**26449 `fabs, fabsf, fabsl` — absolute value function26450 **SYNOPSIS**

```
26451 #include <math.h>
26452 double fabs(double x);
26453 float fabsf(float x);
26454 long double fabsl(long double x);
```

26455 **DESCRIPTION**

26456 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
 26457 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26458 volume of POSIX.1-2008 defers to the ISO C standard.

26459 These functions shall compute the absolute value of their argument  $x$ ,  $|x|$ .

26460 **RETURN VALUE**

26461 Upon successful completion, these functions shall return the absolute value of  $x$ .

26462 **MX** If  $x$  is NaN, a NaN shall be returned.

26463 If  $x$  is  $\pm 0$ ,  $+0$  shall be returned.

26464 If  $x$  is  $\pm\text{Inf}$ ,  $+\text{Inf}$  shall be returned.

26465 **ERRORS**

26466 No errors are defined.

26467 **EXAMPLES**26468 **Computing the 1-Norm of a Floating-Point Vector**

26469 This example shows the use of `fabs()` to compute the 1-norm of a vector defined as follows:

```
26470 norm1(v) = |v[0]| + |v[1]| + ... + |v[n-1]|
```

26471 where  $|x|$  denotes the absolute value of  $x$ ,  $n$  denotes the vector's dimension  $v[i]$  denotes the  $i$ -th  
 26472 component of  $v$  ( $0 \leq i < n$ ).

```
26473 #include <math.h>
26474 double
26475 norm1(const double v[], const int n)
26476 {
26477     int i;
26478     double n1_v; /* 1-norm of v */
26479     n1_v = 0;
26480     for (i=0; i<n; i++) {
26481         n1_v += fabs (v[i]);
26482     }
26483     return n1_v;
26484 }
```

26485 **APPLICATION USAGE**

26486 None.

26487 **RATIONALE**

26488 None.

26489 **FUTURE DIRECTIONS**

26514 **NAME**

26515 **fattach** — attach a STREAMS-based file descriptor to a file in the file system name space  
 26516 (**STREAMS**)

26517 **SYNOPSIS**

```
26518 OB XSR #include <stropts.h>
26519 int fattach(int fildev, const char *path);
```

26520 **DESCRIPTION**

26521 The *fattach()* function shall attach a STREAMS-based file descriptor to a file, effectively  
 26522 associating a pathname with *fildev*. The application shall ensure that the *fildev* argument is a  
 26523 valid open file descriptor associated with a STREAMS file. The *path* argument points to a  
 26524 pathname of an existing file. The application shall have appropriate privileges or be the owner  
 26525 of the file named by *path* and have write permission. A successful call to *fattach()* shall cause all  
 26526 pathnames that name the file named by *path* to name the STREAMS file associated with *fildev*,  
 26527 until the STREAMS file is detached from the file. A STREAMS file can be attached to more than  
 26528 one file and can have several pathnames associated with it.

26529 The attributes of the named STREAMS file shall be initialized as follows: the permissions, user  
 26530 ID, group ID, and times are set to those of the file named by *path*, the number of links is set to 1,  
 26531 and the size and device identifier are set to those of the STREAMS file associated with *fildev*. If  
 26532 any attributes of the named STREAMS file are subsequently changed (for example, by *chmod()*),  
 26533 neither the attributes of the underlying file nor the attributes of the STREAMS file to which *fildev*  
 26534 refers shall be affected.

26535 File descriptors referring to the underlying file, opened prior to an *fattach()* call, shall continue to  
 26536 refer to the underlying file.

26537 **RETURN VALUE**

26538 Upon successful completion, *fattach()* shall return 0. Otherwise,  $-1$  shall be returned and *errno*  
 26539 set to indicate the error.

26540 **ERRORS**

26541 The *fattach()* function shall fail if:

26542 [EACCES] Search permission is denied for a component of the path prefix, or the process  
 26543 is the owner of *path* but does not have write permissions on the file named by  
 26544 *path*.

26545 [EBADF] The *fildev* argument is not a valid open file descriptor.

26546 [EBUSY] The file named by *path* is currently a mount point or has a STREAMS file  
 26547 attached to it.

26548 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
 26549 argument.

26550 [ENAMETOOLONG]

26551 The length of a component of a pathname is longer than {NAME\_MAX}.

26552 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

26553 [ENOTDIR] A component of the path prefix is not a directory, or the *path* argument  
 26554 contains at least one non- $\langle$ slash $\rangle$  character and ends with one or more trailing  
 26555  $\langle$ slash $\rangle$  characters and the last pathname component names an existing file  
 26556 that is neither a directory nor a symbolic link to a directory.

**fattach()**

- 26557 [EPERM] The effective user ID of the process is not the owner of the file named by *path*  
 26558 and the process does not have appropriate privileges.
- 26559 The *fattach()* function may fail if:
- 26560 [EINVAL] The *files* argument does not refer to a STREAMS file.
- 26561 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
 26562 resolution of the *path* argument.
- 26563 [ENAMETOOLONG]  
 26564 The length of a pathname exceeds {PATH\_MAX}, or pathname resolution of a  
 26565 symbolic link produced an intermediate result with a length that exceeds  
 26566 {PATH\_MAX}.
- 26567 [EXDEV] A link to a file on another file system was attempted.

