RATIONALE

AMS-QQ-A-250/13B stabilizes this document because it is no longer state of the art and other documents contain equivalent requirements.

STABILIZED NOTICE

AMS-QQ-A-250/13B has been declared "STABILIZED" by SAE AMS Committee D Non-Ferrous Alloys. This document will no longer be updated and may no longer represent standard industry practice. This document was stabilized because it is no longer state of the art and other documents contain technically equivalent requirements. Previously this document was cancelled and superseded by AMS4048 and AMS4049. The last technical update of this document occurred in August, 1997. Users of this document should refer to the cognizant engineering organization for disposition of any issues with reports/certifications to this specification; including exceptions listed on the certification.

NOTE: In many cases, the purchaser may represent a sub tier supplier and not the cognizant engineering organization.

AMS Committee D recommends that the following technically equivalent specifications be considered for future procurement. This listing does not constitute authority to substitute these specifications for the "STABILIZED" specification.

Temper	Superseding Material and Specification
O, F	7075-O or -F in accordance with AMS 4048; Aluminum Alloy Sheet and Plate, Alclad 5.6Zn - 2.5Mg - 1.6Cu - 0.23Cr (Alclad 7075-0) Annealed or when specified, "As Fabricated" (Alclad 7075-F)
T6/T651	7075-T6/T651 in accordance with AMS 4049; Aluminum Alloy, Sheet and Plate, Alclad 5.6Zn - 2.5Mg - 1.6Cu - 0.23Cr (Alclad 7075; -T6 Sheet - T651 Plate) Solution and Precipitation Heat Treated

SAE Executive Standards Committee Rules provide that: "This report is published by SAE to advance the state of technical and engineering sciences. The use of this report is entirely voluntary, and its applicability and suitability for any particular use, including any patent infringement arising therefrom, is the sole responsibility of the user."

SAE reviews each technical report at least every five years at which time it may be revised, reaffirmed, stabilized, or cancelled. SAE invites your written comments and suggestions.

NOTICE

This document has been taken directly from Federal Specification QQ-A-250/13E, Amendment 1, and contains only minor editorial and format changes required to bring it into conformance with the publishing requirements of SAE technical standards.

The original Federal Specification was adopted as an SAE standard under the provisions of the SAE Technical Standards Board (TSB) Rules and Regulations (TSB 001) pertaining to accelerated adoption of government specifications and standards. TSB rules provide for (a) the publication of portions of unrevised government specifications and standards without consensus voting at the SAE Committee level, (b) the use of the existing government specification or standard format, and (c) the exclusion of any qualified product list (QPL) sections.

The complete requirements for procuring 7075 aluminum alloy alclad plate and sheet described herein shall consist of this document and the latest issue of AMS-QQ-A-250.

1. SCOPE AND CLASSIFICATION:

1.1 Scope:

This specification covers the specific requirements for 7075 aluminum alloy alclad plate and sheet; the general requirements are covered in AMS-QQ-A-250. The plate and sheet covered by this specification shall be an integral composite product consisting of a heat-treatable aluminum alloy (7075) core with thin layers of an aluminum alloy (7072) anodic to the core and of approximately equal thickness bonded to both surfaces.

1.2 Classification:

1.2.1 Tempers: The plate and sheet are classified in one of the following tempers as specified (See 6.2): O, T6, T62, T651, or F temper. Definitions of these tempers are specified in AMS-QQ-A-250.

2. APPLICABLE DOCUMENTS:

See AMS-QQ-A-250.

3. REQUIREMENTS:

3.1 Chemical Composition:

3.1.1 The chemical composition of the core ingots or slabs and of the cladding plates used for the manufacture of the alclad plates and sheets shall conform to the requirements specified in Table I for core and cladding, respectively.

TABLE I. Chemical Composition ^{1/}

Element	Analysis			
	Core (7075)		Cladding (7072)	
	Minimum Percent	Maximum Percent	Minimum Percent	Maximum Percent
Zinc	5.1	6.1	0.8	1.3
Magnesium	2.1	2.9	-	0.10
Copper	1.2	2.0	-	0.10
Chromium	0.18	0.35	-	-
Manganese	-	0.30	-	0.10
Iron	-	0.50	-	<u>2/</u>
Silicon	-	0.40	-	<u>2/</u>
Titanium	-	0.20	-	-
Other Elements, each	-	0.05	-	0.05
Other Elements, total	-	0.15	-	0.15
Aluminum	Remainder		Remainder	

^{1/} Analysis shall routinely be made only for the elements specifically mentioned in Table I. If, however, the presence of other elements is indicated or suspected in amounts greater than their specified limits, further analysis shall be made to determine that these elements are not present in excess of specified limits.

^{2/} Iron plus silicon 0.7 percent maximum.

3.2 Mechanical Properties:

3.2.1 Mechanical Properties of Material as Supplied: The mechanical properties perpendicular to the direction of final rolling, except for material under 9 inches in width, shall conform to the requirements of Table II for the temper specified. For material under 9 inches in width, the mechanical properties parallel to the direction of final rolling shall conform to the requirements of Table II for the temper specified.

1/ Not required for material 1/2 inch or less in width.

2/ D represents specimen diameter.

3/ Maximum

4/ The properties for these thicknesses are those of the core alloy since the tests are made on a round specimen machined from the plate.

5/ Material in the T62 temper is not available from material producers.

6/ No requirements.

7/ The properties specified for the T62 temper are those formerly specified for the T6 temper (See 6.4).

- 3.2.2 Mechanical Properties After Heat Treatment: In addition to conforming to the requirements of 3.2.1, material in the annealed (O) and the as-fabricated (F) tempers shall, after proper solution heat-treatment and aging, also conform to the requirements of Table II for the T6 and T62 tempers. Material as received in the T6 and T651 tempers shall, after proper re-solution heat-treatment and aging, be capable of conforming to the requirements specified in Table II for the T6 and T62 tempers.
- 3.2.3 Bend Test: Bend specimens taken from material shall be capable of withstanding, without cracking, the bend test specified in AMS-QQ-A-250. The values for bend factor N are given in Table III.

TABLE III. Bend Test Factor "N"

Thickness of material	Tempers	
	O	T6 and T62
Inch		
0.008 thru 0.020	1	6
0.021 thru 0.032	1	7
0.033 thru 0.063	2	7
0.064 thru 0.091	3	8
0.092 thru 0.125	3	9
0.126 thru 0.249	4	10
0.250 thru 0.499	6	12

3.3 Cladding Thickness:

- 3.3.1 Thickness of Cladding Plates: The aluminum alloy (7072) plates that are bonded to the two sides of the aluminum alloy (7075) ingot or slab to form a composite that is to be rolled to the finished thickness shall each have a thickness as specified in Table IV.

TABLE IV. Cladding Thickness

Thickness of Finished Plate or Sheet Inches	Nominal Cladding Thickness per Side; percent of composite thickness	Average Thickness per Side of Cladding on Finished Plate or Sheet; minimum percent of plate or sheet thickness
Under 0.063	4	3.2
0.063 thru 0.187	2.5	2
0.188 and over	1.5	<u>1</u> / 1.2

1/ For plate 0.500 and over, the average cladding thickness per side shall have a maximum value of 3 percent of the plate thickness.