26568 **EXAMPLES**26569 **Attaching a File Descriptor to a File**

26570 In the following example, *fd* refers to an open STREAMS file. The call to *fattach()* associates this  
 26571 STREAM with the file **/tmp/named-STREAM**, such that any future calls to open **/tmp/named-**  
 26572 **STREAM**, prior to breaking the attachment via a call to *fdetach()*, will instead create a new file  
 26573 handle referring to the STREAMS file associated with *fd*.

```
26574 #include <stropts.h>
26575 ...
26576     int fd;
26577     char *filename = "/tmp/named-STREAM";
26578     int ret;
26579
26579     ret = fattach(fd, filename);
```

26580 **APPLICATION USAGE**

26581 The *fattach()* function behaves similarly to the traditional *mount()* function in the way a file is  
 26582 temporarily replaced by the root directory of the mounted file system. In the case of *fattach()*, the  
 26583 replaced file need not be a directory and the replacing file is a STREAMS file.

26584 **RATIONALE**

26585 The file attributes of a file which has been the subject of an *fattach()* call are specifically set  
 26586 because of an artifact of the original implementation. The internal mechanism was the same as  
 26587 for the *mount()* function. Since *mount()* is typically only applied to directories, the effects when  
 26588 applied to a regular file are a little surprising, especially as regards the link count which rigidly  
 26589 remains one, even if there were several links originally and despite the fact that all original links  
 26590 refer to the STREAM as long as the *fattach()* remains in effect.

26591 **FUTURE DIRECTIONS**

26592 The *fattach()* function may be removed in a future version.

26593 **SEE ALSO**

26594 *fdetach()*, *isastream()*

26595 XBD <stropts.h>

26596 **CHANGE HISTORY**

26597 First released in Issue 4, Version 2.

26598 **Issue 5**

26599 Moved from X/OPEN UNIX extension to BASE.

26600 The [EXDEV] error is added to the list of optional errors in the ERRORS section.

26601 **Issue 6**

26602 This function is marked as part of the XSI STREAMS Option Group.

26603 The normative text is updated to avoid use of the term “must” for application requirements.

26604 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
26605 [ELOOP] error condition is added.

26606 **Issue 7**

26607 Austin Group Interpretation 1003.1-2001 #143 is applied.

26608 The *fattach()* function is marked obsolescent.

26609 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a  
26610 pathname exists but is not a directory or a symbolic link to a directory.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

**fchdir()**26611 **NAME**26612 `fchdir` — change working directory26613 **SYNOPSIS**26614 `#include <unistd.h>`26615 `int fchdir(int fildev);`26616 **DESCRIPTION**26617 The `fchdir()` function shall be equivalent to `chdir()` except that the directory that is to be the new  
26618 current working directory is specified by the file descriptor `fildev`.26619 A conforming application can obtain a file descriptor for a file of type directory using `open()`,  
26620 provided that the file status flags and access modes do not contain `O_WRONLY` or `O_RDWR`.26621 **RETURN VALUE**26622 Upon successful completion, `fchdir()` shall return 0. Otherwise, it shall return -1 and set `errno` to  
26623 indicate the error. On failure the current working directory shall remain unchanged.26624 **ERRORS**26625 The `fchdir()` function shall fail if:26626 [EACCES] Search permission is denied for the directory referenced by `fildev`.26627 [EBADF] The `fildev` argument is not an open file descriptor.26628 [ENOTDIR] The open file descriptor `fildev` does not refer to a directory.26629 The `fchdir()` may fail if:26630 [EINTR] A signal was caught during the execution of `fchdir()`.

26631 [EIO] An I/O error occurred while reading from or writing to the file system.

26647 **Issue 7**26648 The `fchdir()` function is moved from the XSI option to the Base.

26649 **NAME**

26650 fchmod — change mode of a file

26651 **SYNOPSIS**

26652 #include &lt;sys/stat.h&gt;

26653 int fchmod(int *fildev*, mode\_t *mode*);26654 **DESCRIPTION**26655 The *fchmod()* function shall be equivalent to *chmod()* except that the file whose permissions are  
26656 changed is specified by the file descriptor *fildev*.26657 SHM If *fildev* references a shared memory object, the *fchmod()* function need only affect the S\_IRUSR,  
26658 S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits.26659 TYM If *fildev* references a typed memory object, the behavior of *fchmod()* is unspecified.26660 If *fildev* refers to a socket, the behavior of *fchmod()* is unspecified.26661 OB XSR If *fildev* refers to a STREAM (which is *fattach()*-ed into the file system name space) the call  
26662 returns successfully, doing nothing.26663 **RETURN VALUE**26664 Upon successful completion, *fchmod()* shall return 0. Otherwise, it shall return -1 and set *errno* to  
26665 indicate the error.26666 **ERRORS**26667 The *fchmod()* function shall fail if:26668 [EBADF] The *fildev* argument is not an open file descriptor.26669 [EPERM] The effective user ID does not match the owner of the file and the process does  
26670 not have appropriate privileges.26671 [EROFS] The file referred to by *fildev* resides on a read-only file system.26672 The *fchmod()* function may fail if:26673 XSI [EINTR] The *fchmod()* function was interrupted by a signal.26674 XSI [EINVAL] The value of the *mode* argument is invalid.26675 [EINVAL] The *fildev* argument refers to a pipe and the implementation disallows  
26676 execution of *fchmod()* on a pipe.26677 **EXAMPLES**26678 **Changing the Current Permissions for a File**26679 The following example shows how to change the permissions for a file named */home/cnd/mod1*  
26680 so that the owner and group have read/write/execute permissions, but the world only has  
26681 read/write permissions.

26682 #include &lt;sys/stat.h&gt;

26683 #include &lt;fcntl.h&gt;

26684 mode\_t mode;

26685 int fildev;

26686 ...

26687 fildev = open("/home/cnd/mod1", O\_RDWR);

26688 fchmod(fildev, S\_IRWXU | S\_IRWXG | S\_IROTH | S\_IWOTH);

**fchown()**26714 **NAME**26715 `fchown` — change owner and group of a file26716 **SYNOPSIS**26717 `#include <unistd.h>`26718 `int fchown(int fildes, uid_t owner, gid_t group);`26719 **DESCRIPTION**26720 The `fchown()` function shall be equivalent to `chown()` except that the file whose owner and group  
26721 are changed is specified by the file descriptor `filde`s.26722 **RETURN VALUE**26723 Upon successful completion, `fchown()` shall return 0. Otherwise, it shall return `-1` and set `errno` to  
26724 indicate the error.26725 **ERRORS**26726 The `fchown()` function shall fail if:26727 [EBADF] The `filde`s argument is not an open file descriptor.26728 [EPERM] The effective user ID does not match the owner of the file or the process does  
26729 not have appropriate privileges and `_POSIX_CHOWN_RESTRICTED`  
26730 indicates that such privilege is required.26731 [EROFS] The file referred to by `filde`s resides on a read-only file system.26732 The `fchown()` function may fail if:26733 [EINVAL] The owner or group ID is not a value supported by the implementation. The  
26734 OB XSR `filde`s argument refers to a pipe or socket or an `fattach()`-ed STREAM and the  
26735 implementation disallows execution of `fchown()` on a pipe.

26736 [EIO] A physical I/O error has occurred.

26737 [EINTR] The `fchown()` function was interrupted by a signal which was caught.26738 **EXAMPLES**26739 **Changing the Current Owner of a File**26740 The following example shows how to change the owner of a file named `/home/cnd/mod1` to  
26741 “jones” and the group to “cnd”.26742 The numeric value for the user ID is obtained by extracting the user ID from the user database  
26743 entry associated with “jones”. Similarly, the numeric value for the group ID is obtained by  
26744 extracting the group ID from the group database entry associated with “cnd”. This example  
26745 assumes the calling program has appropriate privileges.

```

26746 #include <sys/types.h>
26747 #include <unistd.h>
26748 #include <fcntl.h>
26749 #include <pwd.h>
26750 #include <grp.h>
26751
26751 struct passwd *pwd;
26752 struct group *grp;
26753 int
26754     filde;
26755
26755 ...
26755 filde = open("/home/cnd/mod1", O_RDWR);
26756 pwd = getpwnam("jones");

```

```
26757     grp = getgrnam("cnd");
26758     fchown(fildes, pwd->pw_uid, grp->gr_gid);
```

**26768 CHANGE HISTORY**

26769 First released in Issue 4, Version 2.

**26770 Issue 5**

26771 Moved from X/OPEN UNIX extension to BASE.

**26772 Issue 6**

26773 The following changes were made to align with the IEEE P1003.1a draft standard:

- 26774 • Clarification is added that a call to *fchown()* may not be allowed on a pipe.

26775 The *fchown()* function is defined as mandatory.

**26776 Issue 7**

26777 Functionality relating to XSI STREAMS is marked obsolescent.

**fchownat()***System Interfaces*26778 **NAME**26779 `fchownat` — change owner and group of a file relative to directory file descriptor26780 **SYNOPSIS**26781 `#include <unistd.h>`26782 `int fchownat(int fd, const char *path, uid_t owner, gid_t group,`26783 `int flag);`26784 **DESCRIPTION**26785 Refer to *chown()*.

STANDARDSISO.COM : Click to view the full PDF of ISO/IEC/IEEE 9945:2009

26786 **NAME**26787 `fclose` — close a stream26788 **SYNOPSIS**26789 `#include <stdio.h>`26790 `int fclose(FILE *stream);`26791 **DESCRIPTION**

26792 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 26793 conflict between the requirements described here and the ISO C standard is unintentional. This  
 26794 volume of POSIX.1-2008 defers to the ISO C standard.

26795 The `fclose()` function shall cause the stream pointed to by `stream` to be flushed and the associated  
 26796 file to be closed. Any unwritten buffered data for the stream shall be written to the file; any  
 26797 unread buffered data shall be discarded. Whether or not the call succeeds, the stream shall be  
 26798 disassociated from the file and any buffer set by the `setbuf()` or `setvbuf()` function shall be  
 26799 disassociated from the stream. If the associated buffer was automatically allocated, it shall be  
 26800 deallocated.

26801 CX If the file is not already at EOF, and the file is one capable of seeking, the file offset of the  
 26802 underlying open file description shall be adjusted so that the next operation on the open file  
 26803 description deals with the byte after the last one read from or written to the stream being closed.

26804 The `fclose()` function shall mark for update the last data modification and last file status change  
 26805 timestamps of the underlying file, if the stream was writable, and if buffered data remains that  
 26806 has not yet been written to the file. The `fclose()` function shall perform the equivalent of a `close()`  
 26807 on the file descriptor that is associated with the stream pointed to by `stream`.

26808 After the call to `fclose()`, any use of `stream` results in undefined behavior.

26809 **RETURN VALUE**

26810 CX Upon successful completion, `fclose()` shall return 0; otherwise, it shall return EOF and set `errno`  
 26811 to indicate the error.

26812 **ERRORS**

26813 The `fclose()` function shall fail if:

26814 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor underlying `stream` and  
 26815 the thread would be delayed in the write operation.

26816 CX [EBADF] The file descriptor underlying stream is not valid.

26817 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

26818 XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the  
 26819 process.

26820 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the  
 26821 offset maximum associated with the corresponding stream.

26822 CX [EINTR] The `fclose()` function was interrupted by a signal.

26823 CX [EIO] The process is a member of a background process group attempting to write to  
 26824 its controlling terminal, TOSTOP is set, the process is neither ignoring nor  
 26825 blocking SIGTTOU, and the process group of the process is orphaned. This  
 26826 error may also be returned under implementation-defined conditions.

26827 CX [ENOMEM] The underlying stream was created by `open_memstream()` or  
 26828 `open_wmemstream()` and insufficient memory is available.

**fclose()**

26829 CX [ENOSPC] There was no free space remaining on the device containing the file or in the  
26830 buffer used by the *fmemopen()* function.

26831 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
26832 any process. A SIGPIPE signal shall also be sent to the thread.

26833 The *fclose()* function may fail if:

26834 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
26835 capabilities of the device.

**CHANGE HISTORY**

26847 First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

26849 Large File Summit extensions are added.

**Issue 6**

26851 Extensions beyond the ISO C standard are marked.

26853 The following new requirements on POSIX implementations derive from alignment with the  
26854 Single UNIX Specification:

- 26855 • The [EFBIG] error is added as part of the large file support extensions.
- 26856 • The [ENXIO] optional error condition is added.

26857 The DESCRIPTION is updated to note that the stream and any buffer are disassociated whether  
26858 or not the call succeeds. This is for alignment with the ISO/IEC 9899:1999 standard.

26859 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/28 is applied, updating the [EAGAIN]  
26860 error in the ERRORS section from “the process would be delayed” to “the thread would be  
26861 delayed”.

**Issue 7**

26862 Austin Group Interpretation 1003.1-2001 #002 is applied, clarifying the interaction of file  
26863 descriptors and streams.

26865 The [ENOSPC] error condition is updated and the [ENOMEM] error is added from The Open  
26866 Group Technical Standard, 2006, Extended API Set Part 1.

26867 Changes are made related to support for finegrained timestamps.

26868 **NAME**

26869           fcntl — file control

26870 **SYNOPSIS**

26871           #include &lt;fcntl.h&gt;

26872           int fcntl(int *fildev*, int *cmd*, ...);26873 **DESCRIPTION**26874           The *fcntl()* function shall perform the operations described below on open files. The *fildev*  
26875           argument is a file descriptor.26876           The available values for *cmd* are defined in <fcntl.h> and are as follows:

26877           **F\_DUPFD**           Return a new file descriptor which shall be the lowest numbered  
26878           available (that is, not already open) file descriptor greater than or equal to  
26879           the third argument, *arg*, taken as an integer of type **int**. The new file  
26880           descriptor shall refer to the same open file description as the original file  
26881           descriptor, and shall share any locks. The FD\_CLOEXEC flag associated  
26882           with the new file descriptor shall be cleared to keep the file open across  
26883           calls to one of the *exec* functions.

26884           **F\_DUPFD\_CLOEXEC**26885           Like F\_DUPFD, but the FD\_CLOEXEC flag associated with the new file  
26886           descriptor shall be set.26887           **F\_GETFD**26888           Get the file descriptor flags defined in <fcntl.h> that are associated with  
26889           the file descriptor *fildev*. File descriptor flags are associated with a single  
26890           file descriptor and do not affect other file descriptors that refer to the  
26891           same file.26891           **F\_SETFD**26892           Set the file descriptor flags defined in <fcntl.h>, that are associated with  
26893           *fildev*, to the third argument, *arg*, taken as type **int**. If the FD\_CLOEXEC  
26894           flag in the third argument is 0, the file descriptor shall remain open across  
26895           the *exec* functions; otherwise, the file descriptor shall be closed upon  
26896           successful execution of one of the *exec* functions.26896           **F\_GETFL**26897           Get the file status flags and file access modes, defined in <fcntl.h>, for the  
26898           file description associated with *fildev*. The file access modes can be  
26899           extracted from the return value using the mask O\_ACCMODE, which is  
26900           defined in <fcntl.h>. File status flags and file access modes are associated  
26901           with the file description and do not affect other file descriptors that refer  
26902           to the same file with different open file descriptions. The flags returned  
26903           may include non-standard file status flags which the application did not  
26904           set, provided that these additional flags do not alter the behavior of a  
26905           conforming application.26905           **F\_SETFL**26906           Set the file status flags, defined in <fcntl.h>, for the file description  
26907           associated with *fildev* from the corresponding bits in the third argument,  
26908           *arg*, taken as type **int**. Bits corresponding to the file access mode and the  
26909           file creation flags, as defined in <fcntl.h>, that are set in *arg* shall be  
26910           ignored. If any bits in *arg* other than those mentioned here are changed by  
26911           the application, the result is unspecified.26911           **F\_GETOWN**26912           If *fildev* refers to a socket, get the process or process group ID specified to  
26913           receive SIGURG signals when out-of-band data is available. Positive  
26914           values indicate a process ID; negative values, other than -1, indicate a  
26915           process group ID. If *fildev* does not refer to a socket, the results are

**fcntl()**

|       |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 26915 |          | unspecified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 26916 | F_SETOWN | If <i>fildev</i> refers to a socket, set the process or process group ID specified to receive SIGURG signals when out-of-band data is available, using the value of the third argument, <i>arg</i> , taken as type <b>int</b> . Positive values indicate a process ID; negative values, other than $-1$ , indicate a process group ID. If <i>fildev</i> does not refer to a socket, the results are unspecified.                                                                                                                                                                                                                                                                               |
| 26917 |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 26918 |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 26929 | F_SETLK  | Set or clear a file segment lock according to the lock description pointed to by the third argument, <i>arg</i> , taken as a pointer to type <b>struct flock</b> , defined in <b>&lt;fcntl.h&gt;</b> . F_SETLK can establish shared (or read) locks (F_RDLCK) or exclusive (or write) locks (F_WRLCK), as well as to remove either type of lock (F_UNLCK). F_RDLCK, F_WRLCK, and F_UNLCK are defined in <b>&lt;fcntl.h&gt;</b> . If a shared or exclusive lock cannot be set, <i>fcntl()</i> shall return immediately with a return value of $-1$ .                                                                                                                                            |

| 26936 | F_SETLKW | This command shall be equivalent to F_SETLK except that if a shared or exclusive lock is blocked by other locks, the thread shall wait until the request can be satisfied. If a signal that is to be caught is received while <i>fcntl()</i> is waiting for a region, <i>fcntl()</i> shall be interrupted. Upon return from the signal handler, <i>fcntl()</i> shall return $-1$ with <i>errno</i> set to [EINTR], and the lock operation shall not be done.                                                                                                                                                                                                                                   |

| 26950 |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 26951 |          | The structure <b>flock</b> describes the type ( <i>l_type</i> ), starting offset ( <i>l_whence</i> ), relative offset ( <i>l_start</i> ), size ( <i>l_len</i> ), and process ID ( <i>l_pid</i> ) of the segment of the file to be affected.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 26952 |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 26953 |          | The value of <i>l_whence</i> is SEEK_SET, SEEK_CUR, or SEEK_END, to indicate that the relative offset <i>l_start</i> bytes shall be measured from the start of the file, current position, or end of the file, respectively. The value of <i>l_len</i> is the number of consecutive bytes to be locked. The value of <i>l_len</i> may be negative (where the definition of <b>off_t</b> permits negative values of <i>l_len</i> ). The <i>l_pid</i> field is only used with F_GETLK to return the process ID of the process holding a blocking lock. After a successful F_GETLK request, when a blocking lock is found, the values returned in the <b>flock</b> structure shall be as follows: |
| 26954 |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 26955 |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 26956 |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 26957 |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 26958 |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 26959 |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|       |                 |                                                                                                                                     |
|-------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------|
| 26960 | <i>l_type</i>   | Type of blocking lock found.                                                                                                        |
| 26961 | <i>l_whence</i> | SEEK_SET.                                                                                                                           |
| 26962 | <i>l_start</i>  | Start of the blocking lock.                                                                                                         |
| 26963 | <i>l_len</i>    | Length of the blocking lock.                                                                                                        |
| 26964 | <i>l_pid</i>    | Process ID of the process that holds the blocking lock.                                                                             |
| 26965 |                 | If the command is F_SETLKW and the process must wait for another process to release a lock,                                         |
| 26966 |                 | then the range of bytes to be locked shall be determined before the <i>fcntl()</i> function blocks. If the                          |
| 26967 |                 | file size or file descriptor seek offset change while <i>fcntl()</i> is blocked, this shall not affect the                          |
| 26968 |                 | range of bytes locked.                                                                                                              |
| 26969 |                 | If <i>l_len</i> is positive, the area affected shall start at <i>l_start</i> and end at <i>l_start+l_len-1</i> . If <i>l_len</i> is |
| 26970 |                 | negative, the area affected shall start at <i>l_start+l_len</i> and end at <i>l_start-1</i> . Locks may start and                   |
| 26971 |                 | extend beyond the current end of a file, but shall not extend before the beginning of the file. A                                   |
| 26972 |                 | lock shall be set to extend to the largest possible value of the file offset for that file by setting                               |
| 26973 |                 | <i>l_len</i> to 0. If such a lock also has <i>l_start</i> set to 0 and <i>l_whence</i> is set to SEEK_SET, the whole file           |
| 26974 |                 | shall be locked.                                                                                                                    |
| 26975 |                 | There shall be at most one type of lock set for each byte in the file. Before a successful return                                   |
| 26976 |                 | from an F_SETLK or an F_SETLKW request when the calling process has previously existing                                             |
| 26977 |                 | locks on bytes in the region specified by the request, the previous lock type for each byte in the                                  |
| 26978 |                 | specified region shall be replaced by the new lock type. As specified above under the                                               |
| 26979 |                 | descriptions of shared locks and exclusive locks, an F_SETLK or an F_SETLKW request                                                 |
| 26980 |                 | (respectively) shall fail or block when another process has existing locks on bytes in the specified                                |
| 26981 |                 | region and the type of any of those locks conflicts with the type specified in the request.                                         |
| 26982 |                 | All locks associated with a file for a given process shall be removed when a file descriptor for                                    |
| 26983 |                 | that file is closed by that process or the process holding that file descriptor terminates. Locks are                               |
| 26984 |                 | not inherited by a child process.                                                                                                   |
| 26985 |                 | A potential for deadlock occurs if a process controlling a locked region is put to sleep by                                         |
| 26986 |                 | attempting to lock the locked region of another process. If the system detects that sleeping until                                  |
| 26987 |                 | a locked region is unlocked would cause a deadlock, <i>fcntl()</i> shall fail with an [EDEADLK] error.                              |
| 26988 |                 | An unlock (F_UNLCK) request in which <i>l_len</i> is non-zero and the offset of the last byte of the                                |
| 26989 |                 | requested segment is the maximum value for an object of type <b>off_t</b> , when the process has an                                 |
| 26990 |                 | existing lock in which <i>l_len</i> is 0 and which includes the last byte of the requested segment, shall                           |
| 26991 |                 | be treated as a request to unlock from the start of the requested segment with an <i>l_len</i> equal to 0.                          |
| 26992 |                 | Otherwise, an unlock (F_UNLCK) request shall attempt to unlock only the requested segment.                                          |
| 26993 | SHM             | When the file descriptor <i>fdes</i> refers to a shared memory object, the behavior of <i>fcntl()</i> shall be                      |
| 26994 |                 | the same as for a regular file except the effect of the following values for the argument <i>cmd</i> shall                          |
| 26995 |                 | be unspecified: F_SETFL, F_GETLK, F_SETLK, and F_SETLKW.                                                                            |
| 26996 | TYM             | If <i>fdes</i> refers to a typed memory object, the result of the <i>fcntl()</i> function is unspecified.                           |
| 26997 |                 | <b>RETURN VALUE</b>                                                                                                                 |
| 26998 |                 | Upon successful completion, the value returned shall depend on <i>cmd</i> as follows:                                               |
| 26999 | F_DUPFD         | A new file descriptor.                                                                                                              |
| 27000 | F_DUPFD_CLOEXEC |                                                                                                                                     |
| 27001 |                 | A new file descriptor.                                                                                                              |

**fcntl()**

|       |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 27002 | F_GETFD              | Value of flags defined in <code>&lt;fcntl.h&gt;</code> . The return value shall not be negative.                                                                                                                                                                                                                                                                                                                                                     |
| 27003 | F_SETFD              | Value other than <code>-1</code> .                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 27004 | F_GETFL              | Value of file status flags and access modes. The return value is not negative.                                                                                                                                                                                                                                                                                                                                                                       |
| 27005 | F_SETFL              | Value other than <code>-1</code> .                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 27006 | F_GETLK              | Value other than <code>-1</code> .                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 27039 |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 27040 |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

27041 The *fcntl()* function may fail if:

27042 [EDEADLK] The *cmd* argument is F\_SETLKW, the lock is blocked by a lock from another  
 27043 process, and putting the calling process to sleep to wait for that lock to become  
 27044 free would cause a deadlock.

## 27045 EXAMPLES

### 27046 Locking and Unlocking a File

27047 The following example demonstrates how to place a lock on bytes 100 to 109 of a file and then  
 27048 later remove it. F\_SETLK is used to perform a non-blocking lock request so that the process does  
 27049 not have to wait if an incompatible lock is held by another process; instead the process can take  
 27050 some other action.

```

27051 #include <stdlib.h>
27052 #include <unistd.h>
27053 #include <fcntl.h>
27054 #include <errno.h>
27055 #include <stdio.h>

27056 int
27057 main(int argc, char *argv[])
27058 {
27059     int fd;
27060     struct flock fl;

27061     fd = open("testfile", O_RDWR);
27062     if (fd == -1)
27063         /* Handle error */;

27064     /* Make a non-blocking request to place a write lock
27065        on bytes 100-109 of testfile */

27066     fl.l_type = F_WRLCK;
27067     fl.l_whence = SEEK_SET;
27068     fl.l_start = 100;
27069     fl.l_len = 10;

27070     if (fcntl(fd, F_SETLK, &fl) == -1) {
27071         if (errno == EACCES || errno == EAGAIN) {
27072             printf("Already locked by another process\n");
27073             /* We can't get the lock at the moment */
27074         } else {
27075             /* Handle unexpected error */;
27076         }
27077     } else { /* Lock was granted... */

27078         /* Perform I/O on bytes 100 to 109 of file */
27079         /* Unlock the locked bytes */

27080         fl.l_type = F_UNLCK;
27081         fl.l_whence = SEEK_SET;
27082         fl.l_start = 100;
27083         fl.l_len = 10;
27084         if (fcntl(fd, F_SETLK, &fl) == -1)
  
```

**fcntl()**

```

27085             /* Handle error */;
27086         }
27087         exit(EXIT_SUCCESS);
27088     } /* main */

```

### 27089 **Setting the Close-on-Exec Flag**

27090 The following example demonstrates how to set the close-on-exec flag for the file descriptor *fd*.

```

27091 #include <unistd.h>
27092 #include <fcntl.h>
27093 ...
27094     int flags;
27095
27096     flags = fcntl(fd, F_GETFD);
27097     if (flags == -1)
27098         /* Handle error */;
27099     flags |= FD_CLOEXEC;
27100     if (fcntl(fd, F_SETFD, flags) == -1)
27101         /* Handle error */;

```

### 27101 **APPLICATION USAGE**

27102 The *arg* values to F\_GETFD, F\_SETFD, F\_GETFL, and F\_SETFL all represent flag values to allow  
 27103 for future growth. Applications using these functions should do a read-modify-write operation  
 27104 on them, rather than assuming that only the values defined by this volume of POSIX.1-2008 are  
 27105 valid. It is a common error to forget this, particularly in the case of F\_SETFD. Some  
 27106 implementations set additional file status flags to advise the application of default behavior,  
 27107 even though the application did not request these flags.

### 27108 **RATIONALE**

27109 The ellipsis in the SYNOPSIS is the syntax specified by the ISO C standard for a variable number  
 27110 of arguments. It is used because System V uses pointers for the implementation of file locking  
 27111 functions.

27112 This volume of POSIX.1-2008 permits concurrent read and write access to file data using the  
 27113 *fcntl()* function; this is a change from the 1984 /usr/group standard and early proposals.  
 27114 Without concurrency controls, this feature may not be fully utilized without occasional loss of  
 27115 data.

27116 Data losses occur in several ways. One case occurs when several processes try to update the  
 27117 same record, without sequencing controls; several updates may occur in parallel and the last  
 27118 writer “wins”. Another case is a bit-tree or other internal list-based database that is undergoing  
 27119 reorganization. Without exclusive use to the tree segment by the updating process, other reading  
 27120 processes chance getting lost in the database when the index blocks are split, condensed,  
 27121 inserted, or deleted. While *fcntl()* is useful for many applications, it is not intended to be overly  
 27122 general and does not handle the bit-tree example well.

27123 This facility is only required for regular files because it is not appropriate for many devices such  
 27124 as terminals and network connections.

27125 Since *fcntl()* works with “any file descriptor associated with that file, however it is obtained”,  
 27126 the file descriptor may have been inherited through a *fork()* or *exec* operation and thus may  
 27127 affect a file that another process also has open.

27128 The use of the open file description to identify what to lock requires extra calls and presents  
 27129 problems if several processes are sharing an open file description, but there are too many

27130 implementations of the existing mechanism for this volume of POSIX.1-2008 to use different  
27131 specifications.

27132 Another consequence of this model is that closing any file descriptor for a given file (whether or  
27133 not it is the same open file description that created the lock) causes the locks on that file to be  
27134 relinquished for that process. Equivalently, any close for any file/process pair relinquishes the  
27135 locks owned on that file for that process. But note that while an open file description may be  
27136 shared through *fork()*, locks are not inherited through *fork()*. Yet locks may be inherited through  
27137 one of the *exec* functions.

27138 The identification of a machine in a network environment is outside the scope of this volume of  
27139 POSIX.1-2008. Thus, an *l\_sysid* member, such as found in System V, is not included in the locking  
27140 structure.

27141 Changing of lock types can result in a previously locked region being split into smaller regions.

27142 Mandatory locking was a major feature of the 1984 /usr/group standard.

27143 For advisory file record locking to be effective, all processes that have access to a file must  
27144 cooperate and use the advisory mechanism before doing I/O on the file. Enforcement-mode  
27145 record locking is important when it cannot be assumed that all processes are cooperating. For  
27146 example, if one user uses an editor to update a file at the same time that a second user executes  
27147 another process that updates the same file and if only one of the two processes is using advisory  
27148 locking, the processes are not cooperating. Enforcement-mode record locking would protect  
27149 against accidental collisions.

27150 Secondly, advisory record locking requires a process using locking to bracket each I/O operation  
27151 with lock (or test) and unlock operations. With enforcement-mode file and record locking, a  
27152 process can lock the file once and unlock when all I/O operations have been completed.  
27153 Enforcement-mode record locking provides a base that can be enhanced; for example, with  
27154 sharable locks. That is, the mechanism could be enhanced to allow a process to lock a file so  
27155 other processes could read it, but none of them could write it.

27156 Mandatory locks were omitted for several reasons:

- 27157 1. Mandatory lock setting was done by multiplexing the set-group-ID bit in most  
27158 implementations; this was confusing, at best.
- 27159 2. The relationship to file truncation as supported in 4.2 BSD was not well specified.
- 27160 3. Any publicly readable file could be locked by anyone. Many historical implementations  
27161 keep the password database in a publicly readable file. A malicious user could thus  
27162 prohibit logins. Another possibility would be to hold open a long-distance telephone line.
- 27163 4. Some demand-paged historical implementations offer memory mapped files, and  
27164 enforcement cannot be done on that type of file.

27165 Since sleeping on a region is interrupted with any signal, *alarm()* may be used to provide a  
27166 timeout facility in applications requiring it. This is useful in deadlock detection. Since  
27167 implementation of full deadlock detection is not always feasible, the [EDEADLK] error was  
27168 made optional.

#### 27169 FUTURE DIRECTIONS

27170 None.

**fcntl()**27171 **SEE ALSO**27172 *alarm()*, *close()*, *exec*, *open()*, *sigaction()*27173 XBD **<fcntl.h>**, **<signal.h>**27174 **CHANGE HISTORY**

27175 First released in Issue 1. Derived from Issue 1 of the SVID.

27176 **Issue 5**27177 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX  
27178 Threads Extension.

27179 Large File Summit extensions are added.

27180 **Issue 6**27181 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.27182 The following new requirements on POSIX implementations derive from alignment with the  
27183 Single UNIX Specification:27184 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was  
27185 required for conforming implementations of previous POSIX specifications, it was not  
27186 required for UNIX applications.27187 • In the DESCRIPTION, sentences describing behavior when *l\_len* is negative are now  
27188 mandated, and the description of unlock (F\_UNLOCK) when *l\_len* is non-negative is  
27189 mandated.27190 • In the ERRORS section, the [EINVAL] error condition has the case mandated when the *cmd*  
27191 is invalid, and two [EOVERFLOW] error conditions are added.

27192 The F\_GETOWN and F\_SETOWN values are added for sockets.

27193 The following changes were made to align with the IEEE P1003.1a draft standard:

27194 • Clarification is added that the extent of the bytes locked is determined prior to the  
27195 blocking action.27196 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
27197 *fcntl()* results are unspecified for typed memory objects.

27198 The normative text is updated to avoid use of the term “must” for application requirements.

27199 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/29 is applied, adding the example to the  
27200 EXAMPLES section.27201 **Issue 7**27202 Austin Group Interpretation 1003.1-2001 #150 is applied, clarifying the file status flags returned  
27203 when *cmd* is F\_GETFL.27204 Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the  
27205 FD\_CLOEXEC flag atomically at *open()*, and adding the F\_DUPFD\_CLOEXEC flag.27206 The optional **<unistd.h>** header is removed from this function, since **<fcntl.h>** now defines  
27207 SEEK\_SET, SEEK\_CUR, and SEEK\_END as part of the Base.

27208 **NAME**27209 `fdatasync` — synchronize the data of a file (**REALTIME**)27210 **SYNOPSIS**

```
27211 SIO #include <unistd.h>
27212 int fdatasync(int fildev);
```

27213 **DESCRIPTION**

27214 The `fdatasync()` function shall force all currently queued I/O operations associated with the file  
 27215 indicated by file descriptor *fildev* to the synchronized I/O completion state.

27216 The functionality shall be equivalent to `fsync()` with the symbol `_POSIX_SYNCHRONIZED_IO`  
 27217 defined, with the exception that all I/O operations shall be completed as defined for  
 27218 synchronized I/O data integrity completion.

27219 **RETURN VALUE**

27220 If successful, the `fdatasync()` function shall return the value 0; otherwise, the function shall return  
 27221 the value `-1` and set `errno` to indicate the error. If the `fdatasync()` function fails, outstanding I/O  
 27222 operations are not guaranteed to have been completed.

27223 **ERRORS**

27224 The `fdatasync()` function shall fail if:

27225 [EBADF] The *fildev* argument is not a valid file descriptor open for writing.

27226 [EINVAL] This implementation does not support synchronized I/O for this file.

27227 In the event that any of the queued I/O operations fail, `fdatasync()` shall return the error
